CHAPTER XLI.

STATISTICS OF SECONDARY SCHOOLS.

The total enrollment in the schools and colleges of the United States for the scholastic year ending June, 1899, was 16,738,362. Of this number the secondary students comprised nearly 4 per cent, or 655,227. This was a gain of 29,112 over the preceding year. The secondary students enumerated were distributed among eight classes of institutions, as follows:

Institutions.	Male.	Female.	Total.
Public high schools	197,127	279,100	476,227
Public normal schools	1,572	3,232	4,804
Public universities and colleges	5,259	2,259	7,518
Private high schools	51,900	51,938	103,838
Private normal schools	4,380	3,811	8,191
Private universities and colleges	28,254	13,544	41,798
Private colleges for women	----------	5,089	5,089
Manual training schools	4,384	3,378	7,762
Total	292,876	362,351	655,227

In localities in most of the States where high schools are not accessible there are many students pursuing secondary studies under the direction of teachers of the elementary schools. These students and others not reported may number nearly 20,000. Including this number, the total enrollment of secondary students for the scholastic year 1898-99 was not less than 675,000. This does not include the students enrolled in commercial schools or city evening schools.

This chapter is devoted almost exclusively to the statistics of the 5,495 public high schools and the 1,957 private high schools, academies, and seminaries reporting directly to this Bureau for the year 1898–99. The following table shows the remarkable growth of public and private high schools for the past ten years:

Year reported.	Public.			Private.			Total.		
	Schools.	Teachers.	Students.	Schools.	Teachers.	Students.	Schools.	Teachers.	Students.
1889-90	2,526	9,120	202,963	1,632	7,209	94,931	4,158	16,329	297,894
1890-91	2,771	8,270	211,596	1,714	6,231	98,400	4,485	14,501	309,996
1891-92	3,035	9,564	239,556	1,550	7,093	100,739	4,585	16,657	340,295
1892-93	3,218	10,141	254,023	1,575	7,199	102,375	4,793	17,340	356,398
1893-94	3,964	12,120	289,274	1,982	8,009	118,645	5,946	20,129	407,919
1894-95	4,712	14,122	350,099	2,180	8,559	118,347	6,892	22,681	468,446
1895-96	4,974	15,700	380,493	2,106	8,752	106,654	7,080	24,452	487,147
1896-97	5,109	16,809	409,433	2,100	9,574	107,633	7,209	26,383	517,066
1897-98	5,315	17,941	449,600	1,990	9,357	105,225	7,305	27,298	554,825
1898-99	5,495	18,718	476,227	1,957	9,410	103,838	7,452	28,128	580,065

The increase in the number of public high schools since 1889 is one of the most remarkable facts in the educational history of the decade. In 1889–90 there were 2,526 public high schools and 202,963 students, while in 1898–99 the number had reached 5,495 schools, with 476,227 students. This was an increase of 117 per cent in the number of schools and 135 per cent in the number of secondary students.

Up to the middle of the decade there was an increase in the number of private high schools and academies, but since 1895 there has been a small decrease annually.

In 1889-90 the public high schools had about 68 per cent of the number of students and the private high schools about 32 per cent, while in 1898-99 the former had over 82 per cent and the latter nearly 18 per cent of the secondary students. The relative progress of public and private high schools for the past ten years is shown in the following table, which gives the proportion of the number of schools, teachers, and students of the two classes:

Year reported.	Per cent of number of schools.		Per cent of number of teachers.		Per cent of number of students.	
	Public.	Private.	Public.	Private.	Public.	Private.
1889-90	60.75	39.25	55.85	44.15	68.13	31.87
1890-91	61.78	38.22	57.03	42.97	68 26	31.74
1891-92	66.19	33.81	57.42	42.58	70.40	29.60
1892-93	66.23	33.77	60.25	39.75	70.78	29.22
1893-94	66.67	33.33	60.21	39.79	70.91	29.09
1894-95	68.37	31.63	62.26	37.74	74.74	25.26
1895-96	70.25	29.75	64.21	35.79	78.11	21.89
1896-97	70.87	29.13	63.71	36.29	79.18	20.82
1897-98	72.76	27.24	65.72	34.28	81.03	18.97
1898-99	73.74	26.26	66.55	33.45	82.10	17.90

Since 1871 the United States Bureau of Education has been collecting statistics of private secondary schools, and since 1876 statistics of public high schools in the larger cities, but it was not until 1889-90 that a systematic effort was made to obtain information concerning all the public high schools of the country. The following table shows the number of secondary students and the per cent to the total population each year for the past 28 years, so far as the information could be gathered by this Office:

Number of secondary students in public and private high schools.

Year.	Secondary students.					
	In public high schools.	Per cent of population.	In private high schools.	Per cent of population.	In both classes of schools.	Per cent of population
1871	----------	----------	38,286	0.097	----------	----------
1872	----------	----------	48,660	.120	----------	----------
1873	----------	----------	56,640	.137	----------	----------

1898-99	476,227	.643	103,838	.141	580,065	.784

a Previous to 1890 only the pupils in public city high schools are given. From 1890 onward all public high schools are included.

Prior to 1890 the number of students reported by a large number of private high schools included the whole number in attendance, the elementary pupils as well as the secondary students. In the above table the statistics for the years from 1871 to 1889 have been carefully corrected upon the basis of the reports for later years, eliminating the pupils below the high school grades.

Public High Schools.

Tables 1 to 15 in this chapter summarize the statistics of the public high schools reporting to this Office, while the information concerning each school is given in detail in Table 42. Tables 16 to 29 relate to private secondary schools, while Tables 30 to 38 exhibit the combined statistics of public and private secondary schools. Tables 39 and 40 show the distribution of secondary students by States in the various classes of institutions.

For the scholastic year 1898-99 there were 5,495 public high schools reporting to this Office, a gain of 180 over the preceding year. The number of these schools reported as departments of public school systems was 5,017, while only 478 were reported as independent. These are generally outside the cities or villages. Of the number belonging to city or village systems 731 are in cities which have 8,000 population or over.

As shown in Table 1 there were 18,718 teachers instructing secondary students in the public high schools, the number of men being 9,239 and the number of women 9,479. This was an increase of 777 in the number of teachers over the preceding year.

It is shown in the same table that the public high schools had 476,227 secondary students, 197,127 males and 279,100 females, a gain of 26,627 in the total number. The male students comprised 41.39 per cent of the whole number and the female students 58.61 per cent.

Of the total number of students in the public high schools of the United States, 239,061, or more than 50 per cent, are found in the 2,916 schools of the North Central Division. The 1,342 public high schools of the North Atlantic division had 150,683 secondary students, the 598 schools of the South Central had 35,632, the 406 schools of the South Atlantic had 35,684, and the 233 schools of the Western Division had 25,167 secondary students.

In the total number of students reported there were included 7,117 colored secondary students. Of this number only 3,352 were in the colored high schools of the two Southern divisions, while the other divisions had 3,765. In the colored high schools of Missouri, a former slave State, there were 685 secondary students. If this number be subtracted from the North Central Division and added to the total in the two Southern divisions the number would be 4,037 for the Southern and 3,080 for the other sections of the United States.

Students and Courses of Study.

The number of secondary students in classical and scientific courses known to be preparing for college, the number of graduates in 1899, the number of college preparatory students in the graduating classes, and the number of public high-school students in military drill are shown in Table 2. The number preparing for college was 54,794, or 11.51 per cent of the whole number. The number of graduates was 56,468, or 11.86 per cent of the total enrollment. The number of graduates prepared for college was 16,293, or 28.85 per cent of the total number of graduates for the year. The number of students in military drill was 10,396, an increase of 1,364 over the preceding year.

The table which follows is a synopsis of the summaries exhibited in Tables 2 to 11. The per cent of male students preparing for college was 14.39, and the per

cent of female students 9.47. Over 10 per cent of the male students enrolled and nearly 13 per cent of the female students graduated in 1899. The per cent of male graduates who had prepared for college was 36.26 and the per cent of female graduates 24.68.

Students in certain courses and studies in public high schools.

Courses, studies, etc.	Number of students.	Per cent of total number of secondary students.	Male students.	Per cent of total number of male students.	Female students.	Per cent of total number of female students.

a Per cent of number of graduates.

The above table shows that there were 239,981 public high-school students studying Latin, or 50.39 per cent of the whole number. It may be considered as remarkable that a greater proportion of female than male students were studying Latin. There were 93,741, or 47.55 per cent, of the male students and 146,240, or 52.40 per cent, of the female students in Latin. Only 4.08 per cent of the male students and 2.44 per cent of the female students were studying Greek. The per cent of male students studying algebra was 58.15, and the per cent of female students in the same study was 56.35. The total number studying algebra was 271,889, or more than 57 per cent of the total public high-school enrollment. The numbers and percentages of the other leading high-school studies are given in the above table for the United States, and for the States in detail in Tables 3 to 11.

As shown in Table 3, Latin was taught in 4,706 of the 5,495 public high schools. This was an increase of 218 in the number of schools in which Latin was taught. The number of students was 16,674 more than the preceding year.

The per cent of students in each of the leading high-school studies reported annually for the past ten years is given in the table which follows. It will be noted that the per cent of students in Latin has increased from 34.69 in 1889–90 to 50.39 in 1898–99. In the same period the per cent in algebra increased from 45.40 to 57.09, the per cent in German from 10.51 to 14.01, and the per cent in general history from 27.31 to 38.32. The proportion of students in Greek has remained at a fraction above 3 per cent for ten years.

Per cent of total number of secondary students in public high schools in certain courses and studies, etc.

a Per cent of total number of graduates.

Although the actual number of students reported as preparing for college has increased each year, there has been a falling off in the percentage in the last ten years. In 1889–90 the per cent of public high-school students preparing for college was 14.44 and in 1898–99 only 11.51.

Tables 12, 13, and 14 compare the statistics of public high schools in cities and outside of cities. In cities of 8,000 population and over there were 731 public high schools, with 7,563 instructors and 224,686 students. Outside of these cities there were 4,764 public high schools, with 11,155 instructors and 251,541 students. In the cities the high schools had an average of 307 students to the school, while the average outside of the cities was 53 students to a school.

EQUIPMENT AND INCOME.

The equipment and income of the public high schools in each State may be found summarized in Table 15, so far as the items were reported to this Office. The number of volumes in the libraries of 4,537 schools was 2,618,445; the value of grounds, buildings, scientific apparatus, etc., owned by 4,430 schools was $89,096,912. Owing to the fact that in most cases separate accounts are not kept of the proportion of public appropriations used by the high schools, only 1,905 of these schools were able to report the amounts of State or municipal aid received. The aggregate of these amounts was $4,700,762. The aggregate received from tuition by 1,580 schools was $514,489. The amount received by 722 schools from sources reported as unclassified was $1,362,561. Nearly all of the latter item should be credited to State, county, or city appropriations. The total income of 2,102 schools reporting this item was $6,769,213.

Private High Schools and Academies.

Tables 16 to 29 summarize the statistics of private high schools, academies, and seminaries. Tables 16 to 26 are similar in form to Tables 1 to 11, relating to public high schools, and the two series may be compared. Tables 27 and 15 may also be compared. Table 30 is a comparative showing of the average numbers of teachers and students in public and private high schools.

For the year 1898-99 there were 1,957 private secondary schools reporting to this Office, or 33 less than the number reporting the previous year. These schools had 9,410 teachers for secondary students, an increase of 53, and 103,838 secondary students, a decrease of 1,387. The total number of private secondary students included 2,956 colored students—2,645 in private colored schools in the two southern divisions and 311 in the other divisions. The 1,957 schools reported 118,050 in the elementary grades.

Students and Courses of Study.

In the private secondary schools there were 26,714 students preparing for college, or nearly 26 per cent of the number enrolled. As shown in Table 17, the number of these college preparatory students preparing for the classical course was 16,613 and the number preparing for scientific courses 10,101. The number of graduates in 1899 was 11,862, or more than 11 per cent of the secondary students enrolled. In the classes that graduated there were 5,309 students prepared for college, or nearly 45 per cent of the graduates. There were 8,459 students in military drill, an increase of 605 over the preceding year.

The number of students in each of 18 high-school studies in each State will be found in Tables 18 to 23, while the percentages of students in these studies are shown in Tables 24, 25, and 26. The following table gives a synopsis of the number and per cent of students, by sex, in college preparatory courses and in the leading high-school studies in private secondary schools in 1898-99:

Students in certain courses and studies in private high schools and academies.

Courses, studies, etc.	Number of students.	Per cent of total number of secondary students.	Male students.	Per cent of total number of male students.	Female students.	Per cent of total number of female students.
Students preparing for college:

a Per cent of total number of graduates.

An interesting comparison may be made with the above table and a similar synopsis on a preceding page relating to public high schools. It is shown that nearly 26 per cent of the private high-school students were preparing for college, while less than 12 per cent of the public high-school students were making such preparation. In both the public and private high schools about 50 per cent studied Latin. The per cent studying algebra in the private high schools was 52.17 and in the public high schools 57.09.

The following table shows the progress made by the private high schools and academies in the past ten years as indicated in the increased percentages of students in certain courses and studies:

Per cent of total number secondary students in private high schools and academies in certain courses and studies.

Students and studies.	1889–90	1890–91	1891–92	1892–93	1893–94	1894–95	1895–96	1896–97	1897–98	1898–99

a Per cent of number of graduates.

The above table shows that in the private secondary schools the per cent of graduates has increased from 8.50 in 1890 to 11.42 in 1899, while the proportion of graduates prepared for college has decreased from 61.37 per cent in 1891 to 44.75 per cent in 1899. As in the case of public high schools, there has been a marked increase in the number of students in certain studies. The per cent studying Latin increased from 31.32 in 1889–90 to 49.80 in 1898–99, and the per cent in algebra from 37.12 in 1889–90 to 52.17 in 1898–99. In the public high schools it has been noted that a little more than 3 per cent of the students reported each year for ten years have been studying Greek. In the private high schools the percentage increased from 7.02 in 1889–90 to 10.43 in 1898–99. For the past year there was an unaccountable decrease to 9.55 per cent in the number studying Greek.

EQUIPMENT AND INCOME.

Table 27 exhibits the equipment, income, benefactions, value of endowment, etc., of the private secondary schools. The number of volumes in the libraries of

1,353 of these schools was 1,697,884. The value of buildings, grounds, scientific apparatus, etc., owned by 1,372 schools was $55,749,456. The amount of aid from public funds received by 264 of these schools was $146,273. The tuition fees of 1,130 schools aggregated $5,595,421, while 278 schools derived $1,654,112 from productive funds. Receipts from sources not named amounted to $1,032,859 for 449 schools. The aggregate income of 1,242 schools was $8,428,665. During the year 184 schools received benefactions amounting to $1,611,693. The total money value of the endowments of 353 schools is reported as $43,035,885.

Denominational Schools.

Of the 1,957 private secondary schools reported, 924 are controlled by religious denominations. In these denominational schools there were 4,637 instructors and 49,798 secondary students, as against 4,637 instructors and 54,040 students in the 1,033 nonsectarian schools. In Table 43, which gives in detail the statistics of private secondary schools, the name of the religious denomination controlling each school is given in column 4. Tables 28 and 29 show the number of schools in each State controlled by each religious denomination. The following synopsis is made from these tables:

Religious denomination.	Schools.	Instructors.	Students.
Nonsectarian	1,033	4,773	54,040
Roman Catholic	344	1,712	14,259
Baptist	98	449	6,623
Methodist Episcopal South	60	265	4,875
Presbyterian	93	392	4,738
Episcopal	99	691	4,668
Methodist	41	243	3,552
Friends	52	271	3,434
Congregational	51	211	2,559
Lutheran	30	126	1,427
All other denominations	56	277	3,663
Total	1,957	9,410	103,838

Public and Private Secondary Schools.

The statistical summaries of public and private secondary schools are combined in Tables 31 to 38. Table 30 presents a comparison of certain statistics. It is shown that in the public high schools there are about 87 students to a school and 25 students to a teacher, while in the private schools there are 53 students to a school and only 11 secondary students to a teacher. Table 31 shows that the 7,452 public and private secondary schools had 28,128 teachers and 580,065 students. Over 57 per cent, or 331,038, of these students were females. The number of students preparing for college was 81,508, or 14 per cent of the total secondary enrollment. The graduates for 1899 numbered 68,330, or nearly 12 per cent of the number enrolled for the year. The number of graduates who had prepared for college was 21,602, or nearly 32 per cent of the total number of graduates.

Tables 33 to 38 give the number and per cent of students in each of the 18 leading high-school studies in each State. The following synopsis shows the number of male and female students in certain courses and studies for the United States in 1898-99.

Students in certain courses and studies in public and private high schools and academies.

Courses, studies, etc.	Number students.	Per cent of total number secondary students.	Male students.	Per cent of total number male students.	Female students.	Per cent of total number female students.

a Per cent of number of graduates.

One of the most significant facts recorded by the high-school statistics of the past ten years has been the steady increase of the number of students in Latin. In 1889–90 there were 100,152 students in public and private high schools studying Latin. This was 33.62 per cent of the total. In 1898–99 the number had increased to 291,695 or 51.29 per cent of the total number of secondary students in these schools. There has been but little variation in the percentage of students in Greek, the highest for any year being 4.99 and the lowest 4.27. There has been a small increase in the percentage in French. The number studying German increased from 11.48 per cent in 1889–90 to 14.91 in 1898–99. In the ten years the per cent of students in algebra increased from 42.77 to 56.21, and the per cent in geometry increased from 20.07 to 27.36. The percentage of students in general history increased from 27.83 in 1889–90 to 38.32 in 1898–99. The following synopsis exhibits these percentages for each of the ten years:

Per cent of the total number of secondary students in public and private high schools and academies in certain courses and studies, etc.

Students and studies.	1889–90	1890–91	1891–92	1892–93	1893–94	1894–95	1895–96	1896–97	1897–98	1898–99

a Per cent of total number of graduates.

Distribution of Secondary Students.

Tables 39 and 40 show the distribution of secondary students enrolled in 1898–99 in the eight classes of institutions mentioned on the first page of this chapter. It is shown that of the 655,227 secondary students reported to this Bureau for the scholastic year, 488,549 were in public institutions and 166,678 were in private institutions. In the public institutions 476,227 were in public high schools, 7,518 in preparatory departments of public universities and colleges, and 4,804 in public normal schools. In the private institutions 103,838 were in private high schools and academies, 46,887 in preparatory departments of private universities and colleges, 8,198 in private normal schools, and 7,762 in manual training schools.

Table 41 shows that the number of secondary students to each 1,000 of population in the United States was 8.86.

The same table shows that the number of students in higher education was 147,164, or an average of 1.99 to the 1,000 of population. This number includes all students who in 1898–99 were receiving higher instruction in colleges, resident graduate students in universities and colleges, and all professional students in theology, medicine, and law. The independent professional schools are included, as well as those classed as departments of universities and colleges. Students of normal schools and schools of dentistry, veterinary surgery, pharmacy, and nurse training are not here included.

Tables 42 and 43 give in detail the statistics of the 7,452 public and private high schools reporting to this Bureau in 1898–99. Table 44 shows the number of public and private high schools for boys only, for girls only, and the number of coeducational secondary schools in each State.

TABLE 1.—*Public high schools—Number of schools, secondary instructors, secondary students, and elementary pupils in 1898–99.*

CHAPTER XLII.

MANUAL AND INDUSTRIAL TRAINING.

References to recent Reports of the United States Commissioner of Education, in which this subject has been treated or statistics published: Annual Report for 1888-89, pages 411-428, 1362-1367; 1889-90, pages 1148, 1209-1212, 1351-1356; 1891-92, page 1197; 1892-93, pages 186-188, 569-575; 1893-94, pages 877-949, 2093-2169; 1894-95, page 2170; 1895-96, pages 989-992, 1001-1152, 1321-1329, 1510-1521 (column 8); 1896-97, pages 193-197, 699-703, 2211-2222 (column 8), 2279-2294; 1897-98, pages 141, 194, 723, 2370-2382 (column 8), 2419-2440.

The number of manual or industrial training schools reporting statistics to this office for the school year 1898-99 was 125, an increase of 11 over the preceding year. This includes the 24 industrial schools for Indian children.

The 125 schools have 1,077 teachers in the manual and industrial training departments, 548 men and 529 women, as shown in Table 3. This was an increase of 132 in the number of teachers over the previous year. The number of pupils receiving manual training in these schools was 38,621, an increase of 7,938. The number of boys receiving manual training was 23,002, an increase of 3,850, and the number of girls 15,619, an increase of 4,088.

The total expenditure for manual training by 96 of the 125 schools was $913,450, as compared with $655,247 expended by 86 schools the year before. Of the aggregate of expenditure for 1898-99 the sum of $676,478 was paid teachers, $98,807 for materials, $53,187 for new tools and repairs, and $84,978 for incidentals and for items not classified.

The statistics in detail for the 101 manual and industrial training schools other than Indian schools will be found in Table 4. In these 101 schools there were employed 815 teachers, 432 men and 383 women. In the same schools there were 33,257 pupils, 19,926 boys and 13,331 girls.

Table 5 gives in detail the statistics of the 24 Indian schools. There were 262 teachers employed in these schools, 116 men and 146 women. The number of pupils was 5,364, the number of boys being 3,076 and girls 2,288.

The branches of manual training or the trades taught and the number of pupils in each branch, so far as reported by the individual schools mentioned in Tables 4 and 5, are shown in Table 6.

This office did not attempt to ascertain the number of pupils receiving manual or industrial training in 1898-99 in institutions not distinctively manual or industrial training schools. General statistics of this character were collected in 1893-94 and printed in the Report of this office for that year, pages 2093 to 2169.

Table 1, on the next page, shows the number of cities of 8,000 population and over in whose public schools manual training has been given in the last ten years. In 1890 it was given in 37 cities, in 1894 in 95 cities, in 1896 in 121 cities, in 1898 in 146 cities, and in 1899 in 170 cities.

Table 2 gives a list of the 170 cities in whose public schools manual training (other than drawing) was given in 1898-99, and indicates the grades in each city system in which such instruction was given.

TABLE 1.—*Cities of 8,000 population and over in each State, in which manual training was given.*

TABLE 2.—*Cities in which manual training (other than drawing) was given in the public schools in 1898–99.*

Cities.	Grades in which manual training was given.
ALABAMA.	
New Decatur	All.
CALIFORNIA.	
Fresno	7, 8, 9, and 10.
Los Angeles	6, 7, 8, and 9.
Oakland	8 and 9.
San Diego	6, 7, and 8.
San Francisco	High school.
Santa Barbara	3, 4, 5, 6, 7, and 8.
Santa Cruz	1, 2, 3, 4, 5, 6, 7, 8, and 9.
Stockton	9, 10, 11, and 12.
COLORADO.	
Colorado Springs	1, 2, 3, 4, 5, 6, and 7.
Denver:	
District No. 1	1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, and 12.
District No. 17	All.
Pueblo:	
District No. 1	4, 5, and 6.
District No. 20	6, 7, 8, 9, and 10.
CONNECTICUT.	
Bristol	5, 6, 7, and 8.
Hartford	8 and 9.
Manchester (South)	5, 6, 7, 8, and 9.
Naugatuck	7, 8, 9, and high school.
New Britain	8 and 9.
New Haven	4, 5, 6, and 7.
New London	6, 7, and 8.
Stamford	6, 7, 8, and high school.
DELAWARE.	
Wilmington	High school.
DISTRICT OF COLUMBIA.	
Washington:	
7th to 8th divisions	3, through high school.
9th to 11th divisions	7 and 8.
FLORIDA.	
St. Augustine	Grammar school.
GEORGIA.	
Athens	1, 2, 3, 4, 5, and 6.
Columbus	1, 2, 3, 4, 5, 6, 7, and 8.
ILLINOIS.	
Canton	4, 5, 6, and 7.
Champaign	High school.
Chicago	Grammar and high.
Galesburg	9, 10, and 11.
Moline	7, 8, 9, and 10.
Oakpark	High school.
Rockford	7, 8, and high school.
Springfield	7, 8, and 9.
INDIANA.	
Frankfort	Primary.
Indianapolis	4, 5, 6, 7, and 8.
Laporte	All.
IOWA.	
Davenport	9 and high school.
Des Moines (West)	High school.
Iowa City	5, 6, 7, 8, 9, 10, 11, and 12.
Mason City	7, 8, 9, 10, 11, and 12.

TABLE 2.—*Cities in which manual training (other than drawing) was given in the public schools in 1898–99*—Continued.

Cities.	Grades in which manual training was given.
KANSAS.	
Pittsburg	Primary.
KENTUCKY.	
Frankfort	7, 8, and high school.
Lexington	Primary.
Louisville	High school.
MAINE.	
Lewiston	6, 7, 8, 9, and 10.
Oldtown	All.
Portland	7, 8, and 9.
Saco	5, 6, 7, 8, and 9.
MARYLAND.	
Baltimore	6, 7, 8, 9, 10, and 11.
MASSACHUSETTS.	
Amherst	6, 7, 8, and 9.
Arlington	7, 8, 9, and 10.
Belmont	7, 8, 9, 10, 11, and 12.
Boston	Grammar school.
Braintree	6, 7, 8, and 9.
Bridgewater	8 and 9.
Brockton	High school.
Brookline	Grammar and high school.
Cambridge	High school.
Concord	5, 6, 7, and 8.
Dedham	5, 6, 7, 8, 9, and 1 class in high school.
Easton	5, 6, 7, 8, and 9.
Everett	5, 6, 7, and 8.
Fall River	High school.
Fitchburg	9, 10, 11, and 12.
Gardner	High school.
Greenfield	2 to high school.
Haverhill	5, 6, 7, 8, 9, 10, 11, and 12.
Holyoke	6, 7, 8, 9, and high school.
Lawrence	High school.
Lowell	10, 11, and 12.
Lynn	High school.
Malden	9 and high school.
Medford	5, 6, 7, 8, and 9.
Milton	5, 6, 7, 8, and high school.
Natick	5, 6, and 7.
New Bedford	7, 8, and 9.
Newton	8 and 9.
North Adams	Do.
Northampton	5, 6, and 7.
Salem	Grammar school.
Somerville	High school.
Southbridge	5 and 6.
Springfield	8, 9, and high school.
Wakefield	5, 6, 7, 8, and 9.
Waltham	6, 7, 8, 9, and 2 of high school.
Watertown	5, 6, and 7.
Woburn	1, 2, 3, and 4.
Worcester	9 and high school.
MICHIGAN.	
Bay City	8, 9, 10, and 11.
Flint	6, 7, 8, 9, 10, 11, and 12.
Ishpeming	High school.
Kalamazoo	5, 6, 7, 8, 9, and 10.
Menominee	7, 8, and high school.
Muskegon	All.
MINNESOTA.	
Duluth	High school.
Minneapolis	Do.
St. Cloud	Grammar school.
St Paul	High school.
Stillwater	Do.
MISSISSIPPI.	
Greenville	6 and 7.
MISSOURI.	
Carthage	7, 8, and high school.
Kansas City	High school.
Moberly	Do.
St. Louis	7, 8, and high school.
NEBRASKA.	
Omaha	9, 10, 11, and 12.
NEW HAMPSHIRE.	
Concord	7, 8, 9, and high school.
Manchester	Grammar school.
Nashua	1, 2, 3, 4, 5, and 6.
Portsmouth	4 and 5.
NEW JERSEY.	
Bayonne	All.
Camden	High school.
Hackensack	Grammar school.
Hoboken	6, 7, 8, and 9.
Newark	5, 6, 7, 8, and high school.
Orange	All.
Passaic	3, 4, 6, 7, and 8.
Paterson	7, 8, and high school.
Phillipsburg	2, 3, 4, 5, and 6.
Redbank	All.
Union	3, 4, 5, 6, 7, 8, 9, and 10.
Vineland	Grammar and high school.
Woodbury	High school.
NEW YORK.	
Albany	High school.
Batavia	Primary.
Binghamton	9, 10, 11, and 12.
Buffalo	8 and 9.
Corning	Primary.
Glens Falls	5, 6, 7, and 8.
Ithaca	Do.
Jamestown	All.
Newburg	8, 9, 10, and 11.
New York	Elementary, secondary, and truant.
Port Chester	Primary.
Rochester	4, 5, 6, and 7 in six schools only.
Syracuse	7 and 8.
Utica	5, 6, 7, and 8.
Whitehall	High school.
Yonkers	Grammar and high school.
NORTH CAROLINA.	
Durham	6, 7, 8, 9, and 10.
OHIO.	
Akron	All.
Bucyrus	Do.
Cleveland	Do.
Dayton	7 and 8.
Elyria	1, 2, 3, 4, 5, and 6.
Toledo	5, 6, 7, 8, 9, 10, 11, and 12.
Wapakoneta	All.
Youngstown	High school.
PENNSYLVANIA.	
Allegheny	Grammar school.
Conshohocken	All above primary.
Homestead	4 to high school.
Norristown	7 and high school.
Philadelphia	High school.
Pittsburg	Grammar school.
Shamokin	Primary.
Warren	High school.
West Chester	High school.
RHODE ISLAND.	
Newport	Intermediate, grammar, and high school.
Providence	High school.
Woonsocket	7, 8, and 9.

TABLE 2.—*Cities in which manual training (other than drawing) was given in the public schools in 1898–99*—Continued.

Cities.	Grades in which manual training was given.	Cities.	Grades in which manual training was given.
SOUTH DAKOTA.		WISCONSIN.	
Sioux Falls	All grades.	Appleton	High school.
TEXAS.		Eau Claire	7, 8, and high school.
Austin	9, 10, and 11.	Fond du Lac	High school.
VERMONT.		Janesville	Do.
St. Johnsburg	7 and 8.	La Crosse	Do.
VIRGINIA.		Menomonie	All.
Staunton	1, 2, 3, 4, 5, 6, 7, 8, and 9.	Milwaukee	2 high schools.
		Oshkosh	All.
		Portage	High school.

TABLE 3.—*Summary of statistics of manual and industrial training schools in the United States in 1898–99.*

State or Territory.	Number of schools.	Different teachers of manual and industrial training.			Different pupils who received manual and industrial training.			Expenditure for manual and industrial training during 1898–99 for 96 schools.				
		Male.	Female.	Total.	Male.	Female.	Total.	For teachers.	For materials.	For new tools and repair.	For incidentals.	Total.

CHAPTER XLIII.

COMMERCIAL AND BUSINESS SCHOOLS.

REPORT OF THE COMMITTEE OF THE DEPARTMENT OF BUSINESS EDUCATION OF THE NATIONAL EDUCATIONAL ASSOCIATION ON A COURSE OF STUDY FOR COMMERCIAL COLLEGES.

The Correlation of Studies in the Commercial Course.

The term correlation, as used in this report, your committee understands to refer not only to the co-relation of the studies in the commercial course, but also to the relation of the school to the office and to the relation of the training and conduct of the student in the school to the conditions he will meet in the business house in which he is to begin his career as a business man, it being deemed of the utmost importance that the step the student must take between the business school and the business office be made as short and easy as possible.

Much assistance and information have been received by this committee from the commercial school people not of the committee, and, in addition to this, the former reports of the proceedings of this body have been freely drawn upon, for all of which the members of this committee hereby render their acknowledgment and express their thanks.

CORRELATION.

Whatever else may be said of the business college curriculum, there are, perhaps, no other schools that possess a course of study the several branches of which are so unified and correlated.

It has for its foundation bookkeeping, which requires a knowledge of arithmetic, in order that the computation necessary to its conduct may be performed with accuracy and dispatch.

The bookkeeper who does not know the legal rules governing business transactions and who does not understand the penalties for their violation would certainly be unfit to manage the affairs of a modern business office. Therefore no one can lay claim to the title of bookkeeper, or, rather, accountant, in the true sense of the word without a reasonably accurate knowledge of commercial law; and thus we have a third element in the course.

Further, bookkeeping as an art depends largely upon good handwriting, and thus the fourth element in the course of study is brought into close connection with the three branches already named.

Again, bookkeeping, as a record of business transactions, is closely allied to business correspondence, and the bookkeeper, as well as the correspondent, requires a knowledge of English, including grammar, spelling, and composition; thus these branches are intimately connected with the other subjects of the course.

Since the introduction of the typewriter into the business house, no one having

any considerable amount of correspondence can dispense with its use, and hence shorthand and typewriting have been added to the commercial course.

As the work of the business correspondent and amanuensis requires accuracy and close discrimination, punctuation assumes the importance of a separate branch of study, and some knowledge, at least, of rhetoric becomes necessary.

To enforce and fix in the student's mind the principles of bookkeeping, and to assist in giving him a knowledge of business methods and customs, a course in business practice has been introduced. This feature of the course, in connection with intercommunication, or trading between colleges in different parts of the country, is an excellent introduction to commercial geography, another branch of study of great importance to the future business man.

Inasmuch as the education of a business man is not complete without the ability to stand before his peers in public and express his views, public speaking becomes a branch of business training of no little importance.

A knowledge of the laws relating to production, distribution, and consumption is necessary to an understanding of the facts of commerce in their true light and to a correct view of their relations to each other. A place for economics must, therefore, be found in the business course.

Whether we regard the principal work of the business college to be the training of young men and women for positions in business houses, thereby opening the avenue of business life to them, or look beyond this work to broader fields of usefulness, we must, through a series of lectures, if not in some more formal manner, strive to teach the elements of business ethics.

Further, it is none the less our duty than that of other schools to prepare young men and women for intelligent citizenship: for this reason the subject of civil government must be given a place in the curriculum of the business school.

Your committee is aware that this outline will appear to many to be too comprehensive. It is not claimed by your committee that these several branches of study shall be considered to be of equal importance; some of them may, and indeed must, be taught incidentally, but they all, none the less, belong to the education of the modern American business man.

SUGGESTIVE OUTLINE OF BUSINESS COLLEGE STUDIES.

Mathematics:
- (*a*) Bookkeeping.
- (*b*) Arithmetic, including rapid calculation.

Writing:
- (*a*) Penmanship.
- (*b*) Shorthand.
- (*c*) Typewriting.

Business:
- (*a*) Business practice, including business methods and customs.
- (*b*) The history of commerce.
- (*c*) Commercial geography.

English:
- (*a*) Spelling.
- (*b*) Grammar and punctuation.
- (*c*) Business correspondence.
- (*d*) Composition and rhetoric.
- (*e*) Public speaking.

Civics:
- (*a*) Commercial law.
- (*b*) Civil government.
- (*c*) Economics.

Suggestions on the Outline.

TIME REQUIRED.

The time mentioned under each topic in this outline is the probable time required, but it must be borne in mind that in commercial or business schools the qualifications of students vary greatly, and their fitness for business life must be measured by their attainments and not by the time they have spent in school.

The ability or power to do certain things neatly and accurately in a limited time alone decides the student's qualifications, and he should be graduated when he can meet these requirements, regardless of the time he has spent in securing this attainment.

ELEMENTARY BOOKKEEPING.

Time, three hours (by hours is here meant periods of sixty minutes) daily for two months, exclusive of the time spent on bookkeeping in business and office practice.

As before stated, your committee assumes bookkeeping to constitute the basis of the commercial course. The student should begin the study of bookkeeping only when he writes sufficiently well, and can perform ordinary computations under the fundamental rules of arithmetic, including interest, with a reasonable degree of accuracy. It may be necessary, therefore, for the incoming student to pass through a preparatory course of study before entering upon the course here described.

Bookkeeping should be taught individually. Drills and lectures may be given in classes, but each pupil should pursue the course in bookkeeping independently of other students, except in so far as is necessary to carry out a scheme of practice as hereinbefore mentioned.

This plan of individual study has many advantages:

First. The bright student is not held back by others who are slow, but is allowed to proceed as fast as he can do his work well.

Second. The slow student is not pushed ahead of his ability by those who are more rapid in their work, but is allowed to understandingly master the work as he progresses.

Third. This individual work in bookkeeping renders the course flexible; the student may devote all the time he can spare from other studies to this subject, and therefore may be always kept busy. Where this arrangement is made no student need be idle at any time, and as bookkeeping is the groundwork of the course of study, it is eminently fitting that it should be thus made the subject of special individual instruction.

Special test exercises in this subject, illustrating various applications of the principles of bookkeeping and fixing, by review, the work the student has already gone over, may be given to advantage throughout the course. In these tests the student should be thrown upon his own resources, and he should satisfy both himself and his teacher as to his ability to work independently of aids of any kind.

Here, as elsewhere, weekly class drills or oral quizzes are recommended as valuable in assisting to fix in the minds of students the principles underlying the subject taught.

BUSINESS PRACTICE AND ADVANCED BOOKKEEPING.

Time: Three hours of sixty minutes, daily for six months.

Before entering upon what is usually known as "business practice" pupils should have in some measure the qualifications that they would be required to possess before beginning actual work. These should include order, neatness,

good penmanship, etc. In correspondence and business forms they should have a clear idea of the mechanical arrangement of a letter and a knowledge of the forms and uses of checks, notes, drafts, etc., with a fair understanding of the use of the daybook, journal, ledger, cashbook, sales book, and bill book. They should be quick and apt in journalizing, and should have at least passed the test in the first division of arithmetic.

Your committee will not undertake to designate what the course in business practice shall or shall not be, but takes the liberty of submitting the following propositions:

First. As the course in business practice is especially designed to correlate the school work with the work of the office, the business transactions in the business-practice course should come to the student bookkeeper for record in the same way they come to the bookkeeper in the business house; and the business done by the student, and the transactions made and booked by him, should be done and recorded as nearly as possible as they would be done and recorded in a first-class business house.

Second. The books, stationery, and appliances used in the school should be modern in form, well bound, of good material, well printed or engraved, and in every respect the equal, at least, of those found in use in business houses. Good books and stationery tend to the formation of habits of neatness and accuracy.

Third. A reasonable variety of books should be used, in order that the student may, when going out of the business-practice department of the school, pass into the actual work of the office without feeling that books of account are all fashioned alike, but he should rather go out with a fair degree of knowledge concerning various forms of books of account, especially those that may be considered standard. But, on the other hand, this variety of forms should not be so great as to confuse and annoy the student. Whatever is undertaken should be well done. And here, as elsewhere, one thing done well is better than any number of things poorly or loosely done.

Fourth. The student should remain a sufficient time in each office or subdivision of the business practice work to gain a fair knowledge of the detail of such office or employment. Your committee believes that a week in a bank, for instance, is almost futile, and tends rather to confuse the student than to make plain the principles and modes of modern banking. Not less than a month should be given to the actual work in the bank, and a proportionate time should be spent in the other offices. Nothing should be attempted that can not be done thoroughly and well.

Fifth. From the time assigned to bookkeeping and business practice in this report it will be seen that your committee believes that from two-thirds to three-fourths of the whole time given to bookkeeping in the commercial course should be devoted to this business-practice work.

Sixth. Accuracy in this department should be insisted upon to the letter, and all the "checks" possible should be placed upon the student, that his work may be done thoroughly and accurately. All loose and haphazard work should be rewritten, and neatness and accuracy should be insisted upon. Let all this work be done under an experienced and competent supervisor.

Seventh. The student in the business-practice department should be taught to conscientiously care for all original documents coming into his hands, to file letters and papers with care and accuracy, and to keep everything in and about his office neat, clean, and orderly.

