CHAPTER XXXIV.—LIST OF FOREIGN UNIVERSITIES AND OTHER INSTITUTIONS OF HIGHER EDUCATION.

Arranged according to age 1459
Arranged according to number of students 1461
Arranged alphabetically, with faculties and number of students 1463
Arranged according to countries 1470
Technological schools 1471
Higher agricultural, forestry, and mining schools 1472
Veterinary schools 1472

CHAPTER XXXV.—CURRENT QUESTIONS.

Teachers' salaries in cities 1475
Teachers' pensions and annuities 1478
The teaching force in England and Wales 1481
Foreign students in German universities; women students in Prussian universities 1485
Causes of mortality among teachers 1488
A new history of education 1489

CHAPTER XXXVI.—CITY SCHOOL SYSTEMS.

Recent laws relating to city school boards 1491
Summary of laws relating to school boards of certain cities 1495
Summary of statistics of city schools 1498
High-school enrollment in cities of over 100,000 inhabitants 1501
Comparative statistics of cities containing over 8,000 inhabitants 1506
Comparative statistics for the years 1891 to 1899, inclusive 1510
Statistics of school attendance in cities of over 8,000 inhabitants 1511
Statistics of officers, teachers, and property 1524
Statistics of receipts of city public schools 1537
Statistics of expenditures of city public schools 1548

CHAPTER XXXVII.—INSTITUTIONS FOR HIGHER EDUCATION.

Changes in courses of study 1559
New buildings 1560
The degree of associate 1561
Ratio of students to population, 1872–1899 1562
Statistical review 1562
Requirements for the degree of doctor of philosophy 1564
Whole number of students receiving higher education 1582
Number of undergraduate and graduate students in public universities, colleges, and schools of technology 1583
Number of undergraduate and graduate students in private universities, colleges, and schools of technology 1584
Number of undergraduate students in universities and colleges for men and for both sexes 1585
Classification of universities and colleges for men and for both sexes according to amount of endowment funds 1586

Page.
Classification of universities and colleges for men and for both sexes according to the number of undergraduate students 1587
Nonsectarian and religious control of universities and colleges for men and for both sexes, with the number of professors and students in undergraduate collegiate departments, and the total amount of endowment funds 1588
Professors and instructors in universities and colleges for men and for both sexes 1592
Students in universities and colleges for men and for both sexes 1593
Students pursuing various courses of study in universities and colleges for men and for both sexes 1594
Degrees conferred on men by universities and colleges for men and for both sexes 1595
Degrees conferred on women by coeducational colleges 1597
Honorary degrees conferred by universities and colleges for men and for both sexes 1598
Property of universities and colleges for men and for both sexes 1599
Income of universities and colleges for men and for both sexes 1600
Statistics of instructors and students in universities and colleges 1612
Financial statistics of universities and colleges 1632
Statistics of colleges for women 1652
Statistics of schools of technology 1662

CHAPTER XXXVIII.—PROFESSIONAL SCHOOLS.

Summary of statistics of professional and allied schools 1675
Statistics of schools of theology 1690

THE POWER OF COMMON SCHOOLS TO REDEEM THE STATE FROM SOCIAL VICES AND CRIMES.[1]

By HORACE MANN,
Secretary Massachusetts State Board of Education.

The incontestable progress which the cause of popular education is making in Massachusetts and in some of the other States of our Union is a subject for hearty congratulation among ourselves and for devout gratitude to Heaven. It can not be denied that the cause has won to itself most able and earnest advocates, who are in no way officially connected with it, but who cherish it from the purest motives of duty and philanthropy. But it happens to this, as to all other good causes, that some of its professed friends have attached themselves to it from collateral and some from sinister motives. It is equally true that the cause has enemies, although in this community there are but few who dare to make open proclamation of their hostility. But opponents are all the more formidable when their opposition is secret. Their measures of counteraction are not the less efficient because they are indirect and hide their origin under specious pretenses. There is a third class who have no faith in the utility of education. They number it among what they are pleased to call the Utopian schemes of reform with which the age is teeming, and they regard with an ill-concealed suspicion either the honesty of purpose or the soundness of intellect of those who are laboring to uphold its banner and to bear it forward. There are those also who suspect in education the existence of some unknown and mystical power which, should it once obtain the ascendency, would bear the community onward, they know not whither; and having some *ism* or *ology* of their own by which, provided all civil institutions and Nature herself will succumb to their dictation, they can forthwith extricate the world from all its troubles and carry it forward in the directest line and with the swiftest speed to a millennial goal, they discard an agency whose power they can neither control nor comprehend. And lastly, there are those who array themselves against education solely from mercenary

[1] From the Eleventh Annual Report (1847) of Horace Mann to the Massachusetts State Board of Education, pp. 39–135.

motives—because of the one or two mills upon the dollar which its support subtracts from their property.

To meet the opposition and the indifference originating in these and similar prejudgments, the subject of education has been very much "agitated," particularly in the northern portion of our country, within the last dozen years. There can be no hazard in affirming that far more has been spoken and printed, heard and read, on this theme within the last twelve years than ever before, were it all put together, since the settlement of the colonies. The consequence certainly has been a very marked development of the merits of the subject and a corresponding opening or expansion of the public mind for their recognition. To many sensible men it has come like a revelation, inspiring hopes for the amelioration of mankind and for the perpetuity of our institutions which they had never dreamed of before. There are thousands of persons among us whose once darkened minds have been so quickened with life and illuminated with wisdom on this subject as to beget an intolerable impatience under old imperfections, a perception of which has made rest impossible and the pleasures of home uncomfortable until, within their respective spheres, they had effected a reform.

In order to make this subject more intelligible to the common mind, as well as to conform to broad distinctions which Nature herself has established, it has been considered under a threefold aspect—first, as embracing the proper care and training of the body, that its health and longevity may be secured; second, as cultivating the faculties by which we perceive, compare, analyze and combine, remember, reason, and perceive natural fitness and the beauty of things, so that we may know more of the world in which we are placed and of the glorious attributes of its Maker, and so that, by more faithfully harmonizing our conduct with its laws, we may the better enjoy its exquisite adaptations to our welfare; and third, as fashioning our moral nature into some resemblance to its divine original, subordinating our propensities to the law of duty, expanding our benevolence into a sentiment of universal brotherhood, and lifting our hearts to the grateful and devout contemplation of God.

In pursuance of these fundamental ideas, it has been shown by the authority of the highest medical men in the country that even in the present imperfect state of physiological science more than one-half of all the cases of bodily disability and disease, more than one-half of all the pains and expenditures of sickness, more than one-half of all the cases of premature death—that is, of death under the age of 70 years—are the consequence of sheer ignorance—not of any irrepealable decree or fatality necessitating their existence, independently of our consent and cooperation, but of our own brutish ignorance of the conditions of health and life to which our bodies have been subjected by their Maker. And I desire, also, to be here understood as not including in this moiety of unnecessary suffering and of untimely death a single one of that extensive class of cases which result from a slavish submission to some tyrannous appetite, such as intemperance for instance, where the knowledge, even if we possessed it, might be overborne in a conflict with the sensual desire; but I mean maladies, pains, and death which a bad man would be as quick to avoid as a good one, which every sane man would desire to escape from as he would from blindness or deafness, the gout or the toothache. Even were ignorance, then, to be classed among the greatest luxuries of life, it would be found too costly an indulgence to be borne by an economical people.[1]

The indispensableness of education to worldly prosperity has also been demonstrated. An ignorant people not only is but must be a poor people. They must be destitute of sagacity and providence, and, of course, of competence and comfort. The proof of this does not depend upon the lessons of history, but on the constitution of nature. No richness of climate, no spontaneous productiveness of soil, no facilities

[1] See letters of eminent physicians, in my Sixth Annual Report; also, Common School Journal, vol. 5.

for commerce, no stores of gold or of diamonds garnered in the treasure chambers of the earth, can confer even worldly prosperity upon an uneducated nation. Such a nation can not create wealth of itself; and whatever riches may be showered upon it will run to waste. The ignorant pearl divers do not wear the pearls they win. The diamond hunters are not ornamented by the gems they find. The miners for silver and gold are not enriched by the precious metals they dig. Those who toil on the most luxuriant soils are not filled with the harvests they gather. All the choicest productions of the earth, whether mineral or vegetable, wherever found or wherever gathered, will in a short time, as by some secret and resistless attraction, make their way into the hands of the more intelligent. Within the last four centuries the people of Spain have owned as much silver and gold as all the other nations of Europe put together, yet at the present time poor indeed is the people who have less than they. The nation which has produced more of the raw material and manufactured from it more fine linen than all contemporary nations is now the most ragged and squalid in Christendom. Let whoever will sow the seed or gather the fruit, Intelligence will consume the banquet.

It must be admitted, indeed, that when the people composing any particular state or country are compared with each other, the wisest are not always the wealthiest. This natural law, like others, is liable to fluctuations and disturbances from artificial and arbitrary institutions. Primogeniture, entail, monopoly, may derange its action. Yet even here, as if to add confirmation to the general principle, it is always found that the families of inferior minds who inherit wealth, and the imbecile sovereigns or rulers who inherit power, owe their elevation to the greatness of some ancestor, whose mental superiority not only won preeminence for himself, but for his descendants also. Where wealth or social position has not been earned or won by the possessors themselves, it is the representative of some ancestral talent whose force is not yet expended.

Who that visited the late Mechanics' Fair in the city of Boston was not bewildered by the number and diversity of the products of inventive genius and skill there exhibited? To the common observer it was profusion producing confusion. What would be the result and "sum total" of a mechanics' fair among a tribe in the interior of Africa or among the aborigines of our Western wilderness? Hardly more than a stone hatchet, a flint-headed arrow, a stick burned at the end and sharpened into a spear, and a few yards of tawdry wampum. Yet the variety and richness of the one compared with the poverty and rudeness of the other would be but feeble symbols of the relative power and weakness of the minds from which they sprung. And whence came the vast, the wonderful intellectual superiority? It came from the old slate and pencil; the bit of chalk and the bit of board, planed or unplaned; the spelling book, and the reading book, which have been found in every household through all our borders from the time of the first rude huts that went up, amid winter and storm, about Plymouth Rock, which have been the companions and playthings of every nursery and the business things of every schoolroom for more than two centuries, until the children, as if by force of hereditary instinct, seem to look round inquiringly after them almost as soon as they are born. These are the acorns whence the majestic forest has sprung.

If the difference between persons dwelling in the same community and living side by side be less striking to the senses, it is not less instructive to the reason. In my fifth annual report I presented the testimony of some of the most eminent and successful business men amongst us, proving from business data and beyond controversy that labor becomes more profitable as the laborer is more intelligent, and that the true mint of wealth, the veritable coinage of the country, is not to be found in magnificent Government establishments, at Philadelphia or New Orleans, but in the humble schoolhouse.

On the occasion referred to one of our most sagacious manufacturers declared, not

only in accordance with the conclusions of his own reason, but as the result of an actual experiment, that the best cotton mill in New England, if worked by operatives so low in the scale of intelligence as to be unable to read and write, would never yield the proprietor a profit—that the machinery would soon be worn out, the owner impoverished, and the operatives themselves left penniless. Another witness, for a long time superintendent of many work people, made the following striking remark: "So confident am I that production is affected by the intellectual and moral condition of help that whenever a mill or a room should fail to give the proper amount of work my first inquiry, after that respecting the condition of the machinery, would be as to the character of the help, and if the deficiency remained any great length of time I am sure I should find many who had made their marks upon the pay roll, being unable to write their names; and I should be greatly disappointed if I did not, upon inquiry, find a portion of them of irregular habits and suspicious character." [1]

Is it not, in fact, most palpably demonstrable from a comparison of the nature of man with the powers and properties of the material universe in which he is placed that he was designed to reach a point of intellectual and moral elevation far higher than any which the most favored people on the earth have yet attained? A material world, active with such invisible energies and constantly displaying such fitful changes as belong to our planet, would be the most cruel prison house to beings capable of perceiving its aspects but incapable of understanding its laws. The superiority of our affective and sympathetic faculties over those possessed by the lower orders of creation would only render us so much the more miserable and defenseless if we had not the faculties of reason and judgment, also, by which we are able to bring ourselves into harmony with surrounding circumstances. Without knowledge our present lives would be far more wretched than those of the brutes which perish, for we should be vulnerable on all sides, capable of suffering the keenest pain while incapable of avoiding its causes. The revolution of the seasons would inflict want and debasement upon the whole race if we could not foresee their vicissitudes and provide for their varying necessities. Comets and eclipses are fitted in their very natures to shed consternation and dismay upon the hearts of men until the intellect comes in to explain the sublime order that produces them.[2]

To the savage, thunder and lightning are tokens of divine wrath; while to the Christian philosopher they are only emphatic and vivid proofs of the greatness and wisdom of God. To the enlightened mind a tempest or a whirlwind is only a tempest or a whirlwind; but a barbarian dreads them a thousand times more for the anger of the gods which they denote and for the evils they portend than for any actual injuries which they inflict. The auroras of the north, so beautiful to the eye of science, have shaken myriads of hearts with fear. That numerous and varied class of phenomena which we call optical illusions are sources of the direst terror to the ignorant, while they gratify a philosophic curiosity with the purest delight. In short,

---

[1] See Fifth Annual Report, pp. 86–100; also, Common School Journal, vol. 4, p. 361.

[2] It has been well said, "No eye has ever witnessed the spectacle of a total eclipse of the sun, even when announced with every characteristic of accuracy, without a shudder of awe, a sensation of deep terror, which reason in vain essays to subdue. The chilling and somber darkness which spreads over nature; the manifest terror of birds and animals; their instinctive retreat to the abodes of man, as if some awful danger was impending; the horror of the idea of the destruction of the great source of light and life, and the possible dissolution of nature—all conspire to render this one of the most terrific scenes that the eye of man has ever witnessed. What, then, must have been the horror which seized every spectator of this awful scene in those ages of the world when profound ignorance of its physical causes existed, and this terrible phenomenon burst suddenly upon the world, unanticipated and unannounced?

"The great Roman historian and annalist has, in a few graphic sentences, depicted the effect of an eclipse of the moon on the devoted legions of Pannonia. These hardy veterans, these iron men, born and bred to battle and to war, cowered before the awful spectacle, marched in agony to their contemned commanders and implored their forgiveness and deprecated the wrath of the avenging gods for their disobedience and insubordination."—Sidereal Messenger.

we know that all the wonders and glories which nature displays in her majestic course are only sources of superstition to those who have not learned her sublime laws—darkening the already darkened mind, debasing the debased, and terrifying the affrighted. It seems impossible that a benevolent Being could have gifted the human race with its high faculties if He had not provided for and ordained their development and education. All the other orders of animated nature are adapted to their condition; but a human soul, quickened by irrepressible impulses of curiosity, subject to the illusions of hope and to the agonies of fear, but with no power to unriddle the mysteries by which it is encompassed—with no power to realize the hopes spontaneously springing up within it or to emancipate itself from the bondage of fear—such a soul would be forever the trembling slave of nature, while nature would be a tyrant over it, deaf and remorseless. Whatever name might be given to the place of its habitation, it would be a habitation of unquenchable fire.

Knowledge and a highly developed and highly trained reason are to the temporal necessities of man what instinct is to the brute. But instinct is complete, perfect, self-active; while knowledge and reason can never reach any adequate height without vigorous self-effort and copious instruction from others. Far better, therefore, would it have been for mankind had they never been elevated in the scale of existence above the simian tribe—the ape, the monkey, or the baboon—than that they should have been endowed with the faculties of memory, of hope, of fear, and of imagination, without an adequate ability to derive wisdom from past experience and to make provision for future necessities. There is no earthly power but education which, by supplying these wants, can rescue the human race from sinking as much below the brute creation as they were designed to rise above it.

So, too, if the practice of equity, virtue, and benevolence were not possible for the race, its condition would be far more deplorable than that of any horde of wild beasts that ever prowled through a wilderness or hid themselves for ambush in the depths of a jungle. Even tigers and wolves, with all their ferocity, can inflict but a transitory pain upon each other or upon the weaker races around them. The most ingenious of all the animals have never invented machines to torture those of their own or of an inferior order. The iron boot, the thumbscrew, the rack, the fagot, are dreadful realities in natural history, but the infamy of their invention and their use belongs not to the brute creation. Brutes can not build ships and cross oceans to despoil or enslave a defenseless and kindred race in another hemisphere, nor can they forge any fetters, whether of iron or of law, which shall bind in remorseless bondage not only the victim himself, but generations of his descendants. Brutes can not bereave each other of their natural instincts, make the mother forget her young, the mated pair assail each other's lives, or the offspring lay parricidal hands upon its parent, by transforming the choicest fruits of the earth into poison, and selling this poison for ignominious gain. The most selfish and ignoble races that ever flew through the air or swam in the sea never availed themselves of the accidental possession of power to establish orders of patrician and plebeian, or of lord and commoner, and thus to doom one portion of their number to perform all the toil and bear all the burdens of the tribe while they themselves monopolized all its leisure and its luxuries. What a spectacle would be presented if a few individuals of some family of insects, gathering themselves into conclave upon some spire of grass in the middle of a vast plain, or upon some leaf in a boundless forest, should there presume, not only to adjudicate upon all the purposes of creation and all the mysteries of eternity, but should denounce imprisonment and torture, the fagot and the scaffold, upon all who would not bow to their authority and vow assent to their conclusions. There are tribes of the brute creation, it is true, which prey upon other tribes, but it is only for the satisfaction of a physical want, and when their hunger is appeased their fierceness subsides; but not in the north, where their rage is whetted by arctic cold, nor in the south, where their blood is fevered by tropical heats, do they ever inflict upon a victim

the life-long solitude of a dungeon or gratuitously burn his body and heap contempt upon his ashes for not believing as they believe, or for not acknowledging as the Great Spirit of the universe the idol which they may have set up. If, then, I say, it had not been a part of the divine determination in the creation of our race that its terrible propensities should be controlled and its higher susceptibilities advanced into supremacy, zoology has yet to discover the species of animals so vile, so wretched, so mutually predaceous, that mankind has not reason to envy them. If posterity is to be what history shows us that nineteen-twentieths of all the preceding world have been, what not less than four-fifths of it now are, then is man not the noblest but the ignoblest work of creation, the accursed and not the favored of heaven. Not believing in such a destiny, I believe there is a way to avoid it.

Having proved, then, in former reports, by the testimony of wise and skilled men, that disease may be supplanted by health, bodily pain by enjoyment, and premature death by length of life, merely by the knowledge and practice of a few great physiological principles, such as every person can easily master before the age of sixteen years; and having also shown, by testimony equally authentic and satisfactory, that intelligence, cooperating with the bounties of nature, is sufficient to secure comfort and competence to all mankind, I propose to myself in the residue of this report the still more delightful task of showing, by proofs equally unexceptionable and convincing, that the great body of vices and crimes which now sadden and torment the community may be dislodged and driven out from amongst us by such improvements in our present common-school system as we are abundantly able immediately to make.

During the last summer, in order to a clear and full presentation of the subject to those persons whose testimony I wished to obtain, I prepared a circular setting forth, with as much precision and completeness as possible, certain specific emendations of our present school system—only such emendations, however, as we can readily make—and appealing to the experience and judgment of the persons addressed, to know what would be the results were the system to be so amended. This circular was sent to teachers highly competent to give evidence on so important a subject—competent, from their science and from their personal experience, from the sobriety of their judgment and from their freedom from any motive to overstate facts, or to deduce inferences too broad for the premises on which they were founded. In fine, the circular was sent to persons whose elevated character and whose extended personal acquaintance with the subject-matter on which they testify place them above denial, cavil, or suspicion.

The circular and the answer to it follow:

Circular.

To ——— ———*:*

I desire to obtain the opinion of teachers who are both scientific and practical on a subject of great importance to the cause of popular education. Your long experience in school keeping, the great number of children whom you have had under your care, and your well-earned reputation as an instructor and trainer of youth prompt me to apply to you for answers to the subjoined inquiries.

My general object is to obtain such an opinion as your experience will authorize you to give respecting the efficiency in the formation of social and moral character of a good common-school education, conducted on the cardinal principles of the New England systems. In other words, how much of improvement in the upright conduct and good morals of the community might we reasonably hope and expect if all our common schools were what they should be, what some of them now are, and what all of them, by means which the public is perfectly able to command, may soon be made to become?

As we look around us we see that society is infested by vices both small and great. The value of life is diminished, and even life itself is sometimes made burdensome and odious by the existence amongst us of pests and nuisances in human form, whom the law forbids us to destroy, and whom, with all our efforts, we are unable wholly

to reform. Were we permitted to hunt out and exterminate from society a wicked or mischievous man as we would a prowling wolf from the sheepfold, or could we apply the sovereign antidote of extinction to a pestilent brood of children whom profligate parents are about to send forth into the world, we might then secure ourselves in a summary manner from present fears and from future annoyance. So, too, if we could arrest the momentum of long habit or win back to the paths of virtue those who by their frequent tread have worn the highways of vice both smooth and broad, we should then have access to a milder though a more laborious remedy. But the common sentiments of mankind would revolt at any proposal to prevent all violations of the moral code by extinguishing the life of the violators; and all history and experience afford concurrent proof that the inbred habits of grown men and women, their accustomed trains of thought and of action, are mainly beyond the control of secondary causes. Hence it is that a great part of the legislation of every State and nation, a vast majority of the decisions of all legal tribunals, and a still larger proportion of all the labors and expenditures of philanthropic and Christian men have been devoted to the punishment of positive wrong or to the vain attempt to repair its nameless and numberless mischiefs. Could these wrongs and mischiefs be prevented our descendants would inherit a new earth.

The classes of common offenses by which society is vexed and tormented are numerous, but the individual acts of commission under the respective classes are absolutely incomprehensible save by the Omniscient.

There is the detestable practice of profane swearing, which is motiveless and gratuitous wickedness. This is a vice which neither gives any property to the poor man nor any luxury to the rich one. It degrades even the clown to a lower state of vulgarity, and it would render the presence even of the most polished gentleman offensive and disgusting, if it were ever possible for a gentleman to be guilty of it.

Though greatly restricted at the present day in its destructive agency and gradually withdrawing itself from the more respectable and intelligent classes to the two extremes of society, to the luxuriously rich and the self-made poor, yet the vice of intemperance still exists amongst us. Wherever it invades it eats out the substance of families, not only consumes the means of educating children, but eradicates also the very disposition to educate them; involves the innocent in the sufferings of the guilty, even torturing them with superadded pangs of shame which the guilty do not feel, and, according to the divinely ordained laws of our physical being, it visits the iniquities of the fathers upon the children unto the third and fourth generation by sowing in their constitution the seeds of inordinate desires.

Below that degree of slander or defamation which the law denounces as punishable there exists such an amount of censoriousness and detraction as often estranges acquaintances, dissolves friendships, introduces discord into neighborhoods and communities, and sometimes entails hereditary animosities upon families and circles which might otherwise be blessed by harmony and peace.

Nor can the gross and cowardly offense of lying be omitted from this odious catalogue. This vice includes in its very nature so much of the assassin and the dastard that it lurks to inflict secret blows or only ventures abroad when large numbers, bound together by strong ties of passion or of interest, impart mutual confidence and boldness in the prosecution of a common object. Hence a private individual who is known as a liar is detested, scorned, and shunned, while profligate political defamers and sectarian zealots, inspired by a common sentiment of ambition or of intolerance and keeping themselves in countenance by their numbers and their partisanship, welcome this vice as an ally and rejoice in the successes obtained by its aid. No patriotism is proof against the rancor of party spirit, no piety or good works against the rage and blindness of religious bigotry.

In pecuniary transactions, the temptations to overreaching, to exorbitance, and to actual dishonesty are yielded to with a most lamentable frequency. The buyer takes advantage of the necessities of the seller, and obtains a transfer of his property for a small part of its value; or sometimes, by adroit management and preliminary scheming, he creates the necessity which places the victim within the jaws of his avarice. The seller knowingly overstates the quantity, the quality, or the value of the commodities he sells; and perhaps takes advantage of the ignorance or credulity of the purchaser to obtain a price which he knows to be exorbitant and inequitable. The employer often avails himself of the necessities of the employed to obtain his services for less than they are worth; he summons in hunger, and cold, and the sufferings of a dependent family, as advisers in helping to make an unrighteous bargain, and as sureties for its performance. Men without any pecuniary resources which they can call their own embark in hazardous speculations, where, if the rash adventure should chance to prove successful, they will pocket all the gain; but should it turn out to be disastrous, their creditors must suffer all the loss.

In some of the commercial countries of Europe, a merchant's insolvency affects his moral character hardly less than his pecuniary credit. If a bankrupt can not show that his deficiency of means was occasioned by some disaster which he could not control, or by some loss which he could not reasonably be expected to foresee, he forfeits his mercantile standing amongst honorable dealers, and can retrieve his character only by actual proof of returning or of newly created honesty. A second failure, unexplained and unatoned for, brands with disgrace, and expels not more from the traffic than from the companionship of honorable men.

The above classes of wrongdoing, together with many others of a kindred nature, are regarded by the law as minor offences. Some of them it does not undertake to punish; yet, from their widespread prevalence and great frequency, they perhaps inflict as large an aggregate of evil upon society as those of a more heinous and formidable character, but of less frequent occurrence.

In regard to offences of a graver nature—such as come under the head of crimes or felonies—the condition of our country compares favorably with that of any other part of Christendom. Especially will this remark appear true, if we consider the slight amount of preventive force made use of in any part of our Union to deter from actual transgression; and as a general rule the lightness of the penal sanctions held up as a terror to evildoers. Yet that there does exist amongst us an appalling amount of criminality of this deeper dye; that flagrant offences against the rights of property, of person, of reputation, and of life are perpetrated, is proved by the records of our criminal courts, and by the mournful procession of convicts and felons, whom we see on their way to our penitentiaries and other receptacles prepared for the guilty.

Including all classes of offenders, both the less and the more flagitious, it is undeniable that there exists amongst us a multitude of men of whom it may be truly said, that it would be better for the community had they never been born; or had they died in childhood before their propensities for evil had been developed, or before they had gone abroad to disturb the peace of society, and to destroy that sense of security which every honest man is entitled to feel. To thin the ranks of this host of enemies to the welfare of the race, or to cripple the evil energies of those who could not be wholly reclaimed, has been the object of philanthropists and sages from the beginning of time. Their efforts, however, have been expended a million fold more upon the old than upon the young; and a million fold more, also, in the way of punishment than of prevention.

Among the republics of ancient times, a few wise and sagacious men did clearly perceive the bearing of education upon character; and, of course, upon innocence and guilt, both personal and public; but among the masses of the people there never existed any settled and operative conviction of this truth; and not a single year can be pointed out in all their long annals, where a majority of those who held the reins of government, and framed the laws of the State, rose to any practical or even theoretical conception of the grand idea, that the vital intelligence or the stupidity, the integrity or the dishonesty of the people at large, will be measured and bounded by the kind and degree of the education imparted to its children, just as the zones upon the earth's surface are measured and bounded by the amount of sunlight which is shed upon them.[1]

In modern times this relation of early education to adult character has been more clearly and generally recognized as being what it truly to a very great extent is, a relation between cause and effect. As one means of establishing this truth, many earnest well-wishers of their race have made extensive collections of what are called the "Statistics of Education and Crime." The inmates of large penal establishments have been subjected to a personal examination, in order to ascertain whether a greater portion of them, than of the community at large from which they were taken, were wholly ignorant of letters. In this investigation the comparison has been made between those who were able both to read and write, and those who could perform neither or but one of these operations.

I will not dwell here upon the amazing absurdity of any definition of the word "education," whose spirit or whose terms are satisfied by the mere ability to read and write. Reading and writing may be, and among this class of persons they usually are, mere mechanical processes; and how such attainments should ever have been dignified by the name of education, or confounded with that noble culture of the soul which pours the noonday illumination of knowledge upon the midnight darkness of ignorance, which seeks to enthrone the moral faculties over all animal desires and propensities, and to make the entire course of instruction subservient to the great duties of love to God and love to man—how an absurdity so extravagant

[1] Even Marcus Aurelius declared himself satisfied if he could only improve a few persons; and he denied the possibility of establishing Plato's republic.

and now so obvious could ever have been committed can be explained only by reference to the low and unworthy ideas of education which once prevailed.

The naked capacity to read and write is no more education than a tool is a workman, or a telescope is a Laplace or a Le Verrier. To possess the means of education is not the same as to possess the lofty powers and immunities of education, any more than to possess the pen of a poet is to possess a poet's skill and "faculty divine;" or than the possession of the Gospel is the possession of that liberty wherewith Christ maketh his disciples free; and, that reading and writing are only instruments or means to be used in education, is a truism now so intuitively obvious as to disdain argument. And hence it is, that, of two persons one of whom can barely write his name or spell out a paragraph in a newspaper, while, to the mind of the other, the contents of all manuscripts and of all libraries have no more existence than nonentity has to his senses, it would be hazardous to affirm that the chances of the former for a virtuous life are much superior to those of the latter. Nor do the best authorities dispel all the clouds of doubt which hang over this question. Some writers maintain that crime actually increases in proportion to the diffusion of the rudiments of knowledge, provided the knowledge which is diffused stops with mere rudiments. I think, however, it must be conceded that the preponderance of names and of statistical results does, on the whole, clearly favor the opinion that crime recedes as knowledge advances; and that, as the full-risen sun enables a traveller to see his path and to avoid the dangers that beset it, so the first and faintest gleaming of the morning twilight helps him to discover his way and to shun its perils. It must also be remembered, that when great numbers are taken as the basis of comparison, all of whom possess the rudiments of knowledge, it will always happen that some of them will possess more than the rudiments. Hence, taking whole communities together, I believe the legitimate and inevitable conclusion to be that every advance in knowledge amongst a people is pro tanto an invasion of the domain of crime.

For years past, however, although I have carefully scrutinized these so-called "Statistics of Education and Crime," and am convinced that they do establish a distinction between the two classes—one of which can read and write, while the other can do neither of these things or but one of them—in regard to their relative exemption from crime, or exposure to it, yet I have never been able to bring myself to present these schedules to our people, as an argument in favor of that elevated and ennobling education to which it is their duty to aspire. I have felt that, by so doing, the argument would be shorn of half its power by the feebleness of the proofs brought to sustain it. It would be like exhibiting a taper to prove the existence of light, while surrounded by the sun's effulgence. Our present state of society, the form of government under which we live, the improvable faculties with which we have been endowed by our Maker, and the solemn destiny that awaits us, all demand vastly more than "a knowledge of the nature and power of letters, and the just method of spelling words," and the mechanical ability to imitate, with a pen, their written of printed signs.

Yet this degrading idea of education, which was first conceived in reference to the ignorant classes of Europe, has been, to some extent, adopted and acted upon in our own country. The last census of the United States, taken by authority of a law of Congress, and in compliance with a provision of the Federal constitution, proceeded upon this European fallacy. It virtually adopted the old line of distinction between education and ignorance, for it required an enumeration of all persons over twenty years of age who were unable to read and write. The results have been published and they are now embodied with the permanent statistics of the country. Towns, counties, and States are classed, their condition is mentioned with honor or with opprobrium, according to their relative position above or below this absurd standard of knowledge and culture. It is inevitable that this legislative sanction of such a standard—this naturalization of it, so to speak—should have a most baneful effect in debasing public opinion upon the subject. Facts of an interesting nature are presented, it is true, but their tendency is to rob education of all its noblest attributes.

But though the public mind always tends strongly to conform its modes of thinking to legal definitions, and to subscribe to opinions sanctioned by high authority, yet the common sense of the community, especially in the more educated States of the Union, has outgrown these contracted notions, and has claimed for the word education a far ampler and loftier significance. All intelligent thinkers upon this subject now utterly discard and repudiate the idea that reading and writing, with a knowledge of accounts, constitute education. The lowest claim which any intelligent man now prefers in its behalf is, that its domain extends over the threefold nature of man—over his body, training it by the systematic and intelligent observance of those benign laws which secure health, impart strength, and prolong life; over his intellect, invigorating the mind, replenishing it with knowledge, and culti-

vating all those tastes which are allied to virtue; and over his moral and religious susceptibilities also, dethroning selfishness, enthroning conscience, leading the affections outward in good will toward men, and upward in gratitude and reverence to God. In thousands of reports, prepared by school committees; in frequent addresses and lectures, delivered on public occasions; in all educational documents emanating from high official sources; and in every work pretending to scientific accuracy, or to any comprehensive outline of the subject, these sacred and majestic attributes have been set forth; and it has been demonstrated, hundreds of times over, that the effect of a sound education of the people must, not accidentally but necessarily, not occasionally but always, be, to repress the commission of crime and to promote the diffusion of human happiness; and that to act in conscious defiance or disregard of these truths is treachery to the best interests of our fellow men, and impiety towards the Author of the moral universe.

But, notwithstanding all that has been said, and so well said, as to the moral power of education in reforming the world, there have still been a vagueness and an indefiniteness in regard to the extent of that power which have shorn argument and eloquence of much of their strength. Nowhere have its advocates set forth distinctly and specifically how much they believe can be accomplished by it. When an alleged improvement is presented to a judicious man, he wishes to know whether and to what extent its benefit will exceed its cost. A capitalist will not aid a new enterprise with his money until he is satisfied of the profitableness of the investment, nor will a manufacturer purchase new machinery unless he is convinced that it will do better work in the same time or equal work in less.

It seems to me that the time is now arrived when the friends of this cause should plant themselves on a more conspicuous position, when, surveying the infinite of wretchedness and crime around them, before which the stoutest heart is appalled and humanity stands aghast, they should proclaim the power and the prerogatives of education to rescue mankind from their calamities. Founding themselves upon evidence that can not be disputed, and fortifying their conclusions by the results of personal experience, they should proclaim how far the miseries of men can be alleviated and how far the dominion of crime can be overthrown by such a system of education as it is perfectly practicable for every civilized community forthwith to establish, and thus they should awaken the conscience of the public to a sense of its responsibility.

The idea will be more distinctly presented under an inquiry like the following:

Under the soundest and most vigorous system of education which we can now command, what proportion or percentage of all the children who are born can be made useful and exemplary men—honest dealers, conscientious jurors, true witnesses, incorruptible voters or magistrates, good parents, good neighbors, good members of society? In other words, with our present knowledge of the art and science of education, and with such new fruit of experience as time may be expected to bear, what proportion or percentage of all children must be pronounced irreclaimable and irredeemable, notwithstanding the most vigorous educational efforts which in the present state of society can be put forth in their behalf; what proportion or percentage must become drunkards, profane swearers, detractors, vagabonds, rioters, cheats, thieves, aggressors upon the rights of property, of persons, of reputations, or of life; or, in a single phrase, must be guilty of such omissions of right and commissions of wrong that it would have been better for the community had they never been born? This is a problem which the course of events has evolved, and which society and the Government must meet. If, with such educational means and resources as we can now command, 80, 90, 95, or 99 per cent of all children can be made temperate, industrious, frugal, conscientious in all their dealings, prompt to pity and instruct ignorance instead of ridiculing it and taking advantage of it, public spirited, philanthropic, and observers of all things sacred; if, I say, any given proportion of our children, by human efforts and by such a divine blessing as the common course of God's providence authorizes us to expect, can be made to possess these qualities and to act from them, then just so far as our posterity shall fall below this practicable exemption from vice and crimes, and just so far as they shall fail to possess these attainable virtues, just so far will those who frame and execute our laws, shape public opinion and lead public action be criminally responsible for the difference. I can conceive of no moral proposition clearer than this. Society, in its collective capacity, is the possessor of all the knowledge and the owner of all the property in existence. Governments have been organized and are invested with power to use any needful amount of this property for purposes of education, and by holding out adequate inducements and remuneration they can command the services of the highest talent. Here, then, duty and the means to perform it come together. The only remaining question is how much can be done? For in a cause and for a pur-

pose like this nothing which can actually be done can be guiltlessly omitted. If it is proved with a reasonable degree of certainty that 99, 95, 90, 80, or any other given percentage of all children, can be rescued from vice and crime and can be so educated and trained as to become valuable citizens but the State refuses or declines to do this work, then the State itself becomes a culprit, and before the great Moral Judge who is seated on the throne of the universe it must stand a spectacle of shame and guilt, like one of its own inferior culprits before its own judicial tribunals.

With these preliminary observations, which seemed to be necessary in order to a full exposition of the object I have in view, I proceed to submit the following specific inquiries, and to request your answer to them:

1. How many years have you been engaged in school keeping, and whether in the country or in populous towns or cities?

2. About how many children have you had under your care, of which sex, and between what ages?

3. Should all our schools be kept by teachers of high intellectual and moral qualifications, and should all the children in the community be brought within these schools for ten months in a year, from the age of 4 to that of 16 years; then, what proportion, what percentage, of such children as you have had under your care could, in your opinion, be so educated and trained that their existence on going out into the world would be a benefit and not a detriment, an honor and not a shame, to society? Or, to state the question in a general form, if all children were brought within the salutary and auspicious influences I have here supposed, what percentage of them should you pronounce to be irreclaimable and hopeless? Of course, I do not speak of imbeciles or idiots, but only of rational and accountable beings.

You will perceive that in certain respects I am supposing no change in the present condition of society. I am taking families as they are now, and am allowing all the unfavorable as well as the favorable influences of the old upon the young to continue to operate, at least for a time, as heretofore. Nor do I suppose any sudden or transforming change in cooperative or auxiliary institutions—such as the Sabbath school, the pulpit, and so forth—although it is certain that such a state of things as is here outlined would gradually impart new vigor to all that advances the progress of society, while it would impair the force of all that retards it.

On the other hand, however, I am supposing two great changes. I am supposing all our children to be placed under the care of such a class of men and women as we now honor by the appellation of first-class or first-rate teachers, of such teachers as are able in the schoolroom, both to teach and to govern, and who, out of the schoolroom, will be animated by a missionary spirit in furthering the objects of their sacred vocation. I have also supposed that all the children in the community shall be brought under the forming hands of such teachers, from the age of 4 to that of 16, ten months in each year.

While, therefore, the above supposition leaves children exposed in many cases to the pernicious family and social influences, under which they are now suffering, it assumes that all the children, when out of school, shall meet only such children as are enjoying the same high training, the same daily instillation of moral principles as themselves. My supposition allows a continuance of the same family and adult influences, at least until these shall be supplanted by the better influences of the rising generation, action and reaction hastening results, because these influences are facts which no earthly power can cause to be immediately changed. But I have supposed this noble company of teachers, this length of schools, and this universality of attendance, because these are reforms on the present condition of things which can be effected without any great delay, at the furthest a very few years being an ample allowance for the completion of such a change.

To reduce my third question, then, within its narrowest limits and to make it as definite and precise as possible, suppose yourself to be stationed as a school teacher in a place similar to any of those in which you have before labored; suppose yourself, too, to be surrounded by teachers fully as capable and as zealous in all respects as yourself; and suppose, further, that all the children are brought under your care or theirs, as above specified—that is, for a period of twelve years, or from 4 to 16, and ten months in each year, and will you then please to declare what proportion or percentage of those under your own care you believe could be turned out, the blessing and not the bane, the honor and not the scandal, of society; and on what proportion or percentage—the complement of the other—would your experience compel you to pronounce the doom of hopelessness and irreclaimability?

Very truly and sincerely, yours, etc.,

HORACE MANN,
Secretary of the Board of Education.

I extract from the replies to this circular only the specific answers to the circular.

Letter from John Griscom, esq.

BURLINGTON, N. J., *August 27, 1847.*

MY ESTEEMED FRIEND: * * *

My belief is that, under the conditions mentioned in the question, not more than 2 per cent would be irreclaimable nuisances to society, and that 95 per cent would be supporters of the moral welfare of the community in which they resided.

With teachers properly trained in normal schools, and with such a popular disposition toward schools as wise legislation might effect, nineteen-twentieths of the immoralities which afflict society might, I verily believe, be kept under hatches, or eradicated from the soil of our social institutions.

Every step in such a progress renders the next more easy. This is proved not only on the grand scale of comparing country with country, and state with state, but district with its adjacent district, and neighborhood with neighborhood.

Finally, in the predicament last stated in the circular, and supposing the teachers to be imbued with the Gospel spirit, I believe there would not be more than one-half of one per cent of the children educated, on whom a wise judge would be "compelled to pronounce the doom of hopelessness and irreclaimability."

In nothing which I have advanced has it been my intention to advocate any sectarian instruction in our schools; or anything adverse to the statutory limits of the Massachusetts school system. I therefore expressly disavow any intention to recommend truths or doctrines as part of the moral instruction to be given in public schools, which any believer in the Bible would reasonably deem to be sectarian.

I am, with true esteem, thy friend,

JNO. GRISCOM.

Letter from D. P. Page, esq.

STATE NORMAL SCHOOL,
Albany, N. Y., November 20, 1847.

HON. HORACE MANN,

DEAR SIR: * * *

Could I be connected with a school furnished with all the appliances you name, where all the children should be constant attendants upon my instruction for a succession of years; where all my fellow-teachers should be such as you suppose, and where all the favorable influences described in your circular should surround me and cheer me, even with my moderate abilities as a teacher, I should scarcely expect, after the first generation of children submitted to the experiment, to fail, in a single case, to secure the results you have named. * * *

But I should not forgive myself, nor think myself longer fit to be a teacher, if, with all the aids and influences you have supposed, I should fail, in one case in a hundred, to rear up children who, when they should become men, would be "honest dealers, conscientious jurors, true witnesses, incorruptible voters or magistrates, good parents, good neighbors, good members of society," or, as you express it in another place, who would be "temperate, industrious, frugal, conscientious in all their dealings, prompt to pity and instruct ignorance, instead of ridiculing it and taking advantage of it, public-spirited, philanthropic, and observers of all things sacred;" and, negatively, who would not be "drunkards, profane swearers, detractors, vagabonds, rioters, cheats, thieves, aggressors upon the rights of property, of person, of reputation or of life, or guilty of such omissions of right and commissions of wrong that it would be better for the community had they never been born." * * *

With sincere regard, your friend,

D. P. PAGE.

Letter from Solomon Adams, esq.

BOSTON, *November 24, 1847.*

HON. HORACE MANN.

MY DEAR SIR: * * *

1. I have been engaged in this profession twenty-four years. The first five years in the country, the remainder of the time in a city.

2. My whole number of pupils is a little below two thousand. The last nineteen years my pupils have been females. Previously, both sexes. * * *

If a well-conducted education produces benevolence, justice, truth, patriotism, love to God, and love to man, in one case, the same education, in the same circum-

stances, will produce the same results in all cases. The results for which we look and labor sometimes fail, not because the great law of uniformity is at fault, but by reason of counteracting causes which may escape our most careful scrutiny. Does the failure impair our confidence in the uniformity of moral causes and effects? The moment the law fails, every cord that binds society together is sundered; society is disintegrated. Every social enactment by which society attempts to regulate its members, every motive by which one man hopes to influence another, assumes this uniformity. It is the hinge on which all social influences turn. Without it we could not shape moral means to moral ends. To destroy it—to doubt it—would be the moral unhingement of society.

In this great law are the teacher's hopes and encouragements. The great outline of the means he is to employ is well defined. It is his province to bring all those moral appliances to bear upon the soul, which are suited to lead it into harmony with truth and with God—to train it to the perception and love of truth and goodness. In doing this the faithful teacher is a coworker with God, and may confidently look to the Author of all good to give the crowning blessing to his strenuous endeavors. There are those (and I confess myself of the number) who believe and feel that all human endeavors, unaided by an influence from on high, will prove fruitless so far as the highest wants of the immortal spirit are concerned. Yet those who feel so can tell us of no way in which they are authorized to expect such an influence, and of no way in which it is exerted even by almighty power, except through the instrumentality of truth presented to the mind. There might as well be a conflagration without fire, or a flood without fluid.

I confess I do not see how our different theological views can essentially alter our modes of instruction. We are all to train the young in the way in which they should go, "giving line upon line, precept upon precept, here a little and there a little," waiting for and expecting precious fruit. The fruit may ripen slowly. From day to day you may not be able to see any progress. This holds true both in moral and intellectual training. But by comparing distant intervals progress is perceptible. At length a result comes which repays all the teacher's labor and inspires new courage for new efforts. You ask for my own experience. This is my apology for alluding with freedom to myself. Permit me to say that in very many cases, after laboring long with individuals almost against hope and sometimes in a manner, too, which I can now see was not always wise, I have never had a case which has not resulted in some good degree according to my wishes. The many kind and voluntary testimonials given years afterwards by persons who remembered that they were once my wayward pupils are among the pleasantest and most cheering incidents of my life. So uniform have been the results that I have unhesitatingly adopted the motto, "Never despair." Parents and teachers are apt to look for too speedy results from the labors of the latter. The moral nature, like the intellectual and physical, is long and slow in reaching the full maturity of its strength. I was told a few years since, by a gentleman who knew the history of nearly all my pupils for the first five years of my labor, that not one of them had ever brought reproach upon himself or mortification upon friends by a bad life. I can not now look over the whole list of my pupils and find one who had been with me long enough to receive a decided impression whose life is not honorable and useful. I find them in all the learned professions and in the various mechanical arts. I find my female pupils scattered as teachers through half the States of the Union, and as the wives and assistants of Christian missionaries in every quarter of the globe.

So far, therefore, as my own experience goes, so far as my knowledge of the experience of others extends, so far as the statistics of crime throw any light on the subject, I should confidently expect that ninety-nine in a hundred, and I think even more, with such means of education as you have supposed and with such divine favor as we are authorized to expect, would become good members of society, the supporters of order and law and truth and justice and all righteousness.

That I may not be misunderstood, allow me to add a few explanatory remarks.

I have no confidence in the reformatory power of education into which moral and religious influences do not enter. I assume—as anyone having the slightest acquaintance with your writings and teachings on this subject knows that you do—that the three great classes of powers—the physical, intellectual, and moral—shall each receive its proper training; and then I feel authorized to look confidently for that providential blessing which will secure the high results already alluded to. Without such a training I have no right to expect the blessing of Heaven or a good result; I do not fulfill the conditions on which such results are promised. * * *

It is to be feared, yea, to be for a lamentation, that comparatively few of teachers and still fewer of the community have looked upon a school education as anything more than a very limited intellectual training, leaving physical and moral culture to

take care of themselves. The school laws of Massachusetts have always contemplated other attainments and vastly higher ends. Yet it so happens that that part of the law has been best remembered and acted upon which speaks of reading, writing, and the elements of arithmetic. These have been insisted on chiefly with reference to their direct application to the business and traffic of life, as if it were the chief end of man to count coppers, pocket them, and keep them. While the law contemplates these elementary attainments as merely the beginnings and inlets to all the treasures of wisdom, how many have looked upon them as the education of the boy and the man! * * *

Very truly, your friend and obedient servant,

S. Adams.

Letter from Rev. Jacob Abbott.

New York City, *June 25, 1847.*

Hon. Horace Mann,

Dear Sir: * * *

1. I have been engaged in the practical duties of teaching for about ten years, chiefly in private schools in Boston and New York.

2. I have had under my care, for a longer or shorter time, probably nearly eight hundred pupils. They have been of both sexes, and of all ages from four to twenty-five.

3. If all our schools were under the charge of teachers possessing what I regard as the right intellectual and moral qualifications, and if all the children of the community were brought under the influence of these schools for ten months in the year, I think that the work of training up the whole community to intelligence and virtue would soon be accomplished, as completely as any human end can be obtained by human means.

I do not think, however, that, so far as the formation of the habits of virtue in the young is concerned, the accomplishment of the result depends either upon the intellectual powers or attainments of the teacher, or upon the amount of formal moral instructions which he gives his pupils. Knowledge alone has but little tendency to affect the feelings and principles of the heart; and formal moral instructions, except as auxiliaries to other influences, have very little power, according to my experience, over the consciences and characters of the young.

The true power of the teacher in giving to his pupils good characters in future life, seems to me to lie in his forming them to the practice of virtue, while under his charge, by the influence of his own personal character and actions. To do this, however, he must have the right character himself. He must be governed, in all that he does, by high and honorable principles of action. He must be really benevolent and kind. He must take an honest interest in his pupils—not merely in their studies and general characters, but in all their childish thoughts and feelings, in the difficulties they encounter, in their temptations and trials, in their sports, in their contentions, in their troubles—in everything, in fact, that affects them. He must, in a word, feel a strong interest and sympathy for them, in the thousand difficulties and discouragements they must encounter, in slowly finding their way, with all their ignorance and inexperience, to their place in the complicated and bewildering maze of human life.

A teacher who takes this sort of interest in his pupils will understand them and sympathize with them, in a way which will at once command their kind regard, and give him a powerful, and, in the view of others, a very mysterious ascendancy over their minds. They feel as if he was upon their side, taking their part, as it were, against the difficulties, and dangers, and troubles, which surround them. Thus he becomes one of them—a sharer in their enjoyments—a partaker of their feelings. They come to him with confidence. He plans their amusements; he joins them in conversation; he settles their disputes. They see on what principles he acts, and they catch, themselves, the same mode of action, from him, by a kind of sympathy. They imbibe his sentiments insensibly and spontaneously, not because he enunciates them, or proves them in lectures, but because he exhibits them in living reality in his conversation and conduct. This sort of sympathetic action between heart and heart has far greater influence, among all mankind, than formal teachings and exhortations. It is the life and spirit of virtue, in contradistinction from the letter and the form. * * *

If all the children of this land were under the charge of such teachers, for six hours in the day, and ten months in the year, and were to continue under these influences for the usual period of instruction in schools, I do not see why the result would not be that, in two generations, substantially the whole population would be

trained up to virtue, to habits of integrity, fidelity in duty, justice, temperance, and mutual good will. It seems to me that this effect would take place in all cases, except where extremely unfavorable influences out of school should counteract it, which I think would hardly be the case, except in some districts in the more populous cities.

I am, very respectfully, yours,

JACOB ABBOTT.

Letter from F. A. Adams, esq.

Hon. HORACE MANN,

DEAR SIR: * * *

I do not hesitate to express the conviction that there is no agency which society can exert, through the Government, capable of exerting so great a moral influence for the rising generation as the steady training of the young in the best schools. * * *

In reply to the specific inquiry in your circular, What proportion of our youth would probably, under the advantages of schooling presupposed in the circular, fail of fulfilling honorably their social and moral obligations in society? I would say that in the course of my experience for ten years in teaching between three hundred and four hundred children, mostly boys, I have been acquainted with not more than two pupils in regard to whom I should not feel a cheerful and strong confidence in the success of the proposed experiment. In regard to these two cases I should not despair, but should have a strong preponderance of fear that under the best influences, such as you have supposed, they would still remain wedded to low and mischievous habits. From their peculiar temperament there was much reason to suppose that a life of steady and hard labor would do for them much, in a moral point of view, which the influences of school could not accomplish.

The class of youth I have had under my care would in some respects afford a better than average chance for the success of the experiment, as they in all cases have been exempt from the evils of poverty. In other respects, however, this exemption was counterbalanced by habits of self-indulgence, which could not have existed had the pecuniary means been wanting.

I remain, dear sir, with sincere respect and esteem, yours,

F. A. ADAMS.

ORANGE, N. J., *December 11, 1847.*

Letter from E. A. Andrews, esq.

NEW BRITAIN, CONN., *December 8, 1847.*

Hon. HORACE MANN,

DEAR SIR: * * *

In reply to your first and second questions, permit me simply to remark that I have been connected with the department of education, either as pupil or as teacher, for more than fifty years. I have instructed both in the country and in cities; in the former I have, for the most part, had the charge of only a few select pupils; in the latter, for about twenty years, I was connected with large institutions of instruction. I have no means of determining with any tolerable approach to accuracy the whole number of my pupils, nor the proportion of each sex. * * *

I do not hesitate to express my conviction that such an education as your question supposes, continued for so long a period as twelve years, and including all the children of the community, would remove a very large portion of the evils with which society is now burdened. I need not say that I would be far from attributing so important results to any system of merely intellectual training, or even to the most perfect combination of intellectual, physical, and moral discipline, to the exclusion of that which is strictly religious. Such a qualification of my meaning might have been necessary, on account of the limited sense in which the word education is often used, had not the necessity been removed by the express terms of the conditions annexed to the questions in your circular.

It may indeed be feared that society is not yet fully prepared to put forth the effort necessary to accomplish so desirable a result; but I can not believe that the time is very remote when its attainment will be considered an object of paramount importance. It can not be that the millions of intelligent men found in this and in other Christian countries can much longer permit their feelings to be enlisted, and the resources of the communities to which they belong to be employed, in promoting objects of far inferior value; while the advantages of a good system of general education are, in so great a degree, overlooked. If, as I fully believe, it is in the power of the people of any State, by means so simple as your question supposes,

and so completely in their own power as these obviously are, so to change the whole face of society in a single generation that scarcely 1 or 2 per cent of really incorrigible members shall be found in it, it can not be that so great a good will continue to be neglected, and the means for its attainment unemployed.

In forming our estimate of the probability of so important a result as I have supposed, it must not be forgotten, that, simple as are the means now proposed for its attainment, they have never been employed, so far as I know, in any extended community whose experience is on record. In Scotland, and of late in Prussia, a considerable approximation has been made toward reaching the supposed conditions, and with benefits, it is believed, fully corresponding with the degree of perfection of their respective systems. The common schools of New England, which have done so much to elevate her character, have still fallen immeasurably short of the conditions supposed. With all their acknowledged defects, however, the instances, I believe, are few in which those who have been trained in them, from childhood to the close of the period usually allotted to education in these schools, have afterwards, on mingling with the world, proven to be incorrigibly vicious, a burden rather than a benefit to society. The records of our criminal courts and the doors of our penitentiaries, have seldom been opened to those who, in childhood, had been in regular daily attendance, for ten or twelve years, upon the exercises of our common schools, however imperfect these schools may have been in their organization, and notwithstanding all the evil influences of uneducated associates to which the pupils have been exposed when out of school. The cell of the convict has, on the contrary, been almost uniformly occupied by those who have enjoyed few of the benefits of our common schools; and even the tenants of our poorhouses, it is believed, have, in most instances, belonged to the same unfortunate class. * * *

Very truly, yours, etc.,

E. A. Andrews.

Letter from Roger S. Howard, esq.

Thetford, Vt., *September 1, 1847.*

Hon. Horace Mann,

Dear Sir: * * *

Judging from what I have seen and do know, if the conditions you have mentioned were strictly complied with, if the attendance of the scholars could be as universal, constant, and long-continued as you have stated, if the teachers were men of those high intellectual and moral qualities, apt to teach, and devoted to their work, and favored with that blessing which the word and providence of God teach us always to expect on our honest, earnest, and well-directed efforts in so good a cause, on these conditions, and under these circumstances, I do not hesitate to express the opinion that the failures need not be, would not be, one per cent. Else, what is the meaning of that explicit declaration of the Bible, "Train up a child in the way he should go, and when he is old he will not depart from it?"

I am aware that the opinion I have expressed above may by some be considered extravagant. But I have not formed or expressed it without deliberation. During all my experience as a teacher, I have never known the scholar whom, if brought within the reach of these salutary and auspicious influences for the length of time named, I should now be willing to believe, or dare to pronounce, utterly hopeless and irreclaimable. I do not mean to say that I never failed. But I do say that, in some of the most difficult and desperate cases I have ever met with, as a teacher, the result of direct, special, and perserving effort was such as to create the conviction that, with more zeal, patience and perseverance, and especially with the favoring influences above alluded to, success would have been certain and complete. And this conviction became more settled and strong the longer I continued to teach.

The power of a truly enlightened and Christian system of common-school education is but little understood and appreciated. When parents shall begin to feel, as they ought, its importance, when the community generally shall be willing to make the necessary efforts and sacrifices, and when teachers of the requisite literary qualifications and of high moral aims shall enter upon the work with a martyr's zeal, conscious that every day they are making deathless impressions upon immortal minds, then we shall see, as I believe, results which will greatly surpass the highest expectations of the most ardent and enthusiastic advocates of popular education.

But I am occupying more space than I intended, and will only add that I am, dear sir,

Very respectfully and truly, yours,

Roger S. Howard.

Letter from Miss Catherine E. Beecher.

BRATTLEBORO, *August 20, 1847.*

HON. HORACE MANN.

DEAR SIR: In reference to the questions you propose, I would reply that I have been engaged directly and personally as a teacher about fifteen years in Hartford, Conn., and Cincinnati, Ohio. I have had a few classes of quite young children under my care, for the purpose of making some practical educational experiments; but most of my pupils in age have ranged from twelve to twenty. I have had pupils from every State in the Union, and, though I have no precise records, I think the number can not be less than a thousand.

I have ever considered intellectual culture as subordinate to the main end of education, which is the formation of that character which Jesus Christ teaches to be indispensable to the eternal well-being of our race. Excepting the few classes of young children before named, my efforts have been directed to measures for reforming bad and supplying good habits and principles in minds already more or less developed by education; and this I consider a much more difficult work than the right training of minds as yet uninjured by pernicious influences.

In reference to the work of reforming miseducated minds, I have found that the noblest constructed minds when greatly mismanaged are most liable to become the worst, while at the same time they most readily yield to the reformatory measure, so that, as a general rule, with exceptions, of course, I should expect to do the most good to the worst class of pupils, and in some cases to make finer characters from this class than from those who, possessing less excitable temperaments, have not fallen so far.

I would also remark that in the results I should anticipate, in the case to be supposed hereafter, my chief hope of success would rest on the proper application of those truths and motives which distinguish the teachings of Jesus Christ from what is called "natural religion," and by modes of presentation more simple and practical than I have ever seen fully adopted, or than I ever adopted myself when a practical teacher.

With these preliminaries, which I hope will be carefully pondered and borne in mind as indispensable, I will now suppose that it could be so arranged that in a given place, containing from ten to fifteen thousand inhabitants, in any part of our country where I ever resided, all the children at the age of four should be placed six hours a day for twelve years under the care of teachers having the same views that I have, and having received that course of training for their office that any State in this Union can secure to the teachers of its children. Let it be so arranged that all these children shall remain till sixteen under these teachers, and also that they shall spend their lives in this city, and I have no hesitation in saying I do not believe that one, no, not a single one, would fail of proving a respectable and prosperous member of society; nay, more, I believe every one would at the close of life find admission into the world of endless peace and love. I say this solemnly, deliberately, and with the full belief that I am upheld by such imperfect experimental trials as I have made or seen made by others; but more than this, that I am sustained by the authority of Heaven, which sets forth this grand palladium of education, "Train up a child in the way he should go, and when he is old he will not depart from it."

This sacred maxim surely represents the divine imprimatur to the doctrine that all children can be trained up in the way they should go, and that when so trained they will not depart from it. Nor does it imply that education alone will secure eternal life without supernatural assistance, but it points to the true method of securing this indispensable aid.

In this view of the case I can command no language strong enough to express my infinite longings that my countrymen who as legislators have the control of the institutions, the laws, and the wealth of our physically prosperous nation should be brought to see that they now have in their hands the power of securing to every child in the coming generation a life of virtue and usefulness here and an eternity of perfected bliss hereafter. How then can I express or imagine the awful responsibility which rests upon them, and which hereafter they must bear before the great Judge of nations, if they suffer the present state of things to go on, bearing as it does thousands and hundreds of thousands of helpless children in our country to hopeless and irretrievable ruin.

Respectfully, yours, C. E. BEECHER.

P. S.—All I anticipate, as stated in my communication, may come to pass without any departure from your statutory regulations in regard to religious instruction, as I understand these statutes, and as I suppose them to be understood by the great body of those who formed them, and of those who are bound by them.

C. E. B.

The above answers are not choice specimens selected from among many; they are all I have received; and every person to whom the circular was sent was pleased to answer it. From conversations, held at different times, with many other teachers I believe the amount of testimony might have been very much increased, though no confirmation can be needed of its authority. The witnesses here introduced certainly possess all the requisites to entitle them to implicit credence. Their character for honor and veracity repels the idea of distrust. Years of experience in different places and the training of children in great numbers qualify them in point of knowledge to speak with authority, and they are exempt from any imaginable bias to warp or to color the truth.

From time immemorial it has been customary for Parliaments and other legislative bodies to commit important practical subjects to committees, and through their instrumentality to obtain the testimony of learned and skilled men on the matter of inquiry. Sometimes witnesses are heard at the bar of the House—that is, before the legislative body by whom the inquiry was instituted. Now I have desired, in the present case, to introduce testimony of such credibility and cogency that no legislative committee could report against it, and no legislative body could act against it, without incurring an historic odium, either for want of intelligence or want of integrity.

So, too, by the rules of "common law," all questions of fact are decided by the intervention of a jury. In ancient times, when the character of juries was very different from what it now is, they sometimes gave a corrupt verdict; that is, a verdict so contradictory to evidence as to be of itself proof that they had discarded the testimony adduced and been governed by some dishonest motive in their own breasts. A jury convicted of this offense was said to be "attainted." Its members were punished by a fine and rendered infamous ever after. It was my intention, in the present case, to introduce evidence of such authority and directness as if submitted to a jury and rejected by them would, under the ancient law referred to, subject them to the penalties of an "attaint."

There is one quality or characteristic common to all the witnesses whose testimony is above introduced which, as it seems to me, I am not only justified in stating, but which it would be inexcusable to withhold. All of them, without exception, are well-known believers in a theological creed one of whose fundamental articles is the depravity of the natural heart. They hold, in a literal sense and with regard to all mankind, that the innate affections or dispositions of the soul are "not subject to the law of God, neither indeed can be," until another influence, emanating from the Godhead, and equal in itself to an act of creation, shall have renewed them. With this private belief of the witnesses, of course, neither the board of education nor any man or body of men have aught to do, unless, indeed, it be to affirm their right to hold it, in common with every other man's right either to agree with them or to dissent from them. But as bearing upon the point under consideration the fact is most important; it adds great cogency to their testimony, and invests it, as it were, with a compulsory power. For, if those who believe that the human heart is by nature alienated from God, that its innate relation to the Holy One is that of natural repulsion and not of natural attraction, nor even of neutrality; if they, from their own experience in the education of youth, believe that our common-school system, under certain practicable modifications, can rear up a generation of men who will practice toward their fellow-men whatsoever things are true, honest, just, pure, lovely, and of good report; then, surely, a rational community can need no additional evidence or motive to impel it to the work of reform. And all those, if such there are, who believe that moral evil comes from the abuse or misuse of powers in themselves good, and not from any inborn and original predilection for wrong, may well take courage, and may tender their heartiest cooperation in furthering an enterprise which, even under fundamental postulates the most adverse, promises results

so glorious. If they who believe that there is a principle of evil in the human soul, lying back of consciousness incorporated as an original element into its constitution, beginning to be when the spirit itself began to be, and growing with it through all the primordial stages of its growth, which, indeed, belongs to the antenatal period of every descendant of Adam, as much as spottedness belongs to an unborn leopard before it has a skin, or venom to an unhatched cockatrice before it has a sting; if those who believe this do nevertheless believe that our common-school system, with certain practicable modifications, can send out redeeming and transforming influences which shall expel ninety-nine hundredths of all the vices and crimes under which society now mourns and agonizes, then those who dissent from the belief that the natural heart is thus organically intractable and perverse, will be all the more ready to proclaim the ameliorating power of education, and will all the more earnestly labor for its diffusion. And the crowning beauty of the whole is that Christian men of every faith may cordially unite in carrying forward the work of reform, however various may be their opinions as to the cause which has made that work necessary; just as all good citizens may unite in extinguishing a conflagration, though there may be a hundred conflicting opinions as to the means or the men that kindled it. In short, it may be difficult to determine which class will act under the more conscience-moving motives—those who hold to a total depravity or corruption of the human heart, but still believe it can be emancipated from worldly vices and crimes by such instrumentalities as we can readily command; or those who hold that heart to be naturally capable of good as well as evil, and who therefore believe, not only that a still larger proportion of the race can be rescued from the dominion of wrong doing, but that a consummation so glorious can be reached at a still earlier period and with a less expenditure of effort.

But this divine result of staying the desolating torrent of practical iniquity by drying up its fountain head in the bosoms of the young, is promised only on the antecedence or performance of certain prescribed conditions. These conditions are the three following:

1. That the public schools shall be conducted on the cardinal principles of the present New England system;

2. That they shall all be taught, for a period of ten months in each year, by persons of high intellectual and moral qualifications—or, in other words, that all the teachers shall be equal in capacity and in character to those whom we now call first-class or first-rate teachers; and

3. That all the children in the Commonwealth shall attend school regularly—that is, for the ten months each year during which they are kept—from the age of 4 to that of 16 years.

As it is on the performance of these conditions that the renovation of society is predicated, it is, of course, necessary to show that they are practicable conditions. I therefore proceed to consider and, as I trust, to establish their practicability.

I. The first condition—namely, that the schools shall be conducted on the cardinal principles of the New England system—is already satisfied. The Massachusetts school system represents favorably the systems of all the New England States. Not one of them has an element of prosperity or of permanence, of security against decay within, or the invasion of its rights from without, which ours does not possess. Our law requires that a school shall be sustained in every town in the State—even the smallest and the poorest not being excepted—and that this school shall be as open and free to all the children as the light of day or the air of heaven. No child is met on the threshold of the schoolhouse door to be asked for money, or whether his parents are native or foreign, whether or not they pay a tax, or what is their faith. The schoolhouse is common property. All about it are inclosures and hedges, indicating private ownership and forbidding intrusion; but here is a spot which even rapacity dares not lay its finger upon. The most avaricious would as soon think of monopo-

lizing the summer cloud, as it comes floating up from the west to shed its treasures upon the thirsty earth, as of monopolizing these fountains of knowledge. Public opinion—that sovereign in representative governments—is in harmony with the law. Not infrequently there is some private opposition, and occasionally it avows itself and assumes an attitude of hostility; but perseverance on the part of the friends of progress always subdues it, and the success of their measures eventually shames it out of existence.

The law requires all public schools to be kept by a teacher whose literary and moral qualifications have been examined and approved by a committee chosen for the purpose by the people themselves. Not less than the six following branches of knowledge are to be taught in every town; namely, orthography, reading, writing, English grammar, geography, and arithmetic. The teaching of "good behavior," which includes all the courtesies of life, and all the minor morals, is also expressly enjoined. These peremptory requisitions are the minimum, but not the maximum. Any town may enlarge the course of studies to be pursued in its schools as much as it may choose, even to the preparation of young men for the university, or for any branch of educated labor. It may also bestow an equivalent education upon the other sex. The law also contains a further provision (subject, however, to be set aside by the express vote of a district or town), that in every school of more than fifty scholars in regular attendance an assistant teacher shall be employed. Although there is no statutory provision to this effect in any other of the New England States, yet the good sense of the community everywhere advocates this rule.

Nor are the needs of the intellect alone provided for. In prescribing the education to be given to the moral nature the law grows more earnest and impressive. Its beautiful and deep-toned language is, "It shall be the duty of the president, professors, and tutors of the university at Cambridge, and of the several colleges, and of all preceptors and teachers of academies, and all other instructors of youth to exert their best endeavors to impress on the minds of children and youth committed to their care and instruction the principles of piety, justice, and a sacred regard to truth, love to their country, humanity and universal benevolence, sobriety, industry and frugality, chastity, moderation and temperance, and those other virtues which are the ornament of human society and the basis upon which a republican constitution is founded, and it shall be the duty of such instructors to endeavor to lead their pupils, as their ages and capacities will permit, into a clear understanding of the tendency of the above-mentioned virtues to preserve and perfect a republican constitution and secure the blessings of liberty, as well as to promote their future happiness, and also to point out to them the evil tendency of the opposite vices." But lest any individual or body of individuals, forgetful of the divine precept to do unto others as they would be done unto, should seize upon this statutory injunction, or upon some part of it, as a pretext for turning the schools into proselytizing institutions, the law rears a barrier against all sectarian encroachments. That which is "calculated to favor the tenets of any particular sect of Christians" is excluded from the schools. The use of the Bible in schools is not expressly enjoined by the law, but both its letter and its spirit are in consonance with that use, and, as a matter of fact, I suppose there is not, at the present time, a single town in the Commonwealth in whose schools it is not read. Whoever, therefore, believes in the Sacred Scriptures has his belief, in form and in spirit, in the schools, and his children read and hear the words themselves which contain it. The administration of this law is intrusted to the local authorities in the respective towns. By introducing the Bible they introduce what all its believers hold to be the rule of faith and practice, and although, by excluding theological systems of human origin, they may exclude a peculiarity which one denomination believes to be true, they do but exclude what other denominations believe to be erroneous. Such is the present policy of our law for including what all

Christians hold to be right, and for excluding what all, excepting some one party, hold to be wrong.

If it be the tendency of all parties and sects to fasten the mind upon what is peculiar to each and to withdraw it from what is common to all, these provisions of the law counterwork that tendency. They turn the mind toward that which produces harmony, while they withdraw it from sources of discord, and thus through the medium of our schools that song which ushered in the Christian era, "Peace on earth and good will to men," may be taken up and continued through the ages.

The first condition, then, not only may be, but actually is, complied with, in the the school system of Massachusetts as now established and administered.

II. The second condition requires that all our schools shall be kept, for ten months in each year, by persons of high intellectual and moral qualifications—by persons equal in capacity and in character to those whom we now call first-class or first-rate teachers.

This condition supposes two things which, as yet, we are very far from having attained. The question is, are they attainable?

In regard to teachers, it supposes such an improvement as shall advance all those who are now behind what we call the front rank until they shall come upon a line with it. Of course if this be done, some will be found in advance of this line, for it never can happen, with regard to all the members of any profession, that they will stand precisely abreast. It supposes, also, that all our schools shall be kept for ten months each year.

The questions, then, for consideration under this head, are two, namely:

1. Is there, in the community at large, sufficient natural endowment or capacity from which, by appropriate training and cultivation, the requisite number of teachers possessing the supposed qualifications can be prepared? And

2. Can the towns and the State, separately or as copartners, bear the expense of maintaining the required class of teachers for the required length of time?

Is not the first question answered in the affirmative by observation and experience? For the last two generations, with exceptions comparatively few, all the eminent men of our State, whether men of letters, physicians, lawyers, clergymen, legislators, or judges, have taught school, more or less, during the early part of their lives. Now, it is no disparagement to say, respecting those who constitute at present our best class of teachers, that they are not superior in endowments or natural capacity, in industry or in versatility of genius to a vast number of their predecessors who, having labored for a limited period in this field, at length abandoned it in quest of some other occupation truly known to be more lucrative and falsely supposed to be more honorable. It is no unauthorized assumption, then, to say that great numbers of those who left the employment of school keeping for something deemed to be more eligible would, had they continued in it, have won the honor of standing in the foremost rank of this noble profession.

In the second place, to prove that there is no lack of natural talent in existence from which to form the supposed class of teachers, I may refer to the general history and experience of mankind in all other departments of human effort. No new calling has ever reached such an elevation as to insure honor and emolument to its professors which has not, without delay, attracted to itself an adequate number of followers. Witness the intrinsically odious profession of arms—a profession so odious that those have been held worthy of especial reward who resisted the natural love of ease and instincts of self-preservation to encounter its hardships and perils. So, also, has it been in regard to commerce and the useful arts; and in those truly dignified and honorable professions—the legal and clerical—where mind is the object to be acted upon, as well as the agent to act, the supply has generally exceeded the demand. Now, could the business of education take its stand in public estimation

by the side of the most honorable and lucrative callings in life, we are authorized by all the experience of mankind to conclude that it would soon cluster around itself an amount of talent, erudition, and genius at least equal to what has ever adorned any other avocation among civilized men.

But, independently of personal knowledge and of historic experience, may not a conclusive argument in support of the general position be drawn from the energy and versatility with which, as we all know, Nature has gifted the minds of her children? In the variety and strength of the capacities belonging to the race there must be the means or instruments by which Providence can accomplish every good work. Somewhere, in each generation, the powers exist by which the generation that is to succeed it may be advanced another stage along the radiant pathway of improvement. But in the whole of the past history of the world no generation has yet existed whose faculties have not, to a very great extent, lain dormant, to say nothing of the perversion of those which have been developed. But our free institutions cherish growth. The future with us is not to be measured by the past. The mind of the masses, which for so many ages had been crippled, and fettered after it was crippled, is here unbound. Under the stimulus applied to native vigor, talent and genius start up as naturally as vegetation in the spring. The desire of bettering one's condition springs from a universal instinct in the human mind. With us every man sees that the gratification of this desire is within his reach. Including the lifetime of a single generation—that is, within the last forty or fifty years—there is not a school district in Massachusetts, however obscure, which has shown any interest in the character of its schools, that has not sent out one or more men who have become conspicuous in some of the honorable positions of society. They are found throughout the Union—wherever enterprise or talent is rewarded. Those districts and, still more, those towns, where common schools have been an object of special regard, have sent forth many such men. While visiting different parts of the State, for the last ten years, facts in sufficient numbers to make a most interesting and instructive book have come to my knowledge, showing that those districts and towns, where special pains have been exerted and special liberality bestowed in behalf of common schools, have supplied a proportion of all the distinguished men of the vicinity corresponding with the superior excellence of the early education afforded them. So, on the other hand, neglectful towns and districts have been comparatively barren of eminent men. The great ears of corn will not grow on sand hills. Great men will not spring up in an atmosphere void of intellectual nutrition. Nature observes a law in this respect in regard to her spiritual as well as her physical productions. Now, although something has been done in Massachusetts for the culture and expansion of the common mind, yet indefinitely more may be done. Even were it admitted, therefore, that the State had not been able in the past times to supply the requisite number of teachers of the highest grade, it would by no means follow that she could not do so in the future.

The intrinsically noble profession of teaching has, most unfortunately, been surrounded by an atmosphere of repulsion rather than of attraction. Young men of talent are generally determined by two things in selecting an employment for life. The first of these is the natural tendency of the mind—its predisposition toward one pursuit rather than toward another. In this way nature often predetermines what a man shall do, and, to make her purpose inevitable, she kneads it, as it were, into the stamina of his existence. She does not content herself with standing before his will, soliciting or tempting him to a particular course, but she stands behind the will, guiding and propelling it, so that, from birth, he seems to be projected toward his object, like a well-aimed arrow to its mark. Those in whom the love of beautiful forms, colors, and proportions predominate are naturally won to the cultivation of the fine arts or to some branch of the useful arts most congenial to the fine. Those who have a great fondness for botany and chemistry, and to whom physiological

inquiries are especially grateful, become physicians. Persons enamored of forensic contests, roused by their excitements and panting for the eclat which their victories confer, betake themselves to the study of the law and become advocates. The clerical profession is composed of men whose minds are deeply imbued and penetrated with the religious sentiment, and who ponder profoundly and devoutly upon the solemn concerns of an hereafter.[1] This constitutional or moral affinity for one sphere of employment rather than for another predetermines many minds in choosing the object of their pursuit for life. It is like the elective attractions of the chemist, existing beforehand, and only awaiting the contiguity of the related substances to make their secret affinities manifest.

But this natural tendency is often subjected to a disturbing or modifying force; and it yields to this force the more readily as it is itself less intense and dominant. All minds have a desire, more or less energetic, for pleasure, for wealth, for honor, or for some of that assemblage of rewards which obtains such willing allegiance from mankind. Hence the internal, inborn impulse is often diverted from the specific object to which it naturally points, and is lured away to another object, which, from some collateral or adventitious reason, promises a readier gratification.

There is also a class of minds of vigorous and varied capacities which stands nearly balanced between different pursuits, and which, therefore, may be turned, by slight circumstances, in any one of many directions. They are like fountains of water rising on a table-land, whose channels may be so cut as to cover either of its slopes with fertility.

Now, the qualities which predispose their possessor to become the companion, guide, and teacher of children are good sense, lively religious sensibilities, practical, unaffected benevolence, a genuine sympathy with the young, and that sunny, genial temperament which always sees its own cheerfulness reflected from the ever-open mirror of a child's face. The slightest exercise of good sense makes it apparent that any one year of childhood will exert a more decisive control over future destiny than any ten years afterwards. The religious and benevolent elements seize instinctively upon the promise made to those who train up children in the way they should go. The love of children casts a pleasing illusion over the mind, in regard to everything they do—if, indeed, it be an illusion, and not a truth above the reach of the intellect—elevating their puerile sports into dignity, hailing each step in their progress as though it were some grand discovery in science, and grieving over their youthful wanderings or backslidings with as deep a sorrow as is felt for the turpitude of a full-grown man, or for the heaven-defying sins of a nation. So that genial, joyous, ever-smiling temperament, which sees only rainbows where others see clouds, and which is delighted by the reflection of itself when coming from one child's face, will never tire of its labors when the same charming image perpetually comes back from the multiplying glasses of group after group of happy children—ever varying, but always beautiful.

Now, I think we have abundant reason to believe that a sufficient number of persons, bearing from the hand of nature this distinctive image and superscription of a school-teacher, are born into the world with every generation. But the misfortune is that when they arrive at years of discretion, and begin to survey the various fields of labor that lie open before them, they find that the noblest of them all, and the one, too, for which they have the greatest natural predilection, is neither honored by distinction nor rewarded by emolument. They see that if they enter it many of their colleagues and associates will be persons with whom they have no congeniality of feeling, and who occupy a far less elevated position in the social scale than that to which their own aspirations point. If they go through the whole country and question every man, they can not find a single public-school teacher who has acquired

[1] This general remark must be taken with the exception of a few of the very worst men which any age ever produces. These become members of the clerical profession because, under the mask of its sanctity, they hope to practice their iniquities with impunity.

wealth by the longest and the most devoted life of labor. They can not find one who has been promoted to the presidency of a college, or to a professorship in it; nor one who has been elected or appointed to fill any distinguished civil station. Hence, in most cases, the adventitious circumstances which surround the object of their preference repel them from it. Or, if they enter the profession, it is only for a brief period, and for some collateral purpose; and when their temporary end is gained they sink it still lower by their avowed or well-understood reasons for abandoning it. Such is the literal history of hundreds and of thousands who have shone or are now shining in other walks of life, but who would have shone with beams far more creative of human happiness had they not been struck from the sphere for which nature preadapted them.

Look at the average rate of wages paid to teachers in some of the pattern States of the Union. In Maine it is $15.40 per month to males and $4.80 to females. In New Hampshire it is $13.50 per month to males and $5.65 to females. In Vermont it is $12 per month to males and $4.75 to females. In Connecticut it is $16 per month to males and $6.50 to females. In New York it is $14.96 per month to males and $6.69 to females. In Pennsylvania it is $17.02 per month to males and $10.09 to females. In Ohio it is $15.42 per month to males and $8.73 to females. In Indiana it is $12 per month to males and $6 to females. In Michigan it is $12.71 per month to males and $5.36 to females. Even in Massachusetts it is only $24.51 per month to males and $8.07 to females. All this is exclusive of board; but let it be compared with what is paid to cashiers of banks, to secretaries of insurance companies, to engineers upon railroads, to superintendents in factories, to custom-house officers, navy agents, etc., and it will then be seen what pecuniary temptations there are on every side, drawing enterprising and talented young men from the ranks of the teachers' profession.

Nor does the social estimation accorded to teachers much surpass the pecuniary value set upon their services. The nature of their calling debars them almost universally from political honors, which throughout our whole country have a factitious value so much above their real worth. Without entire faithlessness to their trust they can not engage in trade or commercial speculations. Modes of education have heretofore been so imperfect that I do not know a single instance where a teacher has been transferred from his school to any of those departments of educated labor in which such liberal salaries are now given. And thus it is that the profession at large, while they enjoy but a measured degree of public respect, seem shut out from all the paths that lead to fortune or to fame. No worldly prize is held up before them; and, in the present condition of mankind, how few there are who will work exclusively for the immortal reward. It supposes the possession only of very low faculties to derive pleasure from singing the praises of a martyr; but, to be the martyr oneself requires very high ones.

Hence it is, as was before said, that when the aspiring and highly endowed youth of our country arrive at years of discretion, and begin to survey the varied employments which lie spread out before them, they find that the noblest of them all presents the fewest external attractions. Those whose natural or acquired ambition seeks for wealth go into trade. The mechanical genius applies himself to the useful arts. The politically ambitious connect themselves with some one of those classes from which public officers are usually selected. Medicine attracts those who have the peculiar combination of tastes congenial to it. Those who ponder most upon the ways of God to men minister in sacred things. Who, then, are left to fill the most important position known to social life? A few remain whose natural tendencies in this direction are too vehement to be resisted or diverted; a somewhat larger number, who have no strong predilection for one sphere of exertion rather than for another, and to whom, under the circumstances peculiar to each, school keeping is as eligible as any other employment. But many, very many, the great majority,

engage in it not for its own sake, but only to make it subservient to some ulterior object, or (with humiliation be is said) perhaps only to escape from manual labor.

The profession of school keeping, then, as a profession, has never had an equal chance with its competitors. On the one hand, it has been resorted to by great numbers whose only object was to make a little money out of it and then abandon it; and, on the other, its true disciples, those who might have been and should have been its leaders and priesthood, have been lured and seduced away from it by all the more splendid prizes of life.

Even though, therefore, the profession of school keeping has not been crowded by learned and able men, devoting their energies and their lives to its beneficent labors, this fact wholly fails to prove that nature does not produce, with each generation, a sufficient number of fit persons, who, under an equitable distribution or apportionment of honors and rewards for meritorious services, would be found preadapted for school keeping in the same way that Newton was for mathematics, or Pope for poetry, or Franklin for the infallibility of his common sense. Indeed, the proportion of good teachers whom we now have, notwithstanding all their discouragements against entering and their seducements for leaving the profession, seem demonstrative of the contrary.

Thus far the argument has proceeded upon the basis that the required number of teachers, possessing the high grade of qualifications supposed, must equal the present number, such as these are. But it is almost too obvious to need mentioning that if the qualifications of teachers were to be so greatly enhanced and the term of the schools so materially lengthened, as is proposed, teaching would then really become a profession, and the same teachers would keep school through the year. Instead, therefore, of changing from male teachers in the winter to females in the summer, back again to males in the winter, and so on, alternately—the children of each school suffering under a new stepfather or a new stepmother each half year—they would enjoy the vastly improved system of continuous training under the same hands. This would diminish by almost one-half the required number of teachers for our schools; the poorer half would be discarded, the better half retained. Surely, under these circumstances, if a sufficient number of the very highest class of teachers could not be found, it would not be owing to any parsimony of nature in withholding the endowments, but to our unpardonable niggardliness in not cultivating and employing them.

Feeling now authorized to assume that the first proposition has been satisfactorily established, it only remains to be considered, under this head, whether the community at large—the towns separately, or the towns and the State by joint contributions—can afford to make such compensation as shall attract to this field of labor the high order of teachers supposed, and shall requite them generously for their services.

To induce persons of the highest order of talent to become teachers, and to deter good teachers from abandoning the profession, its emoluments must bear some close analogy to those which the same persons could command in other employments. The case, too, as presented in the circular, and upon which the evidence has been obtained, supposes the schools to continue for ten months in each year. Although in many large towns the schools are now kept more than this portion of the year, yet their average length for the whole State is but eight months. The increased expense, then, both of the longer term and of the more liberal compensation, must be provided for. Can the community sustain this expense?

Let us suppose for a moment that 99 per cent of our whole community should be temperate, honest, industrious, frugal people—conscientious in feeling and exemplary in conduct—is it not certain that two grand pecuniary consequences would immediately follow, namely, a vast gain in productive power and a vast saving in the criminal destruction and loss of property? Either of these sources of gain would more

than defray the increased expenses of the system, which, according to the evidence I have obtained, would insure both. The current expenses last year for the education of all the children in the State between the ages of 4 and 16 was $3.14 on an average for each one. Look into the police courts of our cities in the morning—and especially on Monday morning—when the ghastly array of drunkards is marched in for trial. A case may not occupy ten minutes, and yet the fine, costs, and expenses would educate two children for a year in our public schools at the present rate, or one child at double the present rate. The expenses incurred in punishing the smallest theft that is committed exceed the present cost of educating a child in our schools for a year. A knave who proposes to obtain goods by false pretenses will hardly aim at making less than $1,000 by his speculation. There are more than 150 towns in Massachusetts—that is, about half the whole number in the State—in each of which the annual appropriation for all its schools is less than $1,000. A burglar or highway robber will seldom peril his life without the prospect of a prize which would educate 500 or 1,000 children for a year. An incendiary exhibits fireworks at an expense which would educate all the children of many a school district in the State from the age of 4 to that of 16, while the only reward he expects is that of stealing a few garments or trinkets during the conflagration. In a single city in the State, consisting of 16,000 or 17,000 inhabitants, it was estimated by a most respectable and intelligent committee, that the cost of alcoholic drinks during the last year far exceeded the combined cost of all the schools and all the churches in it, although, for both religion and education, it is a highly liberal city. The police expenses alone of the city of New York are about half a million a year. But all these are but a part of the sluiceways through which the hard-earned wealth of the people is wasted. What shall be said of those stock swindlings and bank failures whose capitals of hundreds of thousands of dollars are embezzled in "fair business transactions;" whose vaults, sworn to be full of specie or bullion, remind one, on inspection, not merely of a pecuniary, but of a philosophical vacuum; what of those epidemic speculations in land—often fairyland, though void of both beauty and poetry—where fortunes change hands as rapidly as if dependent upon the throw of a gambler's dice; and what of those enormous peculations by government defaulters, where more money is engulfed by one stupendous fraud than Massachusetts expends for the education of all her children in a year? All this devastation and loss the public bears with marvelous, with most criminal composure. The people at large stand by the wreck-covered shore, where so many millions are dashed in pieces and sunk, and seem not to recognize the destruction; and—what is infinitely worse—there are those who rejoice in the howl of the tempest and the shrieks of the sufferers, because they can grow rich by plundering only here and there a fragment of property from the dead or the defenseless. By charity, by direct taxes, by paying 20 or 30 per cent more for every article or necessary of life than it is equitably worth, by bad debts, by the occasional and involuntary contributions of a pocketbook, a watch, a horse, a carriage, a ship, or a cargo, to which the robber and the barrator help themselves, by paying premiums for insurance, and in a hundred other ways, the honest and industrious part of the people not only support themselves, but supply the mighty current of wealth that goes to destruction through these flood-gates of iniquity. The people do not yet seem to see that all the costs of legislating against criminals, of judges and prosecuting officers, of jurors and witnesses to convict them; of building houses of correction, and jails and penitentiaries for restraining and punishing them, is not a hundredth part of the grand total of expenditure incurred by private and social immoralities and crimes. The people do not yet seem to see that the intelligence and the morality which education can impart is that beneficent kind of insurance which, by preventing losses, obviates the necessity of indemnifying for them—thus saving both premium and risk. What is engulfed in the vortex of crime, in each generation, would build a palace of more than Oriental splendor in every school dis-

trict in the land; would endow it with a library beyond the ability of a lifetime to read; would supply it with apparatus and laboratories for the illustration of every study and the exemplification of every art, and munificently requite the services of a teacher worthy to preside in such a sanctuary of intelligence and virtue.

But the prevention of all that havoc of worldly goods which is caused by vice transfers only one item from the loss to the profit side of the account. Were all idle, intemperate, predatory men to become industrious, sober, and honest, they would add vast sums to the inventory of the nation's wealth, instead of subtracting from it. Let any person take a single town, village, or neighborhood and look at its inhabitants individually, with the question in his mind—how many of them are producers and how many are nonproducers; that is, how many, either by the labor of the body or the labor of the mind, add value and dignity to life, and how many barely support themselves, and I think he will often be surprised at the smallness of the number by whose talent and industry the storehouses of the earth are mainly filled and all the complicated business of society is principally managed. Could we convert into coworkers for the benefit of mankind all those physical and spiritual powers of usefulness which are now antagonists or neutrals the gain would be incalculable.

Add the two above items together—namely, the saving of what the vicious now squander or destroy, and the wealth which, as virtuous men, they would amass—and the only difficulty presented would be to find in what manner so vast an amount could be beneficially disposed of.

But it is not to be disguised, whatever reforms may be instituted, that the cost of crime can not at once be prevented. For a season, therefore, and until the expense of education shall arrest and supersede the expenses of guilt, both must be borne. I wish to state the difficulty without extenuation. The question, then, is, Can both be temporarily borne?

The appropriations for which the towns voluntarily taxed themselves last year for the current expenses of the schools—that is, for the wages and board of teachers and for fuel—were $662,870.57. Adding the income of the surplus revenue, when appropriated for the support of schools, it was $670,628.13. The valuation of the State I suppose to be not less than $450,000,000. Last year's tax, therefore, for the current expenses of the schools was less than one mill and a half on the dollar—less than one mill and a half on a thousand mills. Taking the average of the State, then, no man was obliged to pay more than one six hundred and sixty-sixth part of his property for this purpose; or, rather, such would have been the case had there been no poll tax—had the whole tax been levied upon property alone. At this rate it would take six hundred and sixty-six years for all the property of the State to be once devoted to this purpose. And does not the portion of our worldly interests which is dependent upon public schools bear a greater ratio to the whole of those interests than 1 to 666? I need not argue this point, for who, out of an insane asylum—or even of the curable classes in it—will question the fact? Who will say that the importance of this interest as compared with all the earthly interests of mankind is not indefinitely greater than this? Who will say that to secure so precious an end as the diffusion of almost universal intelligence and virtue, and the suppression, with an equal degree of universality, of ignorance and vice it would not be expedient to do as the Bishop of Landaff once proposed that the British nation should do in an eventful crisis of its affairs—vote away, by acclamation, one-half of all the wealth of the kingdom? But there is no need of carrying our feelings or our reason to this pitch of exaltation. There is no need of any signal or unwonted sacrifice. There is no need of a devotion of life as is done in battle. There is no need of periling fortunes as is done every day in trade. There is no need that any man in the community should lose one day from his life, or an hour from his sleep, or a comfort from his wardrobe or his table. Three times more than is now expended—that is, 4½ mills

on every 1,000 mills of the property of the State, or only 1 part in 222, instead of 1 in 666—would defray every expense and insure the result. Regarded merely as a commercial transaction—a pecuniary enterprise whose elements are dollars and cents alone—there is not an intelligent capitalist in the State who would not, on the evidence here adduced, assume the whole of it, and pay a bonus for the privilege. When the State was convinced of the lucrativeness or general expediency of a railroad from Worcester to its western border, it bound itself at a word to the amount of $5,000,000; and I suppose it to be now the opinion of every intelligent man in the Commonwealth that when the day of payment shall arrive the road itself, in addition to all the collateral advantages which it will have conferred, will have paid for itself, and will then forever remain, not merely a monument of wisdom, but a reward for sagacity. Yet, what is a railroad, though it does cut down the mountains and lift up the valleys, compared with an all-embracing agency of social and moral reform which shall abase the pride of power and elevate the lowliness of misfortune? And those facilities for travel which supersede the tediousness of former journeyings and the labor of transportation, what are they when compared with the prevention of that "lamentation, mourning, and woe" which come from the perpetration of crime. When the city of Boston was convinced of the necessity of having a supply of pure water from abroad for the use of its inhabitants it voted $3,000,000 to obtain it; and he would be a bold man who would now propose a repeal of the ordinance, though all past expenditures could be refunded. Yet all the schoolhouses in Boston, which it has erected during the present century, are not worth a fourth part of this sum. For the supply of water the city of New York lately incurred an expenditure of $13,000,000. Admitting, as I most cheerfully do, that the use of water pertains to the moral as well as to the ceremonial law, yet our cities have pollutions which water can never wash away—defilements which the baptism of a moral and Christian education alone can remove. There is not an appetite that allies man to the brutes, nor a passion for vain display which makes him more contemptible than any part of the irrational creation, which does not cost the country more every year than such a system of schools as would, according to the evidence I have exhibited, redeem it almost entirely from its follies and its guilt. Consider a single factitious habit of our people, which no one will pretend adds any degree to the health, or length to the life, or decency to the manners of the nation—I mean the smoking of tobacco. It is said, on good authority, that the annual expenditure in the country for the support of this habit is $10,000,000; and if we reflect that this sum, averaged upon all the people, would be only half a dollar apiece, the estimate seems by no means extravagant. Yet this is far more than is paid to the teachers of all the public schools in the whole United States.

Were nations to embark in the cause of education for the redemption of mankind, as they have in that of war for their destruction, the darkest chapters in the history of earthly calamities would soon be brought to a close. But where units have been grudged for education, millions have been lavished for war. While for the one purpose mankind have refused to part with superfluities, for the other they have not only impoverished themselves, but levied burdensome taxes upon posterity. The vast national debts of Europe originated in war; and but for that scourge of mankind they never would have existed. The amount of money now owed by the different European nations is said, on good authority, to be $6,387,000,000. Of this inconceivable sum the share of Great Britain is about $4,000,000,000 (in round numbers, £800,000,000; of France, $780,000,000); of Russia and Austria, $300,000,000 each; of Prussia, $100,000,000; and the debts of the minor powers increase this sum to $6,387,000,000. The national debt of Great Britain now amounts to more than $140 for every man, woman, and child in the three kingdoms. Allowing six persons to each family, it will average more than $850 to every household—a sum which would be deemed by thousands and tens of thousands of families in that country to be a

handsome competence—nay, wealth itself—if it were owing to instead of from them.

It is estimated that during the twenty-two years preceding the general peace of 1815 the unimaginable sum of £6,250,000,000 sterling, or $30,000,000,000, had been expended in war by nations calling themselves Christians—an amount of wealth many fold greater than has ever been expended for the same purpose by all the nations on the globe whom we call savage since the commencement of the Christian era. The earth itself could not be pawned for so vast a sum as this, were there any pawnbroker's office which would accept such a pledge Were it to be set up at auction, in the presence of fierce competitors for the purchase, it would not sell for enough to pay its war bills for a single century. The war estimates of the British Government, even for the current year of peace, are $85,000,000; and the annual interest on the national debt incurred by war is at least $120,000,000 more, or more than $200,000,000 for a common and, on the whole, a very favorable year. Well might Christ, in the Beatitudes, pronounce His emphatic benediction upon the "peacemakers."

We have emulated in this country the same gigantic scale of expenditure for the same purpose. Since the organization of the Federal Government, in 1789, the expense of our military and naval establishments and equipments, in round numbers, is $700,000,000. Two of our ships of the line have cost more than $2,000,000. The value of the arms accumulated at one time at the arsenal in Springfield, in this State, was $2,000,000. The Military Academy at West Point has cost more than $4,000,000. In our town meetings and in our school-district meetings wealthy and substantial men oppose the grant of $15 for a school library, and of $30 for both library and apparatus; while at West Point they spend $50 in a single lesson at target firing, and the Government keeps 100 horses, and grooms and blacksmiths to take care of them, as an indispensable part of the apparatus of the Academy. The pupils at our normal schools, who are preparing to become teachers, must maintain themselves; the cadets at the Academy receive $28 a month during their entire term as a compensation for being educated at the public expense. Adding bounties and pensions to wages and rations, I suppose the cost of a common foot soldier in the Army can not be less than $250 a year. The average cost of female teachers in the public schools of Massachusetts last year was only $13.60 a month, inclusive of board, or at a rate which would give $163.20 for the year; but the average length of the schools was but 8 months, so that the cost of two common soldiers is nearly that of five female teachers. The annual salary of a colonel of dragoons in the United States Army is $2,206; of a brigadier-general, $2,958; of a major-general, $4,512; that of a captain of a ship of the line, when in service, $4,500; and even when off duty it is $2,500. There are but seven towns in Massachusetts where any teacher of a public school receives so high a salary as $1,000, and in four of these towns one teacher only receives this sum.

Had my purpose been simply to show the pecuniary ability of the people at large to give the most generous compensation to such a company of accomplished, high-minded, noble teachers as would lift the race at once out of the pit of vice and ignorance and superstition, as safely and as tenderly as a mother bears her infant in her arms; had my purpose been merely to show this pecuniary ability, then I have already said too much. But my design was not merely to carry conviction to the minds of those who would contest this fact, but to make the denial of it ridiculous.

III. But the consummation of this reformatory work is not promised except upon the performance of a third condition,—namely, that all the children in the State between the ages of 4 and 16 years shall be brought into school for ten months in each year. In other words, while the schools are kept the attendance of all the children upon them, with one or two exceptions to be hereafter noticed, must be regular.

Since the keeping of registers in our schools has made known the enormous amount of absences from them there is but one subject which has excited greater alarm or given rise to louder complaints. Teachers complain of this absence, because, while it increases their labors, it diminishes their success; indeed, it makes entire success an impossibility. Parents who do send their children regularly to school complain of it, because the tardy and the occasional comers are a dead weight upon the progress of those who are uniformly present and prompt. Committees complain of it in behalf of the towns which they represent, because it lowers the general standard of intelligence among the people, and because, taken on an average for the whole State, it incurs a total loss of from one-third to one-half of all the money which is annually levied by taxation for the support of schools. Men of wealth who have no children to send to school, or who for any reason send none, complain of it, because, though they may be willing to be taxed for the education of all, yet they are not willing to be taxed to have their money taken and thrown away. They think it, and with good reason, too, to be an intolerable hardship to be first confronted with the argument that they are bound to secure the general intelligence and morality of the people through the instrumentality of schools, and when they have acknowledged the validity of this argument and cheerfully paid their money to have the very men who so argued and so claimed turn upon them and say, We are still at liberty to throw your money away by keeping our children at home; and though you must keep the school regularly for us we have a right to use it irregularly, or not at all, as we please. Thus the delinquents, where they owe apology and repentance, retort with indignity and persevere in injustice.

I can not believe that our people will always, or even long, submit to this enormous abuse, now made known to them by well-authenticated documents. For an economical people, who form political parties on the subject of expenditures by the Government and make "retrenchment" a watch-word; for a people whose legislature sometimes debates for days together whether the salary of an officer shall be a few hundred dollars more or less, to continue to throw away, as was done last year, more than $200,000 on account of voluntary, gratuitous, and, in most cases, wanton absences from school is not credible. For a people who are sufficiently proud, to say the least, of their general intelligence and who are sincerely anxious to perpetuate and improve their moral character, to be willing to forfeit one-third part of all the blessings of their free school system, without any necessity or any plausible pretext, is not to be believed. This great evil must be dealt with according to its magnitude. Violent diseases demand energetic remedies. It would be as unwise in a State as in an individual to allow its precautions to diminish while its dangers increase; to sleep more quietly as peril becomes more imminent. When we know that a malady is dangerous and that a remedy is at hand wisdom dictates its speedy application.

I propose, then, to consider the objections that may possibly be urged to the regular attendance of all our children upon school for ten months in each year, from the age of 4 to that of 16 years. I believe them to be by no means insurmountable; nay, that their formidableness will wholly disappear if subjected to a candid examination.

1. It may be said that there is a class of parents amongst us who depend partially upon the labor of their children for the support of their families, and who are too poor to forego the earnings of these children for ten months in the year and for twelve years of their minority.

With regard to a portion of the class of parents referred to this suggestion would have a foundation in fact; with regard to another portion of them it would have no such foundation. It is well known that a class of parents exists amongst us who work their children that they may themselves be idle; who coin the health, the capacities, and the future welfare of their own offspring into money, which money when gained is not expended for the necessaries or the comforts of life, but is wasted

upon appetites that brutify or demonize their possessor. The objections of this class against permitting their children to be educated at the public expense are not legitimate. It would be infinitely better for them, for their families, and for the public if they were cut off from these means of sinful indulgence. It would improve their condition still further if they were obliged to be industrious, even though coerced to labor by the goads of hunger and cold. The best of all conditions for them would be that they should themselves labor for the support of their children at school, where those intellectual and virtuous habits would be formed and that filial piety inculcated which would lead the children in after years to return to their parents, with a generous requital, the favors they had received.

There is, doubtless, another portion of this general class with whom the alleged necessity for their children's earnings as a part of the means for family support is no pretence. The number or age of the family, sickness, misfortune, or other cause may render this or some other resource indispensable to the procurement of the necessaries and decencies of life. I would not underrate the number of the necessities of this class of persons; they have claims upon our warmest sympathies; but I have reason to believe that the class itself is not a very large one. Where the heads of the family enjoy good health; where they may have the assistance of their children who are of an age able to render it, for several hours each day, for one or two entire half days each week and for two months uninterruptedly each year the circumstances must be peculiar where industry and frugality, with such favors as the honest and praiseworthy poor may always count upon from their better-conditioned neighbors, will not supply the means of a comfortable subsistence.

Still cases of necessity do and will exist; and where the need is not supplied by individual charity there is no other alternative but to do it at the public expense. This would introduce no new principle into our legislation. It would be only a moderate but highly beneficial extension of an existing one. Our laws now provide for physical destitution, whatever may be its cause; and they enjoin upon school committees the duty of furnishing all needful school books at the expense of their respective towns, to all children whose parents are unable to procure them.

The question then arises, What degree of destitution—and there is no propriety in restricting this to physical destitution—makes it expedient for a wise government to interfere and afford relief? "Poor laws," as we understand the term, are of modern origin. They were not only unknown to all barbarous nations, but to most Christian and civilized ones, until a recent period. In England they date from the reign of Elizabeth. In Scotland, although in a small class of extreme cases legal relief may have been rendered, yet "poor laws" can hardly be said ever to have had an effective existence in that country. In Ireland they were unknown until recently. In this country they are almost coeval with our colonial settlements.

But there neither is, nor ever has been, any legal standard of poverty. The degree of destitution which shall entitle the sufferer to relief is not a fixed quantity, like the statutory length of a yard, or the Winchester bushel. The general notions of men as to what constitutes poverty range between wide extremes, according to their prevalent style of living, their enlightenment, and their benevolence. It is said that when the present King of France heard that the income of the Jewish banker in London amounted only to some hundreds of dollars each hour, he expressed his deep grief at learning that he was so poor. With us he who can command a comfortable shelter, decent clothes, and a sufficient supply of wholesome food for himself and family excites no special commiseration for his poverty; while there are places upon the earth where a potato a day is considered an independent fortune. Now, between these extremes, what shall the true definition of poverty be?

So the line which divides poverty from competence is not a stationary, but a movable one. The laws themselves change; and the same law, on a question like this, will be made to speak a very different language under different administrators. In

favor of the militia, or of the country's defense, our law exempts from attachment, execution, and distress, whether for debt or for taxes, the uniform, arms, ammunition, and accouterments which officers, noncommissioned officers, and privates are required to possess. In favor of the common sentiments of humanity, our law exempts also from attachment and execution not only wearing apparel, but a great variety of articles of household furniture—bedsteads, beds, bedding, an iron stove, fuel, and other commodities, to the value of $50; also a cow, six sheep, one swine, and two tons of hay; also the tools and implements used by a debtor in his trade, not exceeding $50 in value; and also rights of burial, and tombs used as repositories for the dead. Our legislation on this subject has been humanely progressive, as may be seen by reference to statutes 1805, chapter 100; 1813, chapter 172; 1822, chapter 93, section 8; 1832, chapter 58; 1838, chapter 145, etc. In a neighboring State, by a late law, a portion of the debtor's homestead is also brought within the same rule. In favor of learning and religion, all schoolbooks and Bibles used in the family are also exempted from attachment and execution for debt; and, as was before said, all schoolchildren destitute of schoolbooks are first supplied with them at the public expense, and where the parents are unable to reimburse the cost the supply is gratuitous. Massachusetts has from time to time founded and endowed hospitals for the insane, and she makes annual and liberal appropriations for the education of the blind and the deaf and dumb. She is now engaged in erecting a noble institution for the reformation of juvenile delinquents; and a commission, instituted by her, is inquiring at the present time into the condition of idiots, which unfortunate, repulsive, and hitherto outcast portion of the community, it is not to be doubted, she will soon gather together and, in imitation of the noble examples set by France, Switzerland, and Prussia, will educate to cleanliness, to decency, and to no inconsiderable degree of positive enjoyment and usefulness. Each one, too, of all these great movements, when carried out into execution, has proved economical, as well as philanthropic and Christian. What striking results, in proof of this, are exhibited by the statistics of the State Lunatic Hospital at Worcester. According to the last report of that institution which Dr. Woodward made, the average expense of 24 old cases, taking the first 24 on the list, and not selecting them or taking them at random, was $1,945.83 each, and their aggregate expense $46,700; while the average expense of the same number of recent cases, taking the last on the list who were discharged cured, was $41.53 each, and their aggregate expense $996.75; so that the whole expense of twenty-four recent cases was but about one-half as much as of one old one. That hospital already has far more than paid for itself by the saving it has effected, because without it all the new cases would have been old ones. I present these economical aspects of the subject by no means because I deem them to be the most important, but because all over the world there is a large class of persons with whom the pecuniary argument is the most persuasive and eloquent, and who will be induced to lend their services in aid of great social ameliorations only when they find that humanity is economy and that "godliness" is "great gain" in a worldly sense. They will then enlist for the sake of the "great gain," though quite indifferent as to the other quality. When I have been asked by persons from the fertile and exuberant regions of our own country or from transatlantic nations how it is that with our ungenerous soil and ungenial clime we are pecuniarily able to support these various and costly establishments, my answer has been that we are able because we do support them.

But the question recurs, What is poverty? What is that straitness of circumstances which for educational purposes would require a wise and profound statesman, and, of course, the State itself, to interpose and to supply those means for the education of the child which the parent is unable to render? It being proved if all our children were to be brought under the benignant influences of such teachers as the State can supply from the age of 4 years to that of 16, and for ten months in each year,

that ninety-nine in every hundred of them can be rescued from uncharitableness, from falsehood, from intemperance, from cupidity, licentiousness, violence, and fraud, and reared to the performance of all the duties and to the practice of all the kindnesses and courtesies of domestic and social life—made promoters of the common weal instead of subtractors from it—this being proved, I respectfully and with deference submit to the board, and through them to the legislature and to my fellow citizens at large, that every man is poor in an educational sense who can not both spare and equip his children for school for the entire period above specified; and that while he remains thus poor it is not only the dictate of generosity and Christianity, but it is the wisest policy and profoundest statesmanship, too, to supply from the public treasury—municipal or State, or both—whatever means may be wanted to make certain so glorious an end. These principles and this practice the divine doctrines of Christianity have always pointed at, and a progressive civilization has now brought us into proximity to them. How is it that we can call a man poor because his body is cold, and not because his highest sympathies and affections have been frozen up within him in one polar and perpetual winter from his birth? Hunger does not stint the growth of the body half so much as ignorance dwarfs the capacities of the mind. No wound upon the limbs or gangrene of vital organs is a thousandth part so terrible as those maladies of the soul that jeopard its highest happiness and defeat the end for which it was created. And infinitely aggravated is the case where children are the sufferers; where moral distempers are inflicted upon them by parents or are inherited by them from ancestors; where they are born into an atmosphere saturated with the infection of crime; where vice obtrudes itself upon every sense and presses inward through every pore to be imbibed and copied just as the common air forces itself into the nostrils to be breathed, and where in their early imitative transgressions they are no more consciously guilty than in the heaving of their lungs in an act of respiration.

Were a ship in midocean to be overtaken by a storm, to be dismantled, dismasted, and reduced to an unmanageble hulk, and while its crew were famishing and in momentary danger of foundering, were another ship to pass within hail, but to refuse all succor and deliverance, should we not justly regard the deed as an enormous atrocity? But what moral difference does it make whether we pass by our perishing "neighbor" on the sea or on the dry land? The pitfalls of perdition on shore are deeper and far more terrible, and are inhabited by direr monsters, than any ocean caves. Now, it is the children of the man who through sickness or other misfortune has not the means fully and thoroughly to educate them for the duties of life who represent this perishing and foundering crew, and the man who has superfluities, or even an independency of means, but refuses to aid in giving these children an education sufficient for all the common responsibilities of life, he is the hardened mariner who sails recklessly by and sees the helpless sufferers engulfed in the wake of his own proud vessel.

On this point, then, are we not authorized to conclude, in the first place, that the cases are comparatively few where parents can not afford to forego the earnings of their children and to send them to school for the length of time and with the regularity proposed; and, in the second place, were the cases of destitution far more numerous than they are, that there is still an abundance of means as well as an obvious duty on the part of the public to supply all deficiencies? Assuming the value of all the property in the State to be $450,000,000, the simple interest upon it alone at 6 per cent, and without any addition from earnings, is $27,000,000 annually. The industrial statistics of the State show that its income from all its occupations and trades is more than $100,000,000 annually, and even this does not include improvements upon its wharves, bridges, roads, or lands. Must such a State pare and clip and scrimp, and dole out its means with a niggardly hand when unfolding the mortal and the immortal capacities of its children?

2. But though the means for supporting the schools are abundant, and though the earnings of children as a part of the family's daily livelihood may be foreborne in one class of cases and made up in the other, a further question still remains, Can the State itself afford to forego these juvenile services? Can the machinery be operated, the shoes bound, the types set, the errands and "chores" done, and the doorbells tended if all children under 16 years of age are withdrawn from the performance of these kinds of service for ten months each year? Minors under 16 are let out to corporations to be employed in manufacturing establishments; they are taken into the families of the wealthy and forehanded as underservants; a few are employed as errand boys in the offices and shops of cities, and in several of the lighter handicrafts they are put to regular labor. There are no exact data by which to determine the number of children so employed in the State. Compared with the whole number of children in it between the ages of 4 and 16, I suppose it to be inconsiderable, so inconsiderable, indeed, that if their services in these employments were henceforth to be wholly discontinued it would subtract hardly an appreciable fraction from the aggregate products of our labor and machinery. A highly intelligent gentleman, who has been engaged in manufacturing business for many years, informs me that the company with which he is associated now employs 3,119 persons, namely, 2,571 in five cotton mills, 450 in two machine shops, and 98 in one woolen mill. In the cotton mills 346 persons are employed who are under 16 years of age, equal to 13 per cent. In the machine shops there are none. In the woolen mill there are 6, or 6 per cent. The average for the whole is about 11 per cent. He adds: "I am of the opinion that this statement may be taken as a fair representation, in regard to age, of the persons in these several employments. Very few are under 15. * * * This class of labor is not profitable to the employer, and, except in particular cases, is only employed from motives of charity. From my recollection of the labor required in print works [he was formerly extensively engaged in printing calicoes], I am inclined to think the proportion of persons under 16 is not greater than the average in the mills and shops before mentioned."

Here, then, is a statement worthy of implicit reliance respecting the largest branch of labor in which those children are employed who, on the proposed reformatory plan, would be sent to school. Can a substitute be found for this juvenile labor?

In the first place, if that class of parents who now coin into money their children's highest capacities for usefulness and enjoyment that they themselves may live in idleness and intemperance were peremptorily deprived of this source of gain they could perform a portion of the labor now exacted of the children; or, if not capable of performing this particular kind of labor, they could at least do some other work, and thus set free a class of persons who could perform it.

In the second place, manufacturers could employ, at a slightly enhanced price, a few more adults, or more persons over the age of 16. I trust that no liberal-minded manufacturer would object to employing older help at the present time on the plea of nonremunerating returns.

But, thirdly—a consideration of more significance than all the rest—the children who had enjoyed such a school development and training as we are now supposing would go into the mills, after the completion of their educational course, with physical and intellectual ability to help and with a moral inability to harm, which of itself would far more than compensate for all the loss of their previous absence. Take any manufacturer whose mind has ever wandered, even by chance, to a contemplation of the only true sources and securities of wealth, and what would he not give to have all his operatives transformed at once into men and women of high intelligence and unswerving morality; to have them become so faithful and honest that they would always turn out the greatest quantity and the best quality of work, without the trouble and expense of watching, and weighing, and counting, and superintending; that they would be as careful of his machinery as though it were

their own; that they would never ask or accept more in payment than their just due; that they would always consult their employer's interest, and never sacrifice it from motives of personal ease, or gain, or ill-will.

I have been told by one of our most careful and successful manufacturers that, on substituting, in one of his cotton mills, a better for a poorer educated class of operatives, he was enabled to add 12 or 15 per cent to the speed of his machinery, without any increase of damage or danger from the acceleration. Here there was a direct gain of 12 or 15 per cent—a larger percentage than that of the supposed whole number of children under 16 years of age in all our factories. And this gain was effected, too, without any additional investment of capital or any increased expense for board. The gain from improved morals would far exceed that from increased intelligence. On the whole, then, if all children under 16 years of age were withdrawn from the factories for ten months of each year, in order to be sent to school, there is reason to believe that the aggregate amount of the fabrics produced by the mills would not be diminished even a yard.

The above considerations have special reference to children employed in factories. I have selected this department of labor because I suppose that at least as many children under 16 are let out to service in factories as in all other branches of business taken together. The same views, with inconsiderable modifications, will apply to all others. It will be seen at a glance, therefore, that the contemplated diversion of children from manual labor to mental and moral pursuits will not be such as to impair the industrial resources of the State or to diminish the marketable value of its products.

But there is one remark which applies alike to all these classes of employers. They use the services of children not their own. Now, it must be conceded that there exists a well-grounded reluctance, on the part of free governments, to any such interference with parental relations as is not made necessary by the nature of the government itself or by the criminal conduct or culpable neglect of the parents. But those who employ other men's children for their own profit can not intrench themselves behind the sacredness of parental rights. Their object is their own personal gain, a lawful and laudable object, it is true, when pursued by justifiable means, but one which can not sanction for a moment the infliction of a positive injury upon any child, or the deprivation of any privilege essential either to his well-being or to the permanence and prosperity of the Republic. The Republic, indeed, if true to itself, can never allow any of its members to do what will redound to its own injury; and, where no parental title can be alleged, the assertion of any right over the labor of children has as little foundation in natural justice or equity as the tyrant's claim to the toil of his vassals. How can any man, having any claim to the character, I will not say of a Christian or a philanthropist, but to the vastly lower one of a patriot, use the services of a child in his household, his shop, his office, or his mill when he knows that he does it at the sacrifice, to say the least, of that child's highest earthly interests? How can any man seek to enlarge his own gains, or to pamper his own luxurious habits, by taking the bread of intellectual and moral life from the children around him?