Eighth. The strictest attention should be given to correspondence, and, as the intercommunication work usually connected with this department gives rise to a large amount of correspondence, which, in the nature of things, no other plan can secure, the student should be made to profit by this opportunity to develop his ability to write a good business letter. All work in this line should be performed

with care and fidelity, and every letter and document written in this department should pass under the eye of a careful teacher, who should firmly decline to accept anything but reasonably good work.

Ninth. A plain, easy, rapid style of business writing, without shade or flourish, should be taught in this department, and students not meeting a reasonable requirement in handwriting should be debarred from the work in bookkeeping, and should receive special attention in penmanship until such a handwriting is acquired. A constant improvement in the student's handwriting during the whole course should be insisted upon.

Tenth. Special attention should be given in this department to the art of bookkeeping, such as indexing, the arrangement of accounts in the ledger, the proper manner of closing accounts, forwarding, etc.; the handling and care of books, the filing of papers, and every detail connected with office work.

Eleventh. The student should be taught to be exhaustive in the examination of statements and accounts; to check his books when balancing, even though they balance after the first addition; to check all statements received, and to carefully go over a second time all statements rendered. He should be taught to examine and audit books, and should acquire the skill necessary to perform these operations with reasonable dispatch.

Twelfth. The order and discipline in this department should be that of a well-conducted modern office; communication between students should be allowed concerning the business in hand only. Necessary conversation should be carried on only in a low, soft tone of voice, and no unnecessary noise, heavy walking, or irregularities in deportment should be permitted.

ARITHMETIC.

Time: Five periods a week for six months.

To facilitate coordination with bookkeeping, the work in arithmetic may be arranged in four divisions, as follows:

First. The fundamental rules, United States money, factoring, common and decimal fractions, and denominate numbers.

Second. Percentage, with its applications, profit and loss, discounts, commission and brokerage, simple and compound interest, and partial payments.

Third. Insurance, exchange, equation of accounts, and stocks and bonds.

Fourth. Taxes, partnerships, national and savings banks, etc.

Tests or examinations should be given as these parts of the arithmetic are severally completed, and the student's progress in arithmetic should be made to keep pace with his advancement in bookkeeping.

Rapid calculation should include addition, substraction, multiplication, extension, cancellation, and interest and discount, by short and rapid methods.

"Mental arithmetic," whether formally or incidentally taught, should have a place in all arithmetic work.

A brief practical course in mensuration should be given to all students in the business course, either in classes or as a general exercise.

The metric system, longitude and time, marine and life insurance, foreign exchange, and general average may usually be omitted; not because they are not important, but because other more important subjects demand all the time that can be given to arithmetic in these schools. It is urged by some teachers that the metric system should be taught, but, for the reason given, your committee suggests that it be omitted.

Equation of payments should be performed by the "interest method," in order to afford additional practice in interest computations and to insure a rational view of the subject.

The work in partnership settlements should be performed, as far as possible, on

paper ruled by the students in the form of statements, trial balances, etc. This work, done in such manner, tends to greatly increase the student's efficiency in the practice of accounting.

Students failing to pass the tests in arithmetic may proceed with their work and be given such tests again when time has been afforded them for review or private study, providing, however, that the student shall not be allowed to advance in his bookkeeping beyond the point where such test in arithmetic is required to be passed.

Your committee recommends the analytic method, and the avoidance of formulas of all kinds throughout the whole course in arithmetic. If it be thought best to use a formula, it should be thoroughly explained, that each student may fully understand the process upon which such formula is based. The fact that the arithmetic of business is preeminently the arithmetic of common sense should not for a moment be lost sight of in drilling classes in this branch in our schools.

PENMANSHIP.

Time: Five periods a week throughout the course.

Your committee believes that nothing but plain, practical business writing should be taught in these schools except to those taking a special course in ornamental penmanship (and ornamental penmanship constitutes no part of a commercial course). A student whose writing is below a reasonable standard should be made to discontinue work in bookkeeping until his writing is improved. Figures should receive close attention, and students should be drilled in both their form and their rapid execution. Skill in accommodating writing to the space to be occupied should be carefully cultivated. An easy arm movement should be early acquired. Unnatural and unhealthful positions of the body should be guarded against. Every teacher in the school should give attention to the correction of the writing of students as to position, movement, and form in the branches taught by him, and nothing but the best work of the student should be accepted anywhere. The student should be induced to write to the best of his ability always, and always in a correct position.

No criticism upon the usual methods of teaching this branch is here intended, but it is the opinion of your committee that there is generally too much of oral explanation attempted by teachers of penmanship, an effort to hold the attention of pupils to extended and minute descriptions of form, when the students are not prepared for such explanations. As a rule but a few moments should be devoted to any explanation in this branch until the student has attempted to write the copy. After making such attempt his attention should be again called to the form for a short time, and he should again be allowed to attempt its reproduction. All long and tedious analysis should be avoided. Especially is this true concerning the teaching of those who are beginning the systematic study of penmanship. Persistent practice under careful direction is what is needed to produce good business penmanship.

COMMERCIAL LAW.

Time: Three periods a week for four months.

It is the sense of your committee that commercial law should be taught as a regular class recitation. The student should be provided with a text-book and be required to prepare his lessons as in other branches. Lectures on law are valuable, but lectures should not be depended upon to the exclusion of regular text-book work. The application of business law to bookkeeping should be most carefully enforced, and the student's knowledge of business law should be carefully correlated with his work in business practice. While the teacher of this branch should be well acquainted not only with the facts in the book he is using, but be

well informed in law generally and acquainted with the rules of pleading and practice in the courts, it is by no means necessary that he should be a lawyer. Lawyers are often not teachers, and more often they are not disciplinarians, and when employed to teach commercial law in business colleges they are not likely to give sufficient attention to the order and discipline of their classes. For this reason what is gained in the direction of law is often lost or more than lost in other directions.

The common forms of legal and business documents should be exhibited in the classes as the subject of the lesson deals with them, and it is better to use forms that are now or have been used in the regular course of business. For instance, the policy of insurance, the protested bill, the deed, the mortgage, etc.

An occasional "moot court," judiciously conducted, may be made very useful in illustrating the practical details of lawsuits and the practice of law. Such "moot courts" must, however, be managed with the greatest care to prevent them degenerating into a mere amusement.

CIVIL GOVERNMENT, INCLUDING CIVICS.

Time: Two periods a week for four months.

These subjects are sometimes taught in our schools incidentally and through lectures, but many schools use a text-book and do regular class work in these branches. Your committee recommends that these branches be taught formally, even if they are made elective. No finishing school can afford to assume the business education of young men and women to be complete till they have acquired a reasonable knowledge of the methods by which our government is conducted and have also a fair comprehension of the rights and duties of citizenship.

ECONOMICS.

Time: Two periods a week for three months.

The subject of economics should find a place in schools devoted to the training of young men and women for business life. However this branch may be taught, its teaching should so impress the student that he will desire to continue reading and thinking on the subject.

SPELLING.

Time: Three to five periods a week till excused by meeting the requirements.

The following is a very excellent method of teaching spelling:

The pupil studies fifty words from a text-book on spelling; the teacher pronounces these, and the student writes them in a blank book kept for that purpose. When this is done the misspelled words are checked by the students as they are spelled by the teacher. The words checked are immediately afterwards written correctly by the student on a separate slip of paper. At the opening of the next lesson they are copied from this slip into the back of his blank speller. But whatever method may be used, no student should be graduated from any course in our schools who has not attained a reasonable degree of proficiency in this branch. The passing grade should not be less than 95 per cent in the shorthand course and 90 per cent in the commercial course, but students should not be excused from spelling until they reach a grade of 95 per cent. All misspelled words in any work the student may do should be marked by the teacher and corrected by the student by rewriting.

GRAMMAR.

Time: Three periods a week for four months.

Grammar should be taught with a view to the correction of errors in speech and writing. The subtleties of the subject may well be avoided, but much that

is usually termed "technical grammar," but which is necessary to the understanding of our language, should be carefully taught and persistently drilled upon. The test of all instruction should be, "Will it aid the student in the construction of the English sentence?" Blunders should not be allowed to pass without correction, either in class recitations, written exercises, or ordinary conversation, and all papers containing inaccuracies in language should be corrected and rewritten. Care must be taken and tact used that the spontaneity of students be not suppressed by this work.

It has been suggested that the student should learn grammar by copying rules, etc., on the typewriter, but while the typewriter is an important aid in the improvement of language, nothing but careful, formal instruction, persistent and regular, can be depended upon to secure good results in the teaching of this subject.

BUSINESS CORRESPONDENCE.

Time: Two periods a week for four months.

Business correspondence should receive most careful attention:

(1) As to mechanical arrangement. (2) As to style. A text-book on this subject should be used, and, in addition to the work of the text-book, many letters should be written by the student, criticised by the teacher, and returned to be rewritten, if deemed necessary. The letters of the entire class should be read in the class, signatures omitted, and comments and criticisms should be made upon them by the class and the teacher, applying the principles of grammar and rhetoric to their correction where those principles have been violated. Such work affords excellent additional drill in composition and rhetoric, but this work should not be relied on exclusively for instruction in those subjects. A good collection of business letters from good business houses may be profitably used in this work to inspire and encourage students to excellence in letter writing.

COMPOSITION.

Time: Two periods a week throughout the course.

Composition should receive attention in an incidental way through every paper in school. Not less than twice each week every student in the school should submit to his teacher in this branch a paper in his own language of not less than one page in length of ordinary letter paper. The teacher should correct this paper with reference to grammar, spelling, arrangement, etc., or rather suggest the correction with red ink, and return the paper for the student's examination and correction. If thought necessary, it should be rewritten.

As much instruction on various topics must be given in the form of lectures, abstracts of these lectures should be written by the student, and when criticised by the teacher, they form the best means for the composition work mentioned.

RHETORIC.

Time: Two periods a week throughout the course.

This branch, with few exceptions, must be taught incidentally in our schools; but nevertheless it may be well taught, and that, too, without consuming much time.

PUBLIC SPEAKING.

Time: One period a week throughout the course.

Students should receive, through lectures and familiar talks, instruction in public speaking and should be required to take part in exercises that will give them opportunity for practical training. Every student should be required to stand while reciting and to clothe his thoughts in the best language he can command. This alone will aid him greatly in the art of public speaking. It is a very

important thing that men and women of affairs should be able to appear to advantage when presenting their business, and public speaking is one of the best means to acquire this ease and grace of manner. Students should be encouraged to form societies for practice in public debating and parliamentary practice, and to take part in them.

BUSINESS METHODS AND CUSTOMS.

Time: Two lectures a week throughout the course.

In addition to the work done in this line in the practice department, business methods and customs should be taught through lectures and familiar talks. An important feature in connection with this instruction as well as in commercial law, and a very interesting one, is the use of original documents in connection with the subject, such as the freight receipt and bill of lading in shipping, the deposit slip, check, and draft in banking, etc. In addition to such methods of giving instruction on these subjects, the various departments of arithmetic and commercial law afford a most excellent opportunity to acquaint students with the methods adopted and employed in the conduct of business.

The history of commerce will occupy a place under this head, as, for the present at least, it must be taught through lectures.

COMMERCIAL GEOGRAPHY.

Time: Two periods a week for three months.

This branch may be taught through lectures and general exercises, though your committee advises that, where possible, it be taught formally in classes. There is no subject connected with commerce more interesting than this. Just now the acquisition of islands by our Government, the extension of our trade, the competition between our Gulf and Eastern ports, and many other matters of commercial interest are attracting the attention of the business men of the entire country, and the teacher who reads and thinks will not want for material to make this subject attractive.

Shorthand Course.

SHORTHAND STUDY.

Time: Five periods a week for eight months.

Each lesson in shorthand should be thoroughly understood by the pupil before advancing to the next. The principles contained in the lesson should be fixed upon the mind of the student by reading exercises illustrative thereof. Such exercises should be copied by the student with the greatest accuracy a sufficient number of times to enable him to commit not only the matter but the shorthand characters contained therein to memory. It is suggested that not less than ten times is usually sufficient. The exercises should then be read to the student at an increasing speed until he has reached the limit of his ability to make good notes; illegible characters should never be allowed under any circumstances. Accuracy and not speed is the great desideratum in early work in shorthand.

READING SHORTHAND NOTES.

The student should never be permitted to write anything in shorthand which he does not thereafter read; and should read each exercise often enough to enable him to give fluency and expression to the reading. He should not be permitted to hesitate over his notes, but should translate them at once with good expression and in a clear tone.

SPEED WORK.

The student should not be allowed to use any new matter, for speed or other work, until the text-book has been mastered. But the speed work outlines under

"Shorthand study" should be carried through to the end of the book. The "writing exercises" should be translated into shorthand by the student, and, when they have been corrected by the teacher, should be used the same as the "reading exercises" spoken of under the head last mentioned.

DICTATION.

Time: Throughout the course.

The students should be arranged in couples or groups, in each of which the students will have as nearly as possible the same speed ability. A selection should be given to the group, and they should read it around, turn about. When it is read, the reader should call upon the one to the left to read his notes, and at the very first error made the reader should call "next." If the next does not at once respond, "next" should be again called, and so on, until some one corrects the error made by the first one who read, and proceeds. If no one reads, the reader should correct the error and proceed as before. When the matter has been read back correctly, the one to the left becomes the reader and proceeds as before; and so on, round and round, until all have the matter by heart, and the notes as well. Then another selection should be given them, and the work shou'd proceed as before.

The matter used in these groups should be engraved matter furnished by the author of the text-book or by the teacher, and before it is used in the groups it should have been copied by each member of the group in the manner outlined under "Shorthand study."

No new matter should be used until each member of a group has reached a speed of at least 150 words per minute upon the copied matter.

Note: By "new matter" is meant that which the student has not copied and as to which he forms the outlines upon his own responsibility as it is being read to him.

SHORTHAND TESTS.

Your committee would recommend the following tests:

First, to write 300 words in three minutes and read it back without a mistake in the same length of time.

Second, to write 300 words in three minutes and make a transcript of the same on the typewriter in thirty minutes.

Third, to write 300 words in three minutes and make a transcript of the same on the typewriter in twenty minutes.

TYPEWRITING.

Time: Five periods a week for six months.

The student should complete some good typewriting manual, containing, in addition to the usual drill for fingering, etc., all the ordinary business and legal forms in common use, and hand each lesson to the teacher without an error or erasure. After completing the manual, from five to ten pages of typewritten matter should be handed to the teacher daily for correction. The typewriter manual having been completed and the foundation for accuracy laid, the student should copy from new matter a stated number of words per minute, and upon reaching the required speed, dictation should be given direct to the machine, and letters should be taken in shorthand and transcribed upon the typewriter. He should be required to arrange and tabulate figures in statements and to correct and improve matter from "rough draft" where the matter is poorly arranged and improperly tabulated.

TYPEWRITING TESTS.

Your committee would recommend the following tests:

First, to copy from manuscript at the rate of 30 words per minute for three

minutes, returning a neat, accurate page, free from erasures or letters struck over each other.

Second, to copy manuscript at the rate of 35 words per minute for three minutes.

Third, to write from dictation at the rate of 45 words per minute for three minutes.

COLLATERAL BRANCHES.

Penmanship, spelling, grammar and punctuation, composition and rhetoric, and rapid calculations, as recommended for the student of the commercial course, with equal proficiency therein, are absolutely necessary for the graduate of the shorthand course. Especially should all the branches necessary to give the student a good understanding of the English language receive the closest attention in all cases where such student is not well qualified in English before entering on the study of shorthand. In the latter case, such students should pass the test in grammar before being excused from the study of this branch.

BOOKKEEPING.

At least such a knowledge of bookkeeping as will enable the student to act as assistant bookkeeper is recommended to be required of all taking this course.

OTHER TESTS.

In addition to the tests in shorthand and typewriting, students should be required before graduating to pass examinations in grammar and punctuation with grades of not less than 85 per cent, and to correctly spell at least 95 reasonably difficult common words out of a possible 100. Daily drills in penmanship and rapid calculation should be given from the time the student enters until he leaves the school.

General Remarks.

ARRANGEMENT OF CLASSES, TIME, TERMS, ETC., OF SCHOOL.

As most commercial schools in this country continue in session throughout the entire year, admit students at any time, and teach bookkeeping, at least individually, but little can be profitably said in this report concerning the above-named subjects. These matters must be left to the management of the individual schools as their needs seem apparent.

PROGRAMMES.

It must not be forgotten that (unlike the public schools, where students usually enter at the beginning of a term and continue throughout the course) in commercial schools students are coming and going constantly; some for a month's instruction only, others for two, many for three, and some for a full course. It would seem, therefore, useless to give in this report any outlines even of programmes, arrangement of studies, or order of classes, further than to say that all work should be done by schedule and all classes called and dismissed regularly and promptly.

LIBRARIES, MAGAZINES, ETC.

It is pertinent to suggest that all schools should contain libraries for the use of students, and the commercial school is no exception to the rule. Students, in addition to the use of the library, should be urged to subscribe for and read some of the best periodicals published on the subjects they are studying.

A MORE COMPLETE REPORT.

It is confidently hoped that ere long a more complete and more advanced course of study than this now submitted will be required for the use of the commercial

schools of America, and if this elementary effort shall afford any help in that direction it will amply recompense this committee for the labor expended.

Respectfully submitted.

J. M. MEHAN.

STATISTICS OF COMMERCIAL AND BUSINESS SCHOOLS.

There are 2,350 institutions of various grades in the United States in which there were 131,518 students reported as pursuing commercial or business studies in the scholastic year 1898-99. The number of each class of institution and the number of business and commercial students in each of the five classes is shown in the following summary:

Class of institution.	Number schools.	Males.	Females.	Total.
Universities and colleges	191	5,127	1,336,	6,463
Public and private normal schools	105	4,023	2,103	6,126
Private high schools and academies	670	7,136	3,473	10,609
Public high schools	1,064	19,597	18,737	38,134
Commercial and business schools	320	46,421	23,765	70,186
Total	2,350	82,104	49,414	131,518

The number of students in each State pursuing business or commercial studies in the five classes of institutions named above will be found in Table 6.

Table 1 gives the number of commercial students in universities and colleges in each State. The same table shows the number of such students in public and private normal schools in each State.

Table 2 summarizes by States the number of business and commercial students in private high schools and academies. The number of such students in the public high schools in each State is given in the same table.

Table 3 is the first of a series of three tables summarizing the statistics of the 320 commercial and business schools reporting to this office for 1898-99. These schools employed 1,781 instructors—1,196 men and 585 women. Of the 70,186 students enrolled, there were 46,421 males and 23,765 females. Many of these institutions have both day and evening schools. The number of students enrolled in the day schools was 56,109, the number of males being 36,185, females 19,924. The number of students in the evening schools of these institutions, and not attending any of the day schools, was 12,071, the number of males being 8,679, females 3,392, as shown in Table 4. A number of the schools reported only total enrollment, without dividing day and evening attendance.

Table 4 shows that the 320 commercial and business schools had 8,449 graduates from commercial courses and 7,755 graduates from amanuensis courses during the year 1898-99.

The number of students in each of four courses of study in each State as reported by the 320 business and commercial schools is shown in Table 5. The number of students in each course is summarized as follows:

	Male.	Female.	Total.
Commercial course	25,439	7,241	32,680
Amanuensis course	9,920	12,749	22,669
English courses	5,916	2,615	8,531
Course in telegraphy	721	260	981
Total	41,996	22,865	64,861

On account of incomplete reports from many of the schools several thousand students enrolled are not accounted for in the above summary.

Table 6 summarizes the number of commercial and business students in various institutions. As mentioned already, the grand total for 1898–99 was 131,518, an increase of 7,605. The commercial and business schools did not contribute to this increase, as the following comparative statement shows:

	1897–98.	1898–99.
In universities and colleges	5,869	6,463
In normal schools	5,721	6,126
In private high schools and academies	9,740	10,609
In public high schools	31,633	38,134
In commercial and business schools	70,950	70,186
Total for United States	123,913	131,518

TABLE 1.—*Students in commercial and business courses in universities and colleges and public and private normal schools in 1898–99.*

CHAPTER XLIV.

EDUCATION OF THE COLORED RACE.

References to preceding Reports of the United States Bureau of Education in which this subject has been treated: In Annual Reports—1870, pp. 61, 337-339; 1871, pp. 6, 7, 61-70; 1872, pp. xvii, xviii; 1873, p. lxvi; 1875, p. xxiii; 1876, p. xvi; 1877, pp. xxxiii-xxxviii; 1878, pp. xxviii-xxxiv; 1879, pp. xxxix-xlv; 1880, p. lviii; 1881, p. lxxxii; 1882-83, pp xlviii-lvi, 85; 1883-84, p. liv; 1884-85, p. lxvii; 1885-86, pp. 596, 650-656; 1886-87, pp. 790, 874-881; 1887-88, pp. 20, 21, 167, 169, 988-998; 1888-89, pp. 768, 1412-1439; 1889-90, pp. 620, 621, 624, 634, 1073-1102, 1388-1392, 1395-1485; 1890-91, pp. 620, 624, 792, 808, 915, 961-980, 1469; 1891-92, pp. 8, 686, 688, 713, 861-867, 1002, 1234-1237; 1892-93, pp. 15, 442, 1551-1572, 1976; 1893-94, pp. 1019-1061; 1894-95, pp. 1331-1424; 1895-96, pp. 2081, 2115; 1896-97, pp. 2295-2333; 1897-98, pp. 2479-2507; Introduction to Annual Report for 1898-99, pp. lxxxviii-xcii; also in Circulars of Information—No. 3, 1883, p. 63; No. 2, 1886, pp. 123-133; No. 3, 1888, p. 122; No. 5, 1888, pp. 53, 54, 59, 60, 80-86; No. 1, 1892, p. 71. Special Report on District of Columbia for 1869, pp. 193, 300, 301-400. Special report, New Orleans Exposition, 1884-85, pp. 468-470, 775-781.

The total enrollment in the public schools of the South (the 16 former slave States and the District of Columbia) for the year 1898–99 was 5,662,259, the number of white children being 4,150,641 and the number of negro children 1,511,618. Table 1 of this chapter shows that the estimated number of children in the South between 5 and 18 years of age was 8,867,310. Of this number 5,954,400, or 67 per cent, were white children and 2,912,910, or 33 per cent, were children of the negro race. The same table shows that 69.71 per cent of the white school population was enrolled in the schools and 51.89 per cent of the negro school population. The average daily attendance in the white schools was 2,669,903, or 64.32 per cent of the white enrollment, and the average daily attendance in the negro schools was 969,911, or 64.10 per cent of the colored enrollment.

The total expenditure for the public schools of the South for the year 1898–99 was $32,849,892, as shown in Table 2. It is estimated that about 20 per cent of this sum, or $6,569,978, was expended to sustain the negro schools. Tables presenting estimates of school expenditures in the South for the last thirty years, classified by race, are given on pages LXXXVIII to XCII of the introduction to this Annual Report.

SECONDARY AND HIGHER EDUCATION.

Statistical reports were received by this office from 164 of the 180 institutions for the education of the colored race for 1898–99. These statistics are summarized in Tables 3 to 8. The information concerning each school is given in detail in Tables 9 and 10.

The 164 schools had 43,430 students—27,971 in elementary grades, 13,302 in secondary grades, and 2,157 in collegiate grades. Of the students in the secondary grades 4,061 were in normal or teachers' training courses. In courses of theology, law, medicine, dentistry, pharmacy, and nurse training there were 1,291 students, or about 60 per cent of the number in the collegiate grades.

Of the total enrollment of 43,430 students in these schools only 14,153, or less than 33 per cent, received manual or industrial training in 1898–99, and 7,747 of these received instruction in sewing, as shown in Table 7.

CHAPTER XLV.

STATISTICS OF REFORM SCHOOLS.

Reports received from the individual reform schools for the year 1898–99 indicate general improvement and progress in this class of industrial training schools. Wherever tried the cottage system has been successful. Under this system it is possible to do more individual work and to separate the better class from the more vicious. It also approaches more nearly healthful home conditions than any other system.

The number of schools reporting was 82; instructors employed, 578; pupils attending school, 22,692, and 14,673 in industrial departments. The total number of inmates was 24,925. The value of grounds and buildings was $18,873,587. The expenditures on buildings and grounds amounted to $605,010; for salaries and other expenses, $2,800,281, making a total expenditure of $3,405,291. The number of assistants, not including instructors in school departments, was 1,788. There were 16,699 white inmates and 2,784 colored inmates; 8,514 were of native parents and 4,122 of foreign-born parents. Those that could only read when admitted were 2,207, and 1,595 could neither read nor write.

The number committed to the institutions during the year was 11,676 and the number discharged 11,990. When discharged from the schools many of the pupils possessed a trade and were provided for in good homes; all could read and write; the majority had received the equivalent of a common school education.

The North Atlantic Division reports 33 schools, 299 instructors, 11,550 pupils in school departments, and 9,282 in industrial departments. The number of inmates reported was 11,767, of which number 9,282 were males and 2,485 females. The value of grounds and buildings was $9,922,733. The expenditures on grounds and buildings amounted to $200,983; for salaries and other expenses, $1,311,832, making a total expenditure of $1,512,815.

The South Atlantic Division reports 11 schools, 57 instructors, 1,898 pupils in school departments, and 925 in the industrial departments. Of the 1,909 inmates reported, 1,679 were males and 230 females. The total value of grounds and buildings was $1,195,097. The amount expended for buildings and improvements was $17,419; for salaries and other expenses, $161,792, making a total expenditure of $179,211.

The South Central Division reports 5 schools, 29 instructors, 1,549 pupils in school departments, and 441 in industrial departments; total number of inmates, 1,694. Of this number, 1,110 are males and 584 females. The value of grounds and buildings was $472,000. The total amount expended was $187,148—for buildings and improvements, $27,241, and for salaries and other expenses, $159,907.

The North Central Division reports 28 schools, 184 instructors, and 7,164 pupils in school departments, and 6,205 in industrial departments. The total number of inmates reported was 9,164, of which number 6,729 were males and 2,435 females. The value of grounds and buildings was $6,738,019. The amount expended was $1,380,117—for buildings and improvements, $353,367, and for salaries and other expenses, $1,026,750.

The Western Division reports 5 schools, 9 instructors, and 531 pupils in school departments, and 446 in industrial. The value of grounds and buildings was $545,738. The amount expended was $146,000—for buildings and improvements, $6,000, and for salaries and other expenses, $140,000.

CHAPTER XLVI.

SCHOOLS FOR THE DEFECTIVE CLASSES.

Schools for the blind.—It is gratifying to note in most of the institutions for the education of the blind in this country the effort to secure for the blind the means of a broader intellectual foundation, a greater development of the inner forces of thought, feeling, and action, a greater power of self-reliance and self-direction. As now conducted the kindergarten and elementary schools lay a firm foundation for their physical, mental, moral, social, and æsthetic development. This, followed by a high or preparatory school complete in its departments for physical and manual training as well as for literary, scientific, and musical studies, will fully equip them to enter colleges and universities and conservatories of music. There, in company with the seeing pupils, the blind may pursue almost any branch of knowledge, thus enabling them to enter many spheres of usefulness, not confining them to the field of manual labor that is now practically closed to them on account of the extensive employment of machinery.

The total number of schools reported was 36; number of instructors, 393—male 137, and 256 female; in music, 127, and in the industrial departments, 122. The total number of pupils reported was 3,665—male 1,898, female 1,767; in the kindergarten, 417; in vocal music, 1,738; in instrumental music, 1,797. In the industrial department were reported 1,924. The total number of volumes in the libraries was 93,262. The value of scientific instruments was $100,610 and the value of grounds and buildings $6,334,307. The total expenditure was $1,065,437.

Schools for the deaf.—There are represented in this report 104 schools for the deaf, with 1,158 instructors and 10,923 pupils. The 57 State public schools report 1,007 instructors—males 362 and females 645; in articulation, 381; aural development, 31; in industrial department, 280. The total number of pupils, 9,890, of which number 3,623 were taught by the combined system, 3,301 by the purely oral method, and 3,169 by the manual method; 696 were taught in the kindergartens. The number of graduates was 246. The libraries of these institutions contained 95,229 volumes. The value of scientific apparatus was $14,420; of grounds and buildings, $11,849,054. The total expenditures amounted to $1,999,767.

The 18 private schools for the deaf report 72 instructors—42 in articulation, 8 in aural development, and 24 in the industrial department. The number of pupils reported was 439, of which number 256 were taught by the combined system, 141 by the purely oral method, and 37 by the manual method; 47 were taught in the kindergartens. There were 32 graduates.

The public day schools for the deaf reported 79 instructors—57 in articulation, 25 in aural development, and 32 in industrial departments. The number of pupils reported was 594, of which number 110 were taught by the combined system, 324 by the purely oral method, 9 by the manual method. The number taught in the kindergartens was 31. There were 13 graduates.

The first oral school in America for the deaf was established in 1867. It then met with very little favor. Since 1891 the system has grown with wonderful rapidity, and is now followed in all the leading schools of the country. Again the kindergarten supplies the means to the end in oral training. The early formation of the habit of looking to the lips rather than to the hands for information is the first step toward the acquisition of speech. Manual training in schools for the deaf occupies an important place. While it is not trade teaching, it prepares pupils for the selection of a trade; and "as a trained mind is the best preparation for the study of a profession, so are the trained hand and trained eye the best preparation for the successful acquisition of a trade."

The South gives evidence of gratifying progress in deaf-mute education. The schools of Georgia and Texas have grown from log cabins to elegant buildings. The deaf school buildings of Georgia are valued at $75,000 and those of Texas at $337,500.

Schools for the feeble-minded.—The number of schools reported was 29, with 231 instructors in the school departments, 236 in industrial departments, and 675 assistants in caring for the inmates. The number of pupils reported was 9,542, of which number 973 were instructed in the kindergarten and 1,559 in music. The 19 State public schools report 233 instructors in school departments, 206 in industrial departments, and 610 assistants caring for the inmates. The number of pupils reported was 9,158. Of these 973 were in kindergartens and 1,559 in music. The value of grounds and buildings was $5,546,827, and the expenditures were $1,472,170.

CHAPTER XLVII.

STATISTICS OF PUBLIC KINDERGARTENS.

There are now 213 cities in the United States of over 4,000 population in which public kindergartens are maintained in connection with the city systems of public schools. The table on the next page summarizes the statistics of the public kindergartens of these 213 cities for the scholastic year 1898–99. There was an increase of 24 in the number of cities supporting public kindergartens over the preceding year. The actual number of kindergartens reported was 1,542, an increase of 177. The number of teachers employed was 2,829, an increase of 297. The number of pupils in the kindergartens was 109,894, an increase of 14,027 over the year 1897–98. The information in Table 2 was furnished this office by the city superintendents of public instruction. The table shows the number of public kindergartens in each city, the number of teachers, and the number of pupils by sex.

For the year 1897–98 this office attempted to collect statistics of public and private kindergartens, kindergarten associations, and kindergarten training schools. The result was printed in Chapter LIII of the Education Report for 1897–98, pages 2537 to 2579. The office, by much correspondence, procured the names of 2,998 private kindergartens known to have been in operation in 1897–98. After repeated requests for information, 1,519 private kindergartens reported statistics to this office. Detailed information from the 1,479 other private kindergartens reported as still in existence could not be obtained. The 1,519 kindergartens reporting had 3,232 teachers and 47,853 pupils. Allowing proportionate numbers of teachers and pupils, it may be estimated that the 1,479 kindergartens not giving statistics had 3,173 teachers and 45,884 pupils. Taking this as a liberal estimate, the 2,998 private kindergartens had 6,405 teachers and 93,737 pupils in 1897–98. The statistics of the private kindergartens as thus estimated will be found summarized in the last three columns of Table 1 on the next page.

Assuming that the private kindergartens in 1898–99 maintained the average enrollment of the preceding year, the number of children receiving instruction in kindergartens was not less than 203,631. If the private kindergartens have kept pace with the growth of public kindergartens, 10,000 to 15,000 may be added to the grand total.

The following table gives the number of public and private kindergartens, the number of teachers, and the number of pupils, as reported to this office for certain years beginning with 1873:

Year.	Kindergartens.	Teachers.	Pupils.	Year.	Kindergartens.	Teachers.	Pupils.
1873	42	73	1,252	1882	348	814	16,916

CHAPTER XLVIII.

CONTRIBUTIONS TO THE HISTORY OF NORMAL SCHOOLS IN THE UNITED STATES.

By M. A. Newell, formerly Secretary of the Maryland State Board of Education.

I.

THE STATE NORMAL SCHOOLS OF NEW ENGLAND.

1. MASSACHUSETTS.

It is said that the first normal school of which we have any authentic account was established in Rheims, France, in 1681 by the celebrated Abbé de La Salle. But the normal idea goes much farther back. "Vixere fortes ante Agamemnona." Luther was filled with it. The mediæval universities had for their prime object the production of doctors—teachers. And what were the "schools of the prophets" but teachers' seminaries of a special kind?

It is very probable that the normal school established by the Abbé de La Salle bore more resemblance to the Hebrew "schools of the prophets" than to the State normal schools of New England; but let him have due credit for his work. The schools of the Christian Brothers, of which he was the founder, are the most progressive of any under the auspices of the Roman Catholic Church. The exhibit which they made at the New Orleans Centennial Exposition was highly creditable, and excited both surprise and admiration.

But though France may have been first in point of time, Germany "bettered the instruction." In 1697 August Hermann Francke organized a teachers' class in connection with his school at Halle. Among the students who flocked to his school to learn his improved methods of teaching was Johann Julius Hecker, who founded a teachers' seminary in 1735 at Stettin, in Pomerania, and another at Berlin in 1748. The graduates of the school at Berlin were considered so far superior to untrained teachers that it is said that Frederick the Great gave orders that no others should be employed to teach in schools on the crown lands of his kingdom. The school established at Berlin was afterwards removed to Potsdam, and both it and the school at Stettin became State institutions, the first State normal schools ever established.[1]

To James G. Carter, of Lancaster, belongs the credit of having first arrested the attention of the thinking men of Massachusetts to the necessity of immediate and thorough improvement in the system of free or public schools. He has been called the father of normal schools in America, but recognizing the subsequent claims of "Father Peirce," we should rather call Mr. Carter the "grandfather." His "Letters to the Hon. William Prescott on the free schools of New England" in 1824, and his "Essays on popular education," on "Education as a science," and an "Institution for the instruction of teachers in 1825," were pioneer efforts in the great work, and

[1] Fifty-third Annual Report of the Board of Education, Massachusetts.

unlike most pioneer work, were as valuable and useful for construction as for destruction. In 1827 he opened an institution with special reference to the education of teachers on the plans which he had expounded, and memorialized the legislature for aid. The memorial sets forth, "That he is about to open a seminary in a central part of the State for the general instruction of children and youth of both sexes, and also for the particular instruction of those who may resort to him for that purpose in the science of education, or in the best means of developing the physical, moral, and intellectual powers of the young by judicious and wholesome exercise of those powers, and at a subsequent period of conveying to their minds the greatest amount of useful knowledge." The normal school was evidently in his head not in a protoplastic state, to be evolved and differentiated subsequently, but full grown, like Minerva in the brain of Jupiter, fully armed and equipped. Unfortunately, Vulcan was not on hand with his ax to effect a speedy delivery.

Mr. Carter asked the legislature, as the chosen guardian of the schools, to extend to private enterprise a moderate amount of public patronage, so as to diminish the necessary expenses to individuals, and to open its doors to all who would aspire to the responsible employment of teachers of youth. By this union of private and public means he believed that "a seminary for the education of teachers might be at once commenced upon a scale more commensurate with its importance to the community, more adequate to the public demands for better instruction, more in keeping with the fundamental principles of the free schools, and more consonant with the whole spirit of our free institutions."

The committee to whom the memorial was referred made a favorable report. They say that Mr. Carter's plan "is entirely practical in its character, simple in its details, and peculiarly calculated to develop the powers of the mind, and that the studies it requires are brought wholly and appropriately within the pale of downright utility." The committee further say that while they "incline to the opinion that this institution should be detached entirely from all other pursuits and be devoted wholly and distinctly to the simple object in view, they would not be considered as deciding definitely that it could not be safely connected with some of the literary establishments of the State." It is worthy of note that the sentiment of Massachusetts, so far as that sentiment has found record, was not in favor of the experiment tried afterwards in New York of grafting a normal scion on an academic stock, nor of the Pennsylvania system of pooling the issues between the State and a private corporation. The committee preferred an institution "detached entirely from all other pursuits" with the "simple object in view"—the preparation of teachers.

The committee are very frank in expressing their views as to the necessity of such preparation. They say "it needs neither argument nor an exhibition of facts to demonstrate to the legislature that the free schools of the Commonwealth are not such as they ought to be—that they fail, most essentially, of accomplishing the high objects for which they were established. Upon this subject public opinion is fully settled. Nor is it difficult to arrive at the true cause. Can it in the large majority of cases be traced to any other cause than the incompetency of teachers?" The logic is simple and irrefutable. Our schools are not what they ought to be. The cause of failure is the incompetence of the teachers. To have competent teachers we must instruct them in the business of their profession. Therefore, etc., Q. E. D. But neither the logic nor the eloquence of the committee prevailed with the legislature. The recommendation of the committee was lost by a majority of 1.[1]

The story of the origin of normal schools in the United States has been told so often and so well that it is introduced here merely for the sake of completeness, and must be disposed of in the briefest possible manner. It was not due to any noticeable uprising of popular opinion; it had not been heralded by any voice crying from

[1] Memorial of James G. Carter to the legislature of Massachusetts, with report of committee, 1827.

the wilderness; it would have come, sooner or later, in any event; but the precise date of the advent seems to us mortals almost like an accident.

In August, 1834, the Rev. Charles Brooks, of Medford, Mass., on his way from London to the United States, made the acquaintance of Dr. St. Julius, of Hamburg, who had been sent by the King of Prussia to learn the condition of schools, hospitals, prisons, and other public institutions in the United States. The six weeks companionship of these two men (record-breaking steamers had not then been invented) resulted finally in planting the seed which afterwards grew up as the normal school system of the United States. Mr. Brooks says: "I fell in love with the Prussian system, and it seemed to possess me like a missionary angel. I gave myself to it, and in the Gulf stream I resolved to do something about State normal schools. This was its birth in me, and I baptized it 'my sea-born child.' After this I looked upon each child as a being who could complain of me before God if I refused to provide for him a better education after what I had learned. The whole Prussian system," he says, "is built on these eight words, 'As the teacher is, so is the school,' and, therefore, we must have seminaries for the preparation of teachers."

In 1835 Mr. Brooks called a convention of the citizens of Plymouth, to whom he opened the whole matter as clearly and as strongly as he could, showing that the great work must begin by founding a State normal school in Plymouth County. The audience was warmed up, and Ichabod Morton, dean of the first parish, rose and said: "Mr. President, I am glad to see this day. The work is well begun; the facts now presented to us so plainly prove conclusively the inestimable value of teachers' seminaries. Mr. Brooks says he wants the first one established in the old colony, and so do I, sir, and I will give one thousand dollars toward its establishment." Thus the Prussian stranger began its journey from Plymouth Rock.

Many conventions were held, many speeches were made, many resolutions adopted, in 1838, but the points emphasized in nearly every convention were:

First. The deplorably low condition of the public schools.

Second. The necessity for immediate and radical reform.

Third. A declaration that the inauguration of normal schools after the Prussian model would reform and vitalize the whole system of elementary education in the State.