I can anticipate but one objection more having the aspect of plausibility. It may be said that although the schools should be kept for the proposed length of time by teachers ennobled with all the intellectual and moral attributes contemplated, yet there are persons capable, like brutes, of bringing children into the world, but impervious to those moral considerations which should impel them to train up those children in the way they should go, and that in regard to this class of parents some coercive measures will be necessary to secure the attendance of their children at school. I admit this. But is coercion a new idea in a community where there are houses of correction, and jails, and State prisons, and the gallows? Surely bolts and bars, granite walls, and strangulating hemp are strange emblems of the voluntary

principle. Massachusetts has at the present moment about two thousand persons under lock and key, nineteen-twentieths of whom, had they been blessed with a good common-school education, would, according to the testimony I have adduced, be now useful and exemplary citizens, building up instead of tearing down the fabric of public welfare. With a population of between 800,000 and 900,000 she has at least 5,000 police officers and magistrates, armed with power to seize and restrain and bring to trial and punishment any transgressors of those laws which she has paid many other thousands for enacting. Does it not argue, then, a perversion of intellect or an obliquity of the moral sense to contend that a child, for the purpose of being blessed by the influences of a good school, can not be taken from a parent who is preparing him to become at least a private, if not an officer, in the great army of malefactors, while it is conceded that by and by, when this same child becomes a parent, he may then be taken from his children, imprisoned, put to hard labor, or put to death? So far as force is concerned, so far as any supposed invasion of private rights is concerned, does not the greater contain the less a thousand times over? If the State can send a sheriff's posse to take a man from his own bed at midnight and carry him to jail, to trial, and to execution, does it require a greater extension or a bolder use of its prerogatives for the same State to send a kind, moral guardian to take a child from the temptations of the street or from the haunts of wickedness and bring him within the benign influences of a good school?

Should it be said that in the case of the adult offender there has been a forfeiture of civil rights by some overt act of violation, while in the case of the child the violation is prospective only, I reply that nothing is more common than to arrest and imprison men on probable suspicion merely; nothing is more common than to hold men to bail in sums proportioned to the suspected offense, and when a man gives proof that he intends to do a wrong and is only awaiting a favorable opportunity to execute his intention nothing is more common than to put him under bonds for his good behavior. Every child who is not receiving a good education comes at least within these latter categories. He is an object of violent suspicion. The presumption is strong that he will not make a good citizen; that in some form or other he will get his living out of the earnings of his fellow-men or offend against their welfare. If the Commonwealth, then, has a right to imprison an adult, or hold him to bail on suspicion, or to bind him over to keep the peace and be of good behavior, has it not an equal, nay, a superior, right to demand guaranties for the child's appearance upon the stage of manhood, there to answer to the great duties that shall be required of him as a citizen? And a good education is surely better security than any bail bond that ever was executed. Has not the State a right to bind each child to his good behavior by imparting to him the instruction and by instilling into his mind the principles of virtue and religion, by which he shall be twice bound or doubly fastened (for such is the etymological meaning of the word religion) to perform with intelligence and uprightness his social and political duties when he becomes a man?

Nor is our legislation without numerous precedents in favor of securing education even at the expense of coercive measures. These precedents are scattered along our annals from the earliest periods of our colonial existence. The colonial law of 1642, after premising that "forasmuch as the good education of children is of singular behoof and benefit to any Commonwealth," ordered "that the selectmen of every town * * * shall have a vigilant eye over their brethren and neighbors, to see, first, that none of them shall suffer so much barbarism in any of their families as not to endeavor to teach, by themselves or others, their children and apprentices so much learning as may enable them perfectly to read the English tongue, and knowledge of the capital laws;" and it imposed upon parents what, in those times, was a heavy penalty for neglect.

By the law of 1671 the selectmen were again required to see that all children and youth "be taught to read perfectly the English tongue, have knowledge in the capital laws," etc.

So the laws of the Plymouth Colony, after setting forth that "whereas many Parents & Masters either through an over respect to their own occasions and business, or not duely considering the good of their Children & Servants, have too much neglected their duty in their Education, whilest they are young & capable of Learning;" proceeded to make substantially the same requirements as were made by the above-cited provisions in the laws of the Massachusetts Bay Colony; and then declared that if any parents or masters, after warning and admonition, should still remain negligent in their duty, "whereby Children & Servants may be in danger to grow Barberous, Rude or Stubborn, & so prove Pests instead of Blessings to the Country," then "a fine of ten shillings shall be levied upon the goods of such negligent Parent or Master." If, after three months subsequent to the levying of this fine, "no due care shall be taken & continued, for the education of such children & apprentices," then a fine of twenty shillings was to be levied. "And Lastly, if in three months after that, there be no Reformation of the said neglect, then the Selectmen, with the help of two Magistrates, shall take such children & servants from them [the parents,] & place them with some Masters for years, (boyes till they come to twenty-one, and girls eighteen years of age,) which will more strictly educate and govern them, according to the rules of this Order."

Nor were the above enactments a dead letter. The earlier judicial and municipal records show that when the natural parent broke from the ties of consanguinity and duty by neglecting the education of his children the law interfered and provided a civil parent for them.

Modern legislation, it is true, has greatly relaxed the stringency of these provisions. No adequate substitute is to be found for them in our present educational code; and already neglected childhood is avenging itself upon society by its manhood of crime, not unfrequently by its precocity in crime, long before the years of manhood have been reached.

Compulsory enactments, however, still attest that all the spirit of our ancestors is not yet gone. Our laws provide in various cases that minor children may be bound out to service—males to the age of 21 years and females to the age of 18 years—but in all cases it is to be stipulated in the contract that they shall be taught to "read, write, and cipher." "Stubborn children" may be committed to the house of correction. Children in the city of Boston under the age of 16 years, whose "parents are dead or, if living, do, from vice or any other cause, neglect to provide suitable employment for or to exercise salutary control over" them, may be sent by the court to the house of reformation. By the late act establishing the State reform school male convicts under 16 years of age may be sent to this school from any part of the Commonwealth, to be there "instructed in piety and morality, and in such branches of useful knowledge as shall be adapted to their age and capacity." The inmates may be bound out; but, in executing this part of their duty, the trustees "shall have scrupulous regard to the religious and moral character of those to whom they are to be bound, to the end that they may secure to the boys the benefit of a good example and wholesome instruction, and the sure means of improvement in virtue and knowledge, and thus the opportunity of becoming intelligent, moral, useful, and happy citizens of the Commonwealth." Manufacturers and overseers in manufacturing establishments are prohibited under a penalty from employing any child in their factories under 15 years of age who has not attended some day school for a specified portion of the year within which he may be so employed; and they are also prohibited from employing any child under 12 years of age more than ten hours a day under any circumstances. In the case of fires, of explosive commodities,

of contagious diseases, of immigrant passengers from infected countries, etc., the law vests its officers with plenary and summary powers "to save the Republic from detriment."

Paley has said that "to send an uneducated child into the world is injurious to the rest of mankind; it is little better than to turn out a mad dog or a wild beast into the streets." It is difficult to conceive why he thought it to be any "better," since one uneducated, vicious man may do infinitely more harm to the world than all the rabid dogs or wild beasts that ever existed. Much as we may need energetic remedies against contagious diseases, we need them against contagious vices more; and quarantine laws in favor of moral health are the most necessary of all sanitary regulations.

But I forbear to press further considerations of this character upon the attention of the board. I hope that the great majority of our people will rather wonder why such an argument should be deemed necessary than be disposed to question its conclusions.

Having now surveyed somewhat at length the various points pertaining to this subject, a brief recapitulation may not be amiss.

The basis on which it is suggested that our public-school system shall be put is carefully defined in the circular.

In some important particulars no change is necessary, as our practice has already reached the point of theoretic excellence. Such are the unconditional rights of all children to enter the school—or their entire exemption from rate bills or any capitation tax, either as a condition precedent or subsequent of their attending school—the range of studies which may be taught; the provision for moral and religious instruction, with guaranties against its abuse, and so forth.

But, in other respects, important improvements are contemplated—no cardinal or organic change in the system itself, but only progression in courses already begun. Such are more befitting qualifications in teachers for the great work they undertake; the maintenance of the schools for a period of ten months in each year, instead of the present average of eight months; and, as a necessary consequence, the appropriation of moneys sufficient to sustain the prolonged school, and to pay the better qualified teachers; and, finally, the gathering into the schools, during their entire term, of all the children in the community between the ages of 4 and 16 years.

From the comprehensiveness of this last condition it is obvious that all cases of sickness, casualty, or other reasonable cause of absence, must be excepted. And equally clear is it that when any parent or guardian prefers to educate his children at home or in a private school, he should be allowed to do so—the means of education to be left wholly optional with everyone, provided assurance is given to the State that the end is attained.

So far as the proposed changes involve the appropriation of more money, it has been shown that the State possesses not only a sufficiency, but a redundancy of wealth for the purpose. Besides, when once in operation, the system will be found, not merely a self-supporting one, but one yielding large revenues, both saving and producing many times more than it will cost, requiting a single expenditure by a manifold remuneration.

So far as higher mental and moral attributes in teachers will be required, reasons have been offered to show that Nature, or the common course of Providence, supplies an abundance of intellectual power and of moral capability; but that through our present misuse or maladministration of these noble qualities they are either lost by neglect of culture or diverted to less worthy pursuits. There is no more iron in the world now than there ever was. We have only discovered how to use it more advantageously, for steamboats, for railroads, for machinery, and a thousand mechanical purposes; and thus in point of mere pecuniary value we have given it the first rank among the precious metals. There is no more water flowing down our streams now

than there was centuries ago. But we have just found out how to make it saw timber, grind wheat, and make cloth; and already it does a thousand times more work than all our 20,000,000 people could do, by their own unassisted strength, should every man vie with his neighbor in the severity of his toil and in the amount of his productions. There are no more individual particles of electricity in the air or in the earth to-day than there always have been. Forever since the creation there has been an inconceivable host of these particles—a multitude deriding all human power of computation—which have careered round the earth by laws of their own, each one being as distinct from all the rest and having as separate and independent an existence as one wild horse upon the prairies has from another. Long ago science learned how to catch and confine these natural racers, but it was not until our day that she discovered how to take them—one, ten, a hundred, or a thousand—and dispatch them as messengers to distant cities—to make them the common carriers of intelligence, whom no pursuers can overtake, no bribe can corrupt, nor robbers despoil. Thus it is with the capacities of the human mind. By the bounty of Providence they may be employed and made sufficient for the greatest work of reform. It is through our blindness and perversity that they are not yet used to achieve their sublime purposes. Like the iron, like the gravity of falling water, like the electric coursers, they, too, have the power of conferring unimaginable blessings upon the race; but as yet they have only been very partially enlisted in the highest services of humanity.

On the third point—that which contemplates the regular attendance of all the children upon the school (with certain specified exceptions), and even their compulsory attendance in a class of extreme cases—I rely upon legal precedents and analogies—upon the necessity which is imposed upon a republican government if it means to keep itself republican, and upon the broad principle that a parent who neglects to educate his child up to the point proposed proves that he has taken the parental relation upon himself without any corresponding idea of its solemnity, and thus, by the nonperformance of his parental duties, forfeits his parental rights. * * *

Such, then, is a condensed view or summary of the testimony given by credible and trustworthy witnesses on a subject so unspeakably important. The judicial mind can not fail to observe that the section of country whence these results of experience have been gathered is large, embracing all the States north and east of Pennsylvania. The schools have been both public and private, in town and country, have consisted of both sexes and of all ages, and have contained children from all the States in the Union. They have embraced thousands and thousands of the youth of the land; and commencing at a point of time now more than fifty years gone by they reach in unbroken continuity to the present day. We have, therefore, no isolated or solitary case, illogically generalized, and made to yield an inference too broad for its premises.

The coincidence of the results, too, to which the witnesses have come is on its face a very remarkable circumstance; but it is rendered still more remarkable by the fact that they made their statements without any concert or comparison of views, and in entire independence of each other. The proof, therefore, is not cumulative merely; but its cogency is raised to a mathematical power equal to the number of the witnesses.

Nor is it to be forgotten that each of the witnesses, in theological character, is a sincere believer in such an innate natural condition of the human heart as opposes the most formidable obstacles to success in moral training. Sovereign, indeed, must be the influences which can educe exemplary lives and a well-ordered society from a race each one of whom could say, literally, "I was shapen in iniquity, and in sin did my mother conceive me," in a race whose alienation from the righteous law of God is supposed to antedate volition and even consciousness, and to be mingled and inbred with the primary corpuscles of being. It was no disrespect toward the many able and eminent teachers of a different religious faith which deterred me from pro-

pounding the same questions to them and soliciting the results of their experience. But it was because I wished to know what was deemed to be practicable by those who saw the greatest difficulties to be overcome before success could be achieved. While, therefore, their statements were solicited, respecting the moral efficacy or "potentiality" of schools "conducted on the cardinal principles of the New England systems," yet it was my wish that each one should make his own theological views manifest on the face of his communication; so that governors, and legislators, and all leaders of public opinion, might see how much was believed to be attainable, even while contending against the most formidable obstacles. I reasoned thus, that if those who believe the battle ground to be most nearly inaccessible, and the enemy's intrenchments to be most nearly impregnable, and his power to be most nearly invincible, do still believe that victory can be won—then all would say, there should be no sleep in the camp until the war cry is rung and the hand-to-hand struggle is begun.

But I must not disguise the fact, nor in any way divert attention from it, that universality of education either public or private, is a substantive part of the plan here proposed and indispensable to its successful working. Indeed, I should have thought it nugatory and trifling to ask the opinion of any teacher about attainable results had this condition been omitted from the scheme. Had it been stipulated or supposed as a preliminary of the plan that 1 per cent only of the children might be left out of the schools, doubtless the witnesses would have made a deduction of at least 5 per cent in their estimate of results. They would have felt bound to make an allowance, not only for the abandoned class themselves, but for the poisonous influence of that class upon all the rest. Doubtless every advance in the qualification of teachers and in gathering more and more of the children within the renovating influences of the schools will yield a great reward of mental and moral benefits, but universality in the end to be accomplished demands universality in the means to be employed. If a contagious or infectious distemper were to break out in any quarter of the city and all its victims but one were to be removed, though this removal would abate something from the malignant type of the disease, and contract the circle of its ravages, yet who would feel secure while even one should remain to impart its virus by contact or radiate its noxious effluvia? In moral no less than in physical maladies the security of each is conditioned on the security of all. The confidence of every rational man must be impaired respecting the prospective virtue of his own children while the children of his neighbor are vicious, and for the comprehensive meaning of the word "neighbor" Christ is our authority. I thank God that there can be no safety for any until there is safety for all. Were the sky to be opened and a voice to address us audibly from the heavens it could not proclaim more articulately than is done by the common course of Divine Providence that God has made of one blood all nations of men to dwell on all the face of the earth, and that therefore, being by the law of consanguinity one brotherhood and one body, no one member of this body can suffer but all the members must suffer with it, and no one member can be truly honored but all the members must rejoice with it. Where men are religious, therefore, this principle appeals to their religion and enforces all its dictates; where men are not religious, but have only an enlightened selfishness, it invokes that selfishness to do good to others for the reflected benefits upon itself, and thus it leaves only those to pursue a different course who are morally selfish and intellectually blind. Hence any system of education which does violence to this great principle of universal benevolence, which circumscribes itself within the limits of a family, a caste, a party, or a sect, is but human weakness wrestling against divine power, and, under whatever specious disguises it may mask itself, it is only mortal selfishness seeking by feigned and counterfeited compliances to cajole Heaven out of blessings promised only to those who do unto others as they would that

others should do unto them. What right has any man or body of men to make the second table of the law of less account than the first, or to delude themselves with the belief that they love the Lord their God with all the heart while they do not love their neighbor as themselves? If God is our Father, all men must be our brethren.

I believe it would not be only practicable but easy for the legislature, at its ensuing session, now so soon to be commenced, to initiate a series of measures which in a very brief period would carry us through the earlier stages of the contemplated reform, measures which would command the ready assent of a vast majority of the citizens of Massachusetts and would thus leave but few of those unnatural cases—of those parents who are not parents—to be dealt with compulsively.

In concluding this report I shall not attempt to heighten the effect of the evidence and the argument which have been submitted by any effort to describe the blessedness of that state of society which the universal application of this reformatory agency would usher in. Such an endeavor would be vain. He who would do this must first behold the scenes and be thrilled by the joys he would delineate; he must borrow the language of the Paradise he would describe, and more than this he must be able to depict the depth and fierceness of the pains which have been inflicted by the crimes of mankind, not only upon the guilty perpetrators themselves, but upon the innocent circles of their families and friends; the terrors of the conscience-stricken malefactor; the sorrow and shame of children bemoaning a parent's guilt; the madness of the mother at the ruin of her child; the agony which brings down a father's gray hairs with sorrow to the grave; the pangs of fraternal and sisterly affection, to which a stain upon a brother's or a sister's name is a dark spot upon the sun of life, which spreads and deepens until it eclipses all the light of existence; all the varied cries of this mingled wail of distress, which have been heard in all lands and at all times from the death of Abel to the present hour; all these he must have power to describe who would describe the blessedness of a deliverance from them.

There is one consideration, however, which I can not forbear to introduce, because it appeals alike to all those various and oftentimes conflicting classes of men who are endeavoring in so many different ways to ameliorate the condition of mankind. Will not a moment's reflection convince them all that, so far as human instrumentality is concerned, education encompasses, pervades, and overrules all their efforts, grants them whatever triumphs they may achieve, and sets bounds to their successes which they can not overpass? Why does the advocate of temperance, every time he returns upon his circuit of beneficence, find his way again blocked up with the prostrate victims of inebriation? Why so long, in both hemispheres, have the divinest appeals of the advocate of peace been drowned by the din of mustering squadrons and the clarion of war? Why does the opponent of slavery, before he can strike the fetters even from one victim, see other fetters riveted upon the limbs of many more? Why do our moral-reform societies and our home-mission societies call annually for more money and more laborers wherewith to enter the ever-enlarging fields, as they open before them, of licentiousness and of irreligion? Why do those rich and powerful associations, formed for evangelizing the heathen world, see the very ships which carry out the gospel and its heralds, freighted also with idols made in Christian lands for those heathen to buy and to worship as true gods; and laden with a liquid poison, too, which sinks its victims to such a depth of debasement as to make common heathenism enviable? Why is it that the political parties into which our country is divided persist, year after year, in solemnly and unceasingly charging each other with heinous and premeditated offenses against the fundamental principles of our Government and the highest welfare of our people—charges which, if true, must brand the accused with infamy; if untrue, the accusers? So far as the members of

any one of these various parties are lovers of truth, of righteousness, and of peace, let them be asked what is the reason why they accomplish so little, and why so much ever remains to be done, and they will answer, and answer truly, that they do not fail through lack of reason or of authority, but because of blindness of mind or perversity of heart in those whom they address. The admonitions of history, the precepts of the gospel, the attributes of the Deity, are all on their side; but they are not heard, because they speak to adders' ears; they are not felt, because their words of fire fall upon stony hearts. It is not, therefore, better or more arguments that they need, but men capable of appreciating argument. Their eloquence is sufficiently electric and powerful were it not for the flintiness of the hearts that glance off its lightnings. They want men whose intellects are not blind to the most radiant truths; whose consciences are not as the nether millstone; whose prejudices have not become fossilized. The merits of the divinest cause may be all canceled by the demerits of the hearers, as the innocence of Christ was no better than guilt at the unholy tribunal of Pilate.

But in universal education every "follower of God and friend of human kind" will find the only sure means of carrying forward that particular reform to which he is devoted. In whatever department of philanthropy he may be engaged he will find that department to be only a segment of the great circle of beneficence of which universal education is center and circumference, and that it is only when these segments are fitly joined together that the wheel of progress can move harmoniously and resistlessly onward. Whether, therefore, he is struggling, on the one hand, to emancipate society from the thraldom of some particular enormity, which to him seems more flagitious than all the rest, or whether, on the other hand, he is striving to endue his age with some special virtue, in no way can he pursue his own peculiar aim so directly and so speedily as by preparing a generation of men, ninety-nine in every hundred of whom—even of the first subjects submitted to the experiment—shall be trained "to do justly, to love mercy, and to walk humbly with God." And however a portion of my fellow-mortals or I myself may feel in regard to the highest religious concernments of the soul, I trust there are none who believe that such an education as is here contemplated would be an obstacle, and not an aid, to the reception of divine truth. I trust there are none who would not readily adopt the language of Mr. Page, in his letter above cited, where he says: "I am fully of the opinion that the right of expectation of a religious character would be increased very much in proportion to the excellence of the training given, since God never ordains means which He does not intend to bless."

THE RELATION BETWEEN CRIME AND EDUCATION.[1]

By Edward D. Mansfield, LL. D.

* * * The general fact is apparent that education is a force restraining vice and crime. Where it is purely intellectual it restrains by teaching the truth expressed in the homely proverb that "honesty is the best policy;" where it rises to the dignity of a Christian education it teaches not only the restraint of the intellect, but the higher restraint of the conscience. In either case it is a restraining force, a moral power, over the appetites and passions of men.

Such being the general fact, we shall endeavor to demonstrate it by the statistics both of Europe and America, the latter being derived directly from the prisons, jails, and reformatories of the several States.

---

[1] From the Report for 1872 of the United States Commissioner of Education, pp. 586–595.

THE RELATION OF CRIME TO EDUCATION IN EUROPE.

For the power to exhibit this subject as regards Europe we are indebted to Dr. E. C. Wines, who, as commissioner of the United States Government to organize the International Prison Congress, propounded a series of questions while traveling in Europe during 1871. Many of the reports were made under the direct supervision of the Government, and the figures may be taken as thoroughly reliable. We shall use here only the totals, disregarding minor details. In this way we shall present the relation of crime to education in Europe in the most striking view.

FRANCE.

Of this country, Malte Brun, the scientific geographer, begins his account thus: "The influence of France may be compared to that which ancient Greece possessed over the civilized world. The French language has become the language of courts and embassadors; the literature of the same people has been admired by the enlightened of every nation. The inference of the reader from this declaration must be that the French are really an educated people, and producing the highest results of education in the fruits of humanity and civilization. But if this were said of what is really the nation, that is, of a great mass of the people, it would be entirely untrue, and furnish a signal proof of the superficial manner in which history is written."

In another part of his work Malte Brun (quoting the tables of Balbi) shows the number of scholars (pupils in school) to be 1 in 23 of the population. The number of children and youth in the public schools of Ohio is rather more than 1 in 4 of the whole population. The number in the schools of France was at that time (1832) only one-sixth the number in proportion to the State of Ohio, or, in other words, of the number that ought to be in school in order to educate the whole people. This is corroborated by another statement, that in 1833 out of 38,000 French communities 14,000 were without any schools! In the meantime great efforts were made to increase popular education; but in 1870 there were still 800 communities totally without schools.

It is said there are now 5,000,000 children attending school, but as the population of France is now 37,000,000, even all that are now claimed to be in school is only 1 in 7.4—that is to say, only about one-half of what would be if the whole people were educated.

In 1856 there were only 63,000 primary schools, which at the usual proportion of pupils would give about 4,500,000 pupils, which corresponds with what has been stated, allowing for the increase of 1,200,000 since 1856, as stated by the French Government.

Looking then to the facts above given, that in 1832 only one-sixth of the French people were educated at all; that in 1856 less than one-half were educated, and that in 1870 only a half, we shall be within bounds when we say that in 1870 more than half the French nation were not educated at all. Now let us look at the number and proportion of crimes committed in such a population. Let us take such general facts as we have, without reference to details.

Malte Brun gives the average number of births annually at about 900,000, of which 74,000 were illegitimate. This is over 8 per cent of the whole. If we were to go into any neighborhood we should find each thirteenth child illegitimate. This shows how far ignorance has depraved the morals of the lower classes of the people. But as late as the past year (1871) it is stated in the papers that there had been 4,500 suicides in the city of Paris, which is two hundred fold the proportion which is found in the State of Ohio. If we suppose this to be exaggerated, or as a consequence of the recent war, there will be enough of this tremendous fact remaining to show how the want of the restraining force of education (especially of moral education) affects the very life of society.

Let us now proceed to trace the effect of this great ignorance in France on the number and character of crimes. The record is the most startling and convincing of anything we have seen in the annals of statistics. Dr. E. C. Wines gives this statement, derived from the best authorities:

Whole number of persons under arrest from 1867 to 1869		444,133
Number unable to read		442,194
Or	per cent..	95.63
Average number of convicts from 1866 to 1868		18,643
Number unable to read		16,015
Or	per cent..	87.28
Average number of juvenile prisoners from 1866 to 1868		8,139
Number unable to read		6,607
Or	per cent..	81.14

We have shown above that at least half of the French people is in a state of total ignorance. Let us assume it as just half. At that time France had, in round numbers, 36,000,000 of people. Then we find these proportions, viz:

In 18,000,000 of people "unable to read and write" there were 442,194 arrests; that is, 1 in 41.

In 18,000,000 of people who were commonly educated there were 1,939 arrests; that is, 1 in 9,291.

Thus proving the proportion of criminals in the uneducated classes to be two hundred and twenty-six times as great as that of the educated classes:

The reader may say, "This is an exaggerated case, and, while the facts are apparently true, this proportion will not hold good in other countries."

We shall show in the sequence that the same general principle is true, and that when the people of the different countries are more and more educated, then this proportion diminishes, until, if we could imagine such a thing, society would present itself on the one hand thoroughly educated, and on the other hand without crime and without reproach.

ENGLAND.

Our mother country is, in every just sense of the word, England. We therefore look with curious interest to the condition of her education, and its influence upon the production or the cure of crime. Let us look at the facts.

Dr. Wines gives the following figures:

Committed to county or borough prisons		157,223
Could neither read nor write		53,265
Proportion of totally ignorant	per cent..	34

IRELAND.

Wholly illiterate, or very imperfectly educated criminals:

Males	per cent..	21.74
Females	do....	63.24

BELGIUM.

Criminals unable to read	per cent..	49

SWITZERLAND.

Average of criminals unable to read through all prisons	per cent..	83

The prisons of Lenzbourg, St. Gall, and Neuchatel give these special figures:

Illiterate	per cent..	25.3
Inferior education	do....	36.9
Passable education	do....	30.4
Good education	do....	4.3

ITALY.

Illiterate in ordinary prisons	per cent..	40
Illiterate in bagnios (prisons of high grade)	do....	30

NETHERLANDS.

Criminals unable to read	per cent..	35 to 38

From the above we find that the proportion of criminals totally ignorant varies in different countries of Europe from 35 to 95 per cent; but this does not show the whole truth, for in the reports from prisons in the United States it is almost universally said that but few of the whole number have anything more than the lowest kind of education, and doubtless this is true of Europe. These statistics prove that in Europe ignorance among criminals is the rule and education the exception.

Let us now examine this question more minutely in regard to our own country.

THE RELATION OF CRIME TO EDUCATION IN THE UNITED STATES.

Mr. F. B. Sanborne, of Massachusetts, in a report prepared for the International Prison Congress, has made some general remarks upon the statistics of American prisoners which are very correct. He says:

The general condition of American prisoners, in point of education, is low, yet they are not so extremely illiterate as criminals are in many countries, if we except the colored criminals of the South.

In Massachusetts, for a period of eight years past, the statistics show very nearly one-third of all prisoners to be wholly illiterate; yet, in the highest prison, at Charlestown, the proportion of illiterate convicts since the beginning of 1864 has been scarcely more than 1 in 10.

What Mr. Sanborne has remarked of Massachusetts is in the main true of the whole United States, as will be seen from the numerous tables hereto annexed.

In the great aggregate of criminals the number of the totally illiterate is very large, but is by no means so large as in Europe, for the reason that no part of our country is so densely ignorant as many parts of Europe. So, also, on the other hand, there are some prisons where the number of the illiterate is small, because they are special prisons of cities, where the better educated criminals are apt to be confined. But we need not remark upon these facts till we exhibit the great mass of prison statistics we have gathered from the Middle and Western States.

The statements following give partial returns from seventeen States, all of them but three from the Middle and Western States. The aggregates, in regard to education, sum up as follows, viz:

Aggregate of prisoners	110,538
Aggregate of whites	91,427
Aggregate of blacks	6,396
Aggregate of foreign born	57,824
Aggregate of native born	41,942
Aggregate of those who can read and write	82,812
Aggregate of those who can read only	5,931
Aggregate of those who have no education	21,650

The discrepancies between the general aggregates and those for color and nativity are caused by the fact that in some prisons no record was kept of sex, color, or nativity. * * *

In regard to the above aggregate facts it may be observed—

1. That the whole number of those who can "read only" is described in the reports as in fact "very ignorant." To have learned to spell out words and read a little gives no real knowledge.

2. That the prison reports almost uniformly speak of the great number of those who "can read and write" as very deficient in education.

The general conclusion is that the great mass of prisoners is very ignorant; but in order to see this more clearly and understand it more thoroughly we shall analyze in the sequel the special reports of the prisons. In the meanwhile the general conclusions of the aggregates above, including the observations of the prison keepers, are as follows:

	Per cent.
The totally ignorant, as shown by those having no education, are	22
The totally ignorant and very ignorant	25
The very deficient, including these and a large share of those who can read and write	50

These proportions are, in regard to the ignorant, much below those of Europe; and they ought to be, for it is beyond all doubt that, except the negroes of the South, the mass of the people of the United States is much better educated than in Europe. This is especially the case in New England, New York, and the central States of the Northwest. But in either case the general fact is shown, beyond doubt or controversy, that ignorance is one great cause of crime, and that in elevating the education of society, both religious and intellectual, we advance the interests of society by diminishing crime.

Just so far, therefore, as society neglects to educate the people, just so far does it prepare the crime which the criminal commits.

Let us now examine our statistics in detail, with regard to color, nativity, and religious education.

In regard to sections of the country, taking the State prisons and jails of New York and Pennsylvania (deducting the metropolitan police reports) as representatives of the Middle States, we have these results, viz:

Aggregate number	12,772
Aggregate number of whites	11,268
Aggregate number of colored	1,465
Aggregate number of foreign-born	4,658
Aggregate number of native-born	8,003
Aggregate number of those who can read and write	8,501
Aggregate number of those who can read only	1,774
Aggregate number of those who have no education	2,360

The proportions are:

	Per cent.
The totally ignorant	19
The totally ignorant and very ignorant	33
The very deficient, at least	60

Let us take now the prisons and jails of the central Northwest, which includes the States of Ohio, Indiana, Illinois, Michigan, and Wisconsin.

Here we have the statistics of thirty penitentiaries, work houses, and jails, a sufficient number and variety to give a complete view of the subject in those States. The results are as follows, viz:

Aggregate number	18,931
Aggregate number of whites	14,362
Aggregate number of colored	1,524
Aggregate number of foreign-born	4,078
Aggregate number of native-born	4,851
Aggregate number of those who can read and write	8,722
Aggregate number of those who can read only	935
Aggregate number of those who have no education	6,565

The proportions are:

	Per cent.
Totally ignorant	40
Totally and very ignorant	46
The very deficient, at least	75

Let us now take the States west of the Mississippi to the Pacific. Of these we have the reports of four State prisons in the States of Minnesota, Iowa, Kansas, and California. The results are:

General aggregate	1,957
General aggregate of whites	1,187
General aggregate of colored	205
General aggregate of foreign-born	503
General aggregate of native-born	696
General aggregate of those who can read and write	1,333
General aggregate of those who can read only	221
General aggregate of those who have no education	403

The proportions are:

	Per cent.
Totally ignorant	21
Totally and very ignorant	31
The very deficient, at least	50

Now, let us take the only States that we have of those formerly slave States where the negro population prevails, viz, Maryland, Kentucky, Tennessee, Georgia, South Carolina. In these States the results are:

Aggregate number of prisoners	4,087
Aggregate number of whites	1,997
Aggregate number of colored	2,090
Aggregate number of foreign-born	267
Aggregate number of native-born	3,485
Aggregate number of those who can read and write	965
Aggregate number of those who can not read and write	1,435

The States of Georgia and Tennessee, having 1,124 prisoners, made no return of the state of education, and were otherwise defective. In the 2,400 returned, the following are the proportions of educated and uneducated, viz:

	Per cent.
Totally ignorant	60
Very deficient, fully	85

Thus we see that in the midst of the South, where the colored population is almost totally ignorant, we have the first approach in the United States to the educational condition of France in 1832, and of much of Europe now.

Comparing the several sections of the country as presented in the above tables, and including those who can read only (and that is usually very little) among the totally ignorant, we have these proportions. Those called "very deficient" are a low estimate, made from universal testimony of prisonkeepers:

	Totally ignorant	Very deficient.
	Per cent.	*Per cent.*
In New York and Pennsylvania	33	60
Central Northwest	46	75
West and Pacific	31	50
The South	60	85

The returns from the "West and Pacific" are deficient, and therefore not a fair test. This, and the fact that the great body of miners are really intelligent men, make the reasons why that section seems to have less ignorance among criminals.

THE PROPORTION OF ILLITERATE CRIMINALS AND OF ILLITERATE POPULATION COMPARED.

Here we come to test facts in regard to the influence of ignorance in producing crime. If the proportion of ignorant criminals to the whole number should prove greatly above that of the illiterate to the whole population, it will be a fact conclusive that ignorance is one great cause of crime. Fortunately the returns of education and illiteracy embodied in the census of 1870 will enable us to examine this question and obtain reliable results.

Taking the returns of the census of 1870 in connection with the tables we have above given, we have the proportions below, premising, however, that, as all prisoners are above 10 years of age, so we have taken from the "illiterate" in the census only those above 10 years of age.

	Proportion of illiterates among—	
	Persons over 10 years of age.	Criminals.
	Per cent.	*Per cent.*
In New York and Pennsylvania	4	33
In Central West	3½	46
In West and Pacific	3	31
In the South	22	60

It appears, therefore, that in the Middle States the proportion of illiterate criminals is eightfold the proportion of illiterate people; in the Central West it is thirteenfold; and in the West and Pacific States it is tenfold. In the South it is only threefold; but this is caused by the great mass of colored people, who make up a large portion of the whole people, and, being nine-tenths of them wholly ignorant, furnish the great mass of criminals. When the still larger white population is counted in it makes the disproportion of the illiterate criminals less. As to colored people only it is very great. But we see in the above proportions the great fact that ignorance is one of the great causes of crime. * * *

Having thus established certain general principles by the incontrovertible testimony of statistics, it will not be inconsequential or uninteresting to give the testimony of some of those who are engaged in the actual management of prisons.

The following statement, made by the superintendent of the Detroit House of Correction, gives the general facts and causes of crime nearly as correctly as can be obtained from the general averages of the most extended table of statistics:

Of the 8,744 prisoners, 44 per cent were under 30 years of age; 65 per cent acknowledged themselves habitually intemperate; 65 per cent were living out of the family relation; only 57 per cent claimed to be able to read and write; 43 per cent acknowledging themselves without any education at all. The whole 8,744, almost without exception, were poor and generally penniless on their admission to the institution. This fact, so generally true of criminals, must bear relation to their criminality. The improvidence that makes the spendthrift and pauper produces also the sensuality and selfishness that seek the means of indulgence without self-denial or regard for consequences.

Professor Tarbell, who has the school in the Detroit House of Correction, says:

Of the 150 men who have been examined individually on entering the school during the past six months, 23 were entirely ignorant of reading; 30 could read a little, but not well enough to use text books; while 97 could read with tolerable readiness, and some of them with intelligence and expression. From this it appears that 35 per cent of those admitted were practically illiterate. In 1869 there were 29 per cent of this class, and in 1870, 33 per cent. Whether this apparently increasing illiteracy on the part of those admitted to the house of correction be due to the demoralizing effect of the late war on many men of intelligence, and that we are now returning to the more usual state of society in which the vicious are the ignorant, I will not say.

If the censuses of 1850, 1860, and 1870 be compared, would not the whole country show the same result in regard to illiterates; and can any other result be obtained without compulsory education?

Mr. Cummings, the moral instructor of the California State prison, says:

A great majority of the prisoners on their commitment are illiterate; others have acquired merely the elements of knowledge, without being able to turn their slight educational acquirements to any practical use; while the number who have acquired a systematic or liberal education is so extremely limited that it has been found difficult to supply the classes with suitable teachers. Hence, when these unfortunate men have been approached in a kind and conciliatory spirit, very few have failed to respond in a similar spirit; and when the means of instruction have been provided for them they have eagerly availed themselves of the privileges of the prison school. The progress that many have made in their studies has been truly gratifying, and has demonstrated not only the practicability, but the great importance, of furnishing educational facilities to prisoners.

The fact that most of those who say they can read and write are "not able to turn their slight educational requirements to any practical use" is a fact which mere statistics do not show, but which the warden or chaplain at once discovers; and that fact is simply, that nine-tenths of prisoners have literally no useful education. Mr. Cummings further says:

The educational acquirements of prisoners here do not differ materially from a general statement that would apply to most prisons in other States. Of 478 prisoners committed from April 11, 1870, to July 1, 1871, 232 were entirely illiterate; 95 could read and write; 120 could read and write very imperfectly, while but 31 were liberally educated.

Those who could read and write "very imperfectly" may without error be put down as uneducated. So that, practically, four-fifths of all the California State prisoners were uneducated; and yet this fact does not half appear in the table of statistics.

The board of inspectors of the State penitentiary of Tennessee say:

One out of every 25 of the entire population of Great Britain is a juvenile delinquent—a destitute vagabond, abandoned, and, in many cases, a law-breaking child before the age of 17. While the same proportion of such a class can not be supposed to exist in this State, still the number is very large, and augmented daily with our increasing population. While no section of the State is entirely free from their presence, our larger cities swarm with them. They are found at every corner, and in every alley; at the doors of the saloon and the theater; at our depots and wharves; here their faces greet you with features pinched by their necessities into expression of premature shrewdness, bordering on villainy, totally foreign to the faces of well-cared-for childhood. From the teeming crop of ignorant, neglected, and criminal children is produced the large majority, if not all, of the thieves, counterfeiters, forgers, burglars, robbers, and murderers who fill our penitentiaries; as also those subjects for seduction, and consequent prostitution, who fill the brothels of our cities.

Here is society preparing the crime which the criminal commits. Here is the negative preparation of noneducation, and the positive one of temptation.

Mr. Darnell, keeper of the Georgia penitentiary, says:

Of all reformatory agencies religion is first in importance because most potent in its action on the human heart and life. Education is also one of the vital powers in the reformation of fallen men and women, who have generally sinned through the influences of some form of ignorance conjoined with vice. Its tendency is to quicken the intellect, expel old thoughts, give new ideas, supply material for meditation, inspire self-respect, support pride of character, excite to higher aims, open fresh fields of exertion, minister to social and personal improvement, and afford a healthful substitute for low and vicious amusements.

It is, therefore, a matter of primary importance in the prevention of crime and the improvement of society, as well as the avoiding of that combat between crime and law which, in this country, has been the bane of our prosperity.

We need not cite any further testimony of this kind; this is in substance the testimony of all the keepers and officers of penitentiaries, prisons, jails, and reformato-

ries in the country. It is the testimony of human experience on one of the most important points which concern human society. The evidence upon the intimate relation of crime and ignorance is clear, complete, and ample. It may be comprised in two general propositions:

First. That one-third of all criminals are totally uneducated, and that four-fifths are practically uneducated.

Secondly. That the proportion of criminals from the illiterate classes is at least tenfold as great as the proportion from those having some education.

If these proportions are true (and we have made rather an underestimate), then, after making due allowance for crimes committed with passion, without regard to education, and crimes, such as forgery, frauds, etc., which require some education, we must come to the conclusion that two-thirds of crimes might be avoided by education, but more especially by religious training. Against this fact some one will reply that so, also, a large number of criminals are intemperate, and, therefore, we may attribute to intemperance a large number of the crimes we now attribute to ignorance. True, if these were parallel causes, but they are not. In the first place a large number of the intemperate are such from want of education, and especially from want of moral and religious training. We see a great many educated persons (that is, commonly educated) who are intemperate, but they seldom commit crime. Secondly, many of those committed to prison have become intemperate on account of previous criminal and vicious habits. But we shall not discuss this topic, except so far as to present some statistics both upon intemperance and upon color.

We give the following examples of the traits of prisoners in regard to temperance and intemperance, in some of the principal prisons, viz:

Institution.	Temperate.	Intemperate.
Northern Indiana prison	105	104
Iowa State penitentiary	122	158
Minnesota State prison	41	46
Illinois State penitentiary	672	743
Kentucky State penitentiary	814	1,033
Detroit House of Correction	3,045	5,655
Total	4,799	7,739

Or in proportions—	Per cent.
Temperate	38
Intemperate	62

This proportion is rather larger than that which the statistics show as the totally ignorant, but not nearly so large as the very ignorant are reported to be by the keepers of penitentiaries, prisons, and jails.

Probably if we had the statistics of every prison and jail in the United States the result would not be materially different from what we have given above. Let us now look a little at the proportions of the colored people in relation to crime and ignorance, remembering their long enslavement and the prohibition of letters to slaves:

Section.	Population.		Prisoners.	
	White.	Colored.	White.	Colored.
New York and Pennsylvania	1,786,826	117,375	11,268	1,465
Central Northwest	8,987,572	130,437	14,362	1,524
West and Pacific	2,720,272	29,393	1,187	205
South	3,568,901	1,680,888	2,058	2,414
Total	23,063,511	1,957,873	28,875	5,608

The above does not contain the population of all the States in those sections, nor by any means all the prisoners, but it does show the proportions of white and colored people, and the proportions of white and colored prisoners; and this is the only purpose for which we have prepared this table.

In New York and Pennsylvania the proportion of colored population to colored prisoners is 80 to 1; but of white population to white prisoners it is 700 to 1.

In the central Northwest the proportion of colored population to colored prisoners is 90 to 1; but of white population to white prisoners, 700 to 1.

In the West and Pacific, the proportion of colored population to colored prisoners is 140 to 1; but of white population to white prisoners, it is 2,300 to 1.

In the South, the proportion of colored population to colored prisoners, is 700 to 1; but of white population to white prisoners, 1,784 to 1.

The only value attached to these proportions is to show that the negro population, being almost entirely ignorant, presents far the larger proportion of criminals. This we might anticipate, but it is one of many great facts which show that ignorance is really the greatest cause of crime.

The nativity of criminals in the foregoing table is:

Foreign born	57,818
Native born	42,495

The foreign born in the United States are to the native population as 1 to 7. Hence, the foreign-born criminals are to natives nearly in the proportion of 10 to 1. If, then, society suffers a large portion of its people to be ignorant; if it offers temptation to intemperance; if it neglects to encourage industry, is not the proposition of Quetelet most emphatically proved, that society prepares the crime which the criminal commits? Can we have a more serious testimony to the duties of society? * * *

THE PUBLIC SCHOOL FAILURE.[1]

By Richard Grant White.

There is probably not one of those various social contrivances, political engines, or modes of common action called institutions, which are regarded as characteristic of the United States, if not peculiar to them, in which the people of this country have placed more confidence or felt greater pride than its public school system. There is not one of them so unworthy of either confidence or pride; not one which has failed so completely to accomplish the end for which it was established. And the case is worse than that of mere failure, for the result has been deplorable and threatens to be disastrous.

To those who have not thought upon this subject, or who have thought upon it vaguely and without careful and considerate observation of all the facts which bear upon it, this assertion will savor strongly of temerity and folly. The belief that education—meaning thereby the acquiring of such knowledge as can be got in schools and from books—is in itself elevating and purifying, and is the most potent agency in the formation of good men and good citizens, is so general and so plausible that it has been assumed as an axiom in that which for reasons that do not yet quite clearly appear has come to be called "social science." If this assumed axiom were well founded, if it were really true that book learning and thrift, decency of life, and good citizenship are so directly connected that they must always be found together, it need hardly be said that this sort of education would be of the first necessity in every wisely constructed and well-ordered society, and would be of supreme necessity in a

[1] From the North American Review, December, 1880, pp. 537–550.

country in which every man who lives outside of prison walls has a voice in the government. Hence, the assumption on this point being what it is and has been for many generations, it would be strange indeed if public education had not been a subject of grave consideration early in the short history of the United States and if it had not been amply provided for by legislation. The provision was early made, and public education at public cost has been so general here and has been developed into a system so vast and so complete that a better opportunity for testing its worth could not be hoped for. The conditions, too, under which this system has been in operation are singularly favorable. The wealth of the country, its vast expanse of uncultivated, unoccupied land, a homestead in which can be acquired at an almost nominal price, the general intelligence of the people, their freedom from burdensome taxation, the absence of privileged classes and of an established religion supported by the State make its people one upon which education, according to the assumed theory, should have the happiest, the most benign effects; but however great may be the intrinsic value of education as a formative social agency, the effect of that which is afforded by our public school system has proved in every way unsatisfactory, and worse than unsatisfactory.

That the system is of New England origin need hardly be said. It is a development of the New England common school, from which it has been gradually evolved under gradually accumulating influences, some of which were pure and philanthropic, but other some of which were corrupt and self-seeking. The former may be called social, the latter political, using the word in that narrow and derogatory sense which it has unhappily acquired in our discussions of public affairs. In Massachusetts, in the year 1647, and in Connecticut only three years later, it was enacted that every township of 50 householders should appoint a person within their town to teach all children that should resort to him to write and read, whose wages should be paid by either the parents or the masters of such children, or by the inhabitants in general; and it was also ordered that in every town of 100 families there should be a grammar school set up, the masters of which should be able to fit youths for the university, a grammar school being then a school for instruction in the Latin language, English grammar and the teaching of it to English-speaking children remaining yet unimagined and to men of that time almost unimaginable. This system of compulsory support of common schools and grammar schools spread itself over all New England and throughout those Northern and Western States which were more or less under New England influence.

The history of public education in the city of New York is of such importance as to merit special although brief consideration. The act establishing common schools in the State of New York was passed in 1812. Before that time money was expended by the State for the encouragement and support of schools, but there was no public school system. The law of 1812 applied to towns and villages, but not to chartered cities, with two or three specified exceptions. New York was not one of these. Public education in that city was in the hands of the Public School Society, a voluntary association, chartered, and in its standing and motives something like the New York City Hospital. I have not been able, in the time that I could give to this subject, to find the act incorporating this benevolent society, but I find so early as the year 1807 an act for its benefit, of which the preamble is as follows:

> Whereas the trustees of the Society for Establishing a Free School in the City of New York, for the education of such poor children as do not belong to or are not provided for by any religious society, have by their memorial solicited the aid of the legislature; and whereas their plan of extending the benefits of education to poor children, and the excellent mode of instruction adopted by them, are largely deserving the encouragement of Government; therefore, etc.

This makes the original purpose of common school education in the city of New York sufficiently clear. It was intended for poor children whose education was not

provided for by any religious society; but, in fact, its benefits were gradually extended to others—children not at all dependent upon charity. The character, the spirit, and the purpose of the society remained, however, unchanged. It sought to give elementary instruction and moral training to children who would otherwise have been more or less neglected in these respects. The benefits of a corresponding plan of education were conferred upon the people of the State at large by the law of 1812, which established a common school system of a somewhat rudimentary nature; but the city of New York remained without provision by law for public education until the year 1842, when the legislature passed an act extending to the city a participation in the system which prevailed in the State. But the act not only did this; it placed the schools of the Public School Society, with those of the orphan asylum, of the Roman Catholic Orphan Asylum, and of several other benevolent societies, under the jurisdiction and supervision of the board of education. Finding themselves in this position, the corporators of the Public School Society transferred their schoolhouses and all their other property, with their rights, to the board of education, and the society ceased to exist. It was not long before other school societies followed their example. This event was a public calamity—a calamity not only to the city of New York, but to the State; not only to the State, but to the whole country. Nor has the blight of its effect upon morals, upon politics, and upon education been confined to the country in which it first was felt. At that time our present public school system may be properly said to have begun its rapid formation. From that time public education passed rapidly into municipal politics, and became an engine at once of political corruption and social deterioration. The example of New York was widely followed, actually if not avowedly. On all sides there was a cry for higher education, and as higher education meant more teachers to be appointed and paid, more schoolhouses to be built, more text-books to be bought by the tens of thousands, and, in brief, more money to be expended, the local politicians, who with anthropomorphic devotion worshipped their own glorified and gigantic likeness in the Hon. William Tweed, did all in their power—and their power was great—to foster the higher education. Admirable, farseeing, large-minded, philanthropic statesmen! They fostered the higher education until, as I was told about ten years ago by a publisher of schoolbooks, there was no department of his trade so profitable as that in which he was chiefly interested, but that to "introduce" a set of two or three text-books into public school use cost between fifty thousand and one hundred thousand dollars (for what, pray let us know, oh, philanthropic dispensers of the healing light of education?); and until now there is a College of the City of New York, as a part of its common school system, and a normal school, at which 1,500 young women are instructed yearly in the mysteries of teaching, which but a very few of the 1,500 practice, mean to practice, or have the opportunity to practice, and until the sum of $3,805,000 is spent upon public education by the city of New York alone, of which sum no less than $1,009,207 is paid to teachers of primary departments.

And such, in a great measure, has the "American" system of public education become in all the country lying north of the Potomac and the Ohio.

Nearly $4,000,000 taken in one year from the pockets of taxpayers of one city for education—more than $1,000,000 paid to teachers of primary schools, and a similar expenditure throughout the State and in more than half the States, and what is the result? According to independent and competent evidence from all quarters, the mass of the pupils of these public schools are unable to read intelligently, to spell correctly, to write legibly, to describe understandingly the geography of their own country, or to do anything that reasonably well-educated children should do with ease. They can not write a simple letter; they can not do readily and with quick comprehension a simple "sum" in practical arithmetic; they can not tell the meaning of any but the commonest of the words that they read and spell so ill. There

should not be need to say that many of them—many in actual numbers—can do all these things fairly well; but these many are few indeed in proportion to the millions who receive a public school education. They can give rules glibly; they can recite from memory; they have some dry, disjointed knowledge of various ologies and osophies; they can, some of them, read a little French or German with a very bad accent; but as to such elementary education as is alike the foundation of all real higher education and the sine qua non of successful life in this age, they are, most of them, in almost as helpless and barren a condition of mind as if they had never crossed the threshold of a schoolhouse.

The testimony to this amazing and deplorable condition of the mass of the pupils of our public schools is so varied, so independent, and comes from so many quarters that it must be true; it can not be disregarded. It is given by private persons, by officers of school districts, by teachers themselves; and it comes from all parts of the country. It can not be repeated here in detail, for it would fill half the pages that can be afforded to this article. But one example of it may be given which fairly represents the whole. Mr. George A. Walton, agent of the Massachusetts State board of education, in a report on the public schools of Norfolk County, Mass., a county which borders upon Boston and the inhabitants of which are somewhat exceptional in wealth and intelligence, sets forth a condition of things which has thus been graphically but correctly summarized by the Chicago Times:

> The examinations were, in the first place, of the simplest and most practical character. There was no nonsense about them. They had but one object—to see if, in the common schools, the children were taught to read, write, and cipher. * * * The showing made by some of the towns was excellent, and of them we shall speak presently. In the case of others, and of many others, it is evident from what Mr. Walton says, and still more evident from what he intimates, that the scholars of 14 years of age did not know how to read, to write, or to cipher. They could, it is true, repeat the pieces in their school readers, and parse and spell in classes, and rattle off rules in grammar and arithmetic, not one word of which they understood; but if they were called upon to write the shortest of letters or the simplest of compositions, or to go through the plainest of arithmetical combinations, their failure was complete. They had, in fact, been taught what to them were conundrums without end; but the idea that the teaching was to be of any practical use in the lives of these children, when they grew to be American men and women, formed no part of the system, and evidently had never entered into the heads of the instructors. * * * Then, when the letters and compositions were brought in the ingenuity in bad spelling seems simply incredible. Unless the different misspellings of the word "scholar," for instance, were given, as in this volume they are, who would believe that they would be some 230 in number? Then, again, 65 different spellings are enumerated of the word "depot;" 108 of the common word "whose," and 58 of "which." Out of 1,122 pupils who used the adverb "too" in the narratives, 859, or nearly 77 per cent of the whole, spelled the word incorrectly. Then on pages 218, 219, and 246–248 of the report we are given facsimile lithographs of these letters and compositions, showing their average excellence in certain of the towns, and anything worse it would be hard to conceive. Language fails to do justice to them; they only can do it to themselves.[1]

This is the intellectual result of the operation of our much-vaunted "American" public school system during the last thirty or forty years. Competent observers in all quarters tell the same story. In the year 1875 it was officially recorded that the candidates for cadetship at West Point had shown a steady deterioration in thorough-

[1] Mr. Walton's report is before me, and I am able to bear unqualified testimony to the unexaggerated truthfulness of this summary setting forth of the case which he presents in great detail. I have quoted this passage less for convenience' sake than that the reader might see how widely a judgment against the efficiency of our public schools is beginning to be diffused. Mr. Charles Francis Adams, jr., in his paper on "The new departure in the common schools of Quincy," says of an examination of those schools by competent and impartial gentlemen in 1873: "The result was deplorable. The schools went to pieces. * * * In other words, it appeared, as the result of eight years' school-teaching, that the children, as a whole, could neither write with facility nor read fluently."

ness of elementary knowledge during the then last twenty-five years. It is needless to waste more words in setting forth a fact equally sad, disgraceful, and undeniable.

Nor need we look very far for information which is both corroborative and explanatory of this lamentable and almost ridiculous failure of public school education. The system soon began to bring forth its proper fruits. The superintendent of public instruction in the State of New York, in the eighth annual report from his office, presented to the assembly in 1862, after discussing in general terms the "limited knowledge" among a "large proportion" of the teachers of "that which all teachers ought first to know," a deficiency which had been found a "source of embarrassment," said:

> Many [teachers] who have been over a very extended ground of higher mathematics fail utterly in the simplest principles of mental and practical arithmetic. More have spent busy terms in the study of the classics, but have no knowledge of the first principles of their own language; while to find one who knows anything of the geography of his own, much less of foreign lands, is rare good fortune indeed! And yet these are not novices, but representative teachers, as the average term of their experience shows (p. 39).

We have here revealed to us the condition into which public education has been brought by twenty years' experience of our public school system, a period just about long enough to mature a second generation of teachers under the influence of that system.

This being the mental condition and the educational equipment of teachers, what may we reasonably look for in their pupils, the time having not yet come when men may gather grapes of thorns or figs of thistles? Mr. Walton's Norfolk County report might have been written in advance by any man gifted with moderate power of forecast. As a mere imparter of useful knowledge the public school system has failed utterly.

And now let us consider that system in relation to the reason, the only reason which justifies its establishment. It is supported by enormous sums of money taken by process of law from the pockets of individuals. Will he, nill he, every man who has property is compelled to pay for the education of other men's children in schools to which he may or may not wish to send his own children, if he has any. The only possible justification for this forcible appropriation of his money is that it is for the public good, for the common wealth, that the system for the support of which his money is taken affords security for life, liberty, and property which without that system would be lacking. And this is the reason for it, and the only reason that is avowed. It has recently been set forth very clearly by an able and highly esteemed public-school officer of high position, in a passage which is a very complete expression of the raison d'ètre of our public school system. The superintendent of the board of education of the city of New York (one of the most high-minded and capable members that board has ever had), in his report for 1879 thus remarks:

> In our day, and in the condition of American life, we need all the power of an educated intelligence in order to lift the masses, as well as to maintain an equilibrium in the forces of society. The distribution of knowledge is as necessary as the distribution of light. We need the distributive power of systems of education which will reach the lowest abodes and penetrate to the farthermost hamlets of the land. The best education of the people will thus become the best government of the people (p. 27).

Here we have the professed and the honestly believed social and political theory upon which the public school system rests. It is to lift the masses. Knowledge is as necessary to healthy social life as light is to healthy physical life. If education reaches the lowest abodes, we may then, and only then, have the best government of the people.

The theory is not merely unsound, it is utterly and absolutely false. Knowledge

will not lift the masses, except as a balloon is lifted, because it is inflated with gas. Mere knowledge does not raise the quality of men's moral natures. Knowledge is light indeed to him who can see, and who can think and feel rightly as to what he sees; but mere intellectual light, without moral warmth, will not produce a healthy social life any more than a healthy physical life can exist in the light of a thousand suns without the genial warmth of one. The road to the best government of the people does not lie only through the door of the public schoolhouse.

This theory itself, however, is the natural fruit of a belief which has obtained general acceptance, and which is embodied in an adage that, like so many adages, is fallacious, and yet is received without question because of its sententious form. It seems conclusive, and it saves people the trouble of observing and thinking. This adage is, "Ignorance is the mother of vice." Among all the hundreds of adages, which are supinely accepted and blindly acted upon, there is hardly one which is more at variance than this is with the truth. On the contrary, the teaching of the world's experience through all past ages, and in the light of the present day, is this:

Ignorance is the mother of superstition, but has no relation with vice.

Ignorance has, indeed, a certain relation with vice—a relation which, however, is merely one of frequent coexistence. But coexistence does not imply connection. It no more implies connection than sequence does. That which follows is not necessarily the consequence of that which goes before. Post hoc does not imply propter hoc. Equally true is it that two things found often, or even generally, together have not necessarily the relation of cause and effect, nor even that of identity of cause. Vice may, and often does, flaunt unpalliated by ignorance; ignorance may, and often does, walk with its humble purity untainted by vice. Some of the most vicious men that have ever lived have been well instructed, accomplished, and even learned. Some of the purest and best have been ignorant—so ignorant that they could read and write hardly better than the majority of the pupils of our public schools. Ignorance and vice are so frequently found together, not because the former is the cause of the latter, but because both—but chiefly the former—are the common companions of poverty. Want, if not the parent of vice, is at least its faithful foster mother. One among the proverbs that really embody the truth of the world's experience is that which tells us "It is hard for an empty bag to stand upright." Becky Sharp said that she could have been a good woman if she had had £5,000 a year. The goodness of the Becky Sharps of this world, under any circumstances, is but skin-deep, like their beauty; but beauty is none the less sought for and longed for; and so decorous behavior and decent life are all that society can demand, no matter what their motive. Thackeray, in this speech of his greatest creation, lays bare the nature of all vice. Vice is the satisfaction of personal wants without regard to right. Now, as the obstacle to the satisfaction of wants is almost always the lack of means—that is, of money or its equivalent—the result is that most vice is directly connected with the need of money. The fact that the need may be actual and healthy—as for the necessities and comforts of life, or fictitious and fanciful—as for luxuries of whatever sort, does not impair the truth of the axiom that need is the motive to the vicious life. Hence it is that poverty and vice are so often found together, and that, poverty being so common, vice is so common. There are thousands of humble Becky Sharps, and of their male counterparts, in every town and county in the country.

If ignorance were the mother of vice, and if our public-school system were what it is set up to be, the fruits of the latter would by this time have been manifest, plainly visible to the whole world, in our moral advancement as a people, in a higher tone in our society, in the greater purity of our politics and the incorruptibility of our legislators, in the increased probity of the executive officers of our State and municipal governments and of our corporate financial bodies, in the superior wisdom and more solid integrity of our bench, in the sobriety of our matrons,

the modesty of our maidens, in the greater faithfulness of wives, in the diminution of divorces, in the steady decrease of vice and crime and idleness and vagrancy and vagabondage. If ignorance be the mother of vice and the public school is the efficient foe of ignorance, the last fifty years should have seen in all these respects an improvement so great that admiring nations would applaud and humbly hope to imitate. But who needs to be told that in all these respects we have deteriorated? It is not Horace's praiser of the days when he was a boy that tells us this. It is a matter of public record. It is known to every observant man who has lived more than thirty years. Our large towns swarm with idle, vicious lads and young men who have no visible means of support. Our rural districts are infested with tramps—a creature unknown to our fathers, and even to us in our youth. The corruption of our legislative bodies is so wide and so deep and so well known that great corporations and business men of large wealth can almost always obtain the legislation needful for their ends, right or wrong. Bribery at elections is almost openly practiced by both our great political parties. The general tone and character of our bench, both for learning, for wisdom, and for integrity, have fallen notably during the last thirty years. Dishonesty in business and betrayal of trust have become so common that the public record of the last fifteen years on this subject is such that it can not be remembered without shame. Politics, instead of being purified and elevated, has become a trade in which success falls year by year more to inferior men who have a little low cunning. Divorces have multiplied until they have become so common as to be a stock jest in the facetious column of our newspapers. Crime and vice have increased year after year almost pari passu with the development of the public-school system, which, instead of lifting the masses, has given us in their place a nondescript and hybrid class, unfit for professional or mercantile life, unwilling and also unable to be farmers or artisans, so that gradually our skilled labor is done more by immigrant foreigners, while our native citizens, who would otherwise naturally fill this respectable and comfortable position in society, seek to make their living by their wits—honestly if they can; if not, more or less dishonestly; or, failing thus, by petty office-seeking. Filial respect and parental love have both diminished; and, as for the modesty of our young men, and even of our young women, they do not even blush that they have lost it. This is the condition in which we are after more than half a century of experience of our public-school system, the only justification for whose existence is that it was asserted and believed to be a panacea for the cure of social and political disease. Nor is the case of that system at all bettered by the quite untenable assumption that all this would have been without its influence; for its only justification, the very reason of its being, is the other assumption, that by it all this would have been prevented.

Moreover, there is evidence on record, evidence furnished quite independently of any investigation of this subject, which proves the case against the public-school system as clearly and as undeniably as the truth of Newton's theory of gravitation is proved by the calculations which enable astronomers to declare the motions and to weigh the substance of the planets. For the census returns show that crime, immorality, and insanity are greater in proportion to population in those communities which have been long under the influence of the public-school system than they are in those which have been without it. The system, be it remembered, is of New England origin, and the New England States have been longest under its influence. The States south of the Potomac are those which were longest without it; and, indeed, in them it has hardly yet obtained favor or foothold. Let us compare the statistics of population, of literacy and illiteracy, and of crime in these two classes of States, carefully eliminating from our calculation the influence of foreign immigration upon the criminal record of the Northern States, which the particularity of the census returns enables us to do. The comparison is between the native white populations of Massachusetts, Connecticut, New Hampshire, Vermont, Maine, and Rhode

Island on the one hand, and the same population of Delaware, Virginia, Maryland, North Carolina, South Carolina, and Georgia on the other. These are all original States of the Union, Maine excepted; but Maine was always a part of New England. They are Commonwealths founded at about the same time by people of the same race and the same religion. In 1860 secession and consequent civil war caused in the Southern States an upturning of all the elements of society, which makes it proper that the examination of their social condition should be limited by the census of that year.

The census of 1860 shows that the New England States had a native white population 2,665,945 in number, and of these there were but 8,543 adults who could not read and write. The six Southern States mentioned above had 3,181,969 native white inhabitants, among whom there were 262,802 adults who could not read and write. In the New England States, therefore, the native whites who could not read and write were in the proportion of 1 to 312, while in the six Southern States the proportion of wholly illiterate whites was 1 to 12. Now, if ignorance is the mother of vice, of crime, of wretchedness, and of all that goes to make bad citizens, the excess of the criminal classes in the Southern States should have been in something like the proportion of 312 to 12. But it was not so. On the contrary, the proportional excess of crime, of pauperism, of suicide, and of insanity (and among the native white inhabitants, be it remembered) was very much greater in the New England States; for in 1860 they had in their prisons 2,459 criminals, while the six Southern States had but 477. New England society, formed under the public-school system, produced 1 native white criminal to every 1,084 inhabitants; while the Southern States, which had been almost entirely without that system, produced only 1 to every 6,670—a disproportion of more than 6 to 1![1] The New England States had one publicly supported pauper to every 178 inhabitants, while the six Southern, which were without public schools, had but 1 to every 345. Of suicides, there were in the New England States 1 to every 13,285 of the entire population; but the others had only 1 to every 56,584. The census of 1860 has no record of insanity; but that of 1870 shows in New England 1 insane person of those born and living in the several States to every 800 native-born inhabitants; but in the six Southern States in question only 1 to every 1,682 native inhabitants. Strange to say, foremost in this sad record stand Massachusetts and Connecticut, which have had common schools since 1647 and 1650, respectively, as was remarked in the beginning of this article, the former producing 1 native white criminal to every 649 native white inhabitants; the latter, 1 to every 845.

The significance of these facts and figures can not be mistaken or explained away. Does it therefore follow that knowledge is incompatible with virtue, thrift, good citizenship, and happiness, and that education is per se an evil? Not at all. But it does follow that ignorance is not the mother of vice; that ignorance has no necessary connection with vice. It does follow that the public school system is not the reformatory agent which it has honestly been supposed to be; that its influence is not to make men good, and thrifty, and happy; that it is not adapted to produce the best government of the people.

In 1870 the cost of the system which coexisted with the condition of society indicated by these figures, and which has been previously described in this article, was more than $64,000,000.

The remedy? A remedy must be found. It can not be set forth in detail at the

[1] The well-known fact that homicide is more common in the Southern States than in the Northern is of no importance in the consideration of these statistics. It merely shows that to the mass of crime in the one case homicide bears a large proportion, and to the mass of crime in the other a very small one. And it is to be remarked that of the homicides in the Southern States a very large proportion, springing as they do from an antiquated perversion of the sense of honor, semisavage as they often are, are generally less base and vicious in motive than the comparatively few murders in the Northern.

end of an article like this, which has already exceeded the limits assigned to it. But it may be briefly indicated as a discontinuation of any other education at the public cost than that which is strictly elementary—reading, spelling, writing, and the common rules of practical arithmetic; and in the remission of all education higher than this to parents, the natural guardians and earthly providence of their children. And those children only should be thus educated at public cost whose parents are too poor to give them even an elementary education themselves. Supplementary to this simple system of elementary education, there might be some jealously guarded provision for the higher education of pupils who have exceptional ability and show special aptitude and taste for science or literature.

Moreover, if Government is to assume a parental and formative function, and to attempt the making of good citizens, it may, with much more reason and propriety, establish public farms and public workshops, and train in them its future citizens to get their own living honestly and respectably, than it may establish and compel attendance upon schools on a system the result of which, according to the experience of half a century, is deterioration in purity of morals, in decency of life, in thrift, and in all that goes to make good citizens, accompanied by a steadily increasing failure in the acquirement of the very elements of useful knowledge.

"THE PUBLIC SCHOOL SYSTEM A FAILURE."—A REPLY TO RICHARD GRANT WHITE.[1]

Mr. Richard Grant White says in the December number of The North American Review that, "as an imparter of useful knowledge, the public school system has failed utterly." And, again, "The case is worse than mere failure, for the result has been deplorable, and threatens to be disastrous." Indeed, according to some statements in this remarkable article, it has already proved disastrous to the intelligence and morals of the people where public schools have existed.

This has a rather strange sound to Northern ears. But, like many other discoveries that seem new, those familiar with Shakespeare's Henry VI will recognize it as what the ethnographers call a "survival."

So far as I know, it was Jack Cade who made the original discovery that Lord Say had "most traitorously corrupted the youth of the realm, in erecting a grammar school." Whether Mr. White got the hint from Cade I don't know, but there seems to be a marvelous resemblance in their ideas.

Before following Mr. White through some of the details of his article, it will be well, perhaps, to call attention to his two leading propositions, on which the whole article rests.

His first proposition is that "as an imparter of useful knowledge the public school system has failed utterly."

This proposition he proves to his own satisfaction by the aid of some detached statements in Mr. Walton's report of examinations in Norfolk County, as well as by some exceptional lithographed examples of poor work contained in that report; and by some exaggerated statements of Mr. Charles Francis Adams, jr., which are sufficiently answered by an official document of the date referred to, bearing his own signature.

Having established, as he thinks, his first proposition, Mr. White lays down another, of which it can not be said that it is like unto the first. It is this: That "Ignorance is not the mother of vice," and has no connection with it, except that they sometimes coexist, neither of them being the cause of the other.

And how do you suppose he undertakes to prove this? Why, by assuming that his first proposition is false, and that the States in which a public school system exists

[1] A paper read before the Massachusetts Teachers' Association, December, 1880, by B. F. Tweed.

are more intelligent, have more knowledge, than those that have no public school system; for he goes on to present such an array of statistics, manipulated to suit his purpose, as shows to his satisfaction that those communities which have been long under the influence of a public school system have more crime and immorality than those which have been without it.

But, supposing it to be true (which, of course, I do not admit) that crime and immorality have been more common in the States where public schools exist than in others, how does this prove that "ignorance is not the mother of vice?"

He has already assured us that "as an imparter of useful knowledge the public school system has failed utterly." Why, then, should we not presume the communities that have not been cursed with a common school system, but where, in the language of Mr. White, education has been remitted to parents, "the natural guardians and earthly providence of their children"—I say, why should we not presume such communities to possess more useful knowledge than those that have had a school system only to find that "as an imparter of useful knowledge it has failed utterly?"

What, then, has Mr. White proved? If the first proposition, then his statistics—if they do not prove that "ignorance is the mother of vice"—do prove that the amount of crime in a community is in direct proportion to the amount of ignorance.

If, therefore, his first proposition is true, he has disproved the second. If his second is proved, it is by a direct denial of the first; for it rests entirely on the assumption that those communities where a public school system has existed are more intelligent—that is, have more knowledge.

It reminds one of the gentleman's servant, who cut off a favorite dog's head to save the pitcher into which he had thrust it, and then broke the pitcher to get the dog's head out.

Such being the character of this article as shown in its two leading propositions, it may be proper to remind Mr. White that logicians have found the same difficulty in proving contradictories that railroad men have in trying to make two trains pass each other on the same track. Thus far the result has always been a damaging collision.

But let us inquire a little into the nature of Mr. White's proof.

Mr. White quotes from a recent statement of Charles Francis Adams, jr., that when, in 1873, they examined the schools of Quincy, "the result was deplorable. They all fell through," etc.

But let us see how this statement—made in 1880—agrees with the annual reports, made when the facts were fresh in the mind of Mr. Adams.

From the school report of Quincy for 1872–73, I take the following:

> The standard of education has not been notably advanced during some years, so far as the committee can judge. But while this is substantially true, it is also true that the standard has neither been lowered nor drawn back; and it is possible that an eagerness for exceptional excellence may have blinded us to a steady and substantial, though slow advance. To those who can recall the situation twenty years since, this may appear considerable.

Again,

> It has been said that a point has been reached in our schools which seems to be near the goal at which common schools aim; and this is substantially true, taking into consideration the age and average attendance of the pupils.

In the report of 1873–74 I find the following:

> The school committe, in entering upon the performance of the closing duty of their school year, are glad to be able to congratulate the people of Quincy upon the satisfactory general character of the results they have to report.
>
> While there have been no striking alterations in the main system of management, no radical innovation in method of instruction, nor considerable change in the style of teachers, a fair, even, and well-distributed improvement has been noted in most of the departments of study.

Then, after speaking of several schools, one of which "appeared much better," another "not so well," and others bearing "indications of improvement," the report continues:

But, as a rule, the committee saw nothing which leads them to modify the opinion expressed in their last annual report, to the effect that, as regards instruction, a point has been reached which is near the natural term of such force as our present system of schooling is calculated to exert.

At the same time it is to be remembered that, as compared with many years ago, the tests applied to our schools have much increased in severity.

The new principle of conducting the examinations introduced by the committee a year ago, under which a single and the same branch of the studies pursued is in the examinations of all the schools assigned to each member of the committee, has also been pursued this year. During the examinations, the schools are thus taken wholly out of the hands of their instructors and into those of the committee.

Under these circumstances a mere education of "veneering" is sure to reveal its false character. It is wholly impossible to prepare classes for a "show-off." The examinations, therefore, now at least reveal as a whole the real results of our schooling. * * * They do not show all that we might desire they should; but they do show much, and what they do show is there; there is at least no parade of results which have no reality in existence.

So said the two excellent reports of the Quincy schools, 1872–73 and 1873–74; both of which were adopted and issued by a committee, of which Mr. Charles Francis Adams, jr., and his brother, John Quincy Adams, were members.

But perhaps this inconsistency in Mr. Adams's utterances is susceptible of an explanation creditable to the present condition of the schools, and indicative that he now takes a broader view of what our philosophical friends would call the "potentialities" of our schools.

In 1873 Mr. Adams knew less of our common schools than he does now, after a long term of service on the school committee. When, therefore, in the light of the great improvement he has seen during the last five or six years, he looks back to the examination of 1873, it is no wonder he exclaims, "It was deplorable." He looks from a different standpoint. It is the old story of the two-sided shield. Mr. Adams had seen only the silver side then; and, like our financiers, previous to that period, he was content with the "dollar of our fathers." Now, having seen the golden side, that "pale and common drudge 'tween man and man" is not satisfactory. He is understood to favor the gold standard, as well in education as in finance.

I may say also that Mr. Walton's report, on which Mr. White relies so much for proof of his first proposition, as a whole, does not justify his indiscriminate condemnation of the schools, even in Norfolk County.

Any one who knows Mr. Walton knows that, while he would be the last man to do injustice to teachers and pupils, he is by nature and habit sufficiently critical to guard against any undue leniency of judgment. And the summing up of the percentages obtained is considerably above what is required in our best colleges for graduation.

So also the lithographs of letters and narratives by primary and grammar school pupils are, I do not hesitate to say, as a whole, creditable. Some are very good; many are creditable; some, I admit, are very poor; and I might have doubted the expediency or justice of circulating them without some explanation.

What is the natural capacity of the pupil whose work is here exhibited?

How long has he been in school?

Has he been regular in attendance?

If it had appeared that the poorest work was done by pupils of average capacity, who had been regular in their attendance during the usual school course, and the best work by those whose limited attendance and other circumstances had saved them from the demoralizing effects of the school system, I should have admitted that there was some force in Mr. White's strictures.

I should like to have some theological Mr. Walton go through a county—I care not

if it be Norfolk, that the parallel may be complete—and test the knowledge and practice of the several congregations of that county in the rudiments of Christianity, marking their progress in the Christian virtues on the same scale of percentages as used in the schools.

Then, if it were possible—I don't know exactly how it could be done—I would have facsimiles of their knowledge of Christian principles, as it appears in their acts—what they do—that we might see whether "their lips and lives express the holy gospel they profess."

If this report should be found better than the educational report, I should say, so much the more creditable to the clergymen, and so much the less creditable to the school-teachers.

If, however, it should prove otherwise, I should not immediately jump to the conclusion that Christianity is a failure. It may not have done its perfect work. Indeed, we know it has not. It has encountered innumerable obstacles. Like our school system, that perfect system of Christian morality has depended for its promulgation on fallible men, many of whom have had no more appreciation of the principles of Christianity than the average school-teacher has of the principles of pedagogy.

And yet, with all these drawbacks, it may have been, and I believe it has been, the most important factor in the world's progress. No doubt the apostle was justified in speaking of the "foolishness of preaching," and I will not take issue with anyone who speaks of the foolishness of a great deal of the teaching in our schools. Still, poor preaching and poor teaching have been infinitely better than none. * * *

As to the moral influence of our school system, and the ratio of crime in the two divisions, about which Mr. White has so much to say, it is sufficient answer to refer him to the able and exhaustive report of Mr. Carroll D. Wright, Chief of Bureau of Statistics of Labor. Had Mr. White carefully studied this report, he might have saved himself the trouble of writing a considerable part of his article, and thus refuting what remained of it.

I have only to make a few brief extracts from this report to show how utterly fallacious all reasoning on the census statistics must be, unaccompanied by such explanation as is contained in Mr. Wright's report.

General Walker, superintendent of census returns in 1870, says:

> No single measure can be taken for determining the proportion of crime in the several communities of our country.
>
> The absence of any effort to reduce to a consistent body the returns on this subject in the last census—that to which Mr. White refers—led to misrepresentations of States and sections. In some cases returns were restricted to convictions for grave offenses, while in others convictions for the most petty offenses were equally considered.

Then follows this statement, which seems to have escaped Mr. White's notice: "In the opinion of the superintendent no use of these figures for purposes of comparisons between the States will be justifiable without reference to the foregoing."

And yet this is exactly what Mr. White has done. Is it possible that he is one of the victims of our public-school system? Was it in a public school that he learned to use the census returns in a manner which the superintendent of those returns says is "unjustifiable?"

But there are other reasons for pronouncing Mr. White's use of these returns "unjustifiable."

Mr. Carroll D. Wright, in comparing Massachusetts and Virginia as representative States, shows that while the criminal code of Massachusetts in 1860 provided for 158 offenses designated as crimes, the code of Virginia recognized but 108 such offenses punishable at law, and several of these, common to both States, were punishable by imprisonment in Massachusetts, but only by fine in Virginia.

Of the commitments in Massachusetts in 1860 more than half (54 per cent) were for offenses punishable in Virginia by fine only.

Perhaps it may throw a little light on the value of Mr. White's statistics to show the demoralizing effects of our schools, to state that the sense of different communities as expressed in their laws differs widely. Thus, while in Massachusetts adultery, fornication, and many other offenses are regarded as grave, and punishable by imprisonment, in Virginia they may be condoned by a fine. * * *

But because our schools have not made all our citizens intelligent and banished ignorance from the State, I am not prepared to pronounce them an utter failure any more than I am to pronounce Christianity an utter failure because in nineteen centuries it has failed to bring the millennium. * * *

COMPULSORY EDUCATION IN RELATION TO CRIME AND SOCIAL MORALS.[1]

By William T. Harris, LL. D.

The question of compulsory education as a means of prevention of crime involves prior questions relating to the nature of education and its different branches or species. It involves likewise a consideration of the nature of crime, and of what constitutes a preventive agency for crime.

If education in general does not act as a preventive of crime, it is useless to expect any good results from compulsory education. If some kinds of education are effective in the prevention of crime, and others not, then the first business of practical importance is to ascertain what branches of education possess this utility, and in what features is to be found the desired virtue.

Let us open the discussion by reference to some of the statistics bearing on the question of school education. In the Report of the United States Commissioner of Education for 1872 there are valuable special articles on the relation of school education to crime, to pauperism, and to productive industry. These articles are a mine of information and sound reasoning on the topic we are considering. In the essay of Dr. E. D. Mansfield, which forms a part of the Commissioner's Report, we have given: The aggregate number of prisoners in 1870 was 110,538; aggregate who could read and write, 82,812; aggregate number who could neither read nor write, 21,650; and of those who could barely read, but not write, 5,931; total illiterates 27,581, or 25 per cent of the entire number of prisoners.

These returns are collected from 17 States, 14 of these being Western or Middle States. Considering that the mere ability to read and write implies only three or four months' schooling, it is surprising to see that so many of the prisoners come from the very small class of the population in these 17 States that is reckoned illiterate or nearly so.

Taking the State prisons and jails of New York and Pennsylvania, showing an aggregate number of 12,772 prisoners, the number totally ignorant was found to be 19 per cent of the whole; taking the totally ignorant and the very ignorant, the amount was 33 per cent of the whole; adding to these the very deficient, the amount was upward of 60 per cent.

In the prisons and jails of the central Northwest, including Ohio, Indiana, Illinois, Michigan, and Wisconsin, returns from 30 penitentiaries, workhouses, and jails showed an aggregate of 18,931 prisoners. Of these, 40 per cent are classified as totally ignorant; 6 per cent more as very ignorant; 29 per cent more as very deficient—making a total of 75 per cent very deficient, very ignorant, or totally ignorant.

---

[1] Delivered before the Twelfth Annual Conference of Charities and Correction, Washington, D. C., 1885.

Taking four State prisons in Minnesota, Iowa, Kansas, and California, of 1,957 prisoners in the aggregate it was found that 21 per cent were totally ignorant, 10 per cent more were very ignorant, and 19 per cent more very deficient, or 50 per cent below the standard fixed upon as the separating line for very deficient.

Taking the States of Maryland, Kentucky, and South Carolina, 2,400 prisoners (a majority colored) were classified as 60 per cent totally ignorant and 25 per cent more as very deficient, or 85 per cent as at least very deficient in school education.

Turning from these statistics to the census returns for 1870, we take next the ratio of illiteracy in the entire population, and compare it with the ratio of illiterate criminals. In New York and Pennsylvania, we see that, while the illiterate in the entire population amount to only 4 per cent—the illiterate prisoners amount to 33 per cent of all the prisoners, and the very deficient includes 60 per cent of them.

In other words, the 4 per cent of the entire population that is illiterate furnish 33 per cent of the criminals—twelve times as many criminals from the illiterate as from an equal number who were not illiterate. The ratio is found thus: Four per cent of the entire population are illiterate, and 96 per cent not illiterate. The 4 per cent illiterate furnish 33 per cent of the criminals, which is more than eight times the quota that they should furnish if education made no difference in this matter. The 96 per cent not illiterate furnish only 67 per cent of the criminals, i. e., about two-thirds of their quota. Hence, in this capacity for furnishing criminals, the illiterate surpass the not illiterate in the ratio of eight to two-thirds, and thus in fact furnish twelve times as many criminals as an equal number of not illiterates do.

In the central West, 3½ per cent of the population is returned as illiterate, and 46 per cent of the criminals illiterate. Hence the illiterates furnish thirteen times their share of the criminals. In the far West and the Pacific section, the returns give 3 per cent illiterate as furnishing 31 per cent of the criminals, or tenfold their quota. In the three Southern States, 22 per cent illiterate furnish 60 per cent of the criminals. In these statistics, it is shown that, of the 110,538 prisoners, 91,427 are whites; of the latter, 57,824 are foreign born.

Statistics collected by Dr. E. C. Wines show that in France the number of persons under arrest from 1867 to 1869 was 444,133, of whom 442,194 were reported as unable to read, making over 95 per cent. Of the illiterates there was an average of 1 arrest for each 41 persons; but only 1 arrest for 9,291 persons who could read. This seems a too great disproportion measured by our American experience.

Further statistics from Dr. Wines show, in England, out of 157,223 committals to county or borough prisons, 53,265 illiterate, or 34 per cent; in Switzerland the average of criminals unable to read, through all prisons, 83 per cent.

These facts go to prove that even a slight degree of school education has an effect to lessen the tendency toward crime. It is to be remarked that statistics are to be used with caution, inasmuch as each quantitative result conceals within it an infinitude of qualitative factors which may possibly assist in the product. Were it possible to eliminate all the qualitative factors but one, the numerical statement would be unambiguous.

In connection with this I give some statistics taken from a recent work on industrial education. In the Philadelphia penitentiary it is said there were, in the period 1860–1870, 1,605 prisoners. Of these, 490 were illiterates, making over 30 per cent of illiterates. In the same penitentiary for this decade there were 1,217 that had never been apprenticed to any trade, or 76 per cent of the total number.

Without further consideration it might seem that the ratio of criminals from those who can read and write is two and one-half times as large as from those who have been apprenticed to a trade. But the illiterates over 10 years of age for Pennsylvania in 1870 were counted at less than 5 per cent of the population, while the proportion of the population returned as engaged in some form of productive industry is nearly 35 per cent. Hence, it would appear that the 35 per cent of industrial population

furnished 24 per cent of the criminals, while the 95 per cent that could read and write furnished only 30 per cent of the criminals. The apprenticed furnished two-thirds of their quota of criminals, while the educated furnished less than one-third.

In the decade from 1870 to 1880 it is said that out of 2,383 prisoners 706 were illiterate, while only 433 had been apprenticed to a trade. It would be unfair to suppose that the word "apprenticed" is taken in its ordinary meaning, for certainly not one in ten of the industrial population of Pennsylvania has been "apprenticed" in the old meaning of the word. It must be understood to mean those who have been taught to earn their living in some gainful occupation, whether agricultural, mechanical, mercantile, or personal. With this meaning the 433 apprenticed, or 18 per cent of 2,383, come from the 34 per cent of the entire population that are engaged in productive industry while the 706, or 30 per cent, of illiterate prisoners have come from the 7 per cent o illiterates reported in the census for 1880.

The 82 per cent of the prisoners that have not been apprenticed come from the 41 per cent of the population returned as being over 10 years of age and not engaged in any gainful occupation. The unapprenticed furnish twice their quota of criminals, while the illiterates furnish from four to thirteen times their quotas of criminals.

In the face of these statistics let us consider for a moment the characteristics of the two terms with which we are now dealing—education and crime. Crime is defined as breach of the laws of the State. The criminal attacks society. He injures his fellow-man in person or property. He prefers the gratification of some selfish passion or appetite to the good of his neighbor.

Now, what is the training which develops in the child a respect for the social whole, a feeling that society embodies his substantial good—a feeling of preference for the good of his fellow-man over his own whim or caprice?

Certainly, that training is the training which is given by bringing up the child in the society of others, and causing him to practice perpetually those customs which respect persons and property. A due sense of public opinion, a respect for the ideal standard of right and wrong set up in the community, is the primary requisite.

It is clear that man can live in society and constitute a social whole only so far as individuals are educated out of their natural animal condition and made to respect social forms more highly than mere animal impulses. Hence it is clear that society itself rests upon education, in this broad sense of the word.

But what has this to do with school education? Much of the education into a respect for social forms and usages is given by the family, and before the age proper for schooling. Then, again, it must be admitted that another part of this education comes later, and is learned in the pursuit of one's vocation in life—the education that comes from bending one's energies into a special channel for the purpose of earning a living. Another form of education is to be found in the part that one bears in politics within one's party, or in the exercise of functions conferred by the state, or still further, in the exercise of patriotic feeling. Lastly, there is the church, which furnishes a form of education most important, because it lays fullest stress on human duty, basing it on divine commands. The church educates the individual into the sense of his existence as a mere unsubstantial creature when living in neglect of the divine ideal manhood, but as a substantial and eternally blessed life when lived according to the forms prescribed in religion. These forms are forms that respect the welfare of the whole and measure the conduct of the individual by his preference of that welfare over his own selfish impulses.

The family, the vocation, the state, the church, are the four great cardinal institutions of education. The school is only a device brought in to reenforce these substantial institutions; but it is a very important device, notwithstanding its supplementary character. It may reenforce the family by giving to the youth the command of such conventionalities as reading and writing and moral behavior; or it may reenforce the vocation by giving instruction in arts and trades or professions;

or it may reenforce the church as a Sunday school, giving instruction in religion; the military school or the naval school may reenforce the education of the state.

Our question deals directly with the education of the school; but we must carefully bear in mind the several educational functions of these institutions, so as not to overestimate the functions of the school, or in any way confound its province with what belongs to the great social institutions.

Family education must furnish that indispensable preliminary education in personal habits, such as cleanliness, care of the person and clothing, respectful treatment of elders and superiors, obedience to authority, the sense of shame, religious observances, and the use of the mother tongue. The school must presuppose that these are already taught by the family, but the school must not neglect them, although it does not make them its special aim. The family does more, in fact, than educate the child in those indispensable things just recited. It builds up within the child's mind the structure of his moral character, making for him a second nature of moral habit and custom, whose limits and boundaries he regards as of supreme moment. This second nature, or moral nature, is secured by daily sacrifice, and all forms of education lay stress upon self-sacrifice as the foundation of their disciplines.

This process which we call education is, in short, essentially the shaping of man by habit into an ideal or spiritual type of being; a realization of what we call human nature in contradistinction to mere animal nature. It is an artificial life, a conventional form of living, but it is far more substantial and divine than the life of the mere animal man. Man, as an animal, is a savage; as civilized, he is an ethical being, who has set up within himself a system of duties and obligations which he observes at the expense of neglecting the impulses of his merely animal nature.

To what end is all this? Is it not because man, as an individual, wills to combine with his fellow-men in such a way as to avail himself of the united endeavor of all? By the organization of social institutions he converts a multitude of atomic individuals into a social unity. The individuals do not get lost in this social unity, like the waves of the sea. But the social unity is of that wonderful character that it reenforces the might of each individual by the might of the whole.

Speaking technically, the individual becomes the species; or, in giving up by self-sacrifice his selfish peculiarities and devoting himself to the service of others, he gains for himself the service of all mankind. The individuals are transmuted into one grand individual, of which each individual is the head, and each individual is also the foot. According to Kant's definition, a living organism is such that every part of it is alike means and end to all the other parts. So, in this social body, every individual human being is alike the means and the end for all others. Hence there is a "Grand Man," as Swedenborgians say.

In the matter of food, clothing, and shelter, the individual toils in his vocation to produce a special product, something useful to the rest, and demanded in the market of the world. In return for this gift of his day's labor he is permitted to draw from the market of the world his share of all the productions collected from all climes, brought hither by the commerce of nations. This is a perpetual process of united human endeavor, in which, by self-sacrifice, the individual reenforces himself by the race.

So, too, the family, the most embryonic of human institutions—the family enables the elder to assist the younger, the mature the immature, the well and strong to assist the sick and weak. It equalizes age and bodily condition, reenforcing each condition by the aid of all others.

The great object, then, of education is the preparation of the individual for a life in institutions, the preparation of each individual for social combination. Education inculcates sacrifice of animal proclivities, in order to secure a higher well-being in the life of the community.

Crime is, therefore, a reaction on the part of the individual against the very object of education. It attacks the necessary forms of social life, and asserts for itself the right to persist in the form of the nonsocial individual. Society must defend itself,

and reduce the rebellious individual to harmony with itself. Inasmuch as the social form is such that the individual who puts it on and becomes a member of the family, the community or the State, does not act directly for himself, but works for others and accepts the service of others in return for his own deed, so, too, punishment for crime takes on the same form; the criminal is made to receive for his deed an equivalent reflected back from society. As his deed injures society, it is returned upon him by society and injures him. If he attacks his neighbors by personal violence, his deed is made to come back to him by physical constraint or even by violent death on the gallows. If he attacks the property of his fellow-men, he is made to suffer in property, in the possession of personal freedom and the right to the products of his own labor. Thus, society treats the criminal who rebels against it just as though he, the criminal, had intended to do a social deed, and not a selfish one. It is a piece of irony. The State says to the criminal: "Of course, you recognize society, and expect to reap what you sow. You have an undoubted right to possess and enjoy the fruits of your own deeds. I will see that they are returned upon you. Your deed of violence on your neighbor shall therefore return upon you. Whatever you do you shall do to yourself."

Turning now from this view of the general educative character of the institutions of society, and the end and aim of all society to aid the individual by the might of the whole, and from this study of crime, let us define for ourselves the place of the school in education, and try to discover its relation to the prevention of crime.

The school, as we have seen, is a means of education auxiliary to each of the four cardinal institutions, and as such, the school in all of its forms is ethical and preventive of crime. The ordinary type of school—the so-called "common school"—receives the child from the family at the age of 5 or 6 years. It receives him into a social body (for the school is a community), and educates him by "discipline" and "instruction," as they are technically called. By "discipline" is meant the training in behavior, a training of the will, moral training. It consists in imposing upon the child a set of forms of behavior rendered necessary in order to secure concert of action—such forms as regularity, punctuality, silence, and industry. These are the four cardinal duties of the school pupil. Without them the school can not act as a unit, instruction can not be given in classes, and no good result achieved. We call these duties mechanical duties, but they underlie all higher ethics. Without silence in the school, without self-sacrifice on the part of each pupil, restraining his impulse to prate and chatter and occupy the attention of his fellow-pupils, there could be no work done. Each pupil would interfere with the work of every other pupil and the result would be chaos or worse—because anarchy is chaos made active and hostile to heaven's first law.

Order is not only the first celestial law, but it is the first law of all social combination. The school could not possibly undertake a more direct and efficient training of the child for social combination than it does undertake in its four cardinal phases of discipline—regularity, punctuality, silence, and industry.

Its method of securing these items of discipline may be good, bad, or indifferent, according to the pains it takes to convert external constraint into willing obedience and unconscious habit. The good school unquestionably shows us the constant spectacle of good behavior become or becoming a second nature to the pupils, so that there is a maximum of regularity, punctuality, silence, and industry with a minimum of self-consciousness in regard to it, although there is an insight into the necessity of such conformity to rule, and a conscious conviction in favor of it whenever any untoward occasion brings up the question. Consequently there is a minimum of corporal punishment in the good school. Necessary as it is in dealing with crude depravity, the school must have got far beyond that stage of discipline before it can be called "good."

This training of the will, we observe, is a training of each pupil to behave in such a form of artificial or conventional restraint that he may combine in the best manner

with his fellow-pupils, and be in a condition to give to and receive from them school instruction. Is it not clear that, once trained to observe set forms of behavior in the school, it becomes a second nature to observe such forms everywhere, and the individual has solved the problem of life so far as the prevention of crime is concerned?

But discipline in the school is wholly formal. It exists for an end; this end is instruction. What is the character of this instruction? First of all, school instruction aims to give the child an ability to use the arts of reading, writing, and arithmetic, the famous "three R's." He must learn to read the printed page, to represent in written characters his own words, and to enumerate the objects of the world.

Here, it is of first importance to note the fact that these fundamental studies of the school concern social combination quite as much as the four cardinal phases of discipline, just considered. To learn to read the printed page is to learn how to use the aggregated experience of mankind. The experience of mankind is ethical; for it contains only one lesson, infinitely repeated—the lesson of the necessity of conformity to law in order to achieve human well-being. Human experience records nothing but the success of combined human endeavor, and the failure of selfishness which avoids such combination. What is reading in itself except the art of appropriating for one's self the thoughts of one's fellow-men? Reading and writing are the arts of intercommunication par excellence. Arithmetic is the art of making quantitative combinations, and is equally fundamental, so far as the quantitative phases of society are concerned. Arithmetic, moreover, underlies all conquest over nature. Divide and conquer the empire of things by means of arithmetic.

As to the practical effects of reading and writing in the prevention of crime, we have had evidence pointing in that direction in the statistics of jails and prisons. The rationale of such effects may now be partially clear. The ability to read and the actual use of this ability in reading tend to bring to bear the life of society as a whole upon the life of the individual. Suppose he reads a newspaper. He finds interest in the deeds of his fellow-men—chiefly national deeds in wars and treaties, deeds of civil society in trade and commerce and other industries, deeds of crime and deeds of retribution by the tribunals of justice, society gossip dealing with manners. How surprising, when we think of it, is the fact that the most empty species of literature, the so-called "trashy novel," is filled with descriptions of the manners of polite society—in short, full of the details of these forms which appertain not to the individual as mere animal, but to the individual as member of society! The trashy novel portrays for the raw, inexperienced youth its ideal of the behavior of men and women in society. It shows bad manners and good manners, to the manifest advantage of the latter. Manners are superficial? Yes, but indispensable to man's life in institutions. Like the Egyptian sphinxes that lined the avenues of temples at Karnak and Luxor, they form the approach to the spiritual sanctuary itself. All instruction in good manners is of the nature of a safeguard to virtue and preventive of crime.

The man who reads habitually breathes the atmosphere of social human existence, and is in so far made to feel the substantiality of social life over mere brute life. He learns to look upon his every act from the standpoint of public opinion. He views all his own industry in its relation to the industry of his fellow-men.

The school, therefore, in teaching reading, writing, and arithmetic, deals in the most direct manner with forms of civilization by giving the individual the means of appropriating to himself the wisdom of the human race. In the newspaper, he may see the daily spectacle of humanity at large—a vision of his own human nature realized on a large scale in all mankind. As particular person, he is only a possibility of man, having realized only one small phase of human nature. In the human race, he sees the revelation of all the possibilities of human nature. This spectacle of the race is possible through the printed page, the newspaper, and the library.

But the common school has other studies, every one of which, however, tends in the same direction as the "three R's." There is geography, manifestly adapted to

give to the individual a knowledge of the world of individuals. It shows their habitat, their means for production of food, clothing and shelter, and culture. Who are my fellow-men, and how do they live? What are they doing for me, and what from my industry goes to them? The veil of the near horizon lifts, and reveals to this private individual the society in which he exists—1,200,000,000 human beings all looking hitherward with their daily tasks! The study of geography is preventive of crime in so far as it teaches the same lesson of social combination that we have already discussed.

Again, there is history as a common-school study. It is the study which looks toward the nation as an institution, for its individuals are nations. This is the one study that develops patriotism. Take away all knowledge of history, all knowledge of nations, all knowledge of the past and present of one's own nation, and there could be no patriotism; even the object of patriotism would not exist in the mind. The high and pure devotion of one's self to his country, the high and pure interest in all peoples on this planet—both these are cultivated by the study of history. The school teaches the pupil how to study history and where to find it.

There is study, more or less, of a purely scientific character carried on in the school. There is grammar, the science of the organization of language showing how reason reveals itself in its special creation, human speech. The framework of reason is logic, and logic is revealed in the laws of syntax and etymology. Self-knowledge of an intimate kind, therefore, is reached in the study of grammar. Inasmuch as language is not the product of individual industry, but a joint product of human society, it is clear enough, without analysis, that language studies in school all lead to an insight into human combination and tend, therefore, to the prevention of crime.

Doubtless the school alone is only a small part of education, but it is a very important part for the reason that it deals with conventionalities, technical means—instrumentalities shall we call them?—of human intercourse—in short, with the tools of human, spiritual combination.

Now any one or all of the educational agencies may fail absolutely to prevent crime. But social science does not find other recourse than to strive to make more efficient these agencies, improve the family nurture, improve the schools, the trades and vocations, the partisan politics, the Sunday school. All these instrumentalities are very crude, as we may easily see, in their present condition. The question that immediately concerns us in this paper is the improvement of common-school education as preventive of crime by making it more effective in reaching all the children of the community.

Undoubtedly compulsory education is a valuable means for this end. I do not see why the common form adopted is not sufficiently effective. Children under 10 years of age shall not be employed in any species of labor that takes them from school. Between 10 and 14 years, children shall not be employed in any industry that prevents them from receiving at least twenty weeks' schooling for each two years. So much education as this provides for will prove very efficient in training the average youth in correct ethical habits.

There will be special cases wherein parental education has failed, and there has happened a consequent premature hardening of the disposition of the child to such an extent that the school can not remedy it. Here we must pause a moment to call attention to the kindergarten as a very valuable instrumentality, especially in two directions very difficult to reach in common schools if neglected until the children are past 6 years of age. The kindergarten takes children at 4 years or even earlier, at the period when the child has begun to be interested in the outer world, as he catches glimpses of it beyond the family circle. The children of very poor parents are prone to neglect the education of the child at this age, and he grows up amid constant lessons in wickedness and vice. On the other hand, in families that have become suddenly rich the parents are so much engaged in readjusting themselves to their new social positions and in directing their business affairs that they leave their

precocious children to incompetent nurses and governesses, who pamper them into self-indulgent youth, destined to early ruin. The kindergarten, all of whose methods are based on true ideas of social combination, has proved very potent in saving both these classes of youth—the depraved of the proletariat and the depraved of the wealthy class.

It is clear, when we study the kindergarten and come to understand its methods of utilizing play, that healthy amusement among young people could be made educative of the social sense more largely than it is, and thus be another preventive of crime.

Industrial education in the form of the school, since the practical abolition of apprenticeship, is also important. The manual training school and the school-shop, modeled on the Russian or on the Swedish plan, ought to be established to a limited extent in all our cities, and made free, like the common schools. They give admirable instruction in wood-working and in metal-working. But when we reflect that the total number of laborers in metals, iron, steel, tin, copper, brass, etc., of all descriptions, counting 22 trades as given in our census, amount only to 585,493 persons, or about one in one hundred of our population, or three in one hundred of all persons actually engaged in gainful occupations, we see that it would be easy to overcrowd the metal industries and cause disappointment to youth whose parents had placed them in industrial schools with the idea that they were preparing to earn their living thereby.

Counting, in like manner, the laborers in the 25 trades of wood-working, we find an aggregate of 763,814 persons, or one and one-half persons in each hundred of the entire population, or say five in each hundred of the people earning their living by gainful occupations. The same danger of overcrowding these trades is apparent. The country is now producing more manufactures of wood and metal than are needed in all its markets, domestic and foreign, and yet it employs in those industries less than 3 per cent of the population and is needing a still smaller ratio on account of its constantly improving machinery.

Turning from this dismal view, one may see clearly that more and more labor is needed in ornamental industries—industries that can produce goods of artistic value. All education that trains the taste of the workman if a positive gain, and makes a place for workmen who will hold the world market firm and secure, and who will never be thrown out of employment on account of overproduction.

One cause of crime that should not escape our attention while we are discussing this question of education is the increasing growth of cities in our country, due to the invention of labor-saving machinery. The city furnishes a hiding-place for criminals who raid on the property of rural districts. There is a constant recruiting of wayward youth in country and town into organized gangs of thieves and burglars. No State legislature seems to have taken up this problem effectively. There ought to be a new form of police invented—a sort of detective force, which makes its business the systematic pursuit of thieves and burglars that raid on the rural districts. At present, left entirely unpunished, they thrive and grow numerous, educating into high criminals a large class of wayward youth.

Increasing urban growth for the most part furnishes us our social problems. Compulsory education in the forms of the common school, the kindergarten, the industrial art school, may furnish us the most valuable preventive agencies against crime.

PUBLIC SCHOOLS AS AFFECTING CRIME AND VICE.

[Extracts from an article by Benjamin Reece in the Popular Science Monthly for January, 1890.]

It is claimed, and almost universally allowed, that the instruction of our public schools serves to ennoble the emotions and to moderate the passions, to regenerate the viciously inclined, and to correct and subdue the tendency to crime. Devoutly as such a result is to be desired, the facts, unhappily, flatly contradict the theory, and,

unless the glaring inconsistencies are reconciled and contravening evidence is satisfactorily explained, the claim must be abandoned as unfounded.

At a session of the National Prison Congress held in Boston during 1888, Mr. Brooker, chairman of the board of directors of the South Carolina Penitentiary, having made the statement that of a thousand convicts in the State not more than fifty were whites, it was asked by a delegate, "What is the condition of the education of the colored people?" To this question Mr. Brooker made the following reply: "Before emancipation the colored people had no opportunity for education. When made suddenly free all negroes were illiterate and ignorant. Since that time a young generation has grown up, and of them a very considerable number are well educated. But it is a fearful fact that a large proportion of our prison population is of the educated class. This is so much the case that the idea has become prevalent that to educate a negro is to make him a rascal. But this idea is, of course, superficial, and does not find lodgment in the minds of thoughtful men. I am totally averse to it myself, and think that all reasonable means should be exerted toward their enlightenment and education. * * *" (Proceedings of the National Prison Association, 1888, p. 72.)

Here was the most astonishing fact that in South Carolina, which in 1880 had more than half of its population returned as illiterate, the educated negroes furnish a large proportion of its criminals, pressed upon a representative body of philanthropists, publicists, and statesmen, and it did not so much as provoke a comment, while the author of the statement boldly affirmed his unshaken faith in a theory the facts of which he had himself impugned. What deference should we pay to thought unless based upon correct observations, and of what utility are facts and experiences unless their teachings are heeded and their meaning properly interpreted?

In his Political Science, Woolsey tells us that "the fall of the Roman Empire was an effect of a moral ruin." Yet all will admit that Rome and the other civilizations of antiquity were richer and more learned in the time of their decay than during the period of their infancy and growth; but the moral correlative being wanting, they tottered to their fall.

Just look at the records of our mentally and morally deranged as exhibited in our statistics of insanity and crime and vice, and they alone are enough to cast a doubt upon the claim that a public-school education for our illiterates is sufficient to insure a decrease of mental and moral delinquency. For it remains to be explained why, in the decade ending with 1880, population having increased 30 per cent and illiteracy only 10 per cent, a relative decrease, the number of criminals during the same period presents the alarming increase of 82 per cent, while of insane persons there appears the enormous addition of 145[1] per cent.

Can it be possible that with greater educational facilities there is to be increased crime, and that every enlargement in the seating capacity of our schools is to be followed by a larger corresponding demand for insane accommodations and additional felons' cells? Perish the thought! Yet, if the instruction of our common schools subdues the tendency to crime, why is it that the ratio of prisoners,[2] being 1 in 3,442 inhabitants in 1850, rose to 1 in every 1,647 in 1860, 1 in 1,021 in 1870, and 1 in 837 in 1880; while, upon the authority of the Rev. S. W. Dicke, the amount of liquor consumed per capita was three times as great in 1883 as in 1840?

One naturally looks to the large and constant influx of foreign immigrants as a partial explanation of this growing disproportionate increase of crime; but the facts deny the hope, for the great increase is to be found among the native born. The Rev. F. H. Wines, who conducted this branch of the Tenth Census Report, says that, while in 1850 the ratio of foreign criminals to population was five times that of the

[1] It is but fair to state that this enormous increase of insanity has led the compiler to question the accuracy of the returns of insane persons made in 1870, yet it is admitted that, after making every allowance, the ratio of increase is out of all proportion to that of population. (See page 1660, Compendium of the Tenth Census.)

[2] Proceedings of the National Prison Congress, 1886, p. 134.

native born, in 1880 the ratio was only 2 to 1; and if we deduct the commitments for disorder and immorality, the ratio of foreign criminals is but little in excess of that for native whites. So clearly is this indicated by facts and figures that Mr. Wines arrives at the conclusion that "the foreign disregard for law shows itself far more in immorality and disorder than in dishonesty and violence."[1]

An examination of the Compendium of the Tenth Census of the United States discloses some novel and threatening facts. The illiterates of the United States comprise 17 per cent of the total population. The morally and mentally deranged, as shown by the number of criminal and insane persons, bear the ratio of 1 to every 332. The general average of illiteracy is exceeded by every one of the original slave States, with the exception of Missouri, but the average ratio of the mentally and morally unsound is only reached in the State of Maryland. South Carolina, which shows the highest percentage of illiterates, viz, 55.4 per cent, presents the lowest average of any State in the Union as regards insanity and crime, having but 1 delinquent in every 568 inhabitants as compared with 1 in every 167 in California, 1 in 205 in Massachusetts, and 1 in every 222 in the State of New York. With the single exception of the State of Maine, every Northern State east of Indiana has a larger ratio of insane and criminals than the average for the Union, while the States west of Ohio, those on the Pacific slope excepted, fall below the general average.

If we measure the extent of unrecorded vice by the proportion of saloons to population, the showing is no less remarkable. The Report of the Commissioner of Internal Revenue for the year 1887, page xxxiii, shows that, for the entire country during that year, a retail license for selling liquor was granted for every 329 inhabitants. Of the fifteen States showing more than the average number of illiterates, that ratio was only exceeded in the State of Louisiana, while the lowest average in the country was to be found in Mississippi, which, with 49.5 per cent of its inhabitants returned in 1880 as being illiterate, supported but 1 saloon for every 1,695 persons. Even the prohibition States of Maine and Kansas secured licenses for the sale of intoxicants at retail to an extent only equalled by four of the superilliterate States. The proportion of saloons to population throughout the fifteen superilliterate States is 1 for every 700 inhabitants, while of the other States California heads the list with 1 to every 99 persons, New Jersey coming next with 1 license to every 171 inhabitants, followed closely by New York, with 1 to every 179.

The table which follows presents some disquieting facts which should serve as a salutary warning to those who expect to find in mental stimulation an equivalent for moral growth and culture:

[Compiled from Compendium of Tenth Census and other official sources.]

	Illiterates 10 years of age and over (1880). *a*	Assessed valuation per capita (1880). *a*	Ratio of insane and criminal (1880). *a*	Ratio of saloons to population (1887). *b*
	Pr. cent.	*Pr. capita.*		
Fifteen illiterate States *c*	40.4	145	1 in 402	1 in 700
Northern States west of Ohio	7	297	1 in 379	1 in 308
Northern States east of Indiana	5.3	551	1 in 265	1 in 227
Average	17	340	1 in 332	1 in 329

a Computed from tables in Compendium of the Tenth Census.

b Retail licenses issued by the United States in 1887, taken from Report of Internal Revenue Commissioner; population for 1887 from World Almanac, 1888.

c Includes all States having a percentage of illiteracy above 17 per cent, the average for the entire country.

[1] Proceedings of the National Prison Association, 1888, p. 255.

The table unmistakably shows a greater per capita of wealth where the fewest illiterates are enumerated, but it no less clearly shows that this augmentation of riches has been accompanied by increased insanity and crime and more widespread vice.

But we need not confine ourselves to the general statistics of the United States, for the records of New York present similar conditions which can be analyzed more in detail. The annual report of the superintendent of the New York State prisons, 1886, records that the prisons of Auburn and Sing Sing contained 2,616 convicts; of these, 1,801 are credited with a common-school education, 373 are classed as being able to read and write, 19 are returned as collegiates, 10 as having received classical and 78 academic educations, 97 as being able to read only, and 238 as having no education. Is it not contrary to our most confident predictions and undoubted expectations that the common schools should furnish 83 per cent and the colleges and academies over 4 per cent of the inmates of Auburn and Sing Sing?[1]

When it is remembered that the detected illiterate generally finds his way to prison, while the highly educated or well-to-do are frequently saved by friends, who compound the felony to escape exposure and consequent family disgrace; that many are saved from conviction by the ability of counsel whose services are far beyond the means of illiterate poor, while still many others escape in voluntary exile to avoid imprisonment, it will be seen that even the figures given inadequately portray the extent of crime which, in strict justice, is properly chargeable to the educated classes. Of the prisoners of Auburn and Sing Sing it is further noted that 20 per cent were total abstainers from intoxicants, showing very clearly that a perfect mastery of self is by no means necessarily allied with an honest regard for the rights of property of others. * * *

Far from mental stimulation being essential to moral development, the most perfect order and deepest sense of justice are often found associated with the densest ignorance among the lowest races of humanity. Turn your attention to the Papuan Islanders,[2] the Veddahs,[3] the Dyaks of Borneo,[4] the Fuegians,[5] and other barbarous races which, in the absence of rulers or organized societies, with no learning, and but little acquaintance with even the rude arts of many primitive people, have developed the highest degree of tribal piety, integrity, chastity, and regard for covenants almost unknown to civilized man. The testimony of early travelers proves conclusively that intense poverty and deep ignorance are by no means incompatible with honesty, integrity, and virtue.

The table shows that where the extremes of poverty and wealth prevail, as in the

---

[1] The report for Clinton prison simply classified the prisoners received during the year, and it could not be included with Auburn and Sing Sing, which classify all inmates.

[2] "It is worthy of remark that these simple islanders, without hope of reward or fear of future punishment after death, live in such peace and brotherly love with one another, and that they recognize the right of property in the fullest sense of the word, without there being any authority among them other than the decision of their elders, according to the customs of their forefathers, which are held in the highest regard." (Earl Kolff's Voyages of the Dogma, p. 161.)

[3] "The Rock Veddahs are divided into small clans, or families, associated for relationship, who agree, partitioning the forests among themselves for hunting grounds, the limits of each family's possession being marked by streams, hills, rocks, or some well-known trees, and these conventional allotments are always honorably recognized and mutually preserved from violation. Each party has a headman, the most energetic senior of the tribe, but who exercises no authority except distributing at a particular season the honey captured by the members of the clan." (Tennant, II, p. 440.)

[4] "The Dyaks' minds are as healthy as their bodies; theft, brawling, and adultery are unknown to them." (Boyle's Borneo, p. 335.)

"The Dyaks are manly, hospitable, honest, kindly, and humane to a degree which might well shame ourselves." (Ibid, p. 215.)

[5] "Nothing like a chief could be made out of the Fuegians of Blunder Cove, nor did they seem to require one for the peace of their society, for their behavior one to another was most affectionate, and all property seemed to be possessed in common." (Weddell's Voyages toward the South Pole, p. 168.)

Eastern States, there is found a maximum of moral and mental derangement, as exhibited in insanity, crime, and vice. Where wealth is more evenly distributed, as in the Western States, there are noted less insanity and crime, but almost as high a ratio of saloons as in the East. In the Southern States, although having a low per capita of wealth, yet the mental and moral forces of development are nearly in adjustment with the material of environment; hence the average of crime and vice is shown by the table to be relatively low.

The Rev. F. H. Wines, statistician and philanthropist, who has made questions of crime and criminals the study of a lifetime, was selected by the authorities at Washington to compile the statistics bearing on delinquents in the Tenth Census, and after a careful study of the mass of figures returned, but few of which appear in the compendium, he makes this very remarkable statement concerning the facts collected and enumerated: "If a comparison is made between offenses against public morals and against public peace, the smallest amount of disorder and the largest amount of immorality, relatively, are found among the native whites; the most disorderly and least immorality among the negroes; and the foreigners occupy a middle ground between the two." (American Prisons in the Tenth Census, Proceedings of the National Prison Association for 1888, p. 268.) When it is realized that the native whites represent the better educated portion of our population and the negroes the more illiterate, while the foreigners are on an educational scale between the two, the significance of the statement can neither be gainsaid nor belittled.

IS CRIME INCREASING IN MASSACHUSETTS?[1]

By David C. Torrey.

The question which I shall endeavor to decide is not the technical question, whether the number of cases which are brought before the courts of justice are increasing from year to year, but the broader and more important question, whether there is an increase of crime in Massachusetts which indicates a decline in social order.

I use the word "crime" as meaning such violation of law as the civil courts punish when called upon to punish them; and by "increase of crime" I shall mean, not simply an increase of cases dealt with by the courts, but an increase of such cases as the courts might deal with if the cases were brought before them.

A complete study of the prison statistics returned to the Massachusetts legislature during the last forty years compels the admission that the courts are making, from year to year, an increasing number of commitments to prisons. I give below the commitments to all prisons in Massachusetts during those years since 1850 in which a State census was taken. That the tendency of crime during these years may be clearly seen, I give the population of the State and the number of people to each commitment.

Year.	Population.	Commitments.	Number of population to each commitment.
1850	994,514	8,761	113
1855	1,132,369	16,032	70
1860	1,231,066	11,764	104
1865	1,267,030	9,918	127
1870	1,457,351	16,600	87
1875	1,651,912	24,548	67
1880	1,783,085	17,053	103
1885	1,942,141	26,651	72

[1] Reprinted from Lend a Hand, January, 1890.

This table shows that the proportion of commitments to population varies much from year to year, and that during the course of the years selected there is a tendency to increase. Perhaps this increase can be best indicated by the average number of people to each commitment during the first half and the second half of the period. From 1850 to 1865 there was 1 commitment to 103 persons. From 1870 to 1885 there was 1 commitment to 82 persons, an increase of almost exactly 25 per cent.

If we stopped our inquiry here we should be made to acknowledge that crime is increasing. But the figures do not always tell the whole truth, and an examination behind them in this case reveals a very different state of affairs from that which the surface indicates. The form in which the reports have been made to the legislature enables us to divide the crimes for which commitments are made into two classes: The crimes more dangerous to society, like murder and burglary, and the crimes less dangerous, like drunkenness and disturbing the peace. To show clearly the movements in crime in the State, I make this division in two ways: First, by separating crimes against persons and property from crimes against public order; and, second, by separating the crimes other than intemperance from crimes of intemperance.

Owing to the form in which the statistics were returned to the State, I can not make the separation by the first plan cover a long series of years. This division was made in the returns for 1865, but was not in those for 1875. This division indicates well the changes in crime in recent years.

Year.	Commitments for crimes against—			Total commitments for crimes against persons and property.
	Persons.	Property.	Order and decency.	
1865	991	2,984	5,760	3,975
1870	1,808	3,289	11,290	5,097
1879	1,514	2,264	12,723	3,778
1880	1,674	2,105	13,274	3,779
1881	1,687	2,238	13,137	3,925
1882	1,695	2,318	18,852	4,013
1883	1,661	2,369	20,095	4,030
1884	1,834	2,666	22,239	4,500
1885	1,880	2,959	21,812	4,839
1886	1,771	2,478	21,209	4,249
1887	1,654	2,477	22,694	4,131

This table shows that the marked increase in commitments is confined to the less serious crimes—those against public order and decency. Before discussing this table at length, I present the division of crimes by the second plan, that of the crimes of intemperance seperated from all other crimes. Here I am able to compare the commitments for crimes with the population of the State through a wider range of years. In 1875 the gross commitments were returned, but no division by crimes was made. In commitments for intemperance are included commitments for drunkenness and as common drunkards.

Year.	Total commitments.	Commitments for intemperance.	Commitments for all crimes other than intemperance
1850	8,761	3,341	5,420
1855	16,032	8,221	7,811
1860	11,764	3,442	8,322
1865	9,918	4,302	5,616
1870	16,600	9,350	7,250
1875	24,548	.....	.....
1880	17,053	10,962	6,091
1885	26,651	18,701	7,950

As the previous division in Table No. 2 showed that the marked increase of commitments was for crimes against public order, this table shows that the marked increase is in commitments for intemperance. A comparison of the commitments with the population of the State in the years in which the commitments were made proves that the increase in commitments which I have shown in Table No. 1 is confined wholly to crimes against public order; and even that the commitments for all other crimes than intemperance, taken together, are not only not increasing, but show a marked decrease.

The following table shows the commitments in proportion to population for the more serious crimes during those years in which a comparison can be made with the population of the State:

Year.	Number of inhabitants to each commitment for crimes against—	
	Persons and property.	Public order and decency.
1865	318	219
1870	285	129
1875 *a*	.....	.....
1880	471	134
1885	403	89

a This division was not made in returns to the legislature.

It is seen that the average in 1865 and 1870 was 1 commitment for crime against persons or property for about each 301 inhabitants, while in 1880 and 1885 the average was 1 commitment to about 436 inhabitants. This indicates a decrease in the more serious crimes of 44 per cent.

Let us apply the same method of comparison with population to the commitments, as divided by our second plan, into those of intemperance and those for all other crimes. For our purpose only the ratio to population of commitments for crimes other than intemperance need be shown:

Year.	Commitments not for intemperance.	Ratio of commitment to population.
1850	5,420	1 to 183
1855	7,811	1 to 144
1860	8,322	1 to 147
1865	5,616	1 to 225
1870	7,250	1 to 201
1875	.....	.....
1880	6,091	1 to 280
1885	7,950	1 to 244

Here we find again that there has been a marked decrease in the commitments for all crimes other than intemperance, taken together, in proportion to the population of the State. From 1850 to 1865 the average of commitments was 1 to about 174 inhabitants; from 1870 to 1885 it was 1 commitment to about 241 inhabitants. Thus a decrease of 38 per cent is indicated in all crimes other than those of intemperance.

I have now shown, as conclusively as can be shown by figures, that the crimes more dangerous to social order are not increasing, but that, on the contrary, they are diminishing at a rapid rate; more than this, I have shown that all crimes taken together, other than intemperance, are decreasing at a rate almost as rapid. I can now confine my inquiry about the increase of crime in Massachusetts to the one crime of intemperance.

The question resolves itself to this: Is intemperance increasing? The number of commitments indicates that it is. The total number of commitments is increasing, the commitments for all crimes other than intemperance are not increasing; then the commitments for intemperance must be increasing.

I think, however, that it can be shown that the increase in commitments for intemperance does not, as in the case of more serious crimes, necessarily indicate an increase in crime, and also that this increase can be accounted for by changes in law and changes in public opinion.

The common opinion of intemperance as a crime is very different from the opinion of murder, or burglary, or even petty larceny. This is shown by the fact that while it is the exception that a person guilty of these other crimes escapes trial and conviction, comparatively few of the men who drink to excess are punished by the courts. Because of this difference in opinion of crimes the commitments for more serious crimes could not increase without an actual increase of those crimes, but there is a chance for an increase of commitments for intemperance without an actual increase of intemperance.

Changes in the law affect the number of commitments for intemperance. In 1874, under a prohibitory law, the convictions for drunkenness in the State numbered 23,981; in 1877, under local-option law, the number fell to 17,862. In Boston alone in 1874 the convictions numbered 11,428, but in 1877, with 2,834 licenses, the convictions for drunkenness were only 7,539.

The number of commitments for intemperance depends also upon public opinion. There is a large and vaguely defined field of intemperance from which increasing commitments may come with increasing intemperance. The number of men who are intemperate and escape arrest is so large that an increase of commitments for a long series of years is not incompatible with an actual decrease of intemperance. Public opinion decides the point at which the drinking man is no longer sober, but becomes a subject for commitment. It makes the law and supports the policeman who makes the arrest and the court which commits the drunken man. It is reasonable to believe that continual agitation has aroused public sentiment against intemperance and so affected the laws and the courts that an increase of commitments for intemperance has taken place without a corresponding increase of crime.

The single change which is made when the new legislation of any year makes a drunkard pay a fine where he would have been imprisoned under the old law, or, on the other hand, imprisons him where formerly he would have paid a fine, is not enough to change entirely the proportions of "commitments" to the population. But these changes do not, of course, affect the real proportion of drunkenness.

From the facts I have presented I think the following conclusions can be drawn:

The commitments by the courts of Massachusetts are increasing.

The more serious crimes—those against persons and property—are decreasing rapidly.

In all crimes other than intemperance, taken together, there is also a rapid decrease.

The increased commitments for intemperance do not necessarily indicate an actual increase of intemperance, for they may depend upon changes of law and changes in public opinion.

On these grounds I think it safe to deny that there is an increase of crime in Massachusetts which threatens social order, or which indicates that, in spite of the educational, philanthropic, and religious effort in the State, its civilization is declining.

EDUCATION AND CRIME.

[From an article by Rev. A. W. Gould, in the Popular Science Monthly for June, 1890.]

In the January number of the Popular Science Monthly there was an article by Benjamin Reece on "Public schools as affecting crime and vice." * * * He thinks that the United States census proves that the increase of prisoners in our prisons is the result of the increase of pupils in our schools. And as I find that these "novel and threatening facts" have aroused some apprehension among those interested in our public school system, it seems to me desirable that some one should point out the figures in our census which seriously modify, if not wholly destroy, Mr. Reece's alarming inference that our public schools are nurseries of crime.

Figures, like Bible texts, may not lie, but they can be made to prove almost anything; and it would not be difficult to establish by our census figures the exact opposite of Mr. Reece's conclusion, if we may be allowed to use the same reasoning that he does. For his statistics only show that crime and education are both increasing. But that does not prove that the increase in education is the cause of the increase in crime. Diseases have increased during the past half century and so has medical skill; but that does not prove that the one increase was caused by the other. Perhaps the increase of diseases would have been far greater had it not been for the increase in the power to cope with them. So education may, for aught Mr. Reece's statistics prove, be the only thing that prevents a still more rapid growth in crime.

The statistics of our last report show that the most enormous strides in developing a criminal class have been taken in those States where ignorance, and not education, most abounds. If we take the 10 States that have the largest number of citizens unable to write we shall find that from 1850 to 1880 the ratio of their prisoners has increased over fivefold; from 1 in 5,400 to 1 in 970; from 1860 to 1880 it has grown threefold, or from 1 in 3,600 to 1 in 970; while the 10 States that have the fewest citizens unable to write have swelled the proportion of their criminals only threefold for the longer period and only 50 per cent for the shorter, the figures being, for 1850, 1 in 3,100; for 1860, 1 in 1,500, and for 1880, 1 in 1,050. So that in the States of greatest illiteracy the relative increase of criminals during the last twenty years has been six times as rapid as in the States of least illiteracy. And if we ask in what classes the most ignorance is to be found, our census tells us that the foreign born are 50 per cent more illiterate than the natives, and the blacks seven times as illiterate as the whites; and our census tells us further that the foreign born furnish 100 per cent more than their share of criminals, and the blacks 150 per cent more than their share

Do not these facts prove that the advance in crime is the result, not of education, but of the absence of education? We might think so if figures had not that reprehensible habit of being all things to all men. Therefore, we may find upon a careful examination that there is some other cause than ignorance for this rapid growth of our prison population in certain parts of our country. If I am not mistaken, there are several such causes, some of them entirely independent of the change in the illiteracy of the nation. One of them lies in the transition from an unsettled condition to a settled condition on our constantly advancing frontiers; another is the change from slavery in the South; and a third is the gradual elevation of the standard of human conduct, making crimes of actions that had hardly been lawful escapades in earlier times.

The first cause comes out clearly if we compare the 10 States that were on the frontier in 1850 with 10 older States—the New England and Middle States, for instance. In the former the ratio of criminals has been multiplied four or five times during the past thirty years, while in the latter it has only been doubled, rising

from 244 to 1,148 prisoners in a million inhabitants on the frontier and from 450 to 1,074 on the seaboard. Of course, it is obvious that in a new country there will be a certain amount of lawless conduct unpunished at first before sheriffs, courts, and jails are in running order. But the rapid increase in the proportion of criminals as the State grows older does not mean more crime; it often means less. The evil-doers are arrested and sentenced, and so get into our prisons and our census; and then we are told that crime is increasing. Kansas had only 289 prisoners to each million of inhabitants in the decade before the rebellion, while it had 1,300 to the same number in the last report, yet everyone knows that this State was a far more dangerous place at the earlier time than now. Colorado had only 477 offenders per million at its first census, in 1870, but in 1880 it reported 1,950, a gain of nearly fivefold in a single decade; while on the other hand the older States, like New Hampshire and Connecticut, showed an actual decrease in percentage during these periods.

But the transition from slavery to freedom was a far more efficient cause in swelling the ratio of this class. If we compare 10 of the original slave States with our 10 New England and Middle States, we shall find the increase in crime in the slave States has been three or four times as great as in the free States. The former had for each million of population only 161 criminals in 1850 and 240 the next decade; but in 1870 they had 829 and in 1880 1,166. This was an increase of sevenfold, while the free States only a little more than doubled their criminal element.

That this was the result of the emancipation is seen in many ways. The sudden leap shows it between the decade before and after the war, or between 1860 and 1880, if 1870 be thought too near the contest to be a fair test. Those twenty years gave a gain of fivefold in the proportion of prisoners of the Southern States, while the Northern States showed a gain of less than 40 per cent. Single instances reveal it still more clearly. Mississippi sprang from 67 to 1,158 criminals in a million inhabitants, and other States of the South show nearly as great a gain; while New York and Massachusetts actually declined in their criminal percentage during that time, as did some other Northern States.

The explanation is obvious. Before the war the negroes were slaves, and nearly all their offenses were punished by their masters, so that the State had no occasion to imprison them. But now from five to ten times as many blacks as whites, in proportion to their numbers, are found in the jails or chain gangs of the South. And when we remember that the greatest illiteracy is to be found in the former slave States, we see that the increase of the criminal ratio in the South may not be due wholly to ignorance in spite of census figures. The ignorance and crime were both there before the criminals were locked up and counted in the census.

One might indeed claim that the lessened ignorance had much to do with revealing this criminal element and imprisoning it. And this brings us to our third cause of the increased ratio of crime. The gradual elevation in the standard of life, and the intervention of the courts in cases which were formerly decided by the bullet or the knife, occasions a rapid increase in the number of official criminals.

Drunkenness, I suppose, was not a crime anywhere in our land half a century ago. Now drunkenness and disorderly conduct form one-tenth of all the crime of the country. And, naturally, the restraint of these offenders will be most complete in the most orderly and educated parts of our land. Accordingly, we find that the 10 educated States show a proportion of imprisonments for these offenses tenfold greater than the uneducated States do. The one had 2,865 and the other only 198 in a population three-fourths as large. And the educated States record three times as many prisoners as the uneducated States for assault and battery and simple assault. If anyone wishes to prove from the census that education is a failure, he could find no stronger facts than these—a tenfold larger share of drunkenness and a threefold larger share of violence in the States where men can read and write than in the States where they can not.

But, of course, no one thinks that the South is more quiet, orderly, and innocent than the North. No one believes that there was not a single case of drunkenness or disorder in all Alabama and Arkansas in 1880, and only a score of cases of assault, while Massachusetts, with a less population, had 597 cases of drunkenness and disorder and 337 cases of assault; yet this is what the census tells us. The natural interpretation must be that drunkenness and violence are not punished by imprisonment in certain States, while they are in others, and the States that punish least are most illiterate. This interpretation is amply confirmed by the census itself. Though education shows three times the violence that ignorance does, yet ignorance perpetrates three times as many murders as education, and that, too, while two or three of the educated States imprison the murderer for life, and so swell the number. * * *

One of the results of raising the mass to a higher moral level is that individuals here and there drop out, and the higher we are raised the more will drop, and this will continue until those incapable of self-control have disappeared. It is only among savages—where there is no chance to drop, because all are on the ground—that we find no criminals or paupers. And Mr. Reece actually sighs for the "perfect order" found associated with the "densest ignorance" among the cave-dwelling Veddahs and other tribes. Possibly we might attain this "perfect order" if we would imitate the savages in leading a savage life, but that would be a pretty dear price to pay for such order as savages secure.

Most of us prefer civilization with all its drawbacks. We prefer to see our country settled, though we know that jails will be built and occupied. The very convenience of city life is paid for by added crime. The disorder that might be allowed in a wilderness among savages can not be tolerated in a crowded metropolis among civilized people. The ten States that have the largest cities punish 50 per cent more violence and 60 per cent more drunkenness than their share, though they have 20 per cent less than their proportion of murders. * * *

I think, then, we need not fear that universal education is to bring us universal crime. We want more and better education. Of course, it is not the mere ability to read and write that is to save a man from prison. He must learn self-control and acquire a loftier standard of life. Mr. Reece dwells much upon the fact that a large percentage of our criminals can read and write. But that does not prove that their education made them criminals. I dare say a still larger percentage of them can see, yet it was not their ability to see that made them criminals. The densest ignorance may, like total blindness, keep men from crime; but we do not propose to put out our eyes of either mind or body. We will have men learn to see better, morally and physically. It is imperfect education that has brought men to prison, as we see from the constant relation of our criminal class to our illiterate classes. They may, indeed, have some sort of an education, but the vast majority of them are ignorant themselves, and have ignorant kindred and associates; and to be ignorant amid the civilization of to-day is to be jealous and bitter and rebellious.

The very fact that Mr. Reece cites to prove his thesis, that ignorance is innocence and knowledge crime, disproves it most completely. South Carolina, he says, has the highest percentage of illiteracy and the lowest of crime; but if he had taken one glance below the surface, he would have seen a fact far more "novel and threatening" than any he discovered. Out of the 626 criminals of South Carolina, 570 are black and only 56 are white. Why are there ten times as many blacks as whites in jail, when they constitute only three-fifths of the population? The only answer the census gives is in the fact that they are three times as illiterate as the whites. So that the very State summoned to prove that ignorance is exception from crime has ten-elevenths of its criminals from the most ignorant class in the country. But perhaps Mr. Reece thinks that their ignorance is not quite dense enough, as one in four can still write. They certainly have not yet reached the point where ignorance is bliss.

SCHOOL STATISTICS AND MORALS.[1]

By W. T. Harris, United States Commissioner of Education.

The question of the relation which school education bears to morals is a very old one, but it is always coming up again in some new form; and inasmuch as it is always profitable to inquire how we may make the school more effective in the direction of moral training, it is wise to have the question in some shape on every new programme of this association of superintendents. Morals include a wide range of virtues, on the one hand bordering on the province of religion, and even overlapping it in the case of such traits of character as hope, faith, and charity—what the church calls celestial virtues to distinguish them from the secular virtues of prudence, fortitude, temperance, and justice.

All kinds of well-wishing and well-doing toward our fellow-men come under divine charity or loving kindness. Under faith as a virtue come all those mental convictions which hold us to the theory of the supremacy of good in the universe, and under hope, as the third of the religious virtues, come all such acts or endeavors as we make on the side of the supreme good. Faith is the intellectual virtue and hope is the virtue of the will, while charity is the virtue of both intellect and will.

The lack of these celestial virtues produces what is called crime, because it sets the intellect and will and the heart against one's fellow-men—that is to say, against the social whole.

Very justly, then, do theologians claim that religious education in this broad sense is the foundation of the institutions of civilization. But it does not necessarily follow that the school should be an appanage of the church, or that anything but secular education should be attempted in it. This will depend upon the further question, whether the secular virtues and the secular work of the school are a real auxiliary to the good work of the church. If the habits taught in the school reenforce the spirit of kindness and mutual helpfulness toward one's fellows, if the intellectual studies aid in the spread of Christian doctrines, then the secular school has a moral tendency, although it does not take up any direct functions of the church.

I think that the most scientific student of social science will admit that the school is no substitute for the church, and that a nation may possibly exist without a school, but that no nation can exist without a church. Even the savage tribes, with their rudimental civilization, have the rudiments of a church, and it occupies a far greater place in savage life than it does in the most advanced civilization. Religion dictates to the Indians of the pueblos what figures they shall weave into their blankets and how they shall plant and harvest their corn. But the religion of the highest civilization permits and encourages the conquest of nature by science and art, and separates, one after the other, the cardinal institutions—the family, civil society, and the state—from the direct control of the church and emancipates them from its authority. Thus, Christianity is forever narrowing the circle of superstition and increasing the realm of enlightenment.

Right here, however, comes in the first appeal to statistics, and the first attack and defense of the school on the line of moral influence. It is supposed, on the one hand, that purely secular instruction in ideas and habits must be antireligious, and consequently tend toward vice and crime. On the other hand, it is claimed that purely secular instruction reenforces religion and exerts an influence repressive of vice and crime, although it does not include any theologic teaching. Statistics are collated to show that the majority of criminals in our jails have attended school for a longer or shorter period. Statistics are likewise quoted to show that those States which have the oldest and most efficient school systems have the largest number of

[1] Reprint from Proceedings of the National Educational Association of paper read before the Department of Superintendence at Boston, February 21, 1893.

criminals in their jails and State prisons. Assertions are made that education merely changes the character of the crime—for example, from robbery and theft, the crimes of the illiterate, to forgery and embezzlement or breach of trust, which are the crimes of those who have had school education. The returns of prisons and jails have been often studied with a view to get the facts in these particulars. Most teachers are familiar with the collation of statistics made on the census returns of 1870 by E. D. Mansfield and published in General Eaton's Report of the Bureau of Education for 1872. The returns from prisons and jails of 17 States, 14 of which were Western or Middle States, gave an aggregate of 110,538 prisoners, of whom 27,581, or almost exactly 25 per cent, were illiterate or not able to write.

The fact that three-quarters of all the prisoners could read and write and had had some schooling looked serious enough to challenge the good influence claimed for the schools. If school education is adverse to crime, why should not the statistics show that a majority of the prisoners are illiterate?

At this point the subject was taken up by those who understood arithmetic, and the question was modified so as to ask whether a given number of illiterates in the population furnished as many criminals as the same number of persons who could read and write. Put in this shape the answer was intelligible.

The illiteracy of the population in the seventeen States which furnished the 25 per cent of illiterate criminals was about 4 per cent, according to the census of 1870. This 4 per cent of the population furnished 25 per cent of the criminals, and the 96 per cent who could read and write furnished only 75 per cent. If 1 per cent of the illiterates had furnished only 1 per cent of the criminals it would appear that education made no difference in regard to crime. But the illiterates furnished more than six times their quota, while those who could read and write furnished one-fifth less than their quota, and the ratio of the two was 1 to 8. A thousand illiterates on an average furnished eight times as many prisoners as the same number who could read and write.

This result worked out with much uniformity where the same degree of accuracy in keeping statistics prevailed. The very small quotas of illiterates in Iowa, Kansas, and Minnesota gave more than eight times their share of criminals, while the three Southern States included in the seventeen were reported as having 22 per cent of illiterates in the population and as having 50 per cent of illiterate criminals, thus showing the illiterates to have five and one-third times their proper share of criminals.

Within the past ten years many of the jails and reformatories have published comparative tables, showing results for a term of years, during which accurate records have been kept. These are, of course, more valuable than the returns for any single year, because inequalities and unusual conditions are eliminated. In 1887, for instance, the jail at Detroit gave a summary for twenty-five years, showing an aggregate of 40,338 committals, of whom 28,652 could read and write and 11,686 could not write. This gives eight times the quota of criminals to the illiterates, because in the total population of the State there were less than 5 per cent of illiterates.

To be mentioned as foremost among institutions keeping and publishing accurate and discriminating records in these matters are the Illinois Penitentiary at Joliet, the Elmira Reformatory of New York, the New York Juvenile Asylum, and the Eastern Penitentiary of Pennsylvania.

The main point in the interpretation of criminal statistics is to consider the ratio between the number of criminals furnished by a given number of illiterates as compared with a like number who can read and write. We must consider not only the numerators, but also the denominators of our fractions in order to get at the true value.

But there are other important items which some future census taker will give us; for example, the number of persons who can read and write but who are so poorly equipped as to be very ignorant. In the statistics taken in the better class of our

jails and prisons a good classification of prisoners prevails. In 1870 the illiterate and the very deficient amounted to 60 per cent of the prisoners according to the returns from New York and Pennsylvania; to 50 per cent in those from Minnesota, Iowa, Kansas, and California; to 75 per cent in those from Ohio, Indiana, Illinois, Michigan, and Wisconsin; to 85 per cent in those of Maryland, Kentucky, and South Carolina.

Many keep careful statistics in regard to previous condition of industry, the character of parents, the time of leaving home, the state of health. A large proportion of criminals were orphans or have left home at a tender age. Many have been brought up by criminal parents; very many have never learned how to work at an honest and honorable occupation.

The question of the prevention and cure of crime is a very complicated one, having many cooperative causes besides that of defect of schooling. But that schooling is a very powerful influence is made probable by these statistics, and it is made certain by considering its nature.

Stated in a word, every school demands good behavior, and most teachers succeed in securing it. Good behavior means respect for the rights of others and regularity, punctuality, self-restraint, and industry at mastering the thought, or at least memorizing the words, of learned and scientific men. It is this requirement of good behavior that secures the moral influence of the school. It is questionable whether set moral lessons produce the desired effect, but obedience to the rules of good order insures moral habits.

This, of course, develops power of self-control. It gives power of inhibiting mere natural impulses and passions and of choosing higher motives. Even selfish motives become purified as they become more general in their scope and bearing, and a perfectly wise selfishness would adopt the golden rule.

To those who have objected to secular education as tending to fill our jails with educated criminals, the defenders of the schools have pointed significantly to the statistics of religious education among criminals which are beginning to be kept in a great number of jails and prisons. For instance, in the Detroit jail, in twenty-five years, there were reported 37,089 out of 40,838 as having religious training, against 2,249 who had none. Of the religious influences, 15 had been under Mormon training, 69 under Jewish, and the remaining 37,000 about equally under Protestant and Roman Catholic training.

In the Elmira Reformatory, in twelve years, those reported as having no religious training were only 7 per cent; with Hebrew training, 5 per cent; with Protestant, 42 per cent, and with Catholic, 46 per cent.

In the reports from 200 jails in the United States, with about 55,000 prisoners last year (1892), in reply to an inquiry made by the Bureau of Education, over one-half reported religious training of prisoners; 10,376 with none; 9,934 with Protestant; 163 with Jewish; 9,115 with Catholic training.

I quote these facts to show how statistics may mislead a person who does not consider the qualitative as well as the quantitative side.

It would be preposterous to think that the training of the church or the Sunday school could tend toward the production of criminals. The doctrine of self-sacrifice for others, the example of the Son of God who suffered, the perfect for the imperfect; no one can conceive a more powerful lesson to distrain the youth from a criminal career. The Jewish instruction in the Ten Commandments would produce righteousness instead of crime. And yet the neophyte in statistics would say that the 92 per cent of criminals in Detroit who had received religious instruction made a bad showing for religious education. But he would say this only because he is a neophyte and omitted his denominator, like the bad arithmeticians who have been decrying public education in the magazines and reviews and comparing numerators without a glance at their denominators.

The religious statistics would read when the denominators are applied somewhat as follows: The 92 per cent of criminals who have had some religious instruction have been furnished by the 98 or 99 per cent of the whole population who have been under religious instruction, while the 8 per cent of criminals without previous religious teaching represent the 1 or 2 per cent of their class in Michigan. And none of the criminals came there through religious teaching, but because they neglected its counsels.

The attack on school education as increasing the number of convicted criminals—an increase proved by the returns from the different States—has brought forward a new phase of the question.

Educators will remember the brilliant attack led by Richard Grant White, some years ago, in the North American Review, and recently an article in the Popular Science Monthly, by Mr. Reece. These have been replied to, the former by Dr. Philbrick, in the North American Review, and by Prof. B. F. Tweed, in a valuable pamphlet. That of Mr. Reece was well answered by Mr. H. H. Clayton, who quoted the interesting analysis of criminal records in Massachusetts, published by Mr. David C. Torrey, in Lend a Hand for January, 1890.

Massachusetts, it was said, committed to its jails and prisons only 8,761 persons in 1850, while in 1885 it committed 26,651, or nearly three times as many. In 1850 only 1 person to 113 inhabitants; in 1885, 1 to 72. This evidently demanded a qualitative inquiry. What crimes are on the increase? Mr. Torrey classified them, first, under two heads, and found that the crimes against person and property were, on an average, from 1865 to 1870, 1 to 301 inhabitants, while from 1880 to 1885 they were 1 to 436, thus showing a decrease in serious crimes of 44 per cent. The second heading was commitments for crimes against order and decency, and these had increased largely.

Investigation further into these crimes against order and decency, Mr. Torrey found that they were mostly cases of drunkenness. The commitments for drunkenness in 1850 were only 3,341, while in 1885 they had risen to 18,701. The commitments for all other crimes than drunkenness in 1850 amounted to 1 for 183 inhabitants, and in 1885 to only 1 for 244 inhabitants. The average from 1850 to 1865 was 1 to 174 inhabitants, while the average from 1870 to 1885 was 1 to 241 inhabitants, for other crimes than drunkenness.

This showing completely turned the tables on that class of sensational or emotional writers who deal with what I call hysterical statistics. Person and property have become more safe in Massachusetts. Between 1865 and 1885 commitments for crimes against them decreased 44 per cent, allowing for increase of population. The decrease was greatest in crimes against property, but there was a decided decrease of crimes against person. But while person and property have become safer in twenty-five years, drunkenness is not nearly so safe; the prisons and jails are crowded with intemperate people, who were formerly allowed to go unmolested through the streets and country roads.

The fact that person and property have become more secure on the whole is very significant, when we consider the fact that the numerous cities of Massachusetts afford hiding places for burglars who raid on the small villages or the rural part of the State by night and escape to the city by railroad before morning. Any species of crime that goes unpunished tends to increase and to multiply criminals. Hence rural districts in the vicinity of the large cities of the Middle and Eastern States suffer more from this species of marauding than any other portion of the United States, not even excepting the borderland.

Of the secular virtues, justice is particularly concerned in this matter of crime. It has two phases, honesty and truth speaking, that are particularly cultivated in good schools. Temperance is a virtue which the school helps to some extent. Fortitude is developed by self-restraint in the school. Prudence or providence is the special

virtue of thrift, and the school nurtures this by increasing intelligence and skill in productive industry.

On the question of the promotion of these virtues by the school, I desire to cite the statistics of thrift in favor of the State that gives the largest amount of schooling to each inhabitant.

It is surprising to the person who has not become familiar with the facts to learn that the total number of years' schooling that each person on an average is getting in the United States is only four and three-tenths, nearly four years of this being furnished by public and less than six-tenths years by private schools. But the amount that Massachusetts is giving is six years and eighty-six hundredths, or two and one-half years more than the general average. There are only five States that give over six years on an average to their whole population. These are, first, Massachusetts, next New York, third Connecticut, fourth Ohio, fifth Rhode Island. The average for the whole nation is about equal to the primary school course of four years.

I quote these statistics to point out a connection between education and industry.

The total production of the labor of the people of the United States for 1880 was about 40 cents apiece per day for each man, woman, and child; but the production of Massachusetts, with its average of seven years of schooling for each inhabitant, was nearly double that of the average for each inhabitant of the whole nation. I have made on different bases three estimates, using the data given by Col. C. D. Wright in his census of the State for 1885. The lowest estimate gives 68 per cent more than the national average, the second 84 per cent, the third and best one exactly 100 per cent. The population of Massachusetts is 4 per cent and its production is 8 per cent of that of the whole nation. Who that looks at modern productions of industry and considers how much of it is due to machinery, and considers further the dependence of machinery for its management on alert and educated intelligence, can fail to see the relation of the schools of Massachusetts to its phenomenal production of the items of wealth?

The virtue of prudence or productive industry insures the existence of other virtues, such as temperance and honesty. For the fact that the people of a State have arrived at the stage of political conscience that they attack not only the crime, but also its source in such vice as intemperance, implies an advance also in regard to many virtues. And can not the well-kept schools claim a large share in producing these favorable moral conditions?

THE CURSE IN EDUCATION.

[From an article by Rebecca Harding Davis in the North American Review for May, 1899.]

The most urgent of rules—the one in which the American puts absolute faith—is "Educate; send every boy and girl to school."

It never occurs to the American that there can be a mistake or room for hesitancy here. * * * Educate a man, he says; teach him mathematics, chemistry, or what not, and he can take care of himself in the universe. It is this unspoken creed that has made the schoolhouse a fetish in the United States. Whether it stands in a village in New England, or in a Florida swamp, or in an Indian reservation, we all believe that a life-giving ichor goes out of it which will conquer not only ignorance, but poverty and crime.

This idea came naturally enough to Uncle Sam when he found his gates besieged by hordes of ignorant Irish, Germans, Russians, Huns, and Italians, and within his gates other hordes of ignorant negroes and Indians. Their ignorance seemed to him the deadly disease which would destroy the nation. Cure that by a certain amount

of book learning, and the American would be the typical intelligent and moral citizen—a model for the world.

Hence the public school.

Has the public school done its work? Has education been always an unmixed blessing to America and Americans?

This question can not be answered so easily and positively as loyal sons of the Republic may suppose.

Two or three facts which come up in my memory seem to me to have a bearing on it.

First. On the table before me lies the annual report for 1898 of the inspectors of the Eastern Penitentiary in Pennsylvania. Here is one item: Ninety-one convicts who were in the prison last year had served one or more terms before. Of these hardened offenders only nine were unable to read and write. Of eight no record had been kept, but as the majority of them were forgers and counterfeiters they had evidently received some mental training. The remaining seventy-four were all educated, having attended school from two to nine years.

Another fact: Three years after the opening of free schools in London a marked increase was noticed in the number of juvenile offenders in the city prisons and reformatories. There was, too, a change in the kind of crimes committed by them. The number of boys and young men convicted of forgery, grand larceny, and intricate swindling schemes was more than doubled, while the number of sneak thieves, drunkards, and pickpockets was lessened by one-half. As years passed the proportion of educated criminals largely increased.

"Are we to understand, then," demanded a zealous humanitarian in Parliament, "that our graded schools are breeding houses of crime?"

But this was too pessimistic a view. Education did not breed crime in the pupils; education only gave crime tools to use. The three R's never begot a desire in the mind of a boy to work harm to his fellows, but finding the desire there already they taught him to forge a note instead of picking a pocket. Without education he tramped barefoot in the mire of the broad road that leads downward; with it he drove in a chariot, but on the self same road and to the same dark end.

Again, about fifteen years ago, I was in a lonely corner of Louisiana—a district of pale green prairies sloping down to the Gulf, dotted with the half-cultivated farms of the French Acadians. There they had been since they left Acadia years before. An isolated, separate clan, they retained the character, the handicrafts, and the bits of homely, useful knowledge which they brought with them, and also the same utter ignorance of the outer world. Very few of them could read or write. The men tilled the fields on the shores of the black bayous which crept lazily through banks of purple and yellow fleurs-de-lis, and the women in their cabins wove the soft, gay cotton stuffs in which they all were clad. They had no railways, no schoolhouses, no bosses with schemes for making big fortunes, no politics, and no newspapers. For years there had not been a case from among them in the parish court of theft, or adultery, or murder. They worked enough to keep them from want. They went to mass in the morning and to a dance at night. They were faithful husbands, loyal friends, tender mothers, single-minded, honest, merry folk. What more would you have?

When I went away from this Attakapas country and looked back at the great, dull green plain rolling down to the sea, with its pleasant farms and snug little homesteads gay with flowers, soft-floating gray mists now and then clouding the sunshine, it seemed the very land of peace. Surely its name should be Arcadia, not Acadie.

A year later I heard a philanthropic Northern lecturer descant on the ignorance of this people, and beg for aid to "send the schoolmaster among them, to open the way for railways, business, and civilization."

Would not any intelligent American question seriously whether these people would be elevated or lowered in the actual scale of being by these things? * * *

A still more tragic instance is the negro, who, as soon as he was freed, was taken out of the cabin of the slave field hand, not to be taught to read his Bible and earn his bread as a skilled mechanic, but to study the higher mathematics and Plato, French and German, medicine and law; and then, with contempt and insult, was denied the chance to use his knowledge.

What, then, is wrong? Too much education?

No. No sane man can doubt that to educate a human being so as to develop his individual capacity and to fit him for his especial place in life is the best thing we can do for him. It is a gift to him from his fellow-men, second only to that of life. But it must be given with wisdom and discrimination. * * *

Into that aforesaid schoolhouse, of which we boast with such fervor, are going to-day countless legions of little Pats and Jans and Sambos—boys with a myriad differing capacities, tendencies, and destinies. And each is crammed with the same dose of unassimilated facts—the alphabets of a dozen sciences which he never learns to put together into an intelligible word. Nothing more cruel and ridiculous was ever done in the world. It is the old story of the boys of Dotheboy's Hall, who were ranged into a row while Mrs. Squeers ladled into each gaping mouth the same dose of treacle and sulphur. * * *

Of course, we all know the secret reason which prompts this American system of education. Every child must be prepared for any possible position. The boy who will end his days behind the counter of a village store, and who has no ambition nor qualification to do other work, must have his smattering of Greek and philosophy, because he may some day be Senator or President. The girl from X——, who would be fitted for a full, happy life by a course in dressmaking or cookery and arithmetic, studies trigonometry and art. May she not, some day, be the first lady of the land? Dull, good young women by the tens of thousands, meant by nature to brood over homes and to mother children, and to teach them truth and honor and the love of God, grapple with the Semitic tongues or biology, with the hope that they will be club women or scholars, and train their sons for college.

It is, as we all know, the chance for every man that constitutes the true greatness of America. But it is this chance also which is at the bottom of our discontent, of our vulgar pretension, of our intolerable rudeness, and of the false values which we are apt to place upon the things of life. Perhaps the falsest value is that which we set on mere book learning. Without religion, it only qualifies the thief to be more expert in his thieving. If it is not assimilated into a man's life, and made a part of his everyday work, it becomes a deadly alien weight on both.

When will Americans see that there is no blessing like the education which we can use, but that the education which we can not use is a curse?

ERRONEOUS INTERPRETATION OF PRISON STATISTICS.

[Interview with the United States Commissioner of Education, reprinted from the Brooklyn (N. Y.) Eagle, October 8, 1899.]

Much comment has been occasioned by an article in a recent number of the North American Review, written by Rebecca Harding Davis, in which she makes some sharp and caustic remarks about the relations of education and crime. The writer takes a very doleful view of the matter and by reference to the number of persons in jail able to read and write attempts to prove that education has served to increase the amount of crime. She even goes so far as to intimate that the graded schools are breeding places for crime and explains the large number of old maids in New England and other portions of the country as the natural result of their disinclina-

tion to marry men of moderate means after having received an academic course of instruction.

The article is a forceful one and has caused widespread notice and criticism. While many people disagree with Mrs. Davis in her gloomy conclusions, no facts have been produced to disprove her contentions. Commissioner of Education Harris, however, is prepared to take issue with her, and in an interview with the Eagle correspondent to-day he presented an array of arguments and statistics on the opposite side. He believes that Mrs. Davis has made her assertions without a fair and full consideration of all the features of the case, and is not willing to admit that education helps to increase the total number of pickpockets, forgers, or other criminals. When Commissioner Harris was asked to-day what he had to say of the statement of Mrs. Davis that our graded schools are breeding houses of crime, he replied:

"If the statistics on both sides of this question are considered, I think most people will believe our schools do not swell the number of criminals of the country, but, on the contrary, exert just the opposite tendency. Communities that send a very large part of their population into schools have a higher ideal as to what is considered lawful and decent behavior in public. They are not content with punishing crimes against person and property, but often arrest persons for drunkenness and other vices. There was a time in Boston when a person seen in the streets smoking a cigar would be liable to arrest by a policeman. A multitude of penalties on the statute books, such as arrest for plucking a flower on the public common or crossing the grass from one gravel walk to another, increase the number of arrests every year, but do not necessarily imply an increase of serious crime. Counting the persons in jail in the United States, it is found that the quota of the illiterate is nearly, or quite, eight times as much as the quota from an equal number of persons who can read and write. For instance, the statistics of the Detroit jail for its first twenty-five years show 40,338 committals, of whom 11,686 could not write. In the total population of the State less than 5 per cent were illiterates. Five per cent, therefore, furnished 11,686 committals and the other 95 per cent of the population furnished 28,652. In other words, the illiterates furnished eight times their quota of criminals for the jail. The report of the Detroit jail for 1887 contains the statistics on this subject."

"How about the statement of Mrs. Davis that the number of juvenile offenders in London was greatly increased after the establishment of the London free schools in 1870?"

"I have before me," replied Commissioner Harris, "two articles on this subject, one in the London School Board Chronicle for April 16, 1898, and the other in the London Schoolmaster for November 6, 1897. The average daily number of persons in the jail in England and Wales is given for thirty-four years, and a study of them will reveal the true facts regarding the point touched on by Mrs. Davis. There was a marked decrease of crime from 1870 to 1894. The schools had scarce begun to have any effect upon the total in 1870, but in that year there were 128 persons in jail out of every 100,000 of the population. Ten years later the 128 had decreased to 111 in each 100,000 population, and in 1890 this had fallen off nearly one-half. Instead of 111 there were only 68 in prison out of a population of 100,000. It has been stated that the school educates the intellect, but does not affect the morals. Nearly all the schools of this country and in England lay more stress on good behavior than they do upon learning lessons. In fact, some schools with poor methods of instruction, in spite of that, do a great deal of good, because they teach children how to behave in public. By insisting on regularity, punctuality, silence, and industry in the schoolroom they secure a quality of self-control on the part of the pupils which no other means can accomplish so well. I do not find it strange, therefore, that the effect of the school shows itself in the morals of the community still more than it does in the quickening of the intellect. People in England who are studying this matter seem

to think that the great falling off of criminals in the jails, namely, from 128 in every 100,000 in 1880 to only 68 in every 100,000 in 1890, is due to the wholesome effect of the schools. Quite extensive investigations were made in 1870 by the Bureau of Education on the same lines. The prisons and jails of 17 States, 14 of them being Western or Middle States, reported 110,538 prisoners. Of these 27,581, or almost exactly 25 per cent, were illiterates. Attention being called to the fact that three-fourths of the prisoners could read and write and had had some schooling, the same claim now put forth by Mrs. Davis was made—that education promotes crime. The conclusion was drawn that the schools were 'breeding houses of crime.' But in this case the numerators were compared and the denominators neglected, for in the 17 States the average illiteracy of the population was about 4 per cent. This 4 per cent of the population furnished 25 per cent of the criminals, and the 96 per cent who could read and write furnished only 75 per cent. The illiterates, therefore, furnished more than six times their quota, while those who could read and write supplied one-fifth less than their proper quota. Thus, 1,000 illiterates furnished on an average eight times as many prisoners as the same number who could read and write. It seems to me that if the discipline of a common school which trains the pupil from day to day in the habit of self-control and respect for the rights of others will not produce law-abiding citizens nothing else is likely to accomplish it."

"What would be the effect of school training on other evil habits outside of the list of schoolroom virtues—regularity, punctuality, silence, etc.?"

"The school impresses upon the pupil the constant necessity of considering the ideal of good behavior, and the boy in school for many months in the year acquires this as a habit; it becomes second nature. Of course, a person who has acquired the habit of regulating his conduct by an ideal must carry this habit into the whole range of his life and modify it to some advantage. Education is far from stimulating evil instincts, but on the contrary serves to suppress them. One of the English writers to whom I referred collected the police statistics as well as the jail statistics, and found that in 1870, while there were 31,225 thieves in jail, there were 50,144 running at large, but known to be thieves by the police. These two items make a total of 81,369, but in 1895 those in jail had decreased from 31,225 to 18,365, and those reported as at large had decreased to 18,033, making a total of 36,398 in 1895, as against 81,369 in 1870. In the meantime the population of England and Wales had increased from 23,000,000 to 30,000,000. This reduction by one-half of the number of suspicious cases and in jail in the face of a big increase in population is certainly an indication of the good effects of education. These statistics are of value because they show the state of the whole community, and not merely the number actually convicted and imprisoned. An interesting record has been made in Massachusetts regarding the relation of the jail population to illiteracy. Massachusetts gives more years of schooling on an average to its population than any other State. It has been claimed that Massachusetts overeducates its children. I have heard this charge, but you have only to consider the average amount of schooling to each inhabitant in order to see that the State does not overdo the matter of education. Massachusetts gives about seven years, of two hundred days each, on an average, to each one of its pupils, but the average for the whole United States is only five years. The average is not enough to take the pupil through the course of study in the ordinary district school. In 1850 there were 8,761 persons in the jails and common prisons of Massachusetts, while in 1885 the number had increased to 26,651, nearly three times as many as in 1850. This occasioned the remark that with the increase in education crime increased in a still greater degree. An analysis of the crimes reported, however, showed that those against person and property had decreased during that period. Serious crimes had decreased 40 per cent, while the offenses against order and decency, being more vigilantly prosecuted, produced the enormous increase in the total number. For example, in 1850 there were 3,341 commitments for drunkenness, but in

1885 there were 18,701 commitments for this offense. The commitments for all other crimes than drunkenness in 1850 amounted to one for each 183 inhabitants, and in 1885 one to each 244 inhabitants. This showing turned the tables on that class of sensational writers who deal with hysterical statistics. Person and property have become more safe in Massachusetts in the past fifty years, but drunkenness is more dangerous to the drunkard.

"What do you think of the statement that education gives young people a disgust for manual labor?"

"I do not think this charge is borne out by statistics. There is no country in the world in which young people are more ambitious to get into occupations in which they can earn a livelihood than the United States. In fact, the hunger for work is too great for the good of our youth. Again, those youths who get the greatest amount of schooling furnish the most productive populations; as, for instance, Massachusetts, with its seven years as schooling for each boy and girl, produces in manufacture, commerce, and agriculture an aggregate of wealth per inhabitant which is nearly twice that of the average product of the nation. In 1880 this product was from 70 to 80 cents per day for each inhabitant, while that for the country at large was only 40 cents. Of course the educated person wishes to save his hands by the employment of machines, and is not so willing to perform mere drudgery by hand when he can see methods of performing it by machines, but in the number of hours that he works per day and in the intensity with which he works he excels the illiterate laborer. A man of education does one day's work at his office and frequently does another day's work when he gets home for the evening. In regard to the declaration that education for women gives them a distaste for marriage with men of moderate means, and therefore increases the number of old maids, I can only say that I do not wonder that an educated woman is more particular about the kind of husband she gets than an illiterate. Then, again, a woman with an academic training can afford to be independent to a certain degree. In closing I would like to quote these words by famous English authorities on the general subject of education and crime. Sir George Kekewich, the head of the parliamentary school board for England and Wales, says:

"'Every time I hear of a new school being opened I say to myself, "There goes another prison."' Sir John Gorst, one of the parliamentary leaders, says: 'Every pound spent on the education of the young saves many pounds in the increased efficiency of the working population in the absence of the necessity for further jails and workhouses.'"

A. B. A.

INFLUENCE OF THE SCHOOLS IN FRANCE.

[Letter of the United States Commissioner of Education, October 14, 1899, to Prof. E. C. Branson, State Normal School, Athens, Ga.]

* * * I send you the following figures, made from the most recent French census, namely:

1. From 1878 to 1895 there was an increase in the proportion of conscripts able to read, namely, from 84.7 per cent at the earlier date to 94.6 per cent at the later date, or an absolute increase of 11.6 per cent.

2. From another source of information we learn that the number of newly married persons able to sign the certificate made the following increase from 1880 to 1890: Men, from 84 per cent up to 91.6 per cent, an absolute increase of 9 per cent; for women, an increase from 75 per cent at the earlier date to 87.4 per cent, namely, an absolute increase of 16½ per cent.

3. With regard to convictions for crime between the years 1876 and 1892, a period

of sixteen years, there was a decrease from 3,236 convictions in 1876 to 2,775 in 1892, the same being a decrease of 14¼ per cent.

4. From 1892 to 1896 there was a decrease of convictions from 2,775 in 1892 to 2,464 in 1896, the same being a decrease of 11.2 per cent.

5. For the entire period from 1876 to 1896, a period of twenty years, the decrease reads as follows: From 3,236 in 1876 to 2,464 in 1896, the same being a decrease of 772, or 23.8 per cent.

6. The crimes considered in this are homicide (including, under this, assassination, murder, parricide, poisoning), rape of minors, and thefts and breaches of trust. A large class of crimes that come under the head of assault and battery are omitted from this, and as the statistics for the rest of the crimes are very complicated, I have not yet collected them from the census report. For these items see the Révue Pédagogique for May, 1899, and compare it with the extensive report on the prisons of France, by the minister of the interior, "Statistique Pénitentiaire," for the year 1894.

7. Another item which has been obtained is valuable in this connection, namely, of the prisoners included in the figures above given who were between the ages of 16 and 21, there was for the entire period a decrease of 30.4 per cent for men and of 43.4 per cent for women. For all, a decrease of 36.6 per cent, as against the 23 per cent above quoted for all criminals. This, of course, relates to the youth that have been under the influence of the schools.

8. For the youthful criminals of 16 years of age and under convicted of the crimes above there was a decrease on the part of the boys of 43.3 per cent, and on the part of the girls of 62.5 per cent, or for both boys and girls a decrease of 50 per cent. This is very significant because of the fact that these persons are young enough to have received the full influence of the schools.

I hope at some time to be able to collect together all of the separate details of crimes against person and property. But the present figures with reference to all the more important items are very significant and refute the statement with regard to the increase of serious crimes since the Government schools of France have caused a decrease of illiteracy.

It will be very clear, even from these figures, that the increase of crimes, if there is any such increase, is to be found in the minor crimes, and that it is probably due to officiousness on the part of the French police, who are seeking to carry out new regulations that have to do with vice rather than with crime. Persons and property are very much safer in France than they were twenty years ago.

STATISTICS FROM THE UNITED STATES CENSUS OF 1890.

Literate and illiterate population 10 years of age and over, classified by nativity and race.

	Total.	Native white.	Foreign born, white.	Colored.
United States	47,413,559	33,144,187	8,786,887	5,482,485
Literate	41,088,857	31,079,184	7,639,316	2,370,357
Illiterate	6,324,702	2,065,003	1,147,571	3,112,128

CHAPTER XXIX.

EDUCATION IN CANADA.

Dominion of Canada, comprising seven provinces, with an extent of 3,653,946 square miles and a population estimated in 1897 at 5,185,900.

Previous articles on education in Canada in the Commissioner's Reports:

Education in Ontario, Report 1892–93, Vol. 1, Chapter VI. Notes on education at the Columbian Exposition, ibid., Chapter X, pages 1213–1215. Manitoba school question, Report 1894–95, Vol. 1, Chapter VII.

Current and historical survey of the systems of education in the several provinces. Report 1897-98, Vol. 1, Chapter IV.

Topical outline.—Chief features of the systems of public education: Central and local control, sources of income, statistics of elementary schools (current and comparative)—Statistics of universities and colleges—University notes—Current discussions and criticisms—Movement to promote technical and industrial education—Existing provision for technical instruction in Ontario—Foundation and original provisions of the Ontario system of education.

By the British North American act of 1867 the right to legislate on matters respecting education was left to the governments of the four provinces, which were then united under the general name of Dominion of Canada. The same right is assured also to the provinces that have since entered the confederation.

All the provinces have established public schools corresponding to the elementary and high schools of our own States. The control of the schools is vested in central and in local authorities. In Ontario the central authority predominates; in the other provinces the local authorities have more independent action. Elementary schools are secular in all the provinces excepting Ontario and Quebec. In Ontario provision is made for separate schools for Protestants and for Roman Catholics where desired. The latter enrolled 8.6 per cent of the total pupils in 1898; the former an insignificant proportion, less than two-tenths of 1 per cent. The vast majority of the pupils, above 91 per cent, were in the nonsectarian public schools.

In Quebec the schools are sectarian, and provision is made for the separate control of Roman Catholic and Protestant schools; the former in 1896–97 enrolled 86.6 per cent of all elementary pupils. A single superintendent has general charge of the dual system, but he is assisted by a council of public instruction organized since 1869 in two committees, one for the charge of Roman Catholic, the other for the charge of Protestant schools.

In the Northwest Territories provision is made for separate schools for religious minorities (Protestant or Roman Catholic). The rate payers establishing these separate or sectarian schools are relieved of taxes for the public schools.

Tuition fees are charged in Quebec, but may not be more than 40 cents nor less than 5 cents a month. In the remaining provinces the public schools are free, excepting the high schools of Ontario, in which fees are paid.

Local authorities.—The municipal system of Ontario is admirably adapted to the maintenance of local self-government. The Province is divided into counties, which are subdivided into minor municipalities. These consist of townships, incorporated villages, towns, and cities. The municipal councils have certain powers and responsibilities in respect to education. Through their municipal councils the counties must make grants of money for high schools, and both counties and townships grants of money for public or elementary schools. Every township is subdivided into school sections, corresponding to a school district in our States, each of which must be provided with a public school. Every incorporated village, town, and city forms a school district. In each of these districts the rate payers (that is, the persons who pay a property tax) elect a board of school trustees, men and women being equally eligible to the positions. These trustees appoint the teachers, who must have a Government diploma, and determine the amounts to be expended for buildings, equipments, and salaries.

The local unit of school administration in Quebec is a school municipality, i. e., any territory erected into a municipality for the support of schools under the control of school commissioners or of trustees elected by those who pay a property tax (rate payers). The commissioners are empowered to divide a municipality into school districts and to maintain one or two schools in each district.

The school law provides that—

"If in any municipality the regulations and arrangements made by the school commissioners for the management of any school are not agreeable to any member whatever of the proprietors, occupants, tenants, or ratepayers professing a religious faith different from that of the majority of the inhabitants of such municipality, such proprietors, occupants, tenants, and ratepayers may signify such dissent in writing to the chairman of the commissioners.

"The notice having been duly served, the dissentients may proceed, after the lapse of two weeks, to elect three school trustees, who will have the same power with respect to dissentient or separate schools as the commissioners have with respect to the schools of the majority. The trustees alone have the right of imposing and collecting the taxes upon the dissentient inhabitants."

In New Brunswick the school district is the local unit of school administration, and the elementary schools are managed directly by trustees elected as in the other provinces.

Nova Scotia maintains a system of free nonsectarian public schools under the general charge of the executive council, which forms for this special interest a council of public instruction.

The province is divided into school commissioners' districts, in charge each of a board of commissioners appointed by the council, subject to the provisions of the town's incorporation act of 1895. Each school section has a board of three school trustees elected by the majority of the qualified voters of the section. The powers and duties imposed upon the trustees are discharged by the appointed commissioners in incorporated towns.

The Manitoba school law of 1890 provides for the formation, alteration, and union of school districts in rural municipalities, and in cities, towns, and villages, and for the election of trustees in each district.

In British Columbia the local unit of school administration is the district. School trustees elected by vote of persons who pay a property tax are empowered to provide sufficient accommodation for all children of the district between 6 and 16 years of age, inclusive.

The system of public schools in the Northwest Territories is under the control of a council of public instruction comprising 4 members of the executive committee and 4 appointed members, of whom 2 must be Protestants and 2 Roman Catholics. The appointed members have no vote, their duties being purely advisory. A school dis-

trict must not exceed in area 25 square miles and must contain not less than 4 resident taxpayers (property tax) and at least 12 children of school age. Each district elects school trustees, who manage the local school affairs.

SOURCES OF INCOME.

Ontario.—Provincial grant and local taxes. The provincial grant for education comprises (1) grants to elementary schools, (2) grants to secondary schools, (3) grants for the training of teachers, (4) grants for technical education. By statute the amount appropriated for public and for separate Roman Catholic or Protestant schools is divided on the basis of average attendance in each, respectively.

In 1897 the legislative grant for elementary schools was $366,538, and the income from local sources $4,621,617.

Quebec.—Provincial grant, local taxes, and fees. In 1898 the expenditure by the government for elementary schools was $170,000, and by the people $1,425,986. Of the amount appropriated by the government $20,000 was a special fund for poor districts.

New Brunswick.—Provincial grant, county fund, and district assessment. The income from these several sources in 1898 was, respectively, $163,022, $90,807, $230,000.

Nova Scotia.—The fixed sum of $182,500 for each school year is paid semiannually, or as the council of public instruction may prescribe, to legally qualified teachers employed in the common schools in accordance with law, to be divided between such teachers in conjoined proportion to the number of days the respective schools are taught and the scale of the respective grades. The school law provides further that "in every county (except that in which the city of Halifax is situate) the clerk of the municipality is required to add to the sum annually voted for general municipal purposes at the regular meeting of the council a sum sufficient, after deducting costs of collection and probable loss, to yield an amount equal to 30 cents for every inhabitant of the municipality, according to the last census preceding the issue of the rate-roll, and the sum so added shall form or be a portion of the municipal rates. The sum thus raised shall be paid annually by the treasurer upon the order of the superintendent of education. Any sum further needed is determined by the majority of those who pay a property tax (rate-payers) and is raised by a poll-tax, and further, if necessary, by a levy on the real and personal property and incomes of the residents of the section. Ordained ministers and unmarried women are exempt from sectional assessment on property to the amount of $500.

Special appropriations are annually made from provincial and county funds toward the support of schools in poor sections. The amounts appropriated for this purpose in 1897 were, from the general government, $4,308; from county funds, $3,762.

Prince Edward Island.—Provincial grant and district assessment. In 1898 the former yielded 79.63, the latter 20.37 per cent of the school income.

Manitoba.—Provincial grant and district assessment.

British Columbia.—Provincial grant.

Northwest Territories.—Provincial grant and local taxes. The former is distributed among the schools on the basis of average attendance, at the rate of $1.50 per capita; number of days in session, at the rate of $1.40 a day for a term not to exceed two hundred and ten days; the graded certificate held by the teacher, 10 or 20 cents a day for an annual term of two hundred and ten days, and the grade assigned to the school on the report of the government inspector, at not less than 5 cents nor more than 15 cents a day for an annual session not exceeding two hundred and ten days.

Education is compulsory in all the provinces excepting Quebec, but complaint is urged that no provision is made for the enforcement of compulsion.

The following tables show the status of the elementary schools of the several provinces for the latest year reported, with the corresponding data for previous years. For purposes of comparison the populations are given at the last two censuses.

Populations.

Province.	1881.	1891.	Increase, per cent.
Ontario	1,926,922	2,114,321	9.72
Quebec	1,359,027	1,488,535	9.52
New Brunswick	321,233	321,263	.009
Nova Scotia	440,572	450,396	2.22
Prince Edward Island	108,891	109,078	.17
Manitoba	62,260	152,506	144.94
British Columbia	49,459	98,173	98.49
Northwest Territories	56,446	98,967	75.33

Enrollment in elementary schools of the Canadian provinces at specified dates. (*a*)

Province.	1881–82.	1887–88.	1891.	1896.	1897–98.	Increase or decrease, 1887–88, 1897–98.
Ontario	476,268	493,212	491,741	*b* 482,722	482,771	2.11
Quebec	.....	*c* 181,402	*d* 183,981	197,993	*e* 204,259	12.6
New Brunswick	48,805	59,636	59,568	61,918	63,333	6.19
Nova Scotia	77,468	82,486	85,792	101,132	101,203	22.69
Prince Edward Island	.....	22,478	22,330	22,138	21,852	—2.78
Manitoba	.....	18,000	23,871	37,987	39,841	121.33
British Columbia	2,571	6,372	9,004	14,460	17,648	117.00
Northwest Territories	.....	3,453	5,652	12,796	16,754	385.20

a Sources of information, Canadian Yearbook, 1898, and reports of chief educational officers.
b By a clerical oversight the enrollment in Roman Catholic separate schools, 41,620, was omitted from table given in Commissioner's Report for 1897–98 (see vol. 2, table, pp. 170; also 2616.)
c Also 70,417 in model schools and academies which include elementary departments.
d Elementary schools only.
e Also 99,938 in model schools, etc.

From column 6 of the above table it will be seen that the increase in enrollment during the decade 1887–88 to 1897–98 was much greater in the more newly settled provinces than in the older provinces, and that in the former it increased enormously during the period. A better idea of the relative amount of school attendance is obtained from the consideration of the ratio of enrollment to population as shown below:

Ratio of enrollment to population at census years.

Province.	1881.	1891.	Province.	1881.	1891.
	Per cent.	*Per cent.*		*Per cent.*	*Per cent.*
Ontario	24.71	23.25	Prince Edward Island	.....	20.47
Quebec	.....	12.36	Manitoba	.....	15.65
New Brunswick	15.22	18.54	British Columbia	5.2	9.17
Nova Scotia	17.58	19.04	Northwest Territories	.....	5.77

Average attendance in elementary schools of the Canadian provinces at specified dates.

Province.	1881-82.	1887-88.	1891.	1896.	1897-98.	Increase or decrease, 1887-88 to 1897-98.
Ontario	215,264	245,789	257,642	246,724	273,544	11.29
Quebec	.....	.....	131,675	139,876	143,665	.....
New Brunswick	28,562	32,465	34,394	37,176	38,874	19.74
Nova Scotia	43,847	47,520	50,820	54,015	57,771	21.57
Prince Edward Island	.....	12,248	12,898	13,412	13,377	9.21
Manitoba	.....	9,856	12,433	23,247	.....	.....
British Columbia	1,420	3,092	4,980	9,254	11,055	257.55
Northwest Territories	.....	.....	.....	.....	8,827	.....

By comparing column 6 of the above table with the corresponding column in the table of enrollment it will be seen that in the provinces for which the data for comparison are available, the increase in average attendance during the decade 1888–1898 was much greater than the increase in enrollment. This implies improvement in all the conditions that make for efficient schools. The ratios of average attendance to enrollment at the beginning and end of the decade were as follows:

Ratio of average attendance to enrollment.

Province.	1887-88.	1897-98.	Province.	1887-88.	1897-98.

a The classical colleges in Quebec are a combination of school and college, attended by both boys and young men. They confer certain degrees, and are mostly affiliated with Laval University.
b Government expenditure.
c Government grant.

In addition to the colleges tabulated above, there are also 14 denominational private schools in Nova Scotia not empowered to confer degrees, and 10 in New Brunswick.

UNIVERSITY NOTES.

The University of Manitoba was founded in 1877 and received from the provincial government a prospective endowment of 150,000 acres, of which it came into actual possession during the current year (1899). The grant of a site for the erection of a building has further increased the favorable outlook of the university. The university was organized originally as an examining body, but teaching functions have since been included. As it is the only degree-conferring institution in the province, all colleges are brought into intimate relations with it. Of this feature a writer in the Winnipeg Free Press says:

It was a great experiment to gather the religious denominations into one common fold, and to lay down the principle that but one source of degrees in arts, medicine, law, and theology should exist in Manitoba. It was a "consummation devoutly to be wished," even if self-denial, difficulty, and at times disappointment were involved in its maintenance.

The most superficial observer may, however, see that the colleges have been the life of the university. Two of them, St. Boniface and St. John's, bring with them the best traditions of the old Red River days. Two of them, Manitoba and Wesley, are of post-confederation date. The college of Esculapius, bearing its symbol of vigor, has now reached a stable place in its history, and it is but just to mention the three excellent collegiate institutes of Winnipeg, Brandon, and Portage la Prairie. All of these institutions have cheerfully and earnestly given the time of their professors and teachers to do the work of the university.

The existence of our provincial university is a matter to us of congratulation, but perhaps we do not fully appreciate its importance as the crown of the educational pyramid of Manitoba. The university gives the tone and direction to the educational development of the country. Those provinces of the Dominion that have a strong and united university life are those that have the best systems of public-school instruction, both primary and secondary. The elevation of the standard for teachers is only possible when the facilities for higher education are good. It is a great matter to have the assistance of men of university standing and broader training to guide the affairs of the lower schools. It has certainly been an advantage to the school system of Manitoba that 6 out of the 8 members of the advisory board that directs public-school education are active members of the university council. The large infusion of university trained teachers in our public schools has introduced a much higher standard of culture into our schoolrooms than would have been otherwise possible.

A considerable band of earnest students, the prospect of ample means of accommodation, such as buildings, laboratories, and apparatus, being given, the question of most pressing importance is, What are our facilities for teaching? The proposal at the present time is to have under the act of 1893 a joint professoriate, a part supplied by the colleges and a part by the university. The terms of the act are that there may be in the university professors of natural sciences, mathematics, and modern languages. A committee of the university is now charged to make with the provincial government arrangements for as much as may be possible in this direction. Natural science and very soon mathematics may be taken by the university. Probably in the meantime modern languages will be left to the colleges, along with classics and

mental and moral sciences. This plan of a joint university and college professoriate is that followed in Cambridge and Oxford in England and in Toronto University.

There seems some reason in this apart from its financial aspect. The colleges all have faculties of theology. To them the teaching of Latin, and especially Greek, is necessary for those who are to be devotees of the "Queen of all the Sciences." To theology also it is of first importance that its cultivators should be logicians and philosophers. Classics, then, and philosophy, as being cognate subjects with theology, may well be taught in the theological colleges. In the meantime modern languages would also thus be cared for.

But, whether in college or university, the band of teachers must be looked on as one—one in aim and so, also, in spirit. That higher education may be advanced, the arrangement must be heartily entered upon if the highest good is to be done.

Presuming that the line of action thus laid out is to be that which will be followed for a number of years to come, it is plain that the colleges have certain other most important functions in our system. They are given an individuality under our constitution of a most marked kind. To me it is a most important feature of these colleges that they all have residences for the students. The residential system is a part of the English university system. It has, to my mind, a great advantage over the Scottish and German system of students living in private lodgings all over the city. The residence system, which seems to have been a failure in Toronto University, is a very marked feature of our Winnipeg college life. It produces a strong esprit du corps in the college. College men form here lifelong friendships. They learn to bear with the failings of their fellow students, and they receive great impulse and assistance from their associates. Both in my student and professorial experience a large percentage of the best workers and most successful students have been students in residence. The hard worker always has his rights respected, and can have all the privacy he desires, for it is a point of honor even among the greatest triflers to avoid disturbing the man who "fags."

The fact that the arts colleges are each under the direction of some religious body gives them a special opportunity to exercise a kind, wise, and watchful care over the young men who are committed to their charge. The atmosphere of a religious life may ever be found in a college; its morning and evening prayers, religious opening, and other influences freely exercised supply a most valuable factor in the training and development of the students. This feature will be most helpful in supplying a side of university education.

Coeducation at Dalhousie College.—Dalhousie College was founded in 1819, but did not begin active operations for nearly twenty years afterwards. From that time until 1881 only male students entered. Then two ambitious young women asked to be admitted. The authorities of the college were inclined to refuse their applications, but as there was nothing in the character of the college to exclude women, a more liberal policy prevailed and the two girls were enrolled as students of Dalhousie. Only one of them finished her course.

In 1882 another woman student entered, and graduated in 1886 with the degree of B. S., with honors in mathematics and mathematical physics. In 1887 three women were graduated. Last year five took the B. A. degree, and the catalogue shows about the same number this year. Besides the regular undergraduate students a large number of young women attend certain courses which are open to them.

CURRENT DISCUSSIONS.

In all the Canadian Provinces there is unusual activity at this time in respect to public education, and in the two leading Provinces there is widespread criticism of the existing systems.

In Ontario complaint is made of a tendency to excessive centralization, and the demand is heard for greater freedom in respect to the internal conduct of schools, especially those of secondary grade.

The situation as regards the secondary schools was very fully discussed in the annual meeting of the Ontario Educational Association. The following points were especially urged: That the curriculum should be specialized to meet the demands of the three distinct classes of students in the high schools, viz, those who are studying for the university and professions; those who are preparing to be teachers, and those who are merely seeking general training; that the pressure of examinations should be lightened; that greater freedom should be left to the teachers. The sense of the meeting was recorded in the following resolution, which was carried by a vote practically unanimous:

Resolution.—"That this meeting is of the opinion that the undue influence of uniformity, aggravated by too frequent changes, is the cause of grave evils in the matter of secondary education."

The system of departmental examinations has been gradually extended until, it is urged, they have an effect upon the whole work of education entirely out of proportion to their real value. This complaint has led already to a revision of the university matriculation examination with a view to lessening its strain upon secondary pupils.

The school boards of Toronto, Guelph, and Hamilton have resolved to do away with examinations for promotion in the grade schools, and to promote pupils on the recommendations of their teachers, based upon the work of the year.

Among other questions widely discussed is that of increasing the proportion of men teachers in the schools. They form now but 32 per cent of the total number, and the ratio is continually decreasing.

In view of these discussions and demands it is interesting to review the main features of the Ontario system, which will remain essentially unimpaired whatever modifications of detail may be adopted. Such a review is afforded by the preface to the sixth volume of the Documentary History of Education in Upper Canada, by Mr. J. George Hodgins, deputy minister of education, which is appended to this report. (See pp. 1361–65.)

The system of education in Quebec is characterized by provision for the separate control of Catholic and Protestant schools and by a high degree of local independence. A bill was submitted to the legislative assembly of 1897 providing for a secular system under the control of a minister of education. The measure was carried in the

assembly, but rejected by the legislative council. Subsequent efforts to revive this measure have failed, and a bill has been substituted which proposes no radical departure from the existing system.

MOVEMENT TO PROMOTE TECHNICAL AND INDUSTRIAL EDUCATION.

The discussion of the systems of education in the Canadian Provinces is accompanied with a widespread agitation of the subject of industrial and technical education. The movement for provision in this respect began in Ontario in 1870 with the establishment of a technical college, since developed into the School of Practical Science. During the last fifteen years the Government has fostered training in industrial art by means of certificates, medals, grants in aid of art schools, and art exhibitions. Commercial courses have been introduced into the high schools, and more recently efforts have been made to provide for instruction in domestic science and in agriculture in the public schools. Provision for manual training is advocated by the department, and the city of Kingston has already introduced the branch.

It is generally recognized that the time has come for systematizing and extending this work, and as a preliminary measure the deputy minister of education, Mr. John Millar, B. A., has made an investigation of the systems of technical and industrial training in this country, chiefly in Massachusetts, and submitted a very full report on the subject. The recommendations of Mr. Millar with respect to technical education at the high-school stage are cited at the end of this article. They are based largely upon his observations in the United States.

The subject of technical education is vigorously agitated in Quebec also. Here the schools of the Christian Brothers afford admirable examples of the methods of combining industrial with general education.

An impetus has been given to the whole movement by the offer of Sir William C. McDonald, whose liberal benefactions to McGill University, amounting to $2,500,000, have already proved his interest in the cause of public education. He now proposes to equip a manual-training school in a suitable center in each Province, and to provide for the maintenance of these schools for a period of three years.

The following statements from the report of Hon. G. W. Ross, for 1898, give particulars of the existing provision for technical training:

TECHNICAL EDUCATION, PUBLIC AND FREE LIBRARIES, ART SCHOOLS, AND LITERARY AND SCIENTIFIC INSTITUTIONS.

The annual report of the superintendent of this branch of the educational department is very encouraging. It shows that the legislation during the past four years for the improvement of free and public libraries has been appreciated by the people throughout the whole province.

The act of 1895 changed the name of mechanics' institutes to public libraries, and provided for establishing free libraries either by direct incorporation or by transferring mechanics' institutes, libraries, and reading rooms to the municipal councils of cities, towns, and villages. The annual legislative grant for the purchase of books was then divided as follows, viz, $200 for cities, $150 for towns, and $100 for villages.

In 1896 an amendment to the act was passed increasing the legislative grant for the purchase of books to $200 per annum for every public library established under the act; also empowering municipal and school corporations to contribute to the maintenance of public libraries.

In 1898 an amendment to the act was passed for establishing free libraries in police villages.

The results are very gratifying, showing that the liberal grants, $46,000 per annum, voted by the legislature for public libraries, have been well expended, imparting valuable information and opening up new avenues of thought to our young people and their parents in the remotest parts of our province. (See Abstract No. 1, giving number of libraries in each county and district.)

The free-library system has been very successful. In 1895 we had only 12 free libraries. There are now 103 free libraries reporting, and several others have been established since 1st of January, 1899.

In 1883 we had 93 libraries, with 13,672 members, who borrowed 251,890 books; while in 1898, 347 libraries reported having 111,208 readers, who borrowed 2,358,140 volumes. In addition, for 1898 we may add 27 libraries which did not send in their returns in time for this report, and 10 new libraries incorporated since the 1st of May, 1898, making a total of 384 libraries for 1898.

During the same period (1883 to 1898) 16,297,033 volumes have been issued, and $1,903,115 expended for public and free libraries, and the assets have increased from $255,190 to $870,167.

ART SCHOOLS, ETC.

During the past fifteen years considerable attention has been paid to art education. We have endeavored to develop a taste for industrial drawing as the basis of industrial education, now universally acknowledged an important factor in the national wealth and prosperity of every country in which it has been adopted.

During the past fifteen years the education department has awarded to the pupils and students of art schools, ladies' colleges, etc., 51,712 proficiency certificates, and 2,562 full certificates in the primary course, which includes free-hand, model, and blackboard drawing, and primary geometry and perspective; 3,746 proficiency certificates, and 196 full certificates in the advanced course, which includes shading from the flat and round, outline from the round, drawing from flowers, and industrial design; 1,107 proficiency certificates and 39 full certificates in the mechanical course, including advanced geometry and perspective, machine drawing, building construction, and architectural design; 286 certificates in the industrial art course, which includes modeling in clay, wood carving, lithography, and painting on china; 1,245 certificates for extra subjects, including oil and water-color painting, etc. (not time studies); 212 extra certificates for industrial designs, etc. (not time studies); 14 gold medals, 64 silver medals, and 106 bronze medals.

Provincial art schools are established at Brockville, Hamilton, Kingston, London, Ottawa, St. Thomas, and Toronto. The annual grant voted by the legislature for these schools, including expenses for examination, etc., is $4,400.

Art schools exhibition.—At the request of her excellency the Countess of Aberdeen and the representatives of the National Council of Women of Canada, who met in Ottawa in the month of May, 1898, I gave directions that the Annual Provincial Industrial Art Exhibition should be held in Ottawa during the time of the women's convention, and appointed Dr. S. P. May, superintendent of art schools, to superin-

tend the exhibition, which consisted of the ordinary sessional work sent to the department for examination, viz, paintings in oil and water colors; drawings from life; outline and shading from the antique; original industrial designs; architectural designs and building construction; machine drawing; wood carving; modeling in clay; sculpture in marble; lithography; pen and ink sketches and photogravures; china painting, etc.

Two large lecture rooms in the Ottawa Normal School were temporarily converted into art galleries, the light being properly adjusted in the daytime and the rooms lit up by electric lamps in the evenings. The walls and blackboards were covered with the proper color groundwork for the display of the paintings, drawings, etc., and the rooms were appropriately decorated.

The exhibition was formally opened by his excellency the Governor-General on the 18th of May, 1898.

The exhibition was a great success and a pleasant surprise to the representatives from the United States and this Dominion who attended the convention, as well as the people of Ottawa, including students and pupils from different educational institutions, who all expressed themselves as having no idea of the variety and excellence of art-school work done in our province.

The Countess of Aberdeen was so much impressed with the importance of the exhibit from an industrial standpoint in the employment of women that she decided to give a gold medal, which was subsequently awarded to Loretto Abbey, Toronto, for its magnificent display of painting on china.

In connection with the exhibition, Dr. May gave an address on the history of art education in this province.

3. *Ontario Society of Artists.*—This society receives an annual grant of $500 from the legislature on condition that it holds an annual exhibition of the work of its members, and from pictures exhibited shall select two pictures to the value of $200 for permanent exhibition in the museum of the education department.

The society has also to send me an annual report on the progress and advancement of art education in this province.

During the past year the society held its annual exhibition, superintended the art department of the Toronto Industrial Exhibition, and was represented at the Loan Exhibition, Winnipeg, the Y. M. C. A. Loan, and Women's Art Club, Toronto, and the Art Association of Montreal. In addition, several of its members sent pictures to the Royal Academy, London; the Paris Salon, and the National Academy of Design, New York.

4. *Provincial art gallery.*—In order to encourage native art I entered into an agreement with the Ontario Society of Artists to provide an annual collection of pictures in one of the galleries in the educational museum, from which collection paintings to the amount of $800 (in addition to $200, for two pictures to be selected by the Ontario Society of Artists from their annual exhibits) are to be purchased every year. The artists in their annual report say: "There can be no doubt that the influence of this patronage by the Ontario government is already being felt, and will stimulate our work very beneficially."

5. *Literary and scientific institutions.*—The following institutions receive financial aid from the Ontario government, viz:

Hamilton Literary and Scientific Association; Kingston School of Mining and Agriculture; Ontario Historical Society; Ottawa Literary and Historical Society; Ottawa l'Institut Canadien; Ottawa Field Naturalist Club; Ottawa St. Patrick's Literary and Scientific Association; Toronto Canadian Institute; Toronto Astronomical Society.

Lectures are given by these societies on various subjects, including agriculture, architecture, astronomy, botany, biology, chemistry, electricity, natural history,

physics, etc.; also in general and Canadian history and literature. Museums are established in some of them; in others, free evening classes on science, etc., are given.

The grants, $3,350, from the legislature to these institutions are well expended, as they teach branches of knowledge which assist in developing the natural talent of our people, and enable them more successfully to compete against the skilled artisans of other countries.

The total number of institutions aided by grants from the legislature in this branch of the education department is as follows:

Public and free libraries	384
Art schools, etc	9
Literary and scientific institutions	9
Total	402

In addition, about fifty ladies' colleges, etc., are affiliated with the department for examination in the fine arts.

5. *Educational museum.*—This museum, established by the late Rev. Dr. Ryerson, chief superintendent of education, was opened to the public in 1856. At that time only one room on the first floor was set apart for museum purposes. Gradually the whole of the rooms on this floor were filled, and the walls of the corridors, etc., had to be used for exhibiting busts, etc. For the past few years increased accommodation was required, and it is gratifying to state that, after frequent applications by this department to the legislature, in 1896 a special grant was voted for the erection of a new story on the top of the old education department buildings. This has been completed, and we now have five extra rooms; also two properly lighted picture galleries. The increased space has enabled me to add four extra departments to the museum.

(1) *Archæology.*—As the museum already contained an excellent collection of sculptured slabs, monuments, etc., illustrative of prehistoric and classical archæology, it was considered that a collection representing more particularly the primitive archæology of North America would be of great interest to the general public, and valuable to students in assisting them to trace the progressive stages of man from his savage state to that of civilization. Reports of this branch of the museum have been printed as appendixes to my annual report on education.

(2) *Zoology.*—As natural history museums are regarded as important agents in national education, it was considered advisable that our museum should commence collecting specimens of natural history, and, as it was impossible for us to provide for a full representation of the fauna of North America, we have been content with collecting specimens of Canadian mammals and birds, and in the near future we hope to have our fresh-water fishes and reptiles well represented.

(3) *Botany.*—As botany is now one of the studies in our schools, and is not altogether a "book study," but a subject which can not be thoroughly taught without a study of plants, it was decided to establish an herbarium of Canadian plants to assist pupils in different parts of the Province in ascertaining the proper methods of mounting specimens, classifications, etc.

(4) *Provincial art gallery.*—In order to encourage native art talent, an agreement was entered into some two years ago between the education department and the Ontario Society of Artists, by which one of the large art galleries in the museum shall be annually filled with the most recent pictures of the members of the society. The scheme has been successful, and the artists acknowledge that it has assisted in developing more interest in their work and an increased sale for their pictures.

As sculpture is a kindred subject to painting, and has been considered in all ages as one of the most important branches of art for perpetuating the memories of great and good men, I have encouraged this branch of art by employing Canadian sculptors to model busts of distinguished Canadians, and although the annual amount at

my disposal for this purpose is very small, I have succeeded in making a fair representative collection of prominent Canadians. (See contents of museum, Department 4, Modern Sculpture.)

AGRICULTURE.

The department has made several attempts to promote the study of agriculture in the public schools of the Province. Under the regulations in force for the last ten years instruction has been given in agriculture in all the model schools in the country as well as in the normal schools, and every teacher authorized to teach a public school during this period has had some training in the best methods of teaching the subject.

In 1891 public-school trustees were, by regulation, authorized to introduce the subject of agriculture into the fourth and fifth forms of the school, and where such regulation was adopted the inspector was required to report annually to the trustees as to the course taken by the pupils and their knowledge of the subject. Although this regulation has been in force for seven years, so far as I know no board of school trustees has passed the necessary resolution, and, as a consequence, the subject receives very scant attention.

One reason alleged for the neglect of the study of agriculture was that the text-book authorized by the department was too technical, and was uninteresting to the pupils. In order to overcome this difficulty, arrangements were made by the department with C. C. James, B. A., deputy minister of agriculture and formerly a member of the staff of the agricultural college, to prepare a text-book, so simple in its language and so elementary in its treatment of the subject as to be within the range of pupils from 12 to 15 years of age. Early in the year Mr. James submitted the manuscript of such a text-book, and after fully considering its merits, it was duly authorized by the department.

COMMERCIAL EDUCATION.

The business activity of the age is calling for improved courses of commercial education in most countries, and the demands for what is termed a practical education are repeated from time to time. It is universally admitted that practical skill in every department of life requires intelligence and general mental activity. Educationists now fully recognize that intellectual skill and power are promoted by training in habits of observation and reflection. No better means of promoting this training can be secured than by providing the best instruction in reading, writing, arithmetic, literature, and the other ordinary subjects of an elementary school course. Indeed, it should not be forgotten that failures in life are due more largely to defects in character than to want of knowledge. Apart from this principle, it must be admitted that the subjects taught in our public schools are of the most practical character possible, and that no farmer, artisan, or merchant could possibly dispense with a knowledge of the subjects of the prescribed course. If industrial training is to be promoted, it can only be made successful by giving suitable instruction in the ordinary subjects of the school programme. Accordingly, the fifth form of the public school provides a course in bookkeeping which will enable students to gain a knowledge of single and double entry; commercial forms, such as drafts, notes, and checks; general business transactions. This course is specially suitable for farmers and artisans, or for retail merchants and general traders. This course provides amply for a pupil of 14 or 15 years of age all the bookkeeping that he is capable of comprehending at that age.

Under amendments made in 1891 to the high-schools act, regulations were prescribed for commercial specialists, thus giving in our high schools and collegiate institutes a further impetus to the acquisition of a business education. The course of study prescribed for commercial specialists is a very extensive one, and it may be doubted if in any part of the world the school law calls for teachers of such high attainments in commercial subjects.

The course for commercial diploma consists of bookkeeping, business forms and usages, and stenography.

[Citation from report on technical education by Mr. John Millar, B. A,, deputy minister of education, Ontario.]

SUGGESTIONS AS TO HIGH SCHOOLS.

Should technical education be carried on in our high schools and collegiate institutes, or should separate institutions be established for the purpose? My impressions have been favorable to the former. I know no reason why there should be any duplication of classes. So far as I have conversed with Ontario high-school masters, they are decidedly in sympathy with technical education, and much may be accomplished if they are relieved in the way I have indicated from the pressure of university matriculation examinations.[1] I must acknowledge, however, that the experience of the United States, and the opinions of those on the other side best informed, to whom I have spoken on the matter, are against my view. I was told repeatedly that where technical education is simply attached to the existing course of study there is a danger that it will be slighted and made a mere makeshift to satisfy popular demands. The best manual-training high schools or technical schools are undoubtedly distinct institutions, though under the same school board. The principal in each case is a good administrator, a university scholar, and teacher of years of experience. Those in charge of the technical departments are fully trained for their work, but they are experienced teachers as well. Judging by what I observed in the technical schools on the other side, the employment of persons acquainted with mechanical operations, but not teachers, would make a weak staff.

Under the circumstances, if the municipalities are ready to incur the cost, I think in a large city like Toronto, and perhaps in cities like Kingston, Hamilton, London, and Ottawa, a separate building would be preferable, with equipments resembling those of the institutions mentioned in Boston, Cambridge, or Brooklyn, N. Y. It is not necessary to refer to the Drexel Institute, Philadelphia, or Pratt Institute, Brooklyn, as they are privately endowed institutions, and their purposes are of a different character. Unless much money can be counted upon, it would be folly to attempt anything so pretentious as either of these institutions would suggest. If a technical school is established in one of our cities, all pupils should be required to pass the high-school entrance examination before admission. No fees should be charged resident pupils, and if the Province is to give assistance, it should be with the understanding that high fees should not shut out nonresident pupils.

In other places a separate institution for technical education could

[1] Mr. Millar suggests that the Ontario universities, following precedents in the United States, admit pupils on the certificates of high-school principals in lieu of examination.

scarcely be maintained. Indeed, a good technical school should give students ready access to the industries of a large manufacturing city. A room in each of our large high schools and collegiate institutes might, however, be provided for manual training in woodwork, but I am not sanguine of immediate results. I see no reason why one of the regular teachers, who has a good knowledge of drawing and who is not averse to using the tools of a mechanic, could not, in a few weeks, acquaint himself with all that is necessary to begin work of this kind. A large amount of machinery is of course necessary for a technical high school, but for manual training in mere woodwork the cost for appliances would be very trifling.

EDUCATION DEPARTMENT, *Toronto, August, 1899.*

FOUNDATION AND ORIGINAL PROVISIONS OF THE ONTARIO SYSTEM OF EDUCATION.

The following statement is taken from the prefatory remarks to the sixth volume of the Documentary History of Education in Upper Canada, by Dr. J. George Hodgins, M. A., LL.D., barrister at law, librarian and historiographer to the education department of Ontario.

Dr. Hodgins has brought to this work the double qualification of administrator and author. His official connection with the educational system of Ontario dates from its inception. The intimate friend and colaborer of Dr. Ryerson, he became his chief of staff in 1844 and for thirty-three years labored with him to develop the system for which Ontario is justly distinguished.

Dr. Hodgins's executive ability was fully appreciated by Dr. Ryerson, who said of him: "He is the ablest and most thorough administrator of a public department of any man whom I have met."

In 1846 Dr. Hodgins was made secretary of the board of education for Upper Canada, which body was afterwards designated the council of public instruction, and in 1855 was appointed deputy minister of education. He has written extensively on educational topics, is the author of several valuable text-books and now crowns his labors with a history of the system with which he has so long been identified. The Documentary History has involved immense research and discriminating judgment. Six volumes are already published, and the whole when finished will form, with the volume on history and legislation of separate schools in Upper Canada, a work of great value to all interested in the social and political development of Canada and to all students of educational history.

CITATIONS FROM THE PREFATORY REMARKS.

This sixth volume of the Documentary History of Education in Upper Canada is largely devoted to a record of proceedings, which detail what steps were taken in 1846 in laying "educational foundations."

As this volume deals chiefly with the subject of "first things," in connection with our system of public education, and of "laying foundations," as connected with that system and university education, I think it desirable to specify, in a somewhat general form, what is implied by these expressions in this connection.

The "first things" which this volume records as having been accomplished in 1846 are:

1. The publication of an extended report on a projected system of popular education for Upper Canada.

2. The preparation and passing of a common-school bill, founded upon that report, and the first school bill prepared under the auspices of Dr. Ryerson.

3. The appointment of a board of education for Upper Canada.

4. The selection of a series of school text-books, which remained in use in the common schools for twenty-two years, and until 1868.

5. The organization of the education department under the school act of 1846.

6. The establishment of a provincial normal school (formally opened in 1847).

7. The substitution of district school superintendents for local township superintendents.

8. General forms and regulations for the government of common schools, including provision for giving religious instruction in these schools, under the school act of 1846.

The only real and effective efforts put forth in 1846 were those of the newly appointed chief superintendent of education, in regard to the common schools of the Province. The strenuous efforts made during that year to settle the university question were practically abortive. They proved, nevertheless, in the end, to be highly useful in clearing the way to a final settlement, at least for the time, a few years later, of that vexed question; but just then they were only tentative in their effects.

On his return from an examination, during 1844–45, of the systems of education and various kinds of schools in Europe and in the Eastern part of the United States, Dr. Ryerson prepared an elaborate "Report on a system of public elementary instruction for Upper Canada," in 1846. This report was based upon his own personal observations and the experience of others, who preceded him in making similar investigations and whom he quotes as authorities in his report.

In the preparation of that report Dr. Ryerson had the great advantage—of which he availed himself freely—of consulting the report of a prolonged inquiry (like the one which he had just made) into the state of popular education in Europe, and the modes of teaching adopted in European schools, by that noted American educationist, the Hon. Horace Mann. Mr. Mann, at the time of his visit to Europe, in 1843, was secretary to the State board of education of Massachusetts. His reasons for making that tour of observation were in effect those which had influenced Dr. Ryerson to visit Europe, with a similar object in view. They were also of a thoroughly practical kind, and they are stated very graphically by Mr. Mann, in the preliminary part of his report, as follows:

"I have attended a great number of educational meetings, and, as far as possible, have read whatever has been written, whether at home or abroad, by persons qualified to instruct mankind on this momentous subject; still, I have been oppressed with a painful consciousness of my inability to expound the merits of this great theme in all their magnitude and variety, and have turned my eyes, again and again, to some new quarter of the horizon, in the hope that they would be greeted by a brighter beam of light.

"Under these circumstances it was natural that the celebrity of institutions in foreign countries should attract my attention, and that I should feel an intense desire of knowing whether, in any respect, those institutions were superior to our own, and, if anything were found in them worthy of adoption, of transferring it for our improvement. Accordingly, * * * having obtained permission from the State board of education, * * * I embarked for Europe on the 1st of May" (1843). * * *

"Among the nations of Europe Prussia has long enjoyed the most distinguished reputation for the excellence of its schools. In reviews, in speeches, in tracts, and even in graver works devoted to the cause of education, its schools have been exhibited as models for the imitation of the rest of Christendom. * * *

"I have seen countries in whose schools all forms of corporal punishment were

used without stint or measure; and I have visited one nation [Holland] in whose excellent and well-ordered schools scarcely a blow has been struck for more than a quarter of a century. * * *

"On reflection it seems to me that it would be most strange if from all this variety of system and of no system—of sound instruction, and of babbling, of the discipline of violence and of moral means—many beneficial hints for our warning or our imitation could not be derived; and as the subject comes clearly within the purview of my duty, 'to collect and diffuse information respecting schools,' I venture to submit to the Massachusetts board the results of my observations."

In the light of to-day, and noting the great advance which has been made—especially in England—in the matter of public education during more than fifty years, this graphic bird's-eye picture of the state and character of popular education and of schools in Europe is deeply interesting. It is the more so, and also the more valuable, from the fact that the picture is drawn by a master hand—one whose name is still a household word in educational circles in the United States, and especially in New England.

The late distinguished Dr. Fraser, Lord Bishop of Manchester, in his official report of 1865, when as commissioner from England he made inquiry into the state of education in the United States and Canada, speaking both of Horace Mann and of Egerton Ryerson, said:

"What national education in Great Britain owes to Sir James Kay Shuttleworth, what education in New England owes to Horace Mann, that debt Canada owes to Egerton Ryerson."[1]

It was but natural that with so able and experienced an educationist, who had but lately—just the year before—gone over the same field, Dr. Ryerson should "compare notes with Mr. Mann" and fortify his opinions and conclusions by quoting, as he has largely done in his report, those of Mr. Mann on the schools of England and of the continent of Europe. Mr. Mann's report, it should be remarked, was reprinted in England at the time and deservedly attained the rank of an educational authority.

This report of Dr. Ryerson was published as a parliamentary paper in 1846, and, in 1847, 3,000 additional copies of it were printed in pamphlet form, and for some years largely formed the basis of subsequent school legislation in Upper Canada.

Soon after the publication of his report Dr. Ryerson drafted his first common-school bill, which during the parliamentary session of 1846 became the common-school act of 1846, known as the Ninth Victoria, Chapter XX.

As this comprehensive report on a projected system of public elementary education for Upper Canada is somewhat elaborate, I shall here merely refer to some of the main features of it. In preparing the report Dr. Ryerson wisely laid down certain fundamental principles which he believed to be essential to the success and stability of that system. These general principles may be thus summarized:

1. That the machinery of education should be in the hands of the people themselves, and should be managed through their own agency; they should therefore, he held, be consulted, by means of public meetings and conferences, in regard to all school legislation. This he himself did every few years.

2. That the aid of the government should only be given where it could be used most effectually to stimulate and assist local effort in this great work.

3. That the property of the country is responsible for and should contribute

[1] Speaking of his three weeks' stay in Toronto, making inquiries into our system of education in Upper Canada, Dr. Fraser, in another part of his report of 1865, said: * * * "My best thanks are due to Dr. Ryerson, the chief superintendent, and to Mr. Hodgins, the deputy superintendent, for the abundant facilities they afforded me for making myself acquainted with the system of which they are the efficient administrators." Report, page 205. The other remarks, quoted above, will be found on page 279 of the same report.

toward the education of the entire youth of the country; and that as a complement to this "compulsory education" should necessarily be enforced.

4. That a thorough and systematic inspection of the schools by competent persons is essential to their vitality and efficiency.

It was not to be expected that so comprehensive a scheme of education as that proposed by Dr. Ryerson in 1846 would at once meet with general acceptance. Its outlines were considered to be too broad for a young country like Canada, and therefore objections were urged against it as impracticable. Even his reference to the compact and systematized plan adopted in Prussia was held to be an indication of his intention to introduce the "oppressive" system of so-called "Prussian despotism." This subject at the time was keenly discussed, but I have only devoted a short space on pages 214 and 215, in referring to the discussion itself, as an incident or episode connected with the introduction of a new school system into Upper Canada.

The school law of 1846, founded upon this report, provided, among other things, for—

1. A general board of education for the province to take charge of a normal school and to aid the chief superintendent in certain matters.
2. A normal school, with practice or model schools attached.
3. The regulations for common-school libraries.
4. Plans of school-houses, rural and urban.
5. Appointment of district instead of township school superintendents.
6. Apportionment of school moneys to each municipality according to the ratio of population, and to each school district according to the ratio of children in such school district, as compared with those in the whole township, (and not, as afterwards by the act of 1850, according to the average attendance of children at each school.)
7. Levy of a school rate by each district municipal council of a sum at least equal to the legislative grant to each such district.
8. The collection, by the local school trustees, of the balance required to defray the expenses of their school, by rate bill upon parents and guardians. (It was only under the school act of 1850 that trustees could raise this money in the way which the school ratepayers at the annual school meeting might determine.)
9. The recommendation of a uniform series of text-books, with a proviso that no aid would be given to any school in which books disapproved of by the provincial board of education might be used.
10. The establishment of district model schools, aided by parliamentary grants (reenacted from the school law of 1843).
11. Examination and licensing of common-school teachers by the district and not by the township school superintendent, as heretofore.
12. Visitation of schools by clergymen, magistrates, municipal councilors, etc., as "school visitors."
13. Protection of children (reenacted from the school law of 1843) from being "required to read or study in or from any religious book, or join in any religious exercise or devotion, objected to by parents."
14. Establishment (reenacted from the school laws of 1841 and 1843) of Roman Catholic separate schools where the teacher of the locality was a Protestant, and vice versa. (These schools only received grants in accordance with their average attendance of pupils. In 1850 this restriction applied to common and separate schools alike.)
15. Levy of rates by district municipal councils, at their discretion, and by them alone, for the erection of schoolhouses and teachers' residences.

Such were the principal provisions of the first school act, proposed and adapted chiefly from other school laws by Dr. Ryerson in 1846, so far as rural schools were

concerned. In the following year he prepared a comprehensive measure in regard to schools in cities, towns, and incorporated villages.

The establishment of the first provincial normal school of Upper Canada, with its model schools or schools of practice, was a notable event, as recorded in this volume. So essential has this class of schools become that there are now three of them, besides a normal college, in this province.

The county model schools, authorized by the act of 1843, and specially aided by the government, were continued under the act of 1846. While they have been very greatly improved of late years, yet in these early years they did good service in giving candidates for school-teaching the first general idea of what was necessary to know and to practice in order to become successful teachers in the schools.

The selection of an excellent and well-prepared series of school text-books—the Irish National—was probably the most important practical event of the school year, as these schoolbooks continued to be uninterruptedly in use in the common schools of Upper Canada for twenty-one years, and were only superseded by a new and revised Canadian edition of them in 1868.

The task of introducing these text-books into the common schools in 1846 was indeed a difficult and delicate one. It was done without exciting the latent strong opposition which was known to exist in many places on the part of those who regarded Morse's Geography, Kirkham's Grammar, Daboll's Arithmetic, Cobb's Spelling Book, and a great variety of other such schoolbooks, then in use, as unexceptionally good. The chapter on the "Text-book question in 1846," page 273 of this volume, deals fully with the difficulties then encountered on this subject. Some of these difficulties arose from the efforts made by the local writers of special and single schoolbooks, forming no part of a connected series, to retain their publications in continued use in the schools.

No compulsion was employed to unduly expedite a change in text-books; nor was any Canadian schoolbook forbidden to be used in the schools. In the case of United States schoolbooks, a reasonable time was allowed before they were disapproved of by the provincial board of education. As a matter of fact, the Irish National schoolbooks, by their intrinsic excellence, gradually superseded all other text-books in the schools.

Among the means employed to give effect to the new common-school act for 1846 was the sending of a circular, in regard to the schools, to the district municipal councils, embodying in it a strong appeal for cooperation and for active and practical support. Another circular, largely explanatory and suggestive, was sent to the newly appointed district superintendents of schools, giving them all necessary information in regard to their duties, and directions as to the efficient inspection of schools, and also as to how to deal with teachers who apply for certificates of qualification, and on other matters.

CHAPTER XXX.

WILLIAM PRESTON JOHNSTON'S WORK FOR A NEW SOUTH.[1]

By Rev. A. D. Mayo, A. M., LL. D.

No school year begins as the year before it evolved to its triumphant ending. One change in the superintendency of the public-school system of an American city may become the most potent factor in the educational development of that community for a generation to come. The death of President William Preston Johnston, of Tulane University, New Orleans, La., at the home of his daughter in Lexington, Ky., on July 17, was an event of so much public importance, apart from a wide personal acquaintance, that for the coming few months the attention of the better-informed educational public of the whole country will be directed to that city. It is not too much to say that any arrest of the educational policy represented by President Johnston would just now be a greater calamity to that city and State, and, indirectly but surely, to the whole Southwest, than any political action of the entire group of States included in this section.

William Preston Johnston was born in Kentucky, the son of Gen. Albert Sidney Johnston, in 1831. After a miscellaneous preparatory schooling at home, he graduated at Yale, studied law at Louisville, and, in 1862, at the age of 31, became aid-de-camp of President Davis till the close of the civil war. After several months of confinement as a political prisoner, he was called, in 1867, by General, then President, R. E. Lee, to the chair of English literature in Washington and Lee University in Virginia. During this period he wrote the life of his father. In 1880 he was called to the presidency of the Louisiana State University at Baton Rouge, where he remained until his final position was found as president of Tulane University in New Orleans in 1884.

Here, first, during the memorable fifteen years of the development of this remarkable seat of learning, the young colonel, professor, and temporary president of a demoralized State university attained a national reputation, beyond question, with the exception of his friend, Dr. J. L. M. Curry, the most notable of the new educational leaders of the South. What men like the late Bishop Haygood and Dr. Curry have done as missionaries at large in the great development of the American system of universal education during the past thirty years, President Johnston, in a work almost exclusively local, but of enduring value and increasing reputation, has achieved by the planting and nurture, in the very heart of the old South, under the most embarrassing circumstances, of the group of schools now included under the general title, Tulane University. With no disposition to depreciate the excellent work now being done in several of the more progressive colleges and universities in these sixteen States, we have no hesitation in declaring that in what it now is, what it represents, and what it can be made in the near future, this institution stands for an educational policy that signifies more to the future of those States than everything that has been written and said concerning Southern affairs since its establishment in 1884.

---

[1] From the Boston Evening Transcript, August 23, 1899.

The two men who seem to have been born and educated as the permanent representatives of the new education of the Southern people, including both races and all classes, were S. C. Armstrong and William Preston Johnston. Both were of New England descent and graduates of New England colleges. Both were specially trained in their youth, in the most characteristic circles, for the great work of their future. Both were engaged in the civil war, in positions especially valuable for wide observation and in intimate relations with the group of remarkable men that surrounded Lincoln and Davis. Neither of them would probably be regarded by the experts a great schoolmaster; yet both were, in the best sense of the word, educational statesmen, fit associates of Mann, Barnard, Winthrop, Haygood, Curry, and the only man yet developed from the colored race worthy of such designation, Mr. Booker Washington. They both were given time to plant the new departure so firmly in Southern soil that Johnston could say on his deathbed, like Armstrong, that he was no longer a necessity in the institution which owed its existence and character essentially to his great personality.

Armstrong, at Hampton, Va., solved the question of the true education of the negro—the question on which the whole future of the South depends—so completely that the Southern educational public and every Southern State have organized the elementary, secondary, industrial, and higher education for their 8,000,000 colored people on the Hampton plan; and, within the coming twenty years, if not earlier, the entire missionary and educational work in our new colonial possessions will be pitched on the Hampton keynote.

In a way less exposed to national observation—indeed, perhaps even now not appreciated in many of the "educational centers" of the North—President Johnston, in the very heart of the most intensely southern portion of the South, like Dr. Curry personally and by training a Southerner of the Southerners, in fifteen years has built up an institution that in the honesty and thorough excellence of all its instruction is not the inferior of any school of the higher education in the country. And, beyond this, in its ideal of organization, methods of college discipline, adaptation to the most embarrassing variety of population in a city and State whose previous experiments in education had been little more than a series of brilliant failures, Tulane University to-day represents more completely the imperative Southern necessity of the broadest education and the most comprehensive method of dealing with this necessity of any school south of Mason and Dixon's line. Indeed, to find its companion work in the North would be difficult. Perhaps the new University of Chicago is the only eminent representative of the same policy of adaptation in the Northern States.

When President Johnston came to Louisiana, in 1880, as president of the State University, he found the educational system in the midst of what might be called a struggle for existence. The university at Baton Rouge was without funds, in a hired house, with 39 students. The fifteen years of fearful political agitation since the days of '65 had made the proper development of the new public-school system almost an impossibility. In New Orleans the common school was practically in a state of siege, with the teachers unpaid and the educational public greatly discouraged. The one thoroughly live spot in city and State seemed to be the University of Louisiana, an excellent collegiate school in New Orleans, doing more work on its moderate income of $10,000 a year than any similar institution in the State. The gift of Paul Tulane of a great block of real estate for the founding of a college for white youth could easily have been disposed of after the method by which every previous donation in Louisiana had been robbed of its vitality, or the college established by it could have easily added another to the long roll of institutions for all races and both sexes which during the past century have played fast and loose with the highest educational titles, with varied results.

The coming of President Johnston at the age of 53, in the full development of his

magnetic and conservative manhood, with his training for the past twenty-five years, was the most pronounced new departure in the higher education in the Southwest. Under the leadership of Dr. Sears and the Peabody education board of trustees, backed by the progressive section of the Southern educational public, the common-school system for the whole people had been inaugurated in every State and was literally waiting, with great expectation, for the action of Congress on the Blair bill for national aid to education. But it can truly be said that in 1880 the American system at best had only effected a lodgment in the Southwest. In this entire group of five States there were not a dozen good free high schools for white pupils, probably not twenty graded school systems; and the State universities, either ruined by the war or not yet established, had before them a battle for life with the old established system of ecclesiastical denominational education, still in possession of the ground. In Louisiana the problem was complicated by the obstinate social and religious distinctions which, from the beginning had successively met and almost overthrown every attempt to plant the American system even for the white race. Happily for the new experiment, the new-come president found himself supported by the most intelligent, resolute, and tactful board of trustees in the South, with Hon. Randall Gibson as its chairman, all personal friends, and with such wise confidence in their leader that he was virtually given a free hand.

The record of the great work of President Johnston and his excellent faculties of Tulane, in both its departments for men and women, requires more than the allotted columns of a metropolitan daily. But in brief, the different steps may be noted—

1. The new president faced the situation with a courage that in a weaker man would have been professional destruction. He simply told the people that a State, full of so-called "colleges," had not in it the material for a proper university, and that the only hope of one was the vital connection of Tulane with every live element of popular education in the Commonwealth. In the face of the most relentless ecclesiasticism he planted Tulane on the broad American platform of the State university in its character-training of youth of all sorts and conditions of theological beliefs. In a State which had just emancipated a majority of its people from chattel slavery, he announced that every boy entering Tulane must take off his coat and fight it out on the manual-training line of mechanics, and sent to Boston for a group of experts in this direction. By a wise stroke he utilized the admirable school known as the University of Louisiana, with its corps of accomplished teachers, as the preparatory training school for his collegiate and university departments.

2. It was soon found that Tulane was to be no hospital for educational invalids, worn-out veterans, and impecunious social celebrities. The new president had already, in the academical, medical, and legal schools, probably the ablest corps of instructors gathered around any Southern institution of learning; the majority young men of promise, one of whom has already graduated to the presidency of a great State university, representing every section of the country with up-to-date educational ideals. A most important department, really the outcome of the industrial training, was the organization within and without the university of a proper school of ornamental design; on the one hand attracting the most accomplished women, and on the other extending a friendly right hand to the mechanical and operative class of the city, recognizing the fact that the final office of New Orleans is to become a great center of ornamental manufacturing industry for the Southwest. In every position in this extended scheme was found an expert, insisting on a thorough dealing with the work in hand.

3. The president displayed the qualities of the true educational statesman in avoiding all controversy and provoking no unfriendly criticism from the regulation college or university anywhere. In the line of the famous maxim of Napoleon, "In any new departure, let the leaders alone and go direct to the people," for the first time in Southern educational history a university president faced right about and,

with neither apology nor explanation, harnessed Tulane to every vital agency of universal education in Louisiana and the Southwest. He was the soul of the Louisiana Education Society, that, in the ten years of its activity, gathered the friends of the common school in the city of New Orleans into a powerful organization, which, in the ten years of its activity, repulsed the assault of its enemies, woke up its friends in city and State, and laid the broad foundation of what is now one of the most hopeful of the public-school organizations of the Southwest. Along with this he placed the entire university at the disposal of the common-school teachers and educational public, through a system of free public lectures by his faculty and eminent gentlemen from the whole country, during one whole season supporting a campaign of education that reached almost every considerable village in the State. He was always ready to answer the call to speak anywhere, through several months in company with the author of this paper, meeting the workingmen of both races in their labor unions in New Orleans. Indeed, in this way the city teachers of New Orleans for several years received from Tulane University a course of instruction equivalent to a normal school of the broadest and highest grade. He began at once the development of the free public library which has grown into the present free library of the city. By a system of free scholarships from all the parishes or counties of the State, and others offered for competition in the leading schools, he built up a constituency which can not be diverted while Tulane retains its present ascendence. By a fortunate early investment in school buildings in the city, with an addition to the original endowment, the university has now been enabled to house itself in an admirable situation adjoining Audubon Park, while the medical department has been favored in a similar way in town. The time will come, with the inevitable coming prosperity of the city, when additional endowments will furnish the necessary funds for the complete development that always haunted the mind and burdened the heart of its great president.

4. But perhaps the most characteristic feature in this almost romantic story of Tulane is its remarkable success in handling the delicate subject of the higher education of woman. Although no part of the country can show a more enthusiastic group of young women, often longing in vain for the means of obtaining but no less praying for the best in the higher education, up to ten years ago the South had been slow to answer the call. There has, indeed, been a gratifying advancement in the character of the so-called female colleges of the section, many of which are becoming valuable secondary schools for women with an upper grade college attachment. A few of the State universities have opened their doors to girls; and six of these States have established the free normal and industrial college for white girls, while every Southern State has now a State normal school. But the most complete institution of the higher education for women is doubtless the Sophia Newcomb College—the proper woman's department of Tulane University. Under the masterly administration of President B. V. B. Dixon . . . . . the Sophia Newcomb College has grown in ten short years into a genuine companionship with Tulane. By its conditions of admission it has sensibly lifted up the entire system of female seminaries in the city and State. Its new buildings, with their furnishings, are the most attractive spectacle in the new side of New Orleans. Aiming at thoroughness in all its work, it has in its president one of the most competent representatives of the higher educational philosophy; and it already has become a power in the cultivation of the literary and artistic life of New Orleans and the Southwest. Its graduates are admitted on equal terms to all the privileges of the university.

This great work, which still remains far short of its own complete development at home, but in the future is to make a radical change in the entire organization of the secondary and higher education through the South, is a good illustration of the imperative need of first-class leadership. No State, perhaps, in this section had a larger number of broad-minded and well-disposed people for such work than Loui-

siana fifteen years ago. Tulane University is the result of the best thought of this group of people, under the fit leadership of President Johnston. Indeed, in his state of failing health, which for ten years made him almost an invalid, it would have been impossible even for him to have done his work without the hearty cooperation of trustees, faculty, and a resolute educational public. Randall Gibson used to say that he "never knew a man of finer fiber than President Johnston." It was only by the power of a marvelous personality, in which an indomitable will was harnessed to a childlike Christian faith, a rare social charm, and a magnetic quality of leadership, that this man could face the inevitable coming of the end; through years of suffering and weariness, denying himself the luxury of dying that he might leave his great task so far accomplished that it can hardly fail of becoming his noblest monument in the future.

CHAPTER XXXI.

REPORT ON EDUCATION IN ALASKA.

DEPARTMENT OF THE INTERIOR,
BUREAU OF EDUCATION, ALASKA DIVISION,
Washington, D. C., June 30, 1899.

SIR: I have the honor to submit my fourteenth annual report as United States general agent of education in Alaska for the fiscal year ending June 30, 1899.

Twenty Government schools, with an enrollment of 1,369, were in operation during the year. The following reports give an idea of the character and scope of these schools:

Sitka, No. 1.—Miss Cassia Patton, teacher; enrollment, 31; population, white, American and Russian. Miss Patton reports as follows:

"My work during the past year has been very pleasant. The yard has been inclosed by a new picket fence which adds much to its appearance. We have one of the most desirable sites in town, facing a sandy beach with an unobstructed view of Sitka's island-dotted bay. The schoolroom is well lighted, but owing to the cloudiness of the short days, I found it necessary to use lamp light more than usual.

"I have added to my circulating library 100 of the 5-cent classics, and the children have enjoyed them. I have found McMurry's Methods in Reading a help in making the list of books which I hope to add during another year. A good library is one of the greatest needs of our village. In our 'story period,' fifteen minutes each afternoon, story reading has been the greatest success. After hearing stories read to them several of the children would borrow the copy of the book and read it again to themselves many times.

"Believing that proper food would do much toward making many homes happier we have had a few cooking lessons. I placed on the blackboard carefully worded recipes which the girls copied in their notebooks and tried at home. They seemed very much interested, and I hope this attempt may result in much good."

Sitka, No. 2.—Miss Anna Kelsey, teacher; enrollment, 175; population, Thlinget. The following is Miss Kelsey's report:

"The year now closed has been pleasant, but greatly broken in upon by the old customs of the natives and trouble between the different factions, which at one time threatened to be very serious. Finally they were induced to let the United States judge adjust their differences. He deferred his decision until the hard feeling had in a measure subsided. I find the native children bright, but restless. During the winter there were quite a number of visiting children belonging to the Taku and Killisnoo tribes, who were here for weeks feasting, dancing, potlaching, etc. Thousands of dollars were spent in this way by our natives. Many made themselves poor. Later in the season they were obliged to go out and hunt or work for themselves.

"I used all sorts of devices to attract the children to school, with some success until their troubles broke out; then our numbers became small. Only one pupil attended throughout the year. I presented him with a suit of clothes at the end of the term. His mother is a widow with three small children, of whom he is the oldest. Both mother and boy were very happy indeed."

Sitka Industrial School.—Room No. 1, Mrs. E. C. Heizer, teacher; enrollment, 91; population, Thlinget. Mrs. Heizer writes:

"The interest throughout the year has been very good. Some of my pupils are as enthusiastic students as I ever had in any school. One young man has repeatedly expressed his regrets that he had not entered several years ago. His zeal is an inspiration, so eager is he to advance.

"The examinations conducted by our superintendent on the completion of a study have been an incentive to thoroughness.

"They have given several very creditable entertainments during the year, in which the pupils showed their individuality.

"Several of the girls want to be seamstresses. They have a knowledge of fractions which will aid them in cutting out work. A few of my pupils show by their interest and earnestness that in course of time they may become teachers themselves. One young woman has received special attention, and has been placed in training in the primary department in order to acquire experience in teaching. She spends two and a half days of each week in this way.

"Our school compares favorably with the leading Indian schools of our country. The greatest hindrance is that the native parents are not willing to place their children in school for a sufficient length of time to acquire a thorough preparation. This hinders them from becoming first-class carpenters or independent workers in any of the industries. Until the native parents realize the great advantage of a thorough education, I suppose we can only do our best and not grow weary in well-doing."

Juneau, No. 1.—C. C. Solter, teacher; enrollment, 74; population, white. The following is Mr. Solter's report:

"As in every new country, many of the residents are not permanent settlers. As soon as business grows dull in one place they leave for a more promising field or return to the States, taking their children with them. This is a serious cause of discouragement for the teacher. Even when a class has been well organized and interest kindled a number of pupils will drop out, to be replaced by others, who are new to the work. I see no remedy for this evil in the near future and believe it will simply have to be tolerated for many years to come. The weather in this part of Alaska is frequently very dismal, the days are so short and it rains so hard and continuously that it is an impossibility for the children to get enough fresh air. The larger boys have changed our small anteroom into a gymnasium, where they have excellent opportunity to give vent to their animal spirits. The small boys and girls have the schoolroom for their play room during recesses. A large shed in the school yard, in which the children could play in bad weather, would be an excellent thing for them and would greatly lighten the burden of the teacher.

"The progress of the pupils has not been as marked as I would have desired for reasons already mentioned. All those who were regular made very good progress."