At one of these conventions (Hanover, September 3, 1838) Daniel Webster and John Quincy Adams were present, and though both had attended under the condition that they were not to be called on to speak, yet neither of them was able to refrain from giving expression to the feelings and sentiments which had been developed by contact with the enthusiastic leaders of the movement.

Mr. Webster said he was anxious to concur with others in aid of the project. The ultimate aim was to elevate and improve the primary schools. If the town schools were no better than they were when he attended them, he was sure they were insufficient to the wants of the present day. This plan of a normal school is designed to elevate the common schools and thus to carry out the noble ideas of our Pilgrim fathers. But there is a larger view yet. Every man and every woman, every brother and every sister is a teacher. Parents are eminently teachers. Now, if normal schools are to teach teachers, they make parents and all who in any way influence childhood competent to their high office. In families there will be better teaching, and the effect will be felt throughout society.

Mr. Adams said:

The original settlers of New England were the first people on the face of the globe who undertook to say that all children should be educated. On this our democracy has been founded. Our town schools and town meetings have been our stronghold in this point, and our efforts now are to second the efforts of our pious ancestors. Some kingdoms of Europe have been justly praised for their patronage of elementary instruction, but they were only following our early example. Our old system has made us an enlightened people, and I feared that the normal school system was to

subvert the old system, take the power from the towns and put it into the State, and overturn the old democratic principle of sustaining the schools by a tax on property; but I am happy to find that such is not its aim or wish; but on the contrary it is accordant to all the old maxims, and would elevate the town schools to the new wants of a growing community. We see monarchs expending vast sums to establish normal schools through their realms, and sparing no pains to convey knowledge and efficiency to all the children of their poorest subjects. Shall we be outdone by kings? Shall monarchs steal a march on republics in the patronage of that education on which a republic is based? On this great and glorious cause let us spend freely, yes, more freely than on any other.

Mr. Brooks and his immediate and active coadjutors, Edmund Dwight, Ichabod Morton, George B. Emerson, Dr. Channing, James G. Carter, Horace Mann, and other less conspicuous but not less honored men, had joined in their minds the idea of a State board of education and a State normal school as essential elements of the proposed reform of the system of her public schools. It was plain to them then, as it is plain to us now, that a State normal school without the support and direction of the State itself would be but as a ship set adrift on the ocean without sails and without a pilot. Each seemed to them to be the necessary complement to the other, and much of the objection raised afterwards against the State board of education was really directed against the State normal school.

First State Board of Education.

The board of education was established by a vote of the legislature, and was organized on the 29th of June, 1837, with Horace Mann as secretary. The promoters of the enterprise hoped to have Mr. Carter as the executive officer, but they were, fortunately as we now think, overruled. No better man than Horace Mann could have been selected. It was understood from the beginning that the first business of the board was to organize a State normal school. Without Mr. Brooks the child would not have been born at that time; without Horace Mann it might not have survived the perils of infancy.

The new board of education recommended, as was expected, the enactment of a law for the establishment of State normal schools. It is doubtful whether their recommendation would have been adopted had not a "*deus ex machina*" descended for the occasion. Mr. Edmund Dwight proposed to the legislature that he would be responsible for $10,000 to aid in the establishment of teachers' seminaries, provided the legislature would give the same amount for the same cause. On the 19th of April (a marked day in the history of the United States) the legislature passed resolutions accepting the gift, and authorizing the governor to draw a warrant on the treasurer for $10,000 for the purpose specified in the resolutions. Thus were the State normal schools of Massachusetts launched upon an ocean of uncertainty, but with a fair prospect of reaching the desired harbor.[1]

The board decided to establish three normal schools—one for the northeastern, one for the southeastern, and one for the western part of the State, to be continued three years as an experiment; and as the money at their disposal was not sufficient to erect buildings, they proposed to establish the schools at suitable places as soon as the requisite assistance was given. Many towns in different parts of the State submitted proposals; and at a meeting of the board December 28, 1838, it was voted "to locate a normal school for the qualification of female teachers at Lexington, and one at Barre for both sexes."

This is the first official use of the word "normal;" and it is to be noticed that it needed an explanatory phrase, "for the qualification of female teachers." The word in the sense in which it was used was not English, and was not understood except by educational experts. The English "Training school for teachers," or the

[1] Two lectures. I. History of the Introduction of State Normal Schools into America, by Charles Brooks, of Medford, Mass. Boston, 1864.

German "Teachers' seminaries" would have been intelligible and suggestive; but the French "Normal" conveyed no precise information to any but well-educated people. There is not a principal of a normal school who was living twenty-five years ago who has not been addressed, as the writer has been, as principal of the "norman" school, or (Dii avertite omen!) principal of the "Mormon" school. But words are things. They are more. They are living things. They take root. They bear fruit. And this word "normal" has borne much bad fruit. There are scores of so-called "normal" schools in the country which have nothing "normal" about them except in their advertisements and catalogues. But the word became popular, and unscrupulous dealers in education used it as an unprotected trade-mark to make their wares more salable.

Lexington–Framingham School.

The Rev. Cyrus Peirce was engaged to teach the school at Lexington. Had he proved a failure, success would have been postponed for a quarter of a century. But he had said, "I would rather die than fail," and though he came very near dying, there was no symptom of failure. He succeeded even beyond the expectation of Horace Mann, a man of great expectations. "He not only knew how to teach with precision, but he evoked from his pupils such a force of conscience as insured thorough study and assimilation of whatever was taught." There is no doubt that the rapidly increasing popularity of normal teaching was largely due to the conscientiousness, the sagacity, and the professional skill of "Father Peirce."

The opening day came, July 3, 1839, and with it a heavy rain. Assembled in the reception room of the normal building were the august visitors of the school, with the newly elected principal, and before them sat three timid girls—only three—to be examined and enrolled as the first pupils of the first State normal school in America. The first quarter closed with 12 students. In the fall a model school was conducted with 33 pupils. "The normal students are," says Mr. Peirce, "in the very undesirable condition of being familiar with the books without knowing anything they contain." The studies for the first term were the common branches, algebra, natural philosophy, physiology, mental philosophy, bookkeeping, moral philosophy, and geometry. In an address delivered about this time by his excellency Edward Everett, chairman of the board of education, his excellency laid down very clearly the lines on which normal instruction is built and the objects it should seek to accomplish.

(1) Instruction, especially in the common branches.

(2) The art of teaching.

(3) The science of school government, and theory applied to practice in the model school.

Truly we have not advanced far since those days. Movements there have been, but motion is not always progress.

Mr. Peirce worked for three years in Lexington, performing an almost incredible amount of labor. There was no appropriation for assistance of any kind, and he took it upon himself to supervise or actually perform the menial services of the school. He seldom allowed himself more than four hours sleep out of the twenty-four. He attended to the fires, he rang the school bell, he heard almost every recitation in the normal room, and visited the model room at recess. With the assistance of his wife he examined the written exercises, the compositions, the school journals, answered the demands of his large correspondence, and arranged all the details of every day's school duties with a persistence and conscientiousness unsurpassed, if ever equaled, elsewhere. "Had it not been for Cyrus Peirce," says Dr. Henry Barnard, "I consider the cause of normal schools would have failed or have been postponed to an indefinite period." [1]

[1] Mrs. Electa N. Lincoln Walton, in the Forty-third Report of the Board of Education, Massachusetts.

COUNTER REVOLUTION.

The course of aggressive reforms, like the course of true love, never runs smooth. The normal school had demonstrated its power; therefore the normal school must be crushed. In March, 1840, the committee of education was directed by an order of the house of representatives to "consider the expediency of abolishing the board of education and the normal schools, and to report by bill or otherwise." The board of education and the normal schools were regarded as Siamese twins—the death of one would be the destruction of the other. The normal schools were not popular at first. Brooks and Carter and Mann believed in them, but there were many who regarded them as newfangled heresies. The committee on education belonged to the latter class. The teacher, like the poet, they said, as Gail Hamilton said forty years ago, "nascitur, non fit;" the faculty of acquiring necessarily implies the faculty of of imparting; all that is needed is knowledge. That will bring with it skill. The arguments of the committee are worth reproducing, inasmuch as they contain the germ of all that has been said in opposition to normal schools for the last half century.

(1) *They are imitated from France and Prussia*, where "the smallest bridge can not be built or any village road repaired until a central board has been consulted." "The French and Prussian systems appear to be much more admirable as a means of political influence and of strengthening the hands of the government than as a means for the diffusion of knowledge."

(2) *Academies and high schools are fully adequate to furnish a competent supply of teachers.* "Comparing the normal schools already established with the academies and high schools of the Commonwealth, they do not appear to present any peculiar or distinguishing advantages."

(3) *There is no need of professional instruction.* "It is insisted by the board of education that the art of teaching is a peculiar art, which is particularly and exclusively taught at normal schools, but it appears to the committee that every person who has himself undergone a process of instruction must acquire by that very process the art of instructing others." [*Nomine mutato.* Every person who has himself undergone the process of being shaved by a barber, must acquire by that very process the art of shaving others.]

(4) "It is obviously impossible, and it is perhaps not desirable, that the business of keeping these [district] schools should become a distinct and separate profession, which the establishment of normal schools seems to anticipate."

(5) "We have no adequate security that the teachers thus taught at the public expense will remain in the Commonwealth, and it seems hardly just that Massachusetts should be called upon to educate at her own cost teachers for the rest of the Union."

(6) These normal schools "do not appear to have any stronger claims on the public treasury than many of our academies and high schools."

(7) "The idea of the State controlling education, whether by establishing a central board or by organizing normal schools, seems a great departure from the uniform spirit of our institutions—a dangerous precedent and an interference with a matter more properly belonging to those hands to which our ancestors wisely intrusted it. It is greatly to be feared that any attempt to form all our schools and all our teachers upon one model would destroy all competition, all emulation, and even the spirit of improvement itself."

The committee, in accordance with their report, submitted a bill abolishing the board of education and the State normal schools. But Horace Mann and his enthusiastic supporters were too strong for the conservative committee, and the bill was lost by a vote of 245 to 182.[1] The "counter revolution" failed.

Just forty-seven years later a gentleman of Alabama published a pamphlet

[1] Commonwealth of Massachusetts. House Document No. 49, session of 1840.

entitled "The normal school question investigated," which had the same object as the report of the committee and met with the same fate. It begins, "Ought the normal schools of Alabama to be abolished? I think they ought, and in the following pages shall give some of the reasons why I think so." But the reasons are so much shrouded in rhetoric that it is hard to find them. A few specimens will suffice:

There is nothing taught in the normals which is not taught in the other schools of the State. Why, then, should they be supported by the State? * * * Those seeking an education very naturally accept the free tuition tendered them, and, besides, they very readily see that, with much lower attainments and much less merit, they can secure the more desirable situations for having attended the normal, so that the very natural tendency is to lower rather than exalt the standard. Besides, the State may have the satisfaction of seeing her true and tried teachers crushed financially and driven from the field. * * * The appropriations to the normal schools have all the offensiveness of the worst kind of class legislation, and as such are fine fuel for communistic fires. * * * I am aware that many are looking to our normal schools to furnish us teachers. Such hopes are delusive. They will never be realized. * * * Normal students, when you get them through school, will not accept work in our common country schools. * * * Is it a part of the legitimate duties of our lawmakers to establish and endow institutions to manufacture teachers? Would it not be better to have teachers educate themselves like [*sic*] men do for the other professions? * * * I can scarcely realize how men can be sincere when they talk about the abolition of these [normal] schools affecting disastrously the educational cause of the State. No fears need be entertained. The tide is rising. These normals are only a little driftwood on the surface, showing that the swell is coming. Their abolition would possibly affect disastrously a few towns and a few teachers, but it will in no wise retard the steady growth of a healthy educational interest in the State. This interest was here before the normals came, and when they are gone it will continue to grow.[1]

The rhetoric of the pamphleteer had no more effect on the legislature of Alabama in 1887 than had the logic of the committee on education on the Massachusetts legislature in 1840.

The normal schools of Massachusetts in their youth were not popular institutions. Carter and Brooks and Horace Mann believed in them from the first. Daniel Webster and John Quincy Adams and men of their stamp, capable of broad views of the present and prescient of the future, gave in their adhesion, but conservatism, localism, and vested interests were against them. A formidable assault through the newspapers, principally religious newspapers, led by a minister of the Gospel, caused some fear and trembling for a moment, but served in the end to show the strength of the fortress. Thirty-one Boston schoolmasters raised the old cry, "Great is Diana of the Ephesians!" A Boston school committee objected to the employment of a school superintendent who should spend part of his time in the training of teachers because "such training would lead to repeated experiments with new methods." But in spite of opposition, and partly because of opposition, the normal schools went on "conquering and to conquer."

Three years of unremitting and excessive labor in Lexington proved too much for Mr. Peirce's health—a man of less power of endurance would have broken down sooner—and in 1842 he resigned, and after two years' rest returned to his old charge. The school had now outgrown its accommodations, and a suitable building was offered at West Newton. The price was $1,500, which was given to Horace Mann by Josiah Quincy, jr. Before this Mr. Mann had sold his own library to fit up the normal boarding house at Lexington. In 1849 Mr. Peirce's health again failed, and he was compelled again to resign.

The school soon outgrew its accommodations at West Newton, as it had done those at Lexington, and in 1852 an appropriation of $6,000 was made by the legislature to defray the expense of providing a more commodious building and a better site for the school with the necessary appurtenances and apparatus. The choice of site fell

[1] The normal question investigated. Rome, Ga., 1887.

upon Framingham, a spot "beautiful for situation," but so far from the nearest railway station that the school fell off in numbers for some years.

On Christmas day, 1887, the boarding house of the school, Crocker Hall, which had been built in the year previous, was partially destroyed by fire, and the legislature at their first session thereafter appropriated $105,000 for the repair of the hall and the erection of a new academic building. If this appropriation is compared with the amount voted to remove the school from West Newton to Framingham, an idea may be formed of the rise in value of normal schools in thirty-five years.

The Barre-Westfield School.

Two months and one day after the opening of the normal school at Lexington the school at Barre (established by vote of the board of education at the same time) was opened for the reception of students under the principalship of Samuel P. Newman, a graduate of Bowdoin College. The opening was signalized by an address from the governor of Massachusetts, Edward Everett, one of the most perspicuous and most polished of his speeches, perspicuous and polished as they all are. He sets forth with great plainness and with sufficient amplification the aims and purposes of normal schools:

(1) A careful review of the branches of knowledge required to be taught in our common schools, it being of course the first requisite of a teacher that he should first know well that which he is to aid others in learning. Such an acquaintance with these branches of knowledge is much less common than may generally be supposed. The remark may sound paradoxical, but I believe it will bear examination when I say that a teacher thoroughly versed in those branches only which are taught in our common schools is as difficult to find as a first-rate lawyer, divine, or physician, statesman, man of business, or farmer. * * *

(2) The art of teaching. To know the matter to be taught, and to know it thoroughly, are of themselves, though essential, not all that is required. There is a peculiar art of teaching. The details of this branch are inexhaustible, but it is hoped that the most important principles may be brought within such a compass as to afford material benefit to those who pass even the shortest time at these institutions.

(3) The third branch of instruction to be imparted in such an institution concerns the important subject of the government of the school, which might perhaps more justly have been named the first. The best method of governing a school—that is, of exercising such a moral influence in it as is most favorable to the improvement of the pupils—will form a very important part of the course of instruction designed to qualify teachers for their calling. * * * How much is implied in the words, "to govern a school!" For several hours in the day the teacher is expected to exercise the authority of a parent over fifty or sixty, perhaps over ninety or a hundred children. Without the aid of that instinct of natural affection which fortifies parental authority he is expected, with a parent's power, to control alike the docile and the obstinate, the sullen and the gay. And he is to do this not by violence and storm, but by wisely threading the maze of that living labyrinth, the affections of the youthful heart. * * * The instruction of the normal school will therefore dwell on the government of youth as of paramount importance, as that part of the teacher's duty which demands the rarest union of qualities, which most tries the temper, and, when faithfully and judiciously performed, is most important in its results. Give me the child whose heart has embraced without violence the gentle

[1] Proceedings of the semicentennial celebration of the State Normal School, Framingham, July 2, 1889.

love of obedience, in whom the sprightliness of youth has not encroached on deference for authority, and I would rather have him for my son, though at the age of twelve he should have his alphabet to learn, than be compelled to struggle with the caprice of a self-willed, obstinate youth whose bosom has become a viper's nest of the unamiable passions, although in early attainments he may be the wonder of the day.

(4) In the last place it is to be observed that in aid of all the instruction and exercises within the limits of the normal school, properly so called, there is to be established a common or district school as a school of practice, in which, under the direction of the principal of the normal school, the young teacher may have the benefit of actual exercise in the business of instruction.

The temptation to quote from the magnificent peroration to this magnificent address is too strong to be resisted. Like other classic gems it has found its way into our schoolbooks, and though much worn it will never become trite:

Permit me, fellow-citizens and friends, in bringing this address to a close, to congratulate you on the establishment, in the bosom of this community, of an institution destined, we trust, to be an instrument of much good. We place it under the protection of an intelligent public. Its organization is simple; its action will be wholly free from parade or display; its fruits, we trust, will be seen in raising the standard of common-school education. This object, we confess, we regard as one of paramount importance—second to no other not immediately connected with the spiritual concerns of man. If there be any persons to whom the words "common schools" and "common-school education" convey an idea of disparagement and insignificance, such persons are ignorant, not merely of the true character of our political system, but of the nature of man. I certainly intend nothing derogatory to our higher seminaries of education in town or country. * * * But whether we consider the numbers who enjoy their benefit, the relative importance to the State of an entire well-educated population and of the services of those who receive the advantages of an education at the higher seminaries, taken in connection with the fact that a liberal education may be had elsewhere, but that a common-school education must be had at home or not at all, no rational man, as it seems to me, can fail to perceive the superior importance of the common schools They give the keys of knowledge to the mass of the people. * * * Our common schools are important in the same way as the common air, the common sunshine, the common rain—invaluable for their commonness. They are the corner stone of that municipal organization which is the characteristic feature of our social system; they are the fountain of that widespread intelligence which, like a moral life, pervades the country; they are the nursery of that inquiring spirit to which we are indebted for the preservation of the blessings of an inquiring Protestant spiritual faith. Established as they were by special legislation in the infancy of the colony, while they are kept up and supported with a liberality corresponding with the growth of the country no serious evil can befall us. Whatsoever other calamities, external or internal, may overtake us, while the schools are supported they will furnish a perennial principle of restoration. With her 3,000 district schools, supported at the public expense, nothing but the irreversible decree of Omnipotence can bring the beaming forehead of Massachusetts to the dust. Vicissitudes may blight the foliage, but there will be vigor in the trunk and life at the root. Talent will constantly spring up on her barren hillsides and in her secluded vales and find an avenue through her schools to the broad theater of life, where great affairs are conducted by able men. Other States may exceed her in fertility of soil, but the skillful labor of her free citizens will clothe her plains with plenty. Other States may greatly outnumber her, but her ingenuity will people her shady glens and babbling waterfalls with half-reasoning engines which will accomplish the work of toiling myriads. Other States will far surpass her in geographical domain, but the government of cultivated mind is as boundless as the universe. Wheresoever on the surface of the globe and in the long line of coming ages there is a reasonable being, there is a legitimate subject of mental influence. From the humblest village school there may go forth a teacher, who, like Newton, shall bind his temples with the stars of Orion's belt—with Herschel, light up his cell with the beams of before undiscovered planets—with Franklin, grasp the lightning. Columbus, fortified with a few sound geographical principles, was, on the deck of his crazy caravel, more truly the monarch of Castile and Arragon than Ferdinand and Isabella, enthroned beneath the golden vaults of the conquered Alhambra. And Robinson, with the simple training of a rural pastor in England, when he knelt on the shore of Delft-Haven and sent his little flock upon their gospel errantry beyond the world of waters, exercised an influence over the destinies of the civilized world which will last till the end of time.[1]

[1] Orations and Speeches on Various Occasions by Edward Everett. Boston, 1850.

The school was kept at Barre for only three years. The whole number of students was 165; young women, 90; young men, 75. On the death of its principal it was suspended for two years, and was then removed to Westfield and placed under the care of the Rev. Dr. Emerson Davis as temporary principal. It occupied for one term the old academy building while rooms were being prepared for its accommodation in the town hall, where it remained for two years, until a building of its own was completed and dedicated to its service September 3, 1846.[1] At this dedication the Rev. Dr. Heman Humphrey made the principal address. He said he would touch upon four topics:

(1) Upon the urgent demand for better-qualified teachers in our common schools.
(2) Upon the reasons why those who are to be teachers should be educated with special reference to the profession.
(3) Upon what is embraced in a good professional teacher's education.
(4) Upon the adaptation of the normal system to give such education.[2]

At the centennial celebration it was stated that the whole number of students registered since the opening at Barre was 3,619, and the number of graduates since 1855 (before which there was no formal graduation) 1,222.

There are two courses of study in the modern school, a two years' and a four years' course. It will be interesting to compare these courses of study with the modest demands of Edward Everett and Dr. Humphrey fifty years before, and with the first printed course of studies under Principal Rowe in 1847.

Course of studies at the Westfield Normal School, 1847.

Reading of Scripture daily.
Orthography.—Fowle's Common School Speller, McElligott's Analyzer, and Worcester's Dictionary; also daily exercises in etymology as connected with spelling.
Enunciation and reading.—Tower's Gradual Reader, Russell and Goldsbury's American School Reader, and Leavitt's Fourth Book.
Writing.—Exercises given by the principal.
Physiology.—Cutter's and Jarvis's.
Drawing.—Schmidt's.
Grammar.—Wells's and Greene's; also Greene's Chart.
Algebra.—Day's and Thompson's algebras; also Tower's Mental Algebra.
Geometry.—Playfair's Euclid.
Philosophy.—Olmstead's.
Phonography.—Andrew's and Boyle's works.
The globes.—Problems.
Theory and practice of teaching.—Page's, Abbott's, and Palmer's treatises.
Vocal music.—Three times a week.
English composition.—Once a week.

Topics of the two years' course.

FIRST TERM.

Arithmetic.—Notation, addition, subtraction, multiplication, and division of integral numbers; common fractional numbers; decimals; compound denominate numbers; metric system taught by apparatus; practical work.
Geometry.—First three books of Wentworth's Geometry, or their equivalent. Pupils do not use text-books. They are required to work out and teach most of the definitions, theorems, and constructions of the course.
Zoology.—General characteristics of animals; chief groups of animals, with methods of determining relative rank; special study of mammals, birds, etc. The school has an excellent "working cabinet" which is in daily use in classes.
Vocal music.—Rhythmics, melodics, dynamics, sight singing, methods.
Composition.—Capitals, punctuation, letter writing, business forms, language lessons.
United States history.—Periods of discoveries; explorations; settlements and

[1] Semicentennial of the State Normal School, Westfield, Mass., June 25, 1889.
[2] Barnard's Normal Schools and Other Institutions, Means, and Agencies designed for the Professional Education of Teachers. Hartford, Conn., 1851.

colonies, with the included wars; revolution; constitution; civil war and events following; collateral reading.

Drawing.—Study and analysis of solids; clay modeling; plane figures; straight and curved lines; free-hand drawing on blackboard and paper from object, dictation, and memory; elementary designs; color.

SECOND TERM.

Arithmetic.—Percentage, and its application in commission, taxes, interest, banking, etc.; extraction of roots, with applications; mensuration; examples and problems in all subjects taught, to apply knowledge. Pupils are encouraged to seek information at the post-office, at lawyers' offices, banks, stores, and the teacher's desk, and thus to become familiar with the practical applications of arithmetic in the affairs of everyday life.

Grammar.—Outline of subject; parts of expressions taught and named; words studied with reference to classification, properties, and construction; parsing and analysis of sentences.

Geography.—Scientific study of the form, size, and motions of the earth; configuration and relief of the land masses; atmospheric and oceanic movements; climate; plant and animal life, and especially man, including distribution of races, and all conditions affecting this distribution; religion, government, and whatever affects the civilization of the races.

Algebra.—Usual topics preceding quadratics.

Botany.—Study of specimens in class room and in field, for knowledge of structure, habits, etc.; bases of classification; analysis of points with artificial keys.

Drawing.—Work of first term continued; geometrical drawing; working drawings; surface developments (objects constructed); free-hand perspective; botanical analysis; historical ornament; design. Drawing is required for only one year, but many continue the study for an additional term or two. For those who do this the subjects are: Model and cast drawing in outline, shading in crayon and charcoal (stump), applied design, details of human figure from the flat and casts.

Composition.—Paragraphing; compositions on subjects assigned; criticism in class and by class; spelling.

THIRD TERM.

Physiology.—General outline of subject; anatomy, physiology, and hygiene of digestive organs, including classification of food stuffs and methods of preparing food; anatomy, physiology, and hygiene of circulatory and respiratory organs; animal heat—its nature, source, distribution, regulation, etc.; clothing—use, qualities desirable in, qualities of common materials, how to dress hygienically, etc. Anatomy is taught from anatomical preparations of organs of the human body; and physiology, as far as possible, by observing organs of other animals in action.

Physics.—Physical properties of matter; definition and enumeration of forces; effects of gravitation, including pressures of liquids and gases, with consequences and applications; electricity, special attention being given to elementary phenomena and to practical applications; machines or means of applying force. In this subject everything is taught experimentally, pupils being required, as far as possible, to perform all important experiments for themselves.

Geography (six weeks).—Philosophic study of topics taken up in second term.

Rhetoric.—Study of figurative language and qualities of style, with practical applications, followed by several weeks of composition writing and criticism; study of the mind and its qualities, including wit, humor, etc.; the sensibilities, especially taste.

English literature.—History of language; study of the life and style of the following authors, and of selections from their works: Wickliffe, Chaucer, Cranmer, Spencer, Bacon, Shakespeare, Milton, Johnson, Whittier, Hawthorne, Lowell, Longfellow; reading (in addition) of Idyls of the King, Ivanhoe, Henry VIII, Merchant of Venice, Julius Cæsar, one book of Paradise Lost, Macaulay's Essay on Johnson, Snowbound, Among the Hills, Vision of Sir Launfal, Commemoration Ode, The Old Manse, Evangeline, Courtship of Miles Standish. There are some variations from term to term.

Mineralogy.—Study of all common minerals, rocks, and ores for qualities and uses.

FOURTH TERM.

Astronomy.—Methods of describing position of heavenly bodies; refraction, parallax, and precession; classification of heavenly bodies; particular study of earth, sun, and moon; tides; eclipses; geography of celestial sphere.

Reading.—Vocal culture; sight reading; study of pieces; methods.

Chemistry.—Chemical physics and inorganic chemistry, with laboratory practice by each pupil.

Theory and art of teaching.—Psychology in its relation to principles and methods of teaching; school organization and government; school laws of Massachusetts; several weeks of purely professional work in common English branches; civil polity.

Geology.—Study of agencies now at work modifying the structure of the earth; historical geology; special study of local features.

Drawing.—Blackboard practice in elementary work for primary school, illustrating reading, language, geography, botany, zoology, etc. Color (theory and practice).

Topics of the four years' course.

Same as those for the two years' course, with the following additions:

Geometry.—Plane geometry completed. The method is the same as for the two years' course.

Algebra.—Pupils have constant drill in the application of the principles, and are taught how to teach the following topics to classes in the upper grades of school: Involution, evolution, radicals and radical equations, imaginary quantities, quadratics, simple indeterminate equations, inequalities, ratio, proportion, progressive series, binominal theorem, logarithms and logarithmic tables.

English literature.—Pupils will select one of the following courses:

COURSE I.—*Chaucer:* Prologue to the Canterbury Tales, The Knight's Tale. *Shakespeare:* Hamlet or Macbeth, As You Like It, Lear, Midsummer Night's Dream, twelve sonnets. *Milton:* L'Allegro, Il Penseroso, Comus, Lycidas, Paradise Lost (Books I and II), Samson Agonistes.

COURSE II.—*Shakespeare:* Hamlet, As You Like It, twelve sonnets, Life. *Milton:* L'Allegro, Il Penseroso, Paradise Lost (Book I), six sonnets, Life. *Scott:* Waverley, Marmion. *Eliot:* Romola. *Tennyson:* Idyls of the King, songs in The Princess. *Thackeray:* Henry Esmond.

COURSE III (Nineteenth Century).—*Scott:* Heart of Midlothian. *Thackeray:* Henry Esmond. *Wordsworth:* Intimations of Immortality. *Tennyson:* Idyls of the King. *Eliot:* Romola. *Byron:* Prisoner of Chillon. *Bulwer:* Last Days of Pompeii. *Carlyle:* Essay on Burns. *Mrs. Browning:* sonnets, short poems. *Froude:* extracts from History of England. *Macaulay:* selected essays.

Drawing.—Models in outline; models in crayon or charcoal (stump); casts in charcoal; botanical analysis and applied design; foliage from nature; historical ornament; color; perspective (parallel and angular); machine drawing; building construction.

Physics.—Sound, heat, light, electricity, and magnetism, with practical applications.

Chemistry.—Qualitative analysis of liquids and solids; chemical theories; preparation of chemicals and apparatus.

Botany.—Structure, composition, growth, functions, and classification of plants; preparation of specimens, etc.

Latin.—Elementary work; translation of Cæsar, Cicero, and Virgil; sight translation; colloquia; scanning and prosody; study of customs, men, times, and style; writing Latin (the more important rules of construction being developed inductively); methods. Pupils are required to teach in the elementary work.

French.—First year: Sauveur's Petites Causeries and Contes Merveilleux, with conversation and dictation exercises; Lambert and Sardou's Manual; Smith's French Principia; Roulier's First Book of French Composition.

Second year: Bernard's L'art d'interesser en Classe; Rougemont's La France; Sand's Petite Fadette; Michelet's Jeanne d'Arc; Souvestre's Confessions d'un Ouvrier; Tableux de la Révolution Française; Roulier's First Book of French Composition; Lambert and Sardou's Manual; Chardenal's French Exercises; Bluet's Class Book of French Composition.

German.—First year: Whitney's German by Practice; Worman's Elementary German Grammar; Schiller's Wilhelm Tell.

Second year: Conversations based on Andersen's Bilderbuch ohne Bilder; Otto's German Grammar; Goethe's Hermann und Dorothea; Goethe's Ausgewählte Prosa (Hart's edition).

General History.—Ancient Greece and Rome, with reference to modern institutions. Institutions and modes of life of the middle ages, with reference to the evolution of our political and other institutions. Modern history, including the development of the nationalities of western Europe and constitutional liberty.

The writer had the pleasure of visiting the Westfield school in 1865, when under the principalship of John W. Dickinson, now secretary of the board of education of Massachusetts. The impression made at that visit will never be obliterated. Though fresh from the study of other normal schools of high reputation—New Jer-

sey, Albany, Oswego, and others—he thought, and still thinks, that the Westfield school was sui generis. One spirit seemed to pervade every room, every class, every student, every teacher—the spirit of John W. Dickinson, the genius loci. An immense and complicated machine animated by one spirit, every part working harmoniously with every other part for the accomplishment of one purpose. In every department of study you found strictness of definition, precision of statement, rigidity of reasoning, variety of illustration, abundance of practical application. Every question, every answer, every recitation, every exercise breathed pedagogy of the severest type. One might, had he been inclined to find fault, have asked for a little more liberty, a little more self-assertiveness on the part of the students, a little more impulsiveness, a little freer play of individual thought, but the keenest critic must have acknowledged that the school was an organization "nobly planned" and skillfully directed by an expert whose convictions were like the laws of the Medes and Persians and who had the full courage of his convictions.

In 1872 the legislature appropriated $72,000 for a boarding hall ample enough for the accommodation of all the students, and lately an appropriation of $150,000 was made to erect a new school building on new grounds.

Model School at Westfield.

The board of education contemplated the addition of a model school, or school of practice, to each of the normal schools under their jurisdiction. It was expected that the town school would furnish this necessary supplement, and such a school was maintained in connection with the normal school at Westfield from 1844 till 1855. But "the relations of this school to the town and to the normal school were never entirely satisfactory, and they were dissolved in 1855, leaving the normal school to obtain its experience by practice on its own members. After this change the Westfield school turned its exclusive attention to the study of the philosophy of teaching, to gaining a technical knowledge of the branches of learning taught in the schools, to preparing such courses of study as are the right occasions for the acquisition of useful knowledge and right mental development, and to training the pupils to teach by requiring them to recite all review lessons in the form of teaching exercises. This method of work produced good practical results, and yet it did not furnish an opportunity for an experience in teaching and controlling a school of real children. To supply the want as far as possible, a school of observation was organized in 1866, and so related to the normal school that its principal could, by permission from the town school committee, nominate the teachers, suggest a course of studies and exercises, and the method of teaching that should be practiced. The normal pupils were granted the privilege of observing the operations of this school and of teaching some of its classes." [1]

James G. Greenough	1887

Bridgewater Normal School.

It has already been stated that the State board of education decided, in April, 1838, to open three normal schools, each to be continued three years as an experiment. Urged by the eloquence and zeal of the Rev. Charles Brooks, the people of Plymouth

[1] Fifty-third Annual Report of the Board of Education, Massachusetts.

County were the first to apply to the board to have one of these three schools located within their borders. The board resolved formally to grant the request "as soon as suitable buildings, fixtures, and furniture, and the means of carrying on the school, exclusive of the compensation of teachers, should be placed at the disposal of the board." At a county convention which met at Hanover in September, 1838, a resolution was passed to raise $10,000 for this purpose. It was found easier to pass the resolution than to raise the money. In fact, it never was raised, although six towns were desirous of the honor of having the normal school within their limits. Finally the board was asked to name the terms on which they would locate the school at Bridgewater.

The board voted "that the school be established at Bridgewater for the term of three years, on condition that the people of the town put the townhouse in such a state of repair as may be necessary for the accommodation of the school, and that they place at the disposal of the visitors of the school the sum of $500, to be expended in procuring a library and apparatus; and that they give reasonable assurance that the scholars shall be accommodated with board within a suitable distance at an expense not exceeding $2 a week."

The conditions were accepted, and the school was opened in the old town hall in September, 1840, with a class of 21 young women and 7 young men, under the charge of Capt. Nicholas Tillinghast. The hall was a frame building, 40 by 50 feet. For the accommodation of the school the main room was divided lengthwise by a board partition, so constructed that the lower half could be raised so as to throw the two rooms into one for general exercises. The seating corresponded to the building—a pine board attached to the desk behind.

At the end of the three years for which the town hall was engaged, it became necessary to obtain a permanent and more capacious building. A memorial was presented to the legislature of 1845, signed by Charles Sumner and other prominent citizens of Massachusetts, asking for an appropriation of $5,000 for normal school buildings, on condition that a like sum should be contributed by private individuals for the same purpose. The people of Plymouth promised to give the required contribution, and were very anxious to have the school removed to that town, but the board of education decided the question in favor of Bridgewater. Plans and specifications were prepared and proposals called for, but no contract could be made because the board had not sufficient funds at their disposal. After considerable delay, Horace Mann came forward and gave his personal obligation to make up the deficiency, which turned out to be about $700, which he paid; but the money was afterwards returned to him from the State treasury. The house was only a plain wooden structure, 64 by 42 feet, and two stories high; but it was considered one of the most attractive schoolhouses in the State. At the dedication in August, 1846, Mr. Mann made one of his characteristic speeches. Referring to the opposition which the normal schools had met with, he said:

I honor the great body of common school teachers in Massachusetts for the magnanimity they have displayed on this subject. I know that many of them have said, almost in so many words, and what is nobler, they have acted as they have said: "We are conscious of our deficiencies; we are grateful for any means that will supply them; nay, we are ready to retire from our places when better teachers can be found to fill them. We derive, it is true, our daily bread from school keeping, but it is better that our bodies should be pinched with hunger than that the souls of children should starve for want of mental nourishment, and we should be unworthy of the husks which the swine do eat if we could prefer our own emolument or comfort to the intellectual or mental culture of the rising generation. We give you our hand and our heart for the glorious work of improving the schools of Massachusetts, while we scorn the baseness of the men who would appeal to our love of gain, or of ease, to seduce us from the path of duty." This statement does no more than justice to the noble conduct of the great body of teachers in Massachusetts. To be sure there always have been some who have opposed the normal schools, and who will probably continue to oppose them as long as they live, lest they, themselves, should

be superseded by a class of competent teachers. These are they who would arrest education where it is, because they can not keep up with it or overtake it in its onward progress. But the wheels of education are rolling on, and they who will not go with them must go under them.

A boarding hall for the students was built in 1869 in accordance with a resolution of the legislature which authorized the commissioners of the Massachusetts school fund to lend the board of education $15,000 for that purpose, and requiring the board to collect from the occupants of the boarding hall "a sum sufficient to cover the interest at 6 per cent per annum on the cost of said buildings and furniture, and a reasonable insurance of the same." The next legislature increased the loan to $25,000. The interest was punctually paid, but in 1871 the legislature released the board from the obligation to pay interest and insurance, and so the loan became a gift.

The hall was hardly built when it needed to be enlarged, and the school building also required enlargement. Both enlargements were carried through, and in 1889 a new building was imperatively required. It was erected at the cost of $150,000, and is one of the handsomest and best equipped of all the normal school buildings in the country. In addition to the usual assembly room, study rooms, recitation rooms, and libraries, it has 7 laboratories—2 physical laboratories, 2 chemical, 1 mineralogical and geological, 1 biological, and 1 industrial. The last is furnished with carpenters' benches and sets of tools, a circular saw and jig-saw attachment, and is especially useful to students who wish to make sets of apparatus for their own schools without great expense. In the early days it was not easy for graduates of this school to find places as teachers; now the demand for graduates exceeds the supply.

The school is organized, like the other State normal schools of Massachusetts, under the direction of the board of education, with three courses of study—a two years' course, an intermediate course, and a four years' course. The two years' course includes arithmetic, bookkeeping, elementary geometry, algebra, elementary physics, chemistry, mineralogy, botany, zoology, geology, physiology, geography, astronomy, reading, orthography, etymology, grammar, rhetoric, literature, composition, penmanship, drawing, vocal music, gymnastics, military drill, history and civil polity of Massachusetts and of the United States, and school laws of Massachusetts, psychology, science and art of education, school organization, school government, and history of education. It goes without saying that on some of these slices of bread the butter must be spread exceedingly thin.

The four years' course has, in addition to the above, algebra, geometry, trigonometry, surveying, physics, chemistry, botany, zoology, general history, English literature, drawing, Latin and French; Greek and German at the option of the principal and visitors.

The intermediate course adds to the studies of the two years' course such advanced studies as the regular order of exercises may permit.

The catalogue of 1890 gives the names of 130 students in the two years' course, 64 in the four years' course, and 5 in the intermediate.

The early plans of the board of education looked to the maintenance of a model school, or school of practice, as an essential element of each of the State normal schools. The proper adjustment of the theoretical to the practical part of the work has been one of the greatest difficulties met with in most of the normal schools of the country, city training schools, perhaps, excepted. The Bridgewater school has had the benefit of much and varied experience on this point. For the first six years the model school was kept in a small schoolhouse, erected for the purpose by the center school district of the town, and was taught sometimes by a salaried principal and sometimes by the students of the normal school under the supervision of the principal of that school. We are told that "practice teaching in the model school was not very attractive to the normal pupils. Those who had taught before coming to the normal school felt

that they were not specially benefited by this practice; and those who had never taught before did not become sufficiently interested to appreciate work" [how could they in the two weeks allotted to them?] "and some parents preferred that their children should not be experimented with." The school was closed in 1850; but the new building (1891) has model school rooms for 120 scholars.[1]

Principals.