Juneau, No. 2.—Miss Elizabeth Saxman, teacher; enrollment, 71; population, Thlinget. Miss Saxman writes:

"I have nothing new to report of this term's work except my effort to have a sewing class in connection with my regular work. I found to my delight that the girls took a great interest in it. I supplied all the materials that were used, such as gingham, calico, thread, buttons, etc.

"It is almost impossible to keep the native children in school during an entire term. Their minds seem to crave a change of work, surroundings, etc., and off they go unless anchored by the Mission Home. Education and Christianity must go hand in hand in accomplishing any good for the natives. The minister must preach education just as much as Christianity as the first steps to salvation."

Douglas, No. 1.—Miss Kate Spiers, teacher; enrollment, 70; population, white. Miss Spiers reports as follows:

"The transient population incident to a mining town accounts in part for the

great difference between enrollment and average attendance. Pupils whose parents reside here during the entire year have been exceedingly regular in attendance—one pupil, Clair Jones, not having been absent a day in two years.

"We have had a very pleasant and successful year's work. The school is well graded; a regular course of study followed and promotions made at Christmas and at the end of June. The progress in reading, language, and map drawing has been marked. The interest of the pupils in music also deserves mention. A choral class consisting of fifty voices selected from two Government schools and the parochial school has been organized. This class sang at various entertainments during the year and received especial compliment for its singing at the public exercises on July Fourth.

Douglas, No. 2.—Miss Gertrude H. Spiers, teacher; enrollment, 28; population, white. The following is Miss Spiers' report:

"Regarding the year's work which has just closed, there is very little to be said except that we have had a quiet, satisfactory, and pleasant year. The patrons have continued to be very kind and helpful and have cooperated in all the work. The death of our kind friend and committeeman, Mr. Robert Duncan, was a great loss. The attendance during the year has been exceedingly regular except in a few cases. The enrollment during the winter months was small, as many families spent the winter in the States. In the spring it was increased to our usual number. The school has been quite thoroughly graded, and a system of monthly examinations and reports was adopted and used during the spring months. The work in German, bookkeeping and drawing has been continued on the same lines as during last year. Some of the pupils now sketch from objects quite rapidly and accurately. A circulating library has been maintained for the two schools during the year. Fifty new volumes have been added, making a total of 114 books. The school now possesses an organ, the gift of our former committeeman, Dr. Campbell."

Fort Wrangell.—Miss Nellie Green, teacher; enrollment, 80; population, white and Thlinget. Miss Green writes:

"There were enrolled in my school during the year pupils whose ages ranged from 4 to 15 years, almost equally divided among whites, Russian creoles, and natives. As a rule, I find the white children hardest to control. They were kind, however, to the native children, and were a help to them in using the English language. The Russian creoles in disposition are much like the natives, quiet and happy. In their studies they are as bright as the white children, but often lack the energy and independence that characterize the whites. Some of them dislike the natives, I believe because they know that one or both of their parents have Indian blood in their veins; many of the children are very attractive; the little native children amused me often by their quaint ways. The parents of nearly all of them have been influenced by civilization—many are quite advanced in their studies. Irregularity of attendance is my greatest difficulty.

Jackson.—Mrs. C. Taylor, teacher; enrollment, 67; population, Thlinget. Mrs. Taylor reports:

"School began September 1, with a very fair attendance. I taught the first month at Klinquan, as at that time there were a great many native children there and none here. Through the kindness of Mr. Miller I kept school in a room over his store. Dry goods boxes furnished seats and desks. The weather was bad and the temporary school room leaky. The attendance, while not large, was regular, the interest good, and the progress satisfactory. In October I came over to Jackson and opened the regular school. My school was largest in January. Many visiting natives were here at that time who brought their children with them; after January the attendance gradually decreased until the close of the term. In the spring of the year the natives began their trapping and took their children with them to their hunting grounds. After the trapping came halibut fishing, gathering of seaweed,

etc. This migrating they kept up until July. The children advance very slowly on account of this irregular mode of living. When the children are in school regularly they learn rapidly, take interest in their work, and are interesting children to teach. The general health of the children has been very good. Our school room is warm and well lighted. The schoolhouse has had a new coat of paint, which adds much to its appearance. We received from the Bureau of Education a valuable addition to our library, consisting of a large quantity of magazines and a bound volume of Harper's Weekly. We are all delighted with them, and I am sure they will prove of great value and interest both to teacher and pupils."

Hoonah.—Mrs. J. W. McFarland, teacher; enrollment, 126; population, Thlinget. Mrs. McFarland writes:

"In looking over the record of the past year I find much to encourage me. When the natives begin their feasting and dancing during the holidays, you may consider yourself a successful teacher if you can keep up enough interest to attract any of them into the school. I had received a Christmas box which contained a great many marbles and other playthings that I used in attracting the boys to school. However, this proved to be more of a hindrance than a help, as it became impossible to get the boys interested in anything else. We had no regularly appointed police in the village this year; consequently it was harder to secure regular attendance. I have found gymnastics of great help by way of recreation and physical culture. The progress of those who attend regularly was very satisfactory. We were sorry to lose four of our number by drowning."

Saxman.—James W. Young, teacher; enrollment, 62; population, Thlinget. Mr. Young reports:

"We have had a year of quietness and progress. More buildings have been erected in the village than during any previous year. You are aware that this place was started for the purpose of gathering the Cape Fox and Tongass natives into one community, as the superintendent of schools thought there were not enough of one tribe to justify the opening of a school for each of them. This plan has been a success so far as the Cape Fox Indians are concerned. There are old feuds and jealousies that have kept them apart; these, however, seem to be quieted down. A few of the Tongass tribe have joined us, and more promise to come next autumn. Some of the Hydah tribe have also come and cast in their lot with us in order that their children may have school privileges.

"The recent discoveries of gold-bearing quartz in this region have made a great demand for laborers, and this, with the high prices paid for furs, has made good times for the natives—they all seem to have their pockets full of money. We have had very little trouble with liquor during the past year. The Rev. Edward Marsden unites with me in excluding it from the community. The natives have improved very much in morality, temperance, and intelligence since the school was started."

Kodiak.—Miss Anna Fulcomer, teacher; enrollment, 44; population, Russian creoles. Miss Fulcomer writes:

"In regard to my year of teaching in Kodiak, I can say that as a rule the children are just as bright as a similar set of children in the States—just as bright and just as naughty. My second reader class was the most interesting that I have ever taught. It was a large class of boys and girls who, with two or three exceptions, displayed considerable rivalry. I have never seen so much enthusiasm in children of that age. It was most amusing to me to watch the expressions on their faces when the new spelling books came. I gave them permission to take them home with them. The next morning the books were brought back neatly covered with brown paper in order to keep them clean. Much more interest and ambition is shown by the younger pupils than by the older ones; they want books and papers to read outside of school, and it was hard for me to keep them supplied. In number work they are somewhat backward. All had drills in English language lessons, a chart serving as a reader

and as a basis for exercises in the use of English. The attendance decreased rapidly during April and May owing to the work they had to do in their homes; hauling summer's supply of wood, fishing, preparing for and attending the Russian Easter services."

Wood Island.—Robert G. Slifer, teacher; enrollment, 56; population, Russian creoles and natives. Mr. Slifer reports:

"The school at Wood Island for the year 1898–99 was held in a room belonging to the Kodiak Baptist Orphanage. The desks are made out of rough lumber, and many of them have no place in which books can be kept. That the school is appreciated is shown by the fact that pupils have come from distant villages in the Kodiak district in order that they may have school privileges. During the greater part of the term a few of the older native children who worked during the day were taught in a night school. The majority of my pupils do very good work; many of them excel in reading, writing, and drawing. They memorize very well, but few of them have the faculty of thinking for themselves, so that it is difficult to teach them arithmetic. The attendance was quite regular. The Russian Church holidays did not interfere with the sessions of the school to any extent.

"During the summer of 1898 the natives of Wood Island did not get a single sea-otter during their annual hunt, so they have been unusually poor. Some of the older boys had to stay out of school to hunt and fish. Though discouraging in some respects, the work has become attractive to me."

Unga.—O. R. McKinney, teacher; enrollment, 36; population, white. Mr. McKinney reports:

"School commenced on September 6 with 33 pupils in attendance, but was interrupted during the latter part of the month by an epidemic of dysentery which lasted four weeks. I opened school again on October 24 and continued until February, when all the children in the village took the whooping cough, and for nearly eight weeks there were no children in Unga able to attend school. I started in again on March 27 and continued until May 20, when the mail steamer returned from the west. After considering the condition of the children and my own family's poor health, I made up my mind to close the school on the 21st instead of the 30th, and I accordingly took passage on the steamer for the States."

Eaton Reindeer Station.—Francis H. Gambell, teacher; enrollment, 11; population, Lapp. Dr. Gambell writes:

"As to the school work, I have the honor of making the following report: School opened on the 18th of October and closed on the 16th of June, being in session all the time, with the exception of the holidays and a spring vacation of a few weeks' duration. The enrollment consisted of 11 children, ranging from 5 to 16 years of age, and all guiltless of having spoken English. Their faces were bright and expectant as they gathered on either side of a rough table made for the purpose, and seated themselves on benches similar, probably, to the school benches of early times in other new settlements. Their first lesson was an object lesson, and so was their third and fourth, and so have all their lessons been during the whole year.

"They are apt and quick to learn, and while they are anxious to advance in all their branches, they seem to give particular attention to their writing, in which they are very neat and careful.

"Their attendance has been very good. Sickness alone has prevented them from coming, and in two or three instances I have sent them home after coming, as they were not in a fit condition to be in school. They have an average attendance of 97½ per cent for the whole year, taking the figures from the register. Their punctuality has been as good as their attendance. Often during the short winter days I have had to light the lamp at the beginning of school, as they would come long before the stars had gone out of sight.

"They have but few games and play very little, but they are always kind and affectionate and never seem to quarrel as they mingle together.

"During the evenings in the fall and winter I have instructed those of the older ones who wished to come. While some attended, I think more will attend when they realize more fully their need of learning to speak the English language well.

"As there have been no natives living near the station, I have had no Eskimo children, although some have expressed their desire to have their children attend, and probably will move nearer next winter, that their children may come."

The following table shows the history of Congressional appropriations for education in Alaska:

First grant to establish schools, 1884	$25,000.00
Annual grants, school year—	
1886-87	15,000.00
1887-88	25,000.00
1888-89	40,000.00
1889-90	50,000.00
1890-91	50,000.00
1891-92	50,000.00
1892-93	40,000.00
1893-94	30,000.00
1894-95	30,000.00
1895-96	30,000.00
1896-97	30,000.00
1897-98	30,000.00
1898-99	30,000.00
Expenditure of appropriation for education in Alaska, 1898-99:	
Amount appropriated	30,000.00
Salaries of 3 officials	4,480.00
Salaries of 27 teachers	20,127.50
Supplies for 20 schools	2,185.40
Fuel and light	1,324.93
Freight	265.00
Traveling expenses	698.87
Repairs	669.49
Rent	224.00
Balance	24.81
	30,000.00

Cost per capita of enrollment, $21.89.

APPROPRIATIONS FOR EDUCATION IN ALASKA.

For the past six years the annual appropriation for the education of children in Alaska has been $30,000, increased yearly since 1895 by the sum of $5,000 from the Indian appropriation bill. By strict economy it has been possible with these amounts to support the present school system. Within the past three years thousands of white men have settled in Alaska, many of them taking their families with them. The population of the older settlements has largely increased and several new towns have sprung up which are clamoring for school facilities. If Congress regards it as the duty of the Secretary of the Interior to continue to provide schools for the white population of Alaska, I can not state too emphatically that it is absolutely necessary that the appropriation for education in Alaska be largely increased. In order to provide school facilities which shall approximate the present needs of the increasing population of Alaska an annual appropriation of at least $60,000 is an imperative necessity. This is the amount which has been urgently recommended by the governor of Alaska.

PERSONNEL.

Dr. Sheldon Jackson, general agent of education for Alaska; William Hamilton, assistant agent of education for Alaska; William A. Kelly, superintendent of schools for the southeastern district of Alaska.

Teachers in public schools.

School.	Teacher.	State.
Sitka, No. 1	Miss Cassie Patton	Pennsylvania.
Sitka, No. 2	Miss Annie R. Kelsey	Do.
Do	Miss Flora L. Campbell	Alaska.
Juneau, No. 1	Charles C. Solter	Kansas.
Juneau, No. 2	Miss Elizabeth Saxman	Pennsylvania.
Douglas, No. 1	Miss Kate Spiers	Kansas.
Douglas, No. 2	Miss Gertrude H. Spiers	Do.
Skagway	Miss Anna Clayson	Alaska.
Fort Wrangell	Miss Nellie Green	Kansas.
Jaekson	Mrs. C. Taylor	Alaska.
Hoonah	Mrs. J. W. McFarland	West Virginia.
Metlakahtla	David Leask	Alaska.
Do	Miss Selina Leask	Do.
Saxman	James W. Young	Washington.
Kodiak	Miss Anna Fuleomer	Illinois.
Afognak	Miss M. Salamatoff	Alaska.
Wood Island	Robert G. Slifer	Pennsylvania.
Unga	O. R. McKinney	Do.
Unalaska	Miss Mary Mack	Alaska.
Do	A. W. Newhall, M. D.	New York.
St. Lawrence Island	William F. Doty	District of Columbia.
Point Barrow	H. Richmond Marsh, M. D.	Illinois.
Sitka Industrial School	George J. Beck	New York.
Do	M. A. Carty	Alaska.
Do	Miss Olga Hilton	Do.
Do	Mrs. M. A. Saxman	Do.
Do	Mrs. E. C. Heizer	Do.

NOTE—In the above list the following denominations are represented: Presbyterian, Methodist, Baptist, Congregational, Moravian, Russo-Greek, United Brethren, Independent (English).

LOCAL SCHOOL COMMITTEES.

In order to place the several schools established for white children on the basis of local self-government as far as possible, local school committees were organized as long ago as 1891 in Sitka, Juneau, Douglas, Fort Wrangell, Kodiak, Unga, and Unalaska. Of these committees, some of the members have continued since their first appointment in 1891, but a larger number have resigned or moved to other places and new members have been appointed in their stead. The following list shows the present membership and the dates of appointment:

Sitka, John G. Brady and Edward de Groff, appointed January 15, 1891; Rev. Anthony Dashkevich, appointed May 14, 1900.

Juneau, John G. Heid, appointed January 15, 1891; B. M. Behrends and J. B. Denny, appointed January 24, 1900; Rev. John B. René, S. J., appointed March 10, 1900.

Douglas, school No. 1, P. H. Fox, appointed January 15, 1891; C. A. Hopp, appointed September 26, 1899. School No. 2, R. J. Willis and William Mackie, appointed July 25, 1899.

Fort Wrangell, Thomas Willson, appointed March 29, 1892; Rev. H. P. Corser, E. P. Lynch, T. G. Wilson, appointed February 20, 1900; William Lewis, appointed May 14, 1900.

Skagway, I. N. Wilcoxen, Frank A. Wise, appointed August 1, 1899; J. M. Winslow, I. D. Spencer, Mrs. M. J. Snyder, appointed October 24, 1899.

Dyea, Jerome Andrews, G. C. Teal, J. Huebner, appointed February 20, 1900.

Kodiak, Frederic Sargent, appointed July 22, 1893; Wm. J. Fisher and P. D. Blodgett, appointed March 21, 1900.

Unga, C. M. Dederick, appointed September 22, 1894; George Levitt and P. K. Guild, appointed November 30, 1899.

Saxman, James W. Young, W. L. Bunard, Rev. Edward Marsden, appointed April 9, 1900.

Gravina, Mark Hamilton, Roderick Murchison, Benjamin Dundas, Alfred B. Atkinson, appointed April 9, 1900.

The following list contains the names of former members of local school committees in Alaska:

Sitka, Hon. James Sheakley, N. K. Peckinpaugh, Dr. C. D. Rodgers; Juneau, Karl Koehler, Rev. Eugene S. Willard; Douglas, G. E. Shotter, S. R. Moon, Robert Duncan, jr., Albert Anderson, A. J. Campbell; Fort Wrangell, W. G. Thomas, William Millmore, Allan Mackay, Rufus Sylvester, Finis Cagle; Jackson, James W. Young, W. D. McLeod, G. Loomis Gould; Metlakahtla, William Duncan, Dr. W. Bluett, D. J. Leask; Unga, N. Guttridge, John Caton, Edw. Cashel; Unalaska, N. S. Resoff, N. B. Anthony, L. R. Woodward; Skagway, Thomas Whitten, E. L. Niskern, Walter Church, F. R. Burnham.

The members of these committees have been of good service to the Bureau of Education, both as correspondents and by acting as auditors, countersigning the bills sent in for various local expenses of these schools, inspecting repairs, and giving advice as to measures for the greater efficiency of the schools.

For the southeastern section of Alaska a local superintendent was appointed as early as 1890 and has been in service ever since. The present local superintendent is William A. Kelly, of the Sitka Industrial School. His duties are to visit the schools, report on their condition, and examine candidates for the position of teacher.

Missionaries and teachers at mission stations in Alaska.

PRESBYTERIAN.

Fort Wrangell, Rev. Harry P. Corser, missionary.

Haines, Rev. W. W. Warne, missionary.

Hoonah, Rev. W. M. Carle, missionary; Mr. Willis Hammond (native), interpreter.

Jackson, Rev. D. Rankin Montgomery, missionary; Miss Minnie J. Taylor (native), interpreter.

Juneau, Rev. W. S. Bannerman (white church), missionary; Rev. L. F. Jones (native church), missionary; Mr. Fred L. Moore (native), interpreter.

Point Barrow, Rev. R. H. Marsh, M. D., missionary.

St. Lawrence Island, W. F. Doty, missionary.

Saxman, Rev. Edward Marsden (native), missionary.

Skagway, Rev. Norman B. Harrison, missionary.

Sitka, Rev. M. D. McClelland, missionary; Mrs. Matilda K. Paul (native), interpreter.

Sitka Training and Industrial School, Mr. William A. Kelly, superintendent; Mr. Dean W. Richards, assistant superintendent; Miss Susan Davis, boys' matron; Miss Sadie Martindale, girls' matron; Miss Frances Willard (native), assistant matron; Miss Anna May Sheets, assistant matron; Miss Lucile Owen, sewing teacher; Mr. John E. Gamble, industrial teacher; Mr. Howard George (native), shoemaker.

Hospital, Dr. B. K. Wilbur, physician and surgeon; Miss Esther Gibson, trained nurse.

EPISCOPALIAN.

Sitka, Bishop Peter Trimble Rowe, D. D., A. W. Kierulff.

Juneau, Rev. H. J. Gurr.

Skagway, Rev. L. H. Wooden; Miss Anna Dickey, matron of hospital.

Ketchikan, Miss Agnes Edmond.

Circle City, Dr. James L. Watt, Mrs. James L. Watt, Miss E. M. Deane.

Fort Yukon, Rev. J. Hawksley.

Rampart City, Rev. J. L. Prevost, Mr. E. J. Knapp.

Fort Adams, Mr. A. A. Selden, Miss Selden.

Anvik, Rev. J. W. Chapman, Mrs. Chapman, Miss B. W. Sabine, Miss L. Proebstel.

Point Hope, Dr. John B. Driggs.

Native assistants: Blind Paul, Neenahnah; P. Bolah, Nuhklakuhyet; I. Fisher, Anvik; J. Kwulwull, Circle City; W. Loola, Fort Yukon; Stephen, Nowikakat; Paul Williams, Nuhklakuhyet.

MORAVIAN.

Bethel, Rev. J. H. Romig, M. D., Mrs. J. H. Romig, Rev. Joseph Weinlick, Mrs. Joseph Weinlick.

Ougavigamut, Rev. Benjamin Helmich, Mrs. Benjamin Helmich.

Carmel, Rev. J. H. Schoechert, Mrs. J. H. Schoechert, Rev. Samuel Rock, Mrs. Samuel Rock; Miss Philippine C. King, trained nurse.

Several native assistants.

FRIENDS.

Kotzebue, Robert Samms, Mrs. Robert Samms, Miss Martha Hadley.

Nome, Mrs. Anna H. Foster.

Douglas, Charles Replogle, Mrs. Charles Replogle, Miss Jennie Lawrence

Kake, Silas R. Moon, Mrs. S. R. Moon.

BAPTISTS.

Wood Island, Rev. Curtis P. Coe, Mrs. C. P. Coe, Miss Hattie Denniston, Mrs. M. G. Campbell.

METHODIST EPISCOPAL.

Unalaska, A. W. Newhall, M. D., Mrs. A. W. Newhall, Miss Ella A. Darling.

CONGREGATIONAL.

Cape Prince of Wales, Mr. W. T. Lopp, Mrs. W. T. Lopp. Native assistants, Sokweena and Elobwok.

Nome, Rev. Loyal L. Wirt, Rev. Raymond Robbins.

SWEDISH EVANGELICAL MISSION COVENANT.

Yakutat, Rev. Albin Johnson, Mrs. Agnes Johnson.

Unalaklik, Rev. Julius Qvist, Rev. A. E. Karlson, Mrs. A. E. Karlson, Mrs. Selma Peterson, Stephen Ivanoff (a native worker), Mrs. Ivanoff, Mrs. Ojeark Rock.

Golovin Bay, Rev. J. Hendrickson, N. O. Hultberg, Mrs. N. O. Hultberg, Miss Amanda Johnson, Rev. P. H. Anderson, Mrs. P. H. Anderson.

ROMAN CATHOLIC.

Juneau, Rev. John B. René, S. J.

Dawson, Northwest Territory, Rev. William Judge, S. J., chaplain of the hospital and of the Sisters of St. Ann; Brother Bernard Cunningham, lay brother.

Koserefski (Holy Cross Mission), Rev. R. J. Crimont, S. J. (superior); Rev. John Lucas, S. J.; Rev. A. Robaut, S. J.; Rev. F. Monroe, S. J.; Rev. J. B. Post, S. J.; Brothers V. O'Hare, S. J.; B. Marchisio, S. J.; J. Twohig, S. J.; P. Brancoli, S. J.

Nulato, Rev. J. Jetté, S. J. (superior); Rev. A. Ragaru, S. J.; Rev. J. Perron, S. J.; Brothers C. Giordano, S. J., and J. Negro, S. J.

Dawson Hospital, Sisters of St. Ann: Mary Zephirine (superior), Mary of the Cross, Mary Pauline, Mary Joseph, Mary John Damascene, Mary Prudentia.

Koserefski (Holy Cross Mission, girls' school), Sisters Mary Stephen (superior), Mary Prudence, Mary Seraphine, Mary Winifred, Mary Benedict, Mary Antonia, Mary of the Passion, Mary Magdalen.

ORTHODOX RUSSO-GREEK MISSIONARIES AND CHURCHES IN ALASKA.

Sitka, Rev. Anthony Dashkevich.

Juneau, Rev. Alexander Yaroshevich.

Killisnoo, Rev. John Soboleff.

Nuchek, Rev. Constantine Pauloff. Chapels: Tatitlak, Kanihlak, Chanig.

Kenai, Rev. John Bortnovsky. Chapels: Alexandrovsk, Seldevoe, Nenilchik, Kusitan, Tayounak, Shushitno, Knik, Wood Island.

Kodiak, Rev. Tikhon Shalamoff. Chapels: Spruce Island, Uzenkoe, Shiok, Anhtalik, Trehsviatitelskoe, Arlovo.

Afognak, Rev. Nicholas Kashevaroff. Chapels: Karluk, Katmai, Kagnak, Duglass.

Belkovshy, Rev. Euthemius Alevine. Chapels: Unga, Korovinskoe, Peregrebenskoe, Protasevskoe, Chigit, Mitrofanievskoe, Sannahk.

Unalaska, Rev. Alexander Kedrovsky. Chapels: Atha, Attu, Borca, Makushi, Kashig, Chernovskoe, Akutan, Ummak.

St. George (island), Rev. Peter Kashevaroff.

St. Paul (island), Rev. Nicholas Riseff.

St. Michael and Ikogmiut, Rev. James Korchinsky. Chapel: Koshlik.

Kuskokvim (Pavlovskoe), Rev. John Orloff.

Nushagak, Rev. B. Kashevaroff. Chapels: Ekuk, Kaluak, Paugvik, Igiashk, Ugashek, Ikagmiut, Inagnasha, Iliamna, Kichek, Aliagnak, Knagnak, Kagvak, Kahonak, Agimek, Tugiak.

SCHOOLS AND TEACHERS.

Sitka, Rev. Anthony Dashkevich, Sergius Popoff, Gabriel Cherepnin. For Indian school, Rev. Methodius; Juneau, Rev. A. Yaroshevich and George Corcoran; Killisnoo, Rev. J. Soboleff; Nuchek, Rev. C. Pauloff and Alexandroff; Kenai, Rev. J. Portnovsky and Alex Ivanoff; Alexandrovskoe, Munin; Seldovoe, A. Demidoff, Minichek, and Kvasnikoff; Taiunak, (vacant); Kodiak, Rev. T. Shalamoff and Andrew Kashevaroff; Afognak, Rev. N. Kashevaroff; Belkovsky, Rev. E. Alexine; Unga, (vacant); Cannah, Nedorezoff; Protasievskoe, Kochutin; Korovinskoe, Chebatnog; Mitropanievskoe, V. Stefanoff; Voznesenskoe, Stepiannik; Chignik, Tulupiak; Unalaska, Rev. A. Kedrovsky, M. Skibinsky, V. Mainoff, Leontius Sivtsoff; Makush, Krukoff; Borca, Tastorgueff; Chernovskoe, Gordeeff; Umnak, Krukoff; Kashiga, Kudrin; Akutan, Petuchoff; Attu, Prokopieff; Atkha, (vacant); St. Paul, Rev. N. Riseff; St. George, Rev. P. Kashevaroff; Nushagak, Rev. B. Kashevaroff; Yukon, Rev. J. Korchinsky; Kuskokvim, Rev. J. Orloff.

PRESBYTERIAN MISSIONS IN ALASKA.

The Rev. George F. McAfee, superintendent of school work, Presbyterian Board of Missions, has kindly sent the following account of the board's work in Alaska:

"The Presbyterian Church has had missionaries in Alaska continuously since 1877. Mrs. A. R. McFarland has the honorable distinction of being both the first Presbyterian missionary, as well as the first white woman teacher in Alaska, being stationed by Dr. Sheldon Jackson at Fort Wrangel in the fall of 1877.

"*Fort Wrangel.*—Rev. Harry P. Corser is now in charge. The native church is in good condition, the people having greatly improved in manner of life during the past few years. A white church has also been organized, and Mr. Corser gives part of his time to it.

"*Haines Mission.*—This mission is among the Chilkats near the head of Lynn Canal. Rev. W. W. Warne is the missionary in charge. The pupils in the industrial part of the school have been transferred to Sitka, where they can be more thoroughly trained.

"*Hoonah.*—The work among the Hoonahs was undertaken in 1881 by Rev. and Mrs. J. W. McFarland. Since Mr. McFarland's death Mrs. McFarland has remained on the field and is now in charge of the Government day school. Rev. Wm. M. Carle and wife now occupy the mission house and carry on the work. It is most interesting and successful at the present time. The people are making rapid advancement in the Christian life and are showing their faith by their works.

"*Jackson.*—This mission to the Hydahs has had no missionary of the board for two years. Rev. D. Rankin Montgomery, a recent graduate from the Western Theological Seminary at Allegheny, Pa., with his bride, has gone to the field. The mission property has been well cared for by friends, and the Government day school teacher, who occupies one of the buildings, is especially deserving of praise for her interest in the matter. The boarding department of the school was closed two years ago and the pupils sent to Sitka.

"*Juneau.*—The native work at Juneau was begun in 1881 by Rev. Eugene S. Willard and wife. The mission is now in charge of Rev. L. F. Jones and wife. It is in a very satisfactory condition. There have been over 100 converts during the year. The industrial work which was carried on for several years, having served its purpose, was closed in 1898 and the pupils transferred to Sitka.

"*Douglas Island.*—Many natives are employed in the mines and about the famous Treadwell mills. Rev. Mr. Jones, of the Juneau Mission, has opened a work among them, placing in charge Mr. Frederick L. Moore, an educated native, who has been his efficient interpreter and helper for a number of years. The mission gives promise of success.

"*Juneau (white church).*—This is the noted Log-Cabin Church, always pointed out as one of the attractions of Juneau. It has been replaced by a beautiful, new, modern house of worship, and a neat and commodious manse completes the plant. Rev. W. S. Bannerman and wife are in charge.

"*Saxman.*—Rev. Edward Marsden, the first educated, ordained native minister, was instructed to open a mission at Saxman in 1898. The work has been fully as successful as was anticipated. Mr. Marsden has built a steamer, *Marietta*, named after his alma mater, and by means of it is enabled to preach the gospel to many isolated groups of people.

"*Skagway.*—A church was established at Skagway in 1898 by the Canadian Presbyterian Church. In 1899 the work came to our body by exchange. It is a flourishing white church, with house of worship and manse on the way to completion. Rev. Norman B. Harrison and wife are in charge. Many a poor, weary, homesick Klondiker on his way out or back has found comfort and cheer in this little church and home. Skagway is at the head of Lynn Canal and the beginning of the White and Chilkoot passes to the head waters of the Yukon.

"*Sitka.*—The Sitka mission is in charge of Rev. M. D. McClelland. He ministers to both the native and white churches. The great revival of the winter of 1899–1900 brought into the church nearly 100 native souls. The white church is also in good condition.

"*Sitka Training and Industrial School.*—This work was begun in 1880 by Rev. and Mrs. A. E. Austin. It has grown in interest and efficiency each year since its organization. As indicated, in connection with Hydah, Haines, and Juneau, the industrial work among the Alaskans has been concentrated at Sitka. This enables us to do better and more thorough work in training the youth for the active duties and responsibilities of life. In order that they may meet the changed conditions of life made necessary by the influx of white people, the taking up of fishing streams, the opening of mines, etc., this more liberal and broader education along both intellectual and industrial lines was necessary. A common English education is given. The girls are trained in the domestic industries so that they are fitted to become intelligent housewives. The boys have a training in trades, such as boat building and carpentry. They also make all the shoes worn by the entire school. One of the most interesting parts of the work is that of settling the graduates who unite in Christian marriage in the model village which is on the mission grounds. The terms are so liberal and the arrangement so satisfactory that these young people are anxious to avail themselves of the opportunity to secure a home for themselves.

They have without exception so far proven themselves worthy of this effort in their behalf.

"*Hospital.*—The hospital work is an important adjunct to the school and mission work. It is under the efficient supervision of Dr. B. K. Wilbur, who has associated with him Miss Esther Gibson, as trained nurse. There were during this year treated as in-patients, 227, as out-patients, 1,580.

"*St. Lawrence Island.*—Mr. and Mrs. V. C. Gambell went to St. Lawrence Island in 1894. They returned to the States in 1897, and in returning hither were shipwrecked. Their place was taken by Rev. W. F. Doty in 1898, and he was relieved by Dr. Lerrigo in 1899. Mr. Doty returns to the field in 1900. Notwithstanding these interruptions the work has gone on successfully.

"*Point Barrow.*—This, the most northerly mission station in the world, opened in 1890. Dr. H. R. Marsh and wife have been in charge since 1897. The mission aided in the rescue of the icebound whalers in 1898, and received and cared for the reindeer relief expedition. A herd of deer are now at Point Barrow, and the hope is that they have passed safely through the winter, and thus this industry will be successfully established in this far-off country.

"*Nome.*—There went into the Yukon Valley in 1899 a heroic band of missionaries. They were under the leadership of that noted pioneer, Rev. S. Hall Young, D. D. After stationing his associates, Dr. Young found himself icebound at Nome. Like an apostle he went to work, and in conjunction with the Congregational missionary on the ground did heroic service until he was prostrated with typhoid fever. At last accounts he was sufficiently recovered to begin preaching, and doubtless at this time—May, 1900—is exploring the unknown regions of the Yukon Valley.

"*Eagle City.*—Passing over the ranges with Dr. Young, from Skagway, Rev. and Mrs. James Wollaston Kirk found their way to Eagle City, and hung out the banner of Christ on the Yukon. Their home is the center of attraction to the weary and lonesome miners. Mrs. Kirk's piano thrills with its sweet sacred music the hearts of the men who are so far away from home and loved ones. These two noble souls are known and beloved by the miners in all that region around Circle City. For the love of Christ and souls these two Christian people were willing to give up their delightful home and prosperous church in the city of Philadelphia and go to the wilds of the unknown, far-away frozen land. Great was the sacrifice, but greater is the reward.

"*Rampart City.*—Rev. M. Egbert Koonce, Ph. D., a young man of promise, with flattering home offers, turned away from them all and set his face like a flint toward the Yukon. His soul was aflame with love for his fellows buried in those northern snows, and in the name of his Master he went forth bearing the glad message of salvation. He built his own hut, manufactured out of 'poles and tin cans' his own furniture, erected his house of worship, hung up the bell, and its gladsome ring called in many a poor, lonely miner who by its sound was reminded afresh of home and dear ones."

Graduates of the Sitka Industrial School.

Mr. William A. Kelly sends the following information regarding the graduates of the Sitka Industrial School:

Sitka, Alaska, *November 25, 1899.*

Rev. Sheldon Jackson, D. D.,

Bureau of Education, Washington, D. C.

Dear Sir: In accordance with your request of November 4, 1899, I herewith send you a list of the names of pupils who have graduated from the industrial school at Sitka, Alaska, and who, at the time I write, are following such trades as were taught them at the school, or are profiting by the instructions they received. These names represent the three principal tribes of southeastern Alaska, viz, Thlinget,

Tsimshean, and Hydah. Many of the pupils whose names are not appended have earned and are still earning good wages simply by their knowledge of the English language by acting as guides, interpreters, and packers for the large number of white men who have come into the territory within recent years. Especially was this true during the memorable season of 1897–98, when the miners found the assistance of our boys of incalculable value. The miners found the boys invariably honest and trustworthy.

As far as I can trace them, their names and employments are as follows:

Boot and shoe trade.—Don Cambren, Sitka; Daniel Shake Ish, Sitka; Chas. Kadashan, Haines; Howard George, Sitka; Chas. Willard, Juneau; Abraham Nelson, Gravina; Aaron, Wrangell; Chas. Bates, Metlakahtla; Geo. McKay, Ketchikan; Chas. Cutter, Klawack; Bert Weir, Chilkat.

Boat building.—Roderick Davis, Lake Bennett; Benjamin Booth, Metlakahtla; Thomas Hanbury, Cape Nome.

Carpentry.—Jack Tugaha, Juneau; Louis Jones, Wrangell; William Cutter, Klawack; Alexander Milne, Metlakahtla; Thomas Buxton, Douglas; Philip Milne, Metlakahtla; Thomas Cook, Sitka; Haines Delbert, Klawack; John Willard, Thomas Jackson, Sitka; Jack Eska, Haines; Joseph Campbell, George Eaton, Arthur Milton, Robert Ridley, Gravina; Matthew Snake Ish, Killisnoo; Frederic Shirkey, Klockwan; Daniel Reece, Metlakahtla; John Baronovitch, Carters Bay; Sam Newman, Chilkat; Robert Lee, Klawack; Harry Leeds, Juneau.

Coopering.—William Stewart, Loring; Maurice Wadham, Sitka; Mark Milne, Metlakahtla.

Clerking.—Thomas Eaton, Metlakahtla; William Wells, Sitka.

Cannery.—Jonah Hudson, Abel Carlton, Robert Alford, Edward Bolton, Metlakahtla.

Cooking.—Carrie Skinner, Sitka Hospital; Med., Millmore Hotel, Sitka.

Dressmaking.—Jennie Willard, Sitka; Annie Korratt, Juneau; Lottie George, Sitka; Mabel Skilli, Howcan.

Engineering.—James Mason, Gravina; Andrew Usher, Metlakahtla.

Mining.—Jamie Daniels, Gilbert Jackson, Ben Butler, Douglas.

Missionaries.—Mrs. Tillie K. Paul, Sitka; Rev. Edward Marsden, Saxman; Mr. Frederic Moore, Juneau; Fanny Willard, Sitka.

Teachers.—Miss Olga Hilton, Miss Selina Leask, Miss Flora Campbell, Sitka; Miss Florence Wells, Chemawa, Oreg.; Mr. Howard George, Sitka; Mr. Job Nelson, Kincolith, B. C.

Merchants.—Henry Phillips, sr., Skagway; Joseph Verney, Frederic Verney, Metlakahtla; Willis Shadahay, Hoonah.

Nurses.—Miss Annie Leask, Metlakahtla; Miss Anna Hines, Sitka.

Painter and paper hanger.—Joseph Jones, Carpers Bay.

Sawmill.—Peter Simpson, superintendent Mills Sawmill; Bartlett Layick Tah, Cyrus Peck, Sitka; Peter Fawcett, Port Simpson, B. C.

Silversmith—Rudolph Walton, Sitka.

Following are the names of girls who have graduated from the Sitka Training School, who have married and are living Christian lives:

Mrs. Rudolph Walton, Mrs. Howard George, Mrs. Thomas Cook, Mrs. John Willard, Mrs. Peter Simpson, Sitka; Mrs. George McKay, Ketchikan; Mrs. Bernard Hirst, Mrs. Russell, Mrs. Cyrus Peck, Mrs. William Mills, Mrs. John Hannah, Mrs. Andrew Usher, Sitka; Mrs. Gertrude Johnson, Mrs. Max Italio, Yakutat; Mrs. John Yokoss, Mrs. Elizabeth Jackson, Mrs. Frederic Moore, Haines; Mrs. Mary Davis, Skagway; Mrs. Jack Eska, Haines; Mrs. Josephine Choquette, Wrangell; Mrs. Alfred Andrews, Mrs. Eli Tate, Chilkat; Mrs. Patience Strong, Mrs. Elizabeth Hubbard Jackson, Juneau; Mrs. Minnie Shotter Ross, Douglas; Mrs. Eliza Willis, Hoonah; Mrs. Nellie Miller Choquette, Wrangell; Mrs. Frank Judson, Sitka.

Of the names of those pupils who are general workers I have not appended any list. Many of the names of girls who are not married, but who are at home, living sober, industrious, Christian lives, are also not on the list. Enough has been sent to show that the Sitka school is an absolutely necessary factor in the lives of the young people of Alaska.

I am, sir, your obedient servant, WILLIAM A. KELLY,
Superintendent of Schools.

CONGREGATONAL MISSIONS IN ALASKA.

By the Rev. CHARLES J. RYDER, D. D.,

Corresponding Secretary, American Missionary Association.

Cape Prince of Wales is on the point of the peninsula that juts out from northwestern Alaska. It is the farthest west of any mainland on the American continent. A mission was planted here by the American Missionary Association in 1890. The point is one of strategic value. Mr. and Mrs. W. T. Lopp have occupied this station for ten years. Many of the Eskimos pass back and forth through this portion of Alaska and are thus reached by the influence of this mission. During the year 1899–1900 both Mr. and Mrs. Lopp have made excursions on sledges into the north and interior regions of Alaska. They have visited the Eskimos on these excursions and have become acquainted with their methods of life and general conditions. They speak the language of the native people with considerable fluency. This greatly increases their usefulness in winning the people and bringing them under the power of Christian civilization.

Two native missionaries have been chosen for special work under the direction of Mr. and Mrs. Lopp. Sokweena and Elobwok are the names of these missionaries, and they have accomplished a good work during the year. It seems the principle of civilization here as elsewhere that only when a native leadership is furnished for the people can the mass be reached. Missionaries of a foreign people and tongue may bring influences to bear in training a leadership. It is only, however, when this leadership is prepared and sent out among the people that the masses can be reached. These two faithful Christian Eskimos have labored during the year with devotion and courage. Their influence and work are most encouraging features of this mission. Reenforcement of their work is needed. Other mission stations at which a native missionary shall gather the people of his own race, teaching them the industries of life as well as leading them in intellectual and spiritual development, will doubtless open more and more in the future.

A letter from Mr. Lopp brings the following message. It is the most recent news received from this field:

"Now that the American Missionary Association is out of debt we hope you will be able to send us a missionary with a missionary wife to be with us. It is hardly necessary for us to cite reasons for this. He should be a minister, if possible. It would not be right to subject children of school age to the influences of the life here. You wrote us up last year as having 'no time for gold hunting,' and yet gold has been discovered within a few miles of the Cape. This brings upon us new anxiety and greater work. Should these claims turn out well the American Missionary Association will not be forgotten.

"The *Bear* has made a wonderful cruise this season. I doubt if she ever made a longer one. The present captain has made a very conscientious commander, and has surely exerted himself to perform his duty vigorously and honestly. He has administered the law toward the Eskimos as well as white men, and arrested those who were guilty of crime. He was very kind to the natives, giving them help in coming

from Cape Prince of Wales to this point, and also across the straits to Siberia. When the sea was too rough for their skin boats he would have them hoisted up on deck. The United States surgeon has also been exceedingly kind to us.

"We now have 437 reindeer, and have sent an order signed by Dr. Jackson to the station on Norton Sound for the 277 which are yet due us. These will be driven up some time this winter. After they come we will make an estimate of the number belonging to the Eskimo boys and mark them. I have taken one new herder as an apprentice, and hope to take another or two next year. We sold reindeer at $30 per head to the Bureau of Education, which furnished money for training other apprentices. Our old apprentices can now pay their own way, and the sale of the reindeer in the future will go toward helping new apprentices till they can help themselves.

"The Woman's Home Missionary Association, of Boston, has contributed toward the support of native workers. We received word about it and rejoiced in their generous gifts. I will use it in helping support Sokweena at our little mission at Mitle-tok. As I wrote last year, we were enabled to start this mission through a small contribution of about $25 from the generous Endeavorers of Westboro, Mass. Then some other friends sent in a little help that went toward the support of Sokweena and his wife. It is not enough, but we will try to make it do for the present. We were unable to visit Sokweena but three times last winter. If we could only visit him oftener and help him more he would be able to accomplish more. But some of the children at his mission learn to spell and write a little, and to sing. We had some very good meetings. Lucy and I went up and stayed three days. We took a lantern. Many of the old folks had professed Christ and seemed to be earnest and sincere in their prayers. The position of Sokweena is a hard one at times.

"Adlooat, one of our brightest boys, was typo and artist for the Eskimo Bulletin. We will not be able to get the Bulletin out before November, I am afraid.

"We have just erected a building 20 by 40 feet, which we have decided to call 'Thornton House.' It is to be used as a workshop, clubroom, and for other purposes for the natives. The need of such a building had occurred to Mr. Thornton and myself in 1890. Last year Mrs. Thornton succeeded in gathering $127 dollars, which was sufficient to purchase the lumber and pay the freight on it. Two natives and myself have put up the building. The natives did most of the work on it, as I could not leave our house long at a time."

This report from Mr. Lopp presents an impressive picture both of the value of this work at Cape Prince of Wales and the methods which have been adopted. The herd of reindeer has increased largely. The method of herding, using natives for such purposes, has familiarized this people with the care of the deer and at the same time created in them a desire to possess herds of their own. This gradually produces higher standards in industrial life and larger views. Convenient transportation back and forth tends to civilization. An isolated people is generally an undeveloped people. Contact with others, especially those of higher civilization, is the important factor in race development. By means of the reindeer these Eskimos go rapidly from place to place and little by little the unfortunate influences of isolation are being overcome.

These reindeer bring also better food both in milk and flesh to the people. Diseases produced by the large consumption of fat will, little by little, pass away and the Eskimos will become physically a stronger people. The very care of such animals is also civilizing. It creates gentler characteristics and makes necessary self-control on the part of herdsmen. This mission of our Congregational churches at Cape Prince of Wales finds large value in the reindeer herds.

The finding of gold in this part of Alaska brings very perplexing problems inci-

dental to such movements. Not only must this mission reach and influence the natives, but it must more and more become a means of grace to the white men coming in. Mr. and Mrs. Lopp are well fitted for these difficult responsibilities, and the mission was never more needed than to-day.

Methodist Missions in Alaska.

By Mrs. S. L. Beiler.

Unalaska.—The Jesse Lee Home has at the present time 27 children. Four have returned to their homes on the Aleutian Islands; 2 have married. We have sent none to the Government school at Carlisle, Pa., this year. There are already 13 from our mission at Carlisle, and 1 in Chicago being educated by Mr. P. B. Weare, and 1 in Canada taken by the sister of one of our missionaries, who writes: "Vasha is doing so well. The improvement in her spiritual life was a joy to me."

The Eskimos we expected this summer did not come, on account of the crowded condition of the Government revenue cutters, which had to care for the Cape Nome miners and others who were stranded. We are looking for them next season.

You ask, "What is our relation to the Government school there?" None whatever; it is entirely separate. About 200 yards from us is the new school building, which is used this winter for the first time. Miss Mann is the superintendent. There are 65 pupils, which includes 30 from the boys' school connected with the Greek Church. Because of this, Dr. Newhall has been requested by the United States Government to assist until another teacher can be provided.

The children from the Jesse Lee Home attend this school, taken to and fro by their teachers. The public school teachers have boarded in the home, because there was no other suitable place. The self-support is increasing. The past year has been the best in this respect. We rented a part of our land to build boats upon. Three hundred dollars was received in this way, which has been sent to the treasurer, toward the hospital fund. We find that the cows are self-supporting by the sale of milk.

Industrial classes have been formed and more practical work is being pursued.

Dr. Newhall has proven of great service in unnumbered ways. He writes: "The attendance at services varies with the number and kind of vessels in port. Great interest is taken in the singing of hymns. On a recent Sabbath there were gathered together an interesting company—American sailors, miners, and natives. There were represented Americans, Englishmen, Norwegians, Irishmen, Swedes, native Aleuts, Germans, Creoles, also Indians and a number of native mothers with their babes. The Sunday school is in a prosperous condition. During the past six months the children have purchased a call bell, blackboard, and crayons, and have some money left.

The Cape Nome gold field has made quite a stir. Thousands of miners have gone there this summer in search of treasure. The lowland, covered only by the deep and swampy growth of moss, has proven a hotbed of disease, and the unsanitary condition of affairs has added to the spread of the disease. Cape Nome fever is rife and has taken away many lives. The country is devoid of timber. The supply of coal is small, likewise provisions. As a result the miners have overcrowded the steamers in order to leave the country. Many will be unable to get out and much suffering will result. Two hospitals have been erected, but have not met the demand. Every steamer has had many sick on board, and not having sufficient accommodations for them, some have been left here at Unalaska. The mission has done its share in caring for them.

A few incidents:

Mr. Buckley, age 58, has been up the river six years. The past year he has been

sick with pneumonia, etc., and soon was left without means save the fare to Unalaska. While boarding the steamer at St. Michaels at night he was crowded through an open door and fell into the engine room far below. Three ribs were fractured. When consciousness returned someone had relieved him of his baggage. He had no place to sleep save on the floor of the second deck, with only a borrowed blanket. His suffering was intense. The ship's company allowed him to sleep aboard while the vessel lay at the wharf, but on her departure his only shelter was a leaky bunk house, with the old floor for a bed. On October 1 he came to the mission. We were glad to give him a bed and food to eat. The man was suffering much, but soon began to improve. Instead of the dirty, rough-looking miner, he became a clean and respectable-looking man. He appreciated the kindness shown by helping on the chores as his strength would permit. After a stay of seventeen days the United States revenue cutter *Bear* called, and Lieutenant Jarvis kindly gave him passage to the States.

The S. S. *Bertha* called and had four sick men on board. Would the mission care for them? To leave them would mean a chance of life; for them to go on would mean a grave in the deep. A room at the Jesse Lee Home was transformed into a ward. A sailor was the only one who could be obtained as a nurse.

One Sunday morning (October 22) at 3 o'clock we were aroused by persons at the door. The S. S. *Portland* was at the wharf. An Englishman of wealth had died on the steamer. Would the mission receive the body and give it a burial? The service was held on Monday evening at 8 o'clock. The room was well filled with officers from the S. S. *Roanoke*. The choir was composed of Eskimos, Aleuts, and Creoles. In the darkness of the night, with the wind and rain to wail their mournful dirge, the procession wended its way to the hillside, where the remains of Mr. Girling were laid to rest. (Mr. Girling was financial agent of a London company operating in Alaska.)

Baptist Missions in Alaska.

By Mrs. James McWhinnie.

In the western part of the Gulf of Alaska is a cluster of islands known as the Kodiak group. These islands are in the center of the district assigned to the Baptist denomination which extends from Mount St. Elias around the Gulf of Alaska to the Shumagin Islands, a distance of 1,100 miles. Upon Wood Island, one of the smallest of the group, a Baptist mission to the natives of this part of the Territory was established by the Woman's American Baptist Home Mission Society in 1893. This island was chosen because it was the headquarters of the North American Commercial Company, who have always been favorable to missionary work. Upon the 4th of July, 1893, an orphanage was opened, and during the past seven years over 50 children have been cared for; there are at present 28 in the home. This orphanage is under the special care of the Baptist women and children of New England who aim to raise $5,000 annually for its support.

There have been many changes in the workers in the seven years, but the present efficient superintendent, Mr. C. P. Coe, is now entering his fifth year of service. The work has steadily grown under his care, and great improvements have been made upon the buildings and grounds. The children are bright and intelligent, and for the most part interested in their work. After a short visit to the States, Mr. Coe returned with his wife and children to Alaska last April. Mrs. Campbell, of San Francisco, accompanied them and has proven a very efficient matron for the orphanage. Miss Hattie Denniston is the industrial teacher. In October Mrs. Coe commenced a work she had had in mind for a long time. She invited the native women to the orphanage for one afternoon a week to show them how to sew. This class has been well attended and much interest taken in the work; the promise of having the

quilt they piece is a great incentive to work. About 30 tons of ensilage have been cut during the summer for the silo, and 6 tons of hay placed in the barn; much of this was brought in the boat from an island 12 miles down the bay. During the haying season our people met with a very sad accident. Conrad Egeter, who had been for a number of years in the employ of Mr. Coe and who was a most faithful servant, with a number of the mission boys went to the end of the island to secure the last load of hay. Upon the return trip the boat was overturned and Conrad, with one of the boys, was drowned. This was the first accident at the mission and has caused deep sorrow and gloom.

The great need at present is for a boys' dormitory. Until this can be supplied Mr. Coe has transformed his own cottage into a place for the boys. He has established a reading room not only for the children, but for the natives and for the sailors who may be in port.

The Government has for the last two years sustained a teacher at this place and the school is taught in the mission building. Mr. Robert G. Slifer is the Government teacher.

The first Baptist Church in Alaska was organized in July, 1897, and a church building erected. At present the church has ten members; two of the children in the orphanage have been baptized during the past year, and three others have been received for baptism. This is the only Baptist Mission to the natives in the Territory, and is under the care of Mr. Coe, who is pastor of the church. We believe the new condition of affairs in Alaska will bring this station into greater prominence in the near future.

Of the good work done in the mission, I quote from a letter of Mr. Robert Slifer, the Government teacher, who has spent the winter at the orphanage:

"The work here is worthy of the attention it is receiving. It is doing a vast amount of good. It has never been my lot to meet a people who were so degraded, and in many ways so hard to work with, as the creoles of this section. The mission children are in most cases the very worst that could be found to deal with when they come into the mission; in a short time they are better than the rest of the outsiders."

Moravian Missions in Alaska.

[From the annual reports of the missionaries.]

Bethel.—The work at Bethel, as in the past so in this year, has been much with those who are traveling up and down the river or from the tundra to the river. This station from its very location naturally has a wide influence and is admirably situated as a center from which to do traveling missionary work. We regret exceedingly that lack of means has necessitated the closing of the school. If we have the children the parents are easy to influence, and the children are likely to remain permanently ours.

In March we had the pleasure of a visit from Brother Rock, of Carmel. His visit was prolonged beyond his calculations, owing to the early spring, which forced him to remain at Bethel and go home by water. Also in March we were visited by Chief Engineer Crow, of the steamer *Hamilton*, on the Yukon. He put our engine and sawmill into good running order free of charge. He came at the request of the mission for that purpose, and when finished donated the value of his work to the mission.

On May 27, 1898, the ice on the Kuskokwim broke up, leaving the river free of ice in a few days. It froze up again for the winter on October 18, 1898.

In August the mission was visited by a party of the United States Government Geological Survey, under the direction of Professor Spurr.

During the fall and winter several white men visited the mission, chiefly traders from Yukon. The high prices caused by the Yukon rush are making themselves

felt on the Kuskokwim. Last year the price of dogs was $6 to $10 each, now it is $20. Ready-made furs, wages, etc., are likewise much affected.

The year has been an active one. Fifteen trips for the performance of actual missionary work were made during the year, different brethren sharing in this duty. The shortest round trip was 10 miles, and the longest 400 miles, the average trip being 186 miles, and the average absence of the traveling missionary from home was ten days to the trip.

Owing to a severe epidemic of the influenza the death roll in our villages is very large. Thirty-five were buried by one or the other of the missionaries. Quite a number were buried in the non-Christian villages, and for these no reliable data can be given.

The out-stations—Naposikagamute and Pinehagamute.—Naposikagamute is located near us and has always been very indifferent to missionary effort. Last year one of the shamans, or "doctors," said if our missionary would give him plenty of tea he would make the people good to us. This year he as well as the whole village want a missionary all of the time, and show signs of much deeper interest than in former years. Helper Neck, who is stationed at this village and at Pinehagamute, though sickly, has labored faithfully and earnestly. He takes down our discourses in his native form of hieroglyphics, and then delivers these sermons to the people.

The four villages between here and Quinehagamute.—These villages are just opening up to missionary influence. Especially among these heathen villages is the use of medicine gratifying in its results. The cure of the itch, so common and so persistent among these people, exercises a great influence over them. There are many school children among them, who, if they could be taken into school, could be readily influenced, and not only they, but their parents also. We may say, medicine and the school together are the best means of winning these villages.

Quinehagamute.—This large village of coast people, "sea pirates," as one of the captains called them, has been under missionary influence to a limited extent in previous years. Here for about six weeks the missionaries and traders stop each spring, while they are waiting for the coming of the vessel. Native missionaries have also been at work for some time at this place. Last year we were encouraged by the conversion and baptism of the first resident member of the village, Albert. This year we have to encourage us the awakening to the glorious hope of salvation of the mother and sister of this pioneer Christian. That other hearts are melting under the warmth and light of God's word is evident from the increased call for medicine, which means less of superstition and shamaning, and also from a general development of the villages with increased friendliness to the missionaries.

The helper stationed at Quinehagamute, Stephen by name, has been faithful and zealous. Last fall he was called upon to mourn the death of his wife. Our hearts go out in sorrow for him, as he was away both from his and her people when she died, and he is left with five small children. He will necessarily have to return to his home village.

Togiak.—Togiak is a district not properly within the bounds of Carmel or of Bethel, being 130 miles from Carmel and 230 miles from Bethel. The people on this river have sent repeated messages both to Carmel and to Bethel asking that a missionary should visit them, and asking for a native missionary to live on their river. Some of the people being related to the Kuskokwim people, they have asked for Helper Kawagleg of the Ougavig district. With the consent of the other missionaries I will send him to visit these people, and will communicate to you the report of his visit by the spring mail.

Helper David.—It may be wondered what he is doing, as he is in the Bethel district. His duties for this year are those of interpreter for Brother Romig. This takes the bulk of his time and is a very responsible position. His delivery is excellent, and his ability to grasp the thought and properly render it in order to give it its true

weight and value make his services very valuable. We would feel comparatively helpless at Bethel were it not for the confidence we have in him to perform his work in an acceptable manner.

The medical work.—The medical work has been on the increase each year, but this year time has not permitted me to keep a detailed record.

When we returned from the coast this spring, there were natives from near and far to welcome us; people of three tribes, our home people, the Youtes, a few Ingalicks, and also a few Kaltchan Indians. These upper Indians had come for medical care, some for a distance of 300 or 400 miles. They had hoped to find me at home, but as we had gone to the coast, they were compelled to wait six weeks until we returned. They had come with the trader and were to return with him. They were, however, hopeless cases, and two of them were overtaken by the influenza on the homeward trip and died. Our hearts were moved for them. They had come through storms and calms, tortured by innumerable mosquitoes and unprotected from the rain, to see an earthly physician. They produced from their meager store as a present to insure the best attention a well-tanned moose skin or some deer sinew, only to learn through the cumbersome channel of double translations (from English to Eskimo and from Eskimo to Kaltchan) that their chances of recovery were few, and that their long journey was in vain. Poor people! could they only recognize their heart's condition and seek the Great Physician as they do an earthly one, they would not return sorrowing from their search.

The Bethel missionaries officiated at about 35 funerals, as stated above, but this can not be taken as the total death roll. One village of about 100 souls lost 11 of its number. We judge that the young and strong that are left will naturally recover in more instances, and that the death rate will not be so great.

Food supply.—The food supply of the natives is annually becoming a graver problem. However, the past summer was one in which all who were active could secure plenty of fish. But in the spring, before the ice left, one whole family and several individuals of other families starved outright. Other cases, which came short of perishing, suffered severely from lack of food.

We still look with interest to the domesticated reindeer. As yet no herd has been granted us.

Should mining develop, which it may in time, the natives will have greater facilities for making a living. However, the remedy of frontier civilization is, as a rule, no better for the natives than the disease of idleness and short food supply.

Carmel.—The mail carriers arrived at Carmel, on the Nushagak River, so much earlier than was expected that the detailed reports were not ready.

Sister King was apparently in better health than at last reports, and was able to perform her noble duties (as a nurse) very successfully. She tells of the distressing amount of sickness, especially among the children of the natives. The missionaries, through God's blessing, have been spared serious sickness. She speaks very modestly of what she has been able to accomplish. But Brother Rock reports that she has the stuff in her of which heroes are made, and relates how she went in a little kayak, while the river was filled with floating ice, which might easily have crushed the frail skin boat, to minister unto those who were sick and whom she was fortunately able to save from death.

Brother Rock reports how he induced the natives to work for the support the mission had to give them, and thus secured a good wood supply for the mission. It is interesting to hear that, though they had to work "like slaves," yet they succeeded in raising a splendid crop of garden vegetables and so many potatoes that they actually had some to sell. In this way and in many other ways they try to save the board expense, and thus lessen the amount that has to be sent to them from the States.

Brother Schoechert reports that every child in the native community under 2

years of age died. There are 167 souls in their charge at Carmel proper and nearly 300 persons, classed as "new people," on the Togiak River, who earnestly desire the truth as it is in Jesus and who are eager to have a missionary. The white settlers greatly appreciate the school. The Greek Church at Nushagak has been left in charge of Deacon Kaseveroff and is shorthanded, as the priest has received permission to leave. There is a steady growth in the interest of the natives up the river. There are, besides Carmel, two out-preaching stations on the Nushagak River and six on the Togiak.

Brother Schoechert describes his visit to Bethel and the mission conference there in February, 1899. He speaks very appreciatively of Dr. Romig's medical work. He also mentions the eagerness of the natives to build chapels in certain of the villages in that district and that the mission conference had resolved to encourage them to do so.

Missions of the Protestant Episcopal Church in Alaska.

The following extracts are taken from the annual report of the Rt. Rev. P. T. Rowe, Bishop of Alaska.

I left Sitka for a visitation throughout southeastern Alaska. My first stop was at Juneau and Douglas Island. The Rev. H. J. Gurr is now the missionary in charge. Juneau is growing slowly and seems to be assured of a permanent and stable future—more so than any other place in Alaska, as far as I am able to judge. Property is very high. The lots on which our church and mission house stand were purchased, less than four years ago, for $375, exclusive of the buildings. To-day they could be sold for $5,000. Juneau, therefore, has a future, and I have hope that our church will become a strong organization in time.

St. Luke's Mission, Douglas City, was visited, services conducted, one person confirmed, and two children baptized. The Rev. Mr. Gurr is attending to the needs of this mission, but we ought to have a young man in holy orders to take up this work. The place is growing, the population is probably 2,000, and it has every appearance of a future. A small chapel is very much needed, and just as soon as there are funds enough available will be commenced. At present the services are held in a hall.

KETCHIKAN.

This mission is situated on Tongas Narrows and on a very large island—with a name quite as large. It is 15 miles from Metlakahtla and about 100 miles south of Fort Wrangell. We have two humble buildings, once Indian cabins, and one of these, set up on a point of rocks, is used for a school. The buildings will hold the ground or rock on which they stand, at least. Until quite recently "squatter's" title was the only title we had in Alaska. Miss Agnes Edmond is the teacher and only representative of our mission.

I arrived in Ketchikan on June 8. I saw that quite a change had taken place since my last visit. There were many more men around. The reason of that is that the district lying on all sides is highly mineralized, and already some good prospects have been discovered. It is entirely a quartz region—copper as well as gold. The surrounding country for many miles is being prospected by several hundred men. I ran across three prospectors in Squawl Arm, Helen Bay, and many other places. I visited the men wherever it was possible. I held services in Ketchikan, and the congregations were, with the exception of three or four women, of men. They seemed to appreciate the services and wished that I could stay with them. But there were other destitute points, the country is great, and as the bishop is the only traveling missionary, I had to deny their request and move on.

I hired a boat, crossed Clarence Straits, and went up to the head of Kasa-an Bay, which runs far into Prince of Wales Island. Here is the old village of the Hydah Indians. It has a beautiful situation, and the village looks very strange as

you approach it. Before every cabin there stand two or three totem poles, large, moss-covered, and seem to have stood there for a hundred years or so. The Indians were not at home, to my disappointment, but they had left behind four dogs and a cat. They had gone to their summer fishing grounds. These Indians have asked Miss Edmond to come and live with them and teach their children. They are anxious for a mission and are urgent for Miss Edmond to make the beginning. They are a superior class of Indians, more intelligent and industrious than others. They have been far removed from the trend of civilization, but now that "propsects" have been found near their village, they will soon be surrounded with whites. Here, as in other sections of Alaska, that means a fearful menace to the native population. The outlook is serious, and the need of missions and workers is greater than ever. It is to these agencies that the natives are looking hopefully for protection and guidance and salvation. May the church realize the importance of these days in Alaska!

Miss Edmond is willing to go to these Hydahs, but until we have a missionary to center at Ketchikan I can not let her go. She not only teaches the children, does all the good she can, but she also occupies and protects our property. There is a native population at this point, and its condition is deplorable. They seem to get liquor without any trouble. Women and men drink alike. Often do the little children seek the shelter of the mission house when their parents get drunk. Moral sense seems dead, too. Miss Edmond has done and is doing much among these conditions to inculcate a higher sense of morality.

I visited Squawl Arm and some other points on Prince of Wales Island, then sailed over to Metlakahtla and had a very pleasant visit with Mr. Duncan, finally reaching Tongas Narrows in time to catch a steamer for the north, and thus ending an interesting visit to this part of Alaska.

SKAGWAY.

Since my return from the East in May I have made four visits to this mission, which has been in charge of the Rev. L. J. H. Wooden for the past year. On Sunday, June 4, I preached, confirmed two candidates, and celebrated the Holy Communion. It was a great happiness to have with us at this service the good Bishop of Olympia. Skagway is a place of considerable importance. Its people are bright, progressive, and enterprising. There is a small church element here, and it is of the very best quality. I have transferred the Rev. L. J. H. Wooden to the vacant mission at Fort Yukon, so that we have no one in charge at present, but I hope, through the help of Mr. Kierulff, to keep up the services until another missionary is appointed.

Our hospital at Skagway, which was such a blessing to the sick and distressed miners a year ago, has continued its good work under the manager, Capt. F. A. Wise, and the highly-esteemed matron, Miss Anna Dickey. A woman's ward has recently been added, and other improvements have been made, so that we possess an institution which is a credit to the church and has made a great name for itself in these parts. The number of patients has decreased, owing to the better conditions of the country and the freedom from sickness. But even now, whenever a man is taken sick on the trail his first thought is to reach the hospital as soon as possible, for the skill of the physicians in attendance, the efficiency and gentle kindness of the nurse, and the comforts of the hospital have become widely known and confirmed everywhere. The craving of these strong men in their sickness for a woman's care, and their dependence on it, is a marvelous and pathetic thing to witness, while their gratitude is deep and genuine. We can not be too thankful for this service of woman, nor for the church which enables us to carry on such a merciful work. The hospital is entirely dependent upon the uncertain ability of the patients to pay, and the voluntary contributions of friends outside to meet the cases of charity that are always cared for. May I quote the words of Senator J. J. Boyce, of Santa Barbara,

Cal., whose son was recently nursed through typhoid fever, contracted on the trail: "Under these circumstances, reverend sir, I feel it incumbent upon me to express to you my heartfelt thanks for your noble work in establishing, at such a place, such a desirable place for the afflicted. * * * During a visit to Alaska, sometime ago, I heard many reports of its good work throughout the Territory, and I little thought then that I should personally come into contact with this evidence of your practical Christianity."

Bishop Barker has been kind enough to receive all contributions for this hospital and has continued to disburse the same. From his statement to me, he says that he has paid out for—

Building the addition	$1,000.00
Medical supplies and freight	296.73
For support	2,000.00
Total	3,296.73

From Captain Wise I am informed that there have been 121 patients received and treated; 19 deaths; that there is charged to charity $1,105.

The rest of my report will be made up from the letters of the missionaries along the Yukon, etc., because I have been unable to visit all these places since my return, and partly because I found it necessary to give attention to the work in this rapidly developing section of Alaska, "set in order" things that were in need of it, so that I might feel free to start on a long and distant visitation, God willing, next spring.

CIRCLE CITY.

The Rev. J. L. Prevost has been in charge of the work at this mission up to June last, when he left for Rampart City, transferred to that work. Mrs. Prevost and children, who are not well, are on their way to the States, accompanied by Mrs. Demonet. I commend Mrs. Prevost to the loving esteem and kindness of all our church people, for she certainly has "endured hardness" in that region, and returns after a good work, faithfully and bravely done.

Dr. James L. Watt, whose wife and child are with him, and Miss E. M. Deane, "Sister Elizabeth," deaconess and nurse, have had charge of "Grace Hospital." Dr. Watt will continue in that work and at the same time act as lay missionary in conducting the services. Both he and Sister Elizabeth have written most hopefully and enthusiastically of their work. Dr. Watt says: "Our work is looking better and brighter all the time; * * * the hospital has been full of patients all the month; * * * they are all broke, bad with scurvy, victims of the Edmonton trail; * * * steamer which brought these from Fort Yukon made me pay the fare of one of them, $12.50."

STATISTICS FOR HOSPITAL.

"We have received and treated in the hospital 42 patients, 31 white, 11 Indians; total number days of treatment, 832. Deaths, white, 1; Indians, 3. Less than one-half paid. Patients treated outside of the hospital were: Whites, 20; Indians, 147. Deaths: Whites, 2; Indians, 2. Total visits made, 487. In September last I went to Fort Yukon, distance 90 miles, at the request of the Rev. Mr. Hawksley to visit the Indians, many of whom were sick. I treated 46 patients and made 116 visits, and was gone six days. Again in January, with sled and dogs, I made a journey over the ice, temperature from 40 to 50 degrees below zero, to attend to the sick, and also Mrs. Hawksley. I treated 15 patients, made 20 visits, remaining five days; was three days going and three days returning. It is expensive traveling here, but I met the expenses by bringing mail and freight on my sled. I have had successful operations for appendicitis and laparotomy, with one exception. These are the first of such operations on the river. Our hospital needs are a sterilizer, a good supply

of needles, sutures of all kinds, tonsilotomes, forceps, bone, artery repair, abdominal dressing forceps, compressed-air tank, pump and spray tubes for throat and nose, silver wire, catgut, silkworm gut, kangaroo tendon, fine suture for intestinal work, good reading matter, sheets, towels, etc.

"The hospital receipts were $2,675.79; disbursements, $2,613.07; the assets, $2,783.57; liabilities, $1,242.98.

"On July 3, I heard that the steamer *Sault Ste. Marie* was hard on a bar 6 miles below Circle City, and that 4 men had scurvy very badly; also little food on board. I took medicines and some fresh potatoes, and went in a canoe to their relief.. The current was running 10 miles an hour, and we made the steamer with difficulty. After seeing to the relief of the men I started for home. The current carried me downstream in spite of myself. Finally I made the opposite shore, where the water was rushing at a terrible rate. I climbed the bank to pull the boat along, when the bank fell in and down I went, with dirt and all, into the water. I swam to the boat and pushed it to the shore, where I crawled out. The water was cold and the air was colder; between the two I lost heart and took a rest. We started again, but were carried 2 miles down the river before we could reach the mainland. There we worked our way along the shore; at 4 in the morning we saw Circle City. I left the boat and started out to walk. Word must have been passed to the mosquitoes that we were coming and were good to eat, for there were myriads of them at every step; for everyone we killed a million seemed to take its place. After falls and scratches, with clothes torn and more dead than alive, we roused Sister Elizabeth, who gave us something to eat, and I went to bed at 6 a. m. Such was my trip to the relief of these six men 6 miles down the Yukon."

FORT YUKON.

This mission has been in the charge of the Rev. J. Hawksley for the past two years. He was obliged to leave and go to the help of Bishop Bompas. He did so, to my regret and his own, but his work has been blessed to a very great degree. The mission is likely to be a very important center for Indian missionary work for a long time to come. The Indians of Gen du Large, Rampart House, Beaver Creek, the Ratband, and Fort Yukon all center here. We have a small log mission house, which is used for school purposes as well as for church services. Mr. Hawksley built a mission residence while he was there and I have just received the bill for the same, $1,100. He was also obliged to hire a teacher, and paid him $175 for a little more than three months' service, the bill of which I have also received. He strongly urges the employment of a teacher, and Bishop Bompas is willing to pay half of his salary, $250; but I do not think we should accept his kind offer—it is our work, and we should bear the responsibility. He urges sending in a missionary at once—the work otherwise would be seriously menaced. I have sent the Rev. L. J. H. Wooden to this mission and he will be there by September 1. He reports again the faithful and loyal services of William Loola, a native reader, to whom I pay $150; but he gives all of his time that he can—often lacks food—so Bishop Bompas increases the offering. This I will endeavor to do myself. Mr. Hawksley has failed to send any detailed statement of his work, although he informs me that this will come later.

FORT HAMLIN.

This is an Indian village about midway between Fort Yukon and Rampart City. The Indians are our baptized people, and the only attention we can give them is such as Mr. Prevost is able to give occasionally as he passes up and down the river. Hereafter he may be able to give them more of his time, now that he is transferred to Rampart City, at which point he will make his center.

RAMPART CITY.

It gives me great pleasure to report that Mr. E. J. Knapp, who offered his services to me for any place in Alaska that I might choose to send him, and at his own expense, has reached Rampart, which is to be the scene of his labors. He writes in the most hopeful spirit, and has entered most zealously into the work. He feels happy and very much strengthened in the fact that the Rev. Mr. Prevost is to be there and assume the charge of the work.

Rampart City is a mining camp, with small camps or villages of our Indians near it. With regard to its future I can not speak. It may to some extent suffer the fate of similar camps—here to-day and gone to-morrow. It is this feature or aspect that makes the work in Alaska so trying, difficult, and discouraging. It is a mission to a movement—a procession. Nothing can be more striking than the contrast between the conditions of missionary work among wandering bands of Indians, stampeding gold seekers, and that in a settled and populous country. The fundamental need and malady are the same, the supply and cure are the same, but the variety of conditions, methods, and often of agency, is immense, forever showing the necessity of diligent adaptation and watchful supervision.

We own a mission site with two buildings on the same. The hospital is one of these. It was erected on our lot by Mr. Prevost's arrangement that the camp should put up the building, and this spring we should take it off their hands, paying therefor $500, and conduct it as a church hospital. The work is promising; the camp is one of 1,500 inhabitants, and these are among the most enterprising, intelligent citizens of our country, and I can not but rejoice that our church is established in their midst.

FORT ADAMS.

Mr. A. A. Selden sends me a very gratifying report of his work. The Indians lived in a large number at the mission last winter. School went on without intermission, and so pleased were the Indians with the results of its work that at Christmas they made an offering of skins, meat, moccasins, etc., amounting to $128, in order that Mr. Selden might send out for such school necessities as were required. Mr. Selden and Miss Selden do, each of them, a missionary's work in teaching school, helping the natives in all the ways that tell upon their lives and homes and character. In addition to the work of holding services and instructing adults, Mr. Selden has before him the great task of removing the old buildings—the good ones—to the new site for the mission, which is opposite the Tanana River, using the material which was bought and brought in by Mr. Prevost four years ago in the erection of St. Saviour's Memorial Chapel, the hospital, etc. Many are the trials, difficulties, and hindrances which he has before him in executing this work. In the first place, it is very expensive; secondly, he has no stated amount—no funds, in fact—so that he may know how far he ought to go. Therefore he has been obliged to use his own judgment and "do the best he can." I did tell him that he might go to the amount of $1,000 this year, and I am now afraid of seeing that bill. The lumber, etc., have to be taken up the swift Yukon, labor has to be employed, which in that country of high prices, scarce food, etc., is not less than $5 a day, the logs rafted from above the mission site and hauled up a steep bank—still, if any one can do it, and can do it for very little, it is Mr. Selden.

The mission had the advantage of having the Rev. Mr. Westley in the neighborhood last winter, and he celebrated the Holy Communion at times, baptized the children, and in many ways proved a help and comfort to the missionary flock in the wilderness.

Mr. Selden made two trips to Rampart City last winter—distance, 80 miles—to look after the interests of the church and hold services. He provided food, sled, and

dogs, and sent "blind Paul" and Stephen on a journey way up the Tanana to tell in the Indian village the "good tidings" of a Saviour—tidings which they themselves had found to be so good. They were gone twenty-one days and had visited many villages when poor Paul was taken sick. Stephen, afraid that he would die, had him carefully wrapped in fur, and started quickly for the mission, reaching it only after many days of forced travel. Paul recovered in time, and I gave a heartfelt prayer of gratitude to God when I learned that he had; for he is a good man—so humble and simple, and yet it is sweet to see his trust and love and faith in God.

ANVIK.

I have received no news from our good friends in this mission, nothing but a letter dated at Anvik in February, and received in Sitka, via New York, early in August. He reported all well at that date and the mission work progressing.

POINT HOPE.

I have not heard from Dr. Driggs since last year.

Alaska, where "men are few and miles are many," where sections of it are practically more distant than Japan or Africa, where one mission is separated from another by hundreds of miles, where the missionary is alone, in a great measure, for years at a time face to face with many adverse powers, and his vigorous fight against these but invites the enmity of those who are seeking at any price the things of this life, with no one from the great world outside to show him that he is sure of backing against these odds—no one but the visit of his bishop—Alaska, under these conditions, is distinctly a foreign mission, and the board is dealing wisely with it in treating it still, in a way, as such. These religious pioneers are conducting most faithfully a noble work, and the church must and will hold up their hands—send them the cheering and prevailing message, Sursum corda.

FRIENDS' MISSION.

Kotzebue Sound.—The following paragraphs are taken from the report of Mr. Robert Samms, one of the missionaries at Kotzebue, which was kindly forwarded by Mr. I. H. Cammack, of the California Yearly Meeting of Friends, which supports the mission on Kotzebue Sound:

Perhaps the most interesting item at this time would be a description of our journey up the Kowak River. This was undertaken in order to ascertain the condition, location, and number of the natives living on that river, all of which information was necessary before we could make arrangements for starting a mission among the natives in that section of Alaska. This seemed to be a propitious time for such a journey, as the white men scattered along the river would be able to help us in the way of food and shelter. My wife and I, in company with a man who was carrying the mail, left the mission at 7 a. m., December 18, with two sleds and nine dogs. The first cabin was 70 miles from the mission, so we had to sleep on the ice three nights; rather a cool bed, but our deerskin sleeping bag proved to be a good thing. We arrived at the first cabin late in the evening of the fourth day out—worn-out, hungry, and foot-sore. The kind-hearted miners sat up all night in order to give us the use of their only bed.

The increasing snow compelled us to leave part of our load and at intervals go back and bring it up. In the course of time we reached the lower Penelope camp at Hunt River, where a hearty welcome was extended to us. Their easy chairs and warm cabin were very much appreciated. After a week's rest we proceeded on our journey with 11 dogs, and C. C. Reynolds and another man accompanying us. Arrangements having been previously made for my wife to remain at their camp and teach school, there being about 40 natives living there, we proceeded about 100 miles

farther and were unfortunate in having our dogs accidently poisoned with strychnine. Eight of them died in a short time. Three of these belonged to the mission. As we could neither go ahead nor turn back without dogs, a new dog team was purchased. We continued our journey to the Par River, the farthest limit of the native villages. Here we found about 280 natives wintering. This is by far the largest village on the river, and would be the place for a mission. It is 300 miles from our station here. The natives expressed themselves as desirous of missionaries, and promised to build a house and assist in other ways. There are about 500 on the river. There seemed to be a scarcity of food in all the places on the lower river. Game of all kinds is very scarce, and the fish supply is not always adequate. We find plenty of timber for fuel and building purposes, but not enough for a sawmill. Perhaps the heaviest item of expense in operating in this region will be the transportation.

We are indebted to many of the miners for kindnesses, and especially to the Penelope men.

The hardest thing in the management of the mission this year has been the finances, the loss of our goods on the schooner in the fall, and the demands for help and hospitality and our trip up the river have amounted to considerable. Our return found the natives short of food. We purchased 30 sacks of flour from miners and distributed about 800 pounds, taking in pay such things as they had, as seal rope, dog feed, some money, etc. It seems to be the general opinion among the white men that the only way of solving the food problem is to introduce reindeer. We paid $1.30 per sack for the flour, that being the price paid in Seattle last year.

It has been a great disappointment to us not to have received any mail from the States this winter. The mad rush for gold seems to have blockaded us on the south.

The Swedish Evangelical Mission Covenant's Missions in Alaska.

By Rev. D. Nyvall.

Our work in Alaska has been pursued this year under many disadvantages, owing partly to the great influx into northern Alaska of gold seekers and white adventurers, putting our mission stations and workers under new and difficult responsibilities; partly to the necessity for many of our missionaries to return home on account of poor health and our inability to find a sufficient number of new missionaries and teachers to take their places.

From Unalaklik both A. E. Karlson and his wife and Miss Malvina Johnson were obliged to return home and in their places we could send only one missionary, Rev. J. F. Qvist, who has been obliged to superintend that station during the winter as best he could with the aid of the native workers, Stephen Ivanoff and Miss Alice Omigetjoak, an Eskimo young lady, who has been educated in the United States for her present work as an assistant teacher. From Golofnin Bay, also, both Rev. N. O. Hultberg and Rev. P. H. Anderson returned to the States. In their place we had to send Rev. E. J. Henrikson from Yakutat, our southern station, and send to his aid Miss Amanda Johnson, a school-teacher educated at North Park College, our school in Chicago. Rev. Qvist is also a graduate from the same school.

Soon after her return to Chicago Miss Malvina Johnson, from Unalaklik, was obliged to submit to an operation. Although the operation was successfully performed she was too weak to recuperate and died sometime after. In her death our society lost a most noble and successful missionary, a loss which was felt so much more keenly as she was the first missionary in the service of this society who has thus departed from the ranks.

Reports from Unalaklik and Golofnin Bay tell of distress and sickness at both stations during the winter, especially at Golofnin Bay, where our interpreter, Gabriel, a native, and Miss Amanda Johnson, the new school-teacher, were taken danger-

ously ill last autumn. Rev. Henrikson was left all alone to do the work and attend to the sick ones until he succeeded in getting a physician. In February Miss Johnson was well again, but Gabriel was still sick and unable to do any service as an interpreter. Still, our workers have persevered nobly. If their work has not succeeded this winter as it usually has, in many converts and in any remarkable increase of the church members, it is no less a victory, under the circumstances, that the mission has been able to hold its own.

The native Christians are naturally deeply impressed and not a little alarmed by the great immigration of white people to their shores.

At Yakutat, our station in southern Alaska, our people have been free from the annoyances mentioned in connection with the northern stations, but they were last autumn greatly shaken up by a terrible earthquake, of which I shall not need to say more, as it was so fully described in the papers. Rev. Albin Johnson writes that they have experienced smaller shocks now and then during the whole winter, but being accustomed to it they have not greatly minded it. Rev. Johnson and his wife have been our only workers at that station during the last winter. They report a successful season. The congregation numbers 62 members at present. In the Sunday school about 60 children and young people are enrolled and in the day school 50 pupils. The branches taught in the school are the following: English, reading, penmanship, history, arithmetic, English grammar, and the Bible.

A great improvement in the communications with Yakutat is mentioned by Rev. Johnson—namely, that the place has been reached during the whole winter by a mail steamer every month, although he reports that these steamers have not been as lucky in getting back; not less than three were probably lost on their return trip. The report adds that, in consequence of these improved communications, Yakutat has been visited by a large number of adventurers whose influence upon the natives is always to be dreaded and in some instances has proved to be disastrous. It would be a great help to the work of Christian missions and civilization in Alaska if the laws of the country could be enforced against acts of brutality and lawlessness committed by some of the white people up there against the native, seemingly in the belief that Alaska is outside of civilization and life there exempt from the laws of decency.

The missions in Alaska have reason to be thankful to the Congress of the United States for the legislation enacted in regard to land held by missionary societies for the sake of mission and school work. But of no less importance is the present aid of laws enforced to save the natives of Alaska from the fate of becoming, so to speak, buried alive in this industrial awakening of their country, occasioned by the late gold discoveries. The eyes of Christian America ought to recognize above the rich soil of golden Alaska the Alaskan himself.

Very respectfully yours,

SHELDON JACKSON,
United States General Agent of Education in Alaska.

THE COMMISSIONER OF EDUCATION.

CHAPTER XXXII.

NINTH ANNUAL REPORT ON THE INTRODUCTION OF DOMESTIC REINDEER INTO ALASKA.

DEPARTMENT OF THE INTERIOR,
BUREAU OF EDUCATION, ALASKA DIVISION,
Washington, D. C., December 30, 1899.

SIR: I have the honor to submit to you my Ninth Annual Report on the introduction of Domestic Reindeer into Alaska.

The year covered by this report has been one of many changes and stirring events.

The 67 Laplanders, Finns, and Norwegians and their families who were brought from arctic Norway in connection with the relief of destitute peoples in the mining regions of Alaska, arrived at the Eaton Reindeer Station, Unalaklik, July 30, 1898, and on the 31st of January, 1899, they were transferred from the care of the War Department to that of the Interior. Thus there was an unusually large number of employees during the year in connection with the reindeer herd. The discovery and opening of the Cape Nome gold mines caused a sudden demand for transportation. The services of all the trained reindeer were required, both of the Government and mission herds in the vicinity. The fulfillment of the Government pledge to return to the American Missionary Association mission at Cape Prince of Wales and to Antisarlook and other Eskimo owners the reindeer which had been borrowed by the Government in January, 1898, to carry food to the ice-imprisoned whalers at Point Barrow required the return to those several parties of 934 head of reindeer. To meet this large demand Congress made a special appropriation of $20,000 for fitting out, under the auspices of the Treasury Department, for the use of the Interior Department, the naval vessel *Thetis*, in order that said vessel might give her whole time to the transportation of reindeer from Siberia. Through the courtesy of the Treasury Department, the United States revenue cutter *Bear* was also allowed to give some time to securing reindeer. Further arrangements were made with the firm of J. S. Kimball & Co., San Francisco, to procure and deliver reindeer in Alaska for the use of the Government.

These several enterprises have made the year just closed one of great interest and activity.

PERSONNEL.

Mr. William A. Kjellmann remained as superintendent.

Mr. Hedley E. Redmyer, in charge of the special expedition for driving reindeer from Haines Mission, on the southeast coast of Alaska, across the country to Circle City, having, after great hardship and much personal danger, fulfilled his mission, resigned October 10, 1899.

F. H. Gambell, M. D., remained at Eaton Station as surgeon and school teacher, and, during the long absences of the superintendent, as acting superintendent looked after transportation and other interests between St. Michael and Nome.

Herders.—On the 30th of July, 1898, 67 Laplanders, Finns, and Norwegians, with

their families, reached the Eaton Reindeer Station. This large number would have been required if the original project of taking food during the winter of 1898 into the Yukon Valley for the relief of destitute miners had been carried out, but, when happily it was found that this measure of relief was not needed and the project of taking relief was abandoned, there was a larger number of employees on the hands of the Government than was needed. A request was made by the contractor for carrying the mail on the Yukon Valley, also by one of the large transportation companies, for permission to hire a number of these extra Lapps. Through a combination of circumstances both the mail contractor and the transportation company failed to carry out their intentions. In the meantime a number of the Lapps had caught the gold fever[1] and asked permission to be released from their contract with the Government. As they were not needed, their request was granted, and they left the station for the mines at Golovin Bay and Cape Nome, as follows:

July 31, 1898.—Jafeth Lindeberg.

February 1, 1899.—Berit Nilsdatter Eira, Ida Johansdatter Hatta, and Magnus Kjeldberg.

March 1.—Thoralf Kjeldberg, Nilkelina Bassie, Otto M. Leinan, and Ole G. Berg.

March 4.—Samuel Hansen and Otto Greiner.

March 10.—Ole Johansen Stenfjeld.

March 20.—Ole Keogh.

March 27.—Lauritz Larsen and Ole Olesen.

March 28.—Johan Peder Johannsen Stalogargo.

March 31.—Karl O. Suhr and Johannes Aslaksen Rauna.

April 1.—Peder Johannesen, Samuel Jonfren, Suders Johansen, Iver Persen Vestad, Lauritz Stefansen, Johan M. Johansen (Toerle), Nils Klemetsen, Ole M. Rapp, Rolf Wiig, Mathis Klemetsen (Nillokka), Ole Klemetsen Hatta, Alfred Salamonsen Nikina, Samuel Johannesen Balto, Isak Johannesen Hatta, Hans Samuelsen, and Johan Himnar Hansen.

April 7.—Karl Johan Sacariasen.

May 1.—Olai Paulsen.

May 15.—John Andersen.

June 10.—Isak Salamonsen Nikkila.

June 15.—Emil Kjeldberg.

June 30.—Peder Berg.

July 31.—Jeremias Abrahamsen.

September 1.—Klemet Persen Boini and Anders Allaksen Bar.

September 20.—Hans Andersen Siri.

October 10.—Hedley E. Redmyer.

The following remained in the employ of the Government:

Nils Persen Bals, wife and 1 child; Alfred Hermansen and wife; Ole Olesen Bahr, wife and 2 children; Nils Persen Sara, wife and 4 children; Anders Johannesen Balto, wife and 2 children; Per Andersen, wife and 1 child; Johan Nango, wife and 1 child; Aslak Johnsen Bals, wife and 1 child; Nellogotoak (Eskimo), wife and 1 child; Anders Biti and wife; John Eriksen Eira, wife and 1 child; Johan Isaksen Tornensis and wife; Aslak Aslaksen Gaup, wife and 1 child; Johan Petter Rista, wife and 1 child; Per Mathisen Spein, Per Josefsen Porsanger, Lars Larsen Anti, Isak Bongo, Isak Tornensis, Ole Olesen Pulk, Nils Klemetsen, Anders Persen Utzi.

In addition to those at Eaton Reindeer Station there were in charge of the herd

[1] The first of the Lapps to resign and go to the mines was Jafeth Lindeberg, who, in connection with John Brinterson and E. O. Linblom, discovered the Cape Nome Mining District. It is reported that Mr. Lindeberg, during the ninety working days of last summer, took out from the mine as his share $200,000 in gold; and it was one of Mr. Lopp's Eskimo herders at Cape Prince of Wales that discovered gold on Anacovak Creek, which was the commencement of the new mining district of Konowgok, a few miles from Cape York, on the Bering Sea coast.

crossing the country from Haines Mission to Circle City Messrs. Hedley E. Redmyer, Klemet Persen Boini, Anders Aslaksen Bar, Hans Andersen Siri, Per Nilsen Siri, Per Johannesen Hatta.

In charge of the herd at Point Barrow and Point Hope were Messrs. Lars Larsen Hatta and Jacob Larsen Hatta, wife, and two children.

At Point Clarence was Mr. Per Larsen Anti.

RENEWAL OF APPOINTMENT AS SPECIAL AGENT OF THE WAR DEPARTMENT.

As the herders brought from Lapland in 1898 were under contract with the War Department until January 31, 1899, and from that time under the Interior Department, on the 21st of April, 1899, I was appointed by the Secretary of War as special agent of the War Department for the purpose of closing the accounts of the Lapps for salary due under their contract with the War Department for services in connection with the Alaska Relief Expedition. During the following September, through Capt. E. S. Walker, Ninth United States Infantry, commanding the post at St. Michael, the Lapps were paid the salary due them from the War Department in full and receipts were given.

STATIONS.

Teller Station.—During the absence of Rev. T. L. Brevig from the Teller Reindeer Station I have placed Mr. Charles E. Chard in charge of the buildings. Arrangements are in progress by which it is expected that Mr. Brevig will return to the station next summer.

Notwithstanding the demand for transportation to the new mines at Nome, I was able to secure freight on the supplies for the reindeer stations from San Francisco to the Teller and Eaton Reindeer stations at the low rate of $10 per ton, ship measurement, the prevailing rate being from $40 to $60.

Eaton Station.—This station, the location of which was selected in the winter of 1897–98, was not occupied until the fall of 1898. It is situated in a well-sheltered valley on the north bank of the Unalaklik River, about 8 miles from the seashore. During the winter of 1898–99 the logs were cut in the surrounding forest and whipsawed into lumber, from which was erected a large two and a half story main building, a large warehouse with a workshop in the basement, together with six double cabins one and a half stories high for the herders.

School.—School was kept by Dr. F. H. Gambell at Eaton Station, as usual, during the year, and reports indicate greater progress than during any former year. The enrollment consisted of 11 children of the Lapps, with the occasional attendance of the parents, the purpose being to assist the Lapps in acquiring the English language. They are reported to be very apt and quick at learning, and during the dark days of winter would often come to school long before the stars had gone out of sight. The character of the pupils makes the school one of more than ordinary interest.

Medical.—Dr. F. H. Gambell, physician in charge, reports having treated at Eaton Station 106 cases during the year, besides numerous minor ailments, such as bruises, sprains, etc. Eskimo came to him from Kings Island and the Diomedes, hundreds of miles away, by small skin-covered native boats. In the same room have been Indians from a long distance up the Yukon River, with Arctic Eskimo and miners traveling from the mines on the Yukon across to the new-found diggings at Cape Nome.

HERDS.

Eaton Station.—The herd at this place numbered 620 adult reindeer and 194 fawns. During the summer and winter over 100 animals were broken in and trained to harness. This served last spring the excellent purpose of teams being in readiness for the transportation of the troops to the new mines for the purpose of keeping order, the transportation of Lapps, and also provision for the miners. During the summer

96 of the sled deer were left at the Teller Reindeer Station as the nucleus of a herd into which could be placed the reindeer brought over from Siberia. During the fall the herd was depleted by the sending of 328 head to Point Rodney to replace the deer which, in 1898, were borrowed from that station by the Government, so that the herd at this station at present numbers but 419. If it were possible to get a central herd of 5,000 head, the increase would be sufficient to do away with the necessity of further importation from Siberia.

Golovin Bay.—From the 395 reindeer in the joint herds of the Swedish Evangelical Union, and Episcopal societies, and Eskimo apprentices, 9 died during the year and 157 were born, of which 10 died, leaving at the station 533 reindeer. During this winter 159 deer belonging to the Episcopal Society, with 52 deer belonging to Apprentice Moses, will be driven to the mouth of the Tanana, in the Yukon Valley. There the portion of the herd that is trained to harness will be used during the winter in the transportation of the United States mail between Tanana and the Eaton Reindeer Station.

One hundred head of deer loaned to the two societies by the Government in 1895 were returned to the Government in the fall by the societies and sent by the Government to Antisarlook to replace in part those borrowed from him by the Government in January, 1898.

During the scarcity of provisions at Nome and the rush of the miners to that place the herd at Golovin Bay performed very important service in the way of transportation.

Point Rodney.—The herd at this place, numbering 328, belongs to Antisarlook, and was given to him in the fall of 1899 in return for those loaned to the Government in the winter of 1898.

Teller Reindeer Station.—Three hundred of the reindeer at this station belonged to Tautook, Sekeaglook, Wocksock, and Tatpan, Eskimos who had served an apprenticeship of five years at the station.

Cape Prince of Wales.—In August, 1898, 167 reindeer were returned to this station of those previously loaned to the Government. Of this number 11 died during the early part of the winter, leaving 156 in the herd. To this herd were born in the spring 79 living fawns, and during the summer 479 deer were brought to this station, making the 714 head that were required to replace the 292 and their natural increase that were loaned to the Government in January, 1898. The absence of the herd during the winter of 1898–99, when there was such a demand for transportation to reach the Cape Nome mines, was a loss of several thousand dollars to the Mission Station and the Eskimo herders. The herd at this station is the joint property of the American Missionary Association and five or six Eskimos connected with the mission.

Point Hope.—The herd at this station belongs to Electoona and Ahlook (Eskimo), and numbers 52. It is expected that during the winter 48 additional deer will be furnished the young men from the Point Barrow herd. For various reasons this herd has not done very well during the past season.

Point Barrow.—When in the fall of 1898 the shipwrecked whalers were brought from Point Barrow to the States on the revenue cutter *Bear*, 378 deer were left in the herd that had been driven to that point for food. During the last spring 118 fawns were born to the herd. Three deer were killed by dogs and three by wolves during the season. At the close of the fiscal year there were at this station 500 head of reindeer. Lieut. D. H. Jarvis, commanding the revenue-cutter *Bear*, during his visit to Point Barrow arranged for leaving 100 head of reindeer at that point for the Presbyterian Mission, and 25 head for Ojello, an Eskimo apprentice. The rest of the herd is to be driven during the present winter, under the care of Mr. William Marshall, to Cape Prince of Wales or Teller Reindeer Station, leaving 48 head at Point Hope while en route. The total number of domesticated reindeer in Alaska

is 2,837, divided into nine herds. Of the 2,837 reindeer 1,159 are the personal property of 19 Eskimos, who have learned the management of reindeer by five years' apprenticeship at the Government reindeer stations.

Number, distribution, and ownership of domestic reindeer in Alaska, 1899.

Total	12,500.00

REINDEER DISTRIBUTION.

Instructions were left with Dr. F. H. Gambell, acting superintendent of reindeer stations, to procure from Golovin Bay the reindeer belonging to the Episcopal mission at the mouth of the Tanana and turn the same over to Mr. N. V. Hendricks, agent of the mission. Further instructions were given to renew correspondence with the Roman Catholics at Nulato and Koserefsky to arrange for the loaning of a herd to the Roman Catholic missions. The Moravian missions on the Kuskokwim were notified that they could receive their loan of reindeer during the fall of 1900, at which time it is also probable that a herd can be loaned to the Friends' mission at Kotzebue Sound.

OVERLAND EXPEDITION.

The following is a statement of the final disposition of the reindeer which were brought from Lapland by the War Department for the purpose of carrying relief supplies to the destitute miners in the Yukon Valley. While procuring the reindeer the necessity for such relief passed away, and when the herd arrived in Alaska, not being needed for the original purpose, it was turned over by the War Department to the Department of the Interior; and I was sent, by the direction of the Commissioner of Education, to the Alaska coast to receive the deer for the Department of the Interior and send them across the country from southeast Alaska to Circle City, Yukon Valley.

The reindeer were landed from the ocean steamer on the 27th of March, 1898, at Haines, Alaska.

Through a combination of circumstances the military authorities were unprepared to receive and forward the reindeer to the moss pasturage, 60 miles from the coast. While these preparations were in progress the deer were delayed at this point without moss until the 15th of April, during which time 362 of the herd died. At this time the remaining deer were transferred by the War Department to the Department of the Interior, and on the 6th of May following, after great hardships, I succeeded in reaching the moss pastures with 185 reindeer out of the 526 that were landed at Haines.

From this time the deer were placed in charge of Hedley E. Redmyer, assisted by

six Lapps, to be driven, when they should regain their strength, across the country to the neighborhood of Circle City, in the Yukon Valley.

On the 1st of September Mr. Redmyer had reached Lake Kukshu, Northwest Territory, with 144 reindeer, 41 of the 185 with which he started having proved too weak to recover their strength and died on the way. Of the 144 remaining on the 1st of September, 3 subsequently died from exhaustion. The balance of the herd (141) had regained their health and strength and were in good condition.

On the 28th of February, 1899, the expedition safely reached Circle City and went into camp with 114 reindeer. Of the 30 deer lost by the way, some met with accidents and were killed; a few were killed by wolves; a few that had strayed from the herd were shot by the natives, mistaking them for caribou; a few strayed away and were not recovered.

Mr. Redmyer kept a diary in which he graphically narrates the hardships and difficulties encountered in driving across an unknown wilderness without roads or trails or guide. He states that often a wolf or mountain lion would appear and cause a stampede of the herd and compel the Lapps to chase them through miles of unbroken snow, woods, and underbrush before they could be gathered together for another start. Again and again, coming to ranges of mountains too precipitous to be crossed, the expedition was compelled to retrace its steps and try another route; again and again, through the delays, provisions ran out and the men were threatened with starvation; they were often compelled to lie down to sleep in wet clothing, which froze upon their bodies; but notwithstanding all these difficulties and hardships the expedition was carried through successfully, and the reindeer proved their ability to make a journey that could not have been made either with horses or dogs.

During the spring and early summer, at the request of the United States Army officers stationed at Circle City, two or three distant military explorations were made with the reindeer.

To avoid the expense of driving the herd from Circle City to the Eaton reindeer station, 1,000 miles westward, I exchanged the herd with the Protestant Episcopal mission at the mouth of the Tanana River for an equal number of deer owned by that mission. The deer belonging to the Episcopal mission were at Golovin Bay, from which place they were proposing to remove them to the mouth of the Tanana, 800 miles eastward.

This exchange was consummated on the 1st of September, 1899, and the reindeer received from the Episcopal mission at Golovin Bay were driven to Point Rodney, 80 miles to the west, to help replace the herd which in the winter of 1897–98 the Government had borrowed from Antisarlook for the rescue of the whalers at Point Barrow.

PURCHASE OF REINDEER IN SIBERIA.

On the 7th of July, in Baroness Korfg Bay, Kamchatka, 116 reindeer were purchased and taken on board the *Bear* by Lieut. D. H. Jarvis, commanding. The journey of 900 miles from Kamchatka to Cape Rodney proved to be a stormy and rough one, and a large number of the fawns died en route. Upon reaching Cape Rodney July 13, the surf was found too rough for landing, and on the 14th anchor was hoisted and the *Bear* went to Port Clarence for shelter. That evening 83 deer were landed at Cape Riley, near Port Clarence, from which point they were to be driven from 40 to 60 miles across the peninsula to Antisarlook, at Cape Rodney. On July 18, 14 deer were landed at Cape Spencer from the revenue cutter *Thetis*, Lieutenant Buhner commanding. These deer also were to be driven to Antisarlook.

On the 27th of July 15 male and 90 female reindeer were landed from the steamer *Albion* at Cape York, Alaska, for the herd of the American Missionary Association, and 67 reindeer were subsequently landed at the same place from the revenue cutter *Thetis*.

REINDEER AND MAIL SERVICE.

Since the beginning of the introduction of domestic reindeer into Alaska I have kept steadily before my mind the fact that sooner or later the reindeer would prove a very important element in the rapid transportation of the mail in winter over the frozen tundra of artic and subartic Alaska, between the widely separated mission stations and isolated mining camps of that region. When, therefore, in the spring of 1898 it was announced in the press that the herd of reindeer which had been brought from Lapland for the purpose of carrying freight and food to the mining regions of the Yukon Valley for the relief of the destitute miners would not be needed for that purpose and were for sale, Mr. P. C. Richardson, the contractor for carrying the mail through the Yukon Valley, immediately telegraphed me, March 16, 1898, that he wanted me to reserve him 100 head of reindeer and all the Lapp drivers that could be spared by the Government. In the following June I was waited upon by Mr. Richardson and Mr. Emerson, his associate, with the proposition that the Government should not only sell them the reindeer needed to carry the mail on the Yukon, but also that Mr. William A. Kjellmann, superintendent of the reindeer stations, be allowed to take charge of the carrying of the mail between St. Michael and the mouth of the Tanana. As the Government had been waiting for an opportunity to give a practical test of the utility of the reindeer in mail transportation, I agreed to their proposition. Through a combination of circumstances Mr. Richardson failed to meet Mr. Kjellmann during the summer at St. Michael or the Eaton Reindeer Station and consummate the arrangement.

In the spring of 1899 the North American Transportation and Trading Company, which had secured a contract for carrying the mail from St. Michael to Kotzebue Sound and Golovin Bay, sublet the same to Mr. Kjellmann, of the reindeer station. About the same time Mr. Richard Chilcott, of Seattle, secured a contract for carrying the mail from Valdes to Circle City, Alaska, and at the suggestion of the Postmaster-General made application for a few reindeer for transportation purposes. His agents delayed so late last fall in consummating the agreement that the reindeer which the Government had to sell for that purpose were otherwise disposed of.

During the summer the new gold mines in the neighborhood of Cape Nome had proved so rich that a large population had been attracted to the vicinity. In order to furnish them with a winter mail, the Post-Office Department entered into a contract with Mr. William A. Kjellmann to carry the mail during the winter semi-monthly between Eaton Reindeer Station and Nome City.

REINDEER TRANSPORTATION OF TROOPS.

The failure to complete arrangements during the summer of 1898 between Mr. Richardson, the mail contractor, and Mr. Kjellmann, in charge of reindeer, was providential. Late in the fall gold mines were discovered on Snake River, near Cape Nome, Alaska, and during the winter there was a stampede to the new mines from St. Michael, Kotzebue Sound, and the mining districts on the Lower Yukon that received the information. The influx of a large population into a region where there was an insufficiency of supplies and shelter required the presence of United States troops to preserve the peace. An application was made by Captain Walker, in command of the camp at St. Michael, to Mr. Kjellmann for transportation, in response to which Lapps and reindeer were sent from Eaton Station to St. Michael, and transported troops, with their tents, rations, and camp equipage, from St. Michael to the Golovin Bay mining region. When there was no longer any need for their presence at Golovin Bay the Lapps and reindeer returned the soldiers to St. Michael without accident or difficulty. If the reindeer had been engaged in the mail service they could not have performed the transportation thus unexpectedly required of them.

REINDEER TRANSPORTATION.

In order to further demonstrate the possibilities of reindeer transportation, and as an act of humanity and relief to the crowd of miners that had flocked into the Cape Nome region and were short of provisions, the reindeer station agreed to transport a limited amount of food from St. Michael to Nome, which was done, and payment was rendered for the same by the transportation companies, by furnishing necessary food supplies to the station.

REINDEER AS A PACK ANIMAL.

During the summer Mr. Hank Summers, for fifteen years a miner and prospector in Alaska, and secretary of the Pioneer Association of the Yukon Valley, procured the loan of a reindeer from one of the mission stations. Upon this deer he packed his tent, blankets, provisions, and tools during the entire summer. When not engaged in packing his reindeer was picketed out, and everywhere found the reindeer moss—his natural food. Mr. Summers had had many years of long and painful experience in packing provisions on his back, and worrying with dog teams. After the experience of the summer's prospecting with a pack reindeer he testified at the close of the season, "I can not say too much in praise of the reindeer; they are a decided success; I have never found anything so useful for packing or for food as the reindeer."

REQUESTS FOR REINDEER.

In the contract made between the War Department and the Laplanders, on February 1, 1898, was a clause that, after two years' service, such of the Laplanders as might wish it could have a loan of 100 head of reindeer for from three to five years, at the end of which time they would return the 100 head of deer to the Government, retaining the increase as their private property. Several of the Laplanders have made such requests for the season of 1899. Nearly all of them desired to secure herds for themselves and go into the business of raising reindeer in Alaska, considering it a much more remunerative field for that industry than Lapland.

I have also received a petition from a number of miners in the region of Kotzebue Sound, who were so impressed by the destitution of the natives with whom they were surrounded, and of the relief that would be afforded by the introduction of domestic reindeer in that section, that they asked that the reindeer might be thus introduced.

A request has also been received from missionaries in Alaska connected with the Swedish Evangelical Union Mission for the privilege of purchasing $20,000 worth of domestic reindeer for the purpose of introducing them among the native adherents of their mission stations.

REINDEER ATTRACTING ATTENTION IN CANADA.

The success of this Government's introduction of reindeer into Alaska has attracted the attention of thinking minds in Canada, and a public sentiment is growing in favor of a movement on the part of the Canadian Government to introduce the reindeer industry among the Eskimo population in the regions of Hudson Bay, Great Slave Lake, and in fact the whole of arctic and subarctic Canada, so that it will not be necessary to feed them at public expense, on account of the growing scarcity of food supplies in that section.

REINDEER FOOD.

During the year interesting letters were received through the State Department from Mr. Victor Ek, vice and acting vice consul at Helsingfors, Russia; Edward D. Winslow, consul-general at Stockholm, Sweden, and W. R. Holloway, consul-general at St. Petersburg, Russia, with reference to the natural food of the reindeer in their respective sections of the country.

RETURN OF REINDEER TO THE AMERICAN MISSIONARY ASSOCIATION, ANTISARLOOK, AND OTHERS.

On January 20, 1898, Lieut. D. H. Jarvis, R. C. S., in charge of the relief expedition to the ice-imprisoned whalers at Point Barrow, borrowed from Antisarlook, an Eskimo living near Point Rodney, Alaska, 133 reindeer; and on January 25, from Mr. W. T. Lopp, at Cape Prince of Wales, representing the American Missionary Association, 292 reindeer, making a total borrowed for the Government of 425. These reindeer were loaned to the United States Treasury Department with the understanding that they were to be replaced in the summer of 1898, together with the estimated increase in the herd for the coming season, and if for any cause they were not returned during the season of 1898, that the increase of the following years until the debt was paid be also taken into account.

In the summer of 1898 there were due, under the above arrangement, to the American Missionary Association 432 reindeer and to Antisarlook 213, making a total of 645 to be replaced by the Government. The Government, however, was unable to procure during the season but 159, which were given to the American Missionary Association at Cape Prince of Wales. The delay in replacing the full number of deer required still further obligated the Government to take into account the natural increase during the spring of 1899. This increased the number to be paid to the American Missionary Association to 714, less the 159 delivered in 1898, and to Antisarlook 328, aggregating 1,042 head for which the Government was liable. This is a striking illustration of the rapidity of increase of the herds. In January, 1898, 425 were loaned to Mr. Jarvis, and in July, 1899, two fawning seasons having intervened, 1,042 head were required to cancel the obligations of the Government to the above-named parties. This was so large a number it was felt that unusual preparations should be made for securing a largely increased importation over that of previous years, when the greatest number procured has been less than 200 head in any one year. Accordingly, on the 24th of January, 1899, the Commissioner of Education addressed a letter to the honorable the Secretary of the Interior, which was duly transmitted to the honorable the Secretary of the Treasury, requesting that instructions be issued to the commanding officer of the revenue cutter *Bear* authorizing him to receive on board the general agent of education in Alaska, and proceed to cruise along the coast of Siberia northward for the double purpose of securing additional information with regard to Siberian herds of reindeer and for the purchasing of the reindeer. In reply the honorable Secretary of the Treasury stated that owing to the increase of business in Alaskan waters caused by the present mining excitement the *Bear* would be unable to devote the time necessary to the work of obtaining the reindeer, and suggested that Congress be asked for an appropriation for fitting out the naval vessel *Thetis*, which had been condemned as unserviceable for naval duty and yet would be seaworthy for a trip like the one proposed. Accordingly the Secretary of the Interior, with the cooperation of the Secretary of the Treasury, applied to Congress for an appropriation of $20,000 for the fitting out and support of the *Thetis* for this season's cruise in Alaskan waters. This appropriation was granted and the *Thetis* was placed in commission.

On the 1st of May, when we were expected to sail from San Francisco, steam being got up, it was found that the boiler tubes were leaking badly and that it would be necessary to replace them before proceeding; which repairs were at once ordered by the Treasury Department. These repairs, however, would delay the sailing of the vessel so long that it would be impossible to make the trip proposed to lower Kamchatka, and the cutter *Bear*, that was ready to sail, was substituted for the *Thetis* between Petropavlovsk and Bering Straits.

To still further increase the number of deer purchased, and as the coast to be visited was much greater than any one vessel could efficiently inspect during the few months

that those shores would be free from ice, I further arranged with J. S. Kimball Company, San Francisco, to purchase, in behalf of the Government, all the female reindeer they would deliver on the coast of Alaska during the season. Through the combined efforts of the three vessels we secured during the season 322 reindeer. This left 485 head of reindeer to fully settle up the obligations of the Government to the American Missionary Association and to Antisarlook, and these 485 reindeer were taken from the Government herd at the Eaton Station.

REVENUE-CUTTER SERVICE.

As in former years, so in this, the Treasury Department, through its division of the Revenue-Cutter Service, has rendered hearty cooperation and valuable assistance; indeed, it would have been practically impossible for me, without the transportation of a revenue cutter, to have visited the coast of Kamchatka, thereby securing valuable information with reference to the supplies of reindeer from that section of Siberia; also without their assistance it would have been impossible to procure and transport the large number of reindeer that were obtained during the season.

The instructions of Capt. C. F. Shoemaker, Chief of the Revenue-Cutter Service, indicated his special interest in the successful securing of a large number of reindeer. The same interest was also manifested by Lieut. D. H. Jarvis, commanding the *Bear*, and Lieut. A. Buhner, commanding the *Thetis*, together with their officers and men in the execution of the above instructions. The carrying out of the details of procuring, loading, and landing the reindeer was made the special duty of Lieut. E. P. Bertholf on the *Bear* and of Lieut. H. G. Hamlet on the *Thetis*. I was also indebted for valuable assistance to Capt. W. C. Coulson, R. C. S., commanding the cutter *McCulloch*, and Capt. W. F. Kilgore, commanding the cutter *Perry*.

ITINERARY.

Under your instructions I left Washington on April 25, 1899, spending the following Sabbath at Salt Lake and arriving at San Francisco the 2d day of May.

The revenue steamer *Thetis*, upon which I was expecting to journey, was under instructions to sail on the 2d of May. In getting up steam it was found that the boiler tubes leaked badly. Capt. C. L. Hooper, in charge of the repairs of the revenue cutters, immediately telegraphed the Treasury Department for permission to put in a new set of boiler tubes, which was granted. As this would detain the *Thetis* for a month and would prevent my visiting the coast of Kamchatka to confer with the general manager of the Russian Sealskin Company, of St. Petersburg, with regard to the purchase of reindeer, I at once telegraphed, asking that the cutter *Bear*, which was ready to sail, might be substituted for the *Thetis* on the trip to Kamchatka, that I might join the *Thetis* at Bering Strait, which vessel would then engage for the rest of the season in the purchase and transportation of reindeer. Through the kindness of the honorable the Secretary of the Treasury and the hearty cooperation of Captain Shoemaker, Chief of the Revenue-Cutter Service, this request was granted, and instructions were sent to the commanding officer of the *Bear* to receive me on board and convey me to Kamchatka and then coast northward along the Siberian coast until the *Thetis* should be met in the neighborhood of Bering Strait.

The *Bear* sailed from San Francisco for Seattle on the afternoon of the 5th of May. On the 8th, having completed arrangements with Capt. B. Cogan for the transportation of freight and supplies to the reindeer stations on Bering Sea, also with the J. S. Kimball Company for the purchase of reindeer, I took the train for Portland that evening.

On May 10, at the request of the Secretary of War, I called at the First National Union Bank, of Portland, Oreg., and completed arrangements for the payment of the salaries of the Lapps upon my arrival in Alaska. I reached Seattle the following evening.

On the 12th of May the *Bear* arrived at Seattle and found orders to await the arrival of dispatches from Washington. This meant a week's delay in Seattle. In the meantime Capt. Francis Tuttle, commanding the *Bear*, receiving news that his wife was dangerously ill, telegraphed to the Treasury Department asking to be relieved from the command of the *Bear* and allowed leave of absence to return to his family. This resulted in another week's delay, while a captain could be sent out from the Atlantic coast.

On the evening of May 24 Lieut. David H. Jarvis, the hero of the Point Barrow relief expedition, arrived in Seattle to take the command of the *Bear*, which he did on May 25.

At 9.45 on the morning of the 26th the *Bear* raised anchor and steamed away from Seattle. That night was spent at anchor at Port Townsend.

On the morning of the 27th, a gale raging outside of the Capes, the captain delayed starting until the afternoon. At 2.20 o'clock we got under way for Unalaska, in the Aleutian Islands.

The morning of June 5 we raised land. At 3.15 a. m. Mount Shishaldin, 8,953 feet in height, was sighted, clean-cut and beautiful against the horizon, covered with a mantle of snow from peak to base. A cloud of vapor was floating lazily from the crater. At 6.30 Pogrumnoi volcano, 5,875 feet high, came in sight. During all the forenoon, which was bright and sunny, with a smooth sea, we skirted the southern shore of Tigalda, Akutan, and Avatabak islands, standing for Unalga Pass. Akutan volcano stood out clear and cold, covered with an unusual amount of snow. The crater is not at the highest point, but upon the eastern shoulder of the mountain. Its location was plainly marked by a large black spot on the snow, made by the snow being melted away from the warm rocks that formed the rim of the crater. On the west shoulder of the volcano a large pile of perpendicular rocks, forming a small mountain of themselves, covered sides and top with snow and ice, glistening in the sun, and seemed like a gigantic fairy ice palace. This appearance was still further heightened by some bare rocks at the base, giving the appearance of a large arched doorway. At the mouth of the pass for a short time the tide rips made a rough sea, causing the vessel to roll badly.

Turning northward into the straits, we passed Egg Island, so called for the abundance of the eggs of wild fowl found there. In the distance was the village of Biorka, noted as the cleanest village on the Aleutian Island. At 3.15 p. m. we were passing the south end of Unalga Island. Off in the distance to the southwest was the little village of Biorka. At 3.30 we passed Point Erskine and at 4 we were abeam of Kaletcha; soon after the celebrated Priest's Rock was passed. We entered Unalaska Bay, and at 5.15 p. m. made fast to the wharf at Udakhta (Dutch Harbor).

Three busy days were passed in visiting the Jesse Lee Memorial Home of the Methodist Woman's Home Missionary Society at Unalaska, also the public school, and auditing the accounts of Mr. James C. Blaine, who had been in charge of the removal of the old and the reconstruction of the new school building.

At 4.10 p. m. June 8 the ship cast off from the wharf, and, after taking on board the steam launch, passed out of the harbor and headed westward for Asia.

At 2.30, the 9th, we passed the celebrated Bogoslov volcano, 13 miles distant. Our route lay to the north, parallel with the Aleutian Islands. These, however, were so far distant that only occasionally the peaks of the highest mountains were visible.

During the morning of the 13th we crossed the one hundred and eightieth degree of west longitude, and owing to the change from west to east longitude dropped a day in the calendar, making six instead of seven in our present week. At 10.14 a. m. on the 14th Attu Island was raised, and at noon we were distant from it about 23 miles. At 4 p. m. Cape Wrangell became visible. A high mountain range seemed to traverse the island from south to northwest, covered with snow down to the water. The coast seemed to be precipitous and desolate.

The morning of June 17 dawned with a sky overcast and cloudy. According to our reckoning we should have been in sight of the mountains of Asia. We had already passed south of Cape Tahipunski (although the fog prevented us from seeing it) and were rapidly approaching the mouth of Avatcha Harbor. An anxious lookout was kept for the land. At 12.30 p. m. the officer of the deck thought he saw a bold headland through the fog. A half hour later there was no doubt about it; rocky cliffs loomed up all around us; the great mountain range that incloses the bay like a gigantic amphitheater was partially concealed by a curtain of fog. Afterwards, when, on the 23d, we steamed out of the bay under a cloudless sky, great precipices of rock appeared, walling in the waters of the sea, and great columns of rock rising out of the sea stood like eternal sentinels guarding the coast; range upon range of snow-covered mountains encircled Avatcha Bay, crowned with the white volcanic cones of Wilinchiniski (7,257 feet high), Kozelska (5,333 feet), Avatcha (9,081 feet), and Korianski (11,406 feet); we stood as if entranced by the scene. Some day the wonderful scenery of the Kamchatkan coast will attract thousands of tourists. Soon the light-house on Dalni Point, 449 feet above the sea, was made out; the light is used from April to October. The keeper's residence is a long white building with its broad side to the sea; a tall white column some distance in front of the residence shelters the light. The two buildings are so placed that from the sea they represent a great white cross. Later the "Brothers"—three great sentinel rocks inside the heads—came into view; their tops were alive with sea gulls and sea parrots nesting and laying their eggs. Sweeping up the bay and rounding Pinnacle Rock, the small village of Petropavlovsky, with its red and green and brown roofs, was seen nestling at the foot of the encircling mountains that stood guard around it. Isnenai Bay and Point, Rakovya Point and Bay, were successively passed, and rounding to at 4.10 p. m. we came at anchor off the village cemetery. The ship could have entered the inner harbor and anchored within a stone's throw of the village, but did not.

We were now in Siberia, the battle ground of the conquering Cossack and freebooting Promyshlenki in their century's march across Asia. In its northern and northwestern sections a dreary waste of low rolling and frozen tundra; in its southern and central sections. rugged snow-covered and storm-swept mountains, the land of the fierce howling poorga, of wild beasts and scattered tribes of brave, hardy and half-civilized people.

Directly in front of our anchorage mountain brooks were visible, tumbling down the mountain side and running through the village, furnishing in summer, at least, an abundant supply of pure water to the inhabitants. . Shortly after, Mr. A. Jacovleff, bookkeeper of the Russian Seal Company, came on board. He is a Russian naturalized as an American citizen, and is now engaged in business in Siberia. He, however, looks forward to making his home in California, where he has spent a number of years. He speaks English and Russian fluently, and proved serviceable as an interpreter during our stay in port. Before leaving the ship we were invited to call upon him whenever we had need of his services.

After dinner I accompanied Lieutenant Jarvis ashore to call upon the ispravnik (governor), who represents the authority of the Russian Government over the lower part of the peninsula and is magistrate, governor, and chief of police for this whole section.

Upon reaching the governor's house we found that he had gone out. Leaving our cards, we called upon the lieutenant-governor. He also was out. We then went to the Russian Sealskin Company's store, and afterwards returned to the ship.

June 19, Sunday, after breakfast, we went ashore to attend the Russo-Greek Church, morning service being at 9 o'clock. There were about 100 present. The singing and chanting were good. Father P. Donskoi, the senior priest, although but 65 years of age, had the appearance of being 75 or 80. For many years he had made 3,000 miles a year with dog teams, traveling about his extensive diocese. The hard-

ships of such travel in this semiarctic region have broken him down. During the service the communion was administered to some babes in arms. There were no seats in the church, and all remained standing during a service that lasted two hours. After service we returned to the ship, and soon after Governor Oshurkoff came, with Mr. Jacovleff as interpreter, to call upon us. Mr. P. Oshurkoff is a large, well-formed man, with a face that indicates force of character. They were accompanied by Mr. G. Chupiatoff, agent of the Russian Sealskin Company.

June 19, after breakfast, the captain and myself went ashore sightseeing, also to secure what information we could with reference to procuring reindeer. Interviews were had with the governor, employees of the fur company, and private citizens, but the man who could give us the fullest and most reliable information was Capt. Philip H. Powers, general manager of the fur company. Captain Powers is an American, from New London, Conn., who came out here thirty-five years ago as a whaler and has made his home in this section ever since. A few years ago he went into the service of the fur company, and step by step has become their general manager. He now spends his winters in Japan, but was expected to arrive at this port in a couple of days.

The principal objects of interest in the place are a cenotaph sent out from Russia and erected to the memory of Bering, who fitted out his expedition and sailed from this bay to discover Alaska and explore Bering Sea. His remains are buried on Bering Island, one of the Commander group. His cenotaph is in the yard of the Russian Church.

Near by is a monument to Capt. Charles Clerke, who, upon the death of Captain Cook, February 14, 1779, at the Sandwich Islands, succeeded to the command of the expedition. The exposures and hardships of the expedition in search of the straits between Asia and America were so great that his health gave way, and on the 22d of August he died at sea off the coast of Kamchatka. He was buried at Petropavlovsky. On a ridge separating the inner from the outer harbor is a monument in memory of the French arctic explorer, La Perouse, who visited this place in the summer of 1787. He sailed from this harbor over a hundred years ago, called at Botany Bay, and disappeared with crew and ship. His monument consists of a large rough bowlder set upon a pedestal. Into this bowlder has been deeply carved the name and date "La Perouse, 1787." A real anchor and anchor chain have been placed across the face of the stone, and the anchor chain encircles the base of the pedestal.

The remaining objects of interest are the remains of the earthworks and batteries which were destroyed by the allied fleets of England and France in 1854 and 1855. In 1854 the fortifications were shelled and silenced by the allied fleet. Marines and sailors were then landed from the ships and an attempt was made to capture the place. As the attacking party was advancing through the woods their officers were nearly all killed by sharpshooters, and the troops, thrown into confusion, were slaughtered, and a number of them driven over a precipice and dashed to pieces. The English and French lost 170 in killed and wounded. Hoisting anchor, the fleets sailed away. Returning, however, in 1855, they found the village abandoned by order of the Czar. They then destroyed the fortifications and burned the Government buildings. The fortifications have never been rebuilt. A few troops are kept there as a local police force. On a sand spit in the harbor the Russian Government has erected a monument in honor of the victory of 1854. This obelisk, 25 feet high, is built of stone, painted black, and surmounted with a gilt star and cross. On the eastern side is this inscription in Russian:

In memory of the fallen
at the
Repulse of the attack of the Anglo-French fleet,
20th and 24th August, 1854.

On the reverse side:

Erected in 1881.

In the outskirts of the village there is a well-kept plat of ground in which three crosses (one English, one French, and one Russian) mark the spot where the men of the three nations were buried. Upon the anniversary of the battle religious services are held at the graves. The grounds are kept in better order than any of the yards of the citizens.

The spring has just opened, the buds of the birch and cottonwood are swelling, and in sheltered places the leaves are partly out. To-day I saw specimens of the famous Yakoot pony, a hardy animal that will find his own food, even in a semi-arctic Siberian winter. On this peninsula are said to be large bands of wild horses that have started from strayed domestic stock. They would be a good breed to introduce into Alaska. The Siberian cattle are an undersized breed, but very hardy.

June 20: Last night about 11 o'clock the Japanese steamer *Setsuyo Maru*, in the employ of the Russian Fur Company, arrived from the northern coast, where it had been locating Japanese and Korean fishermen for the season. The output of the fisheries finds a market in Japan. As the steamer sails from here for Japan an opportunity is afforded for sending out a mail.

After breakfast I went aboard the *Setsuyo Maru* with Captain Jarvis and called on Captain Powers, jr., master. With the exception of the captain all the crew and officers are Japanese and Koreans.

June 21: A rainy day. During the morning I called on Father Donskoi, the old Russian priest. His diocese at one time covered all Kamchatka Peninsula and north to the Anadyr River. Since 1888 he has been an invalid. He still, however, has charge of the services of the church. His son was a few years ago Russian priest at Sitka, Alaska.

At 11 a. m. H. I. M. S. *Yakut*, of the Russian navy, arrived from the Commander Islands and dropped anchor. Captain Jarvis made an official call.

June 22: The forenoon was cloudy; the afternoon clear, bringing out the snow-covered volcanoes and mountain range that surrounds Avatcha Bay as an amphitheater in clear relief around the horizon. It was the first good view of the whole horizon that we have had. The scene was one of marvelous beauty and grandeur. The ward-room officers invited the captain and officers of the *Yakut* to dinner at 5.30, after which the officers of the *Bear* returned with their guests to the *Yakut* to spend the evening.

At 7.15 p. m. the steamer *Kotik*, of the Russian Seal Skin Company, from Japan, for which we had been waiting, passed in and dropped anchor. Captain Jarvis called on Captain Powers, manager of the fur company, who came on the *Kotik* and arranged for a business interview immediately after breakfast to-morrow.

June 23: Captain Jarvis had breakfast at 7.30, and soon after 8 a. m. we were on board the *Kotik* and had a satisfactory interview with Mr. Philip H. Powers with reference to the purchase of reindeer in large numbers. He had no doubt they could be purchased in any number we wished, driven over to a good bay on the Bering Sea side of Kamchatka, and shipped to Alaska. It was arranged that on his present trip he would ascertain the cost, etc., and write Mr. Blum, agent of the company at San Francisco.

After finishing our business with Mr. Powers, we went ashore for a final settlement of bills and a farewell call on the ispravnik. The governor gave Captain Jarvis a letter to the starosta (local governor) at Karaginsk, instructing him to give us all possible aid in procuring reindeer on Karaginski Island. The starosta is the local magistrate and highest Russian officer in the small settlements. At 11 a. m., by invitation, Captain Jarvis and myself took breakfast with Commander Novakovsky, R. I. N., of the Russian crusier. His quarters are comfortable; he has an office and

dining room, a large bedroom with an iron bedstead, lounge, and a large bath and toilet room. The breakfast passed off pleasantly.

Returning to the *Bear* we had a call from the Government physician, who has charge of a large region of country. He is employing his spare time in writing a history of Kamchatka and its people. I returned ashore with him for a couple of charts he kindly offered the captain; also bade adieu to Mr. and Mrs. A. Jacovleff. During the forenoon the *Bear* steamed into the bay, taking various courses to ascertain the compass deviation. At 3.45 p. m. the anchor was again hoisted, and at 6.30 p. m. we stood down the bay and put to sea. The sky was clear, and the mountains and volcanoes stood out in bold relief against the sky.

June 24: Last night there was a total eclipse of the moon. At 6.30 a. m. we passed Cape Shipunski. This cape is a rocky cliff 200 feet high, and extends inland along a succession of mountain peaks to Jurnanova Volcano, which is a rocky cone 10,608 feet high, and can be seen 120 miles at sea. Avatcha and Korianski volcanoes are also visible. During the afternoon Kronotski, 10,608 feet high, was prominent. This region is a famous resort for mountain sheep.

June 25: At 4 a. m. Cape Kronotski was abeam, 12 miles distant. At 11 a. m. sighted Cape Kamchatka. During the day we passed to the westward of the Commander Islands. These islands belong to Russia and are the resort of the fur seal. They are 79 miles distant from Kamchatka and 180 miles from the island of Attu, the nearest of the American possessions. They form a connecting link between the volcanoes of the Aleutian Islands and those of Kamchatka. Bering, the largest of the group, is 50 miles long and 16 to 17 miles wide at the north end, which is the broadest point. A chain of mountains, 2,210 feet high, extends the length of the island. Bering, the discoverer, died and was buried on the east side of the island, about three-quarters of a mile west-northwest of Cape Khitroff. Copper Island, the companion island to Bering in the group, is 30 miles long and 5 miles broad in the widest part. At the time of Bering's discovery in 1741 there were no inhabitants on the islands. Aleuts were placed upon the islands in 1826 by the Russian-American Fur Company for the purpose of procuring seal skins. Fifteen reindeer were introduced in 1882 and have multiplied until there are now from 600 to 1,000, the increase furnishing the inhabitants with fresh meat. The yellow raspberry and whortleberry are found in great abundance. Foxes abound, and, in their season, ducks and geese. The present population of the two islands is about 600. The killing of the fur seal is done under Government supervision and the skins turned over to the agent of the Russian Seal Skin Company of St. Petersburg.

June 26: At 2 a. m. Cape Kamchatka was abeam. This cape is a bold headland 1,500 feet high, and at its sea base terminates in a pile of rocks 40 feet high which has the appearance of a castle with turrets. We are now opposite the mouth of the Kamchatka River, the largest stream on the peninsula. On the south side of the river, and visible many miles at sea, is a remarkable group of volcanoes—Kluchefskaya, 16,988 feet; Uskovska, 12,508; Kojerevska, 15,400; Tolbatchinska, 11,700; Mount Gordon and Mount Herbert Stewart, about 8,000 each. Kluchefskaya is more or less active all the time, throwing out ashes two or three times a year, sometimes covering the earth for a hundred miles around, as in 1879, when ashes fell 3 inches deep. From the years 1727 to 1731 it was in constant eruption. Beginning with September 25, 1737, it burned with such fierceness for one week that the rocks appeared red-hot. In 1762 and 1767 other outbursts are recorded, and in 1829 Adolph Erman, a German scientist, found the burning lava pouring out in a continuous stream. In 1854 and again in 1885 it was in active eruption—the pillar of flame in calm weather being visible for 250 miles. On a quiet day it is reported that smoke and steam would ascend forming a perpendicular column thousands of feet high.

An agricultural colony of Russians from the valley of the Lena River were settled

at Melcova, on the Kamchatka River, as early as 1743. Among the seven church bells in the little belfry is one with the date of 1761.

At noon Cape Oserni, 9 miles distant, was abeam, and the southern end of Karaginski Island was sighted. The coast line between Cape Kamchatka and Oserni was found to be from 4 to 7 miles north of charted position. At 6.30 p. m. we were abreast of Cape Nagikinski, which is the boundary line between the Koriaks of the north and the Kamchadales of the south. We came to anchor abreast of Vivinski village, on the west side of Baroness Korfg Bay. No natives putting off shore for the ship, at 10.10 our anchor was hoisted and we were again under way. At 3.25 p. m. we anchored behind a sand spit which forms General Skobeleff Harbor, in the northwest corner of the gulf. At 7 p. m. Lieutenant Bertholf, Dr. Call, and myself went ashore to communicate with the natives. We visited the village at the mouth of Kultuznaya River. On our way over Dr. Call shot several eider ducks. Learning that a prominent deer man with 2,000 reindeer was a day's journey inland, we hired a runner to go and notify him that a ship was in the harbor and that the captain wished to buy reindeer. The villagers were drying fish, long racks of which were to be seen. At 10 p. m. we returned to the ship. At 11.35 p. m. we came to anchor off the mouth of the Karaga Harbor, it being too dark to attempt to enter. Karaga Bay is 9 miles long and from 4 to 8 miles wide.

June 27: Temperature, 56°. The morning was foggy. Two parties were sent out in small boats to make soundings to find the best way into the harbor. After lunch the steam launch was put into the water and Lieutenant Bertholf, Assistant Engineer Lewton, Dr. Call, and myself, with a rowboat in tow, at 1.45 p. m., started ashore to communicate with the natives and get the starosta or headman of the village to go with us to Karaginski Island for reindeer. Within a mile of the shore, at the upper end of the harbor, the steam launch got aground and could go no farther. We then transferred ourselves to the rowboat and started for the mouth of the river, the village sought being 2 or 3 miles up the river. As we were passing a small fishing village the natives raised a flag and signaled us to come ashore, which we did, although the water became so shallow that those who had on rubber boots reaching to the hip were compelled to get out and help pull the boat over the shallow places. To our gratification we found the man we were looking for at this village. The village consisted of several earth huts for the people, and eight or ten storehouses raised on poles, beyond the reach of the dogs. These storehouses had conical roofs thatched with wild grass. Dr. Call secured some photographs, and later in the afternoon I secured for the Alaska Society of Natural History at Sitka a good specimen of one of these notched logs that serve as a ladder. Having completed our arrangements with the headman and a friend who wished to accompany him to the herd, in half an hour we returned to the beach. The sailor in charge of the launch, misunderstanding the orders given him, had steamed back to the ship. Rowing was hard work; we had a head wind and strong tide against us, and soon decided to go ashore on the sand spit and camp until the steam launch should return in search of us.

A good fire of driftwood was soon burning, water was boiled for tea and coffee, bacon was fried to a crisp, sundry cans were opened, and with good appetites we sat down in the sand to enjoy our lunch. After lunch those who had guns strolled off after wild ducks. About 9 p. m. we saw through the fog the smoke of the steam launch, and at 10 o'clock we were again aboard the ship, having had an enjoyable afternoon.

June 28: Temperature, 51°. The fog lifting; pleasant day. At 7.10 the anchor was raised and we steamed away for Karaginski Island, reaching there at 11.35 a. m., and anchoring in Lozhnuikh Vyestei Bay.

While we were at Petropavlovsk the trader of the Russian Sealskin Company stationed at Karaga had arrived and had informed us that on this island was a herd of 3,000 reindeer. According to his statement, about twelve years ago the ice between

the Karaginski Island and mainland became so firm that a band of reindeer had been driven across to the island, and these had increased until now there were 3,000. He said that the Koriak owners, being cut off from all markets, would make haste to let us have all we could carry in return for the supplies with which we could furnish them. At Karaga the starosta (Russian official) whom we had brought with us to the island placed the number of reindeer at 2,000 head. That there might be no unnecessary delays, the trade goods were brought on deck, the litters for carrying the hobbled deer and sling for hoisting them on shipboard were made, and the pens cleared out for their reception on deck. Lieutenant Ulke and Dr. Call were sent ashore to procure the headman of the island and bring him aboard. At 4.15 p. m. the boat returned with the leading deer owner. He was furnished with crackers and a cup of hot tea in the pilot house, and the captain proceeded to negotiate for the deer, when, to our extreme disappointment, we found that the people had no reindeer to spare; that while it was true that a year ago they had from 2,000 to 3,000, during last winter an epidemic had broken out among the deer and there were but a few over a hundred left. All our expectations were in a moment dashed to the earth. He was willing to let us have five, but as it would require three days' time to go to the herd and drive them to the sea, we could not afford to wait for so few. The people seemed very poor. The population of the island numbers 27. The island is about 60 miles long and traversed by a snow-covered range of mountains 2,000 feet high. Foxes, bears, and ptarmigan are found upon the island. Reindeer moss abounds everywhere.

June 29: At 5.15 a. m. we got under way for Karaga to return the starostas, Ivan and his friend. Anchorage was reached at 9.35 a. m. The steam launch, with steam already up, was lowered into the sea and Lieutenants Bertholf and Gamble, Dr. Call, the two Koriaks, four sailors, and myself started with the steam launch and boat in tow for the shore at 9.55. Within 2 miles of the village the water shoaled until the steam launch could go no farther. Dr. Call, Ivan, and I got into the dingey with the understanding that when we reached shore we would send the dingey back for Lieutenants Bertholf and Gamble. When we were about a mile distant from the village the dingey went aground. Dr. Call, having on rubber boots, and Ivan waded ashore, while the two sailors and I sat two hours in the boat until the tide had turned, and with considerable lifting and pushing the boat was once more got afloat. We then returned to the steam launch. Putting the other native ashore on the sand spit, we returned to the ship, arriving at 3.40 p. m. At 3.55 p. m. we were under way down the bay and out to sea.

June 30: At 9.45 a. m. we came to anchor abreast of Vivinski village, on the west side of Baroness Korfg Bay. No natives putting offshore for the ship, at 10.10 a. m. the anchor was hoisted and we were again under way. At 3.25 p. m. we anchored behind a sand spit which forms General Skobeleff Harbor, in the northwest corner of the gulf. At 7 p. m. Lieutenant Bertholf, Dr. Call, and myself went ashore to communicate with the natives. We visited the village at the mouth of Kultuznaya River. On our way Dr. Call shot several eider ducks. Learning that a prominent deer man with 2,000 reindeer was a day's journey inland, we hired a runner to go and notify him that a ship was in the harbor and that the captain wished to buy reindeer. The villagers were drying fish, long racks of which extended along the beach. At 10 p. m. we returned to the ship.

Summary for June: Traveled 2,921.4 miles; under steam and sail 1,722.9 miles; coal used, 164.713 tons.

July 1: Skobeleff Harbor. Warm, sunny day. At 1.50 a. m. Lieutenant Bertholf, Engineer Spear, Dr. Call, and myself went ashore at the village to hire the natives to gather grass or moss for the reindeer while en route. Had lunch on the beach and returned to the ship at 4.20 p. m. After dinner Dr. Call and Lieutenant Bertholf went ashore to communicate with the natives. They found that the run-

ner sent last night for some cause had only gone part way to the deer man and then returned. Another runner was secured and started off. Lieutenant Ulke went hunting and returned with some ducks.

July 2: Beautiful day. Temperature 63. Spent the day quietly reading. As usual on Sunday, we distributed reading matter among the crew, sailors, firemen, and cooks.

July 3: Two deer men came off this morning and news was received that there was a Russian trader at the village on Sibir Harbor, across the bay. After breakfast Lieutenant Bertholf, Dr. Call, and myself went in the steam launch to fetch the trader. He was found and brought off to the ship as interpreter. Dr. Call could talk Russian with the trader, and he in turn could talk Koriak with the natives. While on shore Dr. Call took a number of photographs. In the village were two large tents covered with reindeer skins and a large sod house used as a store, which was without windows, all the light being received through the open door. The contents of the store were a few boxes of trade goods and large piles of furs—bear, fox, squirrel, wolverine, ermine; also swan and reindeer skins.

Upon returning to the ship it was learned that the runner who started off on Saturday night to notify the deer man while en route had met a bear which had killed his dog and had so frightened him that he had turned and fled. Immediately two other men were secured and started off. A conference was held in the pilot house between the captain, myself, and the two deer men. They looked over samples of our barter goods and discussed the matter somewhat with Peter, the trader. It was a new problem to them. They had frequently slaughtered deer and sold them for food, but had never been asked to sell their deer alive to be carried off they knew not where. They finally concluded not to come to any decision until the arrival of the third deer man, and they had had an opportunity of coming to an understanding among themselves. In the meantime a number of sacks were sent ashore to be filled with food for the reindeer while en route.

After dinner Peter, the Russian, and the deer men were taken ashore to wait until the arrival of the third man.

July 4: Rained all day. No natives on board. It was the most quiet day we have had on the trip. At noon a salute of 21 guns was fired in honor of the day. In the evening the launch was sent over to the village to learn if the third deer man had arrived. No tidings yet.

July 5: Launch was sent early to get news of the deer man. At 6.30 p. m. the launch was sent again. No tidings. The captain has concluded that he can not wait longer. One of the deer men has agreed to let us have some reindeer without waiting on the others. His herd is a few miles down the bay, and we will go there early to-morrow morning.

July 6: Hove anchor at 6 a. m. and got under way. Crossed over to Sibir, on the northwest side of the bay. Peter, the interpreter, and three Koriak deer men were brought on board. At 7.41 a. m. we were again under way for the reindeer herd, on the east side of the bay, which was reached at 11.35 a. m. The interpreter and deer men were at once landed. At 1 p. m. I went ashore and remained on shore until work was stopped in the evening. Fifty-three reindeer were received on board during the afternoon, after which, up to 10.30 p. m., the Koriaks were being paid off for their deer.

July 7: At 6.30 a. m. Lieutenant Bertholf and the men went ashore for deer. Received on board 47 reindeer. At 11.30 the deer men came aboard for pay. At 3 p. m. the steam launch and boats were sent ashore for more deer and moss, and at 5.45 returned with deer, the interpreter, and three Koriaks, who wished to return with the ship to Sibir. At 6.35 under way. At 10.10 we came to anchor at Sibir. The three deer men that came with us were paid off in barter goods for their reindeer, which took until 1.30 a. m.

July 8: At 7.40 a. m. Lieutenant Bertholf, with the steam launch towing cutters and men, left for the village across the bay to procure moss. At 8 a. m. a boat was sent to fetch Peter, the interpreter. Peter and Ahlaticah came aboard, and at 9.35 a. m. the ship got under way. Came to anchor at 10.30 a. m. During the day the leading deer man in this region, and the one for whom we waited in vain all the week, arrived and remained on shipboard until we were about to go to sea in the evening. He had a little boy with him about 10 or 12 years old. At 8 p. m. Lieutenant Bertholf and men returned to the ship, having secured 296 bags of moss. At 8.40 hove anchor and returned across the bay. Peter, Ahlaticah, and attendants were sent ashore at 9.20 p. m., and at 10.15 p. m. we started for the sea and Alaska.

July 10: Six fawns died from seasickness and were thrown overboard. In the evening sighted land (Cape Navarin). The cape is formed by a range of mountains extending seaward and ending in a peak 1,690 feet high, from the eastern flank of which the rock descends almost perpendicularly into the sea. It is surrounded by a group of peaks ranging from 1,200 to 2,300 feet high.

July 11: Having crossed the one hundred and eightieth degree of longitude, we changed from eastern to western time, making a day. At 8 p. m. land was sighted on the Asiatic coast, and at 10.30 p. m. St. Lawrence Island was sighted.

July 12: At 7.05 a. m. dropped anchor at Indian Point. A large number of natives came aboard the ship, among them being Koharri, who has a herd of reindeer. He promises Lieutenant Jarvis to let him have some for the Government. Both Koharri and his adult son were under the influence of liquor. At 11.35 a. m. hoisted anchor and steamed over to Gambell, St. Lawrence Island, where we dropped anchor at 5.20 p. m. Lieutenant Bertholf and myself at once went on shore, the lieutenant taking a number of empty sacks with him for moss for the reindeer. After distributing the sacks among the natives we proceeded with Mr. Doty and Abrahamsen, who had met us at the landing, to the mission houses. As Mr. Doty's and Abrahamsen's time had expired they immediately commenced preparations for departure. The house was fastened up and their baggage sent to the landing. In the meantime word had been sent to Lieutenant Jarvis that some of the natives had secured whisky from the whalers and one had attempted the life of the missionary, in response to which an officer and some sailors were sent ashore to arrest Captain Jack (Sablah), the guilty one, and take him to the ship in irons, which was done.

Mr. Doty reported that from the latter part of April to the early part of June there was an epidemic of influenza, which had affected every person in the community. During the prevalence of the epidemic there were 7 deaths in a population of about 300; 5 of these deaths occurred within forty-eight hours, and 4 of the sufferers had been killed by their relatives and friends at their own request. One of them, a blind man, had his friends place a rifle so that he could discharge it with his foot, and then shot himself. Another man, after certain heathen ceremonies, was shot by his sister-in-law. A man and woman were strangled by hanging. All these persons were sick and asked to be killed. It is their belief that when sick and about to die if they, or their friends for them, take their lives they will thereby escape the devil and go direct to God. Therefore this killing is regarded as a favor. After a person is thus killed his relatives and those that assist make great lamentation over the deceased. It is rarely that a man is strangled at St. Lawrence Island. He is either expected to take his own life with a knife or rifle or have his friends do it for him. In the above cases Mr. Doty had been informed of what was about to take place, but his protests and expostulations were of no avail. The influenza extended also along the Siberian coast. It was reported that at Indian Point 6 adults and 18 or 20 children died, and that among the reindeer men inland from the point there had been 60 deaths. Probably many of these were assisted deaths. Captains S. F. Cottle and B. T. Tilton, of the whaling fleet, report that on the Diomede Islands a woman was hung and a man stabbed by their friends.

The whaling vessels *Jeanette, Grampus, Thrasher, Bowhead, Belvedere, Fearless, Alexander,* and *Wm. Bayliss* had called at Gambell. The *Belena, Bonanza,* and *Narwhal* passed without stopping. The *Albion,* with freight and the cutter *Thetis,* had also called. Charles E. Buckler, captain of the *Wm. Bayliss,* who had been drinking hard, accidentally shot himself and was buried at St. Lawrence Island. Mr. Doty conducted the funeral services. Four whales had been taken by the fleet up to June 20. They also had done a large amount of trading. At Gambell the natives secured one whale by hunting and another was found dead in the ice and the bone secured. Two whales floated ashore, but the bone had been removed. It was reported that one whale had been captured by the natives at Indian Point, one near St. Lawrence Bay, one at East Cape, and one at Plover Bay. At the latter place five boat loads of natives off whaling were gone five weeks and given up for lost. They had subsisted on raw walrus meat. The whaler *Alexander,* in 1896, took down a head of bone for Kelly & Siem from the Government reindeer station at St. Lawrence Bay, Siberia. At 10.35 p. m. we hoisted anchor and steamed for Point Rodney, Alaska, where we expected to land our reindeer for Antisarlook.

July 13: Rained all day; dropped anchor off Point Rodney at 9 p. m. Surf too high for landing.

July 14: Being too rough to land the deer, at 6.30 we hoisted anchor and started for Port Clarence, dropping anchor at the sand spit at 1.15. The following vessels were at anchor: Bark *J. D. Peters,* with coal; steamer *Balena,* schooner *J. M. Coleman* (coal and supplies), *Wm. Bayliss,* steamers *Grampus, Narwhal,* and *Thrasher.*

Finding Per Larsen Anthi (Lapp) and Tautook (Eskimo) at the spit, Lieutenant Jarvis employed them, with two Eskimo assistants, to drive the herd of deer across to Charlie's, about 40 miles distant. At 4.25 p. m. the anchor was hoisted and we steamed up the bay to Cape Riley, where the reindeer were landed. After dinner I went ashore and remained until all the deer (83) were landed. Returned with Lieutenant Bertholf and the sailors to the ship at 1.15 a. m.

July 15: At 8.10 the anchor was hoisted and we steamed across the bay to the Teller Reindeer Station, where we anchored at 9.45. Lieutenant Bertholf was sent off with the steam launch to visit schooner *Mary Bitwell,* that had gone ashore near Grantley Harbor. In the meantime supplies for Tautook that had been brought up from San Francisco were "broken out" and preparations made to land them at Teller Station. The surf was so rough that this was given up and at 4 p. m. anchor was hoisted and we returned to the sand spit, where we anchored at 5.30 p. m. Several whaling captains came on board to call upon Captain Jarvis. Mr. Charles E. Chard, applying for permission to occupy one of the buildings at Teller Station, he was permitted to use the log schoolhouse until June 30, 1900, upon condition that he take charge and care of all the other buildings belonging to the Government at the station. Four boat loads of natives who wished to return home to Cape Prince of Wales were taken on board and their umiaks hung to the davits.

July 16: At 2.50 a. m. we got under way for Cape Prince of Wales, where we anchored at 8.30 a. m. The water was so rough and the surf so bad that only one of the native boats made the attempt to land. They had great difficulty in getting ashore. As it was impossible to land the supplies or communicate with shore, and fearing to miss the revenue-cutter *Thetis,* that was at St. Lawrence Island, the captain concluded to run over to St. Lawrence Bay, Siberia. At 10.50 a. m. the anchor was hoisted and we got under way. At 11.55 we met the *Thetis* coming to Cape Prince of Wales with 14 reindeer. We turned around and returned and anchored at 2.10 p. m. off the village. After anchoring, Lieutenant Hamlet brought off a small mail for the *Bear.* Learning that Dr. Call was very sick, he returned to the *Thetis* and brought off Dr. Hawley. The waves were running so high that the *Bear* had to get under way and take Lieutenant Hamlet and his boat to the windward of the *Thetis*

to enable him to get back to his vessel. As the motion of the ship was injurious to Dr. Call, at 7 p. m. we started to return to Port Clarence.

July 17: The sea was so rough and the current so strong that we were twelve hours steaming 60 miles, reaching anchorage at Port Clarence at 7.13 a. m. The day was rainy and stormy. At 7.40 p. m. the revenue-cutter *Thetis* arrived from Cape Prince of Wales.

July 18: At anchor off Point Spencer. Immediately after breakfast went over to the cutter *Thetis* to confer concerning reindeer with Captain Buhner. There were 14 reindeer on the *Thetis*, and fodder exhausted. As there was a herd of reindeer on shore (which he did not know), for the purpose of receiving small lots of deer Lieutenant Hamlet and myself went ashore to hunt up Dunnak and Sekeogluk (reindeer men) and make arrangements for landing. As the *Thetis* was a long distance from the landing place anchor was hoisted and the vessel steamed abreast of the point of landing. Immediately after 12 o'clock the 14 deer were loaded into two boats and Lieutenant Hamlet and I again went ashore. The landing was made without difficulty and the deer driven off to the herd by Dunnak and Sekeogluk.

After dinner I went to the *Thetis*, and in company with Lieutenant Hamlet went in search of a young Siberian from Whalen, known as Chio, Captain Buhner needing him as interpreter in the purchase of reindeer. It was from two to three hours before we secured him as interpreter.

During the afternoon I took ashore and left in Dunnak's tent for Per Larsen Anthi the following supplies: One sack of flour, 2 pounds ground coffee, 5 pounds of sugar, 6 cans roast beef, 3 cans condensed milk, 5 pounds butter, and 25 pounds of salted pork.

July 19: At anchor at Point Spencer. After breakfast received on board, from the whaling bark *Mermaid*, Frank Temple for transportation to St. Michael, he having assaulted with a knife and cut Clutchpid, of that vessel, July 6. He was placed in the forehold in double irons. Clutchpid also was taken on board and placed in charge of the surgeon.

At 11.30 a. m. we got under way for Teller Reindeer Station, where we anchored at 11.10 a. m. A native boat was loaded with supplies belonging to Tautook, which had been paid him for services connected with the relief expedition to Point Barrow in the winter of 1897–98. Went ashore with the boat and inspected the Government buildings at Teller Reindeer Station. They are already commencing to run down. At 1.15 p. m. we got under way for Point Spencer, stopping at 1.25 to board the schooner *Jessie*, of Los Angeles. At 3.15 p. m. anchored at Port Clarence. Lieutenant Bertholf and the master at arms left the ship to arrest As-sher'-ruk, who murdered Frank Boyd, a miner, on the Noatak River, in the fall of 1897. At 4 p. m. they returned with the man in double irons. He was also imprisoned in the fore hold. At 6.58 we got under way for Cape Prince of Wales with four boat loads of Eskimos. A native from the Diomede Islands, Noo-var-loo, while drunk shot Arkiard, a Diomede boy, but he escaped before he could be arrested.

June 20: Came to anchor at Cape Prince of Wales at 12.35 a. m. Got up and dressed so as to be able to see Mr. Lopp, the missionary at that point. The sea proving too rough to land supplies, we lay at anchor all day. Mr. Lopp came off and spent the day and night on the ship. Stormy and unpleasant day.

July 21: At anchor off Cape Prince of Wales. During the night the sea calmed down, so that very early in the morning the landing was commenced of the stores which had been brought to pay Mr. Lopp's herders for their trip to Point Barrow in 1897–98, in the relief expedition. The supplies having been landed, Mr. Lopp bade us good-bye, and at 8.55 a. m. the anchor was hoisted and we steamed away for Cape Blossom, Kotzebue Sound.

July 22· This morning about 8 o'clock we met the schooner *General McPherson*, loaded with miners en route from Kotzebue Sound to Cape Nome. As the schooner

had been taken off last fall contrary to the orders of the owners, and a warrant being out for her seizure, Lieutenant Jarvis arrested the captain and placed Lieutenant Ballinger on board with instructions to convey the vessel to St. Michael and deliver it up to the court. It proved to be a warm, pleasant day. At 4.20 p. m. the ship anchored off Cape Blossom and very soon after, in company with Lieutenant Bertholf and Dr. Hawley, I was on my way to the settlement, some 12 miles distant, which we reached about 8 o'clock. As we came abreast of the Quaker mission, where from 200 to 300 miners were assembled, they gave three hearty cheers at our arrival, knowing that the steam launch had on board their first mail this season. We soon learned that the Kotzebue mining district had not met expectations. There were from 350 to 400 miners in the camp, three-fourths of whom had had the scurvy, and many of them were destitute. There had been a large number or deaths from scurvy, drowning, and freezing. They were sick, without means, and disheartened. Lieutenant Bertholf and the surgeon immediately proceeded to investigate the condition of things, while I spent the time at the mission. Toward morning the lieutenant came in and announced that he would take off to the *Bear* 33 of the worst cases of scurvy. At 5 a. m., having been up all night, a start was made to return to the ship, but the tide being out the steam launch was soon aground and the party returned to the village. The lieutenant then hired a small stern-wheel steamer to take the miners off to the *Bear*. We finally left the shore about 10.15 a. m., and reached the ship soon after noon. The captain, hearing of the sad condition on shore, sent the steamer back for others.

July 23: At 1.30 p. m. the steamer *Arctic Bird* arrived, bringing 33 scurvy-stricken men to the *Bear*. The men were taken on board and the steamer sent back to the camp for another load. It was a beautiful day—temperature 55—mosquitoes very bad on shore. I regretted that I could not have remained on shore to attend the Eskimo service of the Quakers and also preach to the miners.

July 24: At 3.45 a. m. the steamer *Arctic Bird* arrived with 48 men, 2 women, and 1 babe, all destitute. At 5.20 a. m. we were under way for St. Michael. A fine day. During the day we passed a number of small boats with miners, en route from Kotzebue Sound to Anvil City.

July 25: About 6 a. m. passed Cape Prince of Wales. The *Bear* swung around by Cape Spencer to see if the bark *Alaska* was in Port Clarence Harbor. Not seeing it (afterwards it was learned that it was there waiting for the *Bear*), the *Bear* continued on to Synrock, Antisarlook's place, where we anchored at 8.30 p. m., in the lee of Sledge Island. The supplies brought up from San Francisco for Antisarlook, due him for his trip to Point Barrow in the overland relief expedition of 1897–98, were landed. Upon the return of the boats Antisarlook, wife, and child came aboard to go to St. Michael. While on shore the officer learned that Asheuk, the Diomede murderer that shot and killed Naribuck, a boy, at Point Spencer on the 15th and then escaped, had left there only a few hours before.

July 26: At 12.30 a. m. the *Bear* was under way. At 6.40 a. m., seeing a native camp on the beach, Lieutenant Bertholf went ashore and found and arrested Asheuk. At 7.40 a. m. we got under way, taking in tow the seized schooner *General McPherson*, which we had overtaken. At 10.50 a. m. we anchored abreast of Anvil City, the new village which has sprung up in connection with the Cape Nome placer mines. At 11.30 went ashore with Lieutenant Bertholf. Our boat got aground in trying to cross the bar at the mouth of Snake River, and it was with difficulty that we got ashore. Met Mr. Redmyer, assistant superintendent of reindeer, who had come down from Circle City; also Dr. Kittlesen and Messrs. Andersen and Elliott, of the Swedish mission at Golofnin Bay. Learning that Mr. Kjellmann was at the mines, some 5 miles away, I sent a Lapp with a note for him to come at once to go with me to the reindeer station. Mr. D. H. Smith, United States deputy marshal, and the principal owner of the schooner *General McPherson*, in company with an officer of

the *Bear*, went aboard the schooner and arrested Capt. J. B. Neilson, who had stolen the schooner in the fall of 1898. Jeremias Abrahamsen, whom I had brought from St. Lawrence Island, was given his discharge from the Government service and allowed to go ashore. Messrs. Kjellmann and Redmyer came off for passage to St. Michael. At 7.40 p. m. we got under way for St. Michael. Nome (Anvil City) is a conglomeration of tents, with half a dozen frame houses or shanties, and two or three iron warehouses in process of erection by the transportation and trading companies. The ocean front is staked out with claims for from 10 to 20 miles. We saw men panning out gold on the beach in front of the most densely populated part of the place. Some fine teams of horses were being used in hauling.

July 27: A beautiful day. At 10.15 a. m. anchored at St. Michael. The place had greatly improved since I left it last September. The cutters *Corwin*, *Rush*, and *Nunivak* were in the harbor. Went ashore with the first boat, and at once proceeded to military headquarters to arrange with Capt. E. S. Walker, Eighth Infantry, U. S. A. for the payment of the Lapps by the War Department.

July 28: A beautiful day. All day on shore attending to business. During the forenoon Mr. Gray, as agent of the North America Transportation and Trading Company, sublet to Mr. William A. Kjellmann the mail route between St. Michael, Golofnin Bay, and Kotzebue Sound. Mr. Hendricks and I went on Mr. Kjellmann's bond. Returned to the ship at midnight. Mr. William F. Doty left the *Bear* and took up quarters at Hotel Healy.

July 29: Fine weather continues. All day on shore attending to business. About 11 p. m. Captain Walker took me off to the ship on the army steam launch. The trade of St. Michael has greatly changed since a year ago. Then there was a rush of miners up the Yukon River; now very few are seeking passage up that river, but thousands are coming down, some to leave the country in disgust and others to try the Cape Nome mining district. The up-river business is now mostly freight. Owing to the decrease of the passenger traffic, many of the small river steamers are laid up. The harbor is full of them.

July 30: After lunch I went ashore to attend divine service, held in the dining room of the Hotel Healy, and conducted by Rev. Loyal L. Wirt, territorial superintendent of Congregational missionary work in Alaska. About one hundred persons were present at the service, which was of great interest. The theme of the discourse was, "Christ the wonderful." After service I returned to the ship.

July 31: During the night there was a change of weather. A storm commenced, with a low barometer, which increased during the forenoon to a gale. During the night the Yukon River steamer *Jessie*, of the Alaska Commercial Company, went ashore with three barges, loaded with military supplies for Colonel Ray. At 5.30 a. m. the *Bear* commenced dragging its anchor and was thumping on the bottom; in half an hour we were under way, and at 6.45 a. m. anchored in deeper water. The gale increasing, at 10 a. m. we were again under way, seeking shelter behind Egg Island, where we dropped anchor at noon. In the harbor at St. Michael a large number of vessels dragged their anchors and a number of the smaller boats went ashore. Toward evening, the force of the gale being spent, the *Bear* hove anchor at 8.40 and returned to St. Michael at 10.15 p. m. The depth of water in the harbor was lowered 5 feet by the storm.

August 1: Went ashore on the first trip of the steam launch and was very busy with Captain Walker, U. S. A., completing the drawing of checks for payment of Lapps. At 4.30 p. m., with Mr. Kjellmann, returned to the *Bear* on the army steam launch, and at 4.50 we were under way for Unalaklik. A boat was lowered, and Mr. Kjellmann and I were sent ashore with the mail. On shore we fortunately found five Lapps and a boat from the station. They were routed out of their tent, and preparations were made to proceed at once up the Unalaklik River 8 miles, to the Eaton Reindeer Station. As we left the ship a steady rain commenced, which

lasted until we reached Eaton. A piece of driftwood was laid across the boat and a tarpaulin stretched across, which formed a shelter from the rain. Under this shelter Mr. Kjellmann and I crawled. Innumerable mosquitoes also sought shelter under our improvised tent. Mr. Kjellmann made an ineffectual attempt to drive them out with tobacco smoke; failing, he resigned himself to his fate and went to sleep. I alternated my time between fighting mosquitoes and sitting in the rain.

August 2: At 5 a. m. the night trip closed with our arrival at Eaton Station. Dr. F. H. Gambell had given up our coming and had gone down to St. Michael to meet us, and we had passed on the sea. Dr. Lerrigo was awakened, and soon we had a good warm breakfast. After breakfast the Lapps were summoned and the payment of their salaries from July 1, 1898, to January 31, 1899, by the War Department, was commenced. Thus, with the signing of vouchers and arrangements for the deposit of their surplus salaries in banks to their credit, the whole forenoon was consumed. After payment closed I had the 12 children of the settlement brought into the schoolroom, heard them recite and sing and made each the present of a picture book. After dinner supplies were got out for the reindeer herders in the arctic, and at 1 p. m. we were off on our return to the ship. A stop was made at Unalaklik to call on the missionaries of the Swedish Evangelical Union, where we were presented with beautiful bouquets of wild flowers and a box of fine radishes from their gardens.

After our arrival at Eaton, in the morning, the rain ceased and the sun came out. When we started on our return in the afternoon the rain again set in and lasted until our arrival at Unalaklik. While at Eaton Station a fishing party returned with the seine. When they were asked what success they had had, they replied, "Not much, only a hundred salmon." At 5 p. m. Mr. Kjellmann and I reached the ship with supplies for the overland expedition which was to drive a portion of the reindeer back from Point Barrow to Cape Prince of Wales, and also with barter goods for the reindeer trade of the *Thetis*. At 5.45 p. m. we were under way for Nome.

On the 24th of December, 1898, Klemet Nilsen had died at the Eaton Station.

August 3: At 1.55 p. m. we anchored abreast of Nome. The sea was rough and badly breaking on shore. Captain Jarvis and Mr. Kjellmann went ashore and got wet in the breakers. The place was wild with the large returns being received both in the gulches and the black ruby sands on the shore.

August 4: During the morning Mr. John W. Kelly came aboard to be taken to Point Hope, where he will make headquarters for taking the census next winter between Point Hope and Cape Prince of Wales, including the Kotzebue country. At 10.20 a. m. the ship got under way, and at 1.30 p. m. stopped at Synrock to place Antisarlook (Charlie) and his family on board his umniak, which had come out to meet him. As we passed Cape Spencer a dense black cloud hung over Port Clarence, where the *Thetis* was at anchor waiting for us.

August 5: At 1.20 a. m. we came to anchor off Cape Prince of Wales. Going on deck about 6 a. m. I was surprised to find that Mr. W. T. Lopp was on board. During the forenoon Mr. Lopp, Captain Jarvis, and I had a conference with regard to the reindeer. The bark *Alaska* and river steamer *John Riley* were also at anchor in the roadstead. I wrote two or three letters to send by the *John Riley* to the post-office at Nome. In the afternoon Captain Jarvis and I went ashore with Mr. Lopp. Took a look through the village; returned on shipboard about 5 p. m. Mr. Summers, a mining expert, whom the captain had brought up from St. Michael to prospect some mines that Mr. Lopp and his herders had found, was sent ashore with Mr. Lopp. At 5.45 p. m. we were off for Port Clarence.

August 6: Reached Port Clarence early in the morning (3 o'clock), where the *Thetis* was waiting for us. As it seemed best that the rest of the cruise should be made on the *Thetis*, during the forenoon I transferred from the *Bear* to the *Thetis*. The wind was fresh and the sea rough.

August 7: During the forenoon my trunk and personal effects were brought over

from the *Bear* to the *Thetis;* also the reindeer barter goods brought from the Eaton Station. Captain Buhner during the morning furnished rations on shore for Per Larsen Anti, who is keeping a herd of reindeer at this place. Upon going ashore found that the herd had been removed to Cape Riley. During the day the *Bear* went over to Cape Riley to water.

August 8: At 4 a. m. received word from the *Bear* that Anti was out of rations. As the *Thetis* was prepared to go to sea, Captain Buhner hove anchor at 4.30 a. m. and steamed down to Cape Riley, where we dropped anchor at 7 a. m. I was at once sent ashore with a boat and crew and left rations for Anti. He himself was away from camp after some straying reindeer. Returning to the ship, we were soon under way for sea. In the evening we passed King Island and saw the cutter *Bear* at anchor.

August 9: About noon passed Indian Point. At 9.55 p. m. we dropped anchor at Port Providence, Plover Bay. A boatload of natives visited the ship. Learned that there was a large herd of reindeer 30 to 35 miles to the westward.

August 10: Left our anchorage at 5.05 a. m. During the morning we stopped to communicate with some natives who rowed out to meet us. They also testified that there was a large herd to the westward. Reaching the bay where the herd was supposed to be, the ship anchored at 4.20 p. m. Lieutenant Hamlet, Chisthe (interpreter), and I went ashore, where we met the reindeer men. Their herd was five days' inland and they declined to drive it down to the coast. Thus again our hopes were blasted. A few miles farther west another herd was reported. In attempting to launch the boat from the shore it swamped in the surf, and I was wet through and through. Had difficulty in getting through the surf. Returning to the ship at 7.05 p. m., we were under way for the next herd, but the fog setting in thick, at 8.25 p. m. we anchored for the night.

August 11: At 8.05 made a start and at 10.55 a. m. anchored off Managen, where a number of deer men's huts or tents were seen on shore. Soon after a boatload of natives came off to the ship and we heard again the same story. They had deer and would like to trade, but their deer were pastured many days distant and they could not drive them down to the coast. Being convinced of the uselessness of further search along the north shore of Anadir Gulf, at 12.55 p. m. we hove anchor and steamed away for St. Lawrence Island. A beautiful day.

August 12: At 7.40 a. m. dropped anchor on the northeast side of the point at Gambell, St. Lawrence Island. The wind shifting, we hove anchor and steamed around the point and anchored on the southwest side. Went ashore to the Mission Station and brought off a lot of reindeer barter goods that were not needed at this point, but were needed at the Eaton Station. The wind increasing and being a head wind, we lay at anchor until 7.25 p. m., when we put to sea and steamed away for Teller Reindeer Station.

August 13: Head wind and sea, making about 3 miles an hour; I was seasick all day. Distributed magazines to the crew.

August 14: At 11.15 a. m. dropped anchor abreast of Teller Reindeer Station, Port Clarence. Went ashore with the carpenter and nailed up all the doors but one of the large frame house and left the key with Mr. Chard, who has agreed to look after the buildings in return for the use of the log schoolhouse. Also posted notices on the doors of the several buildings, warning against trespassing. The sailors attempted to procure some moss, but in the immediate vicinity of the station, where it had been closely pastured, there was none large enough to gather.

August 15: At 6 a. m. hove anchor and steamed across the bay to Cape Riley, where we dropped anchor at 7.20 a. m. At once went ashore and commenced preparations to take on board 40 sled deer to be removed to Cape York for Mr. William T. Lopp. On July 14, 83 deer had been landed to be driven across to Charley, at Point Rodney, in charge of Per Larsen Anti, Tautook, and two other Eskimos.

By 6 o'clock p. m. 40 deer had been caught and placed on board ship. One was killed on shore in handling. The deer are large, heavy, and in excellent condition. The two umniaks that had been hired were paid for, and at 7.15 p. m. anchor was hove and we steamed away for Cape York and Cape Prince of Wales. The cloud effect at sunset was remarkably brilliant and beautiful.

August 16: Dropped anchor under the lee of Cape Prince of Wales at 4 a. m. The wind was blowing a gale and a driving cold rain storm in progress. No communication with shore or landing of deer possible to-day.

August 17: At 8.50 a. m. hove anchor and steamed to Mr. Lopp's herding grounds near Cape York, where we dropped anchor at 10.10 a. m. At once went ashore, where I found Mr. Hank Summers, mining expert. Sent to have the herd driven down to the beach. Also had gathered a few sacks of reindeer moss. The herd arriving about 10 a. m., we at once went off to the ship and commenced landing the deer. I remained on shore until the deer were all landed (8 p. m.). Good weather until midnight.

August 18: At 9.20 hove anchor and steamed to Cape Prince of Wales, where we anchored at 11.25 a. m. Mr. Lopp and some natives came aboard. Reindeer barter goods for the use of the *Bear* were landed. Reindeer matters and other business was finished up with Mr. Lopp, and at 3.50 p. m. we were under way.

August 19: At 5.45 a. m. dropped anchor off Cape Riley, and I went ashore to make arrangements for shipping reindeer. Hired three native skin boats and all the men I could procure. A number of the women and children were employed in gathering moss for the deer. During the day 36 sled deer, 3 bucks, and 10 female deer were taken on board, making 49 in all. Fine day. At 5.30 p. m. finished loading. Took on board Per Larsen Anti, together with Government dogs and sleds for Eaton Reindeer Station.

August 20: At 4.05 a. m. hove anchor and steamed away for Point Rodney. Beautiful forenoon; afternoon rainy. At 5.25 p. m. anchored off Charley's (Antisarlook's) place.

August 21: Last evening Lieutenant Hamlet was sent to the shore, but could not make a landing on account of the surf. Waited all day anxiously for the wind to change and the swell to go down, so that we could land the deer, as we were without food for them. In the evening moved inshore.

August 22: Finding no landing, this morning we hove anchor and started for Golovin Bay. The day proved a beautiful one, with sunshine and a crisp, invigorating north wind, but still there was no landing on the beach. Anchored at 8.40 p. m. in the mouth of Golovin Bay under the lee of the west shore.

August 23: At 4 a. m. went ashore with Lieutenant Hamlet to hire native boats. It was a long pull of several miles. Secured at the village 4 umniaks. Took breakfast and found some late papers at the Swedish Mission. Returned to the ship about 10 o'clock. After giving the natives some coffee and crackers the work of unloading the deer was commenced. Per Larsen Anti was set ashore in charge of the deer. Word had been sent to the Golovin Bay herd and Owikkon (native herder) came down to help Anti. By 3.45 p. m. the deer were unloaded, and at 7.05 we were under way for Anvil City.

August 24: At 7.30 a. m. dropped anchor off Nome. Immediately after breakfast went ashore and remained all day. Sent word to Mr. William A. Kjellmann and Mr. D. Johnson Elliott that I wished them to come down from the mines to see me. Met Judge Johnson, of the United States district court of Alaska, and was present at the opening of the first court at Anvil City. Saw some of the citizens with regard to a block of ground for school purposes. Had several conferences with the Lapps in the settlement of their accounts. Governor Brady having returned from the mines, invited him to go to Unalaklik with us. Hove anchor at 8.55 p. m.

August 25: At 4.10 p. m. dropped anchor off Unalaklik. The steam launch took Governor Brady, Messrs. Kjellmann, Karlsen, and myself ashore. Had some difficulty in getting over the bar at the mouth of the Unalaklik River. Providentially Dr. P. H. J. Lerrigo and a party of Lapps were down the river with the reindeer station boat. At 10 p. m. Mrs. Karlsen kindly gave us a lunch and soon after Mr. Kjellmann and I, with the Lapps, started for the station in a rowboat. Mr. Lerrigo's supplies and baggage were sent off to the ship by the steam launch. Bright moonlight, crisp and cold. Mr. Kjellmann and I laid some blankets in the bottom of the boat and got some sleep on our way to the station.

August 26: The current was so swift in the river that wherever the banks would allow it the Lapps landed and towed the boat. It was nearly 4 o'clock in the morning before we reached the station. Throwing myself on a bed, I slept until 6.30, when we had breakfast, and at 7 a. m. were hard at work with the accounts and other business of the station. At 12.30 noon we started on our return trip to Unalaklik, Dr. Gambell accompanying us. It rained hard all the way. Reached Unalaklik about 4 p. m. and a flag was set as a signal for the launch. Inspected the new Government warehouse on the south side of the river at the mouth. Instead of sending the launch two boats were sent off, which were between two and three hours reaching shore. As the crews were wet, cold, and hungry, Reverend and Mrs. Karlsen gave them coffee and a warm lunch. It was expected that Mrs. Karlsen and Miss Johnson would go out to the ship with us en route to St. Michael. Miss Johnson being an invalid, the doctor forbade her going out to the ship (8 or 10 miles) in an open boat in a rain storm. Consequently Dr. Lerrigo, Mr. Kjellmann, and I went off to the ship in the boats, and the governor remained to come off with the ladies in the launch. Reached the ship at 9 p. m.

August 27: Early in the morning the launch was sent for the governor and ladies. After receiving them on board the launch started to return to the ship. When in the surf it lost its propeller and had to signal to shore for assistance. Rowboats went at once and towed the launch to shore. In the meantime, the wind rising, the ship hove anchor at 10.05 a. m. and proceeded for shelter to the lee of an island in the bay, where it dropped anchor at 1.15 p. m.

August 28: Remained all day at anchorage.

August 29: The gale having somewhat abated, at 5 a. m. we were under way for Unalaklik, where we dropped anchor at 8.05 a. m. Governor Brady, Mrs. Karlsen, Miss Johnson, and an Eskimo girl going East for an education, came off in a rowboat, and a ship's boat was sent in to tow off the disabled steam launch. The boat and launch returning at 12.45 noon, the ship was soon under way for St. Michael, where we anchored at 8.05 p. m. Went ashore for mail.

August 30: Major Ray, U. S. A., having placed the army steam launch at my service for the forenoon, we had an early breakfast and went ashore. Left vouchers and reports at Captain Walker's office. Adjusted business matters with the North American Transportation and Trading Company. Let Mr. N. V. Hendricks have some reindeer for carrying the mail. Had a conference with Dr. Romig, superintendent of the Moravian Mission on the Kuskokwim River, and at 11.50 a. m. returned to the ship. At 12 noon we were under way for Nome, Major Ray, U. S. A., accompanying us to that place.

August 31: At 6.20 a. m. dropped anchor at Nome. After an early breakfast, went ashore, accompanied by Lieutenant Buhner. Mr. D. J. Elliott and Dr. John Johnson Elliott made application for $20,000 worth of reindeer for the Swedish Evangelical Union Mission Station at Golovin Bay. At 11.20 a. m. we got under way for Gambell, St. Lawrence Island.

September 1: Reached Gambell at 3 p. m. Landed Dr. Lerrigo and opened the mission house. Steamed away for Dutch Harbor (Udakta) at 6.45 p. m.

September 7: Reached Udakta at 10.30 a. m., having seen no land for six days.

Found the United States transport *Athenian* at the dock with 100 soldiers and 450 cavalry horses bound from Seattle to Manila.

September 8: In the harbor were two British men-of-war, revenue cutters *McCulloch*, *Grant*, *Corwin*, and *Thetis*, steamer *Townsend*, and United States transport *Victoria* with soldiers and cavalry horses. Went to Unalaska and inspected school building. Lunched at the M. E. Mission.

September 9: Went aboard the cutter *McCulloch* and steamed away for Unga.

September 10: Beautiful day. At 2 p. m. reached Unga and went ashore and looked over the schoolhouse and teacher's residence.

September 11: At 7 a. m. a term of court was held by Judge Johnson on the *McCulloch;* about a dozen men were naturalized. At 9 a. m. we steamed away for Kodiak. In the afternoon a southeast storm had developed, and the captain, at 10 p. m., headed out to sea and hove to.

September 12: Hove to and weathered out a gale. No table was set for lunch or dinner; took a little food in our hands. Was seasick and very uncomfortable.

September 13: The severity of the gale having somewhat abated and the wind having hauled around to the southwest, at 10 a. m. the ship was headed to the northeast for Kadiak, with a fair wind and sea. Made good progress.

September 14: Early in the morning sighted Kodiak Island. About 2 p. m. dropped anchor opposite Wood Island. Went ashore at Kodiak. Visited the school; Mrs. Hill, teacher. After dinner called at Wood Island.

September 15: Spent the forenoon and took dinner at the Baptist Mission, Wood Island. Appointed Miss H. I. Denniston teacher at Afognak. Sailed about 3 p. m.

September 17: Reached Yakutat and learned of the earthquakes that had been going on since September 3. The whole population is living in tents upon the hills. The severest shock was on the afternoon of the 11th of September. Called upon and comforted the Swede missionaries. At noon steamed away for Sitka.

September 18: When the steamer reached the neighborhood of Sitka the fog was so dense that the captain did not dare venture in, but stood out to sea for the night.

September 19: The fog lifting a little, the harbor was made, and we anchored at Sitka about 2 p. m. Mail steamer *Cottage City* was in. I was the guest of Governor Brady.

September 20: Spoke at the native prayer meeting in the evening.

September 21: Moved from Governor Brady's to the mission. Governor and Mrs. Brady gave a dinner to Captain Coulson, Captain and Mrs. Kilgore, Bishop and Mrs. Rowe, the land commissioner and his wife, and myself.

At 8 p. m. a large reception was given to the officers of the cutters *McCulloch* and *Perry* and the citizens.

September 22: Addressed the teachers in the evening.

September 23: In company with Governor Brady, Senator Shoup, Marshal Shoup, Collector McBride, and Superintendent Kelly, went aboard the cutter *Perry*, Capt. William F. Kilgore commanding, Third Lieut. Eben Barker, Chief Engineer Harry L. Boyd, Second Assistant Taylor W. Ross. Anchored for the night at Killisnoo. Went ashore.

September 24: Started at daylight for Juneau. Anchored at 5 p. m. After dinner went ashore and addressed the congregation at the First Presbyterian Church on Alaskan schools and missions.

September 25: Mr. Kelly and I visited the public schools at Douglas Island.

September 27: Steamed from Juneau at daylight; reached Wrangell about 10 p. m.; went ashore and called on Miss Green, the teacher. Governor Brady, Mr. Kelly, and I also called on Rev. H. P. Corser, the Presbyterian minister.

September 28: At midnight started south, calling at Ketchikan and Saxman, and reaching Metlakahtla at 2 p. m. Went ashore and looked over the place. In the evening met the leading men in conference.

September 29: In the forenoon a conference was held in the church. At 3 p. m. the *Perry* started on its return to Sitka, leaving me at Saxman.

September 30: Rev. Edward Marsden took me in his steam launch *Marietta* to Gravina, where I met the teacher, Miss Hamblet. At 12 noon the church bell rang and I had a conference with the leading men.

October 1: A beautiful day. At 2 p. m. steamer *City of Seattle* came along and I went aboard for Seattle.

October 2: Reached Seattle at 2 p. m., forty-eight hours from Alaska. After attending to a few items of business and procuring my mail, took 4.30 p. m. train to Tacoma, where other matters of business were arranged. Took the train at 11.30 p. m. for Portland.

October 4: Transacted business for the Laplanders at First National Bank. Took the 6 p. m. train for San Francisco.

October 6: Reached San Francisco at 9 a. m. Spent the day at S. Foster & Co.'s office looking up accounts, arranging business, etc. Mr. Blum, whom I wished to see on reindeer matters, was out of the city. Took the 6 p. m. train for Salt Lake.

October 8: Spent the Sabbath at Salt Lake.

October 9: Took 7 a. m. train for Chicago. During the night had a heavy snowstorm.

October 11: Reached Chicago about 1 p. m., the train being between four and five hours late. At 5.30 p. m. took the Pennsylvania Limited for Washington. During the night we were detained five hours by a freight wreck.

October 12: Reached Washington at 8.45 p. m., about four hours late.

Very respectfully, yours,

SHELDON JACKSON,
United States General Agent of Education in Alaska.

The COMMISSIONER OF EDUCATION.

CHAPTER XXXIII.

CONSULAR REPORTS.

Contents.—Commercial Education in Antwerp; Study of Commerce in France; The Vienna Export Academy; The Study of Tropical Diseases in Great Britain; The Education of German Consuls; Educational Statistics in Russia; Care of Children in German Schools; Embroidery Schools in Plauen, Germany; German Schools in Foreign Parts; Industrial Schools in Saxony; Education in Russia; High-Art Reproductions for America; Household Schools in Liége; Manual Training in Germany; Mutual-Aid Societies for French School Children; Workingmen's Aid Societies in France; Music Library in Geneva; Colonial School in France; Colonial Training in Belgium; Liége School of Firearms; Cabinetmaking School at Magdeburg; Commercial University for Hamburg.

COMMERCIAL EDUCATION IN ANTWERP.

Consul-General Lincoln sends from Antwerp, February 25, 1899, an article taken from the Belgian Times and News of even date, giving an account of the higher commercial institute of that city, which is summarized as follows:

The students are divided into two classes—the "regular" and the "free." The former attend all the lectures with a view to obtaining a diploma at the end of two years, which period constitutes the prescribed course of study, except for those preparing for the Belgian consular service, for whom a third year's course has been added. The "free" student follows only the courses of lectures which he considers of importance to his commercial career.

The instruction is practical as well as theoretical. The transactions of commercial and counting houses are practiced, and all questions relating to the theory of exchanges are accurately described. The correspondence of the "office" must be conducted by the student himself, and that, too, in French, German, and English, which languages are obligatory. He must also be competent to correspond in one other foreign language, the choice generally being from the Spanish, Italian, or Dutch. The Russian language is also taught; its study is not obligatory. The principles of political economy, of international commercial law, and of customs legislation are also inculcated. The geographical and economical condition of foreign countries are studied from carefully compiled data, and the relative value of raw material, from different sources of supply, is inquired into and noted.

The student is also encouraged to take a close interest in the political events of the day, so far as these affect commercial interests; and the latest consular reports from all countries are placed at his disposal, so that he himself later on may be in a position to make a report upon the commercial prospects of any country in which he may happen to be.

Another important feature of the Antwerp institute is the bestowal of traveling scholarships on the most deserving students of Belgian nationality. A sum of nearly £2,000 per annum is devoted to this object. A student, who has passed his final examination with credit, is entitled to offer himself as a candidate for one of these scholarships or "bourses," as they are called. If one be granted, he proceeds

abroad, with the certainty of enjoying, for three years at least, an annual income of about £200. He is thus relieved of the necessity of accepting the first situation that is offered to him and can devote the whole of his time, if necessary, to the study of the economic condition of the country in which he resides. He must periodically send home a detailed report of the result of his observations. By his previous training he is enabled to do this effectively; and these reports, after being noted by the Government, are utilized by the students in the prosecution of their studies.

Down to the end of 1892, 62 students had been thus sent abroad, the countries chosen for residence being Algeria, Morocco, the Cape, Japan, China, India, Canada, the United States, the Argentine Republic, Brazil, Colombia, Venezuela, Chile, Mexico, Cuba, Philippine Islands, Australia, and New Zealand—in fact, those countries in which Belgium is seeking to place her manufactures. Of these 62 students, 27 have remained in the countries to which they proceeded and are now doing well as merchants or commercial agents; 16 are established in European countries, also as merchants; and two have entered the service of the Japanese Government as teachers of the commercial sciences.

It will now probably be asked what is the cost to parents of a higher commercial education, such as that given at the institute at Antwerp. It is very small, the expenses of maintaining the establishment being borne by the Belgian Government in part and the rest by the Antwerp municipality. Each student pays a fee of about £10 the first year and £12 the second, the total amount thus raised being given as honorarium to the professors to supplement their salaries.

The Government does its best to procure a really competent teaching staff, and pays so much a year to each "chair," giving a pension to the professors after a certain number of years' service.

STUDY OF COMMERCE IN FRANCE.

Consul Skinner writes from Marseilles, March 24, 1899:

The commercial organizations of France are doing all within their power to promote the study of foreign commerce and foreign languages and to overcome the national habit of indifference to the latter. To this end the Society for the Protection of Commerce in Marseilles maintains a free commercial school, and the National Ministry of Commerce grants "purses for residence in foreign lands." Purses of the first category (4,000 francs = $772 for the first year, 3,000 francs = $579 for the second), are reserved for young men of not less than 16 and not more than 18 years who desire to establish themselves in some country outside of Europe and who, by virtue of the law of July 15, 1889, are relieved of the obligation of active military service if they reside regularly in foreign parts until they shall have attained 30 years. The purses of the second category (varying from 2,500 to 4,000 francs, or $482 to $772) are for young men aged not more than 26 years, graduates of a high school of commerce, who, after having accomplished their military service, are desirous of completing, by a practical apprenticeship, their theoretical knowledge gained at the school. This year two purses are to be granted for each category.

THE VIENNA EXPORT ACADEMY.

A consular report from Vienna on the export academy in that city gives a minute description of the efforts of Austrian merchants, combined with those of the Government, in increasing the exports of the Austrian Empire. The report is here given in full:

Since the 1st of October, 1898, there has existed in Vienna a commercial school of an entirely original organization. This is primarily shown from the fact that the

institution is directed by a high official of the Austrian ministry of commerce. This direction is not merely nominal, but is evidenced, apart from daily influence on the life of the pupils, by weekly conferences under the chairmanship of the director himself, which have the purpose of receiving from each of the teachers a report of the studies of the past week and those to be taken up in the coming one. Every topic, even in its smallest details, is in direct relation to the object of the institution. This object is the promotion of the Austrian export trade. It is not designed that the young men, immediately after finishing their studies, should become Austrian exporters. On the contrary—and this is the second original phase of the scheme—it is desired that the graduates, on leaving the academy, act as clerks in exporting and manufacturing firms, there to learn the practice of some special branch of business, whereupon, under further support of the ministry of commerce, the graduates are to be placed with larger foreign firms; and finally, by the joint aid of the Austrian Government, the chambers of commerce, and the particular foreign consulate concerned, they will be aided to establish themselves abroad.

One hears constantly the complaint of Austrian exporters of the sad lack of national commercial representation abroad. It is much more difficult for an Austrian exporter to find in India, China, or South America a market or bank for Austrian wares or drafts than it is for the German merchant, who is naturally preferred by the German firms in foreign countries. Austrian merchants are rarely to be found, even in the most important cities of other lands. This state of things it is now proposed to remedy by educating ambitious and gifted young men in all branches necessary for the future exporter to know, and inducing them to adopt such career by the certain prospect of aid from the Austrian Government.

The academy has a preparatory course of one year and a regular course of two years. Further, there are special courses of greater or less duration. The tuition fee is 150 florins ($60) a year. The pupils will, besides, be given opportunity to visit occasionally, under the supervision of thoroughly informed teachers as guides, the prominent industrial establishments of all typical export articles, as well as certain commercial cities and ports of special importance. Thus, for instance, an excursion to Hamburg is now planned, while trips to mills, sugar refineries, breweries, and furniture factories have already been undertaken.

The Imperial Royal Commercial Museum, of which the export academy has been made an integral part, has put at the disposition of the academy its library, its valuable trade collections, and the requisite geographical maps and apparatus. The academy has a yearly subvention from the ministry of commerce of 20,000 florins ($8,000), and a like sum is being raised by popular subscription.

First of all, graduates of the higher commercial schools are entered as regular students in the academy. Further, pupils are admitted who have passed the grammar schools and possess such knowledge of commercial branches and of the French and English languages as can be acquired in a commercial school of two classes.

All desiring to be admitted as regular students must pass a preliminary examination. In exceptional cases pupils who have completed their studies in an unusually excellent manner in a commercial school, and can show testimony of already having done praiseworthy work of a practical kind, may be admitted as regular students by the faculty, without preliminary examination. This rule of exception has already been applied in many instances, and gives the academy some of its most promising pupils. Two groups of students can be plainly distinguished—those with and those without practical experience. The academy would perhaps attain its highest plane if only students who have had practical experience were admitted.

In no class of the academy are more than thirty students admitted, and only twenty in the preparatory course. The actual number of pupils at present is near the maximum allowed.

Attendance at the classes and lectures of the export academy is compulsory and

subject to strict supervision. An absence of eight days without proper justification is followed by striking off the student's name from the roll. This is another distinguishing feature of the school, wherein it differs from all other Austrian and German high schools and recalls the Paris École des Hautes Études, as well as French schools in general.

At Christmas and Easter during every year oral examinations are held in all the branches of study. During the first year the annual examination takes place in the first half of July.

By reason of a special order of examination the regular students have to undergo a severe final examination at the close of the second year, before a board of examiners presided over by a representative of the ministry of commerce. The names of students who do not pass one oral examination without good excuse are stricken from the rolls. In some cases, the board of examiners may permit the repetition of a year's course, or of the severe final examination.

Only those students are admitted to the second year who have favorably passed the annual examination in all branches of the first year's course.

There are thirty-four hours weekly in the preparatory course, and in the first year thirty-four or thirty-five obligatory hours every week, besides some that are not obligatory. The preparatory course has for its purpose to advance graduates of gymnasia and other high schools about as far in one year as an ordinary commercial school does the undergraduate in two or three years.

Of the two yearly courses of the academy only the first has so far been opened, and the students have in all the examinations up to now given brilliant evidence of the excellent curriculum. In this course great stress is laid on the study of the French and English languages, with practice in correspondence (six hours each weekly). Four hours a week are devoted to domestic and foreign law, so far as it concerns commerce. Three hours are given to practical exercises in the office work of export, import, and factory businesses. Instruction in this important branch is intrusted to the vice-director of the academy. The limited time given to this work is only the natural consequence of the fact that all students must be familiar with the principles of office work before their admission.

In view of the burden entailed by the large number of school hours home time is demanded only for languages and office lessons. Instruction in economics, with special regard to tariffs, in the usages of export trade, in commercial geography, and in knowledge of the world's wares according to kind and production, is imparted in so-called seminaries—that is, institutions which afford immediate practice of what has been learned from the teacher's lecture, and, as far as possible, actual inspection of the modes of production and of samples. This experiment of giving the pupil the most important facts right in the school, instead of letting him learn by heart what he is sure to forget speedily, and of having him practice it on the spot until indelibly engraved on his memory, is one of the most daring as well as important innovations in the field of pedagogics, and deserves to be propagated.

Besides all this, lectures on selected subjects of actual interest are given by the professors of the export academy, by manufacturers in the various industries, and by ministerial officials, and are attended voluntarily by the students, who display deep interest in them. In this manner they become acquainted with special questions of the day that are engrossing public interest, in a manner that is unbiased by party standpoints.

I had the pleasure of observing the practical working of this feature of the academy in a lecture which was a comprehensive description of the world's commercial institutions devoted to the export trade. The lecturer spoke, in particular, with great admiration and thorough knowledge of the Philadelphia Commercial Museum and the National Association of Manufacturers, as well as of our other export associations. About the lecture room was displayed printed matter bearing on the

subject. In the American exhibit I noticed a copy of the tariff, consular invoice certificates, consular reports, the newly issued American Trade Index of the National Association, a copy of American Trade, and a number of other publications.

This export academy should be of special interest for us in the United States. The addition of a similar school to the excellent means for information at the command of the Commercial Museum in Philadelphia might cause young men to be of great use in our export trade and achieve even better results than the academy here, which is proving so practical a measure. Such a school would be of untold benefit to our national commerce if attended for a year by men about to enter our consular service. It would be an ideal consular training academy.

CARL BAILEY HURST,
Consul-General.

VIENNA, *April 18, 1899.*

THE STUDY OF TROPICAL DISEASES IN GREAT BRITAIN.

A consular report from Liverpool on this subject may be of more than passing interest. The report is here reproduced in full:

A movement has recently been started in England for the special study of tropical diseases, and, now that it has developed into concrete form, there is an endeavor to give it an international character. The originator of this humane project is the Hon. Joseph Chamberlain, the British colonial secretary. The advancement of commerce with tropical regions, particularly Africa, has brought civilization face to face with diseases peculiar to those countries, which science has so far not been able to successfully combat, first, because of lack of exact knowledge as to their nature and, second, because of the inadequacy of the remedial agencies employed. These diseases are of a malarial type, but it has been found that they differ somewhat from those known as belonging to that class in Europe and in North America, although to a certain extent they are similar to the malarial diseases existing in the swampy districts in several of the Southern States.

There are now two organizations in England that have taken up the work of the study of tropical diseases, one at London and one at Liverpool. The Colonial Nursing Association, of London, has also identified itself with the movement. The organization at Liverpool is independent of governmental control and has not as yet received any financial aid from the Government, while that at London is, to a certain extent, under Government auspices. The Liverpool school was started by the head of a large shipping firm, and the project has received the enthusiastic support of the local business community and medical profession. Both the London and Liverpool institutions are working together harmoniously for the same end, and it is confidently expected that the Liverpool enterprise will be given Government support. It is claimed that no other city offers such facilities as Liverpool does for the study of tropical diseases, largely because of the fact that, owing to its enormous traffic with the Tropics, there are more cases of these diseases here than in any other European city. Last year there were in one of the Liverpool hospitals (the Royal Southern) nearly three hundred cases of malaria, and quite a number of cases of beriberi, tropical anæmia, yellow fever, scurvy, etc. All these cases were brought to Liverpool by ships trading with tropical countries.

The Liverpool School of Tropical Diseases is in connection with University College and the Royal Southern Hospital. Students must be qualified medical men of this or foreign countries, or fifth-year students. In other circumstances, special application must be made. A separate ward has been set apart at the hospital for the treatment of tropical diseases, and there is a ward laboratory for the immediate examination of blood and excreta. At the University College there are the Thompson-Yates laboratories, opened by Lord Lister last October, and probably the most

complete in the United Kingdom, where ample facilities will be given for the special scientific study of the subject.

The managers of the Liverpool school urge that their work is not a local one, nor even limited to the British Empire in its beneficent scope. They plead that all countries having commerce in tropical countries should interest themselves in the work, as, quite apart from humanitarian considerations, tropical diseases are one of the greatest barriers at present to the extension of commerce in the countries where they prevail. A short time ago letters were received from Professor Koch, of Berlin, heartily indorsing the undertaking, and stating that Germany was about to found a similar institution. The matter has been officially brought before the foreign consuls in Liverpool, and they, after several conferences, expressed their appreciation of the great value of the movement, and the suggestion was made that each consul should, in such manner as might be deemed best, bring it to the attention of his government and of the medical profession and others in his own country.

Pecuniary aid from foreign governments will not be solicited, but would be gratefully received. The Liverpool school would be pleased to exchange information and the results of scientific observation upon all phases of the subject with any foreign government, or any foreign medical society or hospital, or with any individual traveler or professional man, and foreign students would be cordially welcomed. Those interested are invited to communicate with Professor Boyce, University College, Liverpool. The international feature of the Liverpool School of Tropical Diseases has already received recognition from America. Several months ago Bishop Hartzell, of the Methodist Episcopal Church of the United States, passed through Liverpool en route to his field of labor, which embraces the whole of Africa. While here he became greatly interested in the Liverpool School of Tropical Diseases, and arranged that one of his medical missionaries who was shortly to follow him should study for three months at the school. Several consuls representing maritime nations say that they will advise either direct support to the Liverpool school or cooperative action, for the reason that many victims of tropical diseases that have come under their observation at Liverpool have been sailors of their own nationality.

It is the expectation that the Liverpool institution will become the recognized school for the training of Government medical officers proceeding to the west coast of Africa. A special sphere of activity will be the organization of expeditions to Africa to study tropical diseases, and I am officially advised that students from American medical colleges are invited to accompany these expeditions. Professor Christophers is now conducting an expedition in Africa with this object. He is working under the auspices of the British Government, and was specially selected for that purpose by the Royal Society on request of Mr. Chamberlain. He is operating in cooperation with both the Liverpool and London schools.

It is suggested here that in view of the new responsibilities and opportunities in the West Indies and the East, this enterprise should meet with sympathetic interest in the United States.

JAMES BOYLE,
Consul.

LIVERPOOL, *April 25, 1899.*

THE EDUCATION OF GERMAN CONSULS.

No attentive reader of current newspaper discussion in Germany can have failed to notice the earnestness and intelligence with which the leading journals have seconded the plans which are now understood to be under consideration by the Imperial Government for the reorganization of its consular service.

The scope and purpose of the proposed reform have been dictated by the new and enlarged functions which are imposed upon the foreign service of Germany, by the

expansion of her foreign trade and by the valiant fight which this country is preparing to make for a leading and permanent place in all important foreign markets.

As long as Germany was an agricultural State, without colonies or any large export trade, except in manufactured products which went mainly to the United States and neighboring countries in Europe, her consular service, organized on the old lines, served satisfactorily for the protection of German subjects residing abroad and such other incidental duties as might be required of it. Under that system consuls were educated as lawyers and diplomats, passed the prescribed assessor's examination, underwent a period of training in the foreign office, and became typical Prussian officials, with a good command of languages, a fair knowledge of diplomacy, international law, and the history of treaties, but no practical acquaintance with industrial processes, commercial values, or mercantile usages. As trained officials belonging to the privileged class, many of the imperial consuls and their subordinates—as is now asserted by the German press—have evinced a certain contempt for trade and those engaged in it, and have rejected requests for commercial aid and information as forming no part of their official duties.

The exigencies of the wholly new situation that has been developed during the past ten years—stimulated, as is broadly hinted, by the recognized efficiency of American and other consuls in obtaining valuable information and promoting export trade—have created a demand for a radical reform of the entire consular system and its reorganization upon wholly different lines.

In so far as the leading newspapers are informed, the propositions now under consideration are two:

First. To retain practically the present consular organization and to strengthen the commercial efficiency of the consulates by assigning to them commercial attachés, a plan that has been found to work well in the German consulates in the United States.

Second. To abolish permanent consuls (Berufsconsuln) and appoint in their stead experienced and capable merchants, who will give to the consular office a definite commercial character, while its legal and purely official duties are performed by young attachés trained in the usual manner.

Whichever of the plans may be adopted, there is a general demand that the consular service shall remain, as now, a life career; that the basis of its personnel shall be a corps of consular pupils, selected by competitive examination for their intelligence, energy, and efficiency as students of modern languages, commercial law, and technology, trained by special studies for their career, and then sent out to foreign parts to begin their life work as apprentices. For the purposes of this service, the world will be divided into four or five districts, for each of which the consular pupil will be specially educated in all that relates to languages, history, and special commercial conditions. In such a division, Great Britain and its English-speaking colonies would constitute one district, the United States a second, South America a third, China and Japan a fourth, the East Indies a fifth; and the consular pupil, prepared and assigned to one of these, would remain there during his career, thus saving the reckless waste of valuable knowledge and experience that occurs where a competent consular officer, familiar with the language and commercial uses of one foreign country, is suddenly transferred to another.

To emphasize the need of a radical reform on this point—in respect to which the proposed new German system would be a step beyond what has been hitherto embodied in the consular service of any other government—the Cologne Gazette says:

> The essential condition to the practical success of this reform will be a radical change in the plan by which our consuls are assigned to duty. Hitherto, the whole world has constituted for our foreign service but one district. A consular officer now begins his career at Pekin and during his two or three years' service there learns the language and begins to feel at home. Just as he becomes of real value to the consulate his experience and attainments are wasted by a transfer to Buenos

Ayres. What he learned in China is now lost and worthless. But he begins zealously the study of Argentine conditions and the Spanish language. At the end of three years he is so far advanced that he has practical command of his district, when he is transferred to the consulate at Odessa. There he has to forget his Spanish just as he forgot his knowledge of Chinese at Buenos Ayres. He now works three years more to learn the language and commercial conditions of Russia, when he is promoted to consul-general and transferred to, say, Palermo. Chinese, Spanish, Russian, and all the peculiarities of those countries which he had laboriously acquired, and which would have been so valuable at either of his former posts of duty, are now lost and worthless capital, and he is naturally too discouraged and indifferent to begin the study of Italian and the peculiar conditions in that country, because he knows that sooner or later he will be transferred—perhaps to Chicago—where his Italian would again become useless.

This is, of course, an extreme picture, but it shows what has been a serious weakness in the bureaucratic system of consular administration, and shows how fully the German press at least realizes what governments have been so slow to learn, viz, that the higher, more valuable work of a consul requires special attainments and capabilities, not only in different countries, but often in different districts of the same country; that given intelligence, industry, and patriotic devotion to duty, the practical value of a consul to his country and people increases with each year that he remains at a given post for which he has been prepared by proper antecedent education; that the system of transfers with each advancement in grade or fixed period of service is only less wasteful and ill-considered than the plan of filling important consulates with wholly inexperienced men who are in danger of removal before they have become competent through experience and practically acquired knowledge of their duties.

Whatever else may happen, this much may be recognized and taken into future account: Germany has set herself to the task of remaining what she has become—one of the foremost manufacturing and exporting nations of the world. What she lacks in native materials and resources she will make up for by superior education, organization, energy, and mastery of details; and in the furtherance of this policy every energy of the Government and the people, from Emperor to operative, will be enlisted and exerted with a persistent, unswerving, patriotic purpose.

The consular service is to be made, like the great subsidized steamship lines, the effective agent of the Government for pushing the trade of German merchants into every corner of the civilized world; and it will be reorganized, trained, and equipped for its work with the same scientific thoroughness that characterizes the military, industrial, and educational systems of this country.

If present indications are fulfilled, the officialism which has heretofore restricted the usefulness of the German consular service will be sacrificed to practical utility. Young men, carefully selected and specially educated for service in a designated field, will go out and pass from clerk through the successive grades to consul-general in that one district, and as the final reward of competent, faithful service, will be recalled for duty in the foreign office, which will in time become a bureau of experts, whose aggregate knowledge will cover the whole realm of German export trade.

As has already happened in law, medicine, engineering—in nearly every field of applied science—the day of the all-round man, with a smattering of many things but a thorough knowledge of nothing, is definitely past, and the successes of the future will be won by the nations as well as by the individuals who can bring the highest attainments, the largest experience, and the most consummate proficiency to bear where competition is keenest and the richest prizes are to be won.

FRANK H. MASON,
Consul-General.

BERLIN, *May 13, 1899.*

EDUCATIONAL STATISTICS IN RUSSIA.

Consul Smith, of Moscow, under date of March 24, 1899, sends the following statement of the universities in Russia, with the number of students in each:

University.	Students.	University.	Students.
St. Petersburg	2,634	Odessa	492
Moscow	3,693	Tomsk (Siberia)	477
Kharkof	1,059	Jurjev	1,326
Kief	2,558	Warsaw (Poland)	1,085
Kazan	781	Helsingfors (Finland)	1,500

The number of high schools (not including the military schools) and lyceums is stated as follows:

Description.	Number.	Description.	Number.
Technical	7	Languages (oriental)	2
Medical	2	Law	4
Philological	3	Veterinary	4
Ecclesiastical	7	Agricultural	3
Female	3	Art	1

Siberia has 2,501 schools, with 80,002 scholars.

The expenditure for education in Russia in 1896 (more recent figures not having been published) was $12,747,000. The complete report of Consul Smith is given in this chapter. (See pp. 1443–46.)

CARE OF CHILDREN IN GERMAN SCHOOLS.

Commercial Agent Stern writes from Bamberg, January 7, 1899:

A resolution which is well worthy of being imitated, and which ought to be widely circulated in the American press, has just been passed by the city council of Würzburg, Bavaria, the seat of a university. According to this resolution, the teeth of the poor pupils of the public schools of that city are to be examined and cared for free of cost, provided that the parents give their consent. It is intended to treat diseases of the ear and throat in like manner, should the first experiment prove successful.

EMBROIDERY SCHOOL AT PLAUEN, GERMANY.

Consul Monaghan, of Chemnitz, under date of April 15, 1899, reports that a school for teaching embroidery is about to be opened in Plauen. The Government has appropriated 9,000 marks ($2,142) and the city 3,000 marks ($714) for the initial expenses; 5,000 marks ($1,190) and 3,000 marks ($714), respectively, will be contributed annually for its maintenance. The number of applicants for admission is said to be so large that hardly half can be accommodated. Consul Monaghan speaks of the excellent system of technical education in Germany; nearly every important branch of industry in the Empire, he says, has its school, and the country's industrial development is in large measure due to these educational facilities.

GERMAN SCHOOLS IN FOREIGN PARTS.

Consul Monaghan sends the following from Chemnitz, June 3, 1899:

It may not be generally known that Germany maintains schools in foreign countries. A fund is yearly voted by the Reichstag for this purpose. There is now an agitation in favor of granting the schools the right to award exemption from the long periods of military service; in other words, to grant the one-year service diplomas. It is argued that when young men in foreign parts, born of German parents, can pass examinations and earn the right to serve in the army only one year they will have greater inducement to retain their German citizenship. It is pointed out that boys born abroad, deprived of this right, go into other armies, and necessarily assume citizenship of the state under whose flag they stand. These facts have had great weight with the Government. The efforts of this people in foreign countries not only in selling the products of its industry, but in propagating its language and maintaining its hold on its offspring, are untiring.

INDUSTRIAL SCHOOLS IN SAXONY.

UNITED STATES CONSULATE,
Chemnitz, Saxony, Germany, June 22, 1899.

The commendable efforts now being made among the educational elements of the United States to develop the industrial, industrial art, and technical education of our people are equaled by renewed efforts among the educators and manufacturers of this Empire. June 1 and 2 a meeting was held in Eisenach to consider the question of how best to improve commercial education. The meeting was made up of members of the German Union for the Encouragement of Commercial Education. Twenty-one of its members had been at the last International Educational Congress. They were very much pleased with its work, so much so that a vote was passed to send delegates to the next one, to be held next year in Paris. It was voted further to prepare comparative reports on industrial education in different countries and to present them at the congress in Paris. The union is interested in the preparation of a book dealing with this Empire's industrial conditions, history, progress, and prospects. Some very able writers are employed on the work. It will be exhaustive and exact. A book is to be out this year dealing with the commercial schools of all countries. The union voted also to join the general or imperial union for the encouragement of mercantile and industrial education now forming.

A proposition to still further encourage the so-called Fortbildungsschulen, or supplementary elementary schools, was unanimously adopted. A memorial setting forth how best to establish, fit up, and conduct such schools is to be laid before a school congress that meets this year in Hanover. This congress will discuss the following questions: (1) What fundamentals are necessary for the establishment of mercantile schools? (2) Why should the network of commercial schools be extended, and how shall it be done? (3) How can the apparently contradictory elements now opposing a satisfactory general and technical development of young merchants in commercial matters be equalized or neutralized? (4) How are the pensions and appointment of commercial school teachers to be regulated?

This is interesting and important. It goes to show how eager, how earnest, these people are in all that pertains to education. They are following Bismarck's advice, to "keep ahead."

I am, sir, your obedient servant,

J. C. MONAGHAN, *Consul.*

STATISTICS OF EDUCATION IN RUSSIA.

Higher education, institutions, and lyceums.

Universities	10	Philology	3
Ecclesiastic	7	Languages (Oriental)	2
Military	5	Law	4

City and private charity schools, asylums, and institutions	428

The annual expense of the universities amounts to 4,544,031 rubles, or $2,272,040.50, out of which amount 3,507,667 rubles, or $1,753,833.50, is contributed by the State.

There are 1,701 Jewish schools with—

Male scholars	25,326
Female scholars	4,868

Mohammedan schools.

Mektebs and Medresses	schools	1,785
In European Russia, Siberia, and Central Asiatic Dominions:		
Male scholars		55,779
Female scholars		17,477

Schools for ordinary recruits and soldiers are established in every regiment of the imperial army and navy.

Children's and soldiers' education is in Finland obligatory.

The following languages are taught in Russian schools, and are obligatory:

Gymnasiums: Latin, Greek, French, and German.

Church academies: Latin and Greek.

Female imperial institutions and first-class schools: French, German, and English. (N. B.—English not obligatory.)

Oriental languages (specialty).

Asiatic imperial institution at St. Petersburg: Arab, Turkish, Persian, Chinese, Japanese, Tartar, Sartian, and others; Mongolian idioms and Hebrew.

The Armenian institutions at Moscow and St. Petersburg: Armenian, Hebrew, and all the principal languages of the Caucasus.

Special schools connected with the asylums for blind, deaf, and dumb children have been incorporated since 1886.

The following is a list showing the percentage of each religion in military schools:

	Per cent.		Per cent.
Orthodox	88.70	Anglican	0.09
Roman Catholic	3.30	Armenian Gregorian	.37
Lutheran	7.26	Mohammedan	.28
Reformed		Hebrew	

Recruits' and soldiers' education.

Out of every 100 recruits, different nations and creeds, the following statistics show the percentage of those who can write:

	Can write.	Can not write.
European Russia	37	63
Poland	18	82
Caucasus	32	68
Siberia	20	80
Other parts	35	65

Finland's recruits are all obliged to read and write.

The financial budget of Russia for its educational expenditure for 1891 to 1896 is as follows:

Year.	Roubles.	United States equivalents.
1891	22,769,131	$11,384,565½
1892	21,745,718	10,872,859
1893	22,409,954	11,304,977
1894	22,144,918	11,072,459
1895	23,566,944	11,783,472
1896	25,495,487	12,747,743½

The above includes the administration and management of the institutions.

The budgets for 1897 and 1898 have not yet been published.

THOMAS SMITH, *Consul.*

MOSCOW, RUSSIA, *March 24, 1899.*

HIGH-ART REPRODUCTIONS FOR AMERICA.

Consul-General Mason, of Berlin, under date of September 1, 1899, sends a report giving a description of an association organized in Berlin some years ago for the purpose of applying a new process of colored photogravure to the reproduction of the masterpieces in the royal galleries of Europe. The educational character of the work, Mr. Mason thinks, makes it worthy of notice. The report reads:

It will doubtless interest the friends of æsthetic culture in America to know that a society in Berlin known as the "Vereinigung der Kunstfreunde für die amtlichen Publicationen der Königlichen National Gallerie" (Union of Friends of Art for the Official Publication of the Royal National Galleries), which is organized under a charter issued by the Prussian ministry of worship and education, is about to send a delegate to our country for the purpose of establishing a branch office in the United States. As its name implies, the society is the vehicle for distributing among the educational and religious institutions of Germany, and the people in general, facsimile copies in colors of the great masterpieces and famous paintings in the royal galleries in Europe, thus planting the seeds of art education in the minds of the rising generation and fostering among the intelligent classes a cultivated taste for wholesome art.

As particular stress has been laid by the most eminent authorities in American art education upon the fact that, much as our own art culture has improved within the last twenty years, the improvement in refined æsthetic taste has not kept pace with it, unless in exceptional individuals, and that it has been of necessity limited more or less to the wealthier classes, the establishment of a branch of the Art Patrons' Society of the Royal National Galleries in the United States seems to deserve the earnest attention of our art educators at home.

The popularity which the society enjoys here and the success which has crowned its efforts must be accredited to the artistic standard of its productions, which rise far above the meaningless black-and-white prints, cheap chromos, photogravures, etc., that flood the German art market. This superiority is due, in the main, to the peculiar process owned and employed by the society in its reproductions, a process which, in due course, it intends to transplant to the United States. It differs in its method from any heretofore employed, inasmuch as it enables the reproducing artists not only to create true facsimiles of the original in every outline, by means of photography and steel etching, but also to produce the depth of coloring and the peculiarities of manner of each master by a special employment of the colors called heliotint, thus reproducing the characteristic handiwork of the artists.

The process, although an intricate and costly one, has not been patented; but strict secrecy is kept as to the manipulations of the plates in some of the stages through which they have to pass. After the original paintings have been photographed, for which purpose special cameras have been built and negative plates of particular sensitiveness are prepared, the photographic productions are transferred to steel plates, the surfaces of which, by some peculiar treatment, have been prepared to receive the impressions from the negatives.

The outline work is thus obtained from the steel with an exactitude and clearness never before known. In the meantime the colors, as true to the original painting in the distribution of light and shade as manipulation of the brushes of eminent artists can make them, have been reproduced on the photographic copy first obtained, and the complex "color tableau" thus created is transferred to as many lithographic stones as there are colors represented in the picture, from which impressions are taken on presses worked by hand, as it has been found that presses worked by machinery can not do the work with the minuteness and cleanliness necessary to effect perfect reproductions.

The methods employed by the society for the distribution of its productions among the educational and religious institutions of the country and the people at large are somewhat unique.

It obtained at the start a list of patrons, who, in consideration of certain annual contributions, caused the society to distribute a number of the works among the educational institutions of the country. This list of patrons gradually grew, headed by the Emperor and Empress of Germany, who are followed by many of the members of other royal and princely families in Europe, until it has reached an aggregate membership of more than 16,000.

These patrons gradually introduced the society's productions into the homes of subaltern officers, teachers, civic employees, and people in the humble walks of life, who, however, before becoming entitled to the privilege of receiving such art reproductions, had to sign the society's roll of membership and thus become active agents in the missionary work of spreading culture in art.

Keeping its educational tendencies continually in mind, the society has always exercised the greatest care in the choice of subjects for reproduction. It has made selections from the great classical and modern religious painters, Rafael, Murillo, Guido Reni, Paolo Veronese being among the former, and Hoffmann, Plockhorst, Gerhardt, and others among the latter. It has also endeavored to foster the love of home and country by giving reproductions from famous masters which represent scenes from history, and it will adhere to a like policy in the conduct of its American branch. Each year a number of subjects from the history of the United States, these subjects to be chosen by an American advisory board, will be selected for reproduction, the originals to be painted by American artists. (Leutze's famous canvas "Washington crossing the Delaware" is already on the stocks in the society's ateliers to open the American series.) These American historical paintings will be placed on exhibition both in the United States and in Europe, and gold medals will

be awarded by the society to those American artists whose works are chosen for reproduction. American landscapes and marine views will also be included in this line, and it is proposed, in time, to erect a suitable building in one of the principal cities of the Union, which is to serve the purposes of an artistic workshop for the American branch of the society.

HOUSEHOLD SCHOOLS IN LIÉGE, BELGIUM.

Consul Winslow sends the following from Liége, November 27, 1899:

There are in the city of Liége ten free household schools (schools for domestic science), five of which were founded in 1890 and the others in 1898. Nine of these are evening schools, lasting two hours on four nights of each week during the school year. These evening schools are attended by girls from 12 to 13 years of age who have finished their elementary course in the day schools.

One day school is attended by the girls of the sixth school year in the public schools, divided into groups of 24, each group attending a week at a time. Each group forms four divisions of 6 pupils each, who undertake the different tasks, such as cooking, mending, washing, etc. The authorities intend to open three more day schools during the school year 1899–1900. There is talk of connecting a household school with each elementary school.

The branches taught in these schools are cooking, washing, mending, hygiene, household economy, and, in fact, everything relating to housekeeping. Of late, the care of little children has been added. These schools are founded and maintained by the city, with the aid of Government, which pays from 40 to 60 per cent of the expense. The term lasts from the 1st of October until Easter, when the pupil gets a diploma. From Easter to the last of July the courses are attended by the higher classes for four weeks—a week at a time, in order not to interfere with their ordinary studies.

MANUAL TRAINING IN GERMANY.

On the 1st of October twenty-four years had elapsed since the movement having for its object the manual training of boys was inaugurated in Germany. In this space of time the idea has certainly been disseminated largely in this Empire, and over 2,000 teachers have given their cooperation to the movement; nevertheless, both the internal and the external conditions connected with this new branch of tuition leave much to be desired. The original training in home industries and home occupation has almost entirely disappeared; it is carried on at present only in a few places in Holstein and in 17 institutes for the blind. Most of the other educational establishments in Germany, including 18 orphanages and 46 institutes for the deaf and dumb, have already introduced manual training into their curriculum. But the endeavor to prepare the pupils in the schools direct for the eventual handicraft has obtained importance in only two of Germany's institutions of learning. The majority of the German home-industry schools only deal pedagogically with the subject.

There exist at present in Germany, distributed in 605 places, 861 schools and institutes wherein manual training is carried on in 1,514 workshops. Of this number, 836 schools and institutes conduct the training on a pedagogical basis. Prussia has 570 manual-training schools, spread over 435 places and distributed among 596 workshops. Industrial centers take the lead, as follows: Prussia, Upper Silesia, the Rhenish Province, and the Kingdom of Saxony.

The 1,514 pupils' workshops comprise 286 independent manual-training schools and 238 public schools, of which 16 are auxiliary schools where the work is obligatory, 17 grammar schools, 41 high schools (made up of 8 classical schools, 12 realistic or

modern high schools, 6 mixed high schools, and 15 boarding schools) 7 preparatory institutions, 26 normal schools, and 93 boys' asylums, while the remainder is made up of various kinds of private educational establishments. The organization of the handicraft tuition in the individual schools and institutes is varied in character. Sixty-nine institutes have adopted the whole curriculum as recommended by the German Association for the Dissemination of Manual Skill, while 16 dispense with the preparatory work; of the rest, 177 schools and institutes confine themselves to three branches, 261 limit themselves to two, and the remainder to one branch only. Five hundred and thirty-five workshops are devoted to wood carving, 527 to working in cardboard, and 336 to the carpenter's bench; of these, 68 are closely connected with wood carving, 77 with preparatory roughing-out work, 35 with metal work, 28 with country timbering, 11 with turnery, and 11 with modeling in clay.

Pedagogical manual tuition has branched out in three directions—the practical formal method, which regards handicraft as a means to general culture; the direction advocated by those who aim at the so-called school manual dexterity, and the system which would make the manual training serve as the basis of individual branches of teaching and utilize these in order to influence the method of instruction in schools. The first two are becoming more and more amalgamated. In the third direction, Professor Kumpa, at Darmstadt, School Inspector Scherer, at Worms, and Rector Brückmann, at Königsberg, Prussia, are at present engaged in making thorough experiments in public schools.

The participation of German teachers in the efforts of the German association is steadily increasing. Over 2,200 German teachers have up to now been taught to become instructors in manual training. Of these, 950 were taught in Leipzig and 1,250 acquired training in 33 places in other parts of Germany.

GEO. SAWTER, *Consul.*

GLAUCHAU, *November 20, 1899.*

MUTUAL-AID SOCIETIES FOR FRENCH SCHOOL CHILDREN.

A great many mutual-aid societies, called petit-cavés, from their founders, Edouard Petit and J. C. Cavé, are now being organized among the school children of France. They are established under a law of 1856, amended and made more operative by a law of 1898. Their object is to afford assistance to their child members during sickness and to furnish a pension fund for old age, to be drawn upon when 50, 55, or 60 years old, according to the amount deposited or as the beneficiary may elect. The maximum pension is 360 francs ($69.48).

The children deposit 10 centimes, or 2 sous (2 cents), per week, which is divided into two equal parts, 1 sou going to the mutuality fund for aid in sickness, the other to the pension fund. This money is deposited in a government depository, where it is invested in government bonds and draws 3½ per cent interest.

The especial feature of these societies is the aid given them by the Government. For every child who contributes during an entire year the State adds 1 franc (19.3 cents) to the common fund. It also gives a sum equal to one-fourth of the entire amount deposited by the children.

The 1 sou deposited weekly which goes to the pension fund can never be recovered except in the form of a pension. If the child dies before reaching the age limit, or for any reason drops out of the list of depositors, his sous go to the state. The money derived from the reserve fund passes to the next of kin in the event of the death of the depositor.

Every school child is given a "livret," or bank book, upon the cover of which is printed a brief tabulated statement of the pension rate that 1 franc will produce at the age of 55 if deposited in childhood. The table states that if 1 franc is deposited at 3 years of age the depositor may draw 74 centimes (about 14½ cents of our money)

annually when he is 55 years of age, and that this sum will be increased in proportion to the number of francs deposited until it reaches the limit of 360 francs ($69.48) annually. The table computes the interest on 1 franc deposited when from 3 to 12 years of age, running up to 55 years.

The 1 sou deposited as a reserve capital, which swells the mutuality fund for sickness, does not draw as high a rate of interest as the pension fund. A franc deposited at 3 years of age will yield but 12 sous (12 cents) pension at the age of 55. But the depositor does not part with his reserve capital. He can never possess it again; but if he should die before the age to receive it his next of kin can take the entire accumulations derived from the 1 sou deposited weekly for the reserve fund, and the depositor in the meantime would receive the benefit of it during sickness. This capital is also swelled by national and sometimes communal appropriations, as well as by legacies and gifts from other sources.

There is a trust company in Lyons and a number of other cities, called the Caisse des Dépots et Consignations, under the immediate direction of the Government, in which these mutual-aid funds are deposited, and by whose officers they are invested in government bonds and other securities approved by the state. These moneys are also loaned to public institutions, such as hospitals, the government pawn shop, etc.

The aims of the children's societies, as set forth in a circular addressed to all the parents of pupils, briefly stated, are:

To aid parents by paying them an indemnity, during the sickness of their children, of 10 cents per day during the first, and 5 cents per day during the second and third months of sickness.

To create annual pension funds from the payment of monthly dues, government appropriations, and donations, which can be enjoyed by all persons after a membership of fifteen years.

To imbue all children at an early age with the elements of economy; to accustom them to the use of a bank book, and to the consciousness of having money at work earning something for them and held in reserve for their old age.

To create and maintain a fund called "trésor de l'avenir" (a treasury for the future), the product of which will be exclusively used to provide means of industrial education; to assist the depositors later in life to become members of mutual-aid societies, and to aid them in establishing themselves in business.

This society is very rapidly spreading throughout France, especially among the working classes, who look upon it as furnishing more substantial relief than the savings banks. The latter are becoming gorged with money. The limit for any one depositor at present is 2,000 francs ($386); but after August, 1900, it will be reduced to 1,500 ($289).

There are other societies similar to those herein described, but they are more especially for men. They have recently taken a very wide extension in France and will be the subject of a future report.

JOHN C. COVERT, *Consul.*

LYONS, *December 29, 1899.*

WORKINGMEN'S AID SOCIETIES IN FRANCE.

A meeting of the presidents of the mutual-aid societies of the Rhone, recently held in Lyons, calls attention to a movement among the working classes of France in the direction of solving the labor problem. There were present a number of high functionaries, one minister of the Government, senators, members of the lower house of Parliament, judges of courts, bankers, and other prominent business men, the mayor of Lyons, and representatives of the local and departmental governments.

These societies are organized under national laws, and are partly sustained by

public funds. They are under the immediate supervision of the "superior council of mutual-aid societies." This council is a part of the interior department of the national government, and is composed of 36 members, among whom are senators, members of the lower house of Parliament, officers of the financial, agricultural, labor, and commerce ministries, and of the Academy of Medicine. It is believed in France that these associations will be effective in diverting workingmen from communism and attaching them more closely to the Republic, with which their interests are inseperably involved.

These workingmen's unions are the growth of over a century and are declared to be the final development of the scheme of liberty, equality, and fraternity announced in 1793. Societies of workingmen abounded before the Revolution, but they were abolished because their chiefs used them for their own personal aggrandizement, and they became a part of the despotism against which the Revolution was a protest. The assembly declared that it was "the duty of the nation and of officials, in its name, to furnish work to the healthy and able-bodied, assistance to the infirm, and education to children." To the end that despotism, civil or religious, might find no secret conclave in which to plot, the assembly prohibited the organization of all societies and "all groups of workingmen of the same trade." The guilds and various societies in the country at once disappeared.

Notwithstanding the rejection of petitions pleading for the permission to organize, 45 societies "composed of many different kinds of tradesmen" were reported before the end of the eighteenth century. In 1806 they numbered 90; in 1821, 124, and in 1830, 387. From 1830 to 1848, by encouragement and pecuniary assistance from the Government, the number rose to 1,100. At the end of the Second Republic, in 1852, they numbered 4,721, with 700,000 active members and 80,000 honorary members. Almost stationary under the Second Empire, new life was imparted to them by the advent of the Third Republic. In 1880 the mutual aid societies numbered 6,500, with 900,000 members; in 1890, 8,000, with 1,200,000; in 1898, 12,000, with 2,000,000 members, and to-day their membership foots up nearly 2,500,000. They have distributed over 700,000,000 francs ($135,100,000) to their needy members, have on hand over 300,000,000 francs ($57,900,000), and annually pay pensions to 60,000 aged pensioners.

Mr. Bleton, who presided over the meeting held in this city, said in his address that these societies "originated in a natural disposition among men to help each other, and were perpetuated by a profound sentiment of fraternity sustained by the national government." Employers encouraged the movement, became honorary members, and contributed to the treasury. The speaker continued:

A society is the family enlarged. Women influence their husbands and their children to conform strictly to the regulations of the societies. Husband and wife enjoy equal rights in a society, are bound by the same duties, and the dignity of the family is enhanced by its association with the Government, whose officers become, in a measure, its direct financial managers.

There are two kinds of mutual-aid societies in France—free and approved.

The first has a legal existence, is empowered to receive gifts and legacies, and is under but one legal restriction, to wit, it can not hold real estate. It does not receive direct assistance from the state.

The approved society is under government control. The Government appoints its president, but his name is generally proposed by the society. After a first meeting is held, a copy of the by-laws and constitution is deposited with the prefect for approval and remains there as a part of the archives. Any class of citizens—workingmen, clerks, small or large shopkeepers, girls or boys—can organize a society and have it approved. It must be proved that its members are able to pay the monthly dues, to give aid in sickness, and to deposit in the Government bank. This bank is called La Caisse des Dépots et Consignations. The money deposited is invested in govern-

ment bonds—national, departmental, or communal—which never draw more than 3 per cent interest. Sometimes the premium is so high that the interest is less than this figure; but the Government always appropriates enough to bring the interest up to 4½ per cent, which is left to accumulate for the old-age pension fund.

This pension fund has received numerous contributions, the most important being 10,000,000 francs ($1,930,000) from the estate of the Orleans family, confiscated in 1852. Cities, communes, and departments now and then appropriate a few hundred francs for a local society; employers give aid at times; legacies are bequeathed to the societies; and at the end of every thirty years the unclaimed deposits in the savings banks are turned into the general fund.

The members of these societies may be men, women, and children from 3 years of age up to 50. A marked increase is noticed of late among the depositors ranging from 3 to 19 years of age. During the year 1898 that class represented 46.75 per cent of the total depositors. There were over 1,200 depositors among the school children of Roubaix and Tourcoing, and they all decided to enter upon the enjoyment of their pension when they reached the age of 55. Nearly half of them were not over 10 years old. They calculated that, whatever might befall them, they could take care of themselves up to 55 years of age, and keep up their deposits as a provision for the rest of their lives. Over half the depositors elect to begin living upon their pensions when 55 years old.

During 1898 what are called "collective accounts" represented the largest amount of deposits. These are accounts opened by large business concerns, railroad companies, banks, etc. The Crédit Lyonnais, a bank which has branches all over France, made 8,185 deposits for its employees. The Northern Railroad Company deposited a large sum, the product of contributions from all its employees, to which the company added an almost equal amount. The employees of the arsenals, manufactories of arms, foundries, and powder magazines earn about 5 francs (96 cents) per day, and 4 per cent of their wages is withheld every month and deposited as a pension fund. In the army, 5 per cent of the salaries of officers is withheld and deposited as a pension fund.

In a small circular, which is distributed broadcast among the workingmen of France, is a printed statement of the amount of annual pension which a man can enjoy at the age of 55, 60, or 65 years by a monthly deposit of sums ranging from 1 franc (19.3 cents) up; also, how much money must be deposited yearly to yield an income at 50 or 55 of 360 or 1,000 francs ($69 to $193). If a father deposits 100 francs ($19.30) for a child 3 years old, it will form a pension at 50, "reserved capital," of 41 francs ($7.91); "alienated capital," 51 francs ($9.84). At 60 years it will be 92 and 115 francs ($17.75 and $21.92); at 65, 153 and 190 francs ($26.82 and $36.67). "Reserved capital" reverts to the heirs if the principal dies before the date for enjoying the pension. "Alienated capital" goes to the general fund at the death of the principal.

An economy of 2 sous (2 cents) per day, or 36 francs ($6.95) per year, for sixteen years, yields an income at 50, reserved capital, of 139 francs ($26.83); alienated capital, 208 francs ($40.14); at 55, 210 and 219 francs ($40.53 and $42.37); at 60, 331 and 509 francs ($63.88 and $98.28).

According to the bulletin recently published by the Government the deposits made in 1898 numbered 2,284,224, amounting to 44,543,697 francs ($8,596,930). Ninety-one thousand six hundred and four new accounts were opened; 15,323,576 francs ($2,957,450) were paid to the heirs of depositors in the reserve fund. The grand total of receipts from May 11, 1851, to December 31, 1898, is 1,612,841,576 francs ($311,278,424).