Marshall Conant	1853–1860
Albert G. Boyden	1860

SALEM.

In 1852 the board of education, at the same meeting at which the proposals from Framingham were accepted, resolved to recommend to the legislature the establishment of a normal school in Essex County. The legislature approved the recommendation and made an appropriation to carry it into effect. Proposals were received from Salem, North Andover, Groveland, and Chelsea, and after a careful examination of the claims of the several localities the board decided on Salem, and experience has proved the wisdom of the selection. A suitable site was furnished by the city; a brick building was erected two stories high and 67 feet square, and was dedicated with appropriate exercises in September, 1854, Governor Washburn presiding. The school opened with 65 pupils (the largest opening number up to this date), under the superintendence of Mr. Richard Edwards, a graduate of the Bridgewater Normal School, afterwards principal of the normal school at St. Louis, and later State superintendent of public instruction in Illinois. He was succeeded in 1857 by Prof. Alpheus Crosby, who resigned in 1865, and was followed by Daniel B. Hagar, the present principal.[2]

As a necessary consequence of the labors of three men so distinguished as educators, the school overflowed its banks, and the legislature was called on for an appropriation of $25,000 to enlarge the building, which was promptly and cheerfully granted.

The building as enlarged contains a reception room, 7 recitation rooms, and 3 dressing rooms; an assembly room seated for 210 pupils, rooms for the principal and the assistant teachers, 3 laboratories and lecture rooms, a cabinet, a drawing-room, a library, and a room for text-books. The tower contains a valuable telescope, which was paid for by the voluntary contributions of several graduating classes. The school is intended for the preparation and training of young women exclusively. The course of instruction is the same as in other normal schools of the State.

According to the Report of the Massachusetts State Board of Education for 1889, 88 per cent of the graduates of this school have taught in the State: "50 in normal schools, 2 as principals; 144 in high schools, 11 as principals; 46 in academies and seminaries; 9 in colleges, 2 as professors; 7 in universities; 10 in deaf-mute schools; 8 in the Clarke Institution at Northampton; 5 in kindergarten schools; 4 in training schools; 2 in State industrial schools; 1 in the school for the blind."

WORCESTER.

The normal school at Worcester is thirty-five years younger than the pioneer school at Lexington. The experience of these years was in great part utilized by the new school. There was no need of experimenting. There was no fear of lacking

[1] History of Bridgewater State Normal School, 1876; Report of Board of Education, Massachusetts, 1889; Catalogue of Bridgewater State Normal School, 1890.

[2] Catalogue of the teachers and pupils of the Salem State Normal School, 1854–1887. Annual catalogue, 1890.

support. There was no dread of public opinion.[1] The way had been prepared. The paths had been made straight and the rough places smooth. But the school was not content to follow in the wake of its predecessors. From the first it manifested an individuality of its own; and this has been strengthened by the double good fortune of permanence of location and permanence of its working staff. It has had but one principal in its seventeen years of life, and the changes in the subordinate members of the faculty have not been so numerous as to mar the continuity of the work. From the first no instructors were employed but persons having distinguished professional qualifications, including mature age, wide attainments, and successful experience.

The whole number of students admitted up to January, 1890 (the date of the last available report), was 855, of whom 400 completed the course and graduated with credit. Ninety-five per cent of these graduates engaged in teaching almost as soon as they were free to do so.

The Worcester school is a school of methods, par excellence; not of pedagogic methods merely, but business methods as well. The following selection of blanks will illustrate this in part. (The numbering is the editor's.)

When a student has signed the declaration to teach in the public schools of Massachusetts, as is required in all the normal schools of the State, the following blank is sent to the parent or guardian for signature before the student is formally admitted:

(1) *Certificate of parent or guardian.*

I hereby authorize and approve the declaration signed by Miss ——— ——— as a condition of admission to the State Normal School at Worcester, Mass.

Dated at ....., 18...

[Signature.]

———, ———,

Parent. *Guardian.*

[NOTE.—All blanks are of the feminine gender, so to speak; although young men are legally admissible.]

In order to assist students from a distance in procuring suitable boarding accommodations, the following circular is sent to persons likely to have rooms to spare and to be willing to receive normal students:

(2) *State Normal School at Worcester.*

Please fill in the particulars as indicated below and return this paper to us. We have only a limited number of boarding pupils, and therefore can not always send even to satisfactory places.

Name, ———.
Address, ———.
Accommodations, ———.
Number of rooms, ———.
Number to occupy each, ———.
Size of rooms, ———.
Number of windows in each, ———.
How warmed, ———.
Is light furnished? ———.
Is washing done? ———.
Do you take any other boarders? ———.
Terms, ———.
References, ———.
Remarks, ———.

[1] Some years before this a student of a new normal school, not in Massachusetts, said to her instructor in methods, "Professor, are we to teach this way when we go home?" "Certainly, that is expected," replied the professor. "Well, if I do," was the answer, "I shall be hissed out of the district." But she did; and though she was not exactly "hissed out," she was made so uncomfortable that she sought and found another and better school.

The student, having been duly enrolled and established in a comfortable temporary (or permanent) home, is required to fill up the following blank every week:

(3) *Student's weekly report.*

Report of ——— ———. For the week ending ——— ——, 18—.

[Approximate estimates only are required.]

Time spent.	Monday.		Tuesday.		Wednesday.		Thursday.		Friday.		Saturday.	
	H.	M.	H.	M.	H.	M.	H.	M.	H.	M.	H.	M.
At school												
In study												
At work												
In recreation												
At table												
In sleep												
Accounted for												
Not accounted for												
Total	24	00	24	00	24	00	24	00	24	00	24	00

Questions for students.

1. What has been your latest bedtime during the week? ———.
2. How many meals have you missed? ———.
3. How many evening hours have you spent away from your room? ———.
4. How many hours of outdoor exercise have you had? ———.

Remarks: ———.

[Signature] ——— ———.

Street and number. ———.

(Indorsement:) I have read this report, and believe it to be substantially correct.

[Signature] ——— ———.

Leave of absence being sometimes necessary, the following card is given to the student when the leave is granted:

(4) *Certificate of leave of absence.*

This is to certify that Miss ——— ———, a member of the State Normal School at Worcester, Mass., has permission to be absent ——— ———, until ——— ——, 18—.

——— ———, *Principal.*

——— ——, 18—.

Before the expiration of the leave the student receives a postal card as follows:

(5) STATE NORMAL SCHOOL,
Worcester, Mass., ——— ——, 18—.

Your leave of absence expires on ——— ——, 18—. Please write me whether you expect to come back to school at that time, or whether you desire to prolong your absence. If the latter, please give your reasons and inclose your certificate to me in order that the extension of time may be noted on it.

Very sincerely, yours,

——— ———, *Principal.*

If the extension is granted, a card to that effect is sent to the student.

Occasionally a student is obliged for good reason to leave the school before the expiration of the term. In this case the student receives the following:

(6) *Certificate of dismission.*

This certifies that Miss ——— ——— is honorably dismissed from the State Normal School at Worcester, Mass.

——— ———, *Principal.*

——— ———, 18—.

As supplementary to the systematic study of psychology, the pupils of this school have been engaged for several years in the study of children, objectively, upon a plan which may be outlined as follows:

The principal requests the students to observe the conduct of children under all circumstances—at home, at school, in the street, at work, at play, in conversation with one another and with adults—and record what they see and hear as soon as circumstances will permit. When the nature of the work is explained to the school great emphasis is placed upon the necessity of having the records genuine beyond all possibility of question; of having them consist of a simple, concise statement of what the child does or says without comment by the writer; of making both the observation and the record without the knowledge of the child; and of noting the usual, rather than the unusual, conduct of the individuals observed.

For convenience in classification blanks of five colors are provided for the records; white paper is used for such observations as students make themselves, red for well-attested ones reported by others, yellow for reminiscences of their own childhood, green for mention of whatever they read on the subject, and chocolate for observations that extend continuously over a specified period of time. Each blank has the following heading:

(7) STATE NORMAL SCHOOL AT WORCESTER.

Study of children.

1. Date, ———.
2. Observer's name, ———; age, ——; post-office address, ———.
3. Name (or initials) of person (child) observed, ———; sex, ———; nationality, ———; age (years and months), ———.
4. Length of time between making the observation and recording it, ———.

Record, ———.

If the record is from hearsay the names of both recorder and observer must be given.

Pupils write their records at their convenience (immediately after making the observation is the best time), and put the papers in a designated place. A teacher reads them from time to time and classifies them under the heads of knowledge, reflection, imagination, conscience, feeling, play, etc.[1]

For "exceptional" cases another blank is used with the same items as No. 7, but with the following additional particulars:

(8)

1. Form (body, limbs, size, apparent strength, symmetry, etc.), ———.
2. Head and face (size, shape, symmetry, features, complexion, etc.), ———
3. *Movement and postures* (head and neck, forehead, eyes, mouth, arms and hands, spine, legs and feet) ———.
4. *Health* (nutrition, color, activity in play, sleep, etc.) ———.
5. *Intelligence* (attention, memory, imitation, speech, etc.) ———.
6. *Disposition* (moral, emotional) ———.
7. *Additional* (parents, brothers and sisters, accidents, incidents, etc.) ———.

The public schools of Worcester are the practice or training schools of the normal school. The harmonious relations existing between the two authorities—and not

[1] Fifty-third Annual Report of the Board of Education, Massachusetts, 1889.

often found elsewhere except in city training schools--have led to the establishment of a system of apprenticeships "under the joint supervision of the city superintendent of schools and the faculty of the normal school." Each student after a year and a half spent in the normal school is allowed—not compelled—to go to one of the public schools of the city to observe, to teach, and, occasionally, to take part in the government. The apprenticeship lasting for six months, every student has an opportunity to serve in at least three grades of schools. Each apprentice keeps a diary of the occupation and experience of every day's service, and this record is inspected by the faculty of the normal school. On the completion of the apprenticeship the teacher of the city school in which the service was rendered fills up the following blank:

(9) *Report of the apprentice work of* ——— ———.

Grade ———, ——— street school.
Time, from ——— to ———.
Scale 10—use no fractions.
Number of absences, ———.
Number of tardinesses, ———.
Power of control, ———.
Power of interesting, ———.
Skill in questioning, ———.
Skill in explaining and illustrating, ———.
Enthusiasm, ———.
Bearing, ———.
What traits of excellence (if any) have been shown in teaching or management? ———.
What weakness or deficiency? ———.
Remarks. ———.

[Signature.]

When the apprentice graduates the following certificate is given in addition to the usual diploma:

(10) *Certificate of apprenticeship.*

MASSACHUSETTS STATE NORMAL SCHOOL AT WORCESTER.

——— ———, of ———, a regular graduate of this school (class of ———, 18—), besides doing the work of the two-years' course, has served for half a year as apprentice (or assistant) in the public schools of the city of Worcester.

——— ———, *Principal.*

WORCESTER, MASS., ——— ——, *18—*.

The watchful eye of the school is on the students even after they have left their alma mater. If any should forget this, they will be reminded by the following circular:

(11) STATE NORMAL SCHOOL.

Worcester, Mass., ——— ——, *18—*.

To ——— ———, of ——— Class.

Please answer the following questions and return to me.

The report to be made up from these answers will be seriously impaired in value if you fail to respond promptly.

Very truly, yours,

——— ———, *Principal.*

1. (*a*) Where, (*b*) how many times, (*c*) how many weeks, and (*d*) in how many different schools have you taught since you graduated? ———.
2. (*a*) How large is your present school, and (*b*) is it exceptionally difficult to manage? ———.
3. (*a*) What wages per week do you receive, and (*b*) of how many weeks does your school year consist? ———.

4. What evidence have you that your teaching has been successful? ———.

NOTE.—Reelection, promotion, and increase of salary are the best (though not the only) evidences of success.

5. To what, chiefly, do you attribute your success? ———.

6. Is your health, so far as you are aware, *unimpaired?* ———.

7. What are your expectations with reference to continuing teaching? ———.

8. Give the name and post-office address of a school officer to whom you are or have been directly responsible. ———.

9. Give (*a*) your present and (*b*) your permanent post-office address. ———.

As the graduate derives great advantages from the instruction and discipline of the normal school, it is thought but right in return that the graduate teacher should contribute something to the experience and further development of the normal school. Accordingly a letter making inquiry into the practical effect of normal training on young teachers, so far as they are able to realize it, is sent to graduates of two years standing.

(12) STATE NORMAL SCHOOL, WORCESTER, MASS.

To ——— ———, of ——— Class.

It is thought that the experience of our earlier graduates must enable them to form valuable opinions as to the comparative usefulness in practical teaching of the various points in study and training to which they gave special attention here. Such opinions frankly expressed would furnish important hints for the future management of the school.

The following questions are therefore sent to those who have taught two years or more since graduation. Full and frank answers are earnestly desired, and will be of real service to the school.

1. Have you had much occasion to use the knowledge of hygiene that you acquired here; and if so, in what ways chiefly? ———.

2. (*a*) Do you use and value what you learned here in "Principles?" ———. (*b*) In "Methods?" ———.

3. State pretty fully how you regard your "apprenticeship." ———.

4. (*a*) How much occasion have you had for your acquirements in music? ———. (*b*) In drawing? ———.

5. (*a*) In what respects do you feel best satisfied with your course here? ———. (*b*) In what respects least satisfied? ———.

6. (*a*) What one or two acquirements or habits gained chiefly here do you find most useful in schoolteaching? ———. (*b*) What one or two least useful? ———.

7. What exercise or study, *considering the time it required*, do you regard as the most valuable to you? ———.

8. What influence, if any, do you attribute to the school in the formation or development of your character? ———.

STATE NORMAL SCHOOL AT WORCESTER.

Weekly programme, spring term, 1891.

[EXPLANATIONS: The Roman figure before a class shows the number of the class. The fourth class is divided into two sections, known as *a* and *b* divisions. G means graduates' class.]

9.00 to 9.25	FIRST STUDY PERIOD.

4.10 to 4.40	THIRD STUDY PERIOD—OPTIONAL.				

Normal Art School of Massachusetts.

Drawing has for many centuries been recognized as one of the branches of a finished education in two opposite directions: Technological, as a necessary auxiliary in architecture, engineering, and kindred pursuits; and fashionable, from works of tapestry down to the copying of prints. The fashionable school catalogues of the beginning of the century generally wound up with "drawing and the use of the globes" at so much extra. Even to-day there are thousands of teachers who make a living by assisting their pupils in making pictures to be framed for parlor adornment on which not one stroke of the pupil's own hand can be recognized.

The introduction of drawing as a necessary elementary study is but of recent date.

In 1749 Benjamin Franklin published his "Proposed hints for an academy," in which we find the following:

Studies to be selected and adopted.—As to their studies, it would be well if they could be taught everything that is useful and everything that is ornamental. But art is long and their time is short. It is therefore proposed that they learn those things that are likely to be most useful and most ornamental.

Writing, drawing, and arithmetic.—All should be taught to write a fair hand and swift, as that is useful to all. And with it may be learned something of drawing by imitation of prints, and some of the first principles of perspective.

This is perhaps the first recognition in the United States of drawing as entitled to the same rank as writing and arithmetic, among the "useful" branches of learning.

In 1821 William Bentley Fowle took charge of a Lancasterian or monitorial school in Boston, in which he made drawing a general exercise. Mr. Fowle was ahead of his time, like many other reformers, and after two years' service, his employers discovered that they had no further need of him; but the people had, and a company of private citizens built a schoolhouse and invited him to take charge of it. The school, called the Female Monitorial School, was a notable success.

In 1827 Mr. Fowle published an elementary work on drawing, translated in part from the French of M. Francoeur, with additions and alterations to adapt it to the use of schools in the United States. In his preface he says:

Notwithstanding the great utility of this branch of education, it is a lamentable fact that it is seldom or never taught in the public schools, although a very large proportion of our children have no other education than these schools afford. Even in the private schools where drawing is taught, it is too generally the case that no regard is paid to the geometrical principles on which the art depends. Not one in fifty of those who have gone through a course of instruction can do more than copy such drawings as are set before them. They never originate any design, and rarely attempt to draw from nature.

If Master Fowle had lived forty years longer, he might have made the same remarks with equal truth and equal pertinency.

Among the pioneers of the movement which culminated in the general introduction of drawing as a common-school study must be reckoned the Hon. Henry Barnard, editor of the American Journal of Education, and subsequently the first U. S. Commissioner of Education.

In 1838 Dr. Barnard delivered several lectures on drawing as the foundation of all industrial education, and urged that drawing should be taught in the common school pari passu with reading and writing. It was generally believed at that time that the ability to draw was a gift bestowed only on a few, and that, consequently, it would be a waste of time and energy to make it a common school study—in fact, throwing pearls before swine. Dr. Barnard's views on this subject are briefly presented in the following extract from Professor Stone's Report on the Practice of Music and Drawing in the Common Schools of Prussia, made to the legislature of Ohio in 1838, and printed.

The universal success also and beneficial results with which the arts of drawing and designing, vocal and instrumental music, have been introduced into schools was

another fact peculiarly interesting to me. I asked all the teachers with whom I conversed whether they did not sometimes find children actually incapable of learning to draw and to sing. I have had but one reply, and that was that they found the same diversity of natural talent in regard to these as in regard to reading, writing, and other branches of education; but that they had never seen a child who was capable of learning to read and write who could not be taught to sing well and draw neatly; and that, too, without taking any time which would at all interfere with, indeed which would not actually promote, his progress in other studies.[1]

DRAWING IN PRUSSIAN SCHOOLS, 1840.

How slow is the process of observing, appreciating and imitating the best methods of instruction may be seen by comparing the system used in the Realschule of Berlin in 1840, with the systems, or want of system, in vogue in the United States thirty years later. Again we are indebted to that invaluable thesaurus, the American Journal of Education (August, 1840):

The drawing department of this school [the Royal Realschule of Berlin] is superintended by a teacher who has introduced a new method of instruction particularly adapted to the purpose for which drawing is to be applied in common life and in the arts; a method which is found to enable a much larger proportion of the pupils to make adequate progress than the ordinary one of copying from drawings. In this method the pupil begins by drawing from simple geometrical forms, those selected being obtained from models in wood or plaster, of a square pillar (7½ inches high and 1½ inches in its square section), a niche, and a low cylinder (the form of a millstone). The square pillar separates in joints, affording a cube and parallelopipeds of different heights. The hemisphere which caps the niche may be removed, leaving the concave surface of its cylindrical part. The exercises of the pupils run thus: First, to place upon a board, or upon his paper or slate, a point vertically above another point, or so that the lines joining the two shall be parallel to the right or left hand edge of the board, paper, or slate; second, to join them; third, to place a point horizontally from the second, and at a distance equal to that between the first and second points; fourth, to place one vertically over the third, and at a distance equal to that below the first, and to join the third and fourth. The third and fourth being then joined, a square is formed. After practice in this, the simple elevation of the cube is drawn; next, a perspective, by the use of a small frame and silk threads, such as is common in teaching the elements of this subject, and by means of which the pupil acquires a knowledge of the practice. * * * This method of teaching has been introduced quite generally in Prussia, and with the best results as to the formation of accuracy of eye and of hand.

REPORT OF COMMITTEE ON DRAWING.

Compare with this the report of the "special committee on drawing," Boston, 1870. A few short extracts will suffice:

When this committee was appointed, the programme of studies in the schools of the first twelve wards of this city included drawing. The Boston programme was well, so far as it went; but it was not followed. In many of our schools no time was given for even the very mechanical exercise the rules prescribed. There was a general feeling among the teachers that drawing was simply an accomplishment for those whose leisure might be amused by its exercise, and that a large majority of the children in their charge would be better off without it; and with this impression joined to the knowledge that there were no examinations or requirements in this

[1] While this statement is correct in the main, the writer feels it due to truth to say that it is too broad. He has met with many exceptional cases where a good reader could not be taught to sing. Color blindness is not uncommon; tone blindness is probably just as common. There is this difference, that the inability to recognize a color (in school education) hurts only the observer; the inability to produce the proper sound is an annoyance to all who are compelled to listen. With regard to drawing, the sentiments of the present writer are expressed in the following anecdote: At a meeting of the International Conference on Education, held in London, August, 1884, James Russell Lowell, in the course of some extempore remarks, said that he "once knew a teacher of drawing of whom he asked the question: How many can you teach to draw? 'Anybody.' It is to me you speak; how many can you teach in a hundred? 'Well, fifty.' But how many can you teach well? 'Perhaps twenty.' But how many to draw what you would call *well?* 'Well, perhaps, in two or three years, one.'"

department for promotion to higher schools, it is not strange that the time, already insufficient, was found too short for drawing. In some schools the routine of taking out the books, allowing the children to play with pencil and paper for half an hour, and then putting away the result, often without examination, was virtuously performed. In a few schools instruction, and good instruction, was given by the master and his assistants. But this was very exceptional. * * * There was nowhere any system from the primary to the high schools.[1]

But though no great progress had been made in the teaching of drawing in the thirty years referred to, the subject was kept before the people, and the way was prepared for action when opportunity should offer.

REMBRANDT PEALE IN PHILADELPHIA.

In 1840 Rembrandt Peale, the painter, being convinced that drawing could and should be taught in public schools of every grade, offered his services, at a merely nominal salary, to the Philadelphia High School as professor of graphics. His purpose was to verify his theory by actual experiment. The experiment was entirely successful. He then offered to introduce his system into the lower schools if the directors would allow him. This proposal stirred up much opposition. To teach children, children of the poor, to draw was an unheard of and dangerous innovation. Drawing was an accomplishment, not a necessity; a luxury to be enjoyed by those only who were willing and able to pay for it. In the common schools it would be a waste of time. So argued the "conservatives." The "progressists" had a majority of votes, but the minority were so persistent and so virulent in their opposition that the scheme was dropped, and Peale resigned his position in the high school shortly afterwards. "Could Mr. Peale's ideas have been realized," wrote Prof. John S Hart to Hon. John Eaton, United States Commissioner of Education, "in a great mechanical and manufacturing city like Philadelphia, I have no doubt it would have added millions annually to the productiveness of its artisans. Thirty years ago I expressed the belief, and I am willing still to abide by the record, that such a system as Mr. Peale's, fully and fairly carried out, would have been worth to the city pecuniarily more than the entire cost of her system of public schools."

WILLIAM MINIFIE IN BALTIMORE.

In 1848 and 1849 there was in the Boys' High School of Baltimore a teacher of drawing, Mr. William Minifie, who taught the subject as a science and not as picture making. Based on geometry, his progressive studies proceeded systematically, and the progress made by his pupils was most striking. After teaching in the high school for one or two years this teacher was dismissed, because, forsooth, some member of the committee, who was utterly ignorant of any form of art, had some favorite, equally guiltless of any ability to teach industrial drawing, whom he wished employed; rational drawing was relegated to the limbo of forgotten things, picture making was encouraged, and the school children of Baltimore for the next twenty years were deprived of the very opportunity England had taken such pains to furnish, and which, twenty years later, Massachussetts made such commendable efforts to procure.[2]

Post hoc et propter hoc. In his elaborate report on the school drawing exhibits in the Centennial Exhibition at Philadelphia, Mr. Charles B. Stetson writes:

The specimens of drawings done by the boys in Baltimore City College [formerly high school] which are here exhibited consist almost wholly of reproductions from flat copies in light and shade. There are landscapes, trees, rocks, dilapidated houses, fences, bridges, carts, etc. The boys who are compelled to do such work are truly to be pitied. There is nothing to indicate the course of instruction, if really there is anything of the sort.

---

[1] Art and Industry. Edueation in the Industrial and Fine Arts in the United States, by Isaac Edwards Clarke, A. M., Part I. Drawing in Public Sehools. Washington, Government Printing Offiee, 1885. A most interesting and valuable work, to whieh the present writer is indebted for a great part of the eontents of this chapter.

[2] Art and Industry, p. 30.

The following history of the Normal Art School is taken from the fifty-third report of the Massachusetts board of education, with some abridgment and many omissions:

A petition was presented to the legislature of 1869, asking that the board of education be requested to report a definite plan for providing instruction in drawing in all towns of the Commonwealth having more than 5,000 inhabitants. * * * In response, the legislature passed a resolve, which was approved June 12, 1869, instructing the board of education to consider the expediency of making provision for giving free instruction to men, women, and children in mechanical drawing in all towns having 5,000 inhabitants or more and to report a definite plan therefor to the next legislature.

The board, through a committee of three of its members, recommended the passage of a law "which shall require elementary and free-hand drawing to be taught in all the public schools of every grade, and which shall further require all cities and towns of ——— inhabitants to make provisions for giving annually free instruction in industrial or mechanical drawing to men, women, and children in such manner as the board shall prescribe." * * *

By an act of the legislature approved May 16, 1870, drawing was included among the branches of learning required to be taught in the public schools. Provision was likewise made for giving free instruction in industrial or mechanical drawing to persons over 15 years of age, all to be under the direction of the school committee. The above act was to take effect upon its passage. To ingraft upon the educational system of the State this branch of instruction created a demand for special training in the art of drawing; but from what source were the instructors to come? Clearly an institution for training the teachers must be established, or no satisfactory results would follow.

In the autumn of 1871 the board employed Mr. Walter Smith, recently from the Art School, Leeds, England, to be State director of art education. * * * Convinced of the necessity of providing some means for the training of teachers in the new branch of study, Mr. Smith advised the establishment of a school for that purpose. The board, acting upon Mr. Smith's recommendations, at once appealed to the legislature for the means to establish a normal art school. The first appeal was not successful. The means were finally provided, and on November 11, 1873, the school was located in rooms in the third story of a private dwelling then in possession of the State, in Pemberton square, Boston. * * *

These were wholly inadequate to the demands, being originally prepared for 36 students, while the school at first numbered 107 and in a short time contained twice that number. The legislature of 1875 authorized the sergeant-at-arms to assign to the school other rooms in another dwelling in Pemberton square. From this location in the fall of 1875 it was removed to rooms, 10 in number, in School street block, opposite the city hall. Here it remained for a term of five years, when it was again removed to better-fitted and more ample rooms in the Deacon House on Washington street. Its last remove was in 1878, to a building constructed for its special use on the corner of Dartmouth and Exeter streets. The Normal Art School building was constructed at an expense of about $85,000. It is favorably located. Though unadorned, it is artistic in design and finish. It is abundantly provided with the necessary appliances for art teaching, and is in every respect a model of convenience for the purposes it was built to serve. * * *

The number of students kept pace with the constantly increasing means of accommodation, and was always in advance of these until the art building was erected. The present number is 220. The number that have received certificates and diplomas is 498; the number that have graduated from the full course is 71. * * *

RESULTS OF THE ESTABLISHMENT OF THE SCHOOL.

The law of 1870, which required drawing to be taught in schools of all grades throughout the Commonwealth, went into operation in the absence of every direct means for its enforcement. There were but few teachers of drawing in the State; there was no published scheme for instruction in drawing which was adapted to the several grades of schools; there was no popular public sentiment among the people which demanded its introduction into the list of branches required to be taught.

The Normal Art School has, during the seventeen years of its existence, prepared teachers of practical skill in the art of drawing, for the evening schools now kept in all the cities and large towns of the State. It provided a large number of art directors and teachers of drawing for public and private schools, for the normal and technical schools, and for the collegiate institutions, and they are filling important positions in all parts of the country. * * *

Perhaps the most important result produced by the school is seen in its influence on the general culture of the pupils in all schools where drawing is taught. It trains them to observe with accuracy and intelligence. Its exercises cultivate the imagination and the judgment; they increase the power of invention, and produce an evident effect in purifying the heart and refining the taste.

When the Normal Art School began its work the highest idea of drawing in most schools which gave the subject any attention was picture making, with little else besides copying from books. At present the scheme for teaching this branch begins with molding the elementary forms in clay and extends through all grades of exercises to the highest forms of the art. The present scheme is the elaborated product of much careful study and varied experience by numerous patient observers and workers; and, while it incorporates much that is of foreign birth, it avoids the mistakes of other countries and furnishes a system of instruction well adapted to our own. * * *

The indirect result is what was anticipated by some of its early advocates and what was inevitable: it is creating a taste among the people for art in designs foreign to our hitherto unfamiliar eyes, and at the same time is training designers and artists for manufacturing establishments which but a few years since were wholly dependent upon aliens, or upon the product of their taste and skill brought from other markets.

PROF. WALTER SMITH.

The spread of elementary drawing throughout the public schools, not only of Massachusetts, but of the United States, is largely due to the experience, skill, and untiring energy of the first principal of the Boston Normal Art School and State art director, Prof. Walter Smith. The principles he advocated and the methods he pursued, exhibited in his Boston work and diffused and popularized by his lectures at teachers' institutes at home and addresses at educational conferences throughout the country, were as good seed sown on good ground and brought forth fruit, "some thirty, some sixty, and some an hundred fold." Disciples followed in crowds and in their turn became apostles of the new art education. A man of such energy, of an aggressive spirit, of great self-confidence, of such firm belief in his own doctrines, his own plans, his own methods, could not fail to stir up opposition. The assailants in normal-school contests have two methods of attack. They may attack the system itself or they may attack the head of the system. When the attack is made on both sides at once, it needs no prophet to foretell the result; the man is sure to fall, as in Walter Smith's case—a very small, almost insignificant, minority in the legislature, aided by the governor (Benjamin F. Butler), making an attack on the system, while a powerful combination outside the legislature made war upon the man. The board of visitors formed a sort of aulic council around the art school, and their orders, though given with the best intentions, proved very embarrassing to the commander in chief.

No doubt mistakes were made on both sides; but when two undertake to ride a horse one must ride behind, and the obstinate Englishman refused the back seat. Taking all the circumstances into account, an unconciliating chairman, an unconciliatory principal, a number of very sensitive teachers, a publishing house acting on strictly business principles, it is rather to be wondered at that the fiat had not gone forth sooner, "Delenda est Carthago." And so Walter Smith returned to his native land, not without due recognition of his splendid talents on both sides of the Atlantic.

In their first report after the retirement of Professor Smith the committee on drawing say:

That we are able to carry on drawing so successfully as we do under existing circumstances is due to the past, which gave us a sound system of instruction, trained many teachers in the practice of free-hand and model drawing, taught the principles of design, substituted true for false models as objects of study, and both perfected and equipped the free evening drawing schools, which deservedly rank among the most useful institutions of the city.

Referring to the appointment of Mr. Walter Smith in 1883 as head master of the art department of the Technical College at Bradford, England, the Right Hon. A. J.

Mundella in a public address "congratulated the Technical College on having Mr. Walter Smith as an art master." "There were few art masters," he said, "who had the experience and who possess so completely the successful art of teaching as Mr. Walter Smith and who knew how to apply art to industry."[1]

COURSE OF STUDIES.

The school offers two courses of study—a four-years' course, which gives training in the scientific and artistic branches and in their application to industries, and a two-years' course, which trains for the work of teaching and supervising drawing in the public schools. There are four classes—A, B, C, and D. On the completion of the work of Classes A and C students receive a diploma certifying that they are qualified to teach mechanical and architectural drawing. On the completion of the work of Classes A, B, and D they receive a diploma certifying to their qualifications to teach industrial art.

Applicants for admission to Class A must pass examinations in the following subjects:

1. Model drawing (outline).
2. Model drawing (shaded).
3. Historic ornament (outline from cast).

Upon entering Class A choice is given to each pupil of beginning (*a*) a course of study that will fit him especially for teaching and supervising drawing in the public schools, or (*b*) one that will prepare him to teach the broad subject of industrial art. Those desiring to enter on the former course (*a*) are required to pass an entrance examination (in addition to the subjects mentioned above) on the following subjects: (1) English grammar and composition; (2) history of the United States; (3) geography; (4) plane geometry; (5) elementary botany; (6) elementary physiology.[2]

CONNECTICUT.

Early Legislation.

The law establishing the first State normal school of Connecticut was passed in 1849. It states explicitly that the object of this school "shall be not to educate teachers in the studies now required by law, but to receive such as are found competent in these studies and train them in the best methods of teaching and conducting common schools." It provides that the number of pupils shall not exceed 220, that applicants shall sign a written declaration that their object in seeking admission to the school is to qualify themselves for the employment of common-school teachers, and that it is their intention to engage in that employment in the State; and that to all pupils legally admitted "the tuition and all the privileges of the school shall be gratuitous." For the support of this school there was appropriated "the bonus derived from the 'State bank,' and the interest which may accrue thereon, from which the sum of twenty-five hundred dollars annually, for the term of four years, shall be paid to said trustees with said interest, no part of which sum shall be expended in any building or fixture for said school." At the same session the principal of the normal school was made ex officio superintendent of common schools. Slight changes were introduced into the original law in 1866, 1872, 1883, and in 1889. The most important changes were (1) the maintenance of two normal schools, one of them east of the Connecticut River; (2) the appropriation of $40,000 a year for their support; (3) the regulation of the number of students to be admitted is left to the State board of education; (4) authority is given to the State board of education to establish and maintain model schools under permanent teachers, approved by the board, in which pupils of the normal schools shall have an opportunity to practice modes of instruction and discipline.

New Britain.

The school was opened at New Britain in 1850 with encouraging prospects. During the first year the number of pupils enrolled was 154; it rose, in 1855, to 359, and

[1] Art and Industry, Part I, Drawing in Public Schools, p. 62.

[2] Circular of the Massachusetts Normal Art School, 1890–91.

then gradually decreased till, in 1864–65, it fell to 138. For the next four years the school was suspended (1865 to 1869), from causes which the editor has not been able to ascertain definitely, and at which he prefers not to guess, though he visited the school in its dying moments. But in 1869 it was reopened with 132 students, and the numbers continued to increase till 1874, when it was again closed for a year. In 1875 it was again resumed and the progress, judging from numbers, from that to the date of the last catalogue was steady and nearly uniform. This catalogue contains the names of 401 students.

The building now occupied by this school was erected in 1882, and by successive alterations and additions has become almost a model. Besides the usual assembly room, schoolrooms, recitation rooms, lecture rooms, library, etc., it has two laboratories, a cabinet, a manual training room, a cooking room, a lunch room, a room for drawing and modeling, a gymnasium, and two kindergarten rooms.

The grouping of studies under several teachers is in some instances "very peculiar." For example, Miss A has drawing and literature; Miss B, arithmetic and geography; Miss C, drawing and language; Miss D, singing and arithmetic; Miss E, kindergarten and sloid; Miss F, mathematics and English. The purpose is probably to prevent a teacher from running in one rut by giving her two ruts to run in. The gentlemen teachers, it should be noticed, are provided with but a single wheel, with one exception, and he has a bicycle, "principles of teaching" and "writing." It must be acknowledged that certain unquestionable advantages may be obtained from this system of "union of opposites," especially when, as appears to be the case in the present instance, it is the result of design and not of accident or necessity.

A characteristic feature of the Connecticut normal school is seen in the

Training Department and Model Schools.

The State board of education has under its supervision and full control three model schools—one at New Britain, with 404 pupils and 11 permanent teachers; one at Bristol, with 252 pupils, and one at South Manchester, with 635 pupils.

The professional training course at New Britain will be understood from the following outline:

The *first year* gives a review of common-school subjects, with the special object of making the students familiar with the best methods of teaching children.

The *second year* is devoted to observations, methods of teaching, trial lessons, assisting in model schools, psychology and general principles, and independent teaching under supervision.

Observation.—At the beginning of the second year those students who have reached the required standard of scholarship in all subjects, and who are thought to be sufficiently mature, begin to work in the model schools. They visit the classes daily and describe the lessons they observe.

Methods.—The teachers of the model schools sum up for the training class the essentials of each subject to be taught to children and teach children when members of the class are present.

Trial lessons are required as fast as individuals show a good understanding of the work they observe. Students do not usually give lessons in the presence of all their classmates. Criticism of the teaching is not a public exercise, and each student receives personal suggestions and advice.

Assisting.—After observing in the model schools, students are assigned to the model-school teachers as assistants. They are taught to place work on the blackboard, keep the register, make a programme, and hear classes in all subjects taught in the room.

Psychology and general principles.—From this time on commonly accepted principles are discussed and some instruction is given in physiological psychology.

Independent teaching.—After the completion of the preliminary training described, every student must teach and govern successfully for three months one of the departments in charge of the State board of education, located outside of New Britain, but under the supervision of skilled teachers and closely connected with the parent school.

The members of the senior classes in the normal school observe frequently in the

kindergarten. The kindergartner gives to this class a careful statement of the principles and theory involved and instructs them in the occupations relating to primary work. The first five months are spent in observation and in study of the following special subjects: Biology, botany, physics, chemistry, physiology, free-hand drawing, modeling, coloring, inventional geometry, manual work, gymnastics, singing, literature, and penmanship.

A special diploma is awarded to graduates of the kindergarten training class.[1]

A normal school which is organized with special reference to the requirements of any particular locality can not safely be used as a model for another where the environments are different; yet one who should wish to organize or to reorganize a normal school in any part of this country would do well to study carefully the plans and methods of the school at New Britain. They are fully up to the times, provided always that the actual working corresponds exactly to the printed statement.

Willimantic.

This school was established by an act of the legislature passed in 1889. The sum of $75,000 was appropriated for the construction of a building, but without waiting for its completion the school was opened in September, 1889, in rented rooms. It is the counterpart, in miniature at present, of the school at New Britain. It is under the same superintendence and control and aims at developing the same principles by the same methods.

RHODE ISLAND.

What Horace Mann had been in the educational history of Massachusetts, Henry Barnard was in that of Rhode Island. He was the first State school commissioner, and spent some of the best years of his life in efforts to establish a system of State normal schools in Rhode Island. He visited every portion of the State, delivered lectures, organized teachers' institutes, and began what he called an "Itinerating normal school agency." During his term of office more than 1,100 public meetings were held to discuss subjects connected with the public schools, and at all these meetings one of the most prominent topics was the necessity of a thoroughly organized State normal school.

After one year's incessant and well-directed labor he was sanguine enough to believe that the time had come for carrying his projects respecting the State normal school into execution. His plan was to have two normal schools—one in Providence and the other somewhere in the country. The school in Providence was to supply the missing link between the municipal schools and Brown University. The country school was to be a "training school" with an industrial annex in which pupils might pay part of their expenses by manual labor.

The scheme was too complicated—one might almost say too good—to command popular favor. But the legislature seemed willing to try it, at least in part. In 1845 a bill was passed authorizing the establishment of "one thoroughly organized normal school in the State," but no appropriation was made for carrying the law—if it can be called a law—into effect. The people were simply authorized to spend their own money and declined to spend it.

Now, Brown University came to the rescue. The university created a new chair, a professorship of didactics, and Samuel S. Greene, then superintendent of schools in Providence, was appointed to the position, which he was allowed to hold in connection with the superintendency. In the winter of 1851–52 the first normal classes were taught in the hall of the Providence high school. Next fall the school was opened, in rooms rented for the purpose, with 85 students and 3 assistant teachers. The following term was made noteworthy by a course of lectures on physical geography delivered by the celebrated Professor Guyot.

[1] Catalogue of the Connecticut Normal Training School, New Britain, Conn. Fortieth year, 1891–92.