Deposits can be made in every village where there is a post-office or tax collector. No sum less than 1 franc (19.3 cents) is received; but as postage stamps are accepted, many people begin by a 1-cent stamp, making the deposit when the savings amount

to 20 cents. Not over 500 francs ($96.50) can be deposited by one person in one year. The pension up to 360 francs ($69.48) can not be seized for debt. If the pension is the result of a gift, it can not be seized for debt, however much it may exceed the 360-franc ($69.48) limit. If a wife and husband deposit in one account and one of them dies, the entire pension passes to the survivor. If an aged pensioner receives but 200 or 300 francs ($38.69 or $57.90) per year, he adds to this the franc a day, more or less, that he can earn as porter in an apartment house. The average wages of the porter are 200 francs ($38.60) per year and the use of two rooms. As people prefer old soldiers, porters are often retired gendarmes who have an army pension, an old-age pension from their economies, porter's wages, and free rent. The porter at the bank of the Dépots et Consignations, where all the pension business in Lyons is transacted, is 79 years old. He and his wife have 2,500 francs ($482.50) per year from pensions, rent free, and they deposit in the savings bank every month. There are 8,000 pensioners enrolled at the bank in Lyons; but the number is destined to grow very rapidly now, as it is made obligatory for employees of mills and factories to lay by from 1 to 2 francs (19.3 to 38.6 cents) per month, this sum being withheld from their wages.

Of the monthly dues paid into the mutual-aid societies, a small sum is withheld for the assistance of the sick. Those who are out of work for other cause than a strike receive a daily allowance from their society of from 1 to 2 francs.

The custom of making provision, by government intervention, for the support of the aged and infirm is a natural outgrowth of French institutions. As a boy can not be drafted into the army if he is the only support of aged parents, the maintenance of the defense of the nation exacts that the number of the needy should be made as small as possible. As the Government takes possession of the boy for three years for army service at a time when he might be learning a trade and laying the foundation for a future livelihood, it deems it a duty to intervene in his behalf and aid him in providing for the day of need.

The Government withholds a certain percentage from the salary of army officers against the day when they will be on the retired list. Subordinate officers—lieutenants and captains—are not allowed to get married until they show to the satisfaction of the war department that the wife will bring 1,200 francs ($231.60) per year to the household. This rule is suspended only to legitimize children. The salary of a marshal of France is 30,315 francs ($5,850.80) per year, but he only receives 28,800 francs ($5,558.40), the rest going into an old-age pension fund. Of the 19,894 francs ($3,839.54) which constitute the salary of a general of division, 994 francs ($191.84) is withheld. But if a general is located in a city like Paris or Lyons and is the military governor thereof, an important sum is added for his household expenses. The process of laying up a store for old age runs through the army until the private soldier is reached. He receives 6 cents per day for his services, 5 cents of which are withheld for board and lodging, leaving him 1 cent per day for spending money and his bank account, which he often invests in postage stamps.

JOHN C. COVERT, *Consul.*

LYONS, *January 19, 1900.*

MUSIC LIBRARY IN GENEVA.[1]

A rather unique enterprise of certain music dealers in Geneva may be of interest in the United States.

The dealers in question keep very large stocks of all sorts of classical and popular music, both instrumental and vocal, to all of which access may be had by students

[1] Libraries such as Consul Ridgely describes are found in all cities of Germany. They vary in details, but the essential features are the same as those of a circulating library of books.—*Compiler.*

and others for a subscription fee of from 50 cents a month up. In other words, these dealers in this particular operate their music stores on the plan of a circulating library. Subscribers may take from three to twelve pieces of music at a time, and may change as often as they please. To students who desire to have access to a large and varied repertoire of music and who can not afford to buy at will, this admirable plan comes as a benison, and the dealers who have inaugurated it in Geneva are being well repaid for their enterprise, not only by the patronage of the students, but by a large and general clientèle. The subscription fees are as follows:

Description.	1 month.	1 year.
3 pieces of music at a time	$0.50	$2.40
5 pieces of music at a time	.70	3.00
8 pieces of music at a time	.90	4.00
12 pieces of music at a time	1.10	5.00

Subscribers are held responsible for damage done to the music beyond ordinary wear and tear.

I do not know whether or not an enterprise of this character exists in the United States. If not, it seems to me that it might be generally and advantageously put into use in our larger cities. It might even be made a feature of circulating libraries.

BENJ. H. RIDGELY, *Consul.*

GENEVA, *January 19, 1900.*

COLONIAL SCHOOL IN FRANCE.

Consular Agent Harris, of Eibenstock, under date of February 12, 1900, writes:

A colonial institute is to be opened in Marseilles to prepare young men to fill positions in the French colonies. Expeditions of students will be sent out at the expense of the State, and commercial houses will receive the information thus obtained in the form of detailed reports. Instruction will be given in botany, zoology, natural history, colonial geography, and history, etc. There will be a museum of plants, minerals, etc., so that the student may become acquainted with the actual products of the colonies; also a school of medicine to familiarize him with the diseases peculiar to tropical countries. It is probable that arrangements will be made for teaching oriental languages. For grounds and buildings the city of Marseilles has donated $193,000.

COLONIAL TRAINING IN BELGIUM.

Consul Roosevelt writes from Brussels, February 23, 1900:

In view of the increasing prosperity in the Belgian Kongo, this Government is considering means of interesting the people in the subject of colonization. One of the most practical is the recent establishment at the horticultural school, at Vilvorde, of a special department for the training of students who intend to seek a fortune in the colonies. There will be practical demonstrations of the sort of buildings a settler must construct, and instruction in rules of sanitation. The cultivation of indigenous plants, as well as of European vegetables and plants, the best methods of gathering crops and transporting them to market where there is a demand for them, and the way to treat the native population, from which the labor supply must be drawn, will all be dealt with.

LIÉGE SCHOOL OF FIREARMS

In the city of Liége, Belgium, there is established an industrial school known as the École Professionnelle d'Armurerie, founded in 1896 by the city of Liége, the Government, and the province, where thorough instruction is given in the manufacture of firearms.

The complete course covers a period of three years, and is divided into theoretical and practical. The theoretical covers drawing, lectures on the strength and combination of steel and iron, etc. The practical consists of several departments, such as woodworking, engraving, and polishing, each presided over by a competent instructor.

Tuition is free, and besides the pupil is paid 25 centimes (5 cents) per day, and on completing his course receives a sum equal to 25 per cent of the sales of his finished work.

This school opened with 8 pupils, and at present has 115 in the different departments, which is its limit. Arrangements are about completed for materially enlarging the buildings during the coming summer to provide accommodations for more than 200.

Pupils from this school have no difficulty, I am informed, in securing positions at good wages for this country, which is from 4 to 6 francs (77 cents to $1.15) per day, while ordinary workmen receive from 2.50 to 4 francs (49 to 77 cents) per day.

The important position occupied by the school will be realized when it is understood that about 30,000 persons in this city and immediate vicinity are employed in the firearms industry. The object of the institution is to qualify workmen for responsible positions in the different factories, since for the past few years nearly all are employed on piecework, which does not fit men for positions requiring a general knowledge of the business. This put the manufacturers at a great disadvantage, as it was becoming nearly impossible to secure competent foremen and superintendents of departments.

For several centuries the manufacture of firearms has been the leading industry of Liége and vicinity, and the city maintains an extensive museum of firearms.

It is interesting to note that several thousand of the old flintlock guns are still manufactured here each year for the trade in the interior of Africa, the natives preferring them to the modern guns.

ALFRED A. WINSLOW, *Consul.*

LIÉGE, *March 3, 1900.*

CABINETMAKING SCHOOL AT MAGDEBURG.

The consular reports of late years contain a vast amount of information on the subject of technical and industrial schools in Europe, and they clearly show that Germany easily takes the lead in this line, by annually appropriating large sums of money for instruction in almost every art and industry. It is generally recognized that commercial progress throughout this country depends largely upon the condition of technical education. Outside of the many schools for agriculture and commerce, the system of special schools for other purposes is wonderfully complete. The tailors, the painters, the shoemakers, the bakers, the smiths, the brewers, the butchers—each trade has its schools for theoretical and practical training.

I recently discovered at Magdeburg a school that roused my interest to an unusual degree. Though somewhat familiar with educational work done in this country, and also with its technical schools, I had never yet seen such an institution. It seemed admirable, so much so that I deem it my duty to call attention to it, as it may interest others. There is no imposing architecture of any kind; no lecture halls, no chapel, no museum, no gymnasium, no campus; there are only half a dozen rooms on the top floor of a four-story building in a narrow side street. It has no

faculty of brilliant scholars, but only a few devoted men. There is no liberal endowment by millionaire philanthropists, but a scant support from the Government, hardly sufficient, I was told, to keep body and soul of the institution together.

The school was founded by a Mr. Kiefhaber, a citizen of Magdeburg, a plain mechanic, a cabinetmaker, but a genuis at his trade. After having been prosperous in business, he wished to aid young men apprenticed to the trade of furniture making and carving in his native town.

Under Prussian laws youths who, after having passed through the public schools intend to learn a trade, are required to continue attending some school for some nights during the week and for two hours on Sunday. Such schools are called "Fortbildungsschulen," a significant but untranslatable term signifying a school where the education is to be continued. Mr. Kiefhaber had, through his own long experience, become convinced that such schools could not accomplish this purpose satisfactorily, because boys at the age of from 14 to 17, after having been hard at work all day long, can not be in a condition, either physically or mentally, to attend school for hours with any benefit to themselves. He therefore conceived the idea of establishing the school above referred to. To accomplish his object, however, he needed the assistance of the Magdeburg union in the line of cabinetmaking, sculpturing, and carving. Their cooperation was granted him to the fullest extent. All the boss mechanics of the cabinetmakers, though most of them are men without any means, and therefore can ill afford to lose even time, agreed to send each of their apprentices to this school for a whole forenoon in every week, and also to take turns in assisting in the work of teaching. As these lessons are given every day from 8 to 12 o'clock, each apprentice in Magdeburg gets four lessons a week, all bearing directly upon his future work.

I believe it is impossible to conceive of anything more practical than the teaching in these classes, of which there are three, as it is a three years' course. No question is put, no fact explained, no definition given, and no drawing made, but has some bearing upon either the materials or the tools or the purposes of the combined trades mentioned above. No step forward is taken until the why and wherefore of the preceding step has been fully understood by everyone in the class. And, as in all schools of like character, great stress is laid upon free-hand drawing. This is to give the young men not only all the technical knowledge needed, but also to train the eye and the mind in designing every part of the various styles of furniture, as well as artistic decorations in wood carving and inlaid woodwork. Such work, when added to talent and diligence, must lead to thoroughness and originality.

The young men in the last year's course were scattered all over the room, each standing before a blackboard, engaged in drawing some part of a piece of furniture or some ornamental carving, while the teacher moved about examining the work. Upon inquiry, I was told that this was a lesson reviewing, in an objective way, the oral instruction given by the teacher at the last recitation. I will add that every student was given a different part of the work, so that no two of them had the same drawing to make.

There are only a few salaried teachers employed, while there are always several boss mechanics present, as already stated, assisting in various ways. This must be an excellent way for these men to get and maintain the confidence and respect of their apprentices; for when young people see that their masters are not only able to show them how to handle tools in the workshop, but are also fully capable of instructing them theoretically, it can not fail to have a beneficial influence upon the relations between the master and the apprentices. Surely such teaching unites theory and practice in a wonderfully complete way.

I have already said that the boss mechanics in the cabinetmakers' trade union contribute their own time to this school without any compensation, and also give each apprentice one full forenoon in every week to attend the school. This is a great

sacrifice for most of them. Mr. Kiefhaber, the founder of the school, for several years not only devoted his own time to this work, but has paid most of the expenses himself. Surely, not the least interesting feature of this institution is its benevolent object of reaching young people from the humblest walks of life, elevating and educating them so as to make of them good mechanics, artisans, and citizens.

The attention of the Government, both municipal and national, is now being called to the importance of this work, and it is hoped that the institution will soon be placed on a sounder financial basis. I have no doubt that this school, if properly supported and wisely conducted, will, in course of time, build up in Magdeburg an industry which will give employment to hundreds of artisans and mechanics, and bring renown to the city for its manufacture of fine and artistic furniture, as Dresden is noted for its fine china ware, Munich for its works of art, Leipsic for being the great book mart, and so forth.

To an American this school for apprentices at Magdeburg is interesting, chiefly because it again shows to what an extent intellectual and technical training is carried on in this country in order to achieve and maintain the foremost position in the industrial world.

HENRY W. DIEDERICH, *Consul.*

BREMEN, *April 4, 1900.*

COMMERCIAL UNIVERSITY FOR HAMBURG.

The Berlin correspondent of the London Daily Mail, in a dispatch to that paper, says:

A movement is being started at Hamburg which should prove of exceptional interest to British commercial and shipping circles.

The very important and wealthy Association of Hamburg Landowners proposes to found a commercial university at Germany's foremost seaport. The institute will have chairs for all scientific and technical branches in any way connected with general commerce.

Besides purely commercial matters, it will include lectures on history, geography, natural history, modern languages, international and maritime law, tropical diseases, shipbuilding, and harbor constructions.

As the new institute will enjoy all rights of the German universities and higher technical schools, it is expected that a large number of foreign students will be induced to attend the lectures.

This programme speaks for itself. Germany has led, and is still leading, the world in commercial education. For many years its commercial schools have been preparing young men to go out into the world to take up lucrative and important positions. These young men are selling in distant countries products of the Empire, ranging from a locomotive to a clothespin. Opportunities for industrial enterprise are immediately reported. The German commercial traveler always speaks the language of the country in which he attempts to sell goods. This gives him an immense advantage over his English or American competitor, who, as a rule, is lacking in this essential qualification. The efficiency of these commercial travelers is to be attributed directly to their training. If we had similar colleges of commerce in our country, it is safe to say that our export trade could be largely increased.

ERNEST L. HARRIS, *Consular Agent.*

EIBENSTOCK, *March 30, 1900.*

INTRODUCTION.

The authors of "Minerva, Jahrbuch der Universtäten der Welt" (K. Trübner and F. Mentz), which is the chief source of information offered in the following lists, say that they have submitted their work at various stages of completion to different professors of the countries mentioned, so that they are assured that their decision as to which of the learned institutions of the world should be regarded as universities is upheld by the most trustworthy authority. They describe their Jahrbuch as a collection of names of teaching bodies, of universities, or similar institutions of the world.

Since this Report of the Bureau of Education contains direct information concerning the higher institutions of learning in the United States, they have been omitted from the following lists, which are devoted exclusively to foreign institutions.

I. *Foreign universities arranged according to age.*

Date of foundation.	Locality.	Date of foundation.	Locality.

NOTE.—The number of students in universities and schools not mentioned has not been ascertained.

III. *Foreign universities, etc., arranged alphabetically, with faculties and number of students.*

1. *Aberdeen, Scotland:* University of Aberdeen, 858 students. Philosophical, theological, law, and medical faculties; library.
2. *Aberystwith, Wales:* University College of Wales, with college at Bangor, 482 students.
3. *Adelaide, Australia:* University of Adelaide, 320 students. Observatory.
4. *Agram, Croatia, Hungary:* Königl. Universität Agram, 856 students. Theological, law, and philosophical faculties; library.
5. *Aix-en-Provence, France:* Université d'Aix, 845 students. Law and philosophical faculties; library.

6. *Algiers, Algeria, Africa:* Académie d'Alger, 783 students. Law, medical, scientific, and philosophical faculties; library, observatory.
7. *Allahabad, India:* University of Allahabad. Examining board, 3,423 candidates.
8. *Amiens, France:* École Prep. de Medicine. Medical school.
9. *Amsterdam, Netherlands:* Universiteit te Amsterdam, 1,061 students. Law, medical, scientific, philosophical, and theological faculties; library and several institutes.
10. *St. Andrew's, Scotland:* University of St. Andrew's, 254 students. St. Salvador, St. Leonard's, and St. Mary's College.
11. *Angers, France:* Facultés Catholique Libres. Law, scientific, theological, and philosophical faculties; library.
12. *Angers, France:* École Prep. de Medicine. Medical school.
13. *Athens, Greece:* National University, 3,556 students. Theological, law, medical, and philosophical faculties; public library.
14. *Bangor, Wales:* University College of North Wales.
15. *Barcelona, Spain:* Universidad de Barcelona, 1,887 students. Philosophical, law, scientific, medical, and pharmaceutical faculties; library.
16. *Basel, Switzerland:* Universität Basel, 586 students. Theological, law, medical, and philosophical faculties; public library.
17. *Belfast, Ireland:* Queen's College.
18. *Belgrade, Servia:* Serpska Kraljevska Velika Skola, 471 students. Philosophical, law, and technological faculties; library.
19. *Berlin, Prussia, Germany:* Königl. Friedr.-Wilhelms-Universität, 10,827 students. Theological, law, medical, and philosophical faculties; seminary for oriental languages, and 11 other seminaries, library and 36 university institutes and museums.
20. *Berne, Switzerland:* Universität Bern, 903 students. Catholic and Protestant theology, law, medical, and philosophical faculties; city libraries.
21. *Besançon, France:* Facultés de Besançon, 220 students. Scientific, philosophical, and medical faculties; library.
22. *Birmingham, England:* Mason College, 967 students. Arts and science, medical and dental faculties; library.
23. *Bologna, Italy:* Regia Università di Bologna, 1,590 students. Philosophical, scientific, law, medical, and pharmaceutical faculties; veterinary and engineers' schools; library.
24. *Bombay, India:* University of Bombay. Examining board, 3,428 candidates; five preparatory colleges.
25. *Bonn, Prussia, Germany:* Rheinische Friedr.-Wilhelms-Universität, 2,238 students. Protestant and Catholic theological, law, medical, and philosophical faculties; library and many institutes.
26. *Bordeaux, France:* Facultés de Bordeaux, 1,961 students. Law, medical, scientific, and philosophical faculties; library.
27. *Braunsberg, Prussia, Germany:* Königl. Lyceum Hosianum, 70 students. Theological and philosophical faculties; library.
28. *Breslau, Prussia, Germany:* Königl. Universität Breslau, 1,524 students. Catholic and Protestant theological, law, medical, and philosophical faculties; library.
29. *Bristol, England:* University College, 521 students (210 women). College faculty and medical school; library.
30. *Brussels, Belgium:* Université libre de Bruxelles, 1,316 students. Philosophical, law, scientific, medical, and pharmaceutical faculties; also polytechnical school; library.
31. *Bucharest, Roumania:* Universitatea din Bucuresti, 2,296 students. Scientific, philosophical, law, medical, and theological faculties; library.
32. *Budapest, Hungary:* Királyi Magyar Tudomány-Egyetum, 4,587 students. Theological, law, medical, and philosophical faculties; library.
33. *Buenos Ayres, Argentina:* Universidad Nacional. Law, medical, and general faculties.
34. *Cadiz, Spain:* Facultad de Medicina (belonging to Seville). Medical faculty; library.
35. *Caen, France:* Facultés de Caen, 572 students. Law, scientific, and philosophical faculties; library.
36. *Cagliari, Sardinia, Italy:* Regia Università di Cagliari, 243 students. Law, medical, and scientific faculties; library.
37. *Cairo, Egypt:* Azhar University, about 8,240 students and hearers.
38. *Calcutta, India:* University of Calcutta, 7,210 candidates, of whom 3,475 passed. Examining board; library.

39. *Cambridge, England:* University of Cambridge, 2,929 students. Schools of theology, law, oriental, classical, and modern philology, music, moral science, history and archæology, astronomy, physics, chemistry, mineralogy, biology, geology, and medicine; library.
40. *Camerino, Italy:* Libera Università degli Studi di Camerino, 279 students. Law, medical, and pharmaceutical faculties, and veterinary school; communal library.
41. *Cape Town, South Africa:* University of the Cape of Good Hope.
42. *Cardiff, Wales:* University of South Wales, 170 students. Philosophical and scientific faculties and department of engineering; library.
43. *Catania, Sicily, Italy:* Regia Università degli Studi di Catania, 987 students. Law, medical, scientific, and philosophical faculties; library.
44. *Christiania, Norway:* Kongelige Frederiks Universitet, 1,300 students. Theological, law, medical, philosophical, and scientific faculties; library.
45. *Clermont-Ferrand, France:* Facultés de Clermont, 256 students. Scientific and philosophical faculties; library.
46. *Coimbra, Portugal:* Universidade de Coimbra, 1,429 students. Theological, law, and scientific faculties; library.

Copenhagen. (See Kjøbenhavn.)

47. *Cordoba, Argentine:* Universidad Nacional. Law, scientific, and medical faculties; observatory.
48. *Cork, Ireland:* Queen's College, 212 students.

Cracow. (See Krakau.)

49. *Czernowitz, Bukowina, Austria:* K. k. Franz-Josephs-Universität, 377 students. Theological, law, and philosophical faculties; library.
50. *Dijon, France:* Facultés de Dijon, 642 students. Law, scientific, and philosophical faculties; library.
51. *Dorpat (Jurjew), Russia:* Kaiserliche Universität, 1,334 students. Law, theological, medical, and philosophical faculties.
52. *Dublin, Ireland:* University of Dublin, 1,128 students.
53. *Dublin, Ireland:* Royal University of Ireland, about 600 candidates. Examining board.
54. *Dundee, Scotland:* University College, 220 students.
55. *Durham, England:* Durham University, 250 students. To this university belong the Codrington College, on the island of Barbados, and the Fourah Bay College, in Sierra Leone; also the College of Science, at Newcastle-on-Tyne, which has an enrollment of 1,500 students.
56. *Edinburgh, Scotland:* University of Edinburgh, 2,896 students. Philosophical, theological, law, and medical faculties; library.
57. *Eperies, Hungary:* Evangelische Rechtsakademie, 149 students. Law school.
58. *Erlangen, Bavaria, Germany:* K. Bayerische Friedr.-Alexander-Universität, 1,060 students. Theological, law, medical, and philosophical faculties; library.
59. *Erlau, Hungary:* Erzbischöfliche Rechtsakademie, 94 students. Law school.
60. *Ferrara, Italy:* Libera Università di Ferrara, 100 students. Law, scientific, and medical faculties; library.
61. *Florence, Italy:* R. Instituto di Studi Superiori Practici e di Perfezionamento, 627 students. Philosophical, scientific, medical, and pharmaceutical faculties; library.
62. *Florence, Italy:* R. Instituto di Magistero Femminile, 127 students. Woman's university.
63. *Freiburg, Baden, Germany:* Badische Albert-Ludwigs-Universität, 1,729 students. Law, theological, medical, and philosophical faculties; library.
64. *Freiburg, Switzerland:* Katholische Universität, 353 students. Theological, law, and philosophical faculties; library.
65. *Fünfkirchen, Hungary:* Bischöfliche Rechtsakademie. Law school, 126 students.
66. *Galway, Ireland:* Queen's College.
67. *Geneva, Switzerland:* Université de Genève, 904 students. Theological, law, medical, philosophical, and scientific faculties; five libraries.
68. *Genoa, Italy:* R. Università degli Studi di Genoa, 1,010 students. Law, medical scientific, and philosophical faculties, and schools of engineering and pharmaceutics; library.
69. *Ghent, Belgium:* Université de Gand, 701 students. Philosophical, law, scientific, and medical faculties; library.
70. *Giessen, Hessia, Germany:* Hessische Ludwigs Universität, 850 students. Theological, law, medical, and philosophical faculties; library.
71. *Glasgow, Scotland:* University of Glasgow, 1,953 students.
72. *Gothenburg, Sweden:* Göteborgs Högskola, 457 hearers.
73. *Göttingen, Prussia, Germany:* Georg-Augusts-Universität, 1,383 students. Theological, law, medical, and philosophical faculties; library.

74. *Granada, Spain:* Universidad de Granada. Philosophical, law, scientific, medical, and pharmaceutical faculties; library.
75. *Grätz, Styria, Austria:* K. k. Karl-Franzens Universität, 1,771 students. Theological, law, medical, and philosophical faculties; library.
76. *Greifswald, Prussia, Germany:* Universität, 802 students. Theological, law, medical, and philosophical faculties; library.
77. *Grenoble, France:* Facultés de Grenoble, 523 students. Law, scientific, and philosophical faculties; library.
78. *Groningen, Netherlands:* Rijks Universiteit te Groningen, 465 students. Theological, law, medical, scientific, and philosophical faculties; library.
79. *Grosswardein, Hungary:* Jógakademia, 189 students. Law school.
80. *Halle, Prussia, Germany:* Friedr.-Universität Halle-Wittenberg, 1,779 students. Theological, law, medical, and philosophical faculties; library.
81. *Habana, Cuba:* Universidad de la Habana, 671 alumnos and 555 under private tutors. Philosophical, scientific, medical, and law faculties; library.
82. *Heidelberg, Baden, Germany:* Ruprecht-Karls-Universität, 1,462 students. Theological, law, medical, philosophical, and scientific faculties; library.
83. *Helsingfors, Finland, Russia:* Kejserliga Alexanders Universitet i Finland, 2,238 students. Theological, law, medical, and philosophical faculties; public library.
84. *Inspruck, Tyrol, Austria:* K. k. Leopold-Franzens-Universität, 1,087 tudents. Theological, law, medical, and philosophical faculties; library.
85. *Jaroslavl (or Yaroslavl), Russia:* Demidovskij juridiceskij Licej, 269 students. Law school.
86. *Jassy, Roumania:* Universitatea din Jasi, 420 students. Law, philosophical, scientific, and medical faculties; library.
87. *Jena, Thuringia, Germany:* Sächsische Gesammt-Universität, 804 students. Theological, law, medical, and philosophical faculties; library.
88. *Jerusalem, Palestine:* École Pratique d'Étude Bibliques. Theological school.
Jurjew. (See Dorpat.)
89. *Kasan, Russia:* Imperatorskij Kazanskij Universitet, 859 students. Philosophical, scientific, law, and medical faculties; library.
90. *Kaschau, Hungary:* Rechts-Akademie, 159 students. Law school.
91. *Kecskemet, Hungary:* Rechts-Akademie, 97 students. Law school.
92. *Kharkov, Russia:* Imperatorskij Charkowskij Universitet, 1,520 students. Philosophical, scientific, law, and medical faculties; library.
93. *Kiel, Prussia, Germany:* K. Christian-Albrechts-Universität, 972 students. Theological, law, medical, and philosophical faculties; library.
94. *Kiev, Russia:* Imperatorskij Universitet, 2,565 students. Medical, law, and philosophical faculties; institutes and library.
95. *Kingston, Ontario, Canada:* University of Queen's College, 589 students. Theological, arts, law, and medical faculties; museum.
96. *Kjöbenhavn (Copenhagen), Denmark:* Kjöbenhavns Universitet, about 2,000 students. Theological, law, medical, philosophical, and scientific faculties and polytechnic institute; library.
97. *Klausenburg, Siebenbürgen, Hungary:* K. k. Klausenburger Universität, 992 students. Law, medical, philosophical, and scientific faculties; library.
98. *Königsberg, Prussia, Germany:* K. Albertus Universität, 764 students. Theological, law, medical, and philosophical faculties; royal and university library.
99. *Krakau, Galicia, Austria:* Jagellonische Universität, 1,323 students. Theological, law, medical, and philosophical faculties; library.
100. *Lahore, India:* The Punjab University, 1,983 candidates, of whom 863 passed. Oriental languages, arts, law, medicine, science, and engineering departments.
101. *Lampeter, Wales:* St. David's College, 125 students.
102. *Lausanne, Switzerland:* Université de Lausanne, 487 students. Theological, law, medical, philosophical, and scientific faculties.
103. *Leeds* (see Manchester), *England:* Yorkshire College, 1,039 students.
104. *Leyden, Netherlands:* Rijks-Universiteit, 908 students. Medical, scientific, philosophical, theological, and law faculties; library.
105. *Leipsic, Saxony, Germany:* Universität, 3,601 students. Theological, law, medical, and philosophical faculties; library.
106. *Lemberg, Galicia, Austria:* K. k. Franzen's Universität in Lemberg, 1,901 students. Theological, law, and philosophical faculties; library.
Liége. (See Lüttich.)
107. *Lille, France:* Facultés de Lille, 1,158 students. Law, medical, scientific, and philosophical faculties; library.
108. *Lille, France:* Facultés Libres. Theological, law, medical, scientific, and philosophical faculties; library.

109. *Lima, Peru:* Universidad Mayor de San Marcos. Theological, law, medical, and philosophical faculties.
110. *Limoges, France:* École de Médécine et de Pharmacie. Medical and pharmaceutical courses.
111. *Lisbon, Portugal:* Ecola Medico Cirurgica. Medical college.
112. *Liverpool* (see Manchester), *England:* University College, about 1,000 students.
113. *London, England:* University of London, about 5,000 candidates. Examining board; library.
    To the university belong:
    (1) University College, with philosophical, law, scientific, and medical faculties; library; about 998 students.
    (2) King's College, with theological, philosophical, and medical faculties; library.
    (3) School of Modern Oriental Languages.
    (4) Gresham College.
    (5) Royal College of Physicians.
    (6) School of Economics and Political Science.
    (7) College of Preceptors.
    (8) Eight medical schools, connected with hospitals.
114. *Louvain, Belgium:* Université Catholique de Louvain, 1,890 students. Theological, law, medical, philosophical, and scientific faculties; library.
115. *Lund, Sweden:* Kongl. Universitet i Lund, 643 students. Theological, law, medical, and philosophical faculties; library.
116. *Lüttich* (or *Liége*), *Belgium:* Université de Liége, 1,490 students. Philosophical, law, scientific, and medical faculties; library.
117. *Lyons, France:* Facultés Libres, about 1,000 students. Theological, law, scientific, and philosophical faculties.
118. *Lyons, France:* Université de Lyon, 2,405 students. Law, medical, scientific, and philosophical faculties; two libraries.
119. *Macerata, Italy:* Regia Università di Macerata, 255 students. Law faculty.
120. *Madras, India:* University of Madras, about 4,224 candidates. Examining board.
121. *Madrid, Spain:* Universidad Central de España, 5,575 students. Philosophical, law, scientific, medical, and pharmaceutical faculties; libraries.
122. *Manchester, Liverpool, and Leeds, England:* Victoria University, about 3,000 students. This institution consists of:
    (1) Owens College, Manchester, 1,065 students.
    (2) University College, Liverpool, about 1,000 students.
    (3) Yorkshire College, Leeds, 1,039 students.
123. *Manila, Philippine Islands:* Real y Pontificia Universidad de Santo Tomás de Manila, 1,144 students. Theological, law, medical, and pharmaceutical faculties; library.
124. *Marburg, Hessia, Germany:* Universität Marburg, 1,172 students. Theological, law, medical, philosophical, and scientific faculties; library.
125. *Marseilles, France:* Belongs to Facultés d'Aix. Scientific, medical, and law faculties; library.
126. *Melbourne, Victoria, Australia:* University of Melbourne, 686 students.
127. *Messina, Italy:* Regia Università degli Studi di Messina, 626 students. Law, medical, scientific, philosophical, and pharmaceutical faculties; library.
128. *Mexico, Mexico:* Instituto Médico Nacional. Medical faculty.
129. *Milan, Italy:* Academia Scientifico-litteraria, 97 students. Scientific school.
130. *Modena, Italy:* Regia Università degli Studi di Modena, 450 students. Law, medical, scientific, and pharmaceutical faculties; library.
131. *Montauban, France:* Belongs to Facultés de Toulouse, 73 students. Law, medical, scientific, and philosophical faculties; library.
132. *Montevideo, Uruguay:* University, 132 students. Medical, law, and mathematical faculties; library.
133. *Montpellier, France:* Facultés de Montpellier, 1,446 students. Law, medical, scientific, and philosophical faculties; library.
134. *Montreal, Canada:* McGill College and University, 1,130 students.
135. *Moscow, Russia:* Imperatorskij Moskowskij Universitet, 4,461 students. Philosophical, scientific, law, and medical faculties; library.
136. *Moscow, Russia:* Duchovnaja Akademija. Theological faculty; library.
137. *Munich, Bavaria, Germany:* K. Bayerische Ludwig-Maximilians-Universität, 4,451 students. Theological, law, medical, and philosophical faculties; library.
138. *Münster, Prussia, Germany:* K. Preussische Theologische und Philosophische Akademie, 609 students. Theological and philosophical faculties; library.

139. *Nancy, France:* Facultés de Nancy, 952 students. Law, medical, scientific, and philosophical faculties, and pharmaceutical school; library.
140. *Nantes, France:* École de Médecine de Nantes.
141. *Nantes, France:* École Libre de Droit.
142. *Naples, Italy:* Regia Università degli Studi di Napoli, 5,103 students. Philosophical, law, mathematical, scientific, and medical faculties, and pharmaceutical school; library.
143. *Neuchâtel, Switzerland:* Académie de Neuchâtel, 157 students. Philosophical, scientific, theological, and law faculties; library.
144. *Newcastle, England:* The colleges belong to Durham University.
(1) College of Medicine, 201 students.
(2) Durham College of Science, 200 students.
145. *New Zealand:* University, consisting of four colleges.
146. *Nottingham, England:* University College, 1,902 students. Philology, law, and scientific faculties, and school of engineering; free public libraries.
147. *Odessa, Russia:* Noworossijskij Universitet, 581 students. Philosophical, scientific, and law faculties; library.
148. *Olmütz, Moravia, Austria:* Theologische Facultät, 209 students.
149. *Ouro-Preto, Brazil:* Faculdade de Direito. Law academy.
150. *Oviedo, Spain:* Universidad Literaria, 235 students. Law faculty; library.
151. *Oxford, England:* University, 3,412 students. Theological, law, medical, scientific, and philosophical faculties; Bodleian library.
152. *Padua, Italy:* Regia Università degli Studi di Padua, 1,542 students. Law, medical, scientific, and philosophical faculties, and schools of engineering and pharmacy; library.
153. *Palermo, Sicily, Italy:* Regia Università degli Studi di Palermo, 1,395 students. Law, medical, scientific and philosophical faculties, and schools of engineering and pharmacy; library.
154. *Paris, France:* (1) Université de Paris, 11,827 students. Protestant theological, law, medical, scientific, and philosophical faculties, and schools of engineering and pharmacy; libraries.
155. *Paris, France:* (2) Facultés libres. Law and philosophical faculties; library.
156. *Paris, France:* (3) Collége de France.
157. *Paris, France:* (4) École Libre de Sciences Politiques.
158. *Paris, France:* (5) École pratique des hautes études en Sorbonne, 233 students. Philosophical and theological faculties; library.
159. *Paris, France:* (6) École nationale des beaux-arts.
160. *Paris, France:* (7) École nationale de chartes.
161. *Paris, France:* (8) École du Louvre.
162. *Paris, France:* (9) École des langues orientales vivantes and other special schools.
163. *Parma, Italy:* Regia Università degli Studi di Parma, 585 students. Law, medical, and scientific faculties, and veterinary and pharmaceutical schools.
164. *Pavia, Italy:* Regia Università degli Studi Pavia, 1,029 students. Law, medical, scientific, and philosophical faculties; pharmaceutical school and library.
165. *Perugia, Italy:* Università Libera degli Studi di Perugia, 298 students. Law and medical faculties, and pharmaceutical and veterinary schools; library.
166. *St. Petersburg, Russia:* Imperatorskij Universitet, 3,700 students. Philosophical, scientific, law, and oriental languages faculties; library.
167. *St. Petersburg, Russia:* Imperatorskij Wozensio-Medicineskaja Akademja, 750 students. Medical faculty; library.
168. *St. Petersburg, Russia:* Theological Academy, 239 students; also a law school, 300 students, independent of the university.
169. *St. Petersburg, Russia:* Military medical school, 750 students.
170. *St. Petersburg, Russia:* Law Academy, 330 students, and several other special schools.
171. *St. Petersburg, Russia:* Hist. Philological Institute; 76 students.
172. *St. Petersburg, Russia:* Higher Courses for Women; 900 students.
173. *Pisa, Italy:* Regia Università degli Studi di Pisa, 1,066 students. Law, philosophical, medical, and scientific faculties, and engineering, pharmaceutical, veterinary, and agricultural schools; library.
174. *Poitiers, France:* Facultés de Poitiers, 736 students. Law, scientific, and philosophical faculties; library.
175. *Prague, Bohemia, Austria:* K. k. Deutsche Carl-Ferdinands Universität, 1,162 students. Theological, law, medical, and philosophical faculties; library.
176. *Prague, Bohemia, Austria:* C. k. česk Universitet Karlo-Ferdinandovij, 2,719 students. Theological, law, medical, and philosophical faculties; library.

177. *Pressburg, Hungary:* Jógakademia, 196 students. Law and philosophical faculties; library.
178. *Quebec, Canada:* Université Laval, 231 students. Theological, law, medical, and arts faculties; library and museum.
179. *Recife, Brazil:* Faculdade de direito, 237 students. Law faculty.
180. *Reims, France:* École Prep. de Medicine. Medical school.
181. *Rennes, France:* Facultés de Rennes, 1,057 students. Law, scientific, and philosophical faculties; library.
182. *Rome, Italy:* Regia Università degli Studi di Roma, 2,348 students. Philosophical, scientific, law, and medical faculties; engineering and pharmaceutical schools; library.
183. *Rome, Italy:* A number of collages supported by the church, with 939 students; also a woman's university with 94 students.
184. *Rome, Italy:* Pontificia Universitas Gregoriana in Collegis Romano; 1,026 students. Theological, law, and philosophical faculties.
185. *Rostock, Mecklenburg, Germany:* Grossherzogliche Universität, 493 students. Theological, law, medical, and philosophical faculties; library.
186. *Rouen, France:* École Prep. de Medicine. Medical school.
187. *Salamanca, Spain:* Universidad de Salamanca, 1,247 students. Philosophical and law faculties; library.
188. *Salzburg, Austria:* Theologische Fakultät, 66 students.
189. *Santiago, Chile:* University with 4 faculties and 1,000 students.
190. *Santiago, Spain:* Universidad de Santiago. Law, medical, and pharmaceutical faculties; library.
191. *Saragossa, Spain:* Universidad de Zaragoza, 966 students. Philosophical, law, medical, and scientific faculties; provincial library.
192. *Sarospatak, Hungary:* Theologische und Rechtsschule, 116 students.
193. *Sassari, Italy:* Regia Università degli Studi di Sassari, 166 students. Law, medical, and scientific faculties; library.
194. *Seville, Spain:* Universidad de Sevilla. Philosophical, law, and scientific faculties; library.
195. *Sheffield, England:* University College (belongs to Oxford University), 450 students; also a medical school.
196. *Siena, Italy:* Regia Università degli Studi di Siena, 219 students. Law and medical faculties and pharmaceutical school; library.
197. *Sophia, Bulgaria:* Wische utschilische w Sophia, 354 students.
198. *Stockholm, Sweden:* Stockholms Högs Kola, 337 students.
199. *Stockholm, Sweden:* Medical Institute, 332 students.
200. *Strasburg, Alsace, Germany:* Kaiser Wilhelm's Universität, 1,139 students. Theological, law, medical, philosophical, and scientific faculties; provincial library.
201. *Sydney, New South Wales, Australia:* University of Sydney, 500 students.
202. *Tokyo, Japan:* Teikoku, Daigaku, 2,239 students. Law, medical, philosophical, and scientific faculties and school of engineering; library.
203. *Tomsk, Siberia:* Imperatorskij Tomkij Universitet, 463 students. Theological and medical faculties; library.
204. *Toronto, Canada:* University of Toronto, 1,322 students. Philosophical, law, and medical faculties; library.
205. *Toronto, Canada:* Victoria University, 250 students. Arts and theology; library.
206. *Toronto, Canada:* Three medical schools.
207. *Toulouse, France:* Facultés de Toulouse, 1,899 students. Law, philosophical, scientific, and medical faculties; library.
208. *Toulouse, France:* Facultés Libres Catholiques. Theological and philosophical faculties; library.
209. *Tours, France:* École Prep. de Medicine. Medical school.
210. *Tübingen, Würtemberg, Germany:* K. Eberhard Karls Universität, 1,560 students. Theological, law, medical, philosophical, and scientific faculties; library.
211. *Turin, Italy:* Regia Università degli Studi di Torino, 2,551 students. Law, medical, philosophical, and scientific faculties and pharmaceutical school; library.
212. *Upsala, Sweden:* Kongl. Universitet i Upsala, 1,499 students. Theological, law, medical, and philosophical faculties; library.
213. *Urbino, Italy:* Libera Università degli Studi di Urbino, 126 students. Law and mathematical faculties and pharmaceutical and surgical schools; library.
214. *Utrecht, Netherlands:* Rijks Universität te Utrecht, 953 students. Philosophical medical, theological, law, and scientific faculties; library.
215. *Valencia, Spain:* Universidad de Valencia, 726 students. Law, scientific, and medical faculties; library.
216. *Valladolid, Spain:* Universidad de Valladolid. Law and medical faculties; library.

217. *Vienna, Austria:* K. k. Universität, 5,770 students. Law, theological, medical, and philosophical faculties; library and numerous university institutes.
218. *Vienna, Austria:* Protestantische Theologische Fakultät, 26 students.
219. *Vienna, Austria:* Lehranstalt für Orientalische Sprachen, 112 students.
220. *Vienna, Austria:* Consular Academy, 25 students.
221. *Warsaw, Poland, Russia:* Imperatorskij Warschawskij Universitet, 1,242 students. Philosophical, scientific, law, and medical faculties; library.
222. *Würzburg, Bavaria, Germany:* K. Julius-Maximilians Universität, 1,343 students. Theological, law, medical, and philosophical faculties; library.
223. *Zurich, Switzerland:* Schweizerische Hochshule, 887 students. Theological, law, medical, and philosophical faculties, cantonal and city libraries.

IV. *Foreign universities, arranged according to countries.*

Argentina: Cordoba, Buenos Ayres.
Australia: Adelaide, Melbourne, Sydney.
Austria: Czernowitz, Grätz, Innspruck, Cracow, Lemberg, Olmütz, Prague (German), Prague (Bohemian), Salzburg, Vienna.
Belgium: Brussels, Ghent, Liège, Louvain.
Bolivia: (Universities not mentioned in "Minerva.")
Brazil: Recife, Ouro-Preto.
Bulgaria: Sophia.
Canada: Kingston, Montreal, Quebec, Toronto.
Cape Colony: Cape City.
Chile: Santiago.
China: (College of Foreign Knowledge.)
Colombia: (Universities not mentioned in "Minerva.")
Corea: (None.)
Costa Rica: (None.)
Cuba: Habana.
Denmark: Copenhagen.
Ecuador: Quito.
Egypt: Cairo.
England: (See also Ireland, Scotland, and Wales, below.) Birmingham, Bristol, Cambridge, Durham, Leeds, Liverpool, London, Manchester, Newcastle, Nottingham, Oxford, Sheffield.
France: Aix, Algiers, Angers, Besançon, Bordeaux, Caen, Clermont, Dijon, Grenoble, Lille, Limoges, Lyons, Marseilles, Montauban, Montpellier, Nancy, Nantes, Paris, Poitiers, Rennes, Toulouse, and four separate medical schools.
Germany: Berlin, Bonn, Braunsberg, Breslau, Erlangen, Freiburg, Giessen, Göttingen, Greifswald, Halle, Heidelberg, Jena, Kiel, Königsberg, Leipsic, Marburg, Munich, Münster, Rostock, Strasburg, Tübingen, Würzburg.
Greece: Athens.
Guatemala: (None.)
Haiti: (None.)
Hawaii: (None.)
Honduras: (None.)
Hungary: Agram, Budapesth, Eperies, Erlau, Fünfkirchen, Grosswardein, Kaschau, Kecskemet, Klausenburg, Pressburg, Sarospatak.
India: Allahabad, Bombay, Calcutta, Lahore, Madras.
Ireland: Belfast, Cork, Dublin, Galway.
Italy: Bologna, Cagliari, Camerino, Catania, Ferrara, Florence, Genoa, Macerata, Messina, Modena, Naples, Padua, Palermo, Parma, Pavia, Perugia, Pisa, Rome, Sassari, Siena, Turin, Urbino, and several colleges.
Japan: Tokyo.
Mexico: (Schools of law, medicine, engineering, etc.)
Montenegro: (Theological seminary, not mentioned in "Minerva.")
Morocco: (None.)
Netherlands: Amsterdam, Groningen, Leyden, Utrecht.
New Zealand: One university.
Nicaragua: (None.)
Norway: Christiania.
Orange Free State: (None.)
Paraguay: (National college, not mentioned in "Minerva.")
Persia: (Several colleges, not mentioned in "Minerva.")
Peru: Lima.
Palestine: Jerusalem.

Philippine Islands: Manila.
Portugal: Coimbra.
Roumania: Bucharest, Jassy.
Russia: Kharkov, Dorpat, Helsingfors, Yaroslav, Kasan, Kiev, Moscow, Odessa, St. Petersburg, Warsaw.
Salvador: (One university, not mentioned in "Minerva.")
Santo Domingo: (None.)
Scotland: Aberdeen, St. Andrews, Dundee, Edinburgh, Glasgow.
Servia: Belgrade.
Siam: (None.)
Siberia: Tomsk.
South African Republic: (None.)
Spain: Barcelona, Cadiz, Granada, Madrid, Oviedo, Salamanca, Santiago, Saragossa, Seville, Valencia, Valladolid.
Sweden: Gothenburg, Lund, Stockholm, Upsala.
Switzerland: Basel, Berne, Freiburg, Geneva, Lausanne, Neuchâtel, Zurich.
Turkey: (Several colleges, not mentioned in "Minerva.")
Uruguay: Montevideo.
Venezuela: (Universities not mentioned in "Minerva.")
Wales: Aberystwith, Bangor, Cardiff, Lampeter.

V. *Technological schools.*

1. *Aachen* (Aix-la-Chapelle), *Prussia, Germany,* founded 1870; 496 students.
2. *Berlin, Prussia, Germany,* founded 1779; 3,428 students.
3. *Braunschweig, Germany,* founded 1745; 492 students.
4. *Brünn, Austria,* founded 1850; 357 students.
5. *Budapesth, Hungary,* founded 1856; 1,454 students.
6. *Copenhagen, Denmark,* founded 1829; 500 students.
7. *Darmstadt, Hessia, Germany,* founded 1868; 1,527 students.
8. *Delft, Netherlands,* founded 1864; 630 students.
9. *Dresden, Saxony, Germany,* founded 1828; 1,121 students.
10. *Grätz, Styria, Austria,* founded 1811; 353 students.
11. *Hanover, Prussia, Germany,* founded 1879; 1,393 students.
12. *Helsingfors, Finland, Russia,* founded 1847; 250 students.
13. *Karlsruhe, Baden, Germany,* founded 1825; 1,098 students.
14. *Kharkov, Russia,* founded 1884; 810 students.
15. *Lemberg, Galicia, Austria,* founded 1844; 560 students.
16. *Lisbon, Portugal,* founded 1837.
17. *London, England,* 2 institutions, founded 1884; 238 and 185 students.
18. *Lyons, France,* founded 1857; 50 students.
19. *Madrid, Spain,* 2 institutions, founded 1835; 243 and 150 students.
20. *Milan, Italy,* founded 1863; 399 students.
21. *Moscow, Russia,* founded 1832; 718 students.
22. *Munich, Bavaria, Germany,* founded 1827; 2,046 students.
23. *Nancy, France,* founded 1890; 72 students.
24. *Naples, Italy,* founded 1863; 210 students.
25. *Paris, France,* founded 1794; four schools, with 593 students.
26. *Oporto, Portugal,* founded 1877; 322 students.
27. *Prague, Bohemia, Austria,* founded 1806 and 1868; 2 schools, with 1,500 students.
28. *Riga, Russia,* founded 1832; 1,379 students.
29. *St. Petersburg, Russia,* founded 1828; 4 schools, with 2,384 students.
30. *São Paulo, Brazil,* founded 1894; 380 students.
31. *Sheffield, England,* founded 1885; 750 students.
32. *Stockholm, Sweden,* founded 1798; 363 students.
33. *Stuttgart, Würtemberg, Germany,* founded 1829; 967 students.
34. *Turin, Italy,* founded ——; 489 students.
35. *Vienna, Austria,* founded 1815; 1,682 students.
36. *Zurich, Switzerland,* founded 1851; 1,390 students.

NOTE.—Several noted technological schools in Italy and in other countries are connected with universities; hence are not mentioned separately in this list.

VI. *Higher agricultural, forestry, and mining schools.*

[Figures in brackets signify date of founding.]

1. *Altenburg, Hungary* [1819], Agricultural Academy; 138 students.
2. *Aschaffenburg, Bavaria, Germany* [1844], Forestry Academy; 118 students.
3. *Beauvais, France* [1854], Agricultural Institute; 103 students.
4. *Berlin, Prussia, Germany* [1806], Agricultural Academy; 588 students.
5. *Berlin, Prussia, Germany* [1860], Mining Academy.
6. *Bordeaux, France* [1891], School of Chemistry, Industry, and Agriculture.
7. *Campinas São Paulo, Brazil* [1887], Agricultural Institution.
8. *Clausthal, Prussia, Germany* [1775], Mining Academy; 238 students.
9. *Coopers Hill, England* [1885], Forestry Academy; 120 students.
10. *Copenhagen, Denmark* [1858], Veterinary and Agricultural Academy; 370 students.
11. *Debreczin, Hungary* [1865], Agricultural Academy; 92 students.
12. *Douai, France* [1888], Agricultural College; 30 students.
13. *Eberswalde, Prussia, Germany* [1820], Forestry Academy; 62 students.
14. *Eisenach, Saxe-Weimar, Germany* [1859], Forestry Academy; 27 students.
15. *Evois, Finland, Russia* [1859], Forestry Academy; 20 students.
16. *Freiberg, Saxony, Germany* [1765], Mining Academy; 320 students.
17. *Gembloux, Belgium* [1860], Agricultural Academy.
18. *Grignon, France* [1828], Agricultural Academy.
19. *Hohenheim, Würtemberg, Germany* [1818], Agricultural Academy; 109 students.
20. *Haschau, Hungary* [?], Agricultural Academy; 150 students.
21. *Keszthely, Hungary* [1865], Agricultural Academy; 103 students.
22. *Kolozsmonostor, Hungary* [1869], Agricultural Academy; 100 students.
23. *Leoben, Styria, Austria* [1894], Mining Academy; 228 students.
24. *Lille, France* [1885], Industrial and Agricultural School.
25. *Madrid, Spain* [?], Schools of Agriculture and Veterinary Science; 510 students.
26. *Milan, Italy* [?], Agricultural Academy.
27. *Mons, Belgium* [?], Mining Academy.
28. *Montpellier, France* [1872], Agricultural School; 220 students.
29. *Moscow, Russia* [?], Agricultural and Forestry Academy; 200 students.
30. *Münden, Prussia, Germany* [1868], Forestry Academy; 54 students.
31. *Nancy, France* [1824], Forestry Academy; 27 students.
32. *Nowaja-Alexandria, Poland, Russia* [1892], Agricultural and Forestry Academy; 262 students.
33. *Paris, France* [?], Mining Academy; 195 students.
34. *Paris, France* [?], Agricultural College; 160 students.
35. *Popplesdorf, Prussia, Germany* [1846], Agricultural Academy; 320 students.
36. *Portici, Italy*, founded 1872, Agricultural College.
37. *Pribram, Bohemia, Austria* [1849], Mining Academy; 116 students.
38. *Schemnitz, Hungary* [?], Forestry and Mining Academy; 200 students.
39. *St. Etienne, France* [1816], Mining Academy; 20 students.
40. *Stockholm, Sweden* [1823], Forestry School; also Agricultural Academy [1811].
41. *St. Petersburg, Russia* [1773], Mining Institute; 450 students.
42. *St. Petersburg, Russia* [1880], Forestry Institute; 506 students.
43. *Tharandt, Saxony, Germany* [1811], Forestry Academy; 96 students.
44. *Toronto, Canada* [1888], Agricultural College.
45. *Vienna, Austria* [1872], Agricultural Academy; 353 students.

NOTE.—Other similar higher institutions of learning are connected with universities; hence they are not mentioned in this list of separate institutions.

VII. *Veterinary schools.*

1. *Alfort, France* [1766]; 281 students.
2. *Berlin, Germany* [1790]; 475 students.
3. *Budapesth, Hungary* [1786], 400 students.
4. *Cordoba, Spain* [1802]; —— students.
5. *Dorpat, Russia* [?]; 257 students.
6. *Dresden, Germany* [1774]; 173 students.
7. *Hanover, Germany* [?]; 230 students.
8. *Kasan, Russia* [?]; 436 students.
9. *Kharkov, Russia* [1804]; 150 students.
10. *Leon, Spain* [?]; 99 students.
11. *Lyons, France* [1761]; 120 students.
12. *Milan, Italy* [1791]; 133 students.

13. *Munich, Germany* [1790); 314 students.
14. *Naples, Italy* [?]; 231 students.
15. *Santiago, Spain* [1820]; —— students.
16. *Stockholm, Sweden* [1821]; —— students.
17. *Stuttgart, Germany* [1821]; 90 students.
18. *Toulouse, France* [1825]; 171 students.
19. *Turin, Italy* [?]; 91 students.
20. *Utrecht, Netherlands* [?]; 69 students.
21. *Vienna, Austria* [?]; 545 students.

CHAPTER XXXV.

CURRENT QUESTIONS.

CONTENTS.—Teachers' salaries in cities—Teachers' pensions and annuities—The teaching force in England and Wales—Foreign students in German universities—Women students in Prussian universities—Causes of mortality among teachers—A new history of education.

TEACHERS' SALARIES IN CITIES.

The average amount paid to members of the teaching profession in cities of over 8,000 inhabitants shows a marked increase in 1898–99 over 1897–98. The averages for the last nine years have been as follows:

1890–91	$606.00	1895–96	$629.49
1891–92	613.18	1896–97	624.37
1892–93	607.62	1897–98	628.88
1893–94	608.94	1898–99	638.35
1894–95	624.74		

The course of the average salary is supposed in a general way to show whether the emoluments of the business of teaching increase or decrease, and what may be expected by persons entering the profession. Ordinarily the item may be so accepted, but the vagaries of averages are well known, and in exceptional cases they may lead to inferences far from correct. Two instances which occurred in the knowledge of the writer will serve to illustrate this. The "average salary" paid to teachers, as disclosed by the statistical return of a prosperous city, showed a remarkable falling off recently, and attracted attention because it was known that there had been no cutting of salaries there. Investigation led to the discovery that a number of teachers in training, who had previously served without pay, had been put on the salary lists at $150 a year. A sudden drop in the "average salary" resulted. Another city, during the financial difficulties of a few years ago, to save expenses discharged all principals' assistants and many of the lower-salaried teachers. The "average salary" of the teachers who remained consequently showed a considerable increase.

In one of these cases no teacher received less than before, and the small salary of $15 a month was undoubtedly a great boon to a class of young students. The lower "average" that was caused might have been taken of itself as an indication that the body of teachers as a whole were not as well off as before, while the opposite was true. In the other case, many of the teachers were actually thrown out of employment, and the others were in a much worse condition than before, since they had to do a great deal more for the money they received. The higher "average salary" in that instance meant a misfortune for the guild as a whole.

Even in cases not so extreme as these, fluctuations of averages frequently occur without any change either in the salary schedule or in policy. The employment of more teachers of the lesser grades will lower the average, and the appointment of additional principals or supervisors in the higher grades of pay will raise it. When new positions are to be filled it rarely happens that the relative numbers of high and low salaries are maintained in precisely the same proportion as in the older positions, though in a general way the same relation between them is

observed. Consequently the "average salary" in any city is a continually fluctuating quantity. This meaningless fluctuation, for such it is in reality, is ordinarily not great, and it tends to disappear when numbers of localities are combined in the same calculation. It is not so evident in State statistics, and is still less so in those of the country at large.

Notwithstanding all the anomalies that might be recalled, actual changes of salary schedules are quickly shown in the averages, and under normal conditions marked changes in the averages may be taken to indicate actual changes in the schedules in the same direction. Certainly a series of changes of similar kind is significant, and the gradual increase from $606 in 1890 to $638.85 in 1898–99 must mean that the teaching body receive more for their services than at any previous time.

The following table shows the average salaries by States for 1897–98 and for 1898–99:

TABLE 1.—*Average annual salaries of teachers and supervising officers in cities of over 8,000 inhabitants, summarized by States, etc.*

California	2,571	2,147,535	835.30	2,503	2,080,005	831.00

It will be seen that although the average has fallen in a number of the States, all the divisions as wholes, except the Western, show important increases. Many of the variations in the State averages would undoubtedly fall under the description of "meaningless fluctuations," to which reference was made in a previous paragraph, but there are plain indications of actual changes of salaries, those looking toward increase predominating. For example:

In Massachusetts there were 287 additional supervising and teaching positions, and the excess of salaries paid in 1898–99 over 1897–98 amounted to $517,994. Evidently there must have been important improvements in salary schedules somewhere.

On the other hand, in the State of Washington the number of persons employed was increased by 71, but the aggregate of salaries paid was $9,284 less in 1898–99 than in 1897–98. This could only have come about by wage-cutting. Further examination shows that the sufferers lived in Spokane and Tacoma. The number of teachers was increased in both those cities, but the whole amount paid them was less by $13,713 in Spokane, and less by $24,052 in Tacoma.

Montana furnishes an example in which it was possible for a heavy reduction in the average salary to have occurred without reducing the amount paid to any individual or that assigned to any position. Fifty more teachers were employed in 1898–99 than in 1897–98, and $24,215 more was paid in salaries. A reduction of $47.49 appears in the average salary, yet the pay of all the old positions may have remained just as before and the 50 new teachers may have received $484 each, or salaries averaging that amount.

The great cities would naturally be expected to pay the best salaries. Cost of living is highest, as a rule, in them, and they are supposed to demand the best talent available. The table following shows the averages for all the cities which had over 100,000 inhabitants, according to the Eleventh Census. The figures speak for themselves.

TEACHERS' PENSIONS AND ANNUITIES.

REPORT OF TEACHERS' PENSION COMMITTEE IN CHICAGO, ILL., FOR 1899.

Members Teachers and Employees' Pension and Retirement Fund Association Public Schools of Chicago:

At the delegate convention of the members of the association held last June to consider the practical workings of the law, the condition of the fund, and to suggest changes, if any, to be recommended, two permanent committees were appointed—one on information and publication, the second on investigation of the pension roll and the compiling of financial statistics. The chairman of the general convention was made a member of both committees.

The finance committee has compiled the following statistical report, and in accordance with a resolution of the convention, the facts are furnished to the School Weekly for the information of the members.

Contributors to the pension fund are urged to give these statistics careful consideration. The information committee invites discussion and suggestions suggested by these facts as to what action should be taken, if any, in the near future as to changes that should be made in the law or the general working of the present plans adopted by the trustees of the fund.

The School Weekly generously offers its columns for any communications that may be thought by the committee to be of general interest.

Such suggestions may be sent to the undersigned, and they will be given careful consideration by the committee.

JOHN RAY, *Chairman.*
MARY DARROW OLSON, *Secretary.*

STATEMENT OF COMMITTEE ON STATISTICS.

To the Teachers of Chicago:

The committee appointed by your delegate convention of last June to compile statistics relating to the pension roll and pension fund herewith submits its report through the columns of the School Weekly.

The statistics here presented are arranged under four heads:

Table 1 contains the roll of pensioners complete to January 1, 1900, with date of entry upon the roll, sum received each month, total amount received to Janu-

ary 1, 1900, yearly assessments, and lastly, total amount contributed by each pensioner to the pension fund from the 1 per cent assessment on salary at retiring.

Table 2 shows the number of pensioners on the roll since September, 1896, by months, and the amount paid out on pensions for each month since then up to January 1, 1900.

Table 3 shows the annual collections or receipts from all sources for the benefit of the pension fund from January 1, 1896, to January 1, 1900, and also the yearly disbursements for pensions alone for the same period.

Table 4 contains a carefully prepared estimate based on Wiggleworth's tables of expectancy of life at 40, 45, 50, 55, and 60 years, the calculation being based upon minimum ($40), maximum ($60), and average ($50) monthly payments to pensioners at the present time. This table shows the total amount that would be paid to each pensioner and the total amount that would be received from each pensioner on the basis of expectancy.

Although great care has been used in compiling these statistics, the committee is aware that some inaccuracies will be found, but it is quite certain that in the main the tables are correct. A carefully prepared review of these tables is in course of preparation by the committee on information. This review will contain recommendations and suggestions for increasing and safeguarding the pension fund, and will in due time be published in the School Weekly.

Auditor Custer and Secretary Legner state that additions of the five or six names to the pension roll at the last meeting of the pension board necessitated the selling of some securities in order to meet obligations now outstanding.

Respectfully submitted.

WILLIAM H. CHAMBERLIN, *Chairman*,
MARY DARROW OLSON,
JOHN T. RAY,
Committee on Statistics.

[Table 1, containing names of beneficiaries, is here omitted.]

TABLE 2.—*Pension disbursements from 1896 to 1900, by months.*

Date.	Number of members.	Amount.
September, 1896	36	$1,138.57

RETIREMENT FUND IN SOUTH CAROLINA.

By an act of the general assembly of South Carolina, approved on the 29th of January, 1898, the board of public school commissioners for the city of Charleston established "The public school teachers' retirement fund."

This fund is administered by a board of trustees composed of the chairman of the city board of school commissioners, two other commissioners chosen by the said board, the superintendent of the city public schools as ex-officio secretary and treasurer, and a citizen to be elected by the teachers of the city public schools every four years.

The fund consists of 10 per cent for the first five years and of 4 per cent ever thereafter of the gross income of the special school tax paid by the taxpayers of the city of Charleston.

Every teacher in the public schools of the city of Charleston who is over the age of 65 years, and shall have taught in them for twenty-five years next preceding the time of retirement, shall have the right voluntarily to retire from such service, and upon the certificate of the city board of school commissioners that he or she stands in need of maintenance shall become a beneficiary, and shall be entitled to an annuity for the remainder of his or her life. This annuity shall in no case exceed the sum of $250 in any one year.

Every teacher in the public schools of the city of Charleston who shall have taught continuously therein for at least twenty years, and has become incapacitated mentally or physically, may retire and become a beneficiary of the fund, provided that the annuity shall cease when such incapacity ceases.

There is a local teachers' benefit association whose object is to relieve sick teachers by the payment of 75 cents a day for ten school days, and 50 cents a day for the remaining ten days of a school month, should the sickness continue for that period.

THE PENSION LAW OF CINCINNATI, OHIO.

From Cincinnati comes the report that the law, passed by the Ohio legislature some years ago, which enables the teachers to establish and maintain a pension fund, had to be seriously amended in order to prevent a depletion of the fund. Instead of 1 per cent of the salary, a teacher will now be taxed $2 for every month of the school year, or $20 per annum. No difference is made between teachers and principals. A teacher may retire from service and claim his pension after thirty years' service, and he then draws a pension of $10 for every year he served; hence his pension will amount to $300 after thirty years, $400 after forty years, but no pension over $500 will be paid. In cases of disability before the thirtieth year of service is reached, a pension may be paid, but it can not be larger than $10 for every year of service. One paragraph of the amended law gives satisfaction to the teachers, namely, that hereafter no teacher can be dismissed arbitrarily by the superintendent, but his case must be investigated by a committee of the city school board upon written complaint of the superintendent.

THE TEACHING FORCE IN ENGLAND AND WALES.

The London Schoolmaster, in its issue of May 5, 1900, analyzes the annual returns of the "Education department" for 1899, and reveals some interesting facts from which the following, concerning the number, age, and qualification of the teaching force, as well as the amounts paid them, are gleaned. It says: "This question (respecting the quality and quantity of teachers) represents an item of first-class importance; and no one who knows the lack of adequate financial support under which the great bulk of the voluntary schools, and practically all the rural schools (both board and voluntary or church schools), suffer, will be surprised to learn that in very many cases the teaching staff is woefully insufficient and inefficient." Elementary school teachers are of four classes:

(1) Adults who have gone through all the grades of training and are classed as fully certificated.

(2) Teachers who have been apprenticed as pupil teachers, but have not completed the course for the teacher's certificate. These are styled ex-pupil teachers.

(3) Young women over 18 years of age—technically known as "article 68's"—who have no professional qualification whatever, except that, in the opinion of the inspector, they are presentable young persons and can give evidence that they have been successfully vaccinated.

(4) Juvenile apprentices to the art of teaching, known as pupil teachers.

Under any efficient system of education, neither the "Article 68's" nor the pupil teachers would be looked upon as efficient members of the school staff. But it is too common an experience to find English schools—especially voluntary schools and rural board schools—staffed almost entirely with these inefficient supernumeraries. The whole teaching force (including these inefficient juveniles) in England and Wales at the present time (the report is for 1899) consists of 150,524 persons, distributed as Table A shows. Tables B, C, D, and E give further details in relative and absolute numbers, and the facts as related to Scotland are added. The report does not mention Ireland. The table "Salaries of teachers" has been made serviceable to American readers by stating the amounts in dollars and cents.

The teaching force in England and Wales.

A.—NUMBER OF TEACHERS.

Scotland	56	12		32
London board schools	81	4	0	15

THE FACTS IN SCOTLAND IN 1898.

In 1898 Scotland had 17,836 teachers—9,975 certificated adults, or 56 per cent; 2,193 uncertificated adults, or 12 per cent, and 5,668 juveniles, or 32 per cent. With regard to sex they were divided into 5,435 men or boys (30 per cent) and 12,401 women or girls (70 per cent). Divided into adults and juveniles we get: Adults, 12,168, or 68 per cent, and juveniles 5,668, or 32 per cent.

GENERAL REMARKS.

The foregoing analysis of the composition of the teaching force illustrates in the first place the extent to which women are dispossessing men in the work of teaching. To-day in England and Wales, as will be seen by consulting the tables, roughly speaking, three-fourths of the teachers are women and girls. In the year 1851 70 per cent of the teaching force were men and boys and 30 per cent women and girls. In 1870 the proportions of the sexes were just about equal, and now they are 24.8 per cent men and boys and 75.2 per cent women and girls. Another consideration is the rapid increase in the number of unqualified adult teachers, known as "Article 68's." In ten years the number of these teachers engaged has risen from 5,210 to 16,717. (See explanatory remarks in the introduction.)

FOREIGN STUDENTS IN GERMAN UNIVERSITIES.

During the summer semester of 1899 there were 2,284 foreigners matriculated in German universities. This number does not include about 2,000 foreign "hearers" who could not be matriculated, owing to their want of the preparation prescribed by law; nor does the number include the foreign students of polytechnica, art academies, music conservatories, agricultural, forestry, and mining academies. The Annual Report of this Bureau for 1896 gives a summary of foreign students in polytechnica, agricultural, forestry, and mining academies which shows a total of 1,276. If the art and music students were added, the total would rise to 2,000. The following figures have reference to foreign university students only.

Of the 2,284 students, 563 studied philosophy, philology, and history; 480 studied mathematics and natural science; 477 studied medicine; 299, law; 284, agriculture, forestry, and political economy; 150, theology, and 31, dentistry, making a total of 2,414, which indicates that some—130—study in two faculties.

The "hearers" (nonmatriculated students) have all the privileges of regular students, such as attendance at lectures and exercises, use of library, laboratories, and other agencies if they pay the prescribed fees; but not being matriculated, their names are not kept on the rolls, nor can they acquire degrees or compete in state examinations, the successful passing of which opens up a career in the service of the State, which is coveted by native Germans and is granted almost exclusively to them.

Foreign students came from nearly all the civilized countries. From Russia 594, Austria-Hungary 467, Switzerland 289, England 159, Bulgaria 69, the Netherlands 50, France 41, Servia 39, Italy 37, Turkey 33, Roumania 32, Sweden and Norway 31, Luxemburg 24, Greece 23, Belgium 19, Denmark 8, Montenegro 3, Spain 3; total from Europe, 1,857. From Asia, chiefly from Japan, came 101; from Africa 21, from Australia 5, and from America 300. The report fails to specify from what part of America the last mentioned came.

The following numbers will show which universities are preferred by foreigners: Berlin had 655 foreign students, Leipzig 322, Heidelberg 205, Munich 196, Halle 138, Freiburg 96, Göttingen 93, Strassburg 75, Jena 71, Marburg 66, Würzburg 59, Bonn 50, Königsburg 49, Tübingen 48, Breslau 40, Giessen 35, Erlangen 33, Greifswald 22, Kiel 22, Rostock 7, and Münster 2.

WOMEN STUDENTS IN PRUSSIAN UNIVERSITIES.

As will be seen from the following tables, statistics of all the 22 German universities are not offered, but only of the 10 Prussian universities. The Leipzig Tageblatt (No. 349, July 12, 1899) makes the compilation, chiefly because the Prussian Government has been opposed to the admission of women students. It still debars them from matriculation and only allows them to enter as "hearers." The difference between matriculated students and hearers is explained in the preceding article. The following tables speak for themselves. They give the number of women students, their nationality, age, religion, their marital relations, the occupation of their fathers, their purposes of study, and the branches they select.

1.—*Number of women students in Prussian universities.*

Prussian universities.	Winter of 1895-96.	Summer of 1896.	Winter of 1896-97.	Summer of 1897.	Winter of 1897-98.	Summer of 1898.	Winter of 1898-99.

CAUSES OF MORTALITY AMONG TEACHERS.

Concerning the causes of mortality among teachers, some interesting data are published by the Deutsche Lehrerzeitung, in Leipzig, from which the following information is taken and published here with a view to inciting similar investigations in this country. The facts given concerning teachers refer to German teachers only. In all probability the corresponding figures for the United States will vary from those found in Germany, the teachers there being mostly men, while here, at least in the cities, they are almost exclusively women.

The profession of a person has as much influence upon the duration of life as his pecuniary circumstances. Certain occupations and professions are considered inimical to life, as, for instance, those of hotel keepers and hotel servants, glass blowers, musicians, and medical practitioners. Others seem to be favored with long life, notably those of clergymen and independent farmers. Dr. Richardson, in his English statistics of mortality, states that among each 1,000 Protestant clergymen in the vigorous age between 25 and 45 years, during 1890–1892, the number dying was 4.72, on an average; of farmers the average per 1,000 was 5.64; of medical practitioners, 10.24; of musicians, 12.68; of glass blowers, 14.11; of hotel keepers, 18.81.

Dr. Richardson calculated the mortality of 70 occupations or professions, and found that the printers occupy the third highest place in the list of mortality. Taking the average mortality of all the 70 occupations as 100 per cent, the printers average 117 per cent. Almost 60 per cent of the printers and compositors die of consumption at the comparatively early age of 35.

Generally speaking, the mortality of elementary school-teachers is not very low, but neither is it very high. Taking the average mortality of well-situated strata of the population (civil officers, for instance) as 100 per cent during the vigorous years from 21 to 45, the two German physicians, Karup and Gollmer, calculate the mortality of university professors to be 64.6 per cent; that of Protestant clergymen, 70.2 per cent; that of teachers of preparatory or high schools, 71.4 per cent; that of elementary teachers, 84.6 per cent; that of medical men, 125.9 per cent.

Very different proportions are found if the causes of death are considered. Certain diseases are found among teachers oftener than among persons engaged in other occupations, notably consumption, chronic lung catarrh, and acute diseases of the respiratory organs, such as inflammation of the lungs and pneumonia and bronchitis. To a large extent they may be considered professional diseases of teachers and speakers.

Rural teachers, especially, die young. While generally the mortality in cities is somewhat greater than in the country, the numerous inconveniences and the accumulated troubles to which rural teachers are subjected—such as poor dwellings, much school dust, defective warming and ventilation in schoolrooms, overcrowded classes, ungraded schools, small salaries, long hours, additional service in church as organists and choir leaders which necessitates outdoor walking in all kinds of weather, and, above all, the greater responsibility—cause a greater mortality among rural teachers in Central Europe.

Taking as a standard measure the mortality from each disease of tolerably well-situated civil officers—of administration and justice, for instance—and of similar social strata, and calling this the normal rate for such disease, or 100 per cent, we find the mortality of elementary teachers during the years of vigor (from 46 to 60) to be 110.7 per cent caused by tuberculosis, 108.2 per cent caused by chronic lung catarrh, and 129.4 per cent caused by constitutional diseases, such as disorders of the digestive and kindred organs. These figures show that the normal mortality is far surpassed by that of teachers in every case. The last-named cause is found singularly often among city teachers during the age of 25 to 60 years, as is seen from the following figures: Taking the same normal standard mentioned before,

we find that Protestant clergymen do not reach it, only 67.5 per cent dying from that cause, but 111.3 per cent of rural teachers and 130.2 per cent of city teachers. During old age that difference becomes still more pronounced—rural teachers 97.6 per cent, city teachers 139 per cent. This high percentage of mortality is, however, chiefly found in South Germany, where 142.8 per cent of city teachers die of kidney and liver troubles or disturbances of the digestive organs. Also, with regard to diseases of the organs of circulation and fatal accidents, the teachers of southern States show a higher percentage, to wit, north, 69.9 per cent and 88.1 per cent, respectively; south, 105.7 per cent and 110.2 per cent. This is not strange, if the fact be considered that the general mortality in southern is greater than in northern Germany; local circumstances, the mode of living, and especially injurious dietary habits may be the causes.

How destructive the so-called professional diseases are to teachers may be seen from the list prepared by the two physicians before mentioned, Drs. Karup and Gollmer, after investigations and inquiries made during a number of years. The first established a normal rate of mortality as a standard measure, and then ranged the following groups as follows:

	1. Death caused by lung consumption.		2. Death caused by chronic lung catarrh and emphysema.		3. Death caused by other diseases of the respiratory organs.	
	Age, 26–60 years.	Age, 61–90 years.	Age, 26–60 years.	Age, 61–90 years.	Age, 26–60 years.	Age, 61–90 years.
	Per cent.	*Per cent.*	*Per cent.*	*Per cent.*	*Per cent.*	*Per cent.*
Protestant clergymen	44.2	57.6	61.6	64.1	61.3	74.2
Secondary-school teachers	66.3	70.4	82.2	73.9	65.4	72.9
Elementary city teachers	90.2	81.2	85.0	93.1	84.7	87.6
Elementary rural teachers	101.4	113.9	117.1	112.9	102.6	105.8

However, if all the causes of death are considered without distinction, except as to the period of calculation and age at time of decease, the mortality of teachers can not be said to be very high. The average figures during the age of 26 to 60 years,[1] compared with the normal mortality during the same year, are as follows: University professors, 56.7 per cent; Protestant clergymen (counted among the teachers because they teach religion in secondary schools), 73.6 per cent; elementary teachers in cities, 75.8 per cent; teachers in secondary schools, 77.4 per cent; elementary teachers in rural districts, 84.5 per cent; Catholic clergymen, 103.6 per cent; practicing physicians, 116.2 per cent.

Dr. Sigel, a physician of the health office in Leipzig, examined in October, 1895, all the teachers of that city, and found 42.8 per cent of them suffering from nervousness, chronic catarrh of the throat, lung trouble, and other so-called professional diseases.

A NEW HISTORY OF EDUCATION.

Among the methods of presenting the history of education there are two distinct, if not antagonistic ones; the one deals exclusively, or chiefly, with the theories and plans of reform which in the course of centuries have been advanced by philosophers, and in turn have agitated the educational world. This mode of presenting and studying the history of education is not unprofitable, but it is not, properly speaking, the history so much as it is the theories of education such books present. The other method is the one which exclusively deals with facts gleaned from

[1] These limits are taken because the twenty-fifth year of age is usually the year in which German teachers get their definite appointment, and the sixtieth year the one in which they may be retired on a pension.

documentary sources, from governmental decrees, and from school programmes and chronicles, and thus presents, or attempts to present, actual conditions. It is "Quellenstudium," study of original sources, which is emphasized by modern scholars generally. It is the method advocated in particular by modern historians, and is in accordance with the methods applied in teaching and studying natural history and science. This mode of procedure—the study of historical sources—has taken hold of educational as it has of theological students.

Prof. Stephan Waetzoldt (see Annual Report of 1894–95, page 460) says:

The science of education has only recently begun to sever itself from speculative theories and turn toward historic development of the momenta that constitute it. There is still too much system and theoretical speculation and construction, while unbiased observation and fixation of facts are not as frequently found as desirable. Rarely are the forms of the education of a certain era, or of a country, viewed in connection with the entire development of the people. Comparative pedagogy is still in its infancy. The questions: How does a nation, an era, a society arrive at a particular form of education? and Why is it a historically necessary result? present themselves to the student. He who has accustomed himself to understand historically that which exists in the education of a nation, and compares it with the work and the results of other nations upon similar lines, will not be apt to believe in the possibility or utility of direct copies and adaptations; he will try to understand and explain, but will refrain from copying, for in the end every nation finds that which is best adapted to its needs, and it finds it in its own way.

This method of comparative study of education has been employed by Dr. Karl Schmidt in his famous work of four volumes, which for thoroughness and philosophic insight is not surpassed by any other on the history of education. But this work is not a presentation of original sources, however sound may be its foundation.

Recently another German work has made its appearance following independently a line of research in documentary sources, and thus commending itself to the student. It is a work bearing a Latin name—*Monumenta Germaniæ Pædagogica*. Nineteen volumes have appeared up to April, 1900. Its object is to introduce the reader directly to the original historical sources. A statement of its contents will show what it offers. Volumes I and VIII present the Brunswick governmental school regulations and decrees, which are the first important authoritative orders given for the establishment and regulation of schools by Protestant princes, and are, therefore, of paramount interest in showing how the schools, during the Reformation, began to be severed from the church and how they became state institutions. Volumes II, V, IX, and XVI present the original "Ratio Studiorum" prescribed for the schools of the Jesuits. In view of the fact that for more than a hundred years the schools of that religious order in Europe were the best seats of learning below the universities, this publication is very welcome. It gives an insight into documents not easily available. Volume III contains the history of mathematical instruction in Germany during the Middle Ages. Volume IV contains the German catechisms of the Bohemian and Moravian Brethren. Volumes VI and VIII contain the regulations and orders of the Saxon schools in Siebenburgen (in Hungary). Volume VII presents a biography based on documentary evidences of Luther's friend, the reformer Philip Melanchthon, whom cotemporary historians called Preceptor Germaniæ. Volume XII contains the Doctrinale of Alexander de Villa Dei. Volume XIV contains the history of education in Bavaria, and Volume XIX that of the Bavarian Palatinate. Volumes X, XI, XV, XVII, and XVIII give an account of the history of military education during the last centuries. This last work reaches up to the year 1896, and is therefore quite complete. Further volumes will appear in time, since the publication of this valuable undertaking has been secured by a subsidy from the imperial exchequer by a vote of the Reichstag, likewise by substantial aid promised by the Prussian Department of Public Education and learned societies, as well as the National Teachers' Association. It is to be regretted that the publication proceeds rather slowly—about two volumes a year—but in the interest of thorough scholarship this may, perhaps, be best.

PART II.

CHAPTER XXXVI.

CITY SCHOOL SYSTEMS.

Recent Laws Relating to City School Boards.

In the Report of this Office for 1895–96 was a chapter (Chapter I, p. 3) describing typical laws relating to city school systems as they were then organized. The four years since that paper was written have been preeminently a period of change and experiment. The variations from the normal type then described have been so radical, so numerous, and of such importance that it would be difficult now to say just what the normal type is. The cities in which the changes have been made that have excited the most attention and aroused the most discussion are San Francisco, Cal.; Washington, D. C.; Atlanta, Ga.; Indianapolis, Ind.; Baltimore, Md.; St. Louis, Mo.; New York, N. Y.; Rochester, N. Y.; Toledo, Ohio, and Milwaukee, Wis. In three other large cities—namely, Chicago, Ill.; Boston, Mass., and Detroit, Mich.—laws along lines similar to those of the cities named have been urgently advocated, but none of them have yet been passed.

The board of education has been preserved in all the new laws, but in the number of members, manner of appointment, and duties and powers marked changes have been made. The principle which formerly prevailed universally, that service on the board was an honor to which no pay should be attached, has not been observed in two of the new laws, and paid boards are now advocated very frequently elsewhere. The San Francisco board as it is now constituted represents probably the widest departure from traditional policy, for there the board of only four men devote their entire time to the duties of the office and receive each $3,000 a year. Not more than two of its members may be of the same political party. The superintendent, an officer elected by the people, is ex officio a member of the board, but without the right to vote. An elected superintendent is not a new thing in San Francisco, but a paid school board is. That has been a common plan of organizing police and fire boards, but it is a novelty as applied to schools. It is an experiment, to be sure, but the former law did not give satisfaction, and the San Francisco people appear to feel that whatever the outcome, it could be no worse than the condition of affairs under the old régime. In Washington the new board is to be paid, though the salary was avowedly attached to insure attendance at meetings and to secure more attention to school business. It is not sufficient to pay for all the time of the members, nor is it intended to.

In the selection of members of the board the greatest innovation is developed in the Milwaukee law, which provides for the appointment by the mayor of a bipartisan commission, who shall appoint the members of the board of school direct-

ors. The question of "responsibility to the people" is frequently discussed in connection with the selection of public officers, many holding that officials should be chosen directly by, and be responsible to, the people. Others oppose this because of the supposed demoralizing effects of elections and of the constant pandering to popular caprice that are said to result. The Milwaukee device removes the schools further from "the people" than any which has preceded it. The people elect the mayor, the mayor appoints the commission, the commission appoint the board, the board elect the superintendent, the superintendent, in practice, selects the principals, the principals select the teachers,[1] and the teachers teach the schools. Truly the school system has kept pace with the industrial world in the introduction of machinery; what a difference is this from the primitive plan by which the people in district meeting elected a teacher, and all was done!

The Indianapolis law shows a peculiar feature in subjecting certain acts of the school board to the veto of a subordinate officer, one of its own appointees, namely, the business director. The idea is plainly copied from the Cleveland system, but the important difference is that in the latter city the director is coordinate with the legislative body and not dependent upon it for his position. It is not to be expected of human nature that an official will oppose to the point of antagonism the power that made him; yet that would naturally follow the independent use of the veto. In this case the right of veto does not give the director any real power except to necessitate the reconsideration of a measure of which he disapproves, for no greater vote is required to pass a resolution after the disapproval than before; the three votes necessary make a majority simply, there being but five members. It would seem, therefore, that the provision is intended merely to insure careful consideration of questions involving expenditure, but it is a remarkable one nevertheless.

The New York law was designed to make as little change as possible in the existing local conditions in the several boroughs at the time of their consolidation into the greater city. New boards were brought into being for the smaller boroughs of Queens and Richmond, but the composition of the boards of the old city of New York and of the city of Brooklyn was absolutely unchanged when they became respectively the boroughs of Manhattan and the Bronx and the borough of Brooklyn. The supervision of the schools remains just as before, the title of the superintendents being changed to borough superintendents. The duties of the present city superintendent are mainly advisory, and he has no right to interfere in the actual conduct of any school in the city. The city board of education is charged with the apportionment of certain funds to the several boroughs, the purchase of sites and erection and repair of buildings, the purchase of school supplies, and, through its board of examiners,[2] the examination and certification of teachers. The actual management of the schools remains with the local school boards. This system of divided responsibility has not proved satisfactory, and a commission is already at work to revise the city charter in this as in other respects. It is expected that greater centralization of authority will be the outcome. Indeed, this was probably foreseen by the original framers of the charter, but it was felt at the time that wise policy demanded that as much as possible of local control should remain until the people became accustomed to the larger unit of government. Important changes, though not affecting the plan of organization, have already been made in the charter as it originally stood. The "Ahearn law," passed in 1899, prescribing the minimum salaries of certain teachers, was published in full in the last Education Report.[3] The "Davis law," passed at the last session of

[1] Fortieth Annual Report of the School Board of Milwaukee, 1898-99, p. 24.

[2] The board of examiners consists of the city superintendent and four examiners nominated by him and appointed by the board of education.

[3] Report of the Commissioner of Education for 1897-98, vol. 2, p. 2342.

the legislature (1900), still further regulates teachers' salaries and prescribes a minimum amount to be appropr ated for salaries of the supervising and teaching staff—namely, 4 mills on the dollar of taxable property of the city.

The new laws for Atlanta and Washington were prompted more by the needs of a definite law of some kind than by defects of previous laws, for practically there were no previous laws. The Atlanta board of education was a mere creature of the city council, without any status whatever in the eyes of the State law. It might have been abolished at any time without warning by the city council. In Washington the laws have been for years fragmentary and chaotic, so that no one of the officials knew definitely what authority he had or did not have.

The most conspicious feature that strikes one as common to all the recent laws is the reduction in the size of the boards. This is in accordance with prevailing sentiment. The San Francisco board is the smallest yet organized, and was reduced to 4 from 12. The Baltimore board was cut down from 22 to 9, St. Louis from 21 to 12, Indianapolis from 11 to 5, Milwaukee from 36 to 21, Atlanta from 14 to 7, etc.

The tendency, strongly marked. is to divorce legislative functions from the executive, retaining the former in the board and confiding the latter to paid experts. The tendency is equally apparent to separate business affairs from matters which relate to instruction, assigning the one to a business director, and the other to the superintendent of instruction. These distinctions are well developed in the Toledo law, which has been frequently extolled as one of the best yet drawn, but they are just as strongly marked in other laws.

The superintendent enjoys greater powers in most of the new laws in the appointment of teachers, in the preparation of the course of study, and in the selection of text-books. The choice of teachers from those on the eligible list is given to him absolutely in Indianapolis; and in Baltimore, St. Louis, Rochester, and Toledo the superintendent makes appointments subject to the confirmation of the board. In Milwaukee the superintendent is a member of the committee to make such appointments, and it is stated that in practice the choice really rests with him and the principal of the school in which a vacancy occurs.[1] In Boston, though the bill proposed recently for a reorganization of the board failed to become a law, a number of changes have been made in the powers of the superintendent by rule of the board itself in the line of the new laws applying to other cities.

As a rule, the Western statutes are very minute in their provisions, and are in striking contrast in this respect to some of the Eastern enactments. The Milwaukee law contains 21 sections, and that of Indianapolis 34. On the other hand, the charter of the new board of education at Washington contains but four paragraphs, as follows:

PUBLIC SCHOOLS.

The Commissioners of the District of Columbia are hereby authorized to appoint seven persons, bona fide residents and taxpayers of the District of Columbia, and who have been such for five years immediately preceding their appointment, who shall constitute a board of education and whose term of office shall be seven years, except that the terms of the persons first appointed shall terminate as follows: One each year, to be determined by lot among the seven members of the board first appointed. The compensation of members of the board shall be $10 each for personal attendance at each meeting, but shall not exceed for any member $500 per annum. The board shall have complete jurisdiction over all administrative matters connected with the public schools of the District of Columbia, except that all expenditures of public funds for such school purposes shall be made and accounted for as now provided by law under the direction and control of the Commissioners of the District of Columbia. The board shall make all needful rules and regulations which may be proper for the government and control of said

[1] Thirty-ninth Annual Report of the School Board of Milwaukee, 1897–98, p. 29.

schools, and shall make annual report to the Commissioners of the District of Columbia, who shall transmit the same to Congress, of the condition and operations of said schools and the sanitary and structural condition of all buildings in use, as well as those in course of construction, with recommendations as respects needed changes.

The board shall have power to appoint one superintendent for all the public schools of the District of Columbia, two assistant superintendents, one of whom, under the direction of the superintendent, shall have charge of schools for colored children; a secretary, and three clerks, and to remove said officers at its pleasure, and shall also have power to employ and remove all teachers, officers, and other employees connected with the public schools not already specified: *Provided*, That the graduates of the normal schools shall have preference in all cases when appointments of teachers for the grade schools are to be made. The superintendent shall annually submit to the board for its approval the course of studies and list of text-books and other apparatus to be used in said schools.

The board shall annually transmit to the Commissioners of the District of Columbia an estimate in detail of the amount of money required for the public schools for the ensuing year, and said Commissioners shall include the same in their annual estimate of appropriations for the District of Columbia, with such recommendations as they may deem proper.

The foregoing provisions under the head of "Public schools" shall take effect on the 1st day of July, 1900, and all acts and parts of acts in conflict herewith are hereby repealed.—[From "An act of Congress making appropriations to provide for the expenses of the government of the District of Columbia for the fiscal year ending June 30, 1901, and for other purposes," approved June 6, 1900.]

Summary of laws relating to school boards of certain cities—Part I.

	City.	Name of school board.	Number of members.	How chosen.	Selected from the city at large, wards, or districts.	Term of office.	Vacancies in the board are filled for the unexpired term by—	Remarks.
1	San Francisco, Cal.	Board of school directors.	4	Appointed by mayor	City at large	4 years; 1 appointed each year.	Mayor	Each director receives $3,000 per annum.
2	Washington, D. C.	Board of education.	7	Appointed by Commissioners (or general executive officers) of District of Columbia.	City at large	7 years; 1 appointed each year.	District Commissioners.	Each member to receive $10 for attendance at each meeting, total not to exceed $500 a year.
3	Atlanta, Ga.	Board of education.	9	1 from each of 7 wards; elected by mayor and council; mayor and chairman of committee of council on public schools are members ex officio.	Wards, except as to ex-officio members.	5 years; a portion elected each year.	Mayor and council.	
4	Indianapolis, Ind.	Board of school commissioners.	5	Elected by the people	At large	4 years; elections biennial; 3 chosen at one election, 2 at the next, etc.	Board of school commissioners till next election.	Candidates must be nominated by 200 householders.
5	Baltimore, Md.	Board of school commissioners.	9	Appointed by mayor and confirmed by second branch of the city council.	do	6 years; 3 chosen each alternate year.	Mayor, with confirmation as described.	
6	St. Louis, Mo.	Board of education.	12	Elected by the people	do	6 years; 4 elected each alternate year.	Mayor, till next election.	
7	New York, N. Y.	Board of education of the city of New York.	19	4 chairmen of borough school boards ex officio; 10 elected by school board of Manhattan and the Bronx; 5 elected by school board of Brooklyn.	Boroughs	1 year	Borough school boards.	
		School board of the boroughs of Manhattan and the Bronx.	21	Appointed by the mayor	At large	3 years; one-third appointed each year.	Mayor	
		School board of the borough of Brooklyn.	45	do	do	do	do	
		School board of the borough of Queens.	9	do	do	do	do	

Summary of laws relating to school boards of certain cities—Part I—Continued.

	City.	Name of school board.	Number of members.	How chosen.	Selected from the city at large, wards, or districts.	Term of office.	Vacancies in the board are filled for the unexpired term by—	Remarks.
	New York, N. Y.—continued.	School board of the borough of Richmond.	9	Appointed by the mayor.	At large	3 years; one-third appointed each year.	Mayor	
8	Rochester, N. Y	Board of education.	5	Elected by the people	do	4 years; elections biennial; 3 chosen at one election, 2 at the next, etc.	Mayor, till next election.	
9	Toledo, Ohio	do	5	do	do	5 years; one elected each year.	Board of education, till next election.	Candidates must be indorsed by 200 voters.
10	Milwaukee, Wis	Board of school directors.	21	Appointed by commission of 4, appointed by the mayor, 1 each year for 4 years.	Wards	3 years; one-third appointed each year.	Board of commissioners.	

Summary of laws relating to the school boards of certain cities—Part II.

	City.	Principal source of revenue.	Maximum amount of tax for schools.	Manner of selecting superintendent, and term, if prescribed.	Authority to examine teachers.	Authority to appoint teachers.	Construction of buildings directed by—
1	San Francisco, Cal.	Tax levied by supervisors on demand of board of directors.	$31.50 per pupil in average attendance.	Elected by the people; 4 years.	Superintendent and deputy superintendents.	Board of directors	Board of public works on requisition of board of directors; plans approved by board of directors.
2	Washington, D. C.	Appropriations by Congress; one-half from District of Columbia taxation; one-half from Federal Treasury.	----------	Elected by board of education.	----------	Board of education	District Commissioners; plans of inspector of buildings of District of Columbia.
3	Atlanta, Ga	Appropriations by city council from general fund.	----------	Elected by board of education.	----------	----do----------	Board of education.
4	Indianapolis, Ind	Tax levied by board of school commissioners.	50 cents on $100	Elected by board of commissioners; 1 year; 4 years if reelected.	Determined by board of commissioners.	Superintendent	Business director.
5	Baltimore, Md	Appropriations by city council.	----------	Appointed by board of school commissioners.	Superintendent and assistant superintendents.	Superintendent; confirmation by board of school commissioners.	City inspector of buildings; plans approved by board of school commissioners.
6	St. Louis, Mo	Tax levied by board of education.	40 cents on $100, or 50 cents on $100 by popular vote.	Appointed by board of education; 4 years.	Superintendent	Superintendent, subject to control of board of education.	Commissioner of school buildings.
7	New York, N. Y.	Appropriations by city board of estimate and apportionment.	(*a*)	Appointed by board of education; 6 years.	City superintendent and 4 examiners nominated by him.	Borough school boards.	Superintendent of school buildings; plans submitted to borough school board and approved by board of education.
8	Rochester, N. Y.	Appropriations by city council.	$25 per capita of total enrollment.	Appointed by board of education; 4 years.	Superintendent and 2 persons nominated by him.	Superintendent and principals, subject to approval of board of education.	City executive board; plans of board of education approved by board of health.
9	Toledo, Ohio	(*b*)	(*b*)	Employed by board of education; 2 years.	----------	Superintendent, with approval of board of education.	Board of education, through business manager.
10	Milwaukee, Wis.	Tax levied by city council at request of board of directors.	35 cents on $100 for teachers and current expenses; 2½ cents on $100 for repairs. *c*	Elected by board of directors; 3 years.	Committee of superintendent, president of the board, and 2 members of the board of directors.	Committee of superintendent, president of the board, and 2 members of the board of directors.	City council, on request of board of directors; plans determined by a committee.

a Minimum amount to be appropriated for supervising and teaching staff to be equivalent to 40 cents on $100; maximum not specified.
b Not specified in special law.
c City council erects new buildings.

Statistics of City Schools.

Table 1.—*Summary of statistics of cities containing over 8,000 inhabitants, showing increase from previous year.*

	1897–98.	1898–99.	Increase.	Per cent of increase.
Enrollment	3,803,049	3,920,467	117,418	3.09
Aggregate number of days' attendance	539,141,947	550,909,973	11,768,026	2.18
Average daily attendance	2,849,502	2,931,679	82,177	2.88
Average length of school term, in days	189.2	187.9	(*a*)	
Enrollment in private and parochial schools	872,406	913,369	40,963	4.70
Male supervising officers	2,316	2,320	4	.18
Female supervising officers	2,113	2,270	157	7.43
Whole number of supervising officers	4,429	4,590	161	3.63
Number of male teachers	6,005	6,302	297	4.96
Number of female teachers	72,355	76,348	3,993	5.52
Whole number of teachers	78,360	82,650	4,290	5.47
Number of buildings	9,113	9,367	254	2.79
Number of seats	3,500,970	3,635,486	134,516	3.84
Value of school property	$289,325,794	$312,698,690	$23,372,896	8.08
Expenditure for tuition	$52,064,649	$55,689,787	$3,625,138	6.96
Total expenditure	$88,773,647	$93,413,046	$4,639,399	5.23

a Decrease 1.3 days.

The increases reported above are considerably below the normal increases in nearly every item. The average attendance for 1898–99 shows the smallest increase, both actually and proportionally, that has occurred since the present method of presenting the city school statistics was inaugurated in 1890–91. In enrollment, too, the proportional increase is less than in any previous year within the time mentioned. The growth of cities and of school systems does not always progress with uniform steps, and it may be that the next year will witness an increase in school attendance that will more than make good the deficiencies of this year. But whether this occur or not, it is plain that from some cause the accustomed growth of city schools has been retarded.

The history of growth in the past leads to the hope that the retardation is temporary only, but whether temporary or permanent it is a matter of importance, and considerable pains have been taken to ascertain the causes. The following table shows, for all the cities which had over 100,000 inhabitants according to the Eleventh Census, the enrollment for 1897–98 and for 1898–99, with increase or decrease, and percentage of the same; also the increase during the ten years from 1887–88 to 1897–98, with the percentage of increase and the average annual rate:

a Increase in schools other than kindergartens, 426; per cent of increase, 1.3.
b Number belonging January 31.

The whole of New York City as it is now organized is not given in the above, since it is impossible to give the statistics of the entire period desired for the boroughs of Queens and Richmond. Of the 28 cities in the list there has been in the past year an actual decrease in school enrollment in four, namely, in San Francisco, Denver (District No. 1), Indianapolis, and Rochester. In five—Detroit, St. Louis, Cincinnati, Allegheny, and Pittsburg—the schools have remained practically stationary in regard to numbers. In all the others excepting New Orleans, Kansas City, Jersey City, Newark, and New York, the per cent of increase is decidedly below the average for the previous 10 years.

Of the five cities last named special reasons have conduced to larger attendance in at least 4. Jersey City has greatly extended her school facilities recently; 7 large buildings, long needed, have been opened, making possible the enrollment of a greatly increased number of children. The corporate limits of Kansas City have been extended, bringing 1,823 additional pupils into the school system; even without these, however, the increase was large. The New York City schools are still in the process of reformation following the legislation of 1896 and 1898. Large sums have been spent for new buildings, and salaries have been greatly increased; naturally the enrollment has taken a sharp upward turn. In Newark the kindergarten system has been greatly extended during the year; 2,720 children were enrolled in the schools of that class in 1897–98, and 4,076 in 1898–99; the increase, therefore, in schools other than kindergartens was but 426—a very small number. No information is at hand concerning the conditions that produced an increase larger than the average in New Orleans, but that average has been so small—1.4 per cent—that the excess this year has little general significance. It is plain that the condition of affairs which has affected the growth of the schools has been not local, but general.

The printed reports which have been received throw very little light on the subject. Supt. E. P. Seaver, of Boston, remarks that "the increase in pupils, 1,903, is surprisingly small, being but little more than one-half of that reported last year, 3,612, and considerably less than that reported year before last, 2,634,"[1] but he offers no explanation.

Supt. F. Louis Soldan, of St. Louis, states that "the slower rate of increase is in part accounted for by the fact that the growth in the population of the city during the past two years has been at a slower rate, or has receded in a small degree. Another possible reason is that during times of commercial prosperity,

[1] Boston School Document No. 3, 1899, p. 7.

when there is an increased demand for labor, many young persons leave school to take up lucrative employment who without this chance would have continued in school for a longer period."[1]

Supt. C. G. Pearse, of Omaha, refers to the decrease of 219 in the number of persons of school age in the city, and suggests carelessness on the part of the enumerators as a possible cause. In regard to the falling off in attendance he thinks the cause was "the visitation of smallpox, which for months kept hundreds of children from school through fear of the disease or from unwillingness to submit to vaccination."[2] Similarly Supt. G. F. T. Cook, of the colored schools of Washington, thinks that the decrease of 181 in his enrollment "was due to the appearance of smallpox and to the rigid enforcement of the rule requiring vaccination or other protection against the disease as a condition for securing or retaining membership."[3] The white schools of the city were, however, exposed to the same dangers and subject to the same rules, yet they showed an increase in enrollment, not a decrease.

Supt. A. J. Smith, of St. Paul, assigns reasons which seem to have extended through a number of years, and are not applicable to the last year only. He says:

"It has probably excited some surprise that in a city whose population has increased as rapidly as in St. Paul that there is not a larger increase in the school admissions. When, however, we consider that for several years there has been no increase in the number of sittings; that in many districts the schools are overcrowded; that many children can attend but one-half day; that the financial resources have been inadequate for years, we are enabled to account easily for the very heavy enrollment in the parochial schools. Aside from this, however, children are often withdrawn from school for no good reason whatever. The law of cumpulsory attendance keeps children under a certain age out of employment, but it does not keep them in school."[4]

In none of the other reports at hand from the cities in the above list is there any comment or explanation touching the matter under consideration. It is plain, therefore, that it is impossible to find a single efficient cause by the process of combining reasons given from many sources. It is necessary to recur to the statistics and seek for probabilities.

The following hypotheses might suggest themselves as possible explanations:

1. Loss of favor on the part of the public for the common schools. Combined with increased prosperity this would result in the withdrawal of pupils from the public schools for the purpose of going to private institutions.

2. Unusual prevalence of contagious disease. The natural result of this, of course, would be to lessen all school attendance.

3. General withdrawal of pupils to go to work. The return of "good times" has brought increased opportunity for employment, without doubt. If numbers of children are withheld from school for the purpose of adding to the family earnings the effect on the enrollment would soon be apparent.

4. A check in the growth of the cities themselves. If the tide of migration were turned from the cities and if the clientage of the schools cease to increase, the schools themselves must perforce remain stationary.

No one familiar with the attitude of the people toward the public-school system would admit for a moment the correctness of the first hypothesis. There is no evidence whatever that the schools have suffered in the eyes of the people or that there is less disposition now than at any previous time to patronize them. The statistics of private schools show a slight gain, it is true, as compared with public schools, but the difference is insignificant, amounting to only one-fifth of 1 per cent

[1] Forty-fifth Annual Report of the Board of Education of St. Louis, Mo., 1898-99, p. 42.

[2] Annual Report of the Board of Education of Omaha, Nebr., 1898-99, p. 34.

[3] Report of the Board of Trustees of Public Schools of the District of Columbia, 1898-99, p. 239.

[4] Forty-first Annual Report of the Board of School Inspectors of St. Paul, Minn., 1898-99, p. 18.

(i. e. from 18.7 to 18.9 per cent of the whole enrollment), and the rate of growth of the private institutions was, like the public schools, considerably less than in previous years. The first hypothesis may be dismissed at once as unreasonable.

As to contagious and infectious diseases, these prevail to some extent in all parts of the country every year, but so far from increasing, it is more likely that the constant tendency is toward improvement. Any disease that is communicable is preventable, and the means of prevention are constantly becoming better and more generally known. Methods of treatment also show steady improvement, and a reasonable presumption based upon the general progress of medical science is that the average duration of illness from any disease, in case of recovery, becomes less and less. This does not imply that the necessary course of a disease is shortened, but that its virulence is lessened and that in a growing proportion of cases serious sequelae are prevented. The effect of contagion upon school enrollment and attendance in the country as a whole may be assumed to be of less importance from year to year. There has been no general epidemic of any sort during the past twelve months and the supposition that disease is responsible for any general lack of school enrollment is plainly without foundation in fact.

The next hypothesis seems to be based on more reasonable grounds, and it is probable that many children and youths are now at work who would be in school in less prosperous times. Whether the number is proportionally considerable is the question. The value of education receives ever increasing recognition, and parents are more and more reluctant to take their children from school before they have finished the course. The steady growth of high schools has proved that to be true. The tendency is increasing to keep the children in school as long as possible, and if any are taken out to go to work the oldest are naturally the first taken. The compulsory attendance laws operate to the same effect; in large proportion of the cities children are required to attend school till they are 14 years old. Losses on account of employment, therefore, would be most noticeable in the higher grades, and if such losses reach considerable proportions the high school would suffer conspicuously. But this has occurred in very few places. In all the cities named below, excepting seven, high schools have grown at a greater rate than the elementary schools. Actual losses in high-school enrollment are reported in seven cities only; except in St. Louis and Minneapolis those losses were small and in the latter city, certain changes in the high schools themselves presumably caused the falling off.

The following table shows the differences in high-school enrollment in 1897–98 and 1898–99:

a High schools recently established.

In places in which the growth of high schools has been disproportionately large, like Washington, Detroit, Kansas City, and Philadelphia, it is reasonable to infer that the schools have not suffered seriously from extensive withdrawals for the purpose of employment. In regard to other places like San Francisco, St. Louis, and Omaha, the opposite was probably true, though other circumstances may have been influential to bring about the same result.

In regard to the growth of cities in the last year, the only evidence we have is the annual school census and the city directories. But the school census is not taken every year in a great many cities, and the directories are not official and at the best merely furnish the basis for estimates of doubtful value.

The following table shows the result of school censuses which appear to have been made by actual count and which do not show discrepancies on their face:

TABLE 4.—*Statistics relating to growth of cities of over 100,000 inhabitants.*

a Census of May, 1898. b Census of September, 1899. c In 16 months.

In explanation of the blanks in this table, it may be said that some of the cities have no school census, others report the same figures for both years, and in still others the differences in numbers are so great as to show palpable error.

If the school census be correct, the proportion of increase or decrease in the number of children may be justly taken to represent approximately the proportion of change in total population. Three of these cities therefore appear to have lost ground—namely, Omaha, Jersey City, and Philadelphia.[1] St. Louis may be placed in the same category on the evidence already presented. Louisville, Kansas City, Newark, and Milwaukee remain practically unchanged from the previous year, though with slight gains. The growth of Indianapolis, Detroit, Brooklyn, and Cleveland was far below the normal for those cities, respectively. Only San Francisco, Boston, Cincinnati, and Providence—4 cities out of 15—show the accustomed increase, according to the figures reported.

The conclusion is plain. The cities themselves have not grown, and consequently the schools have not. A number of interesting questions arise in this connection, economic as well as educational. To discuss them would lead far beyond the limits possible here.

In matters depending upon the action of school authorities there have been increases considerably greater than in attendance and enrollment. The authorities have done their part better than the patrons, in other words, and provision was made for pupils who did not come. For 82,177 additional pupils in attendance, 134,516 more seats were provided, and 4,290 more teachers were employed.

The amount spent for supervision and teaching increased nearly 7 per cent, and the average amount paid to each person of the teaching force, $638.35, was greater than in any previous year; it exceeded the average of 1897–98 by $9.47.[2] This increase in the wages of teachers has run up the average cost of instruction to 10.11 cents a day per pupil. In Cheyenne, Wyo., the cost is over 15 cents a day, and in Washington, D. C., and in the cities of California the average is nearly as high. Oklahoma City and the South Carolina cities, with an average of 4.26 cents, are the lowest in the list.

Female teachers continue to supplant men; their increase in numbers this year amounted to 5.53 per cent, while the male teachers increased 4.96 per cent. Of 82,650 teachers in city schools, only 6,302 are men, and the high schools have the greater part of them. Women are also rapidly gaining ground in the supervising positions, and now hold nearly as many of them as men do. Of 161 new places of this kind during the last year, 157 were given to women. There are not many women superintendents yet, but they are in the decided majority as supervisors of special branches and of primary schools.

In buildings the tendency is toward larger, more durable, and more expensive structures. The average size has varied but little in the last eight years. Though a great many very large buildings have been erected, the number of small ones necessary has been sufficient to keep the average of capacity below 400. It has always been a serious problem how to provide for the pupils that have become too numerous for the existing building in a certain locality, yet not numerous enough to justify a new house of the standard size. It has ordinarily been necessary to submit to overcrowding for a time, or else to "build for the future" and have a new building only partly filled for two or three years. Milwaukee and St. Louis have dealt with the problem in a satisfactory manner by the use of temporary wooden structures that are said to serve their purpose admirably. They are described in another chapter of this Report.

The greater cost of modern construction and the advancing values of city real

[1] In Philadelphia the census of 1899 was taken during the summer months, and Superintendent Brooks thinks the decrease may have been due to that fact.

[2] See page 1475 for discussion of average salary of teachers.

estate is shown by the heavy increase in the value of school property, the greatest increase in the entire list. The average value per capita of pupils in average attendance is now $106.65, the highest figure yet reached.

TABLE 7.—*Comparative statistics of cities containing over 8,000 inhabitants, summarized by States, etc.*

Cities of—	Ratio of private school enrollment to enrollment in all schools, public and private.	Ratio of average attendance to enrollment (public schools).	Average number of days' attendance of each pupil enrolled.	Average length of school term.	Average number of pupils in attendance to each teacher.	Average number of teachers to each supervising officer.	Average number of seats for each 100 pupils in attendance.	Average number of seats to a building.	Value of school property per capita of pupils in average attendance.	Cost of teaching and supervision per capita of pupils in average attendance.	Total cost of schools per capita of pupils in average attendance.	Average cost per day of tuition for one pupil.	Average daily expenditure per pupil for all purposes.

TABLE 8.—*Summarized statistics of schools in cities of over 8,000 inhabitants from 1890-91 to 1898-99, inclusive.*

Cities of—	Number of city school systems.	Enrollment in public day schools.	Aggregate number of days' attendance of all pupils.	Average daily attendance.	Number of supervising officers.	Number of teachers.			Number of school buildings.	Number of seats or sittings for study.	Value of public property used for school purposes.	Expenditure for supervision and teaching.	Expenditure for all purposes.	Enrollment in private and parochial schools (largely estimated).

TABLE 9.—*Comparative statistics of city school systems from 1891-92 to 1898-99, inclusive.*

Cities of—	Ratio of private school enrollment to enrollment in all schools, public and private.	Ratio of average attendance to enrollment (public schools).	Average number of days' attendance of each pupil enrolled.	Average length of school term.	Average number of pupils in attendance to each teacher.	Average number of teachers to each supervising officer.	Average number of seats for each 100 pupils in attendance.	Average number of seats to a building.	Value of school property per capita of pupils in average attendance.	Cost of teaching and supervising per capita of pupils in average attendance	Total cost of schools per capita of pupils in average attendance.	Average cost per day of tuition for one pupil.	Average daily expenditure per pupil for all purposes.

CHAPTER XXXVII.

INSTITUTIONS FOR HIGHER EDUCATION.

During the year 1898–99 the following-named institutions were reported as having suspended operations: Bailey Springs University, Bailey Springs, Ala.; Villa Ridge College for Young Ladies, Pewee Valley, Ky.; Stone College for Young Ladies, Meridian, Miss.; Kansas City Ladies' College, Independence, Mo.; Fairfield College, Fairfield, Nebr.; Granville Female College, Granville, Ohio; and Duquesne College, Pittsburg, Pa. Six institutions were transferred to the list of secondary schools, one to the list of normal schools, and one to the list of commercial schools.

CHANGES IN COURSES OF STUDY.

Arkadelphia (Ark.) Methodist College.—Course of study has been raised one year.

Throop Polytechnic Institute, Pasadena, Cal.—Established department for training teachers of domestic science.

Seminary West of the Suwanee River, Tallahassee, Fla.—Standard has been raised two years; Greek and Latin required for A. B. degree; B. S. course added; requirements for entrance to college raised.

Georgia School of Technology, Atlanta, Ga.—Established a textile department for instruction in the manufacture of cotton goods.

Bowdon (Ga.) College.—Added a school of pedagogy.

Le Grange (Ga.) Female College.—A new course of study leading to the B. L. degree.

Emory College, Oxford, Ga.—Established a department of pedagogy.

Armour Institute of Technology, Chicago, Ill.—A new course in civil engineering.

University of Notre Dame (Ind.).—Courses in history and economics, architecture, and journalism added.

Rose Polytechnic Institute, Terre Haute, Ind.—Organized a course in architectural engineering.

College of Emporia (Kans.).—Added a scientific course and a department of pedagogy.

University of Kansas, Lawrence.—A new four years' course in mining engineering.

Bethany College, Lindsborg, Kans.—College and normal courses accredited by State board of education.

Hope College, Holland, Mich.—Established a chair of pedagogy and will give a full course in this branch which will entitle students to a State certificate.

Newark (N. J.) Technical School.—Established a course in electroplating.

Irving Female College, Mechanicsburg, Pa.—A new course in sociology and economics.

Central High School, Philadelphia, Pa.—Established a department of commerce in September, 1898.

College of Charleston (S. C.)—Added department of history and economics

Fredericksburg (Va.) College.—Courses in history and English enlarged.

New buildings.

Institutions.	Purpose.	Cost.

THE DEGREE OF ASSOCIATE.

During the year 1898–99 the trustees of the University of Chicago voted to confer the title or degree of Associate upon those students who finish the work of the junior colleges (freshmen and sophomore years). The reasons which led to this action are stated as follows in the president's report for 1898–99:

From the point of view of the student, the following considerations have had influence in determining this action: (1) The fact, very generally recognized, that no important step is taken at the end of the preparatory course. The work of the freshman and sophomore years in most colleges differs little in content and in method from that of the last year of the academy or high school, except that it is somewhat more advanced; but, on the other hand, (2) at the end of the sophomore year a most important change occurs according to the organization of the larger number of institutions, for it is at this point that the student is given larger liberty of choice, and at the same time higher methods of instruction are employed. For the last two years of college work the university spirit and the university method prevail. A new era in the work of the student has begun. (3) It is evident that many students continue work in the junior and senior years of college life whose best interests would have been served by withdrawal from college. Many continue to the end, not from choice, but rather from compulsion, because of the disgrace which may attend an unfinished course. If it were regarded as respectable to stop at the close of the sophomore year, many would avail themselves of the opportunity. (4) Many students who might be courageous enough to undertake a two years' college course are not able, for lack of funds or for other reasons, to see their way clear to enter upon a four years' course. Many, still further, feel that if a professional course is to be taken, there is not time for a four years' college course. It is for this reason that, in part, our professional schools are made up so largely of noncollege students. If a student who had in view ultimately the medical or legal or pedagogical profession could make provisions to finish a course of study at the end of two years, he would be much more likely to undertake such a course than the longer four years' course. (5) On the other hand, many students who are thus led to take a two years' course would be induced at the end of that time to continue to the end of the fourth year, and in this way many students of the very highest character, at all events, would be enabled to take the entire college course by whom, under the present arrangements, such a course would be regarded as impracticable.