Donations and tuition fees, however, were totally inadequate to the support of such an institution. Even the $1,000 appropriated by the general assembly in 1854 proved to be but a drop in the bucket, and on the urgent recommendation of Mr. Elisha R. Potter, the school commissioner, who succeeded Dr. Barnard, the general assembly, May, 1854, passed an act establishing a "State normal school" and appropriating $3,000 for its support. The school was opened on the 29th of May with 27 students, under Dana P. Colburn principal; before the end of the session the registered students numbered 88. Within two years a library of 1,200 volumes was accumulated and a beginning made in the collection of apparatus. The "collection" was slim enough—"two movable blackboards, one 6-inch and two 12-inch globes, a valuable collection of outline maps and charts, and a set of anatomical plates." The value lay in the fact that it was a "beginning" and in the right direction.

The genial spring was not followed by the usual bountiful harvest. Unseasonable winds began to blow, and kept on blowing. It was said by some that the towns should give more pecuniary aid, and that the State treasury should be relieved in part of the expense of maintaining the school. All parts of the State were not equally benefited, and yet all parts were equally taxed. The old and not yet exploded fallacy that education is a local more than a general benefit was urged for all and more than it was worth. It has fortified itself and been dislodged in many strongholds—the family, the district, the township, the State. When it is once expelled from the citadel the country will be safe. The citizens of Bristol were willing to receive the ark of the covenant, and thither it was carried; but the blessing did not follow it. About the beginning of the civil war the numbers in attendance fell off to 19—5 young men and 14 young women.

At the close of the spring term in 1865 school adjourned for a vacation of five weeks. It was hoped that the general assembly would send it back to Providence, but the hope was not realized. The operations of the school were suspended until after the meeting of the legislature in May, and in July it was suspended indefinitely. But "blessings brighten as they take their flight." The institution was "not dead, but sleeping," awaiting the voice of the master. School committees were urgent in their demand for its reestablishment. One committee declares that "the need is becoming every year more urgent." Another, that "the best interests of public education can not be promoted without the establishment of a State normal school." Another, that "the importance of establishing a State normal school as a means for the advancement of our common schools needs no argument." Another says, "We hope that a normal school will be established in this State, and that no persons will be employed to teach in our public schools except graduates of that or similar institutions. Much of the time of the children is now thrown away at the commencement of each term by employing teachers, who, while their intellectual culture is all that could be desired, know but little, if anything, of the art of teaching."

Then the master appeared.

Mr. Thomas W. Bicknell received the appointment [of State school commissioner] in May, 1869, and he at once set himself to work to bring about the desired result. He left no stone unturned during the years 1869 and 1870 to inspire and combine the public sentiment in favor of the enterprise. It is true that the ground had already been prepared and the seed had been sown by the labors of his predecessors, and he was able to reap the harvest which had in part been brought on to its growth and maturity by them. But at this particular moment it seemed to need precisely the qualities which Mr. Bicknell possessed and the efforts which he put forth to bring the former labors to their consummation. * * * By public educational lectures in every town in the State; by teachers' institutes, and papers and discussions thereon; by the newspaper press, which opened its columns freely to the commissioner; by the Rhode Island institute of instruction; by the distribution of educational tracts, and by personal interviews with the members of the general assembly, the labors of the commissioner began to bear fruit.[1]

[1] The Dedication of the State Normal School Building, Providence, R. I. Printed by order of the general assembly.

In 1871 a bill was introduced for the establishment of a State normal school, and was passed by a very large majority after a very brief discussion. The people were prepared for it. The board of education and the commissioner were made trustees, and they wisely selected Providence as the location of the school. The school was opened in September, 1871, in a rented building; but in 1877 the legislature made an appropriation of $40,000 for the purchase of a building for the permanent home of the school. The city of Providence being about to erect a new high school building, the old high school estate was purchased for $30,000 and fitted up comfortably for the use of the normal school with the remainder of the appropriation. The school took possession of its new home in December, 1878. From the "Catalogue and circular" of 1890 we learn that the number of students for the scholastic year, including graduates who completed their course in January, was 200. The full course (seven half years) includes 100 lessons in composition and grammar, 300 in arithmetic, 100 in chemistry, 150 in drawing, 100 in the English language, 100 in geography, 100 in physiology and hygiene, 50 in bookkeeping (single entry), 100 in general history, 100 in geometry, 100 in reading, 200 in Latin, 100 in rhetoric, 100 in algebra, 100 in botany, 100 in physics, 100 in English literature, 50 in physical geography, 50 in geology, 50 in psychology, 50 in logic, 50 in ethics, 50 in zoology, 50 in pedagogy, 50 in primary methods, 50 in methods in geography, 50 in methods in grammar, 50 in mineralogy.

NEW HAMPSHIRE.

The history of the normal school campaign in New Hampshire is curious, interesting, and instructive—an early and promising attack, a victory, long in doubt; ignorance and prejudice behind the intrenchments; indifference, perhaps treachery within the lines; a deficient commissariat, skirmishes without results, compromises without advantage, indomitable pluck on one side, invincible obstinacy on the other—triumph at last. "The darkest hour of all the night" proved to be "the hour before the morning." All the battles with ignorance, prejudice, misrepresentations, jealousies, parsimony, which had been fought and won in thirty other States, had to be fought again. And not in vain.

> "For freedom's battle once begun,
> Bequeathed by bleeding sire to son,
> Though baffled oft is ever won."

Now peace, with wings outspread, hovers over the beautiful normal buildings at Plymouth; and for a peace offering thousands of dollars can be had almost without asking where hundreds were once sulkily refused.

The story of the State Normal School of New Hampshire can best be given in the words of the present principal of the school, Dr. Charles C. Rounds, in an address which he delivered on the dedication of the new building. The present editor regrets that want of space compels him to omit many paragraphs from this interesting paper. After a brief sketch of the development of normal schools in the State of Massachusetts, Dr. Rounds says:

In 1823 there was established at Franklin, N. H., by the munificence of Mr. Joseph Noyes, a school called the Instructors' School. Its principal for many years was Capt. Benjamin M. Tyler, a graduate of Captain Partridge's Military School at Norwich, Vt. In regard to normal methods of teaching Captain Tyler was far in advance of his time, and in spring and fall terms for years he formed and taught a teachers' class in the principles of the various branches of study and in methods of

teaching and school management. It has been claimed that more than sixty years ago there could be found at Franklin a superior normal school.

At a public dinner in Boston a few years since I heard Hon. J. W. Bradbury, of Maine, a colleague of Webster and Calhoun in the United States Senate, tell the story of the next normal school in New Hampshire. In 1829, having finished his course of legal study, he had three months to wait before admission to the bar. He had noted, as many were noting at that time, the miserable condition of the common schools and the mental poverty of the teachers therein. Instead of taking a vacation he came across the line from his home, in Parsonsfield, Me., to Effingham, and organized for a three-months' term a school for the preparation of teachers.

The next attempt in our State to give teachers special preparation for their work was made here in Plymouth by Samuel Read Hall, who had been connected with the school in Concord, Vt., in 1823, and with Phillips Academy in 1829. In 1837, while teaching in Phillips Academy, he was asked to become preceptor of Holmes Academy in Plymouth. He accepted, on condition that it should be called a teachers' seminary and should have a department specially for the training of teachers. These conditions were accepted, and for two years (1837–1839) the teachers' seminary at Plymouth continued, and then was closed in consequence of the failure of an expected endowment.

I hold in my hand the first catalogue of this teachers' seminary. The course of study and the classification of the school show the honesty of the man and the character of this, as a normal school, much truer to the name than many pretentious institutions which followed long after its time. Although it had a classical department, the teachers' department evidently lay nearest the heart of Mr. Hall.

Though this school antedated by two years the establishment of the normal school at Lexington, Mass., after its closing for many years no other similar attempt was made. Normal schools were established in other States in numbers increasing by a constantly accelerating ratio, but here the reliance seems to have been upon academies, and these doubtless did what they could. But under such auspices popular education could not advance, and after trying all other agencies the conviction became stronger and stronger that again a special effort must be made. In 1870 the act was passed for the establishment of a normal school. * * *

There is not time now to give the history of the efforts which culminated in the passage of the normal-school law, nor of the contests which resulted in locating the school in the buildings of the Holmes Academy, at Plymouth. It was finally here established, and for several years sustained by the tuitions paid by pupils, and by the generosity of the town, of private individuals, and of the Boston, Concord and Montreal Railroad. Here I quote from the principal's report to the trustees in 1887: "Thirty-two years after the first normal school in Massachusetts had been established, with two years in its course of study, and years after Maine, Connecticut, and Rhode Island had established normal schools on the same basis, the State Normal School of New Hampshire was established, with the legal provision that said normal school shall be established and maintained without expense to the State, except the necessary expenses of the trustees, which shall not exceed the sum of $300; that the school should be in session at least twenty weeks each year, and that pupils could graduate from one of the courses at the end of one school year. Large numbers actually went out from the school with diplomas at the end of a course of only twenty weeks. Yet the school, sustained by tuitions and voluntary contributions, opened with a good faculty and 70 students, and in its second year enrolled 184 different pupils. To an urgent request of the trustees for $12,000 for building and $3,000 for a library, the State responded with a total appropriation of $5,000. In the first four years of the school the State gave nothing for current expenses. For the lack of funds the faculty had to be cut down, and at the close of the third year the school suffered the loss of its first principal by death from overwork. During a part of the fourth year the faculty consisted of only two teachers, each teaching from seven to eight hours a day, and one of these broke down before the close of the year. In 1875 the State made its first appropriation for current expenses, and the school was declared a free school, but tuitions were still exacted from those who did not complete the course of the first or the second year until 1886. For four years, without endowment, the school had been sustained by tuitions and contributions. It is safe to say that a State normal school established under such auspices and sustained on such a basis was never before known.

"The report of 1876 speaks of constant improvement in the school, of jealousies which had sprung up against the school as an intruder into the educational field, and of the great harm which had been done to the cause by the graduation of large numbers from the short course of twenty weeks—a course of study only one-quarter the length of the shortest courses of other New England normal schools. Of the 175 graduating up to this time 158 had graduated from the twenty-weeks' course. In

1878 the jealousies and opposition referred to in earlier reports resulted in reducing the annual appropriation for the school to $3,000. The numbers in the school had been greatly reduced; the outlook was most discouraging. Yet, instead of trying to increase the numbers by merely popularizing the school, it was made more severely professional than ever before. The one-year course was abolished. As might have been expected the numbers did not rapidly increase, but the character of the school as a school for professional training was established beyond all possibility of cavil. The policy continued by cutting down even the modest appropriations asked, or of refusing them altogether, and the complaint continues from year to year of insufficient accommodations and means of instruction. * * *"

In 1885 an appropriation of $2,000 was asked for, but was refused. This was apparently a turning point in the history of the school. Hostilities which hindered its work ceased. Friends in increasing numbers came to its aid. The press gave it a more and more generous support. In 1887 it received from the legislature an appropriation of $12,000 for building, and the annual appropriation for support was raised from $5,000 to $7,000. * * * The legislature of 1889 gave an additional appropriation of $60,000, and you here to-day behold the fair results, a lasting monument to the many friends who worked so faithfully to secure this appropriation, as well as to the memory of the devoted teachers of the earlier days, who, amid discouragements, kept alive in New Hampshire the idea of the normal school and carried it through its phases of development. We have this beautiful schoolhouse, which, for solidity of construction, for convenience, for its provisions for comfort and health, and adaptation to the work for which it is designed, may well challenge comparison with any other. We have a boarding hall so planned and furnished as to offer to our pupils a comfortable, healthful, and elegant home. * * * The normal school begins its twenty-first year under these favorable auspices. Like a traveler who, after long wandering through morass and fog, comes out into the sunshine on solid ground, so we at last find firm support for our feet and see the sunshine on our path.[1]

The course of study does not differ greatly from that of other first-class normal schools limited to a two-years' course, as will be seen by the following programme:

Course of instruction.

[Figures denote number of lessons per week (music and writing, each two lessons counted as one).]

	First year.		Second year.

VERMONT.

State Normal School at Castleton.

The institution now known as the State Normal School at Castleton, Vt., celebrated its centennial in 1887, having changed its name several times during the century. It was established by act of the legislature in 1787 as a county grammar school in and for Rutland County, to be held "at the house commonly known by the name of the new schoolhouse, near Dr. William Woolcott's in Castleton, provided that the county of Rutland shall not be at any cost or charge in completing or repairing the same." Another act of the legislature provided "that it shall be known by the name and

[1] Annual Report of the Superintendent of Public Instruction, being the Forty-fifth Annual Report upon the Public Schools of New Hampshire. Concord, 1891.

style of the Corporation of Rutland Grammar School." In 1805 it was enacted "by the general assembly of the State of Vermont that the name and style of the Rutland County Grammar School be, and the same is hereby, altered to the name and style of the Vermont Classical High School." This act was repealed in 1830. In 1866 an act was passed authorizing the establishment of one normal school in each of the three Congressional districts of the State with two courses of study; graduates of the short course to receive certificates for five years, the others for fifteen.

In 1867 the legislature granted an annual appropriation of $500 to each of these normal schools for the purpose of assisting indigent young men and women "inhabitants of this State who may desire to more perfectly qualify themselves for the office of teaching by attending the normal schools within this State." Persons so aided were required to teach at least two years subsequent to their graduation.

This sum was increased in 1870 to $1,000, and in 1882 an additional $500 a year was appropriated to each of these three schools. In 1888 the legislature extended their charters until the year 1900.

The first session of the normal school at Castleton was opened on the 2d of January, 1868.

In 1878 the legislature, fearing that the normal schools might attempt to fly too high, passed the following enactments to clip their wings:

No. 113. SEC. 2. No more than two courses of study shall be allowed in the normal schools of this State. No studies or subjects not included in the course of study established for them shall be taught in the normal schools of the State, nor in any school or department established and controlled by the trustees or by the teachers of any normal school in the State.

SEC. 3. The two courses of study for the normal schools may include such branches of learning as have been set, or shall be set, in them, by the trustees of any normal school acting in concurrence with the State superintendent of education; but *no foreign language, ancient or modern, shall be a subject of instruction in any normal school.*

Yet the course of study in the Vermont normal schools is by no means narrow, judging from the list of text-books used.

First course: Hill's Geometry for Beginners, The Franklin Algebra, Greenleaf's Complete Arithmetic, Prang's Drawing Books, Maury's Physical Geography, Walker's Physiology, Wood's Object Lessons in Botany, Eggleston's History of the United States, Macy's Our Government, True's Our Republic, Conant's Vermont, Whitney's Essentials of English Grammar, Conant's Drill Book in English, Scott's Lady of the Lake, American Poems, American Prose, Principles of Education Practically Applied, Gill's Systems of Education, Putnam's Psychology, Payne's Lectures on the Science and Art of Teaching, De Garmo's Essentials of Method.

Second course: Wentworth's Algebra and Geometry, Sharpless and Phillips's Natural Philosophy, Young's Astronomy, Kellogg's Rhetoric, Swinton's Outlines of the World's History, Arnold's English Literature, Lockwood's Lessons in English, Painter's History of Education, Thomson's Seasons, Bacon's Essays, Janet's Elements of Morals.

The number of students in attendance during the school year ending July, 1890, was 230. The number of graduates since 1868: First course, 350; second course, 85.[1]

State Normal School at Randolph.

The Randolph Academy, or Orange County grammar school, was established in 1806 in a building now occupied as a dwellinghouse. Its last principal was Edward Conant, "the father of the Vermont normal schools," by whose aid chiefly the academy was changed in 1866 to a training school for teachers—one of the three for which the legislature made an appropriation in 1867, as has been already mentioned.

Normal schools naturally divide themselves into three groups: Those whose work is chiefly academic, and whose aim is to secure scholarship in the subjects taught; those of the character of city training schools, which strive to give their students a large amount of practical teaching after certain prescribed methods; and those which seek to give their graduates a scientific basis of practical pedagogy. The Randolph school claims to belong to the last class.

From February, 1867, to June, 1890, the whole number of students admitted was 1,877. Of these 819 graduated in the first course, and 122 in the second course.[1]

State Normal School at Johnson.

This school was started as an academy about the year 1828 with 16 scholars, in a room which had formerly been a shoe shop. In 1836 the school was incorporated by act of legislature as the Lamville County grammar school, and public lands were granted toward its support. In 1866 the school surrendered its original charter and was recognized as a State normal school. The old academy building was at this time rebuilt, greatly enlarged, and fitted up nearly as it stands now. The last principal of the academy, S. H. Pearl, was the first principal of the normal school. In 1884 the village primary school was placed under the care of the principal of the normal school as a model and training school, in which normal students should have the opportunity of doing practical work under the direction of experienced teachers.[2]

The number of students June, 1890, was 136.

MAINE.

First Normal School at Farmington.

The teachers of Franklin County, Me., at their annual convention in 1857 passed a resolution "That the interests of our common schools and the teachers having them in charge not only require the fostering care of the State, but most imperatively demand the immediate establishment of that long-neglected source of improvement, a State normal school." This was no uncertain sound, although it was but the echo of the

[1] The Normal Register; a History of the First Vermont State Normal School. Montpelier, Vt., 1885.
[2] History and alumni record of the State normal school, Johnson, Vt., 1887. Catalogue, June, 1890.

demand made ten years before by William G. Crosby, the secretary of the first board of education of Maine. For thirteen years longer the voice was heard as of one crying in the wilderness, till at last, in 1860, the legislature was stirred up to activity. The first experiment was an endeavor to establish normal departments in 18 academies of the State. Of course, the attempt was a failure. The law was repealed in 1862, and an act for the establishment of normal schools was passed in 1863. A commission of three persons, appointed by the governor and council, was to locate two normal schools, one in the eastern and one in the western part of the State: "Provided, that the citizens of such places will furnish, without expense to the State, suitable buildings for the instruction of 200 pupils for the term of at least five years; and provided, that such locations be not within the limits of any incorporated city." To sustain these schools for five years, four half townships of the public lands were appropriated, to be sold in whole or in part, as should be deemed best by the governor and council. The commission decided to locate one of these schools at Hampden, the other at Farmington, but two years afterwards Castine was selected in place of Hampden. The trustees of Farmington Academy offered a cash donation of $4,000, together with the academy building, which they proposed to enlarge so as to accommodate 200 students. The school began in August, 1864, in a temporary hall, for the new building was not as yet completed. Thirty-one students were present at the opening, and during the year 130 students were entered, a number larger than in any subsequent year.[1]

School at Castine.

From the circular of the State Normal School at Castine, Me., for 1890, we learn that the object and work of the normal school are plainly stated in the act establishing these schools in that State:

They shall be thoroughly devoted to the training of teachers for their professional labors. The course of study shall include the common English branches, in thorough reviews, and such higher branches as are especially adapted to prepare teachers to conduct the mental, moral, and physical education of their pupils. The art of school management, including the best methods of instruction and government, shall have a prominent place in the daily exercises of said schools. While teaching the fundamental truths of Christianity and the great principles of morality recognized by statute, they shall be free from all denominational teachings and open to persons of different religious connections on terms of perfect equality.

This school has been in operation twenty-three years and has had over 2,000 different pupils connected with it since its organization.

A model primary school is in operation in one of the rooms of the normal building, which has been fitted with primary furniture for that purpose. This school is under the control of the principal of the normal school and is taught by a teacher specially selected for that work. It has four grades, and is free to all children of these grades, as far as its capacity extends. The pupil-teachers are here furnished with a model which will help them to form an ideal of what a primary school ought to be. This enables them to have a standard of excellence in mind when they go out to teach, which it will be safe for them to strive to attain.

The following is the outline of work actually done in the model school in the different grades:

---

[1]History of the State Normal School, Farmington, Me., by George C. Purington, A. M., Farmington, Me., 1889.

MODEL SCHOOL AT CASTINE.

FIRST YEAR.—*Reading.*—Word, sentence, and phonic methods from charts. The lesson is first taught from the blackboard in script. *Spelling.*—By sound and letter. *Number.*—The Grube method, modified, as far as 10. Counting and writing numbers. Fraction $\frac{1}{2}$. Simple practical examples. *Geography.*—Position. Divisions of land and water, with molding board. *Language.*—Story-telling by the children; use of words in sentences, and careful correction of bad forms of speech. *Drawing.*—Lines and angles, and simple figures. *Writing.*—On blackboard and slates. *Object lessons.*—Form, color, human body, animals, plants, etc.

SECOND YEAR.—*Reading.*—First and Second Readers. Sight reading. *Spelling.*—From reading lessons. *Number.*—Modified Grube system to 20. Continue counting and writing numbers and practical examples. Exercises with fractions $\frac{1}{2}$, $\frac{1}{3}$, $\frac{1}{4}$. *Geography.*—Map of schoolroom. Oral lessons on continents, with maps and molding board. *Language.*—Continue work of first year. Writing simple sentences. Use of capitals and periods. *Drawing.*—Simple geometrical figures and original designs. *Writing.*—With ink in tracing books. *Object lessons.*—Continue work of first year.

THIRD YEAR.—*Reading.*—Third Readers. Sight reading. *Spelling.*—From spelling book. *Number.*—Multiplication and division tables. Continue practical examples. Work in fundamental rules. Fractions $\frac{1}{5}$, $\frac{1}{6}$, $\frac{1}{7}$, $\frac{1}{8}$, $\frac{1}{9}$, $\frac{1}{10}$. *Geography.*—"Our World No. 1." *Language.*—"Elementary Lessons in English." *Drawing.*—Continue second year's work. *Writing.*—With ink in copy books. *Object lessons.*—Continue second year's work.

FOURTH YEAR.—*Reading.*—Fourth Readers. *Spelling.*—From spelling book. *Number.*—Continue work of third year. Work in common fractions, United States money, decimal fractions, and factoring. *Geography.*—Elementary text-book. *Language.*—"Elementary Lessons in English." *Drawing.*—Original designs and simple object drawing. *Writing.*—With ink in copy books. *Object lessons.*—Continue work of third year. The object lessons are graded so that attention is called to name, parts, form, size; then to qualities and uses; then to relations, so that though the object may be the same in different grades, the lessons taught become more and more difficult.

Normal school—Course of study.

II.

NORMAL SCHOOLS IN NEW YORK, PENNSYLVANIA, NEW JERSEY, AND MARYLAND.

NEW YORK.

Early History.

In 1825 De Witt Clinton, governor of New York, in his annual message, speaking of the common school system, says: "In furtherance of this invaluable system I recommend to your consideration the education of competent teachers." This recommendation is repeated in his message of 1826: "I therefore recommend a seminary for the education of teachers in the useful branches of knowledge." The phrase "the education of teachers in the useful branches of knowledge" indicates that the governor had but a vague notion of the proper function of a "teachers' seminary;" and it is not to be wondered at that for many years after his death the people of New York struggled long and fruitlessly to make normal instruction an annex of the academy system. In his last message, 1828, the governor lamented that no law had been passed to elevate the talents and qualifications of teachers.

In 1830 a committee of the citizens of Rochester petitioned the legislature to establish a State seminary for the education of teachers.

In 1833 Governor Marcy said in his message to the legislature: "One of the most obvious improvements in relation to common schools would be a plan for supplying them with competent teachers." There is no good reason to suppose that the "competency" thus desired extended further than a knowledge of the subjects taught in the common schools.

In 1835 John A. Dix, chairman of a committee of the board of regents, recommended the establishment of teachers' classes in the academies.

In 1839 Governor W. H. Seward recommended that "Normal-school instruction be ingrafted on our public school system." In the same year John C. Spencer, secretary of state and ex officio State superintendent of schools, secured the passage of a law creating a board of visitors of schools. The chairman of the board was the Rev. Dr. (afterwards Bishop) Alonzo Potter, and with him was associated Francis Dwight, who afterwards became superintendent of schools for the city and county of Albany and secretary of the executive committee of the board of regents.

In 1842 a convention of county superintendents was held in Utica, at which the Rev. Dr. Alonzo Potter, Horace Mann, and George B. Emerson advocated the establishment of a normal school; to which project the superintendents promised their support. In 1843 a similar convention was held, and again the county superintendents reported in favor of a normal school. In the same year Calvin H. Hulberd, as chairman of the assembly committee on colleges, academies, and common schools, made an eloquent and elaborate report, accompanied by a bill to establish a normal school for the period of five years. The bill was passed May 7, 1844. The law provided that the sum of $10,000 shall be "annually paid to the superintendent of common schools, from the revenue of the literature fund, for the maintenance and support of * * * a normal school for the instruction and practice of teachers of common schools in the science of education and in the art of teaching, to be located in the county of Albany." The "normal-school idea" had grown since the time of De Witt Clinton, who so ably advocated the establishment of a seminary "for the education of teachers in the useful branches of knowledge." The law also placed the school "under the supervision, management, and government of the superintendent of common schools and the regents of the university," but practically the school was governed by an executive committee of five persons appointed by the

regents, of whom the law required that the State superintendent of common schools should be one.

The school was first located in the depot building of the Hudson and Mohawk Railroad Company, the rent of which, $500 a year, was paid by the city of Albany; afterwards, 1849, in a house built by the State, at the cost of $25,000, on a lot presented by the city in the rear of the old State Hall. The lot was not a very desirable one, and the building corresponded to the lot, though at the time it was regarded as "large and commodious."

The first principal was the now long lamented David P. Page, of whom nothing further need here be said, for he "being dead yet speaketh." [1] One of the first "regulations" prescribed by the executive committee, doubtless at the instance of Mr. Page, deserves more than a passing notice: "The internal regulations of the school shall be left to take their form and character from the circumstances as they arise, and as the teachers may hereafter suggest."

Normal Departments in Academies.

For several years before and after the organization of the Albany school there had been maintained in several academies in the State of New York a department for the instruction of common-school teachers. These departments were of two classes: One was established by the regents of the university by virtue of chapter 140 of the Laws of 1834, for the support of which the regents appropriated annually to each academy $400—a sum supposed to be equal to the expense of maintaining the department; the other class consisted of those academies to which a share of the revenue of the literature fund, equal to $700 a year, was distributed for their ordinary support, and which were required by the regents, pursuant to chapter 237 of the Laws of 1838, to establish and maintain departments for the instruction of common-school teachers. There were in 1840 eight academies in the first class and seven in the second. The number of students entered in these departments was, in 1835, 138; and in the following years successively, 218, 284, 374, 498; and in 1840, 668. The State superintendent, John C. Spencer, in his report for 1840 says he is "convinced that there has been a decided improvement in these departments. The standard of instruction in their vicinity has been raised. The desire for competent instructors has increased; their wages have advanced; the demand for them has augmented, and a general influence in favor of primary education of the most salutary character has been diffused." He thought these departments should be sustained and encouraged, and the means of establishing a larger number in other academies should be provided. Where there were no academies he would have normal schools established—the neighborhoods furnishing the grounds and buildings and the State paying the teachers.

These normal departments do not seem to have been either popular or efficient, notwithstanding the indorsement of Mr. Spencer. An academy in King's County reports: "No students are at present (1840) connected with this [the normal]

[1] "David P. Page, though he labored but four years, filled those four years with such a conseerated purpose and professional skill that he left an impress upon the normal sehools of this eountry that will live for centuries. This school, more than any other in the country, became a center of normal influenee, whieh has pervaded every part of the United States; and I believe that if the true history of the establishment of normal sehools in this country could be written, it would be seen that the infiuenee of the school at Albany during its first four years has had more to do, direetly and indirectly, with the organization and methods of instruction of other similar institutions than all other sehools eombined; and this I believe to be due to the rare genius and inspirational power of David P. Page, the ablest normal-sehool prineipal that this country has produeed—a man whose consecrated spirit, high moral endowments, magnetie presenee and manners, rare genius for organization and management, intuitive knowledge of human motive and eharacter, and strength of personal influenee, make him stand out peerless and alone among the many excellent and eminent men who have adorned similar positions in our country." (Dr. Edward Brooks, superintendent of schools in Philadelphia, in "Proceedings of the National Educational Association, 1876.")

department, nor have any applied for admission since its organization." A seminary in Dutchess County reports that "but few students, compared with the usual number in the school, have applied for admission to the teachers' department." The Troy Female Seminary reports: "No students have been instructed in this institution for the express purpose of teaching in common schools." The Albany Female Academy reports that "no separate department has been established exclusively for the education of common-school teachers." The Ithaca Academy established a department for the education of teachers, but no students presented themselves for instruction in that department.

On the other hand, the St. Lawrence Academy reports: "The establishment of this department has exerted a powerful and salutary influence on the character and supply of teachers of district schools." And in the Genesee Wesleyan Seminary there were 184 students in the teachers' department.

Prof. Alonzo Potter, having visited officially a number of these academies, made an elaborate and instructive report on their condition, in which, after giving them due credit as aids in the education of teachers, he says: "The principal evil connected with our present means of training teachers is that they contribute to supply instructors for select rather than common schools; and that, for want of special exercises, they perform even that work imperfectly." Yet the academic idea is not yet extinct in New York, and in many so-called "State normal schools," both there and elsewhere, "the trail of the serpent" may be distinctly traced.

From the annual school report of Superintendent Young we learn that in the year 1842 there were 681 students under instruction in teachers' departments in the academies of New York. He says: "These departments have doubtless given increased character and efficiency to the business of instruction, but it must be admitted that most of them have practically failed in the accomplishment of the great object for which they were instituted—the special qualification of teachers for the common schools." The great cause of this failure seemed to him to be that "the bounty of the State is diffused over too great a surface, the small sum of $4,800 being divided equally among sixteen separate institutions." Accordingly he advocates the establishment of a State normal school at Albany. "Normal schools," he says, "will not be an innovation. They have, on a limited scale, been in operation for some years in the city of New York, and a similar institution was recently organized at Kingsboro in Fulton County."

Pioneer School at Kingsboro.

It is refreshing to compare the simple exercises of this pioneer school with the three and four story programmes of some normal schools of the present day.

The school opens at 9 o'clock a. m. by reading the Scriptures and prayer. A general exercise follows on arithmetic, consisting of lectures and demonstrations from the blackboard by the principal and students in turn. Lectures are given on notation, numeration, addition, subtraction, multiplication, division, the denominate numbers, reduction, and fractions; and a course of lectures has been given by the principal on ratio and proportion, with a practical application to the rule of three, direct, inverse, and compound. In addition to this exercise in arithmetic, the whole school is divided into four classes, each class spending one-half hour per day in the solution of problems on the blackboard and in reading, the teacher telling them how to solve them and the reason of the operation. Particular attention is given to the principles of arithmetic and their practical application to the business of life. There are two classes in algebra and two in natural philosophy. Algebra has had a tendency to withdraw the attention of the students from the elementary branches, consequently less attention will be given to this branch during the remainder of the term. The whole school is exercised in linear drawing, including most of the figures in geometry. Considerable attention has been given to penmanship, but not as much as its importance deserves. An accomplished writing master has been engaged to teach this art, which will claim special attention during the term. The students are required to recite regular lessons in geography, taking their regular turn in hearing the recitations. Then follows a general exercise of the whole school called classifying, or, in

other words, repeating in concert the names of the different States and kingdoms of the world, with their capitals, the oceans, bays, seas, gulfs, lakes, rivers, etc. This exercise is very interesting and profitable, as students will gain a knowledge of the names and situations of places much sooner in this way than any other with which I am acquainted. This exercise is followed by a lecture on the globe. In English grammar the females constitute one class, the males another, and about three-quarters of an hour every day has been occupied by each class in parsing, correcting false syntax, etc. Then follows a general exercise of the whole school, consisting of lectures by the students alternately, parsing difficult sentences, correcting grammatical errors which occur in daily conversation, and with discussions on disputed points in grammar. One composition a week is required of every student, which is corrected by the principal in the presence of the writer.

The whole school exercise daily upon the sounds of the letters and the principles of orthography. Great attention is given to elocution and reading. In addition to a daily exercise in concert by the whole school, including the elementary sounds of the English language, difficult specimens of articulation, and the best and most difficult pieces in our language, five students declaim every day. The exercises are intended to cultivate and improve the voice, train the organs of speech, and improve the articulation, pronunciation, and taste of the pupil. Attention is given to the grammatical and rhetorical pauses, emphasis, quantity and quality of voice, and everything necessary to enable the pupil to read with beauty, force, and variety.[1]

The reader will bear in mind that this schedule is fifty years old.

The establishment of the State Normal School at Albany was not followed immediately by the organization of similar schools in other sections of the State. A long time sometimes intervenes between the planting of a tree and the ripening of the fruit. The lack of enthusiasm in the cause of normal schools may be traced partly to the early death of the first principal, partly to a general suspicion that the Albany school was not doing strictly normal work, and partly to a preference for the local academies that were supposed to be quite capable of preparing teachers for their calling. It is certain that much of the opposition which normal schools afterwards encountered in the State was due to the zeal of the friends of the academies. At this very time (1891) an experiment is under way which may have the effect of giving the training of teachers for district schools to the academies on the ground that normal graduates are not willing to do "common school" work for common school compensation. If it succeeds, the New York system will be logically perfect: Training classes, normal schools, and the normal college, corresponding to the elementary school, the high school, and the college in the scheme of public instruction.

Nineteen years after the opening of the Albany school a normal school was established at Oswego, under E. A. Sheldon, principal; and four years thereafter (1867) it was accepted by the State as a State normal school. The present writer visited this school in 1865, and made a report to the State superintendent of Maryland, from which the following extracts are made:

The training school at Oswego was organized mainly for the purpose of furnishing the city schools with teachers competent to carry out the objective or Pestallozzian system of teaching. The public schools of Oswego are divided into four grades: The primary, the junior, the senior, and the high school. Each school is divided into three classes, and the course of each class lasts for one year. Pupils are admitted at five years of age, and if they pass regularly and without interruption through the whole course, they are graduated at the age of 17. New classes are formed only once a year. Scholars presenting themselves after the new classes have been formed are admitted, provided their attainments correspond with the standard of any particular class. If they are found defective in certain studies they are sent to what is called the "Ungraded school," an ingenious contrivance to prevent the uniformity of the classes from being broken by an influx of unprepared scholars. For the first four years of the child's school life he is taught without books—reading-books of course excepted. The elements of language, number, place, color, and form; lessons in "objects," drawing, singing, as well as arithmetic and geography are taught by the living voice of the teacher, aided by maps, charts, pictures, real "objects" when they can be introduced, and an unremitting use of the blackboard. * * * Of the

[1] New York State School Report for 1842.

"objective system" of teaching pursued in these schools, I can not speak too highly. I have examined and studied it very closely and I do not hesitate to say that it is not only a good system, but the only good system that I have seen for the rational education of young children. * * * The training school is intended to prepare teachers for conducting the exercises of the "Oswego system," and is admirably fitted to accomplish this result. It is divided into two sections whose time is divided equally between learning and teaching. One section "recites" in the morning and teaches in the afternoon, the other recites in the afternoon and teaches in the morning. The students are not permitted to give any lesson to the section until they have rehearsed the same lesson themselves, and have written out a careful analysis of it.[1]

For a more detailed and very excellent account of the Oswego school, the reader is referred to Circular No. 1, 1891, of the United States Bureau of Education, by Prof. J. P. Gordy. The tree planted at Albany in 1844 now began to yield an annual harvest.

The normal school at Brockport was established in 1867; Fredonia, in 1868; Cortland and Potsdam, in 1869; Buffalo and Geneseo, in 1871; and, after a rest of fifteen years, Newpaltz, in 1886; Oneonta, in 1889, and Plattsburg, in 1890. Though each of these schools has some distinguishing peculiarities, it would be tedious and unprofitable to discuss them separately, especially as at present (1891) they are all working under the following uniform curriculum, prescribed and enforced by the State superintendent of public instruction:

COURSE OF STUDY.

The following is the course of study now in force in the different normal schools: The elementary English course will be discontinued after the school year 1891–92, and the requirements for graduation will then be at least the work now laid out in the "Advanced English course," which will then be designated as the "English course."

ELEMENTARY ENGLISH COURSE.

FIRST YEAR.

First term.—Arithmetic, composition and grammar, botany and familiar science, linear drawing, reading, vocal music, physical culture.

Second term.—Algebra, composition and rhetoric, physiology and zoology, physical geography and map drawing, reading, vocal music, physical culture, a course of reading in history of the United States.

On completing the work of this year, pupils may be admitted to the professional work, as indicated in the second year of this course, if, in the judgment of the faculty, they are sufficiently mature, and have sufficient mental discipline to enable them to do it successfully; otherwise, they will be required to go on with the subject work in one of the advanced courses until the faculty may deem them prepared to take up the study of philosophy of education and methods.

SECOND YEAR.

First term.—Philosophy and history of education, school economy, civil government and school law, methods of teaching the elementary English branches, methods of giving object lessons, including lessons on objects, form, drawing, size, color, place, weight, sound, animals, plants, human body, moral instruction, general science, and common manufactures, declamations, essays, and select readings.

Second term—Teaching in school of practice, a course of reading connected with professional work, essays, declamations, and select readings.

ADVANCED ENGLISH COURSE.

Students, to be admitted to this course, must pass a satisfactory examination in all studies in the first year in the elementary English course.

FIRST YEAR.

First term.—Algebra, geometry, English literature, physics, declamations, essays, and select readings.

---

[1] First report of the State superintendent of public instruction of Maryland.

Second term.—Rhetoric, general history, trigonometry, perspective drawing, chemistry, geometry, declamations, essays, and select readings.

SECOND YEAR.

First term.—Philosophy and history of education, school economy, civil government and school law, methods of teaching the elementary English branches, methods of giving object lessons, including lessons on objects, form, drawing, size, color, place, weight, sound, animals, plants, human body, moral instruction, general science, and common manufactures, orations or essays, and select readings.

Second term.—Mineralogy and geology, astronomy (half term), orations or essays and select readings, teaching in school of practice, a course of reading connected with professional work.

CLASSICAL COURSE.

Students, to be admitted to this course, must pass a satisfactory examination in all the studies of the first year of the elementary English course.

FIRST YEAR.

First term.—Algebra, geometry, Latin, English literature, declamations, essays, and select readings.

Second term.—Latin, general history, rhetoric, geometry, trigonometry, declamations, essays, and select readings.

SECOND YEAR.

First term.—Latin, Greek or French or German, physics, astronomy (half term), orations or essays, and select readings.

Second term.—Latin, Greek or French or German, chemistry, mineralogy and geology, orations or essays, and select readings.

THIRD YEAR.

First term.—Latin, Greek or French or German, philosophy and history of education, civil government and school law, school economy, orations or essays, methods of teaching the elementary branches, methods of giving object lessons, including lessons on objects, form, drawing, size, color, place, weight, sound, animals, plants, human body, moral instruction, general science, and common manufactures.

Second term.—Latin, Greek or French or German, teaching in school of practice, orations or essays, a course of reading connected with professional work.

SCIENTIFIC COURSE.

This course includes all the subjects of the advanced English course, together with a two years' course in two of the following languages: Latin, French, German, Greek.

It must not be inferred that all the State normal schools of New York are purely and simply "training schools for teachers." Nothing is easier than to write a uniform programme; nothing more difficult than to carry the ideal into practice. And it is well that it is so; a school without individuality is simply a wheel in a machine. Differences of situation, of local surroundings, of inherited traditions, of present aspirations, will differentiate the schools, whatever may be the outward bond of uniformity. It would not be surprising if, even at present, comparing the "training school" theory with the academic practice, it should be hard to determine which is the main building and which the annex.

POTSDAM.

Music seems to be a specialty in the Potsdam Normal School. The Outline of Work in Music in the State Normal and Training School, Potsdam, N. Y., is an 8vo. pamphlet of 34 pages, the substance of which may be gathered from a circular of the school bearing date January 1, 1890, and containing the new uniform curriculum:

OUTLINE OF COURSE IN VOCAL CULTURE AND SINGING.

First year.—Voice placing, breathing studies, special attention to distinct articulation, purity of tone and clear intonation; English songs and ballads.

Second year.—Study of vowels and consonants, development of voice in clear and

somber timbres, mechanical exercises for execution, chromatic scale, preparatory studies for trill, English and Italian songs and arias.

Third year.—Studies in execution continued, trill and other embellishments, study of selections from operas and oratorios, study for intelligent interpretation of the best songs.

Fourth year.—Studies in execution continued; study of classical songs, selections from opera and oratorio; French, German, and Italian songs; special attention paid to delivery, facial expression, and stage presence.

A diploma will be given to those completing the course satisfactorily.

PIANO FORTE.

First grade.—Emery's Foundation Studies, or Part First of New England Conservatory Method

Second grade.—Twelve Little Studies, Kohler, op. 157. Kohler, op. 50. Loeschhorn, op. 52. Duvernoy, op. 120. Loeschhorn, op. 66. Major and Minor Scales and Arpeggios from "Complete set of scales," by A. D. Turner. Easy and progressive pieces. Clementi's Sonatinas. Daily practice of technique.

Third grade.—Bertini, op. 29. Berens, op. 61. Heller, op. 46. Turner's Melodious Studies, op. 30. Study of Octaves. Krause, op. 5. Kohler, op. 128. Bach's "Little preludes and two part inventions" (ed. by F. Kullak). Pieces for left hand alone, Hummel, op. 43. Pieces by Mozart, Haydn, Mendelssohn, and modern composers. Daily practice of technique.

Fourth grade.—Turner's Elements of Modern Octave Playing. Cramer's Studies (Bulow edition). Bach's Three Part Inventions. Damper Pedal Studies, op. 15, by A. D. Turner. Clementi's Gradus ad Parnassum (ed. by Tausig). Studies for left hand, by Rheinberger, and A. D. Turner's op. 29. Selections from Mendelssohn, Beethoven, Schumann, Chopin, and other composers. Daily practice of technique.

Fifth grade.—Moscheles, op. 70. Bach's Inventions. Bertini, op. 66. Mayer, op. 119. Selections from Schumann, Chopin, Mendelssohn, Beethoven, Liszt. Mozart's Concertos. Pieces committed to memory. Daily practice of technique. Study of harmony.

Chopin, op. 10. Selections from Bach's "English Suites" and "Well Tempered Clavichord." Kullak's Octave Studies. Selections from Chopin, Schumann, and Liszt. Concertos and concert pieces by the classic composers. Two piano pieces. Daily practice of technique. Study of harmony.

Of the 19 teachers in the "Faculty," 5 and an assistant are devoted exclusively to music.

The Potsdam school has also issued, among other pedagogic circulars, an "Outline of the work in primary methods," 39 pages 8vo., in the main an admirable compend and guide for the use of young and untrained teachers, but without originality. The "Object lessons" are no improvement on the pioneer efforts of Miss Elizabeth Mayo, nearly half a century ago, as will be seen from the following extracts from the "Outline:"

QUALITIES FOR LESSONS IN PART II AND PART III.

Light. Because shavings, feathers, wool, curled hair, dry leaves, etc., are easy to lift or carry, they are said to be light.

Heavy. Because iron, lead, stone, marble, silver, gold, etc., are not easy to lift or carry, they are said to be heavy.

Artificial. Because flowers, fruit, etc., are made by man to look like those made by God, they are said to be artificial.

Useful. Because wood, iron, etc., are of use to man, they are said to be useful.

Adhesive. Because gum, sealing wax (when heated), etc., stick or adhere, they are said to be adhesive.

Soluble. Because sugar, salt, etc., will dissolve in water, they are said to be soluble.

Caution.—If substances not soluble in water, but soluble in spirits, are mentioned, be sure to *name the solvent.*

Insoluble.

Compressible. Because bread, sponge, etc., can be made smaller by squeezing or pressing, they are said to be compressible.

Incompressible.

Preservative. Because sugar, salt, saltpeter, etc., will keep or preserve meat, fruit, etc., they are said to be preservative.

Aromatic. Because cinnamon, sassafras, etc., have a fragrant odor and pleasant, spicy taste, they are said to be aromatic.
Pungent. Because pepper, mustard, etc., have a sharp, hot, biting taste, they are said to be pungent.
Fusible. Because wax, lead, etc., will melt, they are said to be fusible.
Pulverable.
Ductile.
Pliable.
Reflective.
Permeable.
Impermeable.
Medicinal.
Manufactured.
Lessons on manufacture appeal strongly to conception. They lead children to be observing.
Brittle. Because crayon, glass, china, etc., break easily with a snap, they are said to be brittle.
Tough.
Porous. Because bread, sponge, cork, bone, etc., are full of little holes or pores, they are said to be porous.
Fibrous. Because rope, corn stalks, etc., are made of little threads or fibers, they are said to be fibrous.
Liquid. Because water, milk, etc., can be poured out in drops, they are said to be liquid.
Solid. Because sand, corn, stone, etc., can not be poured out in drops, they are said to be solid.
Crumbling. Because bread, cake, etc., break easily into little pieces (crumbs), they are said to be crumbling.
Odorous. Because camphor, perfumery, etc., have an odor, they are said to be odorous.
Inodorous.
Fragrant. Because (some) flowers, oranges, etc., have a pleasant odor, they are said to be fragrant.
Acid. Because lemon, vinegar, cream of tartar, etc., have a sour taste, they are said to be acid.
Flexible. Because whalebone, etc., bend easily without breaking, they are said to be flexible.
Elastic. Because whalebone, rubber, etc., will bend when pressed, and then go back (return) to form (or shape), they are said to be elastic.
Opaque. Because milk, stone, wood, etc., can not be seen through, they are said to be opaque.
Transparent. Because glass, water, air, etc., can be plainly seen through, they are said to be transparent.
Semitransparent. Because mica, thin paper, oiled paper, etc., can be dimly seen through, they are said to be semitransparent.
Sapid. Because bread, milk, etc., have a taste, they are said to be sapid.
Insipid. Because water, etc., have little or no taste, they are said to be insipid.
Palatable. Because bread, milk, etc., have a pleasant taste, they are said to be palatable.
Wholesome.
Nourishing.
Saline. Because salt, etc., have a salt taste, they are said to be saline.
Combustible. Because cloth, sponge, wood, etc., will burn, they are said to be combustible.
Inflammable. Because wood, etc., burn with a flame, they are said to be inflammable.
Durable. Because hard wood, iron, etc., will last a long time, they are said to be durable.
Hard. Because wood, iron, etc., do not give or yield easily to the touch, they are said to be hard.
Soft. Because wool, sponge, etc., give or yield easily to the touch, they are said to be soft.
Buoyant. Because wood, cork, etc., float upon water, they are said to be buoyant.
Absorbent. Because bread, sponge, etc., soak up or absorb water, milk, etc., they are said to be absorbent.
Sparkling. Because salt, loaf sugar, etc., shine or sparkle in little points, they are said to be sparkling.

Granular. Because salt, sugar, etc., are made up of little grains, they are said to be granular.
Vegetable. Because trees, grass, etc., grow from the ground, they are said to be vegetable.
Animal. Because leather, etc., are obtained from animals, they are said to be animal substances.
Mineral. Because iron, lead, etc., are dug from mines in the ground, they are said to be minerals.
Natural. Because God made trees, grass, etc., they are said to be natural.

The "Outline of Work in Grammar," published by the same school, is a very interesting pamphlet of 64 pages. It contains a syllabus of the work in grammar for several terms, the last term being in the first year of the normal course. From this "Seventh Term in Grammar" a single page is selected to show the analytical spirit that pervades the whole course.

I. Connectives: **co-ordinate.**
1. *Parts of Speech*—conjunctions.
2. *Kinds:*
a. **Copulative** conjunctions are—
(1) Principal—"*and.*"
(2) Associate copulative connectives, used for emphasis or some additional idea—*so, also, likewise, moreover, too, besides, now.*
(3) Correlative co-ordinate connectives, not only awaken an expectation of something additional, but make the second part emphatic—*both, and, as well as, first, secondly,* etc.
b. **Adversative** connectives.
(1) Principal adversative, "*but.*"
(2) Associate adversative used for emphasis or some additional idea—*yet, still, nevertheless, notwithstanding, however.*
(3) Correlative Adversatives—*not only—but; but also; but likewise.*
c. **Alternative** co-ordinate connectives.
(1) Principal—"*or*" which offers, "*nor*" which denies a choice.
(2) Associate alternatives for emphasis—*else, otherwise.*
(3) Correlatives—*either—or, neither—nor.*
d. **Illatives** imply consequence or inference.
(1) Principal connective usually understood, "*and.*"
(2) Associate connectives indicating inference—*hence, thence, therefore, wherefore, consequently, accordingly, as,* etc.

II. Connectives: **subordinate.**
1. *Definition.*
2. *Classification.*
[1] Connecting **substantive clauses.**
a. Connecting *statements* [conjunctions]—*that, that not, but, but not.*
b. Containing *questions* [interrogative adjectives, adverbs and pronouns]—*which, what, who, where, whither, whence, when, how long, how often, why, how.*
[2] Connecting **adjective clauses** [relative pronouns, relative adverbs]—*who, which, what, that; whoever, whosoever; whichever, whichsoever; when, where, why.*
[3] Connecting **adverbial clauses** [conjunctions, conjunctive adverbs].
a. **Local,** or connectives of **place**—*where, whither, whence,* etc.
b. **Temporal,** or connectives expressing **time**—*when, while, as, before, after, till, until, since, whenever, soon as,* etc.
c. **Causal:**
(1) Causal—*because, for, as, since,* etc.
(2) Conditional—*if, unless, except, provided that.*
(3) Final—*that, that not, lest, so that, such that.*
(4) Concessive—*though, although, notwithstanding, however, whatever,* with their correlatives, *yet, still, nevertheless.*
d. **Manner or degree:** (1) Correspondence—*just as, same as, such as;* (2) Comparison—
1. Equality—*as—as.*
2. Inequality—*than, more than, less than.*
3. Proportionate equality—*the—the, the—so much the.*

The New Advance.

The honest intention and earnest desire of the State school authorities of New York to make their normal schools distinctly professional, and to exclude from them the two classes of students that have heretofore interfered with the declared purposes of these schools—those who desired boarding-school veneering, and those who needed preparatory education which they could have obtained at home—are made manifest by the following extracts from the circular of the State superintendent (November 1, 1890) already quoted from.

No students can be admitted who have not already acquired a substantial elementary education. This can be gained in all the ordinary schools, and the professional training schools can not properly be taxed with work which the common schools can perform as well. * * * There is room and welcome in the normal schools for the graduates of the elementary and secondary schools, and even for those who have made substantial advancement in the elementary course without technical graduation, provided they give promise of becoming successful teachers, and possess the desire to become such; but *there is no room for students who have laid no real foundation for professional training, and who have no well-determined purpose about the matter, and no fair conception of the responsibilities and obligations of a teacher's occupation.* [Italics are the editor's.] * * * No student is desired at a normal school who does not read readily and intelligibly, spell correctly, and write legibly and neatly. Regardless of diplomas, certificates, and examinations, principals will refuse admittance to all students who do not possess these acquisitions in a highly creditable degree.

If these conditions are complied with in good faith, New York may well boast of having the best arranged and most perfectly equipped system of normal schools in this country.

The preparation actually required and exacted from candidates for admission to the New York normal schools will be best understood from the following sets of examination papers:

ENTRANCE EXAMINATION QUESTIONS.

[Prepared by a committee of normal principals and published by the State department of public instruction.]

Entrance examination, February, 1900.

Write the subject of the examination, your name, and the date at the head of your papers.

The work should be written out in full in the answers.

Correct answers will receive ten credits each, and a proportionately less number will be allowed as the answer approximates correctness or shows knowledge of principles.

In order to secure admission candidates must gain an average of seventy credits in the three branches and not fall below sixty credits in any one of them.

Use care in spelling, writing, and general neatness of appearance.

ARITHMETIC.

1. What is a proof for division? Define a composite number. Define the prime factors of a number. After several numbers have been resolved into their prime factors, how is the G. C. D. of those numbers found? How their L. C. M.?
2. Reduce $17\frac{1}{4}$ to twelfths and write the analysis.
3. If it takes one man $7\frac{1}{4}$ days to do a piece of work, how long will it take three men to do $2\frac{2}{3}$ times as much?
4. Multiply nine thousandths by eight hundred and divide the product by thirty-six millionths.
5. You sell to-day to James Carson for cash 2 bbl. flour, at $6.25 per bbl.; 264 lb. corn meal, at $1.10 per cwt., and 1,850 lb. coal, at $5 per ton. Make out bill in proper form.
6. Having lost $12\frac{1}{2}$ per cent of his capital, a man had $10,850 left. How much did he lose?
7. Write an ordinary bank note, dated to-day, for $200 at 60 days, and find its proceeds if discounted at a bank.
8. At $5.75 per bbl., what costs 3 bbl., 17 gal., 2 qt. of vinegar?

9. What is the exact contents, in cubic yards, of a cellar wall 2 feet thick and 9 feet high, whose outside measurement is 36 feet by 24 feet?
10. How many rods on the side of a square field containing 100 acres?

GEOGRAPHY.

1. What determines the position of the tropics and polar circles?
2. Define latitude, longitude, isothermal lines, river system, and promontory.
3. Name three canals of New York State and state what waters they connect.
4. Mention three counties of New York State on islands.
5. Locate the following cities and give a fact about each: Chicago, Boston, Riga, Bombay, Glasgow.
6. In what zone is Asia situated?
7. Name and locate two lakes of Africa.
8. On what waters would you sail from Edinburgh to St. Petersburg?
9. Describe the largest river in South America.
10. Mention two conditions which determine the climate of a place.

GRAMMAR.

(1.) "You all did see that, on the Lupercal I thrice presented him a kingly crown, Which he did thrice refuse." (2.) "The mellow year is hasting to its close; The little birds have sung their last." (3.) "So sweet a kiss the golden sun gives not To those fresh morning drops upon the rose."

1. Diagram or analyze sentence (1) by any method you may have learned.
2. Parse the verb of the principal clause in (1).
3. Decline and parse all the pronouns in (1).
4. Parse all the verbs in (2).
5. Select the nouns in (3), tell their cases and give reasons.
6. Select and classify the adjectives in (3).
7. Write a sentence containing a verb in the active voice, and recast the sentence so that the verb shall be in the passive voice.
8. Write a sentence containing a predicate adjective.
9. Correct the following sentences:
   (*a*) The number of students are very great.
   (*b*) Everyone has their enemies.
   (*c*) This is the friend which I love.
   (*d*) George sent you and I some candy.
   (*e*) Either Mary or John have gone.
10. Write a composition containing not less than fifty words, setting forth your idea of the usefulness of studying grammar.

Entrance examination, September, 1900.

ARITHMETIC.

1. What is the name of (a) the tenth period in whole numbers; (b) the sixth period in decimals; (c) the eighth place in decimals.
2. Write twenty whole numbers of six significant figures each, and add them.
3. Illustrate your method of verifying your work when you have multiplied two large numbers together.
4. Find (a) G. C. D. of 1872 and 432 by two methods; (b) L. C. M. of same two numbers.
5. Divide $(2\frac{1}{7}\times\frac{3}{16})$ by $(2\frac{1}{4}-1\frac{5}{7})$ and reduce the number to a decimal.
6. How many yards of carpet $\frac{3}{4}$ of a yard wide is required to cover a floor 17 feet long and 16 feet 6 inches wide?
7. In what time will $680, at 4 per cent simple interest, amount to $727.60?
8. A collector who charges 8 per cent commission on what he collects pays me $534.75 on a bill for $775, how much of the bill remains uncollected?
9. A cellar is to be dug 30 feet long and 20 feet wide. At what depth will 100 cubic yards of earth have been removed?
10. How many feet, board measure, in a plank 16 feet 4 inches long, 1 foot 7 inches wide, and $4\frac{1}{2}$ inches thick?

GEOGRAPHY.

1. Name the counties bordering on (a) the Hudson River; (b) Lake Ontario.
2. In what county is (a) Rochester; (b) Syracuse; (c) Binghamton; (d) Middletown; (e) Jamestown; (f) Utica; (g) Poughkeepsie.
3. List of the cities named in question 2 in order of greatest population.
4. Name (a) the four longest railroads in this State; (b) their termini; (c) the cities through which they pass, respectively.

5. By what number, approximately, would you multiply the population of New York State to produce the population of the United States?
6. How many (a) States in the United States; (b) Territories.
7. Name (a) the Territories; (b) the States that have been admitted since the last Presidential election.
8. Name three railroad lines to the Pacific coast.
9. Name the largest State in area in the United States and compare it in size with (a) France; (b) the United Kingdom of Great Britain and Ireland; (c) Germany; (d) Russia.
10. Draw a rough outline map of the Western Hemisphere and locate the large (a) political divisions; (b) rivers; (c) mountains; (d) bays; (e) gulfs; (f) capes.

GRAMMAR.

1. Give a synopsis of the verb "to see" in the third person singular of all the modes and tenses in the active voice.
2. Classify adjectives and give illustrations.
3. Compare much, ill, able, faithful.
4. Give the rule for the formation of the possessive case.
5. Write the possessive case plural of sheep, man, lady, enemy, son-in-law.
6. Name the grammatical forms of the parts of speech and the parts of speech to which they severally apply.
7. Copy the following and underscore the logical subjects once and the grammatical subjects twice: (a) "A thing of beauty is a joy forever;" (b) Chaucer, the father of English poetry, wrote the Canterbury Tales;" (c) "The morn, in russet mantle clad, walks o'er the dew of yon high eastern hill."
8. Diagram or analyze the following by any method: "Franklin, who afterwards became a distinguished statesman and philosopher, learned his trade in the printing office of his brother, who published a paper in Boston.
9. In the first five questions make a list of (a) the nouns and their cases; (b) the verbs and their principal parts; (c) the prepositions and their terms of relation.
10. Write a description of some village or city—seventy-five words. Give special attention to punctuation and capitalization.

In this "new departure," or to speak more accurately, in this return to first principles, the Albany school is expected to take the lead. The executive committee, to whom the reorganization of the school was committed, found that the instruction heretofore given had been chiefly academic; that teachers had been chosen for their scholarship rather than for pronounced professional ability; that the work done in the early years was largely the same as was done in the academies and high schools; that while increased attention was being given to pedagogy, yet the conditions of admission were so low that students of very meager attainments in scholarship were permitted to enter, and consequently a large part of the time of the teachers was spent in teaching subjects usually taught in academies and high schools; that the expectation that graduates of the normal school would become teachers of district schools had not been realized, because such graduates could command a larger salary than districts were able to pay; that consequently the district schools must secure their teachers from the union schools, academies, and high schools; and that it would be wise and economical to offer in the Albany school a course of study which should prepare its graduates to become "teachers and trainers of those persons in the union schools, academies, and high schools who are to become the instructors of the young in small or sparsely settled communities."

English course.

Candidates for admission are required to be at least 17 years of age and to pass a satisfactory examination in the following subjects for admission to the English course:

Arithmetic.	Rhetoric.	Geography.	Physics.
Algebra through quadratics.	English literature.	American history.	Chemistry.
	Bookkeeping.	General history.	Astronomy.
Geometry.	Civil government.	Botany.	Geology.
Plane trigonometry.	Elements of linear drawing.	Physiology.	
Grammar.		Zoology.	

No "degree" is to be conferred on graduates of this course, but they will receive a diploma which authorizes them to teach in the public schools of the State.

Classical course.

Candidates for admission must be at least 17 years of age, but no one will be graduated who is not at least 20 years of age. The entrance examination embraces all the subjects required for entrance to the English course and in addition—

Cæsar, three books.
Cicero, six orations.
Virgil's Æneid, six books.
Latin prose composition.
Xenophon's Anabasis, three books.
Homer's Iliad, three books.
Greek prose composition.

Instead of the requirements in Greek, candidates may offer a two-years' course in French or German or a less amount of both.

COURSE OF STUDY.

First term.—Philosophy of education, school economy, drawing; methods of teaching the following subjects; Number, arithmetic, botany, place, geography, physiology, color, language, grammar, zoology, object lessons, reading, penmanship, composition; a course of reading connected with professional work.

Second term.—Methods of teaching the following subjects; Algebra, geometry, physics, chemistry, Latin, rhetoric, mineralogy, geology, astronomy, preparation of specimens and apparatus.

Third term.—Methods of teaching the following subjects: Latin, Greek or French or German, history, solid geometry, mensuration, physical geography, civil government, trigonometry, sanitary science, bookkeeping, school architecture, preparation of specimens and apparatus.

Fourth term.—History of education, school law, kindergarten methods; methods of teaching the following subjects: Music, drawing, physical culture, elocution, teaching in model school; a course of reading connected with professional work; discussion of educational themes.

Graduates of this course receive the degree of "Bachelor of Pedagogy." Future announcements will prescribe the conditions on which the degrees of "Master of Pedagogy" and "Doctor of Pedagogy" will be conferred.

TEACHERS' TRAINING CLASSES.

The number of teachers employed in the public schools of New York is, according to the last report of the State superintendent (1891), 31,703. Reckoning the average professional life of a teacher at five years, the State requires at least 6,000 new teachers every year. The normal schools send out fewer than 1,000 graduates every year. Estimating the number of graduates and undergraduates of the normal schools who go into the schools as teachers at 1,500, there is still a large deficit of trained or partly trained teachers. How is this deficiency to be supplied? The answer has been already given—by establishing training classes in connection with the academies and union schools. The legislature in 1890 passed an "Act in regard to professional instruction of common-school teachers in academies and union schools," and appropriating $60,000 annually "for the instruction of competent persons in academies and union schools in the science and practice of common-school teaching, under a course to be prescribed by the superintendent of public instruction," who is to designate the academies and union schools in which such instruction shall be given and also to prescribe for them a uniform curriculum. The purpose and scope of these training classes—they would have been called normal schools a few years before—will be best understood by reading the "curriculum:"

COURSE OF STUDY.

The following course of study is prescribed upon the advice of a committee of principals representing the union schools and academies of the State. This course was devised to meet the requirements of the uniform system for teachers' certificates and to satisfy the conditions for admission to advanced classes in the normal schools of the State:

First term.

FIRST RECITATION—ARITHMETIC.

[One recitation daily throughout the term.]

Review of the following topics with special reference to teaching:

1. Definition of terms.
2. Notation and numeration.
   Numbers in the decimal scale; numbers in varying scales; fractions; expressions of per cent.
3. The four fundamental processes applied to numbers in the decimal scale; numbers in varying scales; fractions.
4. Reductions.
   Decimals; fractions; numbers in varying scales.
5. Properties of numbers.
   Classification; factors; divisors; multiples.
6. Ratio and proportion.
7. Involution and square root.
8. Practical measurements.
9. Applications of percentage—in which time is not an element.
10. Interest and discount.
    Partial payments by United States rule; true discount; bank discount; commercial discount.

SECOND RECITATION—GEOGRAPHY.

[One recitation daily for eight weeks.]

Review of the following topics with special reference to teaching:

1. Definition of terms.
2. Shape, size, and motions of the earth; day and night; the seasons.
3. State of New York.
   Boundaries and extent; mountains; rivers and lakes; counties; cities and important villages; agricultural and mineral productions; commerce; railroads and navigable waters; climate; industries or occupations; places noted for natural scenery; places of historic interest.
4. The United States.
   Boundaries and extent; States and Territories; mountain and river systems; agricultural and mineral productions; important cities; population; commerce and transcontinental lines of travel; industries or occupation.
5. Other countries of the world, especially Europe.
6. The great mountain systems and ranges of the world.
7. The principal rivers of the world.
8. Latitude and longitude; local and standard time.
9. Physical phenomena.
   Climate; tides; ocean currents and trade winds.
10. Races of men.
    Location; characteristics; occupations.

The remainder of the term is to be devoted to the study of methods of teaching. The relative time given to each of the following subjects is left to the discretion of the instructor:

METHODS IN PRIMARY NUMBER.

[See Observation and practice work.]

METHODS IN GEOGRAPHY.

[See Observation and practice work.]

Second term.

FIRST RECITATION—LANGUAGE AND GRAMMAR.

[One recitation daily through the term.]

Review of the following topics with special reference to teaching:

1. Definition of terms.
2. Parts of speech.
   Classes; modifications; inflections; syntax.
3. Analysis of sentences.
   Principal clauses; subordinate clauses; analysis of clauses; modifiers—words, phrases, clauses; classification of modifiers as to office.

4. Construction—involving a knowledge of the foregoing topics.
5. Composition.

Divisions—subject, heads, thoughts. About familiar subjects—objects, animals, metals, plants, incidents.

Letter writing, bills, orders, receipts, acknowledgments, introductions.

SECOND RECITATION—PHYSIOLOGY.

[Four weeks.]

Review with special reference to teaching. (See syllabus.)

SCHOOL MANAGEMENT AND SCHOOL LAW.

[Four weeks. See syllabus.]

The remainder of the term is to be devoted to methods of teaching. The relative time given to each of the following subjects is left to the discretion of the instructor:

METHODS OF TEACHING READING.

[See Observation and practice work.]

METHODS OF TEACHING LANGUAGE.

[See Observation and practice work.]

1. *Form-study and drawing*, one recitation every week through each term. The particular day of the week is left to the convenience of the instructor. Where desirable this topic may be presented each day consecutively until completed.
2. *The examination* of the training classes under the uniform system will be held the third Saturday of January and the second Saturday of June.
3. *The laws of mental development and principles of teaching* are to be considered especially in the study of methods of teaching; but as these laws and principles are fundamental to the professional study of the teacher, they can be illustrated and developed in connection with any of the above subjects of study.

OBSERVATION AND PRACTICE WORK.

1. The course of study devotes ten weeks each term to the special study of methods of teaching; during the first term, ten weeks to number and geography; during the second term, ten weeks to reading and language. Part of the time given to these topics must be spent in observation and practice work under the direction of the instructor of the class acting as critic. One consideration specially noted in granting applications is the opportunities afforded for observation and practice work, and it is insisted that these opportunities be improved.
2. *Observation.* In addition to receiving methods of teaching on the authority of the instructor, it is very important that the members should be trained to critically observe and intelligently interpret the principles of teaching by being brought in contact with the pupils in the actual work of imparting instruction. To afford this training, it is expected that the critic teacher, at least twice a week, will give an opportunity to witness practical work, either by taking the class to other departments of the school to observe the work of experienced teachers, or by bringing pupils from other departments to receive a model lesson from the critic teacher.
3. For *practice* work it is recommended that each member be given actual work in teaching, both by taking charge of a class in other departments of the school as often as is consistent with the work of the school, and by having pupils brought before the training class to receive a lesson from a member designated for that purpose.
4. At a subsequent recitation let this observation and practice work be reviewed by the critic teacher, the underlying principles clearly brought out, and the proper methods forcibly presented. In the presentation of the methods the outlines as given in the syllabus may prove suggestive to the critic teacher. The time devoted to the observation work and the criticisms on the work will be accounted part of the regular daily periods of class instruction.
5. Very much depends upon the instructor of these classes whether the instruction and practice drill are of proper grade and character. The number of graduates sent out each year from our normal schools is ample to furnish competent and thoroughly trained teachers to take charge of the classes. Duty to the common schools demands thoroughly trained teachers for this work.
6. If the inspector in his visitations shall find any person in charge of the instruction who is not qualified by professional study or experience to properly present the work,

he is authorized to report the fact to the superintendent, who will annul the appointment to instruct such a class.

SYLLABUS.

The following outlines are presented to aid in the study of methods of teaching, as prescribed during the last ten weeks of each term. Inasmuch as the training classes are not all of the same grade of scholarship, these outlines are not given with the expectation that they are to be followed strictly to the letter, but rather as suggestions to teachers who have no better plan of work.

FORM STUDY AND DRAWING.

The syllabus for work in form study and drawing will be the course prepared by the late Dr. French and issued by the Department of Public Instruction.

THE MENTAL POWERS AND THE LAWS OF MENTAL DEVELOPMENT.

I. The mind:
- (1) The teacher must have practical knowledge of the mind.
- (2) The laws of its growth.
- (3) Means of its culture.
- (4) The right methods of using the means of culture.
- (5) What the mind is, and does.

II. Attention:
- (1) How to secure.
- (2) How to retain.
- (3) Conditions of.

III. How knowledge is gained:

Perception—
- (1) Ideas of pressure and resistance. The sense of muscular resistance.
- (2) Ideas in regard to the surface of objects. Touch and its organs.
- (3) Ideas of flavor. Taste.
- (4) Ideas of odor. Smell.
- (5) Ideas of sound. Hearing.
- (6) Ideas of light and color. Sight.
- (7) Secondary (or acquired) perceptions.
- (8) Law:—Ideas belonging to one sense can not be conveyed through another sense. Application of this law in teaching.
- (9) Sense training.
  - (*a*) Neglect of.
  - (*b*) Importance of.
  - (*c*) Best means of.

IV. Memory.
- Two-fold character:—Reproduction and recognition, spontaneous and voluntary.
- Kinds.
  - Arbitrary—Rote learning.
  - Suggestive—Learning by heart.
  - Associative.
- Growth of memory—"Plastic Period."
- How best cultivated.
- Educational value.

V. Imagination.
- On what depends.
- Kinds.
  - Reproductive.
  - Constructive.
- Necessity of training.
- Its utility in education and in life.
- Means of cultivation.
- Relation to general school work.

VI. Reason.
- Relation to preceding powers.
- Results to be aimed at by teacher.
- Kinds.

Inductive.	Deductive.
Analytical.	Synthetical.
Demonstrative.	Dogmatic.

- Means of cultivation.

VII. Principles of mental culture.
- Senses trained by object-teaching.
- Ideas before words; thoughts before sentences; knowledge before definitions; facts before inferences; processes before rules.
- Power to do comes by doing. Power to think comes by thinking.
- Right habits result from acts frequently and rightly performed.

METHODS IN NUMBER.

I. Preliminary selections:
  (1) Distinguish between number-teaching and the formal teaching of arithmetic.
  (2) Arithmetic is a science and an art.
  (3) A brief presentation of the mental faculties that are brought into action and developed by its study and practice and a brief study of each faculty.
  (4) The mental principles upon which recognized or accepted pedagogical rules are based, and their application in teaching arithmetic.

II. Primary work:
  (1) Method—concrete.
  (2) Furniture.
    (*a*) Frames.
    (*b*) Pictures.
    (*c*) Counters—beans, corn, pebbles, etc.
  (3) Write numbers.
    (*a*) Distinguish between the object and the number. Object word—figure.
  (4) The idea of number.
    (*a*) Its expression.
    (*b*) The relation of numbers.
    (*c*) Kinds of numbers.
  (5) Develop the idea of the order and relation of the figures in the numbers. (Ideas of the meaning of each step dwelt on until comprehended. Explanations and practice in the use of numbers.)
  Grube's method.
  (6) (*a*) Limitations of first year's work; outline of second; development of each number; combining and separating.
    (*b*) Develop idea of the terms, and define.
    (*c*) Develop idea of operations, and give rule.
    (*d*) Develop idea of proofs, and state methods.
    (*e*) Make tables.
    (*f*) Give examples.
  (7) Teaching of the fundamental rules.
    (*a*) Methods of teaching reading and writing numbers.
    (*b*) Systems of practice in addition to gain rapidity and exactness.

III. Factoring:
  (1) Development of: divisors, multiples, terms, principles.
  (2) Operations and applications illustrated by examples and problems.

IV. Fractions. Development of:
  (1) The idea of a fraction.
  (2) The terms, forms, values, classes, uses, changes in forms.
  (3) Operations, principles, reduction.

V. Decimal fractions:
  (1) Treated the same as common fractions.
  (2) The distinctions between decimal and common fractions and simple whole numbers made clear.

VI. Denominate numbers:
  (1) Development of tables, scales, their meaning, use, and how derived.
  (2) Kinds of units as to form, name, and application.
  (3) Reductions, principles, and operations developed from work.

VII. Percentage:
  (1) Derivation, meaning and application of the term.
  (2) Development of terms, definitions and principles.
  (3) Elements of: base, rate, percentage, difference, and amount.
  (4) Development of formulas and rules.
  (5) Oral and written solutions of examples and problems.

METHODS IN GEOGRAPHY.

I. Local primary:
  (1) The hands and pointing.
  (2) Direction and facing.
  (3) Location and direction.
  (4) Points of the compass.
  (5) Lines and their names.
  (6) Lines for the points of the compass.
  (7) Draw ground plan of a schoolroom.
  (8) Plan of lot and house.
  (9) How to begin map study.

II. Advanced primary:
  (1) Study of district, with roads, bridges, buildings, railroads, and water courses.
  (2) Study of township, with villages, hamlets, streams, and bodies of water.
  (3) Study of township, with the surrounding towns.
  (4) Draw outline map of county, with township lines.
  (5) How to go from county to the earth as a whole.
III. General study of countries:
  (1) Position.
  (2) Boundaries—outline map.
  (3) Relief.
  (4) Drainage.
  (5) Soil.
  (6) Climate.
  (7) Vegetation—Flora.
  (8) Animals—Fauna.
  (9) Occupation of the inhabitants.
  (10) Talks on definitions; when to learn them and how to use them.
  (11) Suggestions in regard to arousing interest in the study.
IV. Work on State of New York:
  (1) Outline map on blackboard.
  (2) Boundaries. { Land. / Water.
  (3) Mountains—class to learn location of three or four ranges; describe in class; locate on the blackboard map.
  (4) Valleys—class to give location; describe.
  (5) Lakes—class to give location; describe.
  (6) Rivers, five largest—class to learn source, direction of flow and into what each empties; important cities on each.
  (7) Islands—class to give location; describe.
  (8) Cities—class to learn location, and important and interesting facts about buildings; processes of manufacturing articles. The work to be reproduced in composition form for next recitation.
  (9) Railroads and canals—require termini, direction; principal cities along the line; principal industries of each.
  (10) Conversational lessons—on occupation, productions, education, government, and public buildings.
  (11) Dictation on map.

PHYSIOLOGY AND HYGIENE.

I. Utility of the study:
  (1) Practical.
    (*a*) Knowledge of hygiene will affect personal habits and practices to some extent.
    (*b*) An intelligent conception of the body as a piece of delicate mechanism tends to prevent its owner from trifling with it—one does not tinker with a fine watch, or entrust it to a blacksmith to be mended. Quacks and nostrums do not find favor with one that understands the body.
    (*c*) Though a knowledge of hygienic laws does not always ensure their practice, yet that knowledge on the part of future parents and teachers, *if well grounded in the apprehension of the perfection and complexity of the human machine*, must tend to better hygienic management of children at home and at school.
  (2) Educational.
    (*a*) Affords opportunity for the study of *things*, as opposed to the study of words and abstractions—things in which pupils may be easily interested, and of which their parents will be glad to have them learn—thus training their powers of observation and comparison.
    (*b*) Serves as a center about which the teacher may group the beginnings, and the most important elementary facts of biology, chemistry, and physics.
    (*c*) Gives abundant exercise in tracing out adaptations of means to ends.
    (*d*) Develops the idea of analogy as distinguished from similarity.

I. Utility of the study—Continued.

(*c*) As the nomenclature of anatomy and physiology is tolerably precise, recitations in these subjects give opportunity in older classes for the cultivation of accurate diction. In younger classes the propensity of bright children to delight in their ability to use new words, especially "hard names," finds natural and healthy indulgence if the teacher makes sure that they first have the ideas, and then discreetly encourages them to acquire the names; avoiding any forcing.

II. Suggestions to teachers:

(1) Teach objectively and by observation as much as possible.

(2) Exhibit, when possible, the part or object described, taken from the lower animals.

(3) For objective teaching of physiology great assistance is rendered by the possession of a manikin, models, charts, microscope, and prepared specimens.

(4) Encourage the pupils to invent simple experiments and to observe analogies from nature to illustrate the lesson.

(5) Aim to present the laws of life in a practical way, so that they will become a guide to living.

(6) Teach physiology by a daily practice of hygienic laws. To allow pupils to sit in draughts, to pay no attention to ventilation and arrangement of light, to be careless in regard to diet, dress, and hours of sleep, teaches to little purpose.

(7) Show clearly, without overstatement, the pernicious effect of alcohol and narcotics upon life and health, organ and function.

III. Method of work. Primary:

(1) The study of physiology should be confined to parts that can be seen or felt. Names should be taught, and children should be exercised in "touching." They should be led to discover the functions and adaptations of these parts, and to compare them with corresponding parts of lower animals.

(2) All pictures or descriptions that would excite unpleasant thoughts or morbid fancies are out of place with young children.

(3) Terms to be taught:

Head:	forearm,	root,	Neck:
trunk,	radius,	gum,	throat,
limbs,	ulna,	enamel,	windpipe,
right,	wrist,	incisors,	larynx.
left.	palm,	eyeteeth,	Breast:
Legs:	knuckles,	molars,	breast bone,
ankle,	thumb,	tongue,	ribs,
knee,	forefinger,	saliva.	arm-pits.
hip,	middle finger,	Eye:	Back:
thigh,	ring finger,	pupil,	chest,
kneepan,	little finger,	iris,	abdomen,
calf,	finger tip.	eyeball,	loins,
shin.	Skull:	socket,	spine.
Foot:	crown,	(orbit),	Skin:
toe,	hair,	eyelids,	cuticle,
nail,	face,	eyelashes,	true skin,
ball,	cheek bone,	eyebrows,	pores.
sole,	forehead,	tears.	Sweat:
instep,	temples,	Nose:	blood,
heel.	cheek,	nostrils,	arteries,
Shoulder:	chin,	bridge,	veins.
shoulder blade,	mouth,	septum.	Muscles:
collar bone,	lips,	Ear:	sinews,
arm,	teeth,	lobe,	(tendons),
elbow,	crown,	canal.	joints.

In review teach names of corresponding parts of lower animals; *e. g.*, stifle, hock, pastern, hoof, etc.

(4) Lessons on the care of the eyes, ears, teeth, skin, hair, hands, and feet, should be given in connection with the study of those organs, and there should be talks about habits of eating, drinking, breathing, bathing, sitting, and sleeping.

III. Method of work—Primary—Continued.

(5) Unfortunately, object lessons on the effects of alcohol are too sadly frequent in the vicinity of most of our schools. The attention of the children may be called to the melancholy and too plainly visible effects of intemperance upon the body, and they may be led to pity the sinner and detest the sin. But the utmost care must be used not to hurt the feelings of children that suffer from the drink habit in others.

IV. Method of work. Intermediate:

In graded schools the same general method of oral work may be continued through the intermediate years. The organs and processes of digestion, circulation, respiration, and excretion should be taught. Pupils should become familiar with the location and appearance of the organs by the use of pictures and charts or blackboard drawings, by touching those parts of their bodies beneath which these organs are situated, and particularly by examining the organs themselves as found in other animals. Functions should be explained in a general way, and the hygiene of the organs carefully taught. The effect of stimulants and narcotics should be emphasized, with care to avoid extravagant statements which the observation and experience of the children would contradict.

V. How to use a text-book:

(1) Introduce each main topic and, as far as possible, each subdivision by the exhibition and examination of a real thing—bone, muscle, nerve, brain, skin, heart, artery, lung, stomach, liver, kidney, etc.