From the point of view of the student the following points have been considered: (1) Many academies are able to do, at least in part, the work of the freshman and sophomore years. The high schools in some States are ready to do such work, and in at least one State the university of the State recognizes the work of the freshman year when performed in approved high schools. (2) It can not be denied that until young men or young women have shown some maturity of character it is wise that they should not be sent very far away from home. If, now, the academies and high schools could so perfect their work that freshman and sophomore courses might be offered, many young people would be enabled to pursue their education at least to this higher point. (3) A large number of so-called colleges, which have not sufficient endowment to enable them properly to do the work of the junior and senior years, should limit their work to that of the freshman and sophomore years. In many cases the officers of these colleges recognize most keenly that they are not doing justice to the students in the higher classes. In reality they are defrauding the students who pay their fees in lower classes in order to obtain a meager sum of money with which to provide an entirely inadequate course of instruction for the higher class of men. These institutions, in many cases, would be disposed to limit their work to the lower field if it were made possible for them to do so. They find it necessary, however, to give a degree. If they could follow the example of a large institution and give an appropriate recognition of the work of the lower years, they would be ready to adopt such an arrangement. (4) It is a general law of educational work that in seeking a college students rarely go farther away from home than 100 miles. Ninety per cent of all the students in American colleges are to be found in colleges which are within 100 miles of home. If a fair proportion of these institutions were to limit themselves to the work of the freshman and sophomore years, at the end of this time the students who had finished this work and desired to continue would be compelled to go away from home to some distant institution, perhaps a large university, in which library and laboratory facilities might be found, which would make possible the doing of good work. If, on the one hand, the academies and high schools were elevated, and if, on the other hand, the scope of work done by many

colleges were limited and, as a result, institutions developed which would do that work thoroughly, there would come to be a recognized distinction between college and university which does not now exist.

In order, therefore, to encourage a movement in the direction thus mentioned, the proposed degree has been established. It is believed that the results will be fivefold: (1) Many students will find it convenient to give up college work at the end of the sophomore year; (2) many students who would not otherwise do so will undertake at least two years of college work; (3) the professional schools will be able to raise their standards for admission, and in any case many who desire a professional education will take the first two years of the college work; (4) many academies and high schools will be encouraged to develop higher work; (5) many colleges which have not the means to do the work of the junior and senior years will be satisfied under this arrangement to do the lower work.

RATIO OF STUDENTS TO POPULATION, 1872-1899.

The following tabular statement, giving the number of students in higher education to each 1,000,000 persons in the United States from 1872 to 1899, shows a very substantial increase for each class of students represented. As would naturally be expected, by far the greatest increase is shown in the column devoted to graduate students, the ratio having increased from 5 students in 1872 to 74 in 1899. The first column of students includes all undergraduate, collegiate, and technical students in universities and colleges for men and for both sexes, in colleges for women, Division A, and in schools of technology:

Number of students in higher education to each 1,000,000 persons from 1872 to 1898-99 (based on the number of students in the colleges of the United States).

Year.	Undergraduate collegiate and technical students.	Graduate students.	Law students.	Medical students.	Theological students.	Total.
1872	573	5	49	142	83	852

STATISTICAL REVIEW, 1898-99.

Students.—The total number of students reported in collegiate, graduate, and professional departments of institutions for higher education and in professional schools for the year 1898-99 was 147,164, of which number 43,913 were enrolled as professional students in law, medicine, and theology, leaving 103,251 students reported as pursuing studies in the liberal arts and applied science. The classifi-

cation of students according to the courses of study pursued is not given by all of the institutions reporting to this office. The number of undergraduates pursuing various courses, so far as reported, is as follows:

Classical courses	35,595
Other general culture courses	21,860
General science courses	9,858
Agriculture	2,593
Mechanical engineering	4,376
Civil engineering	2,550
Electrical engineering	2,320
Mining engineering	1,032
Architecture	627
Pedagogy	9,501
Business	6,698

Degrees.—The number of degrees conferred during the year was as follows:

Degrees conferred for work done.

Degrees.	On men.	On women	Degrees.	On men.	On women
A. B	4,910	1,950	E. E	58	0

Property.—The total value of property possessed by institutions for higher education amounts to $342,888,361, a gain of about $31,000,000 over the amount for 1897–98. The endowment funds amount to $154,120,590, and the remainder represents the value of grounds, buildings, machinery, apparatus, libraries, etc., used for instruction and research.

Income.—The total income for the year, excluding benefactions, amounted to $27,739,154, derived from the following sources:

Tuition and other fees	$10,924,415
Endowment funds	6,673,389
State and municipal appropriations	4,287,102
United States Government	3,276,731
From other sources	2,577,517
Total income	27,739,154

Benefactions.—The value of gifts and bequests reported as having been received during the year amounts to $21,925,436. The amounts reported by some of the institutions are as follows:

University of California	$757,000
Leland Stanford Junior University	11,000,000
University of Chicago	786,624
Harvard University	1,544,330
Columbia University	518,667
University of Pennsylvania	510,658
Armour Institute of Technology	750,000

REQUIREMENTS FOR THE DEGREE OF DOCTOR OF PHILOSOPHY.

According to the reports for the scholastic year 1898–99 received from the universities and colleges of the United States, the degree of doctor of philosophy was conferred during the year on 336 persons. Of this number 325 persons were granted the degree for work done under the direction of the several institutions, and the honorary degree was conferred on 11 persons. The institutions that conferred the Ph. D. degree during the year, together with the number of men and women upon whom the degree was conferred, as reported to this office, are as follows:

Ph. D. degree conferred in 1898–99 on examination.

Grove City (Pa.) College	5

The 325 degrees conferred for work done were granted by 48 different institutions in 21 States. A number of the institutions included in the foregoing list and conferring the Ph. D. degree do not provide instruction leading to that degree, but allow students to pursue the prescribed courses in absentia and to pass examinations at their homes under the supervision of a sentinel. With the exception of the institutions offering nonresident courses of study the general requirements for the Ph. D. degree may be stated as follows:

1. The candidate must have a bachelor's degree from a reputable college or university or must show that he has pursued a course of study equivalent to that for which the bachelor's degree is conferred. Each institution determines for itself as to the fitness of the candidate to become an applicant for the degree.

2. A knowledge of French and German sufficient for purposes of investigation. A reading knowledge of these languages is generally deemed to meet the requirements.

3. The pursuit of advanced study and research at some acceptable institution for not less than two years (in most cases not less than three years), the last of which must be spent in residence at the institution by which the degree is to be conferred.

4. The studies pursued must consist of one major or principal subject and, as a rule, two minor or subsidiary subjects.

5. A thesis upon some approved subject connected with the major or principal subject, which must give evidence of the candidate's ability to do original work, must be a contribution to human knowledge and must be accepted by the faculty. Some of the institutions require the thesis to be printed (or its printing guaranteed) before the degree can be conferred.

6. Examinations in all the studies pursued by the candidate.

7. The degree is given not for the mere reason of faithful study for a prescribed time or in fulfillment of a determinate programme, nor for miscellaneous studies,

but on the ground of long study and high attainment in a special branch of learning.

While the foregoing may be stated as the general requirements for the Ph. D. degree, there are, of course, some exceptions thereto. In the following pages are given the requirements (omitting minor details) for the degree as shown by the catalogues of 72 institutions. The requirements are not given in as detailed form as they appear in the catalogues, but have been condensed as much as possible.

University of California, Berkeley, Cal.—A candidate for the degree of doctor of philosophy must hold a bachelor's degree from one of the colleges of general culture of this university, or must have pursued successfully a course of study equivalent to that represented by such a degree. A knowledge of Latin equal to that admitting to the college of letters of this university, and a reading knowledge of French and German will be insisted on in all cases. A course of study must be selected by the applicant and approved by the graduate council, embracing one principal and two subsidiary subjects, and extending over a period of at least three years, one of which ordinarily must be spent in continuous residence at this university; but in cases where continuous residence is impossible, the course of study must be extended to four years, and the separate periods of residence must together amount to three academic half years. A thesis bearing on the principal subject of the course, and of such a character as to show power to prosecute independent investigation, must be presented to the graduate council for approval at least three months previous to the final examination for the degree. Special emphasis will be laid upon this last requirement, and the degree will in no case be given merely for the faithful completion of a course of study however extensive.

The division of time, study, and research among the principal and subsidiary subjects must be approved by the subcommittee in charge of the student; but, ordinarily, at least a fourth of the candidate's work should be given to each one of the subsidiary subjects.

Every candidate must present a detailed written report, signed by the instructors, of the studies actually pursued during the year, and must furnish evidence that the work has been of proper quality and scope.

The degree will not be conferred until the candidate has passed before the subcommittee in charge a special examination, public and oral, upon the studies pursued, and thereby shown distinguished attainments in the principal subject.

One hundred and fifty copies of each accepted thesis must be deposited in the university library. (Register, 1898-99.)

Leland Stanford Junior University, Stanford University, Cal.—The degree of doctor of philosophy is conferred upon graduates of this university, and upon others who have had an equivalent training elsewhere, on the satisfactory completion of at least three years of graduate work beyond the baccalaureate requirements of the department in which the degree is sought, under the following conditions:

The degree is given only on the ground of advanced scholarship and the ability to do independent work in some special line, and not for merely faithful study for a prescribed time or course, nor for miscellaneous study. Three years represent the minimum time in which the degree can be obtained, and often a longer period of study will be necessary.

Graduate work done elsewhere may be accepted in place of resident study in this university; but in no case will private study without sufficient guidance, or pursued at a distance from libraries or laboratories or other necessary facilities, be accepted as an equivalent, and no degree will be granted to any person who has not spent at least the last year of such study in residence at this university.

The course of study shall embrace one major subject and one or two minors in related departments. The minor subject or subjects shall represent approximately one-third of the course of study, except that such minor subjects may be waived on the recommendation of the department in which the major subject is taken and with the approval of the faculty, whenever the general preparation or special needs of the candidate make such a course seem desirable.

The candidate must present a thesis of such a character as shall display power of original and independent investigation and constitute an actual contribution to knowledge. He must guarantee the printing of the thesis within one year after the degree is conferred, and must deposit 100 copies in the university library.

The candidate must sustain such final examinations in major and minor subjects as may be prescribed by the departments in which studies are taken, and also shall

submit to such test or examinations as may be required by the special committee of the faculty.

In addition to the foregoing conditions, the special committee of the faculty will, in general, insist upon the following conditions: (*a*) That all candidates be required to show a reading knowledge of French and German; (*b*) that, whenever practicable, the departmental examinations, in both major and minor subjects, be written, the papers of candidates to be submitted to the special committee prior to the day fixed for the final test before that committee; (*c*) that examinations in minors be held not earlier than the second semester before the time named for conferring the degree. (Register, 1898–99.)

University of Colorado, Boulder, Colo.—For the degree of doctor of philosophy the work assigned shall be estimated at the rate of at least 12 full courses of university work or the equivalent, of which 6 full courses or the equivalent shall be devoted to the major subject, and the remaining 6 courses shall be divided equally between the 2 minor subjects. Additional work may be assigned when lack of previous preparation in any selected subject is indicated.

The criterion of merit is the thesis, which must embody the results of original investigation. The degree is not conferred for mere faithfulness in the acquisition of knowledge; there must also be the power of scientific production. Hence the doctor's dissertation is to be a new contribution to some field of knowledge, and in general will require about one year in the preparation. The thesis must be approved before the final examination is taken. If the candidate shall have sustained himself in his examinations, the dissertation shall be printed by the candidate, and 150 copies shall be delivered to the university library.

The minimum time of resident study for the doctor's degree is three years. Candidates must give evidence of a reading knowledge of French and German. (Catalogue, 1898–99.)

University of Denver, University Park, Colo.—At least one year's actual attendance at the university will be required of candidates for the degree of doctor of philosophy. The rest of the work may be done in absentia. A satisfactory thesis is required from each candidate. (Yearbook, 1897–98.)

Yale University, New Haven, Conn.—Graduates of this and other colleges and universities and (in exceptional cases by special permission) other persons of liberal education, who are at least 18 years old, are received as students. The degree of doctor of philosophy is conferred upon those students who show the results of resident graduate work by a thesis giving evidence of high attainment and power of investigation, and by an examination on studies whose grade and amount meet the approval of the faculty. Under ordinary circumstances two or more years' work in residence will be required, but in exceptional cases work of equal grade at another university may take the place of a year's residence here. The thesis must be deposited at the library for public inspection not later than May 1. A good knowledge of Latin, German, and French is required in all cases, unless, for some very exceptional reasons, the candidate be excused by the faculty. (Catalogue, 1899–1900.)

Catholic University of America, Washington, D. C.—Candidates must—

1. Spend at least three years in resident study subsequent to taking the baccalaureate degree.
2. Fulfill the requirements in a major subject and in two subordinate subjects.
3. Present a dissertation embodying the results of an original investigation.
4. Pass written and oral examinations in his major and minor subjects.
5. Make formal application for the degree at least one academic year in advance of the date at which they expect to present themselves for examination and must, at the time of making such application, prove their ability to read French and German. (Yearbook, 1899–1900.)

Columbian University, Washington, D. C.—Persons holding the degree of M. S., M. A., or their equivalent from institutions of repute are qualified to offer themselves as candidates for the degree of doctor of philosophy. Candidates shall offer themselves in three topics for advanced study—one major and two collateral minor subjects. Before being admitted as candidates they shall pass satisfactory examinations in French and German.

To be eligible for the degree candidates who hold masters' degrees shall pass two years in the study at this university of their major topic and one year in the study of each minor topic; they shall sustain satisfactory examinations upon the three subjects which they may have elected and they shall present theses, accompanied with an exhaustive bibliography, embodying the results of original

research in their major subject, which theses they shall be prepared to defend before a board of experts. (Catalogue, 1898-99.)

Georgetown University, Washington, D. C.—For the degree of doctor of philosophy two years of residence and application to selected and duly authorized graduate courses are required. The candidate must pass a final examination, present a thesis bearing upon his special department of study, and convince the committee appointed by the faculty of his distinguished merit to receive this degree. (Catalogue, 1898-99.)

Hedding College, Abingdon, Ill.—No one will be admitted to the Ph. D. course who has not received the degree of A. B., B. L., B. S., or Ph. B. from Hedding College or some institution requiring equal work for the bachelor's degree. A candidate may pursue 6 units from one course, or he may select, subject to approval, 3 units from each of two courses, or 3 units from one course, 2 from a second, and 1 from a third course. The thesis must be based on the subject from which at least 3 units are selected. One year's residence is required. The rest of the time may be spent in study in absentia. To meet the requirement of residence the candidate must arrange to visit the college at least one day of each week for class work under the personal supervision of the head of the department in which 1 unit of his work lies, and he must complete during the year the work of that unit. Candidates for the master's and doctor's degrees will present a thesis of 5,000 words for each degree. The candidate for the doctor's degree who does not take the master's degree must present the first thesis on completion of his third unit. Examinations may be taken in absentia under the supervision of a sentinel nominated by the candidate. No person will be permitted to receive the degree until at least three years after matriculation, unless having credits for work done in residence here or elsewhere, and at each examination occurring during this period (twice a year) a portion of the studies must be taken. (Announcement of the graduate and nonresident courses, December, 1898.)

Illinois Wesleyan University, Bloomington, Ill.—Offers nonresident courses leading to the Ph. D. degree. Candidates must have received the degree of A. B., B. L., B. S., or Ph. B. from this university or some institution requiring equal work for the bachelor's degree. Applications of persons with other degrees will be specially considered. The candidate may select 6 units from one course, or, with the approval of the head of the department, 4 units from one course and 2 from another. The course from which the 4 units have been chosen shall constitute his major study, and his thesis must be prepared on a subject connected with this. The thesis must contain not less than 5,000 words and must show originality, careful research, and good literary taste in composition and arrangement. Examinations are held twice a year under the supervision of sentinels nominated by the candidates. The final examinations are held at the university, the oral in the presence of the faculty. The degree will not be conferred until at least three years after matriculation, unless having credits for graduate work done in residence here or elsewhere, and at each examination occurring during this period a portion of the studies must be taken. (Announcement of the Graduate and Nonresident Department, 1898.)

University of Illinois, Champaign, Ill.—The degree of doctor of philosophy, or doctor of science, may be conferred upon any member of the graduate school of not less than three years' standing who shall have reached high attainments in scholarship, including a sufficient knowledge of the Latin, French, and German languages to serve the purposes of research in his principal specialty, who shall have shown marked ability in some line of literary or scientific investigation, and shall have presented a thesis giving clear indications of such scholarship and of such power of research. At least the first two, or the last one, of the three years of study must be in residence at the university, and the entire course of study must be in accordance with the regulations of the graduate school.

The time and study required for a master's degree may be included in the three years required, but approval of a course of study for a doctor's degree must be upon the condition that the candidate is prepared, through his baccalaureate work or otherwise, to enter at once upon advanced studies in the line of this major subject, and that work on this major subject be continued through the three years.

The final examination covers the subjects of the course approved for the degree, but is specially searching upon that on which the major work has been done. If the thesis is approved, the candidate must have it printed and must deposit not less than 100 copies with the librarian of the university. (Catalogue, 1898-99.)

University of Chicago, Chicago, Ill.—Any member of the graduate schools who has been in attendance one quarter or more, whose undergraduate course is equivalent

to that required for a bachelor's degree in the University of Chicago, whose thesis subject has been accepted by the principal department, and who has a reading knowledge of French and German (which must be certified by the heads of those departments), may, on recommendation by the principal department in which he wishes to work, be enrolled, by vote of the faculties of the graduate schools, as a candidate for the doctor's degree.

Students thus accepted as candidates will be given the doctor's degree on the fulfillment of the following requirements: (*a*) At least three years of resident study at the university in pursuance of an accepted course of study; (*b*) a satisfactory final examination upon the work done in preparation for the degree; (*c*) the presentation of a satisfactory printed thesis upon a subject which has been approved by the head of the department in which the principal part of the candidate's work has been done; (*d*) a good command of literary expression and such knowledge of subjects considered fundamental as may be prescribed by the several departments; (*e*) candidates for the degree of doctor of philosophy may not take more than two-thirds of their work in one department, and may not take work which is to count toward the degree in more than three departments.

Graduate work done in another university will be accepted as resident work in the University of Chicago, provided that (*a*) the institution in which the work was done is of high standing, and (*b*) sufficient evidence is furnished that the particular work was satisfactorily performed. Work done in other universities will not ordinarily count for more than one and one-half years of resident work in the university; but the degree of doctor of philosophy may in exceptional cases be granted after one year of residence.

From candidates for a doctor's degree the university accepts substitutes to a limited extent for the specified work required for the bachelor's degree in the university.

In the graduate schools of the university nonresident work may be substituted for resident work under the following conditions: (*a*) The nonresident student is expected to matriculate at the university and to spend the first year of the time required for the degree in residence, unless he is able to satisfy the head of the department in which his principal work is to be done that he can do the introductory work in a satisfactory manner when not in attendance; (*b*) the nonresident work shall be performed under the general direction of the head of the department; (*c*) the final examination in all work leading to the degree shall be passed at the university; (*d*) nonresident work will be accepted for only one-third of the work required for a degree; (*e*) a much longer period of time is usually required to accomplish a given amount of work when a student is not in residence than when in residence. (Register, 1898–99.)

Northwestern University, Evanston, Ill.—The degree of doctor of philosophy will be conferred under the following conditions:

1. The candidate must have received the bachelor's degree from this institution or from some other of accepted standing.

2. The degree may be conferred on successful candidates after three years of graduate study, of which at least two must be in residence. The last year or the first two years of the three required must be spent in residence at this university. The period of three years may, however, be shortened in the case of students who, as undergraduates, have pursued special studies beyond the requirement for major work in the direction of their proposed graduate work. Study for any specified time will not be regarded as sufficient ground for conferring the degree. High attainments in scholarship and evidence of original investigation will be expected.

3. Two-thirds of the candidate's time must be given to advanced work in some one department which shall constitute his primary subject. The remaining time must be given to either one or two secondary subjects. The requirement, "advanced work," will imply an amount of preliminary study in the given subject equivalent to at least the undergraduate "major work" of the department concerned.

A reading knowledge of French and German, as a preliminary qualification, will be required of all candidates. In exceptional cases an equivalent in Latin, Greek, or Hebrew may be accepted instead of French.

4. Every candidate must present a thesis upon an approved topic pertaining to his primary subject. The thesis must give evidence of original investigation. If the thesis is approved, the candidate must, within such time as shall be designated, present 25 printed copies of the thesis to the university library. The final examination will be both written and oral and will cover the entire primary subject, including the topic of the thesis.

Each branch of the secondary subject may be completed whenever the candidate shall pass a satisfactory written examination upon it.

The following joint requirements have been made by the College of Liberal Arts and Garrett Biblical Institute for the attainment of the degree of doctor of philosophy by students in theology:

1. The candidate for the degree of Ph. D. must have completed a bachelor's course, the sufficiency of which has been accepted by a joint committee of the faculty of the institute and the faculty of liberal arts.

2. He must have completed two full years of theological study, either in the Garrett Biblical Institute or in another theological school of recognized high standing.

3. He must be accepted as a candidate for the degree of Ph. D. by a vote of the faculty of the institute and be registered as a candidate for such degree with the registrar of the College of Liberal Arts, after which he must continue in residence at least two years and complete the work of two full years. Of this work two-thirds must be taken in one department of the institute—the department in which the candidate does his primary work. The remaining third may be taken in not more than two departments of the institute or of the graduate school of the College of Liberal Arts. The whole course of study selected will be subject to the approval of the faculty of liberal arts, through its committee on graduate study. During the two years of his residence the candidate will be subject to the direction of the head of the department in which his primary work is taken.

Of the four years required as a minimum for the degree of Ph. D., three at least must be spent in residence at a theological school of high standing and the last two at Garrett Biblical Institute.

4. A reading knowledge of French and German, as a preliminary qualification, will be required of all candidates. In exceptional cases a reading knowledge of Latin, Hebrew, or Greek may be accepted in lieu of French, at the option of the faculty of liberal arts.

5. Each candidate must present a thesis prepared by him upon some topic related to his primary subject. The thesis must give evidence of original investigation. A year prior to the final examination the subject of the thesis must be approved by the professor under whom the primary work is performed and three months before the final examination it must be submitted to him for criticism. If the thesis is approved, the candidate must, within a time designated, present 25 printed copies to the university library.

6. The final examination will be both written and oral, and will cover the entire primary subject, including the topic of the thesis. Each branch of the secondary subject may be completed whenever the candidate shall pass a satisfactory written examination upon it.

7. The College of Liberal Arts shall always be represented on the committees for examining theses and candidates.

8. Graduate students in the College of Liberal Arts will be admitted to the graduate courses in Garrett Biblical Institute free of charge for tuition or incidentals. (Catalogue, 1898-99.)

Northern Illinois College, Fulton, Ill.—Nonresident graduate courses leading to the degree of doctor of philosophy are offered to persons who can furnish satisfactory evidence of having completed a regular college course or its equivalent in some approved institution of learning. Upon the successful completion of the course, a thesis upon some subject bearing upon some branch of the work and approved by the faculty, containing at least 5,000 words, will be required, and upon proving satisfactory the degree will be duly granted. The examinations may take place where the student resides or he may come to the college. If taken at home the examination is taken in the presence of an examiner chosen by the student. The papers are examined at the college. No time is set for the completion of the course. (Catalogue, 1897-98.)

Lake Forest University, Lake Forest, Ill.—The degree of doctor of philosophy is open to graduates of colleges of good standing, and also to those who can give proof that their attainments are equal to those of graduates of Lake Forest College. A reading knowledge of French and German is also required. Every candidate should choose a principal subject, and also, in conference with the professor in charge of the chosen subject, two subordinate subjects. The work must extend over at least three years, which must be spent at the university. Graduate work done in other universities may be accepted as meeting the requirements in part; and, provided the faculty be satisfied that the candidate possesses the necessary facilities for independent research, a course of nonresident study extending over a period of not less than two years may be substituted for one year in residence. Yet in all cases two years at least must be spent in this university. The place of examinations will in all cases be Lake Forest; their number and mode will be determined by the professor in charge. The final examination, which is designed to cover the main topics of the whole course of study, will be conducted in pres-

ence of the faculty by a committee of the same. Before the final examination the candidate must present a thesis, either type written or printed, to be approved by a committee of the faculty, and before the diploma is granted 50 printed copies of the thesis shall be put at the disposal of the faculty. As the object of the whole course is the higher intellectual development, no candidate can be successful who does not show power of original investigation. (Catalogue, 1898–99.)

McKendree College, Lebanon, Ill.—Students doing graduate work leading to the master's degree, as also that of doctor of philosophy, must hold bachelor's degrees from this institution or some other whose courses of study are equivalent to those of McKendree College. A master's degree, corresponding to the bachelor's degree held by any candidate, will be conferred upon the student who successfully pursues the required course of study for one year, and presents a satisfactory thesis of not less than 4,000 words upon some fitting and accepted theme.

Those pursuing the course an additional year, upon passing the required examinations and presenting theses which must give evidence of independent research in like manner as required for first year, if they show a sufficiently high degree of scholarly attainment, may receive the degree of doctor of philosophy. It is to be understood that the degree is not given for the mere reason of faithful study for a prescribed time, or on completion of any given course of study, but on the ground of long study and high attainments in a special branch of learning. All candidates for degrees must stand personal examination at the seat of the institution, where they shall spend not less than three months of the year prior to graduation in resident study. (Catalogue, 1898–99.)

Indiana University, Bloomington, Ind.—The degree of doctor of philosophy may be conferred upon graduates of this university, or of any institution of similar character and rank, upon the completion of an advanced course of study of not less than three years, at least one of which must be spent in residence at this university. If the candidate has taken his bachelor's degree in another institution, he must spend at least two years in graduate work at this university. In either case the remaining time may be spent in graduate work at any other university or universities acceptable to the committee on advanced degrees.

The course of study must be pursued under the direction of the committee on advanced degrees, and its value shall be determined by a final examination and by the presentation of a satisfactory thesis embodying original work upon some prescribed or accepted subject. In each case a detailed statement of the work done by the candidate is required. (Catalogue, 1898–99.)

Wabash College, Crawfordsville, Ind.—The degree of doctor of philosophy may be conferred three years after graduation upon the alumnus of any college who has previously taken the degree of A. B. or Ph. B., and who shall have devoted two of the years to study in this college under the care of the faculty, pursuing at least two graduate courses of study, taking a prescribed course of special reading, and who shall present in print a thesis giving evidence of original research and high attainments. (Catalogue, 1898–99.)

Hanover College, Hanover, Ind.—The degree of doctor of philosophy will be conferred upon teachers of known attainments and persons engaged in special scientific pursuits upon ascertained merits. At the same time, persons desiring to make application for the degree may do so, and if it is thought expedient, courses of study or theses leading to the degee will be assigned. (Catalogue, 1898–99.)

Taylor University, Upland, Ind.—Offers nonresident courses of study leading to the Ph. D. degree. The degree is conferred at the end of the third year of study. Printed lists of examination papers are furnished, and the examinations must be conducted in the presence of some minister, teacher, or other person nominated by the student and approved by the faculty. The thesis required for the degree must contain not less than 5,000 words. (Special circular, 1899–1900.)

State University of Iowa, Iowa City, Iowa.—The degree of doctor of philosophy will be granted under the following conditions:

The candidate must have received the bachelor's degree either from this institution or from some other of equal rank; he must present evidence of having completed a satisfactory amount of undergraduate work in the subjects proposed for investigation for this degree; he must possess a knowledge of French and German at least sufficient for purposes of research.

At least three years of graduate study will ordinarily be required, of which two must be in residence and the last year prior to receiving the degree must be spent at this university. In making formal application for the degree the candidate shall select one major study and one or two minors; the minor study or studies

shall be closely allied to the major and shall be such as with it to constitute but one single field of research. The application of the candidate, setting forth the line of research proposed, shall be approved and indorsed by the professor or professors under whose direction it is proposed to prosecute the work.

On completion of his work the candidate shall submit to the faculty a formal dissertation which shall not only exhibit evidence of original research but shall in itself be a contribution to the sum of human knowledge. The dissertation must be in acceptable literary form, although for acceptance it will depend chiefly upon its subject-matter. In case the dissertation offered is accepted and the candidate passes satisfactorily the examinations he shall, prior to receiving his degree, deposit with the librarian of the university 25 printed copies of the dissertation. The candidate must pass an examination in form both oral and written. (Catalogue, 1897-98.)

College of Emporia, Emporia, Kans.—Courses of graduate work leading to the degree of Ph. D. are offered in the following departments: Philosophy, Greek, Latin, English, and German. Candidates must present diplomas from this or other institutions of similar grade covering the usual college requirements in the studies to be pursued. In cases where residence at the college is precluded, the work may be done in absentia. Examinations other than final may be taken in absentia under the supervision of a third party acceptable to the professor conducting the test. Candidates must complete a major and a minor course amounting to three years' work. A thesis, approved by the faculty, must be submitted at least one month before the final examination, 100 copies of which shall be printed at the candidate's expense and become the property of the college. (Register, 1898-99.)

University of Kansas, Lawrence, Kans.—The degree of doctor of philosophy will be granted on the ground of advanced scholarship and the performance of independent work in some special line, under the following conditions:

1. The candidate must be a baccalaureate graduate of this university or of a college or university whose degrees are accepted as equivalent to its own, or he must give satisfactory evidence that he possesses an equivalent preparation for graduate work.

2. He must make application before the 1st day of October preceding the commencement at which he intends to present himself for the degree, and must then give satisfactory evidence of his ability to read such German and French as may be necessary for the proper prosecution of his studies.

3. He must have spent at least three full years in resident graduate work at this or some other approved university; the last year must be spent as a resident student of this university.

4. He must present a thesis showing the results of original research of a high character, and must pass acceptable examinations, both written and oral, in one chief or major study and two allied subsidiary or minor studies, not more than two of which may be in the same department. If the thesis is finally approved, not less than 100 printed copies must be delivered to the librarian of the university before graduation, or proper security be given for the printing of that number; provided, that if the thesis has already been printed, 10 copies only shall be deposited with the librarian. (Catalogue, 1898-99.)

Tulane University, New Orleans, La.—Graduates of our own college and other accepted candidates who shall pursue for two years an approved classical, literary, or scientific course of study in the university in three branches, one major and two minors, and who shall pass a satisfactory examination and present a written thesis acceptable to the faculty will receive the degree of A. M. Graduate work already done elsewhere, whether in private study or at some seat of learning, may be recognized and accepted, but the scholastic year immediately preceding the attainment of an advanced degree must be spent in residence and study at this university.

The degree of Ph. D. will be bestowed for a further prescribed or approved course of study in Tulane University, pursued for two years under like conditions, upon such persons as in examination, and more especially by an original dissertation, shall exhibit such range of knowledge and power of thought as seem to warrant such bestowal. The following rules have been adopted with respect to applications for the Ph. D. degree:

1. The application for an examination for the degree shall be made at least two years before the date of the examination.

2. The candidate shall be a graduate with the master's degree from Tulane University or from some other institution in good standing.

3. Unless the application is made within three years after graduation from col-

lege he shall, by examination or otherwise, satisfy the faculty of his proficiency in the studies of the undergraduate course.

4. No one shall be admitted to candidacy for the degree unless he be able to translate into English, at sight, ordinary French and German prose and poetry.

5. A suitable time before the candidate's examination a thesis shall be submitted, based upon his principal subject, and the faculty's approval of this shall be a necessary condition to admission to examination. (Catalogue, 1898–99.)

Johns Hopkins University, Baltimore, Md.—The degree of Ph. D. is offered to students who have followed advanced courses of university study for a period of not less than three years, under suitable guidance and favorable conditions, and who have submitted an acceptable dissertation and passed the prescribed examinations. In order to be accepted as a candidate the student must give evidence that he has completed such a liberal undergraduate course of academic study antecedent to the baccalaureate degree as is offered by colleges of good standing. He must then follow advanced studies in the departments of knowledge which he may have chosen, and these studies must be pursued under qualified teachers for a period of at least three years. Private study, or study pursued at a distance from libraries and laboratories and other facilities, will not be considered as equivalent to university study. At least one academic year must be passed in this university, and in every case the year immediately preceding the final examinations.

Every candidate must select one principal and two subordinate subjects. He must prepare a satisfactory dissertation and must pass with credit certain written and oral examinations in his chosen departments of study. He must be able to translate French and German at sight. Examinations are held in these languages at the middle and end of each academic year, at one of which times the candidate must present himself.

The dissertation must be written upon a theme approved by the adviser of the candidate. If finally approved, the candidate shall print it in full or in part within one year of the time when the degree is conferred, and shall present 150 copies to the university. A deposit of $50 is required to insure the printing of the thesis if the same is not printed at the time the degree is conferred.

The candidate shall be given written examinations in the principal subject, and, wherever practicable, in both subordinate subjects, and an oral examination in the principal and in the first subordinate subject. (Register, 1898–99.)

Amherst College, Amherst, Mass.—The degree of Ph. D., for which only college graduates may be candidates, is recommended on compliance with the following conditions: (1) A two years' course of study in two subjects of science or literature, or one subject of each, at this college, under the direction of the professors in the departments to which these subjects belong; (2) An examination upon these subjects, and a thesis upon one of them satisfactory to these professors. (Catalogue, 1898–99.)

Boston University, Boston, Mass.—The degree of Ph. D. is conferred upon candidates otherwise properly qualified, who, after admission to the A. B. degree, pursue in the School of Arts and Sciences for two years approved studies in philosophy, or in philosophy and one or more of the following departments: Philology, history, literature, mathematics, natural science, political sciences, or the fine arts, and pass satisfactory examinations thereon. (Year Book, 1898–99.)

Massachusetts Institute of Technology, Boston, Mass.—The Ph. D. degree is awarded for proficiency in graduate courses of study of at least two years' duration approved by the faculty. (Catalogue, 1898–99.)

Harvard University, Cambridge, Mass.—For the Ph. D. degree not less than two years, at least one of which must be spent in residence at this university, devoted to approved advanced studies are required of students already qualified for candidacy for the degree. Advanced work done in the graduate department of another university will be given weight in estimating the amount of study. The degree is given, not for the mere reason of faithful study for a prescribed time, or in fulfillment of a determinate programme, and never for miscellaneous studies, but on the ground of long study and high attainment in a special branch of learning manifested not only by examinations but by a thesis, which must show an original treatment of a fitting subject or give evidence of independent research. The candidate is liable to minute examination on the whole of his special field of study and is also required to prove acquaintance with the subject-matter of his division in general. (Catalogue, 1898–99.)

Smith College, Northampton, Mass.—The Ph. D. degree is conferred only in recognition of high scholarly attainment and of ability to carry on original research. Candidates must have pursued since graduation advanced courses of nonprofes-

sional study under suitable academic direction and conditions for at least three years. A dissertation shall be presented embodying the results of original investigation, and the candidate must submit to examinations in two branches of learning, of which that represented by the dissertation shall be the principal one. On the satisfactory fulfillment of the requirements and before the conferring of the degree, a printed and bound copy of the dissertation shall be placed in the college library. (Catalogue, 1897–98.)

Tufts College, Massachusetts.—The Ph. D. degree will be conferred upon bachelors of arts, philosophy, or science who shall have pursued at least three years of graduate study, two years of which must be in residence. The whole course of study must be devoted to one subject, and a thesis must be presented giving evidence of original research. Each candidate must pass a satisfactory examination before a board of three examiners. (Catalogue, 1899–1900.)

Clark University, Worcester, Mass.—In most cases three or at least two years of graduate work will be necessary for the Ph. D. degree. The first requirement is a dissertation upon an approved subject, to which it must be an original contribution of value, and at least 100 copies must be given to the university, except in case of unusual length or very expensive plates the number may be reduced to 50 copies. Such formal or informal tests as the faculty shall determine shall mark the acceptance of each candidate. One object of this preliminary test shall be to insure a good reading knowledge of French and German. No candidate shall receive the degree without at least one year's previous residence. The examinations for the degree may be held at any time during the academic year, provided that one academic year has elapsed since the completion of the preliminaries of candidature. (Register, 1898–99.)

University of Michigan, Ann Arbor, Mich.—The Ph. D. degree is open to all persons who have received a bachelor's degree; but no person will be accepted as a candidate who has not a knowledge of French and German sufficient for purposes of research. It is not intended that the degree shall be won merely by faithful and industrious work for a prescribed time in some assigned course of study, and no definite term of required residence can be specified. As a rule, three years of graduate study will be necessary, the last two semesters of which must be spent at this university. A candidate for a doctor's degree must take a major study that is substantially coextensive with some one department of instruction in the university. He must also take two minor studies, one of which may be in the same department as the major, but involving a more thorough treatment of the same. Both minors must be cognate to the major. The thesis must exhibit creditable literary workmanship and a good command of the resources of expression; but it must depend for acceptance more upon its subject-matter than upon its formal or rhetorical qualities, and must be an original contribution to scholarship or scientific knowledge. It must be read and defended in public, and if finally accepted the candidate must cause it to be printed and present 25 copies thereof to the university library. The final examination for a degree is conducted under the direction of the committee in charge of the student's work. (Calendar, 1898–99.)

University of Minnesota, Minneapolis, Minn.—The Ph. D. degree will be conferred on bachelors of this or any other reputable college or university within not less than three years after graduation therefrom under the following conditions:

The candidate shall elect work in three distinct departments, a major subject in one department and two minor subjects in other departments. Within the major subject the candidate shall choose a special field. The work included in a minor shall be equivalent to at least one year's work in one subject.

The candidate shall evince on his final examination an exhaustive knowledge of the special field selected, and shall show such acquaintance with the other studies of the major subject and with the minor subjects as the faculty may require.

A committee, consisting of the heads of departments in which the candidate's subjects fall, shall have the direction of his work.

The candidate shall present a thesis on some subject connected with his special field of work, which thesis shall be the result of original investigation by the candidate and shall be a contribution to knowledge.

Candidates shall ordinarily be required to devote three full years of graduate study to preparation for the final examination. They shall be in actual residence at the university and shall pursue their studies therein at least two years; they may, however, offer in lieu of one of these two years an equivalent term of resident graduate work in some other institution, it being always required that they be in residence at the university the year next preceding the final examination.

At the beginning of the year next preceding his final examination the candidate shall pass a preliminary examination on the work for his degree that he has done up to that time.

If the thesis is finally accepted and the degree conferred, 100 printed copies of the thesis shall be deposited with the president of the university on or before the 1st day of January following. In addition to passing the final examination the candidate must make a public defense of his thesis. Candidates must have a reading knowledge of French and German. (Catalogue, 1898–99.)

Carleton College, Northfield, Minn.—A course of three or four years of resident study leading to the degree of doctor of philosophy is offered by the department of mathematics and astronomy, and that degree will be conferred upon those who satisfactorily complete the course. (Catalogue, 1898–99.)

University of Mississippi, University, Miss.—In order to become a candidate for the Ph. D. degree the student must first obtain a baccalaureate degree from this or some other institution of equal grade. In his application he must set forth his choice of the three schools of the university in which he desires to work, designating one of these three as his major and the other two as his minor studies. In the three schools thus selected not more than two of which shall be under the charge of any one professor, the candidate must pursue a course of post-graduate study for at least three years, not less than two of which shall be spent in actual residence at this university. No student will be allowed to select, as one of the three schools in which to do his post-graduate work, any school in which he has not already completed the entire undergraduate course of study. A reading knowledge of French and German is necessary and if such knowledge is deficient the candidate will be required to make up such deficiency during the first eighteen months of his course. The candidate must prepare and present a dissertation showing original investigation in the line of his major study. If the dissertation be accepted, the candidate, before he is admitted to examination must deposit a fee of $50, which amount, or so much of it as may be necessary, shall be used in printing the dissertation, 50 copies of which must be presented to the University. The final examination shall be limited to three hours and shall take place before the faculty. (Catalogue, 1898–99.)

University of the State of Missouri, Columbia, Mo.—The candidate for the Ph. D. degree will be expected to spend at least three years in graduate study under university direction; but with the consent of the faculty one of these years may be spent in absentia. The candidate must have a bachelor's degree in arts, letters, science, or philosophy, from some reputable university or college, and must attain in graduate study at this university a high proficiency in one branch of learning, and a respectable proficiency in at least one other. He must submit a dissertation embodying the results of original investigation, and must pass examinations in his major and minor subjects. (Catalogue, 1898–99.)

Westminster College, Fulton, Mo.—Candidates for the Ph. D. degree will be required to complete a course of study covering not less than two years' work in some one of the following departments: (1) Metaphysics; (2) political and social science; (3) mathematics and natural sciences; (4) languages and their literatures. At least two examinations will be held, one at the close of each year; and the final examination will be held at the college. A thesis upon some subject connected with the course of study must be presented and must embody the result of original and advanced research. Students who select the department of natural sciences as their major or minor study will be required to do all their work in that department at the college. The degree can be conferred only upon those who have previously obtained the A. B. degree from some approved institution. (Catalogue, 1898–99.)

Washington University, St. Louis, Mo.—The Ph. D. degree is conferred on graduates of this or of other institutions who shall have satisfied the committee on advanced degrees of their fitness after two years of residence and study. Every candidate must have a reading knowledge of French and German and shall present an acceptable thesis which shall be the result of original investigation. Every candidate must furnish the committee on advanced degrees with 200 copies of his thesis, after its acceptance, before he can be recommended for the degree. (Catalogue, 1898–99.)

University of Nebraska, Lincoln, Nebr.—A candidate for the Ph. D. degree must satisfy the committee on graduate work that he has done the full equivalent for a bachelor's degree in this university; that he is able to use French and German for his work and also Latin when his major subject is not in one of the sciences. He

must pass at least three years in resident work in the studies chosen for his degree, two of which may have been done in resident graduate work at other institutions, but the last year before graduation must be spent at this university. The examination shall be in one major course and either one first minor course or two second minor courses. The major and minors must be taken in separate departments. The thesis shall embody a scholarly research covering exclusively or largely some topic of the candidate's chief study, and shall be publicly defended before the faculty, if required. If approved, the candidate shall, before graduation, deposit 100 copies of the thesis in the chancellor's office for gratuitous distribution, or give proper security for the printing of this number. (Calendar, 1898-99.)

Dartmouth College, Hanover, N. H.—The Ph. D. degree is at present offered in the departments of biology, geology, and sociology only. A candidate must have received a bachelor's degree from this college or from a college whose degrees are accepted as equivalent to its own. He must pursue graduate studies for at least three years after taking his bachelor's degree, two of which must be in residence at this college. The other year may be spent in graduate study at an approved institution. Candidates are required to present themselves for examination in three related subjects, a major and two minors. The requirements in each minor subject shall not be less than all the required and elective undergraduate courses in that subject, or their equivalent. The graduate work in the major subject will consist largely of original investigation of a definite problem, the results of which are to be embodied in a thesis that shall contain some original contribution to knowledge, together with an historical and critical summary of the pertinent literature. (Catalogue, 1898-99.)

Rutgers College, New Brunswick, N. J.—The Ph. D. degree may be conferred upon resident graduates of the college who shall pursue for two years prescribed courses of study under the direction of the faculty. (Catalogue, 1898-99.)

Princeton University, Princeton, N. J.—The Ph. D. degree may be conferred upon any A. B. of Princeton, or of any approved institution whose academic course is equivalent to that pursued in Princeton, provided he has spent at least two years in exclusive study for the degree. One of the years must be spent at Princeton, and the other either at Princeton or some other approved university. Applications from those who hold some other bachelor's degree than that in arts, or for permission to count two or more years spent at another university as the residence necessary for the degree, will be considered in exceptional cases.

All applicants for enrollment are examined on their ability to read ordinary French and German and in the group of subjects connected with the general department of their proposed studies.

Every candidate must select a chief subject and two suitable subsidiary subjects, which should be cognate to the chief subject, but not included under it. He shall present a thesis on some special topic in the department which constitutes his chief subject, not to exceed ordinarily 20,000 words in length, and must show evidence of thorough scholarship and ability to pursue original research, and, if accepted, it must be published by the candidate before the degree can be conferred.

The examination in the chief and subsidiary subjects is to be conducted orally in the presence of the faculty and can not be divided. In the chief subject, however, there may be a written examination in addition to the oral. (Catalogue, 1899-1900.)

Cornell University, Ithaca, N. Y.—The Ph. D. degree is conferred on graduates of this university and of other universities and colleges whose requirements for the baccalaureate degree are equal to those of this university on the following conditions:

1. The applicant must have pursued a course of study substantially equivalent to that required for graduation in this university in the academic department.

2. The candidate is expected to spend at least three years at the university, pursuing a course of study marked out by the university faculty. In cases of exceptional proficiency a candidate may be recommended at the expiration of a shorter period. A year of graduate work in a university elsewhere may be accepted in place of a year's work in this university.

3. He must present a thesis of such a character as shall display power of original and independent investigation, and must pass the requisite special final examinations. Successful candidates must print their theses and deposit 50 copies in the university library. (Register, 1898-99.)

Columbia University, New York, N. Y.—Candidates for the Ph. D. degree must hold a baccalaureate degree in arts, letters, philosophy, or science, or an engineering degree, or an equivalent of one of these from a foreign institution of learning.

They must pursue their studies in residence for a minimum period of two years; residence at other universities may be credited, but at least one year must be spent at Columbia University. Each candidate must designate one principal or major subject and two subordinate or minor subjects. The major subject is expected to occupy one-half of the time of the student throughout the course and each minor subject about one-fourth of the time. The examinations for the degree are held under the authority and direction of the dean of the faculty under which the student is working. Each candidate shall present a dissertation embodying the result of original investigation and research on some topic of his major subject, and, if accepted, he shall print the same, and 150 copies shall be delivered to the faculty. Every candidate must be able to read French and German at sight, and must defend his dissertation in the presence of the faculty. No student shall continue to be a candidate for the Ph. D. degree for a longer period than three years from the time he ceases to be in residence. (Catalogue, 1899–1900.)

New York University, New York, N. Y.—The Ph. D. degree will be given to none save bachelors of at least three years' standing. No one will be admitted to examination for the degree who has not been enrolled for two entire academic years, including enrollment at another university counted to his credit here. One year must be spent at the university. The thesis required must show original treatment or give evidence of independent research and must be not less than 5,000 words. The candidate must pass written examinations in his major and minor subjects, as well as an oral examination on his major subject. A satisfactory knowledge of French and German is highly desirable for every student, and a reading knowledge of one or both of these languages will be required for admission to many of the courses. (Catalogue, 1898–99.)

Syracuse University, Syracuse, N. Y.—Candidates must have received from this university, or one of equal rank, the bachelor's degree in arts, philosophy, or science. They must pursue an advanced course of study in residence for at least two years. The course must include two or more correlated lines of study under the supervision of at least two professors, which shall be known as major and minor subjects. He must pass satisfactory examinations upon the entire work. Before the examination the candidate must have submitted a thesis upon some phase of his major subject, which shall show unquestioned ability in investigation. If accepted, at least 25 printed copies of the thesis must be deposited with the librarian for preservation and exchange. (Catalogue, 1898–99.)

University of North Carolina, Chapelhill, N. C.—Any student having the baccalaureate degree in arts, philosophy, or science from this university or from any university or college having equivalent undergraduate courses may become a candidate for the Ph. D. degree. He must select three branches of study—a major and two minors—and is required to pursue in residence at the university a prescribed course of advanced study and research. In general, a term of three years is required, but the degree may be secured in two years in cases of exceptional preliminary training in the major subject. The degree is conferred not simply for faithful study in a determinate field of work for a prescribed period, but because of a high attainment in a special branch of learning, which the candidate must have manifested not only by examination, but by a thesis which gives evidence of independent research and contributes to knowledge. To receive the degree a knowledge of French and German will be found indispensable in most instances. The examinations are both oral and written. (Catalogue, 1898–99.)

Western Reserve University, Cleveland, Ohio.—The Ph. D. degree will be conferred only on persons who have previously received a bachelor's degree, either from this or from some other university or college of good standing. He must have pursued courses of advanced study, mainly of university as distinguished from college grade. He must have shown special ability in one branch of study (major) and high attainments in two other branches (minors), as determined by written or oral examinations or both. He must have submitted a thesis which shall be accepted as evincing powers of research and independent investigation. After its acceptance he must deposit at least 50 copies of his thesis, printed either in full or in abstract, as may be required, with the dean of the graduate faculty. The degree will be granted to no one who does not possess a good reading knowledge of French and German and, unless specially excused, of Latin. Ordinarily at least two years of residence are necessary, and often a longer time is advisable. Part of this time may be spent at some other institution of high standing, but the last year, at least, must be spent in residence here. (Catalogue, 1898–99.)

Ohio State University, Columbus, Ohio.—The Ph. D. degree will be conferred upon holders of the appropriate baccalaureate degree from this university or from other institutions making equivalent requirements for the first degree upon the satisfactory completion of three years of resident graduate work in the arts, philosophy, and science college, including thesis and examinations. On approval of the faculty, the work of the first year or of the first two years of the three may be done at another university which offers equivalent graduate work. (Catalogue, 1898–99.)

Denison University, Granville, Ohio.—The course for the Ph. D. degree shall include three full years of graduate work. It shall be at the discretion of the faculty to accept an equivalent kind of work at other universities for a period not to exceed one year, but the last year must be spent in residence. Examination in each subject may be held at its completion, but after the acceptance of the thesis, which shall be printed, a final public examination shall be held. The degree will not be given after the expiration of the period of required residence unless the candidate shall have exhibited independence and originality, as well as industry, in research. (Catalogue, 1898–99.)

Richmond College, Richmond, Ohio.—The Ph. D. degree may be conferred on any bachelor of arts of good moral character who shall successfully pursue a three years' course of study in metaphysics under the direction of the president and professors of this institution. (Catalogue, 1895–96.)

University of Wooster, Wooster, Ohio.—The Ph. D. degree will be conferred upon candidates having bachelor's degrees on the completion of a major course with a minor course in cognate studies. The major course consists of two parts, each of which represents an amount of work which, under favorable circumstances, may be accomplished in a year, and a minor course represents about one year's work. Residence at the university is not required, and examinations in absentia may be arranged whereby students may pass written examinations, other than final, under supervision approved by the faculty. The thesis required of candidates shall ordinarily contain from 5,000 to 10,000 words and is expected to be either a contribution to human knowledge, as embodying the results of original research, or such a discussion of a subject as by new and clearer exposition will lead to more ready acceptance and wider diffusion of established truth. (Catalogue, 1898–99.)

Willamette University, Salem, Oreg.—Graduates of this university, or other university or college requiring equal work, with the A. B. or Ph. B. degree are eligible for the Ph. D. degree. The case of graduates with other degrees will be specially considered. The completion of six groups of studies in a course entitle a graduate to the degree. A course may be taken entire or four groups may be taken from one course and two from another. Candidates will be entitled to examinations at the completion of each group. Examinations will be sent to some selected person, and if such person requires compensation the candidate must pay the amount. Except by special dispensation, no candidate will be allowed to receive the degree in less than three years. The theses are to be the result of original investigation on a specified subject, exhibiting originality, careful research, and good literary taste, and must be carefully written in ink. (Yearbook, 1898–99.)

Western University of Pennsylvania, Allegheny, Pa.—The candidate for the Ph. D. degree must either be a baccalaureate of an American or foreign university, the degrees of which are accepted by this university as the equivalent of its own, or he must satisfy the examiners appointed by the faculty that he possesses an equivalent preparation for graduate studies. He must show proficiency in three studies, tested by written or oral examinations. The minimum time in which the degree will be allowed after matriculation is two years, and in most cases fully three years will be required. Residence at the university is not required, but is recommended for at least a portion of the time, especially in cases in which the candidate has elected as his major branch of study one of the sciences requiring practical work in the laboratory or museum. In case of nonresidence the student will be required to submit annually to a rigorous personal examination in all branches which have been prescribed and present himself at the close of his course at the university for graduation, at which time he must be prepared to present and defend a thesis. (Catalogue, 1898–99.)

Moravian College, Bethlehem, Pa.—The Ph. D. degree may be conferred on college graduates who, after having taken a bachelor's degree, shall have devoted themselves for not less than two years to advanced studies under the direction of

the faculty, passed examinations in them, and presented a dissertation embodying the result of original investigation on some topic previously approved by the faculty. Candidates must spend at least one of the two years of study in residence at this college. (Catalogue, 1898–99.)

Bryn Mawr College, Bryn Mawr, Pa.—The Ph. D. degree may be conferred upon graduates of Bryn Mawr College and upon graduates of other colleges who shall show that the course of study for which they received a degree is equivalent to that for which the A. B. degree is given at Bryn Mawr College, or that it has been adequately supplemented by subsequent collegiate studies. The candidate must have pursued for at least three years a course of liberal advanced study at some approved college or university, and must have spent at least two of these years at Bryn Mawr College. She must have written, on some subject connected with her chief subject of study, a dissertation that bears satisfactory evidence of original research, and must pass an oral examination before the faculty on one major or chief subject, and a written and an oral examination on two minor subjects. In special cases one minor subject may be substituted for two minor subjects. The degree is given to no one who can not read French and German or who is unacquainted with Latin. The dissertation must have been printed before the degree is conferred. (Programme, 1898.)

Lafayette College, Easton, Pa.—The Ph. D. degree may be conferred on any graduate of this college who shall have taken a prescribed course of special reading for three years after graduation, passed examinations in approved courses of study, and presented a thesis showing evidence of original research. The same degree may be conferred two years after graduation on any college graduate who, during two years of continuous residence at the college, shall have devoted himself exclusively to advanced studies under the direction of the faculty, passed examinations in them, and presented a satisfactory thesis on one of the studies pursued. (Catalogue, 1897–98.)

Pennsylvania College, Gettysburg, Pa.—Only those who have received bachelor degrees equivalent to those given in this college are eligible candidates for the Ph. D. degree. Not less than three years' work under the direction of the faculty will be required. At least one year's residence in the case of graduates of this institution, and two years' residence in case of graduates from other institutions. In the case of nonresidents, reports of progress must be made, and examinations will be made in such manner and as frequently as the professors may direct. At the close of the course a satisfactory thesis showing evidence of original investigation must be submitted. Each candidate must select one major and two minor subjects. (Catalogue, 1898–99.)

Grove City College, Grove City, Pa.—Offers three-year courses in philosophy and in political and social science leading to the Ph. D. degree. Matriculates must have a bachelor's degree or show that they have acquired by independent study an equivalent culture. The courses may be pursued by nonresident students. An examination in each year's work may be had at the close of the year, or examination in the whole course may be deferred to the close of the third year's work. Resident students can shorten the time greatly. (Catalogue, 1898–99.)

University of Pennsylvania, Philadelphia, Pa.—Any person holding a bachelor's degree in arts, letters, philosophy, pure or applied science, granted by this institution or by any college or university whose degrees are recognized by this university, may become a candidate for the Ph. D. degree. He must possess a good reading knowledge of two European languages besides English, one of which must be a modern tongue. He must select a major subject and two minor subjects which shall be so related as to conduce to some recognized and approved end. He must also present a thesis upon some topic in the line of his major subject, showing high attainment or power of original and independent research, which must be typewritten or printed unless specially excused. The candidate must pass a private written examination and a public oral examination. The degree will in no case be conferred before the expiration of two years after the date of the candidate's baccalaureate degree, and as a rule three years will be required to do the work to fit himself for the degree. (Catalogue, 1898–99.)

Waynesburg College, Waynesburg, Pa.—A graduate of this or any other accredited college, on a course leading to any of the four degrees, bachelor of arts, of science, of literature, of philosophy, will be admitted to the Ph. D. degree on the completion of two years' additional work. Those qualified to enter upon the studies leading thereto, may, without recitation in the College, be admitted to the degree on completion of the course of study, and after he shall have submitted to an examination and presented a thesis. (Catalogue, 1899–1900.)

Brown University, Providence, R. I.—The Ph. D. degree is conferred under the following conditions: The candidate must be a bachelor of arts, of philosophy, of science, or of letters. He must have resided at the university at least two years after graduation pursuing a systematic course of study and sustaining satisfactory examinations thereon, concluding his course with a thesis giving evidence of high scholarship and of special excellence in the studies pursued. At least two courses are required, a major and a minor. A good knowledge of Latin, French, and German is necessary unless for special reasons excused from one or more of these languages. The degree is not conferred in less than two years from the time of enrollment. The examinations are public. The thesis must be typewritten or printed. (Catalogue, 1898-99.)

Allen University, Columbia, S. C.—The Ph. D. degree, for which only college graduates may be candidates, is recommended on compliance with the following conditions: (1) A two-years' course of study in two subjects of science or literature, or one subject of each, at this college, under the direction and to the approval of the professors in the departments to which these subjects belong; (2) an examination upon these subjects and a meritorious thesis upon one of them. (Catalogue, 1898-99.)

Southwestern Presbyterian University, Clarksville, Tenn.—The candidate must present an A. B. or A. M. diploma of this institution or of some other institution which shall be satisfactory to the faculty. He shall select one major and two minor subjects, the major course to extend through three years, each minor through one year, or a candidate may choose a minor to extend through two years. Residence shall be required during each of the three years. Each candidate shall submit a thesis showing original work on some subject embraced in his major course, and shall undergo examinations in his major and minor courses. (Catalogue, 1898-99.)

American Temperance University, Harriman, Tenn.—Students may enter any one of the graduate courses at any time and pursue their studies under the immediate direction of the faculty. Nonresident students may take the courses largely by correspondence. In special cases examinations in absentia may be arranged by correspondence with the examiner, whereby students may pass written examinations under supervision approved by the faculty. On the payment of required fees and the presentation of a thesis of 3,000 words on an accepted theme the master's degree, corresponding to the bachelor's degree already received, will be conferred. At the end of the second year's work, in accordance with the same requirements, the Ph. D. degree will be conferred. (Catalogue, 1898-99.)

Cumberland University, Lebanon, Tenn.—The candidate must have completed a course of study equivalent to that required in this university for the A. B. degree. Holders of the B. S. degree will be admitted as candidates, provided they pass satisfactorily an examination in Greek such as is required for admission to the freshman class, or devote five hours a week to the study of Greek during their year of residence. Candidates must pursue, under the direction of the faculty, a course of study embracing one major and two minor groups of subjects, must pass satisfactory examinations in them, and present a thesis within the field of the major subject showing original research. At least one year of residence is required. Students may complete the course in three years, or, if they are well prepared, with two years of resident study. (Catalogue, 1898-99.)

Vanderbilt University, Nashville, Tenn.—The candidate must have received from this university or from some other institution of good standing the degree of A. B. or B. S., including Latin. The A. B. candidate is required to pursue three distinct studies, one principal and two subsidiary, for not less than three years, two of which must be spent in attendance at this university. He must have a reading knowledge of French and German and must submit, before his examination, a thesis which shall give evidence of independent investigation. The thesis must be printed by the candidate and 50 copies placed in the university library. The same is required of the B. S. candidate, but he must elect the studies from the schools of Latin, Romanic languages, Germanic languages, English, mental and moral philosophy, and history and economics. (Catalogue, 1898-99.)

University of Virginia, Charlottesville, Va.—The candidate must hold the A. B. degree or other degree of like value from this university or some other college or university of good standing, or must give satisfactory evidence of having an equivalent collegiate education. He must select three subjects of study—a major, in which a dissertation is to be prepared; a cognate minor, and an independent minor. No time limit is set for the acquisition of the degree, except a minimum

time limit of three years of study therefor after the acquisition of the bachelor's degree. The major subject shall be pursued during the whole time, the first minor during at least two years, and the second minor during at least one year. A reading knowledge of French and German is necessary. Each candidate must stand a final examination upon the whole course covered in both major and minor studies. Graduate work in other universities may be accepted, but the last year of work must be done here. If approved, the thesis must be printed, and 50 copies thereof deposited in the university library. (Catalogue, 1898-99.)

Washington and Lee University, Lexington, Va.—The Ph. D. degree will be conferred on any bachelor of arts who shall pursue at the university, for not less than three years, a special course of study in any one subject taught in the academic department of the university. The one special subject shall have associated with it at least one subsidiary or affiliated study. It is expected that from time to time the candidate submit evidence of independent research in his special line of study, that he stand at least two examinations during his course, and that he produce a thesis the final year showing the progress he has made. (Catalogue, 1898-99.)

University of Washington, Seattle, Wash.—The Ph. D. degree is open to all students who have received a bachelor's degree in arts, science, philosophy, or letters, and have a knowledge of French and German sufficient for purposes of research. As a rule, three years of graduate study will be necessary to attain the degree, the last of which must be spent in residence at the university. The candidate must select a major study and two minor studies, one of which may be in the same department as the major, but involving a more thorough treatment of the same. Both minors must be cognate to the major. The thesis must be read and defended in public, and if accepted, the candidate must have it printed and present 25 copies to the university library. (Catalogue, 1898-99.)

University of Wisconsin, Madison, Wis.—The Ph. D. degree will be conferred on successful candidates after three years of graduate study, of which the last year or the first two years must be pursued at this university. Special attainments are requisite, particularly the power of original thought and independent investigation. The candidate will be examined on three subjects—one major and two minors. A thesis must be presented which shall give evidence of original research and independent treatment. In case the candidate is successful he is required to print his thesis and deposit 100 copies in the university library. All candidates must have a reading knowledge of French and German at least one year before the degree is conferred. (Catalogue, 1898-99.)

TABLE 1.—*Whole number of students receiving higher education (including students in undergraduate and graduate departments of universities and colleges, colleges for women, schools of technology, and in professional schools and departments).*

State or Territory.	Universities and colleges for men and for both sexes.		Colleges for women—Division A.	Colleges for women—Division B.	Schools of technology		Professional schools and departments (law, medicine, and theology).		Total number of students in higher education.

CHAPTER XXXVIII.

PROFESSIONAL SCHOOLS.

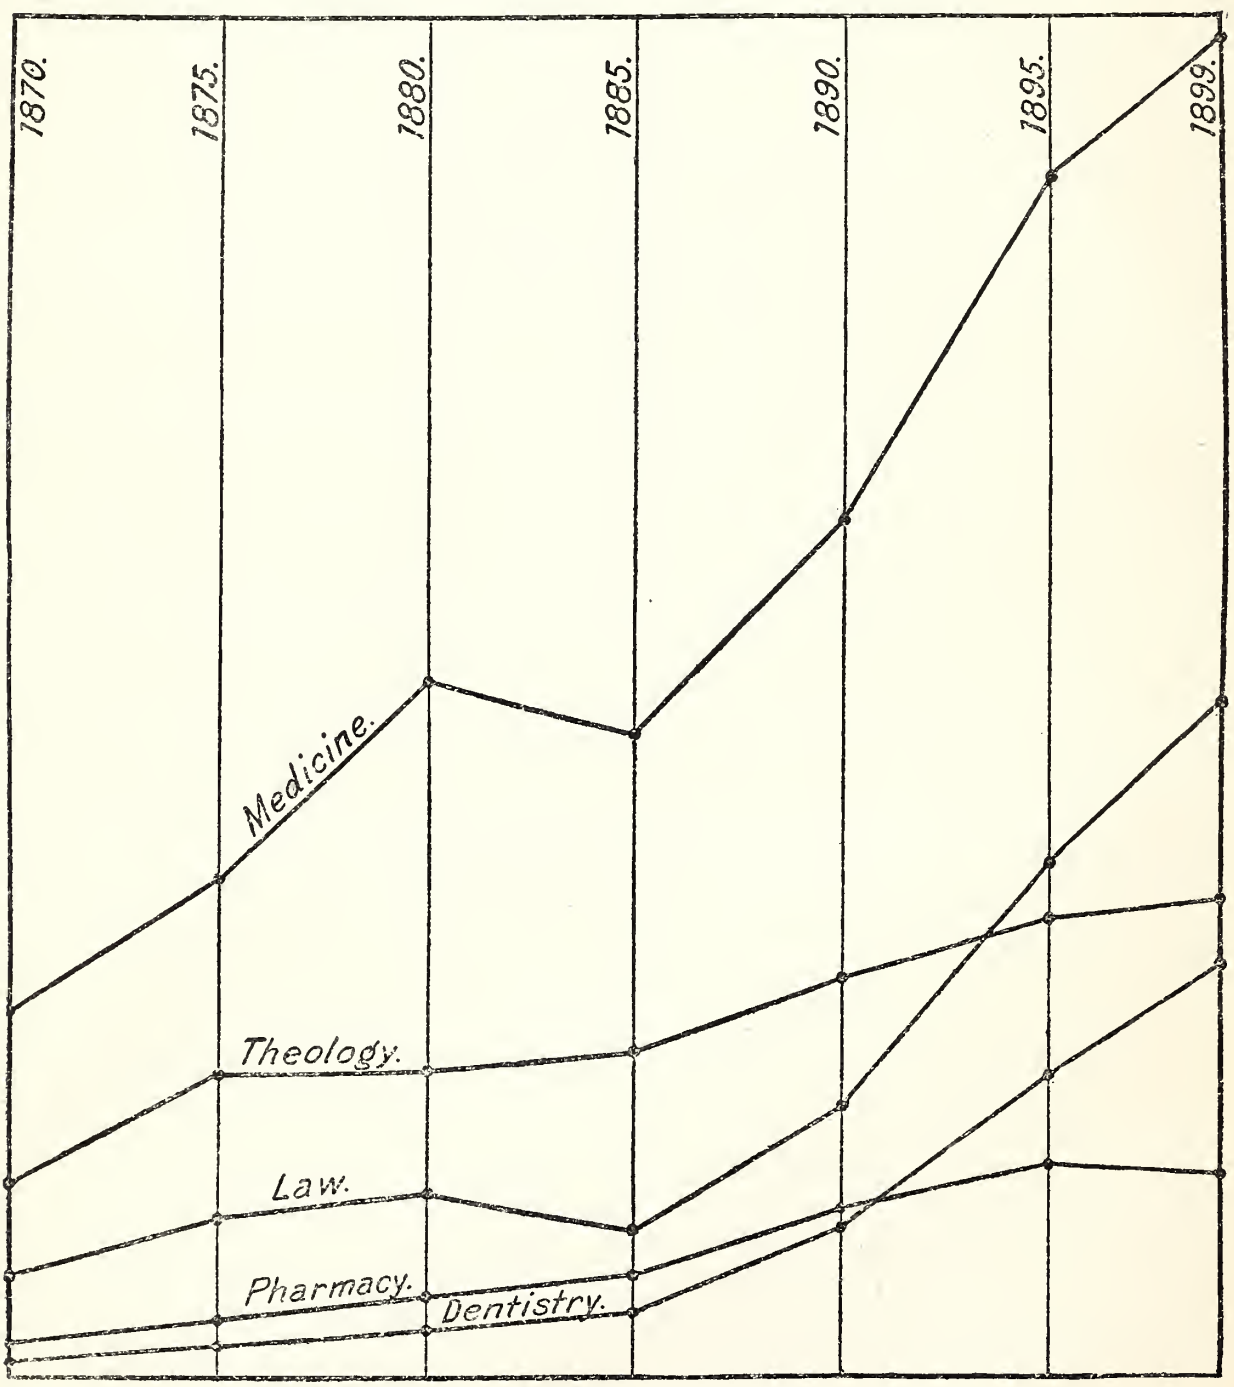
The number of theological students enrolled during the year 1898–99 was 8,261, a decrease of 110 since the previous year. During the last four years there has been an increase of only 211 in the number of theological students, or less than 3 per cent. During the same time the increase in the number of law students was nearly 33 per cent. The number of students in law was always less than the number in theology until the year 1894–95, but since that time the number of law students has increased rapidly.

The number of medical students enrolled was 23,778, an increase of 345 over the previous year, the students in regular schools numbering 21,401; in homeopathic schools, 1,802; in others, 575. All of the medical schools which give full courses of instruction report that they have courses of four years except 15 schools, and some of these are preparing to enter upon courses of four years. In 43 schools the annual session continues eight months or longer, 12 of these schools having sessions of nine months. In several medical schools the time of attendance now required in one year is equal to the whole time of attendance required for a degree twenty years ago.

Dental students numbered 7,354, an increase of 580, while students in pharmacy numbered 3,551.

During the ten years from 1889 to 1899 the number of students in theology increased 18 per cent; in pharmacy, 26 per cent; in homeopathic medicine, 55 per cent; in regular medicine, 75 per cent; in law, 204 per cent; and in dentistry, 301 per cent.

TABLE 1.—*General summary of statistics of professional and allied schools for 1898–99.*



Class of schools.	Schools.	Instructors.	Students.	Increase (+) or decrease (—).	Graduating.	Per cent graduating.
Theological	163	996	*a* 8,261	— 110	1,714	21
Law	96	966	*b* 11,874	+ 259	3,140	26
Medical	151	4,389	23,778	+ 345	4,911	21
Dental	50	948	7,354	+ 580	1,987	27
Pharmaceutical	51	442	3,551	— 161	1,230	35
Veterinary	13	153	316	— 10	100	32
Nurse training	393	.....	10,018	+ 1,213	3,132	31

a 156 women included.

Comparative number of students at different periods.

Increase in the number of dental students.—A diagram is given (p. 1679) showing the rapid increase in number of dental students in the United States as compared with the number in other professions. In the report of the provost of the University of Pennsylvania this increase is mentioned, as well as the proposed methods of limiting admissions, and it is given as the opinion of the dean of the dental school that a course of four years in dentistry must be adopted. The provost says:

Only two years have elapsed since the completion of the new building for this department. When the plans for this building were studied, it was proposed to provide for instruction for a maximum number of 500 men. At the end of the first year the maximum capacity of the school had been reached.

Three methods of limiting admissions are mentioned:

They involve higher entrance requirements, or the increase of the fee—now a very moderate one—or both. * * * It is the view of the dean that the curriculum of the school is at present too full to be fairly covered within three years; and that as all of the branches of study which are recognized as fundamental to the study of general medicine are fundamental subjects in dentistry, the dental curriculum must be so enlarged as to include such subjects. The only solution of this aim would be the establishment of a four years' course.

A literary degree required for admission to a law school.—At a meeting of the trustees of Columbia University, New York, held January 9, 1899, it was—

Resolved, That on and after June 30, 1903, admission to the law school be limited to students who have already taken their first degree.

a So far as reported.
b This is an independent body; according to the United States Census Report of 1890, however, "in doctrine, practice, and usage the United Brethren are Methodistic, and they send representatives to the ecumenical Methodist conferences."

THE HARVARD MEDICAL SCHOOL.

The report of the president of Harvard University for 1898–99 mentions several gifts or bequests in which the medical school is either interested directly or is aided in the full accomplishment of its purposes. From the estate of Mrs. Caro-

line Brewer Croft was received a bequest of $100,000, less $7,975, the amount of the legacy taxes paid in England. The income is to be used in researches for the cure of cancer and other similar diseases.

Mr. James Stillman, of New York City, gave to the corporation $100,000 wherewith to build an infirmary and purchase the land necessary therefor.

An interesting endowment came into the possession of the corporation from an anonymous source at the end of January, 1899. Its object was the establishment of a professorship of hygiene for the benefit of the students of Harvard College. The gift amounted to nearly $156,000; but the whole income of this fund is not yet available. The object of the giver is to provide the students of Harvard College with a medical friend competent to give them the best advice, winning in his nature, and devoting himself chiefly to the physical and moral welfare of the undergraduates at Cambridge. * * *

The corporation also determined on another large use of the Pierce bequest—namely, for the promotion of instruction in comparative medicine—but in three separate sums; $100,000 as the foundation of a new professorship to bear his name, $100,000 for a medical laboratory building to bear his name, and $100,000 as an endowment for the laboratory.

The Calvin Ellis bequest to Harvard medical school.[1]—It has recently been made known that the estate of the late Calvin Ellis has become available for medical purposes. The estate amounts to nearly $400,000, and by the wish of the testator its income is to be devoted to the advancement of the departments of anatomy, physiology, and pathology at the Harvard medical school. Dr. Ellis was at one time dean of the Harvard medical school, and for many years one of its most distinguished clinical professors. He felt what others have also felt but been unable to express materially, that teachers of nonclinical subjects do not receive a just

[1] Boston Med. and Surg. Jour., July 6, 1899.

reward for their services. The first provision of his bequest therefore was that the professors of the several departments mentioned be paid $5,000 a year, which had already been done, and then the income remaining be made available for the development of the three fundamental branches of medicine—anatomy, physiology, and pathology.

Could the benefactor have foreseen the exact lines in which medicine was destined to develop he could not have given more wisely, for the great need of the present, and it will be a constantly increasing need as time goes on, is endowment for the maintenance and growth of laboratories and the cultivation of research, which the existence of such laboratories implies. It is hardly possible that he could have fully realized the enthusiasm for research which was so soon to lead to the development of what we popularly call "scientific medicine," though it had already begun during the later years of his life. Be that as it may, the bequest is a most notable one, coming as it does from a man who, although himself personally interested in the clinical side of medicine, yet had the breadth of vision to see that the future needs of medical education would require that which money alone can give in the development of its more theoretic aspects. In President Eliot's words when the announcement was made, "Could pecuniary resources possibly be more timely, and could there be a more delightful benefactor of the advancement of medical science than Calvin Ellis?"

Per cent of increase in number of students.

COST OF A MEDICAL EDUCATION.

Comparative statement of students' expenses for the academic year, October to June.[1]

[Based on students' statements.]

Items.	Low.	Average.	Liberal.
Matriculation fee (first year)	$5	$5	$5
Tuition fee	200	200	200
Books	15	30	40+
College incidentals		15	50+
Room (32 weeks)	48	112	160+
Board (32 weeks)	112	128	192+
Clothes and washing	35	75	125+
All other expenses	15	25	100+
Total	430	590	872+

[1] Taken from the announcement for 1899-1900 of the College of Physicians and Surgeons, Columbia University, in the city of New York.

No mention is made in the statement of traveling expenses in going to and from the student's home, an item of considerable importance to many students. In most schools, too, there is an examination or diploma fee of $25 or $30.

In the medical department of the University of Michigan,[1] located at Ann Arbor, "the total amount of fees paid to the university during the whole four years' course, for matriculation, incidental expenses, material used, and diploma, is for Michigan students about $300, and for others about $355." "Students obtain board and lodging in private families at from three to five dollars a week."

In the announcement for 1899–1900 of the medical department of the University of Iowa, located at Iowa City, the necessary yearly expenses are given as follows:

Tuition fee, which includes all university charges except laboratory breakage	$65 to $65
Breakage	1 to 2
Room rent, six months	12 to 48
Board, twenty-six weeks	52 to 78
Fuel and light	6 to 16
Books	12 to 20
Total	148 to 228

If we estimate the other expenses at same figures as in first estimate we will have, in addition:

Clothes and washing	35 to 125
All other expenses	15 to 100
Total	198 to 453

It should be noted that the length of the session here is given at twenty-six weeks, while it is much longer in some schools.

AGE OF GRADUATES IN MEDICINE.

The dean of the medical school of the University of Pennsylvania (Dr. John Marshall) comments on the length of time required for completion of a medical course:

The average age of those members of the class possessing collegiate degrees was 22.6. Adding four years, which is the duration of the course in medicine, the age would be brought up to 26.6 years, and assuming that after graduation the

[1] Annual announcement, 1898-99, p. 64.

graduate should spend at least a year or longer as resident physician in a hospital, the age would be brought up to at least 27.6, or practically 28 years. This, it seems to me, unduly defers the time when a man should begin his professional career. Three remedies have suggested themselves to me:

First. That the colleges granting academic degrees decrease their requirements for admission, so that students may begin their studies in college at an earlier age in life; or,

Second. Complete the college course for an academic degree in three years, and confer the degree at the end of three years; or

Third. Let colleges which grant academic degrees arrange so that a student who purposes studying medicine and who has spent the freshman, sophomore, and junior years in the college, may enter an approved medical school, and at the end of the course in medicine, when the candidate shall have received his degree in medicine, he be granted the bachelor's degree by the college in which he pursued his academic studies. In support of the suggestion that the collegiate course of those students who propose pursuing professional studies be limited to three years, I may cite the practice in Germany, where the certificate (zeugniss) of a gymnasium, which may be considered as certifying that the holder had pursued courses of study about equivalent to the first three years of the course in arts in an American college of standing, is accepted as evidence of the possessor having pursued a course of study to warrant his beginning courses of professional study leading to a degree in any university in Germany.

The president of Harvard says in his report for 1898–99, p. 10:

The common attainment of the degree of bachelor of arts in three years is certainly approaching. No specific legislation will be needed to accomplish this important change, for any young man of fair abilities can now procure the degree in three years without hurry or overwork if he wishes to do so or if his parents wish to have him. That this wish is felt by an increasing number of students and parents is demonstrated in the table repeated from the report of last year. In eight years the proportion of the graduates of the year who were credited in three years with sixteen or more courses (the number necessary for the degree in Harvard) has risen from less than one-fourth of the whole number to very nearly two-fifths.

The president of Columbia University, New York, says:[1]

The privilege of shortening the combined college and professional course by counting the first year in the professional schools as a partial fulfillment of the requirement for the bachelor of arts degree is not open to students who enter Columbia College later than the beginning of the junior year.

The New York Medical Record of March 10, 1900, says:

In response to an appeal by college presidents to admit to the second year of the medical course graduates qualified in the branches taught in the first year of the course, the Pennsylvania State Medical Council adopted the following resolution:

"*Resolved*, That in the judgment of the council, when the medical course of a literary college, as proven by the examination of the student by the medical college, covers the entire work of the first year of actual medical study, such course may be accredited by the medical college as the first year of medical study required by law."

FRAUDULENT DIPLOMAS.

The Journal of the American Medical Association, October, 1899, says:

The supreme court of Illinois, on the 16th instant, revoked the charter of the Independent Medical College of Chicago. After obtaining further proof of the wholesale sale of diplomas by this institution, the attorney-general brought suit in the circuit court of Cook County to have the charter of the "college" revoked. After hearing the evidence the court, on February 15, 1899, entered a judgment of ouster. The "faculty" of the college made no defense, but took an appeal to the supreme court simply to gain time. The decree of the circuit court has not apparently interfered with the sale of diplomas. Indeed, the "faculty" has earnestly endeavored to confer as many degrees as possible, and so "lowered the scale of prices" and gave degrees for practice in Michigan, Kansas, Texas, and elsewhere to all who applied and paid. The sale has continued to the present. Early in the month the State board of health purchased one in Fort Worth, Tex., for $30. The transaction, however, was arranged in Champaign, Ill., through a

[1] President's annual report, 1899, p. 36.

licensed physician, whom the board has since summoned to appear and show cause why his certificate should not be revoked for unprofessional and dishonorable conduct. The "physician" in this case, whom the college required to "show evidence of qualifications," was a young law student, of whom the sole requirement demanded was a tender of the necessary fee in advance. Recently the "faculty" began to see ahead the parting of the ways, and in August the institution became affiliated with the Metropolitan Medical College, another legally chartered medical college, the charter being issued by the secretary of state under the provisions of the act of 1872. * * *

Under the provisions of a statute which became in force July 1, 1899, the attorney-general may file a bill in chancery in the name of the people of the State of Illinois against any corporation authorized to confer degrees, diplomas, or other certificates of qualifications in the science of medicine, pharmacy, or dentistry which conducts a fraudulent business, or abuses, misuses, or violates the terms of its charter, in any court having jurisdiction of the corporation and subject-matter of such bill, for an injunction to restrain said corporation from conducting its business fraudulently or abusing, misusing, or violating the terms of its charter, and also for the dissolution of said corporation, "and thereupon it shall be the duty of the court in which said bill is filed to grant such injunction and to hear and determine the same as in other cases in chancery. And provided further, that this act shall apply to schools, colleges, or universities which now or may hereafter be licensed in this State, notwithstanding any provisions that may exist in their charters."

The supreme court had no hesitation in saying that it fully justified the finding and judgment of the court below. In fact, it was sufficient to establish the guilt of the defendant, as charged in the information, beyond a reasonable doubt, and would have justified not only the forfeiture of the charter, but the infliction of a fine on the parties guilty of the abuses. Therefore the judgment of the circuit court was affirmed.

In the same journal, July 8, 1899:

The business done by the Chicago diploma mills is well illustrated by the fact that the county clerk's official records of physicians in one Michigan town are found to include the names of 23 who claim as their alma mater the notorious Independent Medical College. This may be an extreme case; the diploma-mill graduates may have gravitated for some reason or other especially to that locality, but it is certainly suggestive of possibilities elsewhere.

There are still a few States and Territories in which, according to the wording of the law, anyone holding a diploma from "any legally chartered" school of medicine or dentistry, without regard to the character of its instruction, is allowed to practice his profession. It is this that gives value to the diplomas of fraudulent but legally chartered schools.

The following notice is taken from the Washington Post of June 5, 1900:

Chicago, June 4.—Government officers to-day invaded the Metropolitan Medical College, an alleged "diploma mill," and arrested its officers. The men are charged with having used the mails to defraud, and it is said their receipts amount to many thousands of dollars. They were taken before United States Commissioner Humphrey and the hearing of the charges against them set for June 14. Failing to give suitable bonds, all four went to jail.

The institution with which the defendants are connected is also known as the Independent Medical College and the National Law School, and the evidence shows that its faculty has been selling degrees for the practice of medicine and law at prices ranging from $3 to $200, the compensation being determined by the amount the would-be professional men were willing to advance.

Post-Office Inspector Gould, who made the arrest after accumulating a lot of documentary evidence, says the fraud is one of the largest the postal authorities have ever had to deal with, and that the "graduates" of the institution are practicing in every State, and even abroad. He says frequent complaints of malpractice have been made against the holders of the diplomas of the institution. Regular medical colleges and law institutions in all parts of the United States have been fighting the officers of the "diploma mill" for several years in vain, and up to the time the men were arrested it is said they were "graduating" their subscribers at the rate of a dozen each day.

Inspector Gould induced a friend to write to the Metropolitan Medical College for information. The institution offered to give a full course in medicine and a degree for $200, and shorter terms of study for smaller amounts.

Inspector Gould has a bunch of unsigned certificates of practice for the State of Texas, and he says the name of the district clerk is forged to these for an extra compensation. Texas is said to have been the most fertile field for the "graduates" of the institution.

The British consul has made repeated efforts to run the Metropolitan faculty out of business, as Great Britain is said to have been flooded with their diplomas. It is said that dozens of "graduates" of the institution are practicing in India and in all parts of the world. The diplomas bear the names of the whole faculty, but two girls declared they were employed to write these on all the degrees issued by the college.

A Texas diploma mill, calling itself the "New York Medical College," was organized and incorporated last November and has just been permanently closed by the State authorities. It appears to have been the project of an enterprising firm composed of a man and his wife, who associated with themselves certain other individuals—or at least their names—and proceeded to make M. D.'s, after the approved Armstrong & Co. method. * * *

How many would-be M. D.'s have been "decorated" by this concern in its brief but enterprising career is unknown to us, but Texas appears to have been a good field for the Chicago bogus diploma dealers. According to an editorial in the Texas Medical News, from which journal we take the above facts, there were registered in Tarrant County, Texas, alone, 26 diplomas from Chicago's "Independent Medical College," out of a total of 41 in 1898, 115 out of 149 in 1899, besides 14 from the "Metropolitan Medical College"—now in trouble—and 2 from the "International Health University." From January 1 till April 12, 1900, there were 29 diplomas registered altogether, and of these 20 were from the Metropolitan and 2 from the "Independent Medical College."[1]

At the meeting of the National Association of Dental Faculties in 1898 it was—

Resolved, That the committee on foreign relations be instructed to use its utmost diligence in ferreting out fraudulent or irregular colleges, and the granting of degrees irregularly by recognized colleges, should this be done, and to leave undone nothing within their power to bring to justice institutions granting irregular degrees or degrees irregularly.

VETERINARY MEDICINE.

The provost of the University of Pennsylvania says in his report as to the veterinary school:

There appears to be as yet very little public understanding of the importance of veterinary science, and without such understanding the necessary public financial support is entirely lacking. Veterinary science is usually considered as having for its sole object the cure of the diseases of animals. While this is a matter of humanitarian and economic value, and one to which most careful attention is and should be given, it is by no means of so much importance as some other parts of this science. The protection and improvement of the domestic animals are factors of veterinary work that are of far-reaching importance. * * *

Veterinary science stands between this enormous industry and epizootic disease. The magnitude of the losses occasioned by contagious diseases of animals, and the importance of providing thorough training in veterinary science, are illustrated by comparatively recent occurrences in England. It is conservatively estimated that the losses caused by epizootics among cattle in Great Britain during the thirty years ending in 1870 amounted to at least $450,584,270 (Fleming), and in 1872 one disease alone caused losses amounting to $76,000,000. All of these diseases (lung plague, cattle plague, foot and mouth disease) are now under control, and one has been completely eradicated. In this country hog cholera has caused losses amounting to $35,000,000 in one year. Texas fever, by destroying cattle and impeding traffic in southern cattle, caused losses that are estimated at $25,000,000 each year. Tuberculosis prevails extensively in the Eastern States, and causes annual losses aggregating many millions. It is believed that in Pennsylvania diseases that should be prevented destroy at least $6,000,000 worth of live stock every year. * * *

In Germany the breeding interests are aided by experts, most of whom are veterinarians. This direction and assistance have resulted in many districts in making animals from 25 per cent to 50 per cent more productive and valuable without increased cost of production—solely by the application of the teaching of a part of veterinary science.

CHAPTER XXXIX.

AGRICULTURAL AND MECHANICAL COLLEGES.

I.—STATISTICS FOR 1898-99.

The usual statistics for the year ended June 30, 1899, of the institutions endowed by the acts of Congress of July 2, 1862, and August 30, 1890, required by the latter mentioned act to be made to the Secretary of the Interior, have been collected and compiled, and are given in the following pages. Of the 64 institutions endowed by these acts, 14 are for the education of colored students.

Summary of statistics.

	Men.	Women.
Professors and instructors:		
In departments of agriculture and mechanic arts	1,705	253
In all departments	2,655	312
Students:		
In departments of agriculture and mechanic arts:		
Preparatory	4,281	1,967
Collegiate	12,491	2,593
Graduate	460	128
In other departments	8,989	4,742
Total	26,121	9,337

DISTRIBUTION OF STUDENTS IN COURSES OF STUDY.

Agriculture		4,390
Engineering:		
Mechanical	3,355	
Civil	1,463	
Electrical	1,325	
Mining	587	
		6,730
Architecture		410
Household economy		1,573
Veterinary science		646
Military tactics		11,095

PROPERTY.

Libraries:	
Volumes	1,076,887
Pamphlets	390,454
Endowment funds	$24,087,162

PROPERTY—continued.

Land:	
Total number of acres	23,944
Acres under cultivation	10,780
Acres used for experiments	3,904
Value	$2,454,656
Value of buildings:	
Total	$16,822,799
Used for instruction in subjects specified in act of August 30, 1890	$12,347,193
Value of equipment:	
Total	$6,851,134
Used for instruction in subjects specified in act of August 30, 1890	$5,746,377

INCOME.

Federal aid:	
From land grant of 1862	$617,716
From act of August 30, 1890	1,152,000
Total Federal aid	1,769,716
State aid	2,570,427
Fees and other receipts	1,852,873
Total	6,193,016

EXPENDITURES.

For instruction in subjects mentioned in act of August 30, 1890	$2,449,588
For instruction in other subjects and administrative expenses	2,094,788

Statistics for 1898–99 of institutions endowed by the acts of Congress approved July 2, 1862, and August 30, 1890, with public lands, or a part of the proceeds arising from the sale thereof, or both.

a For instruction in all branches.

II.—NEW BUILDINGS AND CHANGES IN THE COURSE OR IN THE METHODS OF INSTRUCTION.

Alabama Polytechnic Institute, Auburn, Ala.—The last State legislature, on application of the trustees, changed the name of the college to the Alabama Polytechnic Institute, thereby showing its comprehensive and general scientific character, including not only agriculture and the mechanic arts, but also physics, electricity, chemistry, etc., in their varied applications to the industrial arts. Much attention is paid to laboratory work on the part of the students. Additions were made to the equipment in mechanical and electrical engineering, and a new residence for the professor of horticulture was constructed at a cost of $1,950. At present a special chemical laboratory for work in the experiment station is being constructed, and the foundry and forge room in the mechanical department is being enlarged. (President William Le Roy Broun.)

Agricultural and Mechanical College for Negroes, Normal, Ala.—One year has been added to the normal course, making it four years instead of three years. All the literary and industrial courses have been strengthened very materially. Sick nursing, cooking, and agriculture have been greatly improved. One of the two-story frame mechanic-arts buildings was destroyed by fire January 28, 1899. It was occupied by the departments in shoemaking, blacksmithing, carpentry, wheelwright, mattress, and broom factory and paint shop. The school being unable to restore the building, it was replaced by a brick building paid for by voluntary subscriptions of the teachers of the school. A new brick wing, 40 by 70 feet, three stories, was added during the year. This contains recitation rooms and laboratories on the first and second floors, and a dormitory for girls on the third floor. (President W. H. Councill.)

University of Arizona, Tucson, Ariz.—The principal change in our course of instruction has been the development of manual-training features, including free-hand and industrial drawing. The shop has been fitted with power and facilities for woodworking, so that we have given courses in carpentry, joinery, wood-turning, and inlaying during the year.

Our requirements for admission have been increased, a fact which tends to lessen our patronage. Almost our only sources of supply for our college classes are our subcollegiate department and the high schools of the Territory, of which there are but few, so that our classes must remain small until our population increases and fitting schools multiply.

While there have been no radical changes to record, the year has shown substantial progress in all lines of work. (President M. M. Parker.)

University of Arkansas, Fayetteville, Ark.—The financial condition of the university is perfectly sound, its educational work vigorous and progressive. The department of history and pedagogy have been separated, history made an independent department, and philosophy and pedagogy united, forming also an independent department. The courses of study have been materially modified, electives being limited to the junior and senior classes, the courses for the freshman and sophmore classes more definitely prescribed, some options, however, allowed among related subjects. Greek required for the B. A. degree, and a course, including Latin but not Greek, arranged leading to the degree of B. Ph. Repairs and minor improvements have been made on the buildings, but no new buildings erected.

By act of the general assembly of Arkansas, approved March 8, 1899, the name of the university has been changed from Arkansas Industrial University to the University of Arkansas. (President John L. Buchanan.)

University of California, Berkeley, Cal.—Paid to complete buildings in San Francisco for use of the professional departments during last fiscal year, $41,000.

The college of commerce began instruction, and instruction in the new department of geography was begun by Prof. George Davidson. Instruction in Cantonese Chinese was provided by the addition of Dr. John E. Gardner to the staff of the department of oriental languages and literatures. (President Benjamin Ide Wheeler.)

Delaware College, Newark, Del.—No changes in the courses of study have been made during the year except to effect a better correlation of work, through several transpositions of subjects, and to enlarge somewhat the freedom of election in the junior and senior years of some courses. The library and reading room, opened in September, 1896, at once began to tell upon the instruction in the departments of English language, history, and economics. The library is steadily growing and is exercising an increasing influence upon the work of the college. (President George A. Harter.)

Florida Agricultural College, Lake City, Fla.—Requirements for admission to the freshman class have been raised by the introduction of elementary botany, elementary physics, and concrete geometry into the preparatory course. The new catalogue outlines for the next year an entirely new course of study, in which agricultural subjects are to receive greater attention and be obligatory on freshman and sophomore classes. (President W. F. Yocum.)

Florida State Normal and Industrial College, Tallahassee, Fla.—In the session of 1897-98, owing to the increasing numbers in the boys' hall, the board of trustees set aside $900 out of the State appropriation for the year to add an extension to that building. An addition of two stories, 32 by 50 feet, containing 16 rooms, each 10½ by 10½ feet, was projected. The boys of the mechanical department, 14 in number, working for seven months at an average of two and two-thirds hours a day, after the close of the literary work, under the superintendence of their instructor, erected this building, which is quite an evidence of the brightness and efficiency of the young men, especially when it is noted that most of them had never handled a carpenter's tool until after entering this institution; this comes in as practice work. Had the building been erected by contractors it would have cost the State at least $1,800. During the past summer the girls' hall has been completed by the construction of the west wing at an expense of nearly $4,000 from the State appropriation of the present year. The finished building is 122 feet in length; the east wing is 20 by 54 feet; the west wing, 20 by 90 feet, and the main body is 36 by 80 feet. (President T. D. Tucker.)

Georgia State College of Agriculture and Mechanic Arts, Athens, Ga.—The condition of the college is good, and its progress for the year has been satisfactory. The faculty have given much consideration to systematizing the curricula and courses of instruction, with special view to strengthening and popularizing the courses in agriculture. By authority of the board of trustees all degrees given by the college have been abolished except one, that of bachelor of science. To obtain this degree four courses are offered, each with a certain degree of elasticity in the matter of options, and, in the special course, permitting the substitution of appropriate technical studies for those in the higher branches of pure science and others as follows: (*a*) General course; (*b*) civil engineering; (*c*) electrical engineering; (*d*) agriculture. The courses are essentially the same for the freshman year, which includes botany, drawing, and elementary agriculture. In each of the courses certain fundamental, liberal studies are required, and it is believed they are of equal pedagogic value, and also equal in this particular, to the courses for bachelor of arts offered in another department of the University. The course of instruction offered in the school of agriculture is essentially that proposed by the committee of the Association of American Agricultural Colleges and Experiment Stations. We believe this step will have a vast influence in establishing the course of instruction in agriculture in its proper place in the college curriculum.

The board of trustees of the university at its last session (June, 1899) also authorized the general faculty to require of all students in the university attendance upon courses of lectures upon agriculture or topics directly related thereto. (President H. C. White.)

University of Idaho, Moscow, Idaho.—We have enlarged the courses of instruction in the preparatory department, giving greater emphasis to scientific instruction and increasing laboratory facilities for the same. Fifteen additional rooms have been finished and furnished in the administration building at a cost of $14,000. These rooms are for laboratory and recitation purposes. In addition to these an auditorium capable of seating 700 has been finished and furnished. A farmhouse has been erected on the experimental farm and a greenhouse on the horticultural grounds. (President Joseph P. Blanton.)

University of Illinois, Champaign, Ill.—The university has enjoyed a year of unprecedented prosperity. In the year we completed and occupied a new electrical building and steam laboratory, and the legislature made an appropriation of $150,000 for a new agricultural building. (President A. S. Draper.)

Purdue University, Lafayette, Ind.—We have made a one-story brick addition to our chemical laboratory; erected a substantial wooden pavilion, 30 by 50 feet, for lecture purposes, particularly for the use of students in agriculture: a two-story piggery, built in accordance with the most improved modern plans; an extensive addition to the dairy; remodeled and made a substantial addition to the engineer's residence; remodeled the central heating plant, putting in new boilers, erecting two new coal houses, etc.; and improved our campus by laying cement walks to the extent of over 25,000 feet. In addition to these improvements, we have added to our equipment to the extent of about $10,000, making the total cost of improvements for the year 1898-99 about $20,000.

While the total enrollment for the year was 749, one less than the previous year, the number of graduates, 158 (regular four-year courses, 103; pharmacy, 33; advanced degrees, 22), was the largest in the history of the university; the freshman class, numbering 180, the largest save one, and the number of students taking the short course in agriculture was 50 per cent in advance of any previous year. During the year 1898-99 there have been published 8 regular station bulletins, 16 newspaper bulletins, 1 pamphlet on civil engineering, and an address by Governor Mount on "The Need for Higher Education in Agriculture and the Industrial Arts." The professors have delivered about 100 lectures on scientific subjects and 92 farmers' institutes have been held, averaging two days each. (President James H. Smart.)

Iowa State College of Agriculture and the Mechanic Arts, Ames, Iowa.—The growth of the attendance of students still keeps up. The college year hereafter will begin about September first instead of the last of July or first of August. We have fitted up new laboratories for pathology and histology. Our professor of zoology is now State entomologist. Our course for young women has been strengthened to a course in philosophy and letters and the degree of bachelor of philosophy given to the young women of this course instead of the degree of bachelor of letters, as hitherto. A number of the prominent buildings have been painted this summer. We have put in 25 shower baths for young men. We have added two new teachers to our department of English and greatly strengthened the quality and quantity of the work done in this department. (President W. M. Beardshear.)

Kansas State Agricultural College, Manhattan, Kans.—A four-years' course in civil engineering has been established; also a short course of one winter term in dairying. In addition to this three other short courses have been prepared to go into effect next year. They are respectively a domestic-science course of two terms, an agricultural mechanics' course of two terms, and a horticultural mechanics' course of two terms. The domestic-science course will be given in fall terms, the agricultural mechanics' and the horticultural mechanics' courses in

winter terms. All these short courses are open without examination to students of good character and 18 years of age. These courses are highly practical and are designed to meet the needs of students who can attend college but a short term.

By systematic effort, continued through a considerable portion of the year, the college has secured the largest legislative appropriation in its history, amounting to $111,600. Of this sum, $25,000 was appropriated to the erection of an agricultural and dairy building, and $9,000 more to the equipment of this building, the purchase of a dairy herd, and the provision of shelter for the herd; $9,000 was appropriated to the erection of an addition to the mechanical engineering building, while $12,000 more was allowed for equipment and additional boilers, boiler house, and engine; $5,200 was appropriated to the college library for completion of room and book stacks and for furnishing, heating, and lighting an addition to the library. (President Thomas E. Will.)

Agricultural and Mechanical College of Kentucky, Lexington, Ky.—We may confidently say that the last year was the most prosperous that the college has ever known. The attendance was larger, the college classes consisted in the main of good material, and the average numbers maintained were better than in former years.

The greatest improvement is along the engineering lines. The graduates from these courses of study find no difficulty in getting remunerative employment of a high order. Indeed, their services are not infrequently engaged in advance of taking their degrees. Experts who visit our shops and examine our lines of work speak uniformly of our good equipment and of the scope and character of work done by engineering students.

In natural science notable advancement has also been made. Our laboratories are well equipped for doing good work, and good work is done.

The removal of the State Geological Museum from Frankfort to Lexington, with the inspector of mines and his assistant, has added to the prestige of the college, and will by the act of removal establish a school of mines in the year 1900. The coal and iron interests of Kentucky will be materially benefited by a course of mining engineering in Kentucky.

The organization of farmers' institutes last winter bids fair to bring the facilities afforded by the college for agricultural instruction before the farming community. These institutes have been liberally attended by our professors of botany, zoology, geology, horticulture, dairying, engineering, and agriculture. We had one or two representatives at every institute held.

In conclusion, we are able to report progress along every line of work. (President James K. Patterson.)

State Normal School for Colored Persons, Frankfort, Ky.—We have purchased a farm of 265 acres, with a two-story brick dormitory, which we use for the boys' dormitory. This purchase increases the value and interest of our agricultural feature very much. The farm cost $16,500. It has outbuildings valued at $2,000. This year 80 acres are in grass, 40 acres in wheat, 12 acres in rye, 30 acres in corn, 10 acres in oats, and 3 acres in garden. (President James E. Givens.)

Louisiana State University and Agricultural and Mechanical College, Baton Rouge, La.—No buildings were erected during the year except a wooden storehouse for implements, tools, etc. A two-story addition to the mechanical workshop, 100 by 30 feet, is now being built. During the session of 1898–99 the course in sugar engineering was extended and perfected and full courses in mechanical engineering and civil engineering were substituted for the old one course in the two combined. A commercial course of four years has been arranged for the next session. (President Thomas D. Boyd.)

Southern University and Agricultural and Mechanical College. New Orleans, La.—There have been no changes in course or methods of instruction during the

session. A course in printing and one in bookkeeping and typewriting have been added during the past session. A printing press was purchased, with type and all necessary accompaniments, and a room was fitted up and a teacher for the same was employed. Classes have been taught in both sections during the session.

The school has just passed through a prosperous session. The total number of graduates this session from all the departments of the school was 23—12 from the literary and 11 from the industrial. Two of the lowest sections were removed. This reduced the total attendance from 443 of last year to 414 this year. We had, however, more applications for admission this session than last. Up to date, during thirteen years past, the number of graduations from the school are as follows: In the literary department, 100; girls' industrial, 27; agricultural, 19; mechanical, 2; making 100 literary and 48 industrial graduates. The agricultural and mechanical feature, however, is of more recent date.

It has been almost impossible to find pupils outside of this school far enough advanced to enter the lowest year of the high-school department. We have been obliged for years to maintain a grammar school to prepare material for the higher grades. The 148 pupils graduated have been brought out, almost without exception, from the raw material, most of them very raw. They have been, nearly all, through one or all of our grammar grades. The New Orleans public colored schools have taken our normal students for teachers about as soon as they graduated, and have picked out a number of our high-school graduates also. As most of these pupils are poor the temptation to secure a position for themselves is too great for them to resist. In making a list of our graduates we could not find one unemployed. (President H. A. Hill.)

University of Maine, Orono, Me.—During the year ending June 30, 1899, the school of law of the university has been opened with a very encouraging attendance. Professors of Latin and Greek have been elected in preparation for the inauguration of the classical course in the fall of 1899.

A dormitory for women has been completed at a cost of about $5,000. About $6,000 has been spent for the equipment of the departments, the largest amount going to the agricultural departments.

The faculty and number of students are the largest in the history of the university. (President A. W. Harris.)

Maryland Agricultural College, Collegepark, Md.—All courses have been materially advanced, the natural science section particularly. The trend of the institution's work is along the line of more technological work. Morrill Hall has been constructed during the past year, at a cost of $12,000. This is devoted to agriculture and allied branches. An annex to the main building for sanitary purposes has been constructed at a cost of $4,500. University extension work is being pushed. Nature studies in the public schools is a feature in which the college is much interested. (President R. W. Silvester.)

Massachusetts Agricultural College, Amherst, Mass.—The elective studies of senior year have been grouped according to their proper relations into 11 courses, and the courses have been made elective. A wooden building with small dairy plant has been erected for the special study of problems in the dairy, at a cost of $2,000. A veterinary laboratory and hospital stable have been erected and equipped at a cost of $25,000. The buildings are of brick. The walls of the laboratories, class rooms, and dissecting pit have the bricks covered with white glaze enamel to facilitate disinfection. The buildings are furnished with the latest apparatus and labor-saving devices.

The most notable piece of work has been working out and describing the life history of the nematodes affecting very seriously the crops of cucumbers, tomatoes, lettuce, etc., grown under glass, and making public a cheap and effective remedy for the same. (President Henry H. Goodell.)

Massachusetts Institute of Technology, Boston, Mass.—Last year's report contained a brief description of the new building named in honor of Henry L. Pierce, which since then has been practically finished. It is valued at about $130,000. In that part of it devoted to the engineering laboratory new pieces of apparatus have been placed to the amount of about $3,500. Additions have been made to the boiler house and electric plant; cost, $23,000. (President J. M. Crafts.)

Michigan Agricultural College, Agricultural College, Mich.—The past year has been a very successful one in the history of this college. The attendance was much larger than during any previous year, and good work was done in all departments. Our State legislature dealt liberally with the college during its last session, making the following appropriations:

For the erection and equipment of a woman's building	$95,000
Dairy building	15,000
Farm barn	4,000
Replacing heating apparatus in Williams and Wells halls	2,500
Fire escapes for these halls	500
Student labor	5,000
Repairs to buildings	10,000
Printing experiment station bulletins	8,000

The increase in attendance has not been brought about by giving up any of the industrial features of the institution. Every student entering is required to take industrial work; young men in either the agricultural or mechanical departments, and the young women in domestic science. Farmers' institutes, experiment station bulletins, and summer excursions to the college have had much to do in bringing this institution into closer touch with the people for whose benefit it was established. (President J. L. Snyder.)

University of Minnesota, Minneapolis, Minn.—The work in mechanical engineering has been materially strengthened during the past year by the introduction of a systematic course in machine design. This has brought about some changes in the general work of drawing and kindred subjects, which also affect and benefit the students in civil and electrical engineering. The administration of the work in shop practice has been somewhat modified, and now includes a course of lectures supplemented by shop visits which bring the student in closer touch with practical methods of construction. Much attention has been given to the development of the courses in railroad engineering, and the facilities for better instruction have been increased by material additions to the equipment. An air compressor for use on the Westinghouse airbrake has been set up in the mechanical laboratory, and special investigations will be carried out with this apparatus.

The college of agriculture and the school of agriculture continue to grow in influence and popularity. The college course has been strengthened in the sciences. The work during the past year has been most satisfactory. The last legislature appropriated $35,000 for a new horticultural and physics building, which is now being erected. The size is 50 by 80 feet, three stories in height. The first story is of pink Kasota stone; the rest of the building is finished in red brick on the outside; the inside walls are of buff brick, no plaster; floors are of hard pine, mill construction; roof of slate. The first story is to be used for a botanical laboratory, the second floor for the horticultural department, the third floor for the department of physics. There is to be a greenhouse laboratory annex 25 by 50 feet, built of brick, one story in height, which will accommodate 30 students. The greenhouse covers 4,500 square feet, one-half of which is designed especially for students. There is a machine and tool exhibition room 20 by 80 feet, and there are storage cellars 20 by 50 feet. This will greatly increase the facilities for instruction in horticulture and physics, and at the same time relieve

the congestion that has existed in the departments of entomology and chemistry. The last legislature appropriated $10;000 to enlarge our heating and lighting plant. (President Cyrus Northrop.)

Mississippi Agricultural and Mechanical College, Agricultural College, Miss.—The course of instruction in agriculture has been enlarged in the freshman class by adding a course in chemistry of agriculture and a course in elementary veterinary science, the two important sciences so closely connected with agriculture. All freshmen receive instruction in agriculture, horticulture, chemistry of agriculture, veterinary science, and botany, besides the usual studies, giving a general or liberal education. The establishment and partial equipment of physical and electrical laboratories, an electric-light plant, and additional instruction and systematic laboratory work in both physics and electricity have been material improvements to the course of instruction in mechanic arts. Good progress has been made during the present year. The course of study is now well arranged and coordinated in the different departments. (President J. M. Stone.)

Alcorn Agricultural and Mechanical College, Westside, Miss.—The following improvements have been made: A new barn, costing $1,000; a shoe shop, costing $1,000; and repairs on eight dwelling houses for professors, costing $1,200. Improvement of old lands has been carried on systematically and 40 acres of new lands have been cleared and improved. An increased quantity of Indian corn, pease, Irish and sweet potatoes, pumpkins, cotton, clover, hay, and numerous grasses, hogs, cattle, and butter were produced and realized from the farm. (President W. H. Lanier.)

Missouri School of Mines and Metallurgy, Rolla, Mo.—Began a new course in general science, four years, leading to the degree of B. S. in general science. This differs from the other courses in being much more largely elective. Enlargement of wood-working shops and dynamo laboratory begun; new system of waterworks completed; bathroom, with shower baths, etc., and lockers for student use added; physical laboratory enlarged by addition of one room. Several new advanced subjects have been added to the graduate courses. The grounds have been improved by planting trees and vines. A new chair, full professorship, was provided for this past year. (Director Geo. E. Ladd.)

Lincoln Institute, Jefferson City, Mo.—In addition to manual training in our shop, as heretofore, we have decided for the coming year to give to our students complete trades in carpentry, blacksmithing, and machine-shop work. For the coming year, also, in addition to dressmaking, we shall give the girls instruction in cooking and laundry work. While we erected no new buildings during the past year, we have repaired and improved our present ones. (President John H. Jackson.)

Montana College of Agriculture and Mechanic Arts, Bozeman, Mont.—No changes of any importance have taken place during the year in methods of instruction. A biological department has been organized in which opportunity will be given students to specialize in the direction of either zoology or botany. A short course in agriculture, covering three years of six months each, has been arranged. The standard for matriculation in college courses has been raised, and the common branches have been thrown out, making it necessary for students to prepare in these subjects in the public schools. (President James Reid.)

University of Nebraska, Lincoln, Nebr.—Many changes in the courses of study have gone into effect during the year. A complete revision of the curricula in the College of Literature, Science, and Arts and in the Industrial College was made after careful and prolonged investigation by a committee of the general faculty. It was found during the past few years, in which a pretty free elective system prevailed, that the great majority of students in both colleges took what may be called general rather than special lines of work. Accordingly the faculty brought

together three "groups" of studies, viz, (1) classical; (2) literary; (3) scientific, with approximately equal entrance requirements, each of which is intended to give a general training. In each of these 130 hours of work are required for graduation, of which 36 hours are elective. The classical and literary groups are in the College of Literature, Science, and Arts, while the scientific group is in the Industrial College. In the College of Literature, Science, and Arts there are 18 special groups of studies, intended to supply all reasonable demands in the way of combinations and electives. Here also are found the teachers' course and course preparatory to law and journalism. In the Industrial College there are seven special groups having the same purpose and four technical groups, in which the purpose is to give a thorough professional and practical training in a particular kind of work. In the Industrial College are also the practical courses of one, two, or three years' length, in which those with less preparation are admitted to the study of agriculture, mechanic arts, domestic science, etc.

The growing demand for opportunities for study during the summer has resulted in the development of the summer school, which had little relation to proper university work, into a summer session (6 weeks in length), limited almost entirely to certain lines of university work.

The relations of these several groups of studies and lines of work are shown in the following synopsis:

I. General groups (requiring 130 hours, of which 36 are elective):
   (*a*) College of Literature, Science, and Arts—
      1. General classical group (including classical studies, 24 hours; modern language, 14; English, 14; science, 12; history and political science, 12).
      2. General literary group (including history and political science, 34 hours; ancient or modern language, 16; English, 14; science, 12).
   (*b*) Industrial College—
      1. General scientific group (including science, 36 hours; English, 16; history and political science, 16; modern language, 8).
      2. General agricultural group (including agricultural subjects, 28 hours; science, 20; English, 16; modern language, 8; political science, 6).

II. Special and technical groups (requiring 130 hours, of which at least 40 hours must be in the special or technical line, and usually permitting less than 36 hours of electives), with some practical groups (with lower requirements):
   (*a*) College of Literature, Science, and Arts—
      1. Eighteen special groups, as follows: (1) American history and political science; (2) English and history; (3) English and philosophy; (4) English and political science; (5) Germanic and Romance languages; (6) Greek and English literature; (7) Greek and Germanic languages; (8) Greek and Latin; (9) Greek and Romance languages; (10) history and philosophy; (11) history and political science; (12) Latin and English; (13) Latin and Germanic languages; (14) Latin and history; (15) Latin and Romance languages; (16) mathematics and political science; (17) philosophy and political science; (18) philosophy and zoology.
      2. Law and journalism group (with the same conditions for admission as for other groups, but requiring 66 hours; in history and political science, 42 hours; English, 19 hours, and philosophy, 5 hours).
      3. Teachers' course (may be elected by juniors and seniors, and includes 65 hours of prescribed work, of which 25 must be devoted to special, 12 to professional, and 22 to general knowledge).

(*b*) Industrial College—

1. Seven special groups, as follows: (1) Agriculture and chemistry; (2) botany and agriculture; (3) botany and zoology; (4) chemistry and physics; (5) horticulture and botany; (6) mathematics and physics; (7) zoology and philosophy.
2. Five technical groups: (1) Technical agriculture; (2) civil engineering; (3) electrical engineering; (4) mechanical engineering; (5) municipal engineering.
3. School of agriculture (including a 3-year course and a "short course").
4. Sugar school (including a 1-year course).
5. School of mechanic arts (including a 2-year course).
6. School of domestic science (including a 2-year course).
7. Preparatory medical group (including a 2-year course).

In addition to the foregoing the following is an elective group for students in either college: Course in physical education (may be elected by sophomores, juniors, and seniors, and including 36 hours of prescribed work).

III. Summer session (of 6 weeks, including courses in science, English, history, Latin, mathematics, pedagogy, and modern language).

The north wing of mechanic arts hall, erected at a cost of $30,000, was formally dedicated October 27, 1898. It is a substantial brick building, 65 by 120 feet on the ground and three stories in height, containing rooms for shops, laboratories, lecture rooms, etc., for the departments of mechanical, electrical, and civil engineering, and temporarily for agriculture, mathematics, entomology, and domestic science. (Acting Chancellor C. E. Bessey.)

Nevada State University, Reno, Nev.—The organization of the university comprises the following schools of instruction and training: (*a*) The school of agriculture; (*b*) the school of liberal arts; (*c*) the school of mines; (*d*) the school of civil engineering; (*e*) the school of mechanical engineering; (*f*) the State normal school; (*g*) a course in the theory and application of electricity. The school of mechanics has become the school of mechanical engineering. The course in the theory and application of electricity is a new course. It is not designed to be a full course in electrical engineering, but rather a supplement, and strengthens the work in all the technical schools. The courses of study in history and political science have been enlarged. The faculty have given careful consideration to improvement in all their subjects of instruction. The college needs larger library resources and better library facilities.

The legislature of the State at the session of 1898 did not feel able to purchase land for the Experiment Station and Agricultural and Mechanical College. The county of Washoe, in which the university is located, purchased a valuable piece of land near the university and gave the land to the State for the use of the college and station. The cost of the land was $12,000. (President J. E. Stubbs.)

New Hampshire College of Agriculture and Mechanic Arts, Durham, N. H.—No important change has been made during the year except such as naturally followed from the decision indicated in the preceding report to adopt a schedule of entrance requirements not lower in grade than those recommended by the Association of American Agricultural Colleges and Experiment Stations.

The preparatory course, adopted as a temporary expedient and incident to the change indicated above, has been continued and will be a necessary burden for one or two years at least.

The two years' course in agriculture required by the legislature of New Hampshire and supported in part by State appropriation is so related with the four years' course in agriculture as to give a theoretical and practical training not too

far removed from collegiate standards. Its permanence, however, is not yet established. (President C. S. Murkland.)

Rutgers Scientific School, New Brunswick, N. J.—The year opened with an increased attendance of students, the entering class being considerably larger than for several previous years and nearly every member of the three upper classes returning for the continuation of study.