(2) Recitation should be both topical and by question and answer; one method for advance, another for review.

(3) Make much use of the pictures and diagrams. Have them recited by blackboard memory sketches.

(4) Illustrate such terms as oxygen, hydrogen, carbon, nitrogen, pressure of the air, carbonic acid, osmose, etc., by simple chemical and physical experiments before these terms occur in the book.

VI. How to use specimens:

When fresh joints, etc., are used for illustration, take the utmost pains to secure neatness. Use dinner plates, plenty of tissue paper or white cloth, pins and needles. Cover every part except what is to be shown. Keep all covered till the proper time comes. Have water and clean towels handy. The exhibition of the muscles and nerves, and even of the organs of respiration, circulation, and digestion of a small, cleanly animal (*e. g.*, a red squirrel), if well managed, arouses intense interest and is very instructive.

VII. How to make models and illustrative apparatus.

VIII. Reference books:

Colton's Practical Zoology (gives very full directions for the study of organs of animals); Blaisdell's Our Bodies and How We Live (contains numerous simple and practicable experiments); Martin's Human Body—Briefer Course (makes prominent the doctrines of energy, and gives good directions for demonstrations); Buckalew and Lewis's Practical Work in the Schoolroom (primary lessons); Woodhull's Manual of Homemade Apparatus; Woodhull's Simple Experiments for the Schoolroom; Lind's Easy Experiments in Chemistry and Natural Philosophy.

SCHOOL MANAGEMENT.

I. Organization of school:

(1) Temporary—

(*a*) Necessity of knowing what to do the first day.
(*b*) Order of the work.
(*c*) How to keep all busy.
(*d*) Manner of forming classes.
(*e*) How to change from your temporary to a permanent organization.

(2) Permanent—

(*a*) Suggestions about forming programme.
(*b*) Number of classes.
(*c*) Order of classes.
(*d*) Time given for study—for recitation.
(*e*) Model programme for the work of an ungraded school, made out by members of the class.

II. Sessions:
  (1) Length.
  (2) How divided.
  (3) Recess.
  (4) How long to keep young pupils in school.
III. Study:
  (1) Objects of study.
  (2) Conditions requisite—
    (*a*) In pupils themselves.
    (*b*) In their surroundings.
  (3) Power of concentration.
  (4) Incentives—
    (*a*) Proper.
    (*b*) Doubtful.
IV. Recitations:
  (1) Objects.
  (2) Methods of conducting—
    (*a*) Advantages of each
    (*b*) Kind of work for which each is adapted.
    (*c*) Use a variety of methods.
  (3) Teacher's preparation—
    (*a*) What it should include.
    (*b*) Need of preparation.
    (*c*) When teacher should use a book in the class.
V. Questioning:
  (1) Character of questions—
    (*a*) Capacity of pupil.
    (*b*) A mental force.
    (*c*) Logical order.
    (*d*) The first question most important.
    (*e*) Teacher should study the answer before asking.
  (2) Object of questions: To direct, to incite, to lead, to arouse, to test.
  (3) Principles of questioning.
  (4) Manner of giving out questions.
  (5) Order of questions.
  (6) Position of pupil in answering.
  (7) Questions to be avoided.
  (8) Answers to questions: To the point, clear, direct, concise, definite, complete.
VI. Examinations:
  (1) Object.
  (2) Frequency.
  (3) Methods.
VII. School ethics:
  (1) Duty of teacher.
  (2) Duty of pupils.
  (3) Duties of school officers.
  (4) Duties of superintendent.
VIII. School government:
  (1) Object.
  (2) School control.
  (3) Elements of governing power.
  (4) Cause of disorder.
  (5) Means of avoiding disorder.
  (6) Rules and regulations.
  (7) School punishment.
  (8) How to detect offenders.
  (9) Self-reporting system.

SPELLING.

I. Combining spelling with reading.
II. Oral:
  (1) Definition.
  (2) Advantages.
  (3) Disadvantages.
  (4) Method of presentation.

III. Written:
  (1) Definition.
  (2) Advantages.
  (3) Disadvantages.
  (4) Method of presentation.
IV. Syllabication.
V. Word analysis:
  (1) Classes of letters—
    (*a*) Vowels.
    (*b*) Consonants.
  (2) Classes of words—
    (*a*) Primitive.
    (*b*) Derivative.
    (*c*) Simple.
    (*d*) Compound.
VI. Practice phonic analysis and sounds of the letters for clearness of articulation.
VII. Use of diacritical marks.

SCHOOL LAW.

I. Kinds of license:
  (1) Normal-school diploma.
  (2) State certificate.
  (3) College-graduate's certificate.
  (4) Limited license.
  (5) Certificate of board of education.
  (6) Certificate of school commissioner issued under the uniform-examination system.
II. License annulled:
  (1) Evidence against moral character.
  (2) Deficiency in learning or ability.
  (3) Appeals to State superintendent.
III. The teacher's contract:
  (1) Prerequisites.
  (2) Relation to trustee.
  (3) With whom made.
  (4) The duration.
  (5) The duties—
    (*a*) To keep a successful school.
    (*b*) To keep school open every school day.
    (*c*) To instruct all pupils.
    (*d*) To keep the school register.
  (6) Breaking of contract.
IV. The teacher's authority:
  (1) Absence and tardiness.
  (2) Control of the child's studies.
  (3) The Bible and religious exercises.
  (4) Suspension and expulsion.
  (5) The parent.
  (6) Corporal punishment.
V. School officers:
  (1) Duties.
  (2) Term of office.
  (3) Salary.
  (4) How elected.
  (5) How removed.
VI. School meetings:
  (1) When held.
  (2) How called.
  (3) Qualifications of voters.

READING.

I. Thought:
  (1) Definition.
  (2) Ways of getting it.
  (3) Ways of expressing it.

II. (1) Definition of reading.
(2) Preparation made for reading before school life begins.
(3) Use of the principle of association in teaching reading.
(4) Comparison of methods.

III. The alphabet method:
Objections—
(1) Term is given before idea.
(2) Works from the unknown to the known.
(3) Does not begin objectively.
(4) Makes slow stumbling readers.
(5) Does not secure good expression.
(6) A very slow method.

IV. The phonic method:
Can not have a perfect phonic method—
(1) The same letters represent different sounds.
(2) Different letters the same sound.
(3) Some letters have no sound.

V. The word method:
(1) Advantages—
(*a*) Teaches ideas before terms.
(*b*) Commences objectively.
(*c*) Begins at the child's standpoint.
(*d*) Makes sight readers.
(*e*) Children read with intelligence and expression.

VI. The sentence method:
(1) Advantages—
(*a*) Does not violate any principle of teaching.
(*b*) Begins at the child's standpoint.
(*c*) Can be made interesting.
(2) Objections—
(*a*) Can not be followed strictly.
(*b*) Gives no key by which pupils can help themselves.

VII. Suggestions in the different methods:
(1) In the alphabet method perception and memory are chiefly cultivated in detecting resemblance and difference.
(2) In the phonic method care should be taken in producing the exact sound.
(3) In the word method the order of development is—
(*a*) The idea suggested by the object.
(*b*) The spoken word expressing that idea.
(*c*) The written word expressing the idea.
(*d*) The thought expressed by a collection of words.

VIII. Steps in the work of each lesson:
(1) A conversational lesson about some familiar object.
(2) Show the object or a picture of it, or make a drawing of the object.
(3) Have the pupils give the name of the object—the spoken name.
(4) Write the name on the board.
(5) Drill on the word, having pupils pronounce it.
(6) Require pupils to write the words on their slates.
(7) Combine words into sentences.

X. How to conduct first work:
(1) Vocabulary to be used.
(2) Practices to be observed.
(3) Practices to be avoided.
(4) How combine spelling and reading.
(5) When use books.
(6) How use them.

X. Means of maintaining interest:
(1) Sight reading.
(2) Supplementary reading.

XI. Errors to be avoided:
(1) Too great rapidity in advancing pupils.
(2) Mispronunciation of words.
(3) Mechanical reading.
(4) Too much criticism.

XI. Errors to be avoided—Continued,
(5) Too much drill on nonessentials.
(6) Neglect to pursue the natural order of mental growth.
(7) Attempt at elocutionary effect.

XII. Points that may need special attention:
(1) Attend to pupils' positions.
(2) Attend to pupils' breathing.
(3) Attend to the thought.
(4) Attend to the expression of the thought.

METHODS IN LANGUAGE.

I. Suggestions to teachers:
(1) Strive to make the child do. He learns to use by using.
(2) Be careful about the use of language before children.
(3) Make every lesson a language lesson.
(4) Train the faculties in the natural order.
(5) Aim to awaken thought, to cultivate the use of correct language, to arouse criticism.
(6) Study the art of questioning. It is the teacher's passport to success.
(7) Use the following methods: Objective, inductive, analytic, synthetic, oral, and written.
(8) Have every thought expressed in a correct sentence.

II. Oral lessons:
(1) Objects: Quality, parts, material, use.
(2) Conversations and descriptions of actions, of animals, of plants.
(3) Complete sentences in answer to all questions.
(4) Supplying omitted words in elliptical sentences.
(5) Formation of new sentences from known words.
(6) Describing what is seen in pictures.
(7) Reproduction of facts from reading and object lessons, of short stories.
(8) Memory lessons, short quotations.

III. Written exercises:
(1) Copying sentences from reading lessons; supplying omitted words in elliptical sentences; construction of new sentences from known words; short sentences reviewing facts learned in language and object lessons.
(2) Dictation: Sentences from reading lessons.
(3) Results to be reached: Spelling, penmanship, capitalization, punctuation.
(4) Original work: Short sentences, descriptive of pictures, objects, animals, plants, etc.
(5) Reproduction from facts in lessons in reading and geography.

IV. Different kinds of sentences:
(1) Development of idea.
(2) Construction.
(3) Definition.
(4) Drill.

V. Development of parts of speech:
(1) Name words (or nouns).
(2) Action words (verbs).
(3) Quality words (adjectives).
(4) How, when, where words (adverbs).
(5) Personal pronouns, prepositions, conjunctions, interjections.

The committee appointed by the conference of secondary principals recommend as especially adapted for the use of instructors and pupils, the following books:

On physchology, *Sully and Hill;* on pedagogy, *White and Johonnot;* on history of education, *Painter and Hailman;* on school management, *Wickersham and Baldwin;* on memory, *Kay.*

PENNSYLVANIA.

Early History.

The normal fire, which was lighted at Lexington in 1839 and which smoldered in New York for some years after the death of Professor Page, did not reach Pennsylvania as a practical force until 1854. During the summer of that year a number of the citizens of Millersville and its vicinity, desiring a more liberal education for their children than was furnished by the common schools of the neighborhood, erected a building for the purpose of accommodating a school, which they proposed to call

"The Millersville Academy." This building was offered to the late Prof. James P. Wickersham, then county superintendent, for the purpose of holding a teachers' institute for three months. The attendance at the institute was so large and the general results so satisfactory that the trustees resolved to enlarge their building and establish a regular normal school.

The legislature had passed a law in 1857 granting certain privileges to such private institutions as would comply with the requisitions of the law and engage in the work of training teachers. Among these requisitions were the following: That each normal school established under the law should possess ground to the extent of 10 acres; a hall, capable of seating 1,000 persons, and boarding accommodations for at least 300 students. The trustees and stockholders of the Millersville Academy at a public meeting voted "that it is expedient to so enlarge the grounds attached to the school and to make such additions to the building connected therewith as to bring the school within the requirements of the act of assembly of May, 1857," already referred to. The institution was continued as a permanent county normal school until it obtained official recognition as a State normal school in December, 1859.

But the "normal idea" had taken root in Pennsylvania long before the fruit appeared. In a letter to the chairman of the joint committee on education (session of 1833), the Rev. George Junkin, president of Lafayette College, at Easton, writes as follows, in answer to a query of the committee:

Are your teachers formed or prepared in the common schools or have you model schools for them? In prosecuting this inquiry it may be best to state distinctly the thing desired, or, in other words, define a good teacher; and I suppose three qualifications to be indispensable: (1) The art of governing a school. (2) The art of communicating knowledge. (3) The knowledge to be communicated. These are set down in what I take to be the order of their importance, but they are all equally indispensable. * * * The capacity of a teacher to train other minds will very much depend on the systematic accuracy to which his own mind has been subjected in its training. The art of communicating must be deeply affected by the practice of acquiring and the habits formed by that practice. These remarks all go to evince the necessity of a model school, in which shall be taught the science—that is, the knowledge of letters and other things to be taught to the children in our common schools, and the arts of communicating and governing. It does appear to me impossible to obtain the right kind of teachers, and in adequate numbers, without it. This point settled, our next business is to settle a plan of attaining this object, and here I know of but three projects: (1) A manual labor academy near Harrisburg, under the immediate direction of the State authorities, in which 100 of the future teachers are to be pupils. [Here follow five weighty objections to this plan.] (2) The establishment of model schools, without manual labor, where the future teacher shall be taught on the best plans. We have settled the question of model schools; they are necessary, and chiefly with reference to practical training in the difficult matters of government and discipline. Without an actual school of children, you have no model at all, be the building and fixtures and apparatus and teacher ever so perfect. There lies, then, in the very nature of the case, this necessity, to wit: You must have a school to teach the science, and another school to teach, by the living thing itself, the arts of government and practical details. Now these are furnished, and the only remaining or third project or plan, which is that of establishing, in the existing colleges of our State, model schools, a teachers' course. This project has in its favor the plea of perfect simplicity, and may be explained in a few words:

(1) Let each college fix upon a liberal course of studies for school-teachers, and constitute a new degree in graduation.

(2) Let a common school, to be kept full of children from the neighborhood, in every respect such as is desirable to see in every district of the State, be established contiguous to the college buildings, which school shall be a model in its buildings, fixtures, desks, books, apparatus, rules and regulations, and mode of management.

(3) Let the candidate for the collegiate honor of a school teacher's diploma be in every respect on the same footing in college with other students—study in the same class his own particular branches, submit to the same system of discipline, and let him in addition to these spend a part of every day in the common school as a spectator, and occasionally as an assistant.

(4) When he shall have completed his course, which will take two years, let him pass a final examination and, if approved, receive the honorable testimony of the board of trustees.

(5) Let every teacher thus qualified, who shall teach within the State, receive, besides the provision made for his support by the people, a yearly allowance from the school fund for every year he shall teach in one place.

The Doctor proceeds to give in six paragraphs what he conceives to be the advantages of this "project." No clearer statement has since been made of the way in which a university chair of pedagogy may be employed for the preparation of teachers of common schools. Beyond this the pioneers of normal training had not at that time ventured.

Pennsylvania claims "to have been the first of our American States to inaugurate the work of preparing teachers." If by "preparing teachers" is meant the furnishing of teachers with sufficient knowledge of the subjects taught in common schools, the claim is somewhat vague, as every good school or college does the same. If it means that Pennsylvania was the first to establish an institution whose principal object was to give instruction in the science and art of teaching and the mode of organizing and governing schools, the claims of Massachusetts must be considered. "The University of Pennsylvania, begun as an academy in 1749, was designed partially as a school for teachers. Dr. Franklin, the chief among its founders, in addressing the common council of the city for aid in its behalf, states that as the country is suffering greatly for want of competent schoolmasters, the proposed academy will be able to furnish a supply of such as are 'of good morals and known character' and can 'teach children reading, writing, arithmetic, and the grammar of their mother tongue.'"[1] The good Doctor had evidently no conception of a normal school as we now understand the term. The Western Boarding School, established by the Society of Friends in 1799, made a report in 1824, announcing that "several of both sexes have so profited by the course of studies and the mode of instruction thus derived as to be qualified for teachers of schools in many parts of the country." The Moravian School, established in 1807 at Nazareth Hall, had "a special department for the preparation of teachers, in which young men received such instruction as qualified them either to teach in schools established at home, or to open and conduct schools in the missionary field." Dr. Benjamin Rush, in an address to the legislature in 1786, favored "the establishment of a system of free schools, of one university at Philadelphia, and of three colleges, one at Carlisle, one at Lancaster, and one at Pittsburg," and added, "the university will in time furnish masters for the colleges, and the colleges will furnish masters for the free schools." In all this there seems to be an intention to make scholars who might or might not afterwards become teachers, but there is no intimation that more than scholarship was needed. In 1838 the trustees of Lafayette College erected a building for a model school, placed a distinguished Scotch educator at the head of it, and established a teachers' course. But the people were not as yet educated up to this point and the project failed. The city of Philadelphia has the credit of establishing the first city training school in this country. The Philadelphia Model School, as it was called, was inaugurated in 1818 expressly as a teachers' school, for the purpose of qualifying teachers "for the sectional schools and for schools in other parts of the State." The name "Model" was imported from England, where it was used to designate a school in which young persons could observe and practice the art of teaching. The Philadelphia Model School was a necessary adjunct of the Lancasterian system, which prevailed in that city until 1836, and in a modified form until 1848.

Colleges as Preparatory Schools.

The plan of utilizing the colleges of the State as preparatory schools for teachers—they can not be called "training schools"—was followed for more than a quarter of a century, and with the same results as in New York.

---

[1] History of Education in Pennsylvania, by James Pyle Wickersham, LL. D. Lancaster, Pa., 1886.

In 1831, Washington College received from the State an appropriation of $500 a year for five years on condition "that the trustees shall cause that there be instructed annually, gratis, 20 students in the elementary branches of education, in a manner best calculated to qualify them to teach common English schools."

In 1832, Jefferson College was given $2,000 a year for four years on condition that "6 students in indigent circumstances should be educated gratuitously for four years," and thereafter 24 students should be prepared for teachers of common schools.

In the same year Reading Academy received $3,000, with the stipulation that 4 poor students be educated for five years, free of expense of tuition, for teachers of common English schools.

In 1834, Pennsylvania College was given $3,000 a year for six years on condition that 15 young men students should be prepared for teachers.

In 1837, Marshall College received a grant of $2,000 a year for two years on condition that 20 students be prepared for teachers of the English language.

In the same year Allegheny College received a grant of $2,000 a year for four years, for which were to be instructed annually 12 students, free of expense, for teachers in the English language.

"But the experiment of educating teachers in the colleges failed," says Dr. Wickersham, "because there was not then much demand for teachers thus prepared, and for the stronger reason that the general work of a college and the special work of a teachers' school can never be made to harmonize." State Superintendent Burrows, in his report for 1838, says, "The colleges have already been tried as a means of supplying teachers, and with little success. * * * Hope from this quarter is dead."[1] The present writer may add as his own experience that a semicollegiate education is the worst possible introduction to the teaching now required in the common country schools. Few teachers and few schools survive the experiment.

Professional Normal Schools Recommended.

In 1838 Superintendent Burrows abandoned the plan of educating teachers in departments connected with colleges and academies and advocated the establishment of separate free institutions for the instruction of teachers, in which they should receive "a full and careful course of theoretic and practical instruction in the art of teaching." Superintendent Haines in 1849 advocated the establishment of a normal school in each county and a central institution of the same character, but of higher grade, for the whole State. Superintendent Curtin in 1857 recommended in substance the provisions of the act which was passed by the legislature in that year for the establishment of normal schools. In drafting this bill and carrying it through the legislature, Dr. Wickersham, then principal of the normal school at Millersville, was the leading and guiding spirit. His good judgment, energy, zeal, and practical success as a teacher, as county superintendent and State superintendent, caused the example which he set in the second district to be followed rapidly by several of the other normal districts, and ultimately by all but one.

Law for Establishment of State Normal Schools.

For normal purposes the State was divided into thirteen districts, in each of which one normal school might be established under the law of 1857, before referred to, and additional enactments passed in 1859, 1872, 1875, and 1879. The pecuniary and other affairs of each State normal school are managed by a board of 18 trustees, 12 elected by the contributors or stockholders and 6 appointed by the State superintendent of public instruction. All changes in by-laws and rules for regulating proceedings of these boards must be approved by the State superintendent before going into effect. The State appropriations made directly to normal schools are distributed through a

[1] History of Education in Pennsylvania, by James Pyle Wickersham, LL. D. Pp. 377-381.

commission, consisting of the governor, the superintendent of public instruction, and the attorney-general, in such a manner as to do exact and equal justice to the several schools.[1] Each school is required to have at least six professors of liberal education and known ability in their respective departments: One of orthography, reading, and elocution; one of writing, drawing, and bookkeeping; one of arithmetic and the higher branches of mathematics; one of geography and history; one of grammar and English literature, and one of theory and practice of teaching, together with such professors, assistants, and tutors as the condition of the school may require. Every school is required to have attached to it one or more schools for practice, or model schools, with not less than 100 pupils, in which the students of the normal schools may have an opportunity to acquire a practical knowledge of the art of teaching. The qualifications for admission and the course of study are by law uniform in all the schools and are determined by a convention of the principals, subject to approval by the State superintendent.

The following notices are taken with much abridgment from the reports of principals of State normal schools to the State superintendent of public instruction and will be found in full in the last (1891) annual report of the superintendent, pages 183–198. The items in the footnotes are excerpted from the latest accessible catalogues of the several schools:

First District, West Chester (G. M. Philips, principal).—There has been no interruption in the prosperity of our school during the past year. Every year sees a substantial but healthy growth in our numbers, and, as usual, we report that the attendance during the past year has been the largest in the school's history. * * * The work in the gymnasium has been carried on with marked success. The physical measurements of our students at the end of the year, when compared with the measurements of the same students at the beginning of the year, showed marked improvement in almost every case. * * * Our post-graduate course has proved to be a marked success. It will be of great value in furnishing higher schools with competent, well-qualified teachers. * * * Many new books have been placed upon the shelves of the library, the number of volumes now reaching about six thousand. * * * The year just ended completes the twentieth year of this school's history, and the tenth of my principalship.[2]

Second District, Millersville (E. Oram Lyte, principal).—The prosperity of this school is still increasing, the attendance last year being the largest in its history. The total number of students for the summer session was 772 (386 of each sex), and 1,225 for the year. The graduating class numbered 72, all of whom obtained good positions as teachers, except a few who have returned to complete the scientific course. * * * One of the most important improvements made during the past year was the completion of the large gymnasium. The style of architecture of the building is Romanesque. The lower floor contains three rooms, entirely separated from each other. One of these contains the bowling and pitching alleys, and the others are each provided with lockers and bathing accommodations. On the main floor are the reception room, examination room, and the large room for exercising purposes, with elevated walking track, etc. The gymnasium is completely furnished with the latest and most approved apparatus. Two teachers are constantly engaged in the department of physical culture [one lady and one gentleman]. * * * Believing that a good model school is absolutely necessary for the proper training of

[1] The amount of special and direct State appropriations to the normal schools of Pennsylvania from the organization of each till June 1, 1891, was $1,520,000.

[2] The West Chester State Normal School was founded in the year 1871 by joint efforts of the trustees of the West Chester Academy and the citizens of West Chester and vicinity. The main building is new, built of greenstone and marble, 256 by 234 feet, four stories high with basement. It is one of the finest and handsomest school buildings in the country. A first-class gymnasium, 104 by 64 feet, is just being finished. It is of stone, two stories high, and is fitted up with every modern improvement, including a full supply of the best apparatus, running track, bathrooms, large swimming pool, bowling alleys, ball cage, etc. With the single exception of Harvard's, it is the largest gymnasium in America, and is believed to be, without any exception, the best and most complete gymnasium connected with any school or college in the United States. The school property has now cost upward of a third of a million of dollars. The number of different students during the year (1889–90) was 709, of whom 395 were ladies and 314 gentlemen. (Nineteenth Annual Catalogue of the West Chester State Normal School, 1890).

teachers, no expense has been spared to increase the efficiency of our practical school. It now contains nine grades, beginning with the kindergarten and ending with the advanced grammar grade.[1]

THIRD DISTRICT, KUTZTOWN (Nathan C. Schaeffer, principal).—The new wing was ready for occupation at the opening of the spring term. The class rooms in it, equipped with all the latest improvements, added greatly to the efficiency of our work. We were thereby enabled to reduce the size of our classes. When students recite in sections numbering from 20 to 30 they can complete a course of several years in a session or two less than it takes if they recite in classes numbering from 50 to 75. Mental growth is greatly stimulated by daily individual contact with live teachers. Probably the greatest need of our Pennsylvania normal schools is a faculty paid by the State. This would lead to free tuition, smaller classes, a standard of scholarship for admission, and would put an end to the strained relations that sometimes result from undue competition.[2]

FIFTH DISTRICT, MANSFIELD (D. C. Thomas, principal).—Six hundred and twenty-nine students were enrolled during the past year. Of these, 93 graduated in the elementary course, 2 in the scientific, and 12 in music. The accommodations in our ladies' building were not sufficient for the constantly increasing attendance of that sex. An addition to the present building is in process of construction. When done, it will be a magnificent structure. The work will cost at least $100,000.

SIXTH DISTRICT, BLOOMSBURG (J. P. Welsh, principal).—The year just closed has added another year of success to the history of this institution. The attendance has been greater than ever before; the senior class was the largest ever graduated here, and was composed of young men and women of exceptional promise as teachers. One hundred and five certificates of admission to the next senior class were issued to juniors at the close of the year, while 37 applicants for this certificate were rejected by the faculty. * * * In September last the manual-training department was organized, and was placed under the management of a teacher who received special training for the work. Under his direction this department has been a marked success. Students, grading from the model school to the senior class, received instruction in the nature and uses of tools and materials. A series of graded lessons has been arranged for this purpose, which terminate in the senior year with wood carving and the construction of useful articles, such as philosophical and mathematical apparatus needed in schools. * * * The classes of 1891 and 1892 have presented to the school a set of gymnastic apparatus, consisting of chest weights, intercostal machines, parallel bars, vaulting bars, wrist machines, flying rings, quarter circles, giant strides, boxing gloves, striking bags, etc. * * * I believe that the professional character of the normal schools would be elevated if, in every instance, all applicants for the normal certificate were examined in actual teaching.[3]

---

[1] The normal school buildings are large, the east front being 352 feet and the south front 160 feet, and conveniently arranged in every respect. There are boarding accommodations for 400, and school accommodations for 800 students. The buildings are surrounded with grounds to the extent of ten acres, which have been tastefully laid out and are used for play and pleasure grounds. The value of the buildings, grounds, furniture, etc., is more than $250,000. The institution is well supplied with philosophical apparatus, and possesses also a good cabinet of mineralogical, geological, and ornithological specimens. The total number of students from the opening of the school to the close of the school year in 1888 was 22,184, and the number of graduates 905. The number of volumes in library, 5,550. (Thirty-sixth Annual Catalogue of the Pennsylvania State Normal School at Millersville, Lancaster County.)

[2] There is a striking resemblance between the origin of the Kutztown Normal School and that of the normal school at Millersville. Both owed their beginning to the efforts of the respective county superintendents, John S. Ermentrout and James P. Wickersham. Both commenced as summer normal schools. Both were developments of neighborhood academies. Before the organization of the Kutztown school there existed in Kutztown and the neighborhood mere academies or seminaries under the control of a limited number of stockholders—the Franklin Academy, the Fairview Academy, and Maxatawny Seminary. But the people demanded better education, and were willing to embark in any enterprise that promised to improve their schools. As the county superintendent was traveling from Lyons to Kutztown, he saw in the distance the building known as Maxatawny Seminary. It occurred to him that, if the people of this section had taken sufficient interest in the cause of education to erect that building, they might be induced to assist him in carrying out his project of establishing a regular State normal school for the Third normal district. In 1865 the teachers were invited to attend a county normal school in Maxatawny Seminary. Students flocked thither from every part of the county and from adjacent districts, and the seminary was found to be too small for their accommodation. This inspired the people with a determination to erect such buildings as the school law requires and to establish a regular normal school for the Third normal district. (Historical Sketch of Kutztown and Maxatawny, by John S. Ermentrout, 1876.)

[3] The school property attracts much attention. It is at an elevation of over 150 feet above the Susquehanna. The view from this elevation is almost unrivaled. Fourteen acres of campus afford ample space for lawns and athletic ground, and include a beautiful oak grove of 3½ acres. The three main buildings are of brick—one is the dormitory, two are devoted to school work. Institute hall contains an auditorium capable of seating 900 persons. The dining room is 100 by 40 feet, and will accommodate over 300 guests. The manual-training room is 40 feet square, and contains benches and tools for the accommodation of 30 pupils at a time. About 250 pupils, at different periods of the day, pass for instruction to this department. They are taught here the structure and uses of different

SEVENTH DISTRICT, SHIPPENSBURG (G. M. D. Eckles, principal).—The year just closed has been one of unusual prosperity for the Cumberland Valley State Normal School. There has been a considerable increase in the patronage of the school, and we believe a marked improvement in the character of the work done. We graduated fourscore young men and women from our school this year, by far the largest class in its history. This increase in numbers has not been secured by any sacrifice of the standard of qualifications fixed by the school. In our junior class the grade of qualifications has been raised, and we expect to continue the raising of our standard with this class from year to year, as the raising of the standard of the juniors is necessarily followed by a corresponding raising of the standard of the seniors. Nearly all the dormitories have been painted and ornamented with neat designs. The designs for the room decorations were all made by students and by those connected with the school.[1]

EIGHTH DISTRICT, LOCKHAVEN (James Eldon, principal).—The Central State Normal School is now fully established in its new home. During the year which ended July 2, 1891, every room in the building was occupied, two in a room, and many boarders had to be accommodated with lodgings in adjacent buildings. At the last commencement 44 graduated in the elementary course, and 90 juniors were admitted to the senior class. Several of the graduates before the term closed were elected to responsible positions as principals of schools.[2]

NINTH DISTRICT, INDIANA (Z. X. Snyder, principal).—Growth characterizes the living. From this standpoint the Indiana normal is a living institution. During the year it has grown in every direction—scholastically, professionally, in efficiency, in teaching power, and in numbers. The annual attendance was 790. * * * The erection of a greenhouse has aided very materially in the beautifying of the grounds. * * * One hundred guns were received from the State for the purpose of military drill. * * * In our industrial department three types of work are done: Kindergarten, sloid, and manual training. * * * A number of good microscopes were purchased for the science department. * * * The model school has passed from a mere practice school to a model school in the true sense. It is a school where experts teach, enabling the juniors and seniors to observe. * * * The trustees contemplate the erection of a gymnasium. It will be commenced in the spring. * * * The classes of 1889 and 1890 erected a beautiful fountain on the campus.[3]

TENTH DISTRICT, CALIFORNIA (Theo. B. Noss, principal).—Our attendance of students was larger than ever before, reaching a total of 711, of whom 502 are in the

---

kinds of wood, the nature of each tool, and the principle on which it works; they then make a drawing, afterwards an object to correspond, and finally give an oral or written description of the object. * * * Lessons are given in shorthand and typewriting. * * * An athletic association, composed of students, has charge of all outdoor sports, such as baseball, tennis, football, and the like. The ladies are drilled in wand and dumb-bell exercises, and have organized several walking clubs. (Circular of the State Normal School of Bloomsburg, Pa., 1891.)

[1] The last catalogue (1890–91) claims for the Shippensburg school the following among other advantages:

1. We employ none but high-grade teachers. * * * All our teachers are specialists in their departments.
2. Our school is thoroughly and properly disciplined. * * * We hold ourselves responsible for the moral as well as the intellectual development of our students.
3. We lay great stress on the professional training of our students. * * * The practice teaching in the model school is under skillful supervision and competent direction.
4. Our school is organized in the interest of the students. Our system of classification enables us to advance students as rapidly as their progress will permit. No person is held in check to accommodate the interests of dull and inattentive scholars.
5. Our graduates are distinguished by their originality, being something more than blind imitators.
6. Our school is not crowded beyond its capacity.
7. Our graduates are doing noble work in their chosen profession. We have no difficulty in securing good positions for them.
11. We do not claim to have the best school in the country, but we do claim that there is none better.

[2] This school was founded in 1871, but was not open for the admission of students until the fall of 1877. In December, 1888, the fine building occupied by the school from its organization was totally destroyed by fire, but the work of instruction was carried on without interruption in a large hotel building, fitted up for the purpose. In May, 1890, the new building was occupied, 200 students being present. To the erection of this building the State contributed $105,000. It is of brick, with brownstone trimmings, and has three distinct parts. It is lighted at night by 450 electric lamps.

The training school is composed of children from 5 to 6 years of age. These are divided into classes so as to represent every grade of teaching required in the public schools of the State, from the kindergarten to the high school. The time given to the practice of teaching is not less than forty-five minutes each day for twenty-one consecutive weeks. All students receive class instruction in vocal music. Lessons are also given, at an extra charge, on the piano, organ, violin, cornet, and other instruments. There are two literary societies, each having its own hall, library, and reading room. The art department offers instruction in oil painting, china painting, portrait painting, and sketching.

Principals.—Albert N. Raub, 1877–1884; George P. Beard, 1884–1887; James Eldon, 1887. (Catalogue of 1891–92.)

[3] The catalogue of 1890–91 showed seven departments: (1) Kindergarten department, (2) primary department, (3) grammar department, (4) high school department, (5) principals and superintendent's department, (6) ungraded department, (7) manual-training department.

normal department and 209 in the model school. A new building is now in course of erection. It will be used for the model school, for the sloid shop, and for the natural science department. The large attic story of this building, which is 86 by 56 feet in size, will be fitted up as a gymnasium. Our graduating class this year consisted of 18 gentlemen and 17 ladies; most of these have already secured desirable positions as teachers for the coming year.[1]

Eleventh District, Slippery Rock (Albert E. Maltby, principal).—The normal school at Slippery Rock has just closed a very successful school year. The increased attendance under adverse circumstances is certainly very encouraging, and the future seems bright with indications of continued growth and prosperity. Our last graduating class numbers 12. * * * Over 500 pupils were in attendance during the year, and the class-room accommodations were taxed to their utmost extent. * * * The plans for a new building have been drawn, and work will begin immediately. The structure will be in brick, handsomely ornamented with stone, and will contain class rooms, society halls, reading rooms, music rooms, parlors, library, gymnasium, offices, and principal's residence. The total cost is estimated at $50,000. * * * Every effort is being made to bring out the beautiful in our campus and school grounds. An addition of some 5 acres, and the planting of many valuable trees have done much toward improvement in appearance. The ball field is unsurpassed by that of any other school.[2]

Twelfth District, Edinboro (Martin E. Benedict, principal).—The past school year closed the 3d of July. There were 89 graduates. One hundred received junior certificates. * * * The average age of the class was 22 years and 8 months. Over 60 had taught in the public schools. Nearly all have entered the schoolroom as teachers, and they received from $40 to $100 a month. * * * In the model school, 60 students can practice a day, one class each. * * * The library occupies a room 50 by 65 feet, and is open daily from 8 o'clock a. m. until 4.15 p. m. The books are in open cases and all students are free to take books from the cases. The librarian is in constant attendance. * * * In recitation the students stand at the blackboard with chalk and pointer, or directly before the class, and in their own language give the substance of the lesson.[3]

Thirteenth District, Clarion (A. J. Davis, principal).—This school completed the fourth year of its history without any remarkable changes or innovations. The stringency of the times affected the population of the district with peculiar force, and

---

[1] Number of students—413 normal, 229 model. On the 11th of April, 1890, the school celebrated the twenty-fifth anniversary of its opening under the charter name of South Western Normal College. It is the outgrowth of an academy first opened in 1852. From the time the success of the experiment at Millersville, in 1855, became known, the undertaking of a similar enterprise at California was freely discussed and was finally achieved (1874). (Catalogue of the State Normal School at California, 1891.)

[2] During the autumn of 1887 the question of organizing a school in the town was agitated. The project found many friends and soon assumed definite form. A meeting was called at which it was determined to erect a building and open an academy. The community was canvassed for money to erect a building and support a school until it should become self-sustaining. While this work was in progress the discovery was made that there was no normal school in the district. A second meeting was called, at which it was resolved to erect the necessary buildings and apply for recognition as the State Normal School of the Eleventh district. In the spring of 1888 an organization was effected, a charter obtained, and the erection of the buildings was begun. In the spring of 1889 the buildings were completed and inspected by the committee appointed by the State, who unanimously recommended the "recognition" of the school as the State Normal School of the Eleventh district. The number of students on the catalogue of 1890–91 was 340 in the normal department and 160 in the model school.

[3] *Means employed to train teachers.*—These are study, recitation, reading, observation, practice, and instruction. The value of study varies, *ceteris paribus*: (1) As the time spent in the study; (2) as the square of the engergy; (3) as the square of the interest; (4) as the cube of the methods; (5) as the fourth power of the quality; (6) as the spirit of willing obedience.

Students in the normal school recite as teachers. They receive no help. Each member of the class while others are reciting is both pupil and critic. The normal school teachers aim to act as model teachers, and thus student teachers, even unconsciously at recitation, become acquainted with methods of teaching.

The library is rich in works upon teaching, and students are taught to select, read, and digest the thoughts of educational writers.

The library occupies a room in the new building 50 by 65 feet. It is opened daily from 8 a. m. until 4.15 p. m. The students learn to know books and to enjoy reading them. They are taught to read with profit, and are referred to the manual of reading among the reference books. The books are classified as follows: (1) Works of reference; (2) works upon teaching; (3) periodical literature.

Two literary societies, the Potter and the Everett, hold regular sessions Saturday afternoons. Each occupies a pleasant and well-furnished hall 25 by 40 feet. All students are free to join or not, as each prefers.

A musical department has been organized whose aim is to prepare teachers for leading the music in public schools, and for skill in teaching music. Especial attention is given to the cultivation of a musical touch and a correct interpretation of the standard works. The department offers two courses, (1) a course for the thorough training of teachers; (2) a course for persons wishing to become skilled singers.

The number of normal pupils is 670, of whom 345 are reported as "unclassified." The model school numbers 208.

the attendance of students during each term was less than in the corresponding terms of the preceding year, the first instance of retrogression since the organization of the school. * * * The number of books in the library is about 3,000. * * * The senior class manufactured a fine lot of apparatus, under the direction of the professor of physics and the instructor in woodworking.[1]

The course of study in the State normal schools of Pennsylvania is intended to be uniform and is prescribed by a convention of principals, aided by the State superintendent; but as the order in which the legal studies are to be pursued is not prescribed, and the number and kind of additional studies are not limited, each school maintains a distinct personality, notwithstanding the basis of uniformity. The legal course and one of the catalogue courses (Bloomsburg) are given below :

The courses of instruction prepared for the State normal schools of Pennsylvania, and approved by the State authorities, are as follows :

ELEMENTARY COURSE.

JUNIOR YEAR.

Pedagogics.—Elements of school management and methods.
Language.—Orthography and reading; English grammar, including composition; Latin, sufficient for the introduction of Cæsar.
Mathematics.—Arithmetic, except mensuration; elementary algebra.
Natural science.—Physiology and hygiene.
Historical sciences.—Geography, physical, mathematical, and political; history of the United States; civil government.
The arts.—Penmanship, sufficient to be able to explain some approved system, writing to be submitted to board of examiners; bookkeeping, single entry, seven weeks; drawing, a daily exercise for at least twenty-eight weeks, work to be submitted to board of examiners; vocal music, elementary principles, and attendance upon daily exercises for at least one-third of the year.

SENIOR YEAR.