The five courses of study leading to the first degree in science (B. Sc.) have been maintained throughout the year.

The course in agriculture still continues to attract attention, and reports from various preparatory institutions in New Jersey indicate that this course is likely to have an increased number of students.

The course in civil engineering and mechanics maintains its high standard as well as its popularity and influence among the students. To this course has been added a plan, now in successful operation, for practical field work under the personal direction of the professor of graphics and mathematics, whose class-room instruction in surveying and in railroad curves is thus happily supplemented.

A professor, two associate professors, and a well-equipped laboratory make the facilities for instruction in the course in chemistry of a superior order.

Those students who are preparing for post-graduate courses in technical schools or for electrical pursuits which do not require, at the outset, a complete professional training find the course in electricity most useful. The physical laboratory has received recent additions of wireless-telegraphy apparatus, an 8-inch spark coil and a Reichsanstalt photometer.

In preparing for advanced studies in medical schools the course in biology has proved most helpful and has received a large number of elections.

The arrangement of the recitation schedule has made it possible for the members of the senior class in the scientific school to attend the lectures in pedagogy given regularly to the members of this class in the classical school.

The plan of instruction and examination in municipal hygiene introduced in Rutgers Scientific School last year and for the first, it is believed, in any American institution, has been continued during the present year. At the examination held in May, 1899, two persons approved themselves as qualified to act in the execution of the health laws of New Jersey—one as an executive health officer and one as a sanitary inspector.

In the general work of the extension department three half courses of six lectures each and two half courses of seven lectures each have been given, as follows: One half course each on the eastern question and modern history and three half courses on the Victorian poets. The total attendance at the 32 lectures was 735 persons, and the average attendance 525. The total attendance at the class hours following each lecture was 303 persons, and the average attendance 230. Ordinary half-course certificates were awarded to four persons, and an honor certificate to one person.

In special work 18 lectures were given, at which the total attendance was 946 persons, and the average attendance 681. The total attendance at the class hours was 600 persons, and the average attendance 425.

The total number of catalogued and classified volumes in the library is 40,000, of which 3,438 volumes were added during the past year.

During the year the membership of the faculty has been 27, and all but 3 of this number have given instruction in the scientific school.

The enrollment of students for the year was 116—graduate students, 2; seniors, 19; juniors, 21; sophomores, 21; freshmen, 47, and special students, not candidates for a degree, 6. There were also 53 students in the classical school and 138 pupils in attendance at the preparatory school. The degree of bachelor of science was

conferred upon 19 graduates in June, 1899. Of these graduates, 10 had pursued the course in civil engineering and mechanics, 4 the course in chemistry, 2 the course in electricity, and 3 the course in biology.

The results of the work of the New Jersey State Agricultural Experiment Station and of the New Jersey Agricultural College Experiment Station are published in the form of bulletins and annual reports. One hundred and thirty-six bulletins, 18 special bulletins, and 19 annual reports were issued by these two stations prior to June 30, 1899. The particular work of the Agricultural College Experiment Station is included in 44 of these bulletins, 13 of the special bulletins, and 11 of the annual reports.

The special work of the year has been a continuation of the investigation of bovine tuberculosis and other diseases of animals, the fungous diseases of plants, the injurious insects found in New Jersey, and of the experiments in irrigation. (President Austin Scott.)

New Mexico College of Agriculture and Mechanic Arts, Mesilla Park, N. Mex.—The courses of study in the college have not been materially changed, but in minor details have been strengthened. A frame building has been erected on the college grounds and has been used as a club house for young men. This has only partially met the demand for better dormitory accommodations, yet it has been fully occupied throughout the year. Improvements have also been made in the basement of the main college building. The equipment of the various departments of the college has been added to, the electrical equipment receiving numerous additions. Satisfactory work has been done in all departments of instruction. The enrollment has been about the same as for the year previous. A class of three men was graduated with the degree of bachelor of science at the close of the year, and the degree of master of science was conferred upon one postgraduate.

The work of the experiment station has progressed satisfactorily during the past year. Investigations in sugar-beet culture and soil moisture have been continued. The station has adopted the plan of issuing press bulletins weekly in addition to the regular printed bulletins. (President Frederic W. Sanders.)

Agricultural and Mechanical College for the Colored Race, Greensboro, N. C.—An architectural course has been added to the curriculum. (President James B. Dudley.)

North Carolina College of Agriculture and Mechanic Arts, West Raleigh, N. C.—No material changes have been made in methods of instruction. The scope of instruction has been extended by the addition of a course in veterinary science under the direction of Prof. Cooper Curtice, B. S., D. V. S., M. D. Additional electrical apparatus has been purchased to the value of $1,000. Two additional rooms have been added to the mechanical building. (President Alexander Q. Holladay.)

North Dakota Agricultural College, Agricultural College, N. Dak.—A combined sheep and pig frame barn, 36 by 48 feet, one and one-half stories, has been contracted for and is about completed, as is also an addition to the mechanical building, 22 by 36 feet, for instruction in blacksmithing. A department of steam engineering has been established in connection with the mechanical course, intended more particularly to accommodate young men desirous of operating steam traction engines.

The boys' dormitory has been abandoned, rechristened Francis Hall, and remodeled and converted into class rooms and laboratories, affording accommodations for the departments of household economics, agriculture, horticulture, veterinary, and a museum.

A brick walk, some 900 feet in length, is about completed, extending from the

main college building to Francis Hall, and a wooden one from there to the barn, some 600 feet distant, is already completed.

The poultry yards have been materially enlarged and the barn, implement shed, poultry house, farm house, and dairy building have been newly painted.

No material change in course of study or methods of instruction, except one year's work has been added to the preparatory course. Several additions have been made to the faculty. During July and August a four weeks' summer training school for teachers was conducted the same as last year, with 180 in attendance. (President J. H. Worst.)

Oklahoma Agricultural and Mechanical College, Stillwater, Okla.—The character and manner of instruction was the same as that followed in former years. A two-story building of native stone, 80 by 35 feet, was erected during the year and fitted for instruction in mechanic arts; cost, $3,553. This increase in facilities permitted of the establishment of a course in mechanic arts. Facilities for instruction in printing have also been provided. The courses of study for the coming year have been revised and arranged so as to permit of elective courses instead of elective studies making up a course. There will be offered courses in general science and literature, agriculture, mechanical engineering, and special science, with (*a*) chemistry or (*b*) biology as majors. (President Angelo C. Scott.)

Oregon State Agricultural College, Corvallis, Oreg.—An armory has been built costing $10,000. It is devoted primarily to military training. It is 70 by 120 feet, two stories. The basement story is of stone and has a commandant's room, a physical-culture room for young ladies, and one for young men, and a bowling alley for both sexes. The second story is of wood and contains a drill hall with armory rooms and a running gallery. The main drill room will be fitted for a gymnasium also. A mechanical hall, to be known as the Morrill Mechanical Hall, 120 by 80 feet, has been completed—two stories, stone. It contains a woodworking room or shop, machine shop, printing office, drawing rooms for both free-hand and mechanical drawing, physical laboratories, and botanical rooms. The cost is $21,000. A power house, including a blacksmith shop, one story, brick, costing $2,000, has been built. The engine rooms are supplied with boiler, engine, and dynamos for furnishing power to the mechanical hall and printing office and for lighting the various buildings. A steam heating plant has been contracted for and will be ready for the fall opening. It will cost about $16,000. (President Thomas M. Gatch.)

Pennsylvania State College, State College, Pa.—The only important fact in relation to the college during the year has been the steady strengthening of the work in the several departments, and the corresponding fact that nearly every member of the graduating class had secured a position for employment in the line of his chosen profession before commencement day. (President G. W. Atherton.)

Rhode Island College of Agriculture and Mechanic Arts, Kingston, R. I.—The institution has continued its usefulness during the past year. In the agricultural department the poultry school has had an increased number of students. The preparatory department has proved itself of great value in fitting country boys and girls for the college course. The biological department has had charge of a summer school for nature study for the teachers of Rhode Island. Over 70 teachers were in attendance, and 40 applications were refused, as our number was limited for lack of accommodations and facilities. (President J. H. Washburn.)

Colored Normal, Industrial, Agricultural and Mechanical College, Orangeburg, S. C.—There has been no change in the course of instruction. Besides Bradham Hall—a building three and one-half stories high, 62 by 126 feet, containing dormitories and class rooms—and a dining hall 36 by 75 feet, with an altitude of 18 feet, we have erected a new college building, 90 by 154 feet, containing chapel, library,

reading room, laboratory, two literary auditoriums, gymnasium, commercial department, 8 class rooms, and 50 sleeping rooms, to be heated by steam, with waterworks on each floor. This building will be ready for use September 20, 1899, and will cost not less than $27,000 when completed. We have purchased opera chairs for the chapel, at a cost of $1,000, and chairs for the new dormitory, at a cost of $200. (President Thomas E. Miller.)

South Dakota Agricultural College, Brookings, S. Dak.—There has been a steady growth all through the year. More than 400 students have been in actual attendance. Every department in the institution has been taxed to its utmost. The legislature has increased State aid materially for the future and will hereafter furnish about the same amount for running expenses that is provided by the national funds (Hatch and Morrill). It has in addition provided money for two new buildings to be erected this summer—one for armory and gymnasium purposes and another for the use of dairy and animal husbandry work. No changes whatever occurred during the year in the faculty. The new departments mentioned in my last report have proven highly popular and helpful and have been well patronized. The changes in courses of instruction announced last year were carried out, and in the main were found helpful. The freedom offered students in choosing majors is highly satisfactory and will be developed more fully in the future. Our courses are so arranged that they articulate well with the work of the common schools. This we regard as very important, because it brings our advantages within the reach of the masses, for whom they are especially provided. (President John W. Heston.)

University of Tennessee, Knoxville, Tenn.—Courses of study and methods continue the same.

A new experimental barn has been erected at the farm especially for work in dairying. It is frame over brick basement, cement floor, iron stall fittings, etc.; cost, $4,200.

The school of agriculture has been reorganized and several assistants added in this department of the station, viz, a dairyman, an assistant for plat experiments, and a foreman of the farm. This school is being fully equipped.

Much new equipment has been added during the year to the mechanical department, a new building for which (costing about $13,000) was completed last autumn. (President Charles W. Dabney.)

Agricultural and Mechanical College of Texas, College Station, Tex.—A department of entomology was established during the year. The standard for entrance has been raised. A student must be able to stand examination in arithmetic and begin with algebra to enter our fourth (freshman) class. The State legislature just adjourned (July, 1899) made the following appropriations for buildings and improvements to be completed the coming year: For agricultural and horticultural building and equipment, $31,000; dormitory and equipment, $28,000; dwelling, $6,500; well and equipment, $2,500; sewerage system, $5,000; repairs, $5,000. When the above-mentioned dormitory is completed, it will furnish room for about 200 additional students at the college. (President L. L. Foster.)

Agricultural College of Utah, Logan, Utah.—The last legislature made provision for a new greenhouse, which is at present erected, at an expense of $2,800. The most noticeable progress in the college is the increased percentage of students who remain throughout the entire school year of nine months. For the benefit of students who can not leave the farm before November 1, provision was made by the last legislature for a five months' course, extending from November 1 to March 31. (President J. M. Tanner.)

Virginia Agricultural and Mechanical College, Blacksburg, Va.—A new four years' course preparatory for study of medicine has been added, and two years' instruction in Spanish, and two years' in Latin provided. Improvements: Cold-

storage plant, cost $1,336; dwelling house and lot, cost $2,000; two laborers' cottages, cost $500. (President J. M. McBryde.)

Hampton Normal and Agricultural Institute, Hampton, Va.—The general condition of the institute is good in all of its lines of work. The standard of excellence in the academic department is being raised each year. The departments of agriculture and mechanic arts have been strengthened by the equipment of new physical and chemical laboratories. The courses in the trade school have been enriched, and the entrance requirements to these courses have been raised. In the agricultural department a dairy course has been started, the elementary course in agriculture has been opened to all the girls of the academic department, and the special course in agriculture, leading to a certificate, has been made a post-graduate course. The work in domestic science has been greatly advanced by the addition of new and commodious sewing rooms and a well-equipped kitchen. The effort in each department is to keep in touch with every-day life and to make its work as concrete and practical as possible. (Principal H. B. Frissell.)

Washington Agricultural College and School of Science, Pullman, Wash.—One hundred thousand dollars have been appropriated for the construction of Science Hall for the departments of botany, zoology, bacteriology, agriculture, horticulture, veterinary science, and geology, and museum; also forge shop and foundry and rebuilding Ferry Hall (the boys' dormitory). These buildings are under construction. (President E. A. Bryan.)

West Virginia University, Morgantown, W. Va.—A department of domestic science has been established, and our premedical course has been made to cover two years. Fellowships in chemistry, Latin, mathematics, agriculture, economics, elocution, English literature, Romance languages, and German have been established. Three new buildings are to be erected: A library building, to cost about $50,000; mechanic arts building, to cost about $30,000, and an armory, to cost about $12,000. (President Jerome H. Raymond.)

West Virginia Colored Institute, Institute, W. Va.—Since the last report our English course has been materially broadened. Our mechanical course has been strengthened by the appointment of two new teachers and the purchase of additional mechanical appliances. We have now in course of erection one brick dormitory which will accommodate 100 boys, and we are also making a much-needed and substantial brick and stone addition to our main building. The boys' new dormitory, when completed, will cost $15,000, and the addition to the main building $6,000. We have also added a new electric plant and engine, at a cost of $3,000. (President J. McHenry Jones.)

University of Wisconsin, Madison, Wis.—During the year a dairy barn and stock-judging building has been completed at a cost of $18,000. In this structure the latest ideas relative to the economic healthful housing of dairy stock has been incorporated. The building is lighted by electricity and three electric motors furnish the required power. A large room is provided for stock-judging purposes. This room, which is 40 by 70 feet in area, is warmed by steam heat and is lighted from above by means of skylights. (President C. K. Adams.)

University of Wyoming, Laramie, Wyo.—During the past year an addition to our greenhouse has been built at a cost of $900. In our military department we have been without a regular officer from the United States Army and one of our professors has taken charge of the department. On the whole, he has been a great success and shown himself surprisingly competent for that line of work. Our normal department will be greatly strengthened the coming year; a business college will be added to the courses of study and some minor changes will be made in our work generally. We have an appropriation from the last legislature also for a new science hall, which will be erected another summer. (President Elmer E. Smiley.)

III.—INSTRUCTION IN DAIRYING.

Prior to the passage by the Congress of the United States of the act of July 2, 1862, donating lands to the several States for the purpose of establishing institutions in which the leading object should be instruction in agriculture and the mechanic arts, very little had been done in this country for the scientific education of the farmer. The passage of the said act and of the act of August 30, 1890, for the more complete endowment and support of the institutions established under the provisions of the act of July 2, 1862, resulted in the establishment of what are generally known as "agricultural and mechanical colleges" in each State and Territory of the country. The courses of study provided for the farmer or for those who wished to prepare themselves as such were intended to cover the entire field of agriculture as well as to furnish a good general education. Thus, while general instruction in dairying as it should be carried on by the farmer was included in the agricultural course, no provision was made until a comparatively recent date for the education of persons who were to devote themselves to the making of butter and cheese.

On account of the lack of such instruction creamery men were compelled to rely upon their own efforts for any improvements in the methods of manufacturing dairy products, and as a result could not compete successfully with the butter and cheese makers of countries where instruction in dairying and investigations into the subject were carried on. In order that the dairy interests of the country might be fostered as much as possible it was considered necessary to provide the needed instruction, and thus special schools of dairying were established in connection with the agricultural colleges of the country. The establishment of experiment stations in connection with these institutions, under an act of Congress of March 2, 1887, undoubtedly assisted in the founding of dairy schools, as it opened the way for investigation of the subjects to be taught therein.

The Wisconsin Dairy School of the University of Wisconsin was established in January, 1890, and in 1891 the legislature of that State appropriated $25,000 for the erection of a dairy building in connection with the dairy school. These steps were quickly followed by other States. The popularity of these schools and the demand for the services of persons who have received instruction therein are proofs of the wisdom of their establishment.

In his report for the years 1896–97 and 1897–98 to the board of regents of the University of Wisconsin, President C. K. Adams says: "Our dairy department has now sent out more than 700 trained students, and still the demand is far more than we can supply. There are now about 2,500 creameries and cheese factories in the State. * * * The importance of the work of the school is indicated by a single fact. Only a few years ago Wisconsin cheese was worth in the market from 2 to 5 cents a pound less than the cheese of New York, but at present, chiefly—directly or indirectly—through the teachings of the dairy school, the relations of the products of these States in the market, as well as in the opinions of experts, have been reversed."

In the tenth biennial report of the board of regents of the University of Minnesota the influence of the dairy school of that institution upon the dairy industry is stated as follows: "Since the establishment of this school dairy industry has made such remarkable growth that Minnesota is now recognized as one of the leading dairy States of the Union. * * *

"During the past two years some 200 new creameries have been built, equipped, and are being successfully operated, bringing the number of creameries in the State up to 650. When the last biennial report was made it was estimated that half of the dairy products in the State was manufactured in creameries. Now the product of the creameries is about 50 per cent greater than that of the home dairy. A careful estimate of the annual amount received by patrons of the cream-

eries in this State is $10,000,000, and the receipts from the home dairy $6,500,000. During the seven years that the school has been established, 484 students have been in attendance."

Probably the most important invention as an aid to the dairying interests of the country is the Babcock milk test, invented by Dr. S. M. Babcock of the University of Wisconsin, by means of which it is possible to determine the amount of fat in milk. This method of testing milk is taught in the dairy schools of the country, and is in almost universal use even in home dairies. As the quantity and quality of butter that may be made out of a certain amount of milk depends upon the amount of fat contained therein, the price paid for milk by some creameries is regulated by the amount of fat it contains as determined by means of the milk test. In the report of the University of Wisconsin, quoted above, President Adams calls attention to another aid to the dairying interests. He says: "Probably next in importance to the invention of the Babcock milk test has been the Wisconsin curd test, also devised at this station. This is a simple method of treating a sample of milk so that it will show to the operator whether or not milk is contaminated or tainted in any way so as to unfit it for use in the dairy, especially for use in cheese making. Not infrequently the product of our cheese factories is depreciated in value from $5 to $15 per day for weeks at a time because of bad milk. It has been calculated that $100,000 a year is not too small an estimate for losses to our dairymen from this source. The experiment station is now teaching the dairy pupils the use of this test, and its introduction over the State is spreading rapidly. The Wisconsin Dairymen's Association for 1898 and the Quebec Dairymen's Association for 1897 have both warmly commended the test as having already greatly increased the value of dairy products."

The special dairy schools are not conducted throughout the entire scholastic year, but are opened, as a rule, in December or January, and continue for from four to twelve weeks, the length of the course varying in the several States. These special courses, being intended especially for persons who have had some experience in creameries or cheese factories, are given in the winter season, as that is the most convenient time for creamery men to leave their work, the summer months always being the busiest in creameries. In some of the schools one of the requirements for admission is that the applicant shall have had practical experience in creameries. Owing to the large amount of practical work included in the courses of these schools the number of students admitted at any one time is necessarily limited to such number as can be accommodated at the machinery and other apparatus of the department.

In the following pages are given outlines of the instruction in dairying offered by the various agricultural colleges with special reference to instruction in butter and cheese making. The special courses in dairying are given in full, so far as they are published in the annual catalogues, together with a description of the equipment for instruction in practical dairying. As may be seen, some of the States do not provide special courses for the instruction of butter and cheese makers, but the only instruction offered in dairying is that included in the regular agricultural courses.

Alabama Polytechnic Institute.

Dairying is taught in the first term of the sophomore year by practical work in the dairy—butter making, determination of fat in milk by the Babcock method, etc.—as well as by instruction in the lecture room. (Catalogue, 1898–99.)

Colorado Agricultural College.

Dairying is taught the first term of the senior year by means of lectures and recitations in the forenoon. The exercises of the afternoon relate to butter making, milk testing, and the handling of dairy apparatus. (Catalogue, 1898–99.)

Connecticut Agricultural College.

1. A short winter course in dairying is given for the benefit of those who can take but little time for the subject, including composition of milk, conditions of creaming, milking for market, butter making, washing, salting, packing, etc. Breeding, feeding, and diseases of dairy cattle are subjects also treated in this course, with such texts as "Milk and its products" (Wing), "Bacteriology" (Russell), and "Feeds and feeding" (Henry).

2. In the regular course the junior class is instructed four and one-half hours a week, with practice in feeding and dairy work and keeping records of the herd. (Catalogue, 1898-99.)

Delaware College.

A course of lectures on the handling and care of milk and its products is given in the winter term of the sophomore year. This includes work in the determination of fat in milk by the Babcock tester and special attention to the commercial handling of milk.

In the short course in agriculture, extending from the first Tuesday in January to the last Friday in March, there are given 12 lectures on the chemistry of milk in general, treatment of milk, creamery machines and methods, testing of milk, and the commercial side of the dairy. One hour per week is devoted to lectures on agricultural bacteriology. Among the subjects treated are: The general characters and methods of study of bacteria and their relations to health and disease; methods of destroying bacteria; antiseptics and disinfectants; the relation of bacteria to milk: (*a*) milk and human disease; (*b*) fermentations of milk and their prevention; preservation of milk; special diseases of milk; (*c*) the relation of bacteria to good and bad butter; (*d*) the relation of bacteria to cheese making. (Catalogue, 1898-99.)

Florida Agricultural College.

Instruction in dairying is given two hours per week during the second term of the senior year. (Catalogue, 1898-99.)

Georgia State College of Agriculture and Mechanic Arts.

Instruction in dairying, including butter and cheese making, is given in the second term of the senior year.

A dairy school is conducted for two weeks in March, in which instruction is given in the best methods of making butter and cheese and of preserving them for home consumption and for market. (Catalogue, 1898-99.)

University of Idaho.

Equipment.—The dairy consists of a butter-making room, a cheese room, a laboratory for milk testing, an engine room, and a cheese-curing room.

Dairying.—This course consists of laboratory instruction in modern dairy methods and appliances. Students taking the course are required to perform at least two hours a week of practical work in the creamery, two hours per week of instruction, and two hours' practicum. (Junior year, second semester.) (Catalogue, 1898-99.)

University of Illinois.

Equipment.—The dairy department is equipped with a plant for laboratory work in testing, pasteurizing, separating, creaming, and churning, and for investigation in dairy bacteriology.

Dairy management.—Origin and development of the various breeds of dairy cattle; noted families and individuals in the different breeds; judging best breeds for grading purposes; improvement of a herd by testing; care and selection; methods of management of a dairy herd; best feeds for the economical production of milk; construction and care of dairy barns. (First semester, once a week.)

General dairying.—Secretion of milk; its composition as determined by chemical analysis and by microscopic examination; general facts concerning bacteria in their special relation to milk, butter, and cheese; methods of preventing contamination; development of acid and the acid test; pasteurization; different methods of testing for fat contents, total solids, and adulterations; variations in milk and their causes; economical production of milk; use and care of cream separators;

comparison of different systems of creaming and the making of butter by the most approved methods. (Second semester, first half.)

Butter making.—Operation of and studies in efficiency of different separators in comparison with gravity methods of creaming under a variety of conditions; influence of character of milk and its handling upon the quality of butter; different methods of ripening cream and the effect upon churning and upon butter, together with an extended practice in the manufacture and in scoring of butter. (Second semester, second half, two periods.) (Catalogue, 1898–99.)

Purdue University.

Equipment.—The dairy contains five rooms, viz: General workroom, milk-setting and churn room, separator room, testing laboratory, and ice house. This building is fitted with a complete set of tools suited for farm dairy instruction, as separators, creamers, churns, cheese-making tools, butter workers, pressers, etc.

Dairying.—Junior year, spring term, eleven weeks, eight hours per week. Study of milk, butter, cheese, methods of handling, etc., including practical dairy instruction. (Catalogue, 1898–99.)

Iowa State College of Agriculture and Mechanic Arts.

Equipment.—The dairy is a practical working creamery and cheese factory in operation every week in the year, and is conducted on a practical and commercial scale, as well as for scientific investigation and instruction. During the summer season from 15,000 to 20,000 pounds of milk are taken in daily and manufactured into butter and cheese. Five different kinds of separators are used in the building and the most approved machinery is used.

Courses of study.—In addition to the work done in dairying by the students of the regular four-year course in agriculture, there are provided a one-year course in dairying, two summer schools in dairying, each extending through sixteen weeks, and a winter school in dairying continuing four weeks.

ONE-YEAR COURSE.

First term.

Dairy practice, six days per week.
Milk and its products, 16 lectures.
Milk testing, 16 lectures.
Bookkeeping, 16 lectures.
Bacteriology of milk, 16 lectures.
Dairy stock, 16 lectures.

Second term.

Dairy practice, six days per week.
Cheese making, 16 lectures.
Pasteurization, 16 lectures and laboratory work.
Dairying machinery, 16 lectures.
Dairy feeding, 16 lectures.
Dairy chemistry, 16 lectures.

SUMMER SCHOOLS.

Dairy practice, half day per week.
Bacteriology of milk, 16 lectures per term.
Bookkeeping, 16 lectures per term.
Dairy machinery, 16 lectures per term.
Milk testing, 16 lectures.
Milk and its products, 16 lectures.

WINTER SCHOOL IN DAIRYING.

Work in dairy building, six half days per week.
Butter making, 20 lectures, or cheese making, 16 lectures.
Dairy chemistry, 15 lectures.
Bacteriology of milk, 10 lectures.
Bookkeeping, 10 lectures.
Milk testing, 10 lectures.

INSTRUCTION.

I. Dairy practice.—This includes from five to seven hours of practical work in the first term of the year's course, the two summer courses, and the winter course. It includes butter making and laboratory work in milk testing. In the second term of the year course it includes cheese making and pasteurization.

II. Milk and its products.—Instruction on the composition of milk and dairy products, the theory of centrifugal separation, and the construction of the various kinds of separators. Special attention is given to the effect of varying conditions of the milk on separation. It includes a consideration of the principles of cream ripening, churning, and the preparation of the butter for market.

III. Milk testing.—A thorough study of the Babcock test for dairy products, with special instruction for overcoming the difficulties from varying conditions. The tests for determining acidity of cream and milk and the use of the lactometer for detecting adulterations are included; also composite sampling and testing of individual cows.

IV. Dairy machinery.—Instruction for firing boilers by the most economical methods, the construction and operation of engines and pumps, and the placing of machinery and shafting.

V. Bookkeeping.—This course is designed to inform the student as to the best system of bookkeeping for the business of the factory.

VI. Bacteriology of milk.—Lectures on the nature of bacteria, distribution, and the conditions necessary for their growth. The effects produced by various bacteria commonly found in milk are shown by lectures and demonstrations. The methods of handling which cause contamination of milk are considered in detail. That the quality of dairy products depends mostly upon the fermentations which have taken place in these preparations is shown with detailed attention to the use and value of starters in butter and cheese making. The principles of cream ripening and pasteurization are also included.

VII. Dairy stock.—The judging of dairy stock with the score card and by comparison is made a leading feature, while the lectures relate mostly to the principles, methods, and practices of breeding dairy stock and their management.

VIII. Cheese making.—In the winter term this consists of six lectures on chedder cheese, including a study of the kind of cheese demanded by different markets, etc. In the second term of the one-year course the same work is taken up as during the winter term, but with the addition of 10 lectures on fancy brands of cheese, including Limburger, Brick, Swiss, Roquefort, Sage, Stilton, Pineapple, and Gonda.

IX. Pasteurization.—The relation of the milk supply to the public health, the principles of pasteurization, and apparatus adopted for various purposes, with the practical operation of the more common machines. The production and sale of "sanitary" milk is taken up, together with a general consideration of the market milk business, the use of preservatives, and allied topics. (Second term, one-year course.)

X. Dairy feeding.—The principles of feeding animals for the most economical production, with a study of the composition and use of various feeding materials and the feeding of dairy cows. Henry's Feeds and Feeding is used as a text book. (Second term, one-year course.)

XI. Dairy chemistry.—The chemical composition of dairy products is considered in a general manner. The alkali test, both in theory and practice, is given in order that it can be used by the student. The adulteration of butter, cheese, and milk as it relates to the dairy industry is also taken up in the lectures. (Catalogue, 1898–99.)

KANSAS AGRICULTURAL COLLEGE.

Equipment.—A dairy-school building, two stories and basement, 100 by 105 feet, with butter, cheese, milk, and testing rooms, cheese-ripening cellars, refrigerating plant, and cold-storage rooms; all apparatus needed for milk testing and for handling milk from the cow through the creamery to the butter tub or cheese room.

Dairy school: One winter term, twelve weeks.

Principles of agriculture.—Treating of soils, crops, tillage, and manures; the selection, laying out, equipping, and management of Kansas dairy farms. Textbook, Bailey's Principles of Agriculture.

Dairy bookkeeping.—Practice in bookkeeping that will enable the student to understand the underlying principles, followed by training in keeping books for farm, dairy, and creamery accounts.

Dairying.—Milk; its secretion, nature, and composition; causes and conditions influencing the quality and quantity of the milk; handling of milk for the mar-

ket and for butter making, including milking, straining, aerating, cooling, preserving, and shipping; creaming of milk by the separator; cream ripening and butter making. Text-book, Wing's Milk and Its Products. Lectures. All students will study dairying together for the first half of the term. This class will then be divided, creamery men taking lectures on creamery butter making, the cheese makers on factory cheese making, and the dairymen on private butter making.

Feeds and feeding.—Properties of common feed stuffs, their effect on character and yield of milk and butter, and their adaptability to Kansas conditions of dairying. The compounding of dairy rations to secure good yields at least cost with products having desired qualities. Careful study of the feeding of the college dairy herd will also be required. Text-book, Henry's Feeds and Feeding.

Breeds and breeding.—Characteristics of leading breeds of cattle, and their adaptability to Kansas dairy farming; dairy farm, and the selection of dairy animals; care and management of the dairy herd; principles of stock breeding. Lectures.

Bacteriology.—Relations of bacteria to methods of keeping milk, ripening cream and cheese, and flavoring butter; diseases of milk, their relations to the health of man and animals; principles of disinfection. Text-book, Russell's Bacteriology. Lectures.

Diseases of dairy cattle.—The common ailments of calves and dairy cows are discussed and their causes and symptoms explained, remedies and preventives suggested, all from a practical farmer's standpoint. During the dairy school the college herd will be tested with tuberculin and the students taught how to make the test. Students will also inoculate hogs against cholera and swine plague. Lectures.

Boilers and engines.—Lectures and practice in the firing of boilers, care and running of engines, pumps, etc. Care and attendance of refrigerating machinery, practice in shops.

Butter making and milk testing.—Practice in handling milk and its products from the time it leaves the cow until it is marketed as butter, cheese, or sanitary milk. Students may choose either creamery butter making, cheese making, or private dairying. Thorough instruction and practice will be given in all three of these lines. The dairy rooms will be fully equipped with hand and power separators, Babcock tests, churns, and butter workers, aerators, heaters, sterilizers, refrigerating machinery, milk and cream vats, factory cheese apparatus, Mann's acid tests, and other needed apparatus. (Catalogue, 1898–99.)

University of Maine.

Equipment.—The dairy building, 50 by 42 feet, contains a milk room, a butter room, a cheese room, a cold-storage room, a cheese-curing room, a lecture room, the office of the professor of animal industry, and a laboratory. It is supplied with all necessary appliances for teaching the most approved methods of handling milk, cream, butter, and cheese. The building is heated with steam and supplied with hot and cold water. Power is furnished by a 6-horsepower engine and by a baby tread horsepower.

Dairying.—Lectures upon the formation and composition of milk; sources of infection; bacteria and their relation to dairying; ferments and their effects. Text-books: Grotenfelt and Woll's Principles of Modern Dairy Practice; Stewart's Dairyman's Manual. (Spring term, five hours a fortnight for nine weeks.)

Dairy practice.—The treatment and handling of milk and cream; milk testing for fat and other solids; aeration, pasteurization, and sterilization of milk and cream; the application of acid tests and ferments to butter and cheese making; operating and caring for the boiler, engine, gravity creamers, centrifugal separators, churns, workers, vats, presses, and the making, curing, and judging of butter and cheese, together with the business management of factories and creameries. (Spring term, seven hours a week for twelve weeks.)

Short winter course in dairying.—This course begins on the first Tuesday in January and continues six weeks. The subjects taken up are as follows: First winter—Plant and animal nutrition; diseases of dairy animals; milk, butter, and cheese; cows, breeding, handling, and judging; building and furnishings; barns, creameries, etc.; accounts. Second winter—Milk, butter, and cheese; bacteriology of the dairy; veterinary science; boiler and engine; business law; carpentry; feeding of cows. (Catalogue, 1898–99.)

Maryland Agricultural College.

Dairying.—Offers a creamery course of six weeks and a private dairy course of six weeks.

Equipment.—The creamery of the experiment station, which is supplied with every modern appliance for dairying, is used for the practical work of students. (Catalogue, 1898-99.)

Massachusetts Agricultural College.

Equipment.—Connecting with the barn is a wing providing accommodation for practical and educational work in dairying. The wing contains one room for heavy dairy machinery, another for lighter machinery, both large enough to accommodate various styles of all prominent machines; a large ice house, a cold-storage room, and a room for raising cream by gravity methods, a class room, and a laboratory. The power used is an electric motor. This department is steam heated and piped for hot and cold water and steam. In this department has been placed a full line of modern dairy machinery to illustrate all the various processes connected with the creaming of milk, its preparation for market, and the manufacture of butter. Special instruction in such work is offered in the dairy course.

Short winter course in dairying (first Wednesday in January to third Wednesday in March).—The soil and crops, 22 hours; dairy breeds and cattle breeding, 22 hours; stable construction and sanitation, care of cattle, 11 hours; common diseases of stock, their prevention and treatment, 11 hours; foods and feeding, 11 hours; bookkeeping for the dairy farm and butter factory, 22 hours; pasteurization and preparation of milk on physicians' prescriptions, 11 hours; composition and physical peculiarities of milk, conditions which effect creaming, churning, methods of testing and preservation, 22 hours; milk testing, 6 hours; butter making, 12 hours; practice in aeration, pasteurization, 6 hours. (Thirty-sixth Annual Report.)

Michigan Agricultural College.

Equipment.—By means of actual work in the dairy room instruction in butter making is given to all students in the agricultural course. Emphasis is laid on the methods of cleaning and keeping clean the dairy room and dairy implements. The dairy room is equipped with various styles of creamers, separators, ripening vats, churns, and workers, with the use of which young men become acquainted by daily experience. The Babcock test is in constant use, and the subjects of pasteurization and sterilization receive attention. Later, if the student so elects, special work along dairy lines is given in the senior year, embracing a more thorough training in the art of butter making, along with a short course, at least, in dairy bacteriology and dairy chemistry.

Special short courses beginning with the opening of the winter term in the first week in January have been arranged as follows: Courses of six weeks each in dairy husbandry and creamery, and a course of four weeks in cheese making.

I.—DAIRY HUSBANDRY.

1. Selection of dairy herd.—The college is well equipped with the highest types of dairy cows belonging to various breeds. Using the members of this herd as a model, the class goes over the various points of the typical dairy animal, score card in hand, until the significance of every variation in form is well understood. Since the records of all the cows are kept it is possible to verify or correct the judgment of the student.

2. Feeding cattle.—An hour a day for the first two weeks of the term is given to the study of the theory of cattle feeding, definition of terms, discussion of feeding stuffs in the markets of the State or grown on the farm, calculation of rations, the use of table of analysis, the nutritive ratio, and the balanced ratio. A discussion of economical methods of storing feed and the general care of the dairy herd follows. Such topics as stall fittings, stable construction, preparation of feeding stuffs, quantities of feed to be given under different circumstances, exercising and watering dairy cows, and general stable management are taken up in turn and as fully dealt with as time will allow.

3. Veterinary science.—A series of 30 lectures on bovine anatomy, hygiene, and medicine forms a very important feature in the course.

4. Butter making.—Along with a course of lectures on the physical properties of milk and its constituents there is given practical work in the butter room in the

handling of milk, cream, and butter, and in all the details of manipulation from the time the milk leaves the udder of the cow until it is made up into a first-class article of butter and the skim milk prepared for feeding calves and pigs. Among the topics upon which special emphasis is laid the following may be mentioned: Aeration and aerators, cleanliness both in milking and in the washing and care of utensils, the use of various styles of creamers and separators, ripening cream with and without commercial starters, preparation of home-made starters, ripening cream, churning temperatures, styles of churns, washing butter, and the various methods of printing and packing for market. Special work in pasteurizing milk and cream for market or for home use is given.

5. *A course of lectures* is given on the physical properties of milk and its constituents, explaining the reasons for the consecutive steps in the progress of the milk through the butter room on its way to the completed product. The object of this course is to do away with empiricism in the work and to give the student a coherent and logical view of butter making as a whole, and the relation of each process recommended to the success of the undertaking.

6. *The Babcock test and lactometer.*—These modern instruments are in daily use in the butter room, but special work is given with them that the students may become accurate and at the same time acquire a correct idea of the physical and chemical composition of milk and its products.

7. *Dairy bacteriology.*—A short course in elementary bacteriology is given that the student may understand how closely the quality of the butter is related to the cultivation of the right kind of bacterial life in the milk and cream and the exclusion of foes by scrupulous cleanliness and proper regulation of temperature.

II.—THE CREAMERY COURSE.

1. *Creamery methods.*—Lectures and exercises will be given in the methods of keeping books, illustrated daily by the business operations of the college dairy. Payments are calculated on the basis of fat content. Methods of conducting the regular business of the creamery, accounts with patrons, with consignees, business forms and routine business, are subjects upon which daily instruction is given. A course of lectures will be given on the physics and chemistry of milk and its products, explaining the reasons for each operation performed in the factory and the chemical and physical facts upon which it depends. The several constituents of milk are separately examined and the relation of each to the various operations in butter making is explained. The separator and churn are studied and the natural laws governing their work are outlined.

2. *Daily work in the butter room.*—The daily practical work in butter making is the dominant feature of the course, to which all others are subordinated. Separators are unpacked, set up, run, and tested; milk is separated at different temperatures and under different conditions, until the student is thoroughly versed in all the details of handling milk and operating separators. Cream is ripened in various ways and with different kinds of vats and apparatus. The churning is done as in an ordinary creamery and repeated until the class is familiar with all the steps in the operation. The Babcock test is in constant use.

3. *Creamery mechanics.*—As thorough drill as possible is given in the care and operation of boilers and engines and the general principles of construction and operation of mechanical appliances used in creameries. The arrangement, size, and speed of shafting, belts, and pulleys will receive attention. The student will be qualified to do all necessary pipe fitting and to care for the machinery of the creamery intelligently.

4. *Milk testing.*—Thorough drill is given in the laboratory in the testing of milk. This work includes the calibration of glassware to determine whether or not the test bottles and pipettes in use are correct, the determination of the strength of acid, and the testing of milk under all the varying conditions met with in the daily operations of a factory. The use of preservatives for keeping milk in condition for testing and the handling of composite samples is also studied. In addition to teaching the use of the Babcock test, practice is given in detecting adulteration in milk by the use of the lactometer in connection with the Babcock test. The use of the various tests for acidity of cream are also studied and the different methods put into practice in the work in the creamery room.

5. *Dairy bacteriology.*—This subject is taught by a course of lectures and demonstrations, though little more is attempted than to give the student an appreciative idea of what bacteria are and their relation to the art of butter making. The reasons for cleanliness in every dairy operation are pointed out. The manufacture and use of the several kinds of starters and their relative merits are explained.

6. *Milk production.*—The creamery manager should be posted not only on mat-

ters relating to the care of the milk prior to its delivery to the factory, but on the essential principles of stock feeding, bovine anatomy and medicine, and treatment of the cows to produce the greatest flow of milk as well, that he may be competent to give advice to patrons on these subjects.

7. Butter judging.—Daily work is given that the student may acquire an accurate taste and smell, and be able to discriminate between good and poor butter, and to recognize faults in the products of his own factory when such occur.

III.—COURSE IN CHEESE MAKING.

Practical work at the cheese vat followed out along scientific lines, with a reason for every detail of the operation, is a feature of this course. The use of the rennet tests for determining the ripeness of milk, the use of starter to aid in the control of fermentation, the use of the curd test for the detection of impurities in the milk, and the use of the Babcock test to determine the loss of butter fat are among the points given especial attention in the daily operations in the cheese room. Work will be given in the laboratory in testing milk. The use of the lactometer and Babcock test for the detection of watering and skimming milk will be taught and the practical application of the test to everyday cheese-factory operations will be emphasized. Lectures and demonstrations in bacteriology, showing the relation of bacteria to the different changes taking place in milk, how to combat harmful agencies and cultivate the helpful ones, are given. The subject of chemistry of milk and its care upon the farm receives attention. (Catalogue, 1898-99.)

UNIVERSITY OF MINNESOTA.

I.—COLLEGE OF AGRICULTURE.

1. Dairy stock and dairy farm management.—Breeding, rearing, and management of dairy stock, the points and characteristics essential in animals intended for the dairy, practice work in judging dairy stock, the management of the dairy farm. (Lectures three hours per week and practice work one hour per week, fall term of junior year.)

2. Dairy feeding.—Lectures covering both the scientific and practical questions underlying the principles of feeding. Practice in compounding rations, estimating comparative value of foodstuffs, and other problems. (Lectures, two terms, two hours per week.)

3. Farm dairying.—Lectures on milk, its care, the various methods of creaming it, care of the cream, and the manufacture of butter and sweet-curd cheese. Greater portion of time is devoted to practice in the farm dairy room. (Lectures and practice work, one term, two hours per week.)

4. Factory course in butter and cheese.—Two lectures a day, one in butter and one in cheese, and practice work two afternoons a week in butter making and two afternoons in cheese making. (Offered in January.)

II.—SCHOOL OF AGRICULTURE.

1. Dairy stock.—During the last month of the first term students receive instructions in regard to characteristics of the various breeds of dairy cattle, their origin and comparative adaptability for the dairy. During the last term instruction is given in breeding, rearing, feeding, and handling dairy stock, with practice in judging stock and formulating rations.

2. Farm dairying.—During the first term a course of lectures is given in farm dairying, giving instruction in the care of milk and utensils, explaining the principles involved in creaming milk by the gravity and centrifugal processes and giving full instruction in regard to running farm separators and the manufacture of butter and cheese in the farm dairy. Students also receive practical training in the most advanced methods of creaming milk, ripening cream, churning, working and packing butter, and measuring the value of milk by the Babcock test and lactometer. The practice work begins the third week of the first term and continues through the school year.

III.—DAIRY SCHOOL.

Instruction in the dairy school continues four weeks and is divided into six courses.

1. Lectures.—The course of 60 lectures furnishes in a plain and concise form the most valuable information for those who are interested in any branch of agricul-

ture, covering as it does the most important points in the breeding, rearing, feeding, and general management of dairy stock, the economical production of milk, growing and preserving of forage and grain crops, the management of meadows and pastures, management of barns, stables, and yards, construction of silos, cooperative dairying, creamery and cheese-factory management, judging and marketing dairy products, the chemistry of milk, dairy bacteriology, engineering, animal hygiene, and treatment of the common diseases of the dairy cow.

2. Butter making.—The running of separators; ripening and churning of cream; the proper acidity of cream to secure best flavor; how to churn, wash, and salt butter so as to avoid specks and mottles; to secure good grain and best methods of preparing for market; scoring butter by the score card.

3. Cheese making.—The work in the cheese room is conducted on a large scale, including the manufacture of several brands of fancy cheese. A complete record of every step taken is required of each student.

4. Milk testing.—The chemist gives a general outline of the work; but in order that each student may have practice in milk testing, daily exercise is given. Steam, turbine, and hand-power machinery and other apparatus are provided and operated in the laboratory. A milk and cream pasteurizing apparatus has been manufactured specially for the dairy school and a few advanced students are given instruction in the process.

5. Motive power.—The work in engineering consists of practical talks on the construction, care, and management of creamery engines and boilers, pumps, injectors, heaters, etc., and work in the practice room. In this room are provided an 8-horsepower, simple, slide-valve engine, three types of boiler feed pumps, two types of deep-well pumps, one injector, two milk pumps, and a steam gauge, which the students have the privilege of examining and operating. Instruction is also given in pipe fitting, placing shafting, babbitting bearings, soldering, etc.

6. Factory bookkeeping.—All the essential features of factory accounting, from the receipt of the milk to the returns in net proceeds, are thoroughly considered. Paying for the milk according to the fat content or otherwise is fully explained. The students do, in books provided, the actual one month's accounting of a creamery. (Catalogue, 1898-99.)

University of the State of Missouri.

Equipment.—The dairy is equipped with several Babcock milk testers, aerators, improved milk and cream vats, various styles of separators, churns, and butter workers, and with a complete sterilizing outfit for pasteurizing milk and cream on a large scale.

Dairying.—Selection, breeding, and feeding of dairy cows; modern methods of butter and cheese making. Fifty hours of practical work in the dairy building are devoted to separating and testing milk, ripening cream, churning, working, salting, coloring, and packing butter for market. (Second semester in short winter course.)

Dairying.—Breeding and improvement of the herd; management and equipment of the farm dairy. One-half of the student's time is devoted to practical work in the college dairy. (Second semester, elective to seniors in regular course in agriculture.) (Catalogue, 1898-99.)

Montana College of Agriculture and Mechanic Arts.

Dairy husbandry.—Adaptability to certain sections; small dairies and creameries; testing of milk; butter and cheese making; breeds of dairy animals; rearing, feeding, and management. (Senior year, fall term, lectures three hours per week, practicum nine hours per week.) (Catalogue, 1898-99.)

University of Nebraska.

Dairying.—The principles of dairy operations; practice and instruction in the handling and ripening of cream, and in churning, washing, salting, working, printing, coloring, judging, and packing of butter; practice in the use of hand separators and in the deep setting of milk; practice in the manipulation of the Babcock and other milk tests in testing whole milk, skimmed milk, buttermilk, and cream. (Two lectures each week and one afternoon in the dairy from 1 to 6, second semester.) (Catalogue 1898-99.)

Nevada State University.

Dairying.—The instruction consists of lectures upon the formation and composition of milk; ferments and their action; testing for purity and value; methods of manufacture of cheese and butter. The lectures are supplemented by practical work with different testing apparatus and by the inspection of dairies and creameries fitted with modern apparatus. (Senior year, first term, five hours per week.) (Catalogue, 1897-98.)

New Hampshire College of Agriculture and Mechanic Arts.

Equipment.—The creamery is equipped with separator, milk tester, pasteurizer, and all tools required in making butter and preparing milk and cream for market.

Dairying (20 exercises).—Practical and theoretical instruction in methods of modern dairying, including the general management of the dairy, the methods of milk analysis, the bacteriology of the dairy, the use of separators, the making of butter, and preparation of milk for the city market. (References: Wing's Milk and Its Products; Gurler's American Dairying.)

In addition to the instruction in the regular course, there is offered during the winter a four weeks' course in dairying, during which all the time is devoted to butter making, milk testing, pasteurizing milk and cream, dairy bacteriology, and dairy husbandry. (Catalogue, 1897-98.)

Cornell University.

Equipment.—The dairy building, a two-story stone structure 45 by 90 feet, was built from an appropriation of $50,000 by the legislature of 1893. It provides lecture rooms, laboratories, and offices, besides two large rooms for butter and cheese making, both of which are fully equipped with modern machinery and appliances. Automatic electrical apparatus for controlling the temperature in cheese-curing rooms, refrigerator rooms, lockers, and bath rooms are also provided. The whole building is thoroughly heated and ventilated, and power is furnished by a 60-horsepower boiler and a 25-horsepower Westinghouse engine.

Animal industry.—Principles of breeding, history and development, improvement and creation of dairy and beef breeds of cattle; principles of feeding, care, selection, and management of dairy and beef cattle. (Lectures, winter and spring terms, twice a week; practice, one hour.)

Dairy husbandry.—Milk and butter. (Lectures, fall term, twice a week; practice, two afternoons.)

Dairy husbandry.—Cheese. (Winter term, practice, two days per week from 10 to 1.)

Dairy husbandry.—Laboratory work on special problems. (Fall and spring terms, one to three hours.)

Animal industry and dairy husbandry (for winter-course students).—Principles of breeding, feeding, and selection, care and management of dairy cattle. (Daily practice, one afternoon.)

Animal industry and dairy husbandry (for dairy-course students).—Lectures on milk and its products, breeding and feeding, daily, one hour; lecture on subjects related to dairy husbandry, one hour daily; practice in butter and cheese making and in dairy laboratory, six and one-half hours daily (winter).

The winter course in dairy husbandry begins the first week in January and extends through one university term of eleven weeks. The instruction is given largely with the view of fitting students for conducting butter and cheese factories, and is partly by lectures and recitations, but largely by actual practice in the creamery, cheese factory, and dairy laboratory as follows: Lectures on milk and its products, two hours per week; lectures on subjects related to dairying, ten hours per week; cheese-room practice, twice weekly, four to six hours each; butter-room practice, twice weekly, four to six hours each; dairy laboratory practice, twice weekly, two to four hours each; problems and bookkeeping, two hours per week. (Register, 1898-99.)

North Carolina College of Agriculture and Mechanic Arts.

Equipment.—The dairy is a frame building, 20 by 40 feet and two stories high. It is supplied with a De Laval separator, Babcock tester, rectangular churn, butter worker, cheap heating apparatus, etc. The cellar is cemented and has a cemented trough on one side through which flows water from a spring situated above the dairy.

Dairying.—Lectures. (Junior year, second term, three hours.) Practical work. (Sophomore, junior, and senior years.)

Dairy bacteriology.—Russell's Dairy Bacteriology. (Junior year, third term, three hours.) (Catalogue, 1897–98.)

Agricultural and Mechanical College for the Colored Race (North Carolina).

Equipment.—The dairy is equipped with modern apparatus for butter making, such as a United States cream separator, 6 Acme bail churns, 1 Davis swing churn, 6 lever butter workers, 1 Eclipse refrigerator, a Boyd cream-ripening vat, a Babcock milk-test machine, etc.

Dairying.—The work in dairying is begun with lectures on elementary dairy bacteriology and chemistry, and completed in the dairy with practical work in butter and cheese making, milk testing, detection of adulterants in milk, butter, and cheese. (Lectures, sophomore year, winter term, five hours per week, and dairy practice in spring term, seven hours per week.) (Catalogue, 1898–99.)

North Dakota Agricultural College.

Equipment.—The dairy building is well equipped with separators, testers, churns, workers, and all necessary dairy utensils, and the student is thoroughly instructed in their use and handling.

Dairying.—The subject of dairy husbandry is taught in the regular four-year course in agriculture, in the two-year course in agriculture, and in the short winter course of twelve weeks.

In the four-year course the first term of the senior year is set apart for the study of dairying and each student devotes two hours per day to practical dairy work in addition to five hours per week in text-book and lecture work on dairy science.

The first term, second year, of the two-year course is devoted to this subject and same plan pursued as in the longer agricultural course. In the winter course the subject of dairying alternates with that of horticulture in recitation and lecture work, and those students who elect the dairy laboratory perform two hours' practical work each afternoon.

The theoretical instruction will consist of lectures and recitations upon the composition, care, and handling of milk; the influences affecting its secretion; the testing of milk and its products; the fermentations of milk and prevention of the same; the separation of cream by gravity and centrifugal process; the ripening of cream, and the churning, washing, salting, working, and packing of the product. Students of dairying are required to spend their afternoons in practical work in the dairy building. (Text-book, Wing's Milk and Its Products.) (Circular of Information, 1899.)

Ohio State University.

Equipment.—The dairy department consists of a receiving room, a pasteurizing room, a storeroom, a refrigerator room, a lavatory, butter-making room, cheese-making room, two cheese-curing rooms, and an instructor's room.

The course in dairying begins each year on the Wednesday following the 1st day of January and continues during the entire term. Butter making, as practiced in the farm dairy and in the creamery, is thoroughly taught, The student performs all necessary operations in the manufacture of butter by these two methods, under the guidance of the instructors. In cheese making the principles are taught, with elementary practice. The instruction is as follows:

Dairy farming.—Lectures and recitations on breeds, breeding, feeding, selection and judging of dairy stock, equipment and management of dairy farms (three hours each week).

Butter and cheese making.—Laboratory practice in running separator, churning, working butter, making cheese, milk testing, etc. (four half days each week). Lectures and recitations (two hours each week).

Milk chemistry and milk testing.—Lectures and laboratory practice (two hours each week).

Bacteriology.—Bacteria in their relation to milk, butter, and cheese. Lectures and laboratory practice (two hours each week).

Veterinary medicine.—Diseases of the cow (three hours each week).

Machinery.—Care of the boiler and engine (one lecture per week for six weeks).

In addition to the course in dairying there is offered instruction in butter and cheese making to the students in the regular agricultural course. It consists of recitations twice a week and laboratory practice two half days each week during the second term in running separators, churning and working butter making cheese, and testing and pasteurizing milk. (Catalogue, 1897–98.)

Oregon State Agricultural College.

Equipment.—A new building has been prepared for the dairy department, and is fitted up with all the necessary machinery for carrying on the work in both butter and cheese making.

Theoretical dairying will be taught in the class room one hour each day in sophomore year. Instruction is given by use of text-books and lectures.

Practical work in the dairy in the junior year. (Catalogue, 1898–99.)

Pennsylvania State College.

The creamery course opens with the beginning of the winter session and continues six weeks. The instruction is as follows:

Dairy husbandry.—The composition of milk, influence of breed and feed upon milk, selecting milk for retail and cream trade, the construction and care of separators, making and use of starters, various methods of ripening cream, conditions affecting churning, working and packing butter for market, scoring milk and butter.

Dairy chemistry.—Different methods of milk testing, use and detection of adulterations, and preservatives.

Dairy feeding.—Composition and digestibility of feeding stuffs, feeding standards, calculating rations. influence of food upon products.

Ice cream.—The manufacture of ice cream, mixing of flavors, making of individual bricks, packing cream for retail and wholesale trade.

Dairy arithmetic and bookkeeping.—Practical examples in dairy problems, including dairy machinery, making creamery dividends, and keeping a set of creamery books.

Dairy breeds and breeding.—The selection, care, and management of dairy cattle.

Dairy machinery.—Study of the steam engine, care of boilers, valves, belts, pulleys, lubrication, fuel, etc.

The cheese-making course follows the creamery course and continues six weeks. The instruction is as follows:

Dairy husbandry.—The composition of milk, influence of feeding, breed, and environment under which the milk is produced upon milk designed for the manufacture of cheese, advantages and use of the rennet test, advantages and use of natural and pure cultures for ripening milk, treatment of gassy milk, different processes used in the manufacture of export and home trade cheese, construction and management of the curing room, and the scoring of cheese.

Dairy chemistry.—Different methods of milk testing, including the use of the lactometer, the testing of whey and cheese, and the detection of adulterations and preservatives.

Dairy feeding, dairy arithmetic and bookkeeping.—Same as in creamery course.

In the regular course in agriculture instruction in dairy husbandry is given throughout the junior year. In the fall session, lectures on milk and butter one hour and practical work six hours per week; winter session, lectures on dairy bacteriology, care of milk and its products one hour and practical work four hours per week; spring session, lectures on cheese and its manufacture one hour and practical work six hours per week. (Catalogue, 1898–99.)

Rhode Island College of Agriculture and Mechanic Arts.

Dairy husbandry.—Breeds and breeding of dairy cattle; barns and dairy buildings; milk production, composition; management, aeration, pasteurization, sterilization, testing, transportation, and marketing; creaming; butter making; cheese making; milk preservation, condensed milk, milk sugar, etc.; milk preparation for infants and invalids; dairy bacteriology. (Elective in senior year, winter term; 3 exercises per week.) (Eleventh annual report.)

Clemson Agricultural College.

Equipment.—The dairy building is a wooden structure of modern design, constructed especially to illustrate the most approved methods of dairy practice. It has an independent steam plant and waterworks, and is supplied with the leading makes of cream separators, churns, butter workers, milk testers, etc.

Instruction in dairying is given to the students of the sophomore and junior classes who take the agricultural course. Wing's Milk and Its Products is used as a text book. Instruction is also given in the breeding, feeding, and handling of dairy cattle. (Catalogue, 1898–99.)

South Dakota Agricultural College.

Domestic dairying.—Care and manipulation of milk, manufacture of butter, approved dairy methods in care of utensils, proper regulations of herds, stable methods, fancy butter making discussed and practiced. Wing's Milk and Its Products, Gunter's American Dairying. (Ten hours per week, laboratory.)

The course in dairy science begins with the opening of the winter term and extends through twelve weeks. The following work is offered:

General agriculture and care of dairy cows, five hours per week.
Dairy lectures, five hours per week.
Dairy arithmetic, three hours per week.
Dairy engineering, two hours per week.
Lectures in botany, entomology, and zoology, three hours per week.
Bookkeeping, three hours per week.
Creamery practice, daily. (Catalogue, 1898-99.)

Agricultural and Mechanical College of Texas.

Equipment.—The creamery is in a substantial building, supplied with a complete outfit of the latest improved apparatus for making butter. The machinery is driven by a 6-horse power steam engine and by a 4-horse power gasoline engine. Practice in both butter and cheese making forms part of the agricultural course.

Dairying is taught in the junior year. Thirty-two lectures are delivered on the subject during the year. The properties and composition of milk, the variations due to breed, feed, and fermentation of milk; creaming, churning, cheese making, testing for fat and for adulterations, and the subject of bacteriology are all discussed in order. Students use the creamery equipment freely in performing the practical work and in the dairy practice required. The proper care of fresh milk, the operation of hand and power separators and churn, the care of creamers, and testing for acidity and for butter fat in milk and cream can be most thoroughly learned by combining this work with the theory taught in the class room. All of the labor of a large machine dairy is performed by students. (Catalogue, 1898-99).

State Agricultural College of Utah.

Equipment.—The dairy rooms are in the basement of the main building and are equipped with the best apparatus for the manufacture of butter and cheese on scientific principles.

Dairying is taught in the senior year of the regular course in agriculture. The instruction is as follows:

1. Milk.—The elaboration, composition, and fermentation of milk; the testing of milk, with a description of the methods used in paying for milk by test and in determining the worth of milk. A brief outline is also given of the fermentation of milk, or bacteriology as applied to milk and dairy products.

2. Butter making.—The different methods of creaming milk and getting the best results are described; the handling and ripening of the cream, churning, salting, working, packing, and marketing the butter.

3. Cheese making.—Cheddar cheese making is described; the making of a uniform product and dealing with practical difficulties are fully illustrated; a brief description is also given of the manufacture of other kinds of cheese, particularly of such kinds as may be made in a home dairy.

4. Factories.—Factory organization; the building, equipment, and management of factories are fully treated.

5. Practical dairying.—The college dairy is equipped with the best modern apparatus for practical dairy work, and from 1,300 to 3,000 pounds of milk are handled daily; factory and farm dairy methods are illustrated, and the student becomes familiar with all phases of dairy work by actual practice in the dairy, the aim being to familiarize him with the best methods of practice as discussed in the class room. (Catalogue, 1898-99.)

University of Vermont and State Agricultural College.

The dairy school opens at the beginning of January and continues four weeks. It is designed to teach in a practical manner the manufacture of butter with the latest and most approved apparatus. Three courses, aggregating about 50 lectures, are given on the constitution and production of milk, its creaming and churning, best methods of handling, testing, etc. Text-books, with quizzes, are used as far as practicable. Seven hours of actual work with dairy machinery are given each day. (Catalogue, 1898-99.)

Hampton Normal and Agricultural Institute.

The course in dairying extends through one year. The instruction is as follows:
Dairy stock.—Breeding, care, management.
Dairy bacteriology.
Milk.—Composition, sterilization, pasteurization, care, testing, creaming.
Butter.—Ripening the cream, churning, working, packing, and marketing.
Cheesemaking.
Dairy apparatus.—Separator, churn, butter workers, cream vats, etc. (Catalogue, 1898-99.)

Virginia Agricultural and Mechanical College.

Equipment.—A large and conveniently arranged building has been erected for the purposes of a creamery and cheese factory, with a cold storage and ice plant attached. It is equipped with a cream separator with a capacity of separating 1,300 pounds of milk per hour, one churn with capacity of churning 75 gallons of cream at a time, one power butter worker, vats, and complete appliances for manufacturing 200 pounds of butter a day. The creamery is in operation throughout the year. Complete plant for the manufacture of cheddar cheese, with a capacity of from 30 to 40 pounds a day.
Dairying.—Cream: Composition and peculiar properties of; how influenced by food, climate, exposure to air, foul odors, etc. Butter: Color, texture, and character of good article; methods of coloring, working, packing, and marketing. The process is followed from the growing of crops until same are converted into the marketable products. Discussion is also made of the merits of the cooperative system, the various methods adopted, and the different equipments in the way of separators, extractors, and creameries. (Third year, first term, three times per week.) (Catalogue, 1898-99.)

Washington Agricultural College.

The school of dairying opens in January and continues for ten weeks. The period from 8 to 9 o'clock a. m. is devoted to lectures on dairy subjects. Students are then divided into three sections, one section going to the butter-making department, one to the cheese-making department, and one to the testing room, where about five hours are spent in practical work. After the work of the day is finished in these departments the students spend one hour in the recitation room, where methods of keeping dairy accounts is the principal theme for consideration.
Equipment.—The creamery is provided with a full equipment for butter and cheese making and for testing milk both for butter fat and for solids not fat. The capacity of the creamery is sufficient to enable it to handle the milk from 300 cows.
Lectures.—Fifteen lectures on milk, the various phases of butter and cheese making, milk testing, selection and management of dairy cows, etc.; 10 lectures on stable hygiene and common diseases of dairy cows; 10 lectures on the care of machinery, speeding of pulleys, etc.; 5 lectures on bacteriology, with microscopic demonstrations; 15 lectures on composition and adulteration of dairy products and fermentative changes in butter and cheese.
Instruction in dairying is also given four times a week during the second semester of the junior year to students in the agricultural course. (Catalogue, 1897-98.)

University of Wisconsin.

Equipment.—Hiram Smith Hall is devoted entirely to dairying. This structure of brick and stone has a frontage of 95 feet by 48 feet in depth and is three stories in height. It contains an office, lecture room, reading room, dairy laboratory, and rooms devoted to creamery practice, cheese making, farm dairying, pasteurizing, cheese curing, etc.
The dairy course opens the 1st of December of each year and lasts twelve weeks. The class is divided into three sections, one of which is assigned daily to the laboratory, a second to the creamery, and a third to the cheese factory. The sections alternate, so that each student receives instruction twice a week in each of the three departments. The courses are arranged as follows:
1. Lectures and class-room work.—Twenty-four lectures on the constitution of milk, the conditions which affect creaming and churning, methods of milk testing

and preservation of milk, etc.; 16 lectures, with demonstrations, on the influence of bacteria in the dairy; 8 lectures on heating, ventilation, and other physical problems directly connected with dairy practice; 10 lectures and demonstrations on the care and management of the boiler and engine; 10 lectures on the common diseases of the dairy cow; 8 lectures on the feeding and management of dairy stock; 8 lectures on breeding and selection of dairy stock; 12 lectures on creamery management and accounts; 12 lectures on practical cheese making.

2. Milk testing.—This embraces instruction in the laboratory in estimating the fat in milk, butter, and cheese by methods adapted to the factory and factory operators (six hours per week).

3. Butter making.—Butter making is carried on daily on the creamery plan. The student learns to operate the several forms of power centrifugal separators on the market. They attend to the ripening of the cream, churning and packing butter, carrying on all the operations as they would be conducted in a creamery (twelve hours per week).

4. Cheese making.—Daily instruction in the manufacture of cheddar cheese, the operations being carried on as in a regular factory, the students being required to take careful notes and make reports of the process (sixteen hours per week).

Students who have had much experience in factory work and can pass satisfactory examinations in the practical work of the creamery or cheese factory will be advanced early in the term to the experimental dairy section, where problems connected with this branch will be studied. Advanced dairy instruction will consist of the following courses:

Instruction on milk and its products; experimental investigations in butter making; investigations in cheese production; dairy bacteriology as follows: (*a*) A special course in the preservation of milk and cream for commercial purposes; (*b*) students familiar with the use of the microscope will be admitted to the bacteriological laboratory for experimental work in dairy bacteriology.

In the regular course in agriculture the instruction in dairying is as follows: The chemistry of the dairy; the composition and physical properties of milk and its manufactured products; the principles involved in modern dairy practice; detection of adulteration, etc. (Lectures and laboratory practice; first semester; five times a week.) Dairy bacteriology. (Laboratory, with conferences; second semester.) (Catalogue, 1898-99.)

IV.—INSTRUCTION IN DOMESTIC OR HOUSEHOLD ECONOMY AND ART.

Instruction in household economy is now being given by a number of the institutions endowed by the acts of Congress of July 2, 1862, and August 30, 1890. The object of such instruction is to provide for the young women attending the institutions the training that will enable them to understand and to perform properly the duties of the household, such as preparing, cooking, and serving good and wholesome food economically, arrangement and decoration of the interior of the house, sewing, dressmaking, millinery, etc. The importance of such instruction is being recognized more and more, and in several States special buildings for the department of domestic economy have been provided.

The instruction in household economy and art offered by the agricultural and mechanical colleges is as follows:

Agricultural and Mechanical College for Negroes, Normal, Ala.

Sewing.—First year, fall term: Running, basting, felling, hemming, stitching, back stitching, notes and lectures on sewing; winter term: Hemstitching, gathering, overcasting, tacking, buttonhole making, notes and lectures on sewing; spring term: Drawing, herring-boning, feather stitching, quilting garments by hand, machine stitching, notes and lectures on sewing. Second year, fall term: Taking measures for garments, cutting by pattern and chart; winter term: Basting and fitting dresses, dressmaking; spring term: Finishing and trimming dresses. Third year, fall term: shirt making, cutting coats, wraps, etc.; winter term: Cutting and making men's clothing; spring term: Fancy needlework and stitching, embroidering on plush, satin, felt, etc.

Millinery.—First year, fall term: Names of hat braids, names of hat shapes, putting on hat bands, putting in hat linings; winter term: Wiring and binding brims, making and putting on bows of ribbon, silk, velvet, etc., lectures and notes on millinery; spring term: Combining shades of ribbons for trimming, combining ribbons, flowers, laces, etc., shaping hats, lectures and notes on millinery.

Cooking.—First year, fall term: Making and care of fire, fuel and heat, kitchen

and appointments, dishwashing, measuring and weighing; winter term: Boiling, steaming, baking, and broiling, cooking of vegetables, marketing, bread making, batters (muffins, etc.), doughs, doughnuts, pastry, cakes, and biscuits; spring term: Desserts, puddings, sauces, selection of foods, soups, roasting of meat and fowl, frying (fish, meat, etc.). Second year, fall term: Preserving, beverages, pickling, chemistry of food, study of the yeast plant; winter term: Salads, mayonnaise and French dressing, croquettes, entrées and sauces, game, eggs, and cheese, desserts; spring term: Fancy cakes, frozen creams, ices, sherbets, etc., serving a luncheon or a dinner, invalid cookery, use of chafing dish.

Laundry.—First year: Equipment of private and steam laundries; care of furniture, machines, flatirons; furnishing of ironing boards; receiving, marking, and assorting linen; plain washing and ironing; chemical features of disinfectants; methods of disinfecting; water and water softeners; hard water; tests for minerals and acids in water; vegetable and mineral alkalis; removing stains. Second year: Liquid and solid blues; use of acids; starches; starch glazes; making soap; preservation of colors; washing flannels; bleaches. (Catalogue, 1898–99.)

Branch Normal College, Pine Bluff, Ark.

The female students have daily training in housekeeping, plain sewing, and art needlework, under the superintendence of Miss Louisa M. Corbin, a graduate of Ann Arbor, Mich. The department is equipped with a sufficient number of sewing machines and a liberal supply of all necessary accessories. (Catalogue, 1898–99.)

Colorado Agricultural College.

The work in domestic science covers the preparation which the proper care of the home requires. There are three terms of text-book work, two terms of lectures, and nine terms of practical exercises. The subject of home hygiene is taken up in the second term of the sophomore year. The text-book used is Public Health, a series of prize essays relating to health in the home, healthy foods, school sanitation, disinfection, prevention of disease, etc. Lectures on household science are given in the third term of the sophomore year. In the first term of the junior year the subject considered is the chemistry of cooking. The text-book used is the work of Mrs. Ellen H. Richards. The second term of the year Atkinson's Science of Nutrition is used as a basis for class exercise and lecture work. The bulletins of the United States Department of Agriculture are helpful in this work. The work of the third term, junior year, includes lectures on nursing, emergencies, etc. The afternoon work in sewing consists of drafting patterns, cutting out garments, plain sewing, plain and fancy stitches, embroidery, and millinery. Special attention is given to dressmaking. The work in the kitchen laboratory includes the study of foods, with practice in all kinds of cooking and laundering. A lecture is given each Friday afternoon on some topic relating to the care of the house, clothing, and person, social duties, customs of good society, and anything that will aid in the development of a perfect womanhood. (Catalogue, 1898–99.)

Connecticut Agricultural College.

Cookery, sewing, laundering, and dressmaking, theoretical and practical; preserving fruits and jellies, making pickles, setting and serving tables, home hygiene and sanitation, home nursing, prevention and care of contagious diseases, chemistry of foods and economic value of common foods are subjects taught in the institution. (Catalogue, 1898–99.)

Florida State Normal and Industrial College.

Sewing.—The course in sewing includes educational sewing, darning, household mending, underwear and dress making (tailor system). The complete course is divided into three parts, each of which covers a school year. The first year comprises instruction in all the different stitches used in hand sewing, including patching and darning. Practice is given in all the various stitches upon small pieces of various materials. In the second year sewing by machine is introduced, and the pupil is taught the use and care of sewing machines, making underwear, drafting, cutting, and fitting a waist of washable material without lining, or a shirt waist. In the third year the student is taught drafting, fitting, and making dresses.

Cooking.—The cookery course, extending through three years, comprises the following subjects: A general knowledge of the nature, use, and preparation of various kinds of meats, vegetables, cereals, fish, soup, bread, food for invalids, etc., with practice in the best and most essential methods of cooking them. The

pupils are taught to prepare and clean everything and leave all in nice order when finished.

Laundering.—Laundry work embraces notes regarding location and care of laundry appointments; classification of articles to be laundered, talks upon different kinds of water, sodas, soaps, bleaching powders, bluings, scalding, rinsing, drying, folding, and ironing; practice work in removing stains, starching, cold and boiled starch; washing of white linens, prints, flannels, and fancy articles, silks, laces, etc. The school laundry is fitted with approved appliances, stationary tubs, hot and cold water pipes, sanitary drainage, etc. (Catalogue, 1898-99.)

Iowa State College of Agriculture and Mechanic Arts.

Facilities.—Domestic Economy Hall includes, besides the general office, the sewing room, dressmaking room, bedroom, kitchen, dining room, and storerooms, all conveniently furnished and equipped for recitations and for demonstration and practice work. The means of instruction include text-book study, lectures on the allied topics, demonstration lessons, and laboratory practice, supplemented by incidental talks, research, and essay writing on assigned subjects, and visits for observation and criticism. The plan followed in arranging the courses combines the actual doing with the study of how and why to do, that manual dexterity may be developed at the same time that study promotes an understanding of the principles underlying directions and rules.

Course I.—Plain sewing.—During the first term of the freshman year young women meet once a week for instruction in sewing, with three hours of practice. Each pupil makes for herself a set of models, including the various stitches, seams, hems, fastenings, plackets, etc., with their several applications in garment making and household sewing and mending. Accompanying the models a series of notes is prepared from lectures by the instructor upon the fabrics, tools, and other manufactures employed, and upon the making and use of each model.

Course II.—Cooking and hygiene.—During the second term of the freshman year cooking is taught to classes meeting each week for a one-hour recitation or lecture and a three-hour period in laboratory practice. During this term the various food stuffs, separate and combined, are studied in connection with the cooking processes and principles. Many simple and substantial dishes are prepared by the pupils, who at the same time receive instruction in general kitchen management.

Course III.—Cooking and hygiene.—Students who have completed Course II continue, during the first term of the sophomore year, the same subjects. In connection with cooking, special attention is given to the combining of foods and the serving of foods in connection with general dining-room work. Table setting, the selection and care of table furnishings, the duties of the hostess and waitress, and kindred subjects are discussed, with object lessons and practice. One hour a week is devoted to domestic hygiene or home sanitation. This includes such topics as the location and construction of the house; its arrangement, lighting, plumbing, ventilation, heating, furnishing, and cleaning. The principles of cleaning and disinfection are also applied to the processes of laundry work.

Course IV.—Sewing.—Students who have completed Course I continue their sewing in garment work. Each one chooses her materials for a suit of underwear which she designs, cuts, fits, and finishes for herself under the direction of the instructor. (Sophomore, second term.)

Course V.—Dressmaking.—Each young woman is expected to purchase, design, and make one unlined cotton dress and one of woolen or other material with a lining. (Junior, first term.)

Course VI.—Cooking.—For the second term of the junior year opportunity is offered for such students as have completed Courses II and III to have more instruction and practice in the art of cookery. The food preparation for this term is somewhat more difficult and elaborate than in the previous terms, and includes soups, roasts, bread and rolls, sauces, salads, and desserts of different kinds, which have not been made before, the particular assignment depending largely upon the individual need of the student.

Course VII.—Sewing.—A fourth term of sewing is also provided for the second term of the junior year for those wishing to study the drafting of patterns to measure in connection with more of designing and dressmaking.

Course VIII.—Cooking.—The last term in domestic economy (senior year, second term) is devoted principally to the study of foods from the hygienic and economic standpoints; and the practice is designed to demonstrate the proper combination and economical preparation of the common materials. Study of cooking and serving for the invalid occupies several weeks of this course, and is supplemented by general consideration of the duties of the nurse in the home and the desirable conditions and care for the bedroom in sickness and health.

During the first term of the senior year no work was offered in this department, as provision is made in the dairy course for young women who desire instruction in home dairying; and at the same time the department of chemistry offers a series of lectures in domestic chemistry.

Course IX.—To graduates who have completed the undergraduate courses outlined above, instruction and opportunity for advanced work is offered. Study and investigation along the line of the chemistry and physiology of foods, practical dietetics, home sanitation, cooking, and the other household arts, is pursued in connection with work elected in the departments of botany, chemistry, and other sciences. (Catalogue, 1898-99.)

Kansas State Agricultural College.

Equipment.—Domestic Science Hall, 84 by 70 feet, contains two stories and basement. The first story and basement are occupied by the department of household economics, lunches to the students and members of the faculty being served in the basement. The second floor is occupied in part by the department of music and in part by that of sewing.

The purpose of the course of domestic science is to afford training in the special subjects which must be considered in the daily administration of every home.

1. Hygiene.—The course of lectures in elementary hygiene is given to both young men and young women. The instruction of the young women is under the direction of the professor of domestic science. The general principles of wholesome living and the general care of the human body will be the leading subjects considered. (First year, fall term.)

In the following courses the work is arranged on educational as well as technical lines, and offers both theoretical and practical instruction, and is given in a well-equipped domestic science laboratory. The student is required to keep a set of notebooks, namely: A permanent notebook, a daily class record of class and personal work, and a recipe book. This plan enables the student to keep a clear, systematic, and concise record of every detail and objective point in the work. The lectures and practical work in cooking are presented in four courses and two special professional courses on the following lines:

2. Household economics.—First year, winter term. Lectures, with weekly laboratory practice. The objective points, neatness, order, economy, and accuracy will be observed. The subject of cookery, its origin, purpose, etc., table of measurements and weights, directions in measuring, definitions pertaining to manipulations, methods of cookery, etc., the general care of utensils, the kitchen and its adjoining apartments, the general sanitation of the home, general household management, and home ethics constitute the leading subjects of practice and lecture work.

3. Chemistry of cookery.—Third year, fall term. Text-books, Mathieu Williams's Chemistry of Cookery, and Ellen H. Richards's Chemistry of Cooking and Cleaning.

4. Domestic science.—Third year. Lectures, recitations, and laboratory instruction are combined throughout the year, Fall term: A course in fruit cookery; plain household cookery; lectures upon the food principles; classification, elementary composition of the human body; study of fuels; heat and its effect; cooking temperatures, etc. Winter term: Plain household cookery continued; advanced household cookery the latter half of the term. Spring term: Advanced household cookery the first half of the term; high-class cookery the second half of the term; standard menus and general lectures in the science of nutrition with parallel readings are required. Instruction in general serving and entertaining is given.

5. Therapeutic cookery.—Fourth year, fall term. Special cookery for the sick and its application to the home and for hospital nurses in training.

6. Emergency lectures and special physiology.—Fourth year, winter term. First aids to the injured; lectures on home nursing.

7. Demonstrations.—Fourth year, spring term. Lecture work in scientific and practical cookery. Each student is required to give a demonstration lecture in cooking before the class and give approved recipes, observing all the educational, scientific, technical, and practical points involved in each method demonstrated. The student lecturer may select one assistant from the class to assist in the general details of the work. In connection with this lecture work each student is required to give a complete lesson outline and conduct one class in practical work according to the best approved methods in laboratory practice. The two professional courses are designed to meet the demand for more thoroughly and broadly trained young women who go out as graduates. The work of the fourth year is planned so as to give the professional training that a complete course of domestic science should involve.

All young women take sewing the first year, and in the domestic-science course dressmaking is required in the winter term of the second year.

1. Sewing.—Industrial work: The course of work has been carefully graded, with the idea of developing habits of accuracy and self-reliance. Each pupil is required to keep a notebook, in which she records a description of the work accomplished. A written examination is held at the end of each term. During the first term the pupil makes a book of models covering the full course in hand sewing, and consisting of basting, hemming, gathering, darning, patching, etc. Second term: Machine practice; drafting, cutting, and making underskirt and drawers. Third term: Drafting, fitting, and making dress without lining. Fourth term: Cutting and making corset cover and nightdress.

2. Dressmaking.—Five hours a week will be devoted to class-room work. Pupils will be taught to adapt and use patterns taken from pattern sheets, also the use of a dress-cutting system. Five hours a week will be devoted to industrial work. Each pupil will be required to furnish the material and draft, cut, and make a woolen dress for herself. (Catalogue, 1898–99.)

Michigan Agricultural College.

A. Cookery.—Freshman year, first term: Making and care of fire; care of kitchen and dining room and appointments; dish washing; measuring; the food principles are discussed and foods are studied with reference to their source, composition, cooking, nutritive value, and cost; the principles of boiling, steaming, stewing, baking, broiling, and frying are illustrated in the preparation of soups, vegetables, cereals, eggs, milk, meat, bread, and biscuit. Second term: The principles already explained are elaborated by the preparation of batters, muffins, soups, bread, pastry, cake, desserts, puddings, sauces, fish, and roast meats. Third term: In this term more difficult dishes are prepared, such as salads, mayonnaise and French dressings, croquettes, entrées and sauces, desserts, frozen creams, ices, sherbets, fancy cakes; luncheons and dinners are prepared and served. Lectures are given throughout the course. In the spring term, junior year, a course in cookery for the sick is given four hours a week. Lectures are given discussing the effect of foods in maintaining and restoring a condition of health; diseases especially affected by diet are considered and foods are prepared for the sick. An elective course in advanced cookery is offered in the fall term of the senior year, five hours a week. This course is intended for students who are familiar with the general principles of cookery. Special attention is given to canning and preserving fruits, and to making jellies, jams, and pickles. Fancy dishes suitable for course luncheons and dinners are made.

B. Household economy.—The course in household economy is given to sophomore women two hours a week through the year. Lectures are given and reference reading and papers are required. The subject is treated broadly under the following divisions:

I. The house.—Its site, construction, sanitation; heating, ventilating, lighting; water supply and drainage; disposal of waste; furnishing, cleaning, and general care; administration of household affairs; the keeping of household accounts; the relation of income to expenditure; the significance of the "home"—its relation to the municipality.

II. Foods.—Their nature, composition, and nutritive value; discrimination in purchasing; preparation and physiological effects; foods for the sick; foods for the well; foods for growing people, for adults.

III. The preservation of health.—The functions of the body; the care of the body; diets for different periods and conditions of life; work and rest; sleep.

IV. Clothing.—Features of healthy garments; sanitary considerations; night clothes; clothing for children and infants; dress materials; principles of construction of dress; artistic considerations of dress.

V. Emergencies.—A course of lessons in the application of the facts of anatomy and physiology, intended to fit one to render that "first aid" so often indispensable in cases of accident or sudden illness when there may be delay in summoning a physician.

Sewing.—Sophomore year, first term: Varieties of stitches used in hand sewing; patching, buttonholes, and hemstitching; application upon samples and simple articles. Second term: Care and use of the sewing machine and machine sewing; taking measures and drafting patterns by systems; cutting and making unlined skirts, yokes, and drawers. Third term: Advanced machine work and instruction in the use of attachments; drafting, cutting, and making a shirt waist; advanced drafting and cutting and making a corset cover; practice on fulled cloth; putting in pockets, making tailor buttonholes, etc. Junior year, first term:

Cutting, fitting, and making a lined dress; finer hand needlework in sewing on and grafting in lace, rolling hems, and appliqued hemming. Second term: Art needlework; a variety of embroidery stitches, and practice on flannel; Spanish laid work and ecclesiastical embroidery; Kensington and solid embroidery; study and practice in color; knowledge thus acquired applied to begun articles of utility. Third term: Millinery; practical and artistic principles; study of texture and quality of materials; care and renovation of materials; practice in making various bows; making and trimming covered hats and bonnets. (Catalogue, 1898–99.)

UNIVERSITY OF MINNESOTA (SCHOOL OF AGRICULTURE).

Cooking.—First year, second term: Kitchen management; care of cooking utensils, glass, china, and silver ware; measuring and invoicing; cooking vegetables, cereals, and bread. Second year, first term: Canning, preserving, pickling, and jelly making; soups, eggs, and meats. Second year, second term: Marketing, care of foods, and cold storage; fruits, salads, hashes, croquettes, "save all" dishes, and lunch baskets; equipment of dining room and table service. Third year, first term: Mixed soups; desserts of various fruits harmoniously combined; proper combination of flavors and colors in garnishing food; mixing and seasoning foods; carving and serving meats. Third year, second term: Food rations, dietaries, and bills of fare; invalid cooking, beverages, frozen dishes, pastry, and cake; food economics, table duties of host and hostess, and essays on housekeeping.

Domestic chemistry.—Third year, second term: Instruction is given in the chemistry and economy of human foods. Simple tests for the detection of the adulteration of foods are given. The chemistry of cleaning material and the composition of various household articles are considered. The instruction is given in the form of laboratory practice.

Home economy.—Second year, second term: This work is taught as the just proportion between income and expenditure; the distinction of economy, frugality, and parsimony are considered with reference to a definite proportion in the expenditures which are made for existence, comfort, culture, and philanthropy. A study is made of the sources of income, especially of the income from the farm in the form of house, food, and luxuries. The purchase of clothing, household stores, and furnishings is considered from the standpoint of the suitable. The relation of cash and credit to cost is also considered. Attention is given to savings and forms of investment, a bank account and the use of a check book. Each student in this class is required to submit at the close of the term a paper setting forth in detail the use of a certain named income for one year, embracing not only every item of necessary home expense but also an outlay made for travel, luxuries, accident, sickness, and other emergencies. The habit of keeping a household account is calculated to strengthen the judgment in making a wise use of money, therefore an analysis and study of expenditures as here indicated serves to bring clearly before the student's mind the relative importance of the different things which money will procure.

Home management.—First year, second term: This includes both housekeeping and home making, and the teaching of the subject naturally falls into three divisions, household work, sanitation, and family life. The instruction is based upon the belief that housekeeping is as important as it is difficult, and that home making is the noblest form of human endeavor. The points in detail in the preparation of food, the making of clothing, the care of the house and household belongings, and the ordering of the family life are considered in their relation to an adequate plan for home management. To start the student in the correct way of becoming mistress of the business of housekeeping is the end sought. It is believed that for one who knows the reason for the doing there is no drudgery; therefore students are taught the specific danger that lurks in dust and dirt, in order that they may understand the dignity of the unceasing war which the housekeeper makes upon these forces. The practical benefit to be derived from the knowledge students have gained in the cooking, sewing, laundering, and dairy classes is emphasized and shown in its relation to an adequate plan for the daily programme for the home. While the science of family life has not been formulated, yet some of its fundamental principles are recognized and may be taught.

Household art.—Second year, first term: This is taught by a series of lectures treating of the adornment of the house and grounds, noting the distinctive character of the country home and opportunity for embellishment found in the surroundings. The intention is to show that thought and energy can accomplish as much or more than money in making a farm home attractive; also to show the importance of acquiring correct knowledge and correct taste in order to secure every possible convenience, combined with harmonious forms, colors, and styles

in walls, draperies, and furniture. The true relation of beauty, use, and influence of surroundings upon life and character are considered in connection with the possibilities for improvement that may be found in simple and inexpensive methods.

Hygiene.—Third year, second term: Hygiene as a special study for women considers the health of the family as dependent upon pure food, pure water, personal cleanliness, and proper habits, as well as upon heredity. The aim is to show how a correct knowledge of the laws of nature is essential not only to the restoration but to the preservation of health. Several lectures by a physician will be given upon maidenhood, maternity, motherhood, infancy, and related subjects. These special lectures will be supplemented by the regular lectures in class, thus extending and simplifying the subjects in plain and easily understood terms.

Laundering.—First year, first term: Several lectures are given and practice work is provided in washing, ironing, starching, polishing, cleaning, and pressing clothing.

Sewing.—During the first year (first term) students receive instruction in the elements of sewing; different stiches, such as basting, seaming, hemming, darning, buttonholing, and patching are taught, and practice is given in the use of all the implements belonging to the sewing basket. The second year's work consists of cutting and making plain garments, such as underwear, children's clothing, shirt waists, and cotton dresses. In the third year the more difficult work of dressmaking is taken up. The cutting and fitting of dresses and jackets are taught by a very simple system; careful attention is given to quality of materials and harmony of colors. The course is designed to make each graduate capable of doing all kinds of sewing needed in the home. (Catalogue, 1898–99.)

Montana College of Agriculture and Mechanic Arts.

Sewing.—All the ordinary forms of sewing are taught, including garment making, dressmaking, and embroidery. The work is carefully graded according to the capabilities of the student, and may be utilized by her in the making of her own clothing. A straight-line system of cutting and fitting is taught, and systems are furnished at cost. The sewing room is furnished with a large cutting table, small sewing tables, three sewing machines, and cases for work.

Household economy.—Lectures embracing such subjects as food stuffs and their nutritive value; marketing, neatness, and order in housekeeping; preparation and serving of foods; food for the well, food for the sick, and talks on etiquette.

Household sanitation.—Lectures pertaining to the proper care of the home and its inmates.

Hygiene and emergencies.—Lectures treating of the laws of health and home nursing.

Cooking.—The object of the work in cooking is to familiarize the student with the most economical, healthful, and attractive methods of preparing and serving foods. Special attention is given to hygienic cookery. The economic value of the Aladdin oven is demonstrated, and a short course is given with the chafing dish. Special attention is paid to table laying and decoration and to serving meals. The kitchen laboratory is a large room provided with cupboards, and conveniently furnished with tables, sinks, range, an Aladdin oven, and a good supply of cooking utensils of all kinds. Individual worktables are provided for the use of each student. These tables have a full equipment of cooking utensils. Opening from the kitchen is a dining room, with sideboard well supplied with table linen, dishes, and silver. (Catalogue, 1898–99.)

University of Nebraska.

Food economics.—Study of food principles, comparison of nutritive and money values of food materials, marketing, values of fuels. General cookery of cereals, vegetables, meats, soups, breads, desserts, etc.

Household economics.—Location of house, plans for the construction of a house, application of chemical principles in cleaning and disinfection, study of light, heat, ventilation, water supply, plumbing, sewerage, etc., in their relation to the home. Keeping of household accounts. Advanced course in cookery, including the preparation of salads, croquettes, pastry, cakes, etc., the preservation of food materials by canning, preserving, pickling, etc. Invalid cookery; serving of meals; preparation of dietaries. (Calendar, 1898–99.)

Agricultural and Mechanical College for the Colored Race, Greensboro, N. C.

Sewing.—This course begins with the first year in the preparatory department and continues throughout the entire course of six years. Special attention is given to the various stitches, buttonholes, cutting and making childrens' and ladies' garments, the use of the sewing machine and attachments, and the art of fancy needlework.

Cooking.—This course begins with the first year in the preparatory department and continues throughout the entire course of six years. Special attention is given to food economics, the selection of foods with regard to cost and quality. (Catalogue, 1898-99.)

North Dakota Agricultural College.

Cooking.—There are two courses of cookery; one aims to give the students who have but a limited time the work that will be of most value to them, and includes plain cooking, dealing with soups, meats, vegetables, breads, invalid cookery and plain desserts; also the care and management of different rooms of a house, order and arrangement of household duties and practical experience in planning and serving meals. The regular course begins with the first term of the freshman year, one hour each day, in the study of the home, its proper construction and location, its sanitation and hygiene, including the heating, plumbing, etc., also how to furnish the home artistically as well as economically and hygienically; also the proper care of the body with regard to clothing, diet, exercise, and rest. Much help is gained from the class study of houses in the process of construction, different types of homes, interior decorations, etc.

Sewing.—The course in sewing is very complete, beginning with plain needlework. One term is required to be devoted to the making of a model book, which is composed of different samples of hemming, running, felling, darning, patching, etc.; these when mounted in the book with full explanation are very helpful for reference. The next work is the drafting and making of cotton and linen garments, which is followed by work in dressmaking. This includes the drafting, cutting, fitting, and finishing of dresses. A study of color combination and work in embroidery is taken up later in the course.

Equipment.—The department has four rooms. The lecture room is well furnished and is used for office purposes, lectures, and recitations. Large doors opening from the room on one side connect with the sewing room and on the other with the kitchen laboratory. The sewing room is provided with machines, sewing tables, cutting and pressing tables with gas connection, chiffonier for materials, blackboard, mirror, and other necessary furniture. The kitchen laboratory is equipped with work desks at which each student has her place and keeps her utensils. The work desks are supplied with gas for cooking, but the students are given experience in the management and care of the kitchen range, which is used when the meals are prepared. Other appliances available for use or illustration are the Aladdin oven, small electrical stove, balances for practical and experimental use, food museum showing the composition and nutritive value of some of the principal foods, food charts, and microscope. It is also aimed to use those kitchen conveniences that tend to simplify and economize household labor. The dining room is supplied with dining-room furnishings, and makes a home-like place in which the practice meals prepared by the students are served. (Circular of Information, 1899.)

Ohio State University.

1. One lecture (demonstrated when necessary) and three laboratory periods a week. (First term.) Lectures on (*a*) principles of combustion, utility and cost of fuels, construction of ordinary stoves and ranges and of the Aladdin oven; practice in building, regulating, and caring for a fire; the consideration of ancient and modern methods of cooking. (*b*) Food economics: Study and classification of food principles, water, salts, carbo-hydrates, proteids, fats; comparative nutritive values of foods; a vegetable diet considered; baking powders, food adjuncts, beverages, filtration, laws regulating adulteration of foods and inspection of meats; the various methods of preserving foods. (*c*) Study of cuts of meats (demonstrated) and of carving. Laboratory work: General cooking; preparation of cereals, vegetables, soups, stews, fish, meats, and breads.

2. One lecture, three laboratory periods a week. (Second term.) Lectures on (*a*) general marketing; (*b*) comparative nutritive values and money values of vari-

ous foods, study of charts and dietetic tables, preparation of dietaries; (*c*) the chemistry of the human body, (1) its composition, (2) the chemistry of digestion; (*d*) the effect of cooking upon the digestibility of foods, necessity for a mixed diet; (*e*) waiting-maids' course (four weeks). Laboratory work: General cookery; preparation of entrees, croquettes, salads, pastry, puddings, and sauces.

3. One lecture and three laboratory periods a week. (Third term.) Lectures on first aids to the injured and on general nursing. Laboratory work: (*a*) General cookery (four weeks): Including cakes, desserts, frozen dishes, etc., and the ordering, preparation, and serving of a dinner to guests; (*b*) invalid cookery (six weeks), including the preparation of such dishes as may be healthful and appetizing during illness or convalescence.

4. One lecture, three laboratory periods a week. (First term.) Lectures on household economics: (*a*) The situation of a house, the planning and construction of a house from attic to cellar, light, heat, ventilation, water supply, plumbing, sewerage, disinfection. (*b*) The ordering of house work. (*c*) Simple household accounts and bookkeeping. (*d*) Laundry work. Laboratory work: (*a*) Canning, jellying, preserving, pickling, etc. (four weeks). (*b*) Chafing dish (three weeks). (*c*) Laundry work (five weeks): Washing, ironing, and general care of underclothing (silk, flannel, and merino), linens, starched clothes, laces, and embroideries.

5. One lecture, with two practice periods in sewing and one in millinery a week (second term). Lectures on production and manufacture of cotton, wool, flax, silk, etc., the choice and treatment of various materials, study of line, form, color, and texture as applied to dressmaking and millinery; artistic and hygienic dress considered. Practice work. (*a*) Plain sewing: Practice in the different stitches, drafting and making white goods by hand and by machine. (*b*) Millinery: Making bows, facing, and finishing brims, trimming simple hats.

6. One lecture, with two practice periods in sewing and one in millinery a week. (Third term.) Lectures on historic costumes illustrated. Practice work. (*a*) Sewing: Drafting and making an unlined dress, drafting and making a cloth skirt, drafting, matching, and making a striped house jacket. (*b*) Millinery: Making and trimming covered hats and bonnets, making a shirred hat.

7. One lecture, with two practice periods in sewing and one in millinery a week. (First term.) Lectures on art and its applications. Practice work. (*a*) Sewing: Drafting and fitting waist linings, drafting and making close-fitting waist, drafting and making princess gown. (*b*) Millinery: Designing and making an evening hat or bonnet; work with fancy straws and mourning goods.

8. One lecture, with two practice periods in dressmaking and one in art needle work weekly. (Second term.) Lectures on history of domestic art. Practice work. (*a*) Dressmaking: Designing, drafting, fitting, and making an evening gown and fancy waist. (*b*) Art needle work: Drawn work, lace work, and simple embroidery.

9. One lecture, with three practice periods in tailoring weekly. (Third term.) Lectures on art in the household. Practice work: Designing, drafting, and making of a tailor suit and lined jacket. (Catalogue, 1897–98.)

Oregon Agricultural College.

Freshman year.—First term: Four sewing lectures and practice work, one hour a day, on sewing samples. Second term: Sewing continued; lectures and talks on social forms and usages, the art of entertaining, readings on the art of conversation. Third term: Sewing, the making of simple garments; readings, conversation.

Sophomore year.—First term: Drafting and making simple skirt, cutting, fitting, and making lined waist from pattern; a study of the texture of goods, five hours. Third term: Drafting and making lined waists, matching stripes and plaids, study of woolen textures, ten hours.

Junior year.—First term: Cookery (canning of fruits, one-half term); three lectures; one hour a day practice work in the kitchen laboratory; technological cookery; preparatory work in chemistry of foods, one-half term. Second term: Practice work in cookery, four hours per week. Third term: Practice work in cookery, three hours per week.

Senior year.—First term: Special hygiene, three hours; æsthetics, four hours; needlework, five hours. Second term: Sanitary science, one hour; æsthetics, four hours. Third term: Home-furnishing course, three hours; emergency lectures, one hour. (Catalogue, 1898–99.)

South Dakota Agricultural College.

1. Plain sewing.—Practice upon samples of the stitches in every-day use, including button-hole making, preparing a model book, and making at least two pieces of a suit of underwear. (Winter term, two hours three times a week.)

2. Household economy.—Lectures on foods and the preparation of same and upon the general care of dining room and kitchen. (Winter term, one hour five times a week.)

3. Cooking.—Bread making, cooking of meats, pudding, cakes, and plain cookery in general. (Spring term, two hours three times a week.)

4. Sewing.—The making of the remainder of the suit of underwear, an unlined dress, and a shirt waist. (Spring term, two hours twice a week.)

5. Sewing.—Drafting, cutting and fitting, and plain dressmaking. (Fall term, two hours three times a week.)

6. Sewing.—Continuation of 5, general dressmaking. (Winter term, two hours five times a week.)

7. Sewing.—Art needlework, as embroidery and hemstitching. (Winter term, two hours five times a week.)

8. Cooking.—Especial attention given to preserving, pickling, and the preparation of entrees. (Fall term, two hours twice a week.)

9. Cooking.—Fancy cooking, menus, dainty methods of serving food, and invalid cookery. (Spring term, two hours five times a week.)

10. Cooking.—Each girl will take up some special line of cookery which will give material for the preparation of her disquisition, if her major study is in domestic science. (Winter term, two hours five times a week.)

11. Household sanitation.—Lectures on proper house planning, ventilation and plumbing, care of sleeping rooms, arrangements for sickness, and care of invalids. (Fall term, one hour twice a week.)

12. Cooking.—Continuation of 10. (Spring term, two hours five times a week.) (Catalogue, 1898–99.)

Utah Agricultural College.

I. HOUSEHOLD ECONOMY.

1. Laundering occupies the fall term, and consists of practical work alternating with lectures. The practice includes plain white washing and removing stains, clear starching, best methods of doing up fine mull, of ironing shirts, cuffs, and collars, washing flannels, and cleaning silk and fine woolen goods. The lectures treat of the chemistry of the various materials used and of hard waters and the process of softening them. Soaps, washing fluids, bleaching powders, bluings, and starch are discussed in their scientific and practical relations to laundry work.

2. Fruit work includes canning by various methods and making all kinds of preserves and marmalades; different methods of making jellies, and experiments with green and ripe fruits; the making of all kinds of catchups, spiced fruits, sweet and sour pickles, table sauces, and meat relishes; the preparing of fruit juices, cordials, and sirups. The latter part of the term's work is a course of lectures on the chemical nature of fruit, its acids and sugars; the value of fruit as food and its action on the human system; the causes of fruit fermentation, and a study of antiseptics.

3. Cooking lectures treat of marketing and the selection of food; general rules of measuring and mixing; best methods of baking and boiling; deep and shallow frying; the general chemistry of cooking; carving and serving of food.

4. Cooking practice includes all kinds of plain and some fancy cooking, covering in a general way all the subjects with which a housekeeper in moderate circumstances needs to be familiar. Demonstration lessons are given at various times throughout the term on subjects difficult of treatment in the general practice. A three-course lunch is served daily during the winter term. Members of the class take turns in presiding as hostess at the table, carving and serving plates and looking after the needs of the guests. They also take turns in waiting upon the table.

5. Science of nutrition is a study of foods, their chemical composition, characteristics, digestibility; the way in which they nourish the body; the best foods to be given in certain diseases; the best food for young children; effect of age, climate, and occupation on amount and kind of food required. In connection with these lectures about 40 lessons are given in preparing food for the sick.

6. Hygiene treats of sanitary conditions about the home; dangers from damp and unclean cellars, foul drains and sinks; ventilation, heating, and lighting;

instructions especially necessary to women on the care of personal health; home nursing, with illustrative lessons on changing beds for the sick.

7. Household management consists of lectures on the convenient arrangement and economical furnishing of rooms; the best methods of doing all kinds of housework, with a view to economy of time and strength; duties of mistress and servants; entertainment of guests, and many other subjects of interest to the home maker.

8. Æsthetics is the science of taste and beauty. The course includes talks on fine china, pictures, furniture, decorations for the home, harmony of colors, taste in dress, and kindred subjects.

II.—SEWING.

1. Piece sewing.—Practice is given first in the various hand stitches used in muslin and woolen goods; overhanging, running, hemming, hemstitching, overcasting, felling, gathering and stroking gathers, buttonholes, gusset, patching and darning, French hem on damask, etc.

2. Dressmaking.—At least two muslin garments are made. A gown is cut out, basted, and entirely made by the student.

3. Designing, cutting, and fitting.—Instruction is given by talks on grace in design of costume and harmony of colors. Special attention is given to hygienic modes of dress. The student is taught to make drawings of the costumes which she designs. She also learns to draft patterns from measurements. Further practice is given in cutting and fitting.

4. Fancy work.—This course includes Kensington embroidery. Roman cut work, Spanish laid work, drawn work, jeweled embroidery, and modern lace making. (Catalogue, 1898–99.)

HAMPTON NORMAL AND AGRICULTURAL INSTITUTE, HAMPTON, VA.

Cooking.—Three and one-half months, four hours a week. Making and care of fires, dish washing and care of kitchen; talks on fuels and foods; baking apples, potatoes, etc.; boiling vegetables and eggs; steaming; lessons in buying meat; cooking of meats; warmed-over dishes, soups, broiling and stewing; simple and invalid cooking; biscuits and cookies; bread; plain cake; plain pastry; cooking of poultry, fish, and eggs; tea, coffee, cocoa; setting table. These lessons are accompanied by instruction in the chemistry of cooking so far as it applies in the practical work.

Sewing.—Junior year, two periods a week: Basting, running, overcasting, backstitching, overhanding, hemming, felling, blind stitching, cross-stitching. Each student makes for herself a book containing samples of the different kinds of work, and keeps a notebook in which she sets down the verbal instruction given. Middle year: Continuation of the work of the junior year; each student cuts and makes for herself a full set of underclothes. Senior year: Students are given talks on colors and material used, and taught to draft and cut from patterns, and each girl makes for herself a dress. (Catalogue, 1898–99.)

WEST VIRGINIA COLORED INSTITUTE.

I.—PLAIN SEWING.

First year.—First term: Holding needle, use of thimble and tools; basting, overhanding, running, turning hem by measure, gathering and stroking gathering; putting on bands. Second term: Sewing on buttons, putting on gussets; herringbone stitched on flannels; patching, hem stitching, and French fell; making of pillow cases; making buttonholes. Third term: Darning on woolen goods; blind stitching; mending and darning; review of previous terms.

Second year.—First term: Names of sewing machines and parts; how to clean, oil, and operate the machines; how and when to use attachments; machine stitching, selection of material. Second term: Instruction in the use of the magic scale system for cutting garments; cutting and making gentlemen's undershirts, colored shirts, and overalls. Third term: Taking measures, cutting skirts by measure; cutting underwaists from pattern; basting, stitching and trimming; cutting and making a plain dress by pattern; review.

II.—DRESSMAKING.

First year.—First term: Choice of material and talk on the manner of wearing goods; drafting and cutting foundation and outer skirts from measurements,

Second term: Making, hanging, and trimming skirt; talking on forms, line, and proportion in relation to draping and trimming. Third term: Drafting, cutting, and fitting plain basques, and the general finish of these garments.

Second year.—First term: Drafting basques, sleeves, and the different accessories to the basque from measurement; drafting basque with extra seam for stout figures. Second term: Cutting and matching striped, plaid, and figured basques and skirts; talks on artistic and hygienic principles of dress; talks on color and textiles applied to dress. Third term: Appropriate selections for different individuals; advanced work in making complete dresses from different kinds of material.

Third year.—First term: Cutting, fitting, and pressing; practice in the use of colors; talk on the manufacture of cloth. Second term: Drafting jackets of various styles; making different styles of collars and trimmings; sewing on hooks; putting in whalebones. Third term: Draping garments of every kind; making and finishing garments of every kind from different kinds of material. (Catalogue, 1897-98.)

CHAPTER XL.

STATISTICS OF NORMAL SCHOOLS.

The number of persons engaged in teaching in the United States, from kindergarten to university, exceeds 485,000. To recruit this vast army of teachers, there were 93,687 students in the scholastic year ending June, 1899, pursuing training courses for teachers in institutions of various grades. Of these students, 56,279 were being educated in 739 public institutions and 37,408 in 749 private institutions. About 48 per cent of the total number, or 44,808, were in the 166 public normal schools, while 23,572 were reported from 165 private normal schools. The normal students in 29 public universities and colleges numbered 2,541; in 206 private universities and colleges, 6,950; in 544 public high schools, 8,930, and in 378 private high schools and academies, 6,886. The following table shows the number of institutions of each class and the number of normal students in each class for four scholastic years:

Normal students reported for four years.

Classes of institutions.	1895-96.		1896-97.		1897-98.		1898-99.	
	Institutions.	Students.	Institutions.	Students.	Institutions.	Students.	Institutions.	Students.
Public normal schools	160	40,421	164	43,199	167	46,245	166	44,808
Private normal schools	169	20,777	198	24,181	178	21,293	165	23,572
Public universities and colleges	27	1,691	30	1,839	23	2,255	29	2,541
Private universities and colleges	166	5,335	166	4,650	188	6,065	206	6,950
Public high schools	447	8,246	507	9,001	494	7,378	544	8,930
Private high schools	439	7,930	422	7,064	326	5,989	378	6,886
Grand total	1,408	84,400	1,487	89,934	1,376	89,225	1,488	93,687
In all public institutions	634	50,358	701	54,039	684	55,878	739	56,279
In all private institutions	774	34,042	786	35,895	692	33,347	749	37,408

The 166 public normal schools had an average of 270 students to the school, and the 165 private normal schools an average of 142 to the school. The 29 public universities and colleges reporting normal students had an average of 84 to the institution, while 206 private universities and colleges had an average of nearly 34. The average number of normal students in 544 public high schools was 16, and the average number in 378 private high schools 18. These averages have reference only to students pursuing training courses for teachers. Students in other courses are enumerated elsewhere.

The number of students graduating from the teachers' training courses of the public and private normal schools in 1899 was 11,175. The normal graduates of other institutions were not reported to this office, but it may be estimated that the number of students graduating from normal courses in all the institutions named, including the normal schools, was not less than 15,300. But this number does not represent the entire number of recruits added to the teaching force of the country each year. Thousands leave the normal schools after one year's study and begin the work of teaching, while thousands more join the ranks from other institutions.

The distribution of normal students by States and Territories classified as in the above table is shown in Table 17 in this chapter. With two exceptions all the States and organized Territories make provision for the education of teachers in public normal schools. Nevada and Wyoming have no public normal schools, but their State universities have departments for the free education of teachers. Tennessee has not a normal school completely under State control, but the legislature makes an annual appropriation of $20,000 to the Peabody Normal College of the University of Nashville, providing for a certain number of free State scholarships. The State board of education has also a voice in the management of the affairs of the college. The State makes still further provision for the education of teachers in the University of Tennessee, where tuition is free.

PUBLIC NORMAL SCHOOLS.

The summarized statistics of the 166 public normal schools will be found in Tables 1 to 8, while detailed information concerning the schools will be found in Table 19.

The number of public normal schools in each State is shown in the first column of Table 1. Fifteen States and Territories support only 1 school each. Massachusetts has 10 schools, New York and Pennsylvania 15 each. These three States have nearly one-fourth the public normal schools in the United States and more than one-third of the normal students. In the 166 schools there were 2,057 teachers employed in instructing students in normal departments and 693 engaged wholly in other departments. The North Atlantic Division had 899 of the teachers for normal students, the North Central Division 638, the two southern divisions 174 each, and the Western Division 172. Of the 2,057 teachers, 839 are men and 1,218 are women.

Tables 2 and 3 summarize the enrollment of students in the public normal schools. Of the 44,808 students in the normal departments, there were 11,543 males and 33,265 females. The North Atlantic Division has 17,714 students, 15,035 of these being in Massachusetts, New York, and Pennsylvania. In the North Central Division the students in normal departments numbered 16,325, quite evenly distributed. The South Atlantic Division had 3,794, the South Central 3,272, and the Western Division 3,703. The public normal schools had 866 students in business courses, 4,804 in secondary grades equivalent to high-school grades, and 24,690 pupils in elementary grades. The grand total, as shown in the first column of Table 3, was 75,168. The number of colored normal students included was 1,138, nearly all in the public normal schools for educating colored teachers in the Southern States.

Many of the public normal schools use their elementary departments as model schools, while some maintain no model schools of their own, but use for the same purpose the elementary grades in convenient public day schools.

Table 4 shows that in 1899 the number of teachers graduating from the public normal schools was 8,948, the number of male graduates being 1,635 and the number of female graduates 7,313. The North Atlantic Division alone had more than half of these graduates, or 4,653. The North Central Division had 2,530 graduates, the South Atlantic 480, the South Central 461, and the Western Division 824. These schools had 182 graduates from business courses and 654 from other courses.

The income of the public normal schools for each State is shown in Table 5. The appropriations from States, counties, and cities for support for the 135 schools reporting this item aggregated $2,510,934. The total income for the year from appropriations, tuition fees, productive funds, and from other sources reported by 141 schools was $3,484,107. Tuition fees received by 105 schools aggregated $498,719, and the greater part of this sum must have been paid by stu-

dents not in normal courses. The amount received from productive funds by 15 schools was $67,853. It is probable that the $406,601 reported by 49 schools as receipts from "other sources and unclassified" came directly or indirectly from public funds.

The value of buildings, grounds, and other property of 142 of the public normal schools reporting to this office in 1898–99 was $20,836,010. As shown in Table 6, the number of volumes reported in the libraries of 148 of these schools was 591,728, valued at $649,293. Five schools received during the year benefactions amounting to $141,273. Ten schools have endowments aggregating $1,886,529. The aggregate of public appropriations for buildings and improvements received by 42 schools was $560,896.

Table 7 shows the amount of public appropriations received each year for the last six years by the public normal schools for support, while Table 8 shows the public appropriations for buildings and improvements in the same period. The following table shows the aggregates of these appropriations for each year since 1889–90:

Public appropriations to public normal schools for ten years.

Year.	For support.	For building.	Year.	For support.	For building.
1889-90	1,312,419	909,533	1894-95	1,917,375	1,003,933
1890-91	1,285,700	409,916	1895-96	2,187,875	1,124,834
1891-92	1,567,082	394,635	1896-97	2,426,185	743,333
1892-93	1,452,914	816,826	1897-98	2,566,132	417,866
1893-94	1,996,271	1,583,399	1898-99	2,510,934	560,896

PRIVATE NORMAL SCHOOLS.

The number of private normal schools reporting to this office varies from year to year. There was a falling off of 13 in the number of schools from 1898 to 1899. A few of the weaker ones went out of existence, while others continue as private secondary schools. The remaining schools were considerably strengthened, the 165 reporting for 1898–99 having 2,279 more normal students than the 178 schools reporting for 1897–98.

Table 9 shows that the 165 schools had 1,036 teachers for normal students, an increase of 28 over the previous year. The number of teachers wholly for other departments was 687, a decrease of 49 from the preceding year.

Private normal schools are not reported from 16 States and Territories. Only 10 such schools are credited to the North Atlantic Division, where there are 57 public normal schools. In the North Central Division there are 72 private normal schools with 14,826 normal students, while the 41 public normal schools of that division have 16,325 normal students. The two Southern divisions have together 79 private normal schools with 5,736 normal students, while the 51 public normal schools of that section have 7,066 normal students.

From Table 10 it may be seen that 11,829 of the 23,572 normal students in the private normal schools were men and 11,743 were women. Of the total number 14,826, or nearly 63 per cent, are in the North Atlantic Division.

The total enrollment in the private normal schools was 50,836, including 5,749 in business courses, 8,191 in secondary grades, and 13,324 in elementary grades. It is shown in Table 11 that there were 2,140 colored students in the normal departments, nearly all being in private normal schools for the colored race in the two Southern divisions.

The number of graduates from teachers' training courses was 2,227, as shown in Table 12, the number of men being 1,129 and the number of women 1,098. There were 1,629 graduates from business courses and 1,250 from other courses.

Table 13 shows that 28 private normal schools received State, county, or city aid aggregating $24,823. The tuition fees of 105 schools amounted to $590,402, while 14 schools received $47,997 from productive funds. The aggregate income of 118 schools was $921,473.

The value of grounds, buildings, and other property owned by 138 private normal schools was reported as $5,831,785, and 28 schools possessed endowments to the value of $2,508,744, as shown in Table 14. During the year 24 schools received benefactions amounting to $423,755. The libraries of 128 schools had 206,893 volumes, valued at $181,573.

DISTRIBUTION OF NORMAL STUDENTS.

It is shown in Table 15 that nearly 26 per cent of the normal students in public normal schools were men and over 74 per cent were women, while in the private normal schools the number of normal students was almost equally divided between the sexes. Nearly 20 per cent of the normal students attending public normal schools in 1898-99 graduated, while in the private normal schools less than 10 per cent graduated.

The number of students pursuing teachers' training courses in universities and colleges, in public high schools, and in private high schools and academies is summarized by States in Table 16. Table 17 is a summary of all the students in the five classes of institutions reported to this office as pursuing normal or teachers' training courses in 1898-99.

Table 18 contains a list of the universities and colleges in which courses designed for the professional training of teachers are maintained. The number of normal students for each year for the past six years is given. Institutions which are public are so designated.

TABLE 1.—*Summary of statistics of public normal schools in 1898–99.*

SCHOOLS AND INSTRUCTORS.

State or Territory.	Schools.	Teachers for normal students.			Teachers wholly for other departments.			Total number teachers employed.		
		Male.	Female.	Total.	Male.	Female.	Total.	Male.	Female.	Total.