Pedagogics.—Psychology, embracing the intellect, sensibilities, and will; methods; history of education; model school work, at least twenty-one weeks of actual teaching daily during one period of not less than forty-five minutes; a thesis on a professional subject, and two meetings each week for the discussion of the practice of teaching.
Language.—The outlines of rhetoric, together with at least a fourteen weeks' course in English literature, including the thorough study of one selection from each of four English classics; Latin, Cæsar, through the Helvetian war.
Mathematics.—Arithmetic, mensuration; plane geometry.
Natural sciences.—Elementary natural philosophy; botany.
Historical sciences.—Reading of general history in connection with the history of education.
The arts.—Elocutionary exercises in connection with the study of English literature.

SCIENTIFIC COURSE.

Pedagogics.—Moral philosophy; logic; philosophy of education; course of professional reading, with abstracts, notes, criticisms, to be submitted to board of examiners.
Language.—Latin, six books of Virgil, four orations of Cicero, the Germania of Tacitus, or a full equivalent; an equivalent of Greek, French, or German will be accepted for spherical trigonometry, analytical geometry, calculus, mathematical natural philosphy, and mathematical astronomy; literature.
Mathematics.—Higher algebra; solid geometry; plane and spherical trigonometry and surveying, with use of instruments; analytical geometry; differential and integral calculus.

---

[1] This school is the outgrowth of the Carrier Seminary, and was recognized as a State normal school in February, 1887. It was opened on the 12th of April following with 150 pupils in attendance. The catalogue of 1888 contains the names of 364 normal students. The seminary hall contains the chapel, auditorium, principal's office, recitation rooms, library, and gymnasium. The school gives a four years' course in music, instrumental and vocal. Lessons are given in oil painting, china painting, crayoning, and pencil drawing; and also in stenography and telegraphy. (Second Annual Catalogue of the Pennsylvania State Normal School, at Clarion, Pa., 1888.)

Natural sciences.—Natural philosophy, as much as in Snell's Olmsted; astronomy, descriptive and mathematical; chemistry; geology or mineralogy; zoology.

History.—General history.

COURSE OF INSTRUCTION ARRANGED FOR THE STATE NORMAL SCHOOL AT BLOOMSBURG.

ELEMENTARY COURSE.

JUNIOR YEAR.

First term.—Arithmetic, beginning with stocks, as in Brooks's; English grammar, beginning with "Complex sentences" in Reed & Kellogg; reading and spelling, Latin, geography, practical teaching, drawing, vocal music.

Second term.—Arithmetic, algebra, beginning with "fractions" in Wentworth; English grammar, Latin, history of the United States, beginning with administrations; practical teaching, drawing, bookkeeping.

Third term.—Algebra, English composition, reading and spelling, Latin, civil government, ½; geography, mathematical and physical, ½; physiology, practical teaching.

SENIOR YEAR.

First term.—Geometry and mensuration, rhetoric, reading of general history, natural philosophy, school economy, teaching, mental philosophy.

Second term.—Geometry and mensuration, English literature, elocution, Cæsar, botany, ½; natural philosophy, ½; methods of instruction, teaching, mental philosophy, history of education.

Third term.—Geometry and mensuration, Cæsar, botany, methods of instruction, teaching, history of education.

SCIENTIFIC COURSE.

When students have completed the studies of the elementary course or the equivalents they can enter this course and graduate in two years. The studies are as follows:

JUNIOR YEAR.

Philosophy of education, higher algebra, solid geometry, plane and spherical trigonometry, surveying, analytical geometry, chemistry, geology, mineralogy, general history, Latin, professional reading.

SENIOR YEAR.

Differential and integral calculus, natural philosophy, mathematical and descriptive astronomy, logic, zoology, moral philosophy, Latin, English literature, professional reading, general review.

All students in this course have the privilege of taking an equivalent of Greek, French, or German for the portions of higher mathematics, specified under substitutions.

ACADEMIC DEPARTMENT.

1. Preparatory collegiate.

FIRST YEAR.

Latin, arithmetic, English grammar, history.

SECOND YEAR.

Latin (Virgil), Greek (Anabasis and Iliad), Latin and Greek composition, geometry, history, Franklin's autobiography, Milton.

2. General academic.

JUNIOR YEAR.

First term.—Orthography and reading, English grammar, history of England, arithmetic, physiology, geography, penmanship and drawing, vocal music.

Second term.—Orthography and reading, English grammar, arithmetic, algebra, United States history, Latin, penmanship and drawing.

Third term.—English grammar, civil government, Trench on Words, algebra, botany, Latin, drawing.

SENIOR YEAR.

First term.—Mental philosophy, natural philosophy, geometry, rhetoric and English classics, bookkeeping, drawing.
Second term.—Geometry, Latin, English classics, elocution, drawing.
Third term.—Latin, reviews, drawing, geometry.

3. Senior academic year.

First term.—Trigonometry and surveying, chemistry, elements of criticism, French, German, or Latin.
Second term.—Geology, political economy, general history, French, German, or Latin.
Third term.—Evidences of Christianity, astronomy, general history, French, German, or Latin.

The Pennsylvania normal schools are not free schools. The local boarding-school element from which most if not all of them were "evolved" rendered it imprudent to make tuition free; but by an act of the legislature the following appropriations are made by the State of Pennsylvania to normal students and graduates:

1. Each student over 17 years of age who shall sign a declaration of intention to teach in the common schools of this State shall receive the sum of 50 cents per week.
2. Each student over 17 years of age who was disabled in the military or naval service of the United States, or of Pennsylvania, or whose father lost his life in said service, and who shall sign an agreement as above, shall receive the sum of $1 per week.
3. Each student, who, upon graduation shall sign an agreement to teach in the common schools of the State two full years shall receive the sum of $50.
4. Any student to receive these benefits must attend the school at least one term of twelve consecutive weeks, and receive instruction in the theory and practice of teaching.

The amount expended under this act in the school year ending June 1, 1891, was $47,875.25.

Comparative table of statistics of the State normal schools of Pennsylvania for the school year ending June, 1890.

Schools.	1891. Years in existence.	1890. Population of district.	Appropriation granted.	1890.

[1] No school organized.

[2] Not included in State school system.

NEW JERSEY.

Early History.

In 1825 Philip Lindsay, D. D., acting president of the College of New Jersey, advocated the establishment of teachers' seminaries, for these among other reasons:

That at present the great mass of our teachers are mere adventurers; either young men who are looking forward to some less laborious and more respectable vocation, and who, of course, have no ambition to excel in the business of teaching and no motive to exertion but immediate and temporary relief from pecuniary embarrassment, or men who despair of doing better or who have failed in other pursuits, or who are wandering from place to place, teaching a year here and a year there, and gathering up what they can from the ignorance and credulity of their employers.

Three years later Prof. John Maclean, afterwards president of the University of New Jersey, recommended, in a lecture on the school system of the State, "the establishment of an institution to educate young men for the business of teaching."[1]

Nineteen years after this (1847) a convention of the friends of education in Burlington County, N. J., was held at Mount Holly. A committee on business was appointed, who reported a series of resolutions in favor of the establishment of a State normal school. The resolutions were fully discussed, but in order to afford time for further deliberation the convention adjourned to meet in the same place on the 2d of December. At this adjourned meeting letters of approval and congratulation were read from the following eminent public men: William H. Seward, of New York;[2] Rev. William H. Campbell, secretary of the executive committee of the State normal school at Albany;[3] Bishop Potter, of Pennsylvania;[4] Joseph R. Chandler, editor of the United States Gazette;[5] Horace Mann, of Massachusetts;[6] Edward Everett;[7] John G. Pal-

---

[1] Report of the United States Commissioner of Education, 1868.

[2] The advantages resulting from the professional education of teachers in what are called normal schools are universally conceded among the friends of education in this State. If I had ever doubted on this subject, all my doubts would have been removed by the experiment of the institution in this city (Albany), which has been eminently successful. The ultimate operation of normal schools will be to elevate the standard of public education and, of course, the dignity of those to whom its labors are confided. (Report on normal schools to the convention of the friends of education, Burlington, N. J., 1847.)

[3] I had doubts when our normal school was first started as to the necessity of such an institution among us; but my opinion is entirely changed. * * * I have become convinced of the great value of the normal school. My conviction is the result of actual observation, and from this I feel justified in saying that a normal school is indispensable in carrying out any State educational system. * * * I hope soon to hear that New Jersey has instituted a State normal school. (Ib.)

[4] I rejoice to hear that the State of New Jersey is moving in respect to the education and training of teachers for common schools. It is beyond doubt the most essential step in the great work of improving and, as it were, of regenerating our system of common-school instruction. * * * The establishment of the State normal school was therefore looked forward to as the essential complement to all other plans. (Ib.)

[5] While all other professions and pursuits have their appropriate schools and other means of preparation for the duties of their calling, why should the teacher alone be neglected? Why should he be allowed to try experiments upon our children until he has learned how to teach, wasting the precious time of our youth by the timidity naturally resulting from his want of practice, or destroying their tempers by the restlessness of one who has never learned to have command over himself? * * * I really believe that the important scheme of public schools can not be carried out as it should be without trained teachers. (Ib.)

[6] I regard normal schools as the one indispensable thing for carrying forward a system of common schools. * * * How it can happen that a man shall need to serve an apprenticeship to make a boot, but can instruct and train a child by instinct is more than I can comprehend. (Ib.)

[7] It affords me much pleasure to hear that you are taking measures for the establishment of a normal school in New Jersey. * * * It seems quite evident that the art of teaching—an art so difficult and so important—should require some special training for its attainment. If it did not, it would differ from all other intellectual arts. * * * The fact is that hardly any teacher is, as such, self-formed. He employs, as an instructor, the methods which were in use at the school where he received, his own education some years—perhaps a good many years—before. His teacher, in like manner probably followed traditionary methods. Such a course can result in nothing but the perpetuation of errors, and must end in degeneracy. (Ib.)

frey, editor of the North American Review;[1] John A. Dix, of New York, formerly superintendent of common schools;[2] David P. Page,[3] principal of the New York normal school at Albany.

The business committee reported a forcible and logical argument in favor of establishing a State normal school, and answering the most plausible objections.

(1) As to the expense.

(2) As to the difficulty of securing the services of the graduates of the normal school to the business of instruction in the State.

(3) As to the allegations that there is no necessity for normal schools, inasmuch as the business of instruction, like other social and private wants, is regulated by the commercial law of supply and demand.

(4) As to the assertion that it is not so much teachers that we need, nor schools for the education of teachers, as it is a higher compensation for their services.

(5) As to the apprehension that a due measure of religious instruction and influence can not be reconciled with the exclusion of sectarianism.

(6) That normal schools are an importation from Prussia, a monarchy, a despotism, well enough adapted to such a Government, but unsuited to the genius and temper of ours.

Time having thoroughly refuted the objections, the cogent and eloquent answers given in the report may be omitted here; but one is tempted to imagine that Bryant wrote "*Error* crushed to earth will rise again" when one recalls the fact that thirty-seven years after this report was written the sixth objection was strongly but ineffectually urged in the legislature of a neighboring State by the son of a German Jew.

The report was accepted and the accompanying resolutions adopted seriatim without a single dissenting voice; yet it was not till the year 1855 that an act was passed by the legislature of New Jersey containing the following sections:

There shall be a normal school or seminary for the training and education of teachers in the art of instructing and governing the common schools of this State, the object of which school or seminary shall be the training and education of its pupils in such branches of knowledge and such methods of teaching and governing as will qualify them for teachers of our common schools.

The board of trustees are authorized to maintain a model school under permanent teachers in which the pupils of the normal school shall have opportunity to observe and practice the modes of instruction and discipline inculcated in the normal school, and in which pupils may be prepared for the normal school.

The act appropriated $10,000 annually to the support of the school, but no provision was made for a site or buildings. It was left to the people to supply by voluntary action the means for which no provision had been made by the legislature. This appeal to the people met with a warm and generous response. New Brunswick, Beverly, Orange, Trenton, and other places made liberal offers. After careful deliberation the trustees selected Trenton, where, by the liberality of the citizens, a large

[1] As chairman of a committee of our [Massachusetts] house of representatives I drew and defended the resolves of March 3, 1842, which placed normal schools on a permanent footing and established school libraries. I did more for others' good that day than in all the rest of my life put together. (Report on normal schools to the convention of the friends of education, Burlington, N. J., 1847.)

[2] It is now nearly nine years since I have been connected with the common-school system of New York. It was during the six preceding years, under my official superintendence, and it was among the first objects of my execution to improve the education of teachers; for without competent instructors schools are of very little use. * * * You will infer that I am very decidedly in favor of normal schools for the education of teachers. (Ib.)

[3] In our State there is no doubt in the public mind but that teachers should be specially educated. The question now started is, Ought they to be educated by the State? * * * It seems to me it must be done by the State or not be done at all. The pay of teachers is not generally high enough yet to warrant much outlay of time and capital by the teachers themselves in their preparations, and they must be encouraged to do it by having a portion of the expense paid for them. Schools for teachers started without public aid have failed, I believe, in every instance. At any rate, they have degenerated into mere academies, in which the pupils have, as elsewhere, been allowed to choose their own studies, and, of course, to choose to neglect the elementary branches most necessary for them to learn. (Ib.)

and commodious building was erected after a plan prepared by the trustees. Sundry citizens of New Jersey sent a petition to the legislature in 1861 praying for the repeal of the act establishing the State Normal School, and asking for the appointment of a joint committee to investigate certain matters therein referred to. The committee on education reported that they did not "perceive either the necessity or the expediency of a committee of investigation, because all the facts called for were fully set forth in public documents to which all have ready access." The petitioners submitted that "at times like the present no unnecessary burden should be laid upon the people." The committee replied that "the great lesson taught at times like these [the beginning of the war] is that we should relax no effort, omit no expenditure, and cripple no resource necessary to the instruction and enlightenment of the masses of the people. The whole fabric of our Government reposes upon the foundation of virtue and intelligence universally diffused among the people; but such a foundation is possible only through good common schools everywhere established, liberally supported, and efficiently conducted by able and skillful teachers. To make good schools, we must first make good teachers. This is precisely the object and aim of the normal school, and the committee believes that a thorough investigation of the facts will establish beyond controversy that these aims and objects are being realized in a most satisfactory degree."

The committee concluded with a unanimous expression of their conviction that the prayer of the petitioners ought not to be granted.

There was until lately in some parts of the State a feeling adverse to the continuance of the normal school. The opposition was partly caused by entire misapprehension of the character and aims of the institution, and partly by an exaggerated estimate of the annual cost of supporting it. Not a solitary well-founded objection was raised, but the attacks being repeated annually were detrimental to the best interests of the institution and to the cause of popular education in the State.

Opening of the School at Trenton.

The State Normal School of New Jersey was opened in the fall of 1855 in a temporary building, rented for the purpose. New buildings were erected from time to time as they were needed. The last building was completed in 1890. It is so located as to connect the old buildings and thus enable the students to pass to all parts of the entire institution without going out of doors. It contains a chemical laboratory, a physical laboratory, a manual training shop, a library, a gymnasium, and an auditorium which seats about 600 persons.

On the opening day, in October, 1855, there were 15 pupils in attendance. At the close of the half year, 43. The attendance varied considerably from year to year. After rising to 140 in 1863, it fell to 53 in 1866. Of late it has been steadily on the increase; the last catalogue contains the names of 326 students enrolled in the normal school; 541 in the model school, and 127 in the Farnum Preparatory School. The number of students graduated from the normal during the year was 89—7 men and 82 women. Twenty-four of the graduates were from the advanced course; the remainder from the elementary course. All of them, except 4, were teaching "when last heard from," at salaries ranging from $35 to $80 a month.

The Farnum Preparatory School is located in the city of Beverly on the Delaware River, about 15 miles from Philadelphia. It was built by Paul Farnum in the year of 1855, and by an act of the legislature in 1857 it was made a part of the State school system, and placed under the control of the trustees of the State Normal School. An endowment of $20,000 was bequeathed to the school by Mr. Farnum. The objects of the school are twofold: First, to act in conjunction with the normal school in the work of preparing teachers for the public schools of the State; secondly, to furnish to the citizens of Beverly and the vicinity a well-organized and well-conducted school, and the best advantages for the proper education of their children. Pupils,

intending to teach are admitted into the four highest classes free of tuition charges. These pupils receive daily lessons in teaching, and are required to assist the instructors in the work of the school. After passing through the preparatory department, they are admitted to the professional course of the normal school without examination. The income of the school is derived from three sources—the State appropriation of $1,200 annually, the interest on the endowment of $20,000, and the proceeds of tuition fees, which average about $20 a year per capita.

Principals of the New Jersey State Normal School.

William F. Phelps	1855–1864
John S. Hart	1864–1870
Lewis M. Johnson	1870–1876
Washington Hasbrouck	1876–1889
James M. Green	1889

COURSE OF STUDY AT TRENTON SCHOOL.

The course of study for the normal extends through three years of two terms each. The work of the first year is formative in character, designed for such students as have been over it, but not in the thorough and disciplinary manner necessary to those who are to be teachers. While the work of this year can not be said to be strictly professional, it is made necessary by the conditions of our State, and, being taught by the regular normal teachers, it becomes in a peculiar way preparatory to the strictly professional work of the years to follow.

The work of the second and third years is strictly professional. While arithmetic, grammar, geography, United States history, etc., are again taken up in these years, they are considered fundamentally in the light of method or how to teach.

The professional subjects—psychology, theory and practice, the history and philosophy of education—are pursued, accompanied by practice teaching, extending over two years.

The practice teaching is so arranged that experience in teaching is given to each student in each of the common branches. This experience consists in observing the regular teacher, preparing plans for teaching, subject to the approval of the critic teacher, and actually teaching, both in the presence and absence of the regular teacher.

The following are the studies of the respective years. In each branch there are five forty-minute recitations per week, or the equivalent:

B.—Geography, physical and political; grammar, with composition; practical arithmetic; United States history, with Constitution; penmanship and bookkeeping; industrial drawing and vocal music, each the equivalent of one term; elocution, with orthography and declamation.

A.—Psychology, theory and practice, one term; methods in the elementary branches; practice, one term; zoology and physiology, one term; botany, one term; algebra, drawing, rhetoric, one term.

Senior.—Elementary physics; elementary chemistry, with mineralogy; geometry, first five books; Shakespeare, one term; outline history, one term; history and philosophy of education; practice teaching, two periods a day; manual training; physical training, throughout the course.[1]

MARYLAND.

The history of the State Normal School of Maryland is the history of the public schools of Maryland. Up to the year 1865 there was no general system of public schools, except in the city of Baltimore. There were schools in every county, some good, some bad, most of them indifferent; but there was no coordination, no supervision, and very little vitality. In 1864, when the star of the Confederacy was about to set, a constitutional convention was called, in which a large majority of the members were supporters of the Union. The two most important objects of this convention were the extinction of slavery and the establishment of a State system of education. Both were accomplished. The new constitution contained the following sections:

[1] Annual Catalogue of the State Normal School of New Jersey, 1891.

SECTION 1. The governor shall, within thirty days after the ratification by the people of this constitution, appoint, subject to confirmation of the senate at its first session thereafter, a State superintendent of public instruction. * * * He shall report to the general assembly within thirty days after the commencement of its first session under this constitution a uniform system of free public schools. * * *

SEC. 3. * * * In case of failure on the part of the general assembly to provide [a public school system as required by the constitution], the system reported to it by the State superintendent of public instruction shall become the system of free public schools of the State: *Provided*, That the report of the State superintendent shall be in conformity with the provisions of this constitution, and such system shall be subject to such alterations, conformable to this article, as the general assembly shall from time to time enact.

The chairman of the committee of education in the constitutional convention was Joseph M. Cushing, esq., of Baltimore. He foresaw the possibility that the legislature might not carry into effect promptly the constitutional requirements respecting education, and therefore persuaded the convention to order that the State superintendent (who had not yet been appointed) should prepare a bill and submit it to the next legislature, with the provision that if the legislature failed to enact a law as required by the constitution the bill should become law. It was already well understood that Dr. Van Bokkelen would be appointed State superintendent. To these two gentlemen belongs the chief credit for the establishment of the public school system of Maryland. They deserve to rank with the educational pioneers of Massachusetts, New York, and Pennsylvania.

The bill submitted to the general assembly by Dr. Van Bokkelen was "harmonious in its parts and comprehensive in its aims—a plan not of common schools, but of thorough and extended public education." It embraced eight titles: (1) supervision; (2) that which is to be supervised; (3) modes of securing competent teachers; (4) sources of income; (5) university of Maryland; (6) benevolent, remedial, and reformatory institutions; (7) aids and encouragements to universal education; (8) miscellaneous.

In the law finally enacted upon the basis furnished by the State superintendent the subjects embraced in the fifth, sixth, and seventh sections were omitted, and in the others his suggestions were followed without material variation.

In his first report, explaining the principles on which the bill was founded, Dr. Van Bokkelen says:[1]

The enactments of the bill submitted are predicated upon principles which have been often discussed and now are accepted as the foundation of all sound legislation on the subjects with which they are connected.

First. Education ought to be universal.

Second. Education ought to be free.

Third. The property of the whole State is responsible for such education of every child in the State as will prepare him to perform the duties of a man and a citizen, in obedience to the laws of God and the laws of the Commonwealth. * * * Education must be free, free as the light and the air. The public schoolhouse must be open to every child, as open as the public highway which leads to its door. And this, not because it is the charitable duty of the State to offer education to all, but because it would be a high crime against humanity to withhold it. The free schools of the State are in no sense charity schools. Through them the State does not give one jot or tittle that each child has not a right to claim. It is the duty of the State, as the agent of the people, as the legal trustee of the whole property which she protects and enables to be used, to take care that the young are not defrauded of their rights. * * * Hence, as a natural sequence, the law which provides at public cost universal and free education should oblige parents to send their children to school and should inflict severe penalties on manufacturers who task young children in their mills, wearing out their bodies and starving their minds. * * * To correct, perchance atone, for the errors of the past, it is proposed to establish at once a thorough system, perhaps a model system. Maryland has no time for gradual development.

[1] Report of the State superintendent of public instruction to the general assembly of Maryland, together with a bill entitled "A uniform system of public instruction for the State of Maryland," Annapolis, 1865.

By one volition she can attain that which has cost her sister States years of experiment to secure. She has taken her place among the Commonwealths that proclaim universal freedom; why not rank also with those that provide universal education? Not the education which halts before the door of the primary school, but marches on, takes the poorest youth whom God has endowed with intellect, nurtures that intellect, gives it the benefit of the best culture and exhibits the pure benevolence of republicanism, which, by bestowing equal privileges upon all, gradually raises the humble to an equality with those who enjoy all the benefits of wealth and social position. Wisdom counsels us not to wait for years to accomplish that which by one earnest, vigorous, unselfish effort can be done in months. The work is before us. No partial system of gradual development, waiting for the decay of old prejudices or the abandonment of local preferences, can do this. If done at all, it will be by a system, perfect in its adaptations, comprehensive in its aims, and immediate in its operations. It will cost money; so do all great public works; but it will be the best and most productive investment the State has ever made—the purse appropriated to the development of brain.

The bill of Dr. Van Bokkelen was not accepted in its entirety, but it became the basis of a system which, with many alterations in nonessentials, has lasted to the present day, has served as a model to other States, and was pronounced by the late governor of the State in his farewell message to be "nearly perfect."

The law as finally enacted provided for a State board of education, a State superintendent, county superintendents, district schools, graded schools, high schools, State uniformity of school books, a normal school and a model teachers' association, teachers' institutes, and an income from State taxation capable of supporting the schools six months in the year, with unlimited power of local taxation.

The first section of the chapter on the normal school reads thus: "There shall be located in the city of Baltimore, until the board of education shall otherwise direct, a State normal school for the instruction and practice of teachers of public schools in the science of education and the art of teaching and the mode of governing schools. The sessions of the State normal school shall be held in such suitable building as may be provided by the mayor and city council of Baltimore, or, they declining to do so, in such building as the State superintendent may select."

The mayor and city council of Baltimore "declined to do so." With a boys' high school and two girls' high schools, which they considered quite equal if not superior to a normal school, they did not feel under any obligation to enter into partnership with the school authorities of the State. Besides, at this time the relations of the State superintendent and the city superintendent were somewhat strained. Therefore search had to be made for a "suitable building." None could be found; but after patient waiting a large hall was procured, by no means suitable in any respect, but the best that could be obtained. The school was opened on the 15th of January, 1866, with 11 students. At the close of the session in June there were 48 names on the roll. The next year there were 129 students, divided into four classes, each of which occupied one of the four corners of the hall. Notwithstanding this disadvantage the numbers continued to increase steadily for six years, when a large and commodious building was rented at $3,000 a year, which gave accommodation to both the normal and the model school for three years. It soon became evident that even this large building would in a short time be too small. Accordingly it was necessary to apply to the legislature for a new building specially arranged for school purposes. Application after application failed to produce any result, but finally, by dint of constant hammering, an appropriation of $100,000 was granted to purchase a site and erect a building. The school took possession of the new building in 1876. It is a very beautiful structure and contains a hall capable of seating nearly 800 persons, ten class rooms, a library, a reception room, an office, a laboratory (physical and chemical), an apparatus room, a calisthenium, and a residence for the principal. But even this house is now insufficient for the demands of the school. It needs a larger library and reading room, a gymnasium, a lecture room, a drawing room, a manual training workshop, a larger chemical laboratory, a sewing room, a

kitchen for lessons in cookery, and additional cloak and toilet rooms. Numbers are no test of the professional value of a school, although they may afford a fair estimate of its popularity. One may travesty the words of Pope—

But most by *numbers*, judge the poet's song—

and apply them to schools, normal and abnormal. A school that gives what its clientèle demands, and at a satisfactory cost, is sure to grow in numbers, at least if it has been properly located. The Maryland school has never courted numbers. From 18— to 1890 one principal object was to retard its numerical growth. The organic law restricted the number of professional students pledged to teach in the public schools of Maryland to 200, with the permission to receive as many pay students as amounted to half the number of those enrolled and pledged to teach in the public schools. But as the free appointments were divided among the several counties in proportion to the number of representatives each county had in the general assembly, there arose a difficulty in the distribution. At first this arrangement allowed two students for each member of the legislature, but as the population increased the number of representatives increased, and the per capita became one and a fraction. Now there is no known method of teaching a fraction of a student or even of obtaining a fractional student to be taught, and so the multiplier 2 was necessarily continued, and under the present law must continue for many years.

As has already been stated, the law allows the admission, on the payment of fees, of one student, free of obligations to teach in the public schools, for every two who have signed the declaration of their intention thus to teach. The purpose was to preserve the professional character of the school as a training school for teachers. Accordingly no special instruction is given to unprofessional students; they simply have the privilege of joining such regular classes as they may be inclined and qualified to enter. There is but one curriculum for all. In striking contrast with the number of "courses" advertised in many normal-school catalogues—elementary, advanced, scientific, classical, commercial, collegiate, etc.—the primary object of the school is simply the training of young persons as teachers of the common district schools in esse and in posse. The effect of constant adherence to this principle has been that about 95 per cent of the graduates and 50 per cent of the undergraduates and a majority of the unpledged students who completed the course have become teachers of the public schools—a small proportion of them in city schools, but by far the largest number in rural districts.

A model school was provided for in the organic law: "The State board of education shall make provision for model and experimental primary and grammar schools, under qualified teachers, in which students of the normal school shall have an opportunity to practice the modes of instruction and discipline inculcated in the normal school." The model school is still an experiment, not an achievement. It was commenced in the first year as a school of observation and practice, the practice largely predominating. It was necessarily a pay school. Had it been a free school it would have come into undesirable competition with the public schools of the city. As a pay school, some parents complained, without just reason, that their children were made subjects of experiment. The fact is that the children were better taught than they had been before or have been since. But vox populi prevailed because the fees were a welcome addition to the restricted income derived from the State. The school then became a school of observation with a seasoning of practice. At present it affords a minimum both of observation and practice, owing to peculiar circumstances, which throw no light on the general question of the place of the model school in an institution for the training of teachers. The subject presents no difficulties in a city training school nor in small towns where there is a unity of purpose between the local school authorities and the superintendent of the normal school. But a State normal school, located in a large city, organized for the special

purpose of preparing teachers for the district country schools, will have a hard road to travel to establish a school of observation and practice which shall meet both the theoretical and practical requirements of the case.

The scholastic attainments required by law for admission into the normal school are a knowledge of the branches "hereinbefore required from teachers." In other words, an applicant for admission must be already legally qualified to teach school. The theory is correct, but in practice not one in ten would apply for admission. The aim of nine-tenths is to be legally qualified, not better qualified. A strict adherence to the law would have had the effect to prepare a very few teachers for higher—or, rather, for more remunerative—positions than country schools, and thus the main intent of the law would have been frustrated. The appointment of free students was vested in the boards of county school commissioners, and they, taking a practical and not a legal view of the case, sent up large numbers of students who needed academic rather than professional instruction, and the normal-school authorities had no right, and indeed no desire, to refuse them admission.

This large infusion of academic instruction was not without its advantages. The young graduate, when thrown upon his own resources as a teacher of a country school, found more help and inspiration in the recollection of the practices and methods of his normal teachers than in the psychological principles and pedagogical precepts with which his notebook was filled.

COURSE OF INSTRUCTION.[1]

The course of instruction extends through three years. Graduates of high schools and certificated teachers may enter the second year's class without examination, and the third year's class on passing an examination on the studies of the second year.

First year, first term.—Review of arithmetic, mental and written; geometry, first book; object lessons; history and geography; English composition, letter writing; pedagogy, lectures on methods in elementary schools; Latin grammar (optional).

First year, second term.—Algebra, through simple equations; English grammar, parsing and analysis; English composition; physiology; Latin reader (optional); lectures on teaching, organization and government of elementary schools.

Second year, first term.—Geometry (plane), continued; geography and map drawing; algebra, completed; botany and natural history; pedagogy, lectures on principles; Latin (optional), Virgil.

Second year, second term.—Arithmetic, completed; parsing and analysis; elocution; English literature; pedagogy, lectures on principles and methods; chemistry, laboratory work; cooking.

Third year, first term.—Physics; physical geography; botany (field work); English literature; geometry, completed; Latin (optional), Cicero.

Third year, second term.—General review of elementary studies, with reference to practical teaching; trigonometry and practical surveying (for men); bookkeeping by double entry; teaching exercises; pedagogy, history of education; psychology, logic.

Singing, drawing, and calisthenics are taught in every term except the last; also sewing (to women) and military tactics and the use of woodworking tools (to men).

Students will be examined on entrance in order to ascertain the proper class to which they should be assigned. Admission to the lowest class will require that the candidate should be able to read fluently, spell correctly, write legibly and rapidly, and perform accurately easy computations in whole numbers and in vulgar and decimal fractions. Young persons who have not received a good primary education should not expect to obtain it at this school, under the claim that they are training for teachers; but all due allowance will be made for earnest and diligent students who will exert themselves to obtain a good standing during the first term of probation. No student will be allowed to enter an advanced class until all the work required in the lower classes has been performed satisfactorily.

Students differ very greatly, both in natural ability and acquired preparation. It is not expected that all shall make equal advancement in equal times. To fail to pass an examination is of itself no disgrace. The disgrace lies in the want of due diligence; or, still more, in the desire to seem to be that which one is not.

III.

NORMAL SCHOOLS IN THE SOUTH ATLANTIC STATES.

VIRGINIA.

State Female Normal School, Farmville.

On the 31st of March, 1879, the senate of Virginia passed the following resolution:

Whereas the State of Virginia, during almost the entire period of her history, has liberally provided for the higher education of her sons, and is now supporting three superior institutions for such purpose; and

Whereas the Commonwealth has never, at any period of her history, made any provision whatever for the education of her daughters; Therefore, be it

Resolved, That the superintendent of public instruction be, and he is hereby, requested to gather and in his next annual report furnish to this body such information and views in regard to higher female education as might be useful in considering the propriety and practicability of making by this State some provision in this direction; and that he inquire and report the cost of education in such female seminaries of other States as are assisted or supported at public expense with any matter of interest concerning the same.[1]

The resolution says not a word about normal schools—wisely, perhaps; higher education was more popular with Virginia legislators than normal education. But the State superintendent in his response to the order of the legislature included normal schools among the agencies of higher education, while he pressed upon the community "the unjust discrimination that had been made in favor of the sons and against the daughters of Virginia." Five years elapsed—years of financial embarrassment and years of needed enlightenment of the public mind under the tuition of that eminent public educator, Dr. W. H. Ruffner, State superintendent—and when the legislature of Virginia took up the question of the higher education of women in 1884 it was prepared to give a favorable answer.

The normal schools of the South, with the exception of South Carolina, were post bellum and, to a great extent, propter bellum. Being the necessary complement of a system of free schools, without such a system normal schools had no raison d'être. It is a curious coincidence that every argument that has been brought against the establishment of normal schools had previously been urged against the maintenance of free public schools. We may expect to find the development of a State system of public schools to be accompanied or followed by the establishment of normal

[1] Report concerning the State Normal School at Farmville. House Doc. No. 2, 1885.

schools. The efficiency of either may always be measured by the progress of the other.

The State Female Normal School of Virginia is the successor and, to a certain extent, the outgrowth of the Farmville Female College, an institution which had been in successful operation for many years previous to the transformation. The legislature enacted in 1884 that there should be established a normal school expressly for the training and education of white female teachers for public schools. Each city of 5,000 inhabitants and each county of the 100 counties in the State was to be entitled to send one pupil free of cost for tuition; also one free pupil for each additional representative in the house of delegates above one. The law appropriated $5,000 for preliminary expenses and $10,000 a year for current expenditure, the amount to be paid out of the public free-school fund. This last clause produced some embarrassment and delay. The second auditor refused to honor the draft of the school board for $10,000 because the attorney-general had given his opinion that it was not legally chargeable to the public-school fund, but to the general treasury, and the auditor declined to pay the amount out of any other fund than the one specified in the act. So the question was carried to the court of appeals, which decided that the amount could not be paid out of either. But the legislature at its first session thereafter cut the Gordian knot and the money was paid.

The first principal of the school was Dr. William H. Ruffner, who had been for twelve years previously State superintendent of public instruction. In an address delivered by him in 1885, before the county superintendents of Virginia, he explained the modes of teaching employed by the instructors:

In normal schools generally the oral method of instruction is employed more fully than is usually practicable in other schools. On most subjects there is no text-book used in the way text-books are commonly employed—that is, there is no uniform set of books in which lessons are assigned to be conned and recited. Books are used only for reference, and any book containing the facts or expositions wanted may be resorted to. In teaching the elementary principles of any study, no use whatever is made of a book.

The principle sought is developed as far as possible by a system of questions addressed orally to the students in class, which will often bring together truths already known in such a way as to reveal their fundamental relations and suggest the desired principle. Examples and perhaps concrete illustrations may also be employed as guides. The teacher must, of course, make affirmative statements, but these are made only when the principle or the fact can not be reached through the previously existing knowledge or the understanding of the student. When, by the combined efforts of teacher and students, the desired statement is put in due form, it is written on the blackboard and copied into the note books and subsequently recited upon. After a time topics are assigned, which the students are required to prepare themselves to expound, and they are expected to resort not to particularly specified books, but to any books they can find which will afford them the help they need. A reference room, furnished with suitable books, is provided for this purpose.

A still more specialized feature in the course is the teaching exercise, given daily by the students as a part of each lesson. The students repeat the teacher's work according to their several ability. Usually the student is notified in advance that she will be called upon to teach a given topic at the proper time, and she is expected to develop the subject by a carefully prepared system of questions and statements, exactly as if she were instructing a class in her own school. At the end of each exercise the members of the class are allowed to make criticisms, and the teacher also corrects any error as to matter or manner.

Dr. Ruffner's successor, Prof. John A. Cunningham, found that these teaching exercises occupied too large a part of the time of the class, and were in his opinion a serious obstacle to progress in the study of subject-matter. As the majority of students were pursuing many of their studies for the first time, it was thought impossible for them to assume the point of view of the teacher in a subject of which they had obtained an incomplete view. Besides, the necessity for such exercises had been lessened by increased amount of work in the practice school. Accordingly the

course of study was divided so as to give two years for academic training and one of strictly professional work. The courses of study, as now (1891) planned, are—

First year, two terms.—Language, including syntax, composition, and thorough sentence analysis; algebra and geometry; physiology, one term; physical geography, one term; general history, drawing, vocal music, elocution, Latin (elective).

Second year, two terms.—History of the English language, rhetoric, and literature; geometry, one term; a teachers' review of arithmetic, one term; chemistry, one term; civics, one term; drawing, vocal music, Latin (elective).

Third year, professional course.—Psychology; history and science of education; school management; methods in arithmetic, grammar, geography, and reading; school laws of Virginia; observation and practice in the model school.

Graduates from known high schools are admitted to the professional course and after one year's successful study under the direction of the faculty are given a diploma.

The annual appropriation from the State is $10,000.

The number of students for the year ending 1890 was 143, of whom 14 were in the professional course and 8 in special courses.[1]

WEST VIRGINIA.

Marshall College, Huntington.

The State normal school of West Virginia was established by act of the legislature February, 1867, which provided "That there be established a State normal school, to be called the 'West Virginia State Normal School,' for the instruction and practice of teachers of common schools in the science of education and the art of teaching." Marshall College, near the young and growing city of Huntington, having already acquired considerable reputation as an educational institution, was made the State normal school, and the property of the college was transferred to the State. Subsequently five branches of the State normal school were established by law, making six normal schools in the State.[2] The supreme direction is in the board of regents, composed of the superintendent of free schools, ex officio, and one member appointed by the governor from each of the four Congressional districts of the State. The board of regents has provided for two distinct courses of study in the State normal school and its branches—a normal training course and an academic course. The former occupies three years; the latter two years. The junior year in the normal department embraces orthography, reading, writing, arithmetic, geography, English grammar and language lessons, United States history, elementary algebra, civil government, physiology, drawing, exercises in composition and declamation. The middle year embraces orthography, reading, prose composition, sentence analysis, physical geography, algebra to quadratics, elements of general history, theory and practice of teaching, elements of pedagogy, the school law of the State, exercises in composition and declamation, ancient or modern languages (optional). The senior year includes spelling by dictation and written exercises, English literature and rhetoric, algebra (completed), elementary geometry and trigonometry, elements of natural philosophy, natural history, botany, bookkeeping by single entry, psychology, history of education, frequent exercises in hearing classes recite, the organization and classification of schools.

The practical working of the regents' scheme will be better understood from the following programme, taken from the Catalogue of the State Normal School at Fairmont for the year 1890:

Programme for daily work.

FALL TERM.

[8.45 to 9.10 a. m., opening exercises, including orthography.]

	9.10–9.50.	9.50–10.30.	10.40–11.20.	11.20–12.
Junior class ...	Civil government ..	Mental arithmetic..	Higher arithmetic to per cent.	Elementary language.
Middle class ..	Elementary algebra.	Mental to fractions.	Higher arithmetic to exchange.	Higher language begun.
Senior class ...	Higher algebra.....	Natural philosophy.	Psychology.....	English grammar.

	1.20–2 p. m.	2–2.40.	2.40–3.20.	3.20–4.
Junior class ...	Penmanship.....	United States history.	Reading	Intermediate geography.
Middle class ..	Elementary physiology.	Physical geography.	Elocution.....	Bookkeeping.
Senior class ...	Rhetoric.....	Geometry.....	English literature ..	General history.

WINTER TERM.

	9.10–9.50.	9.50–10.30.	10.40–11.20.	11.20–12.
Junior class ...	Civil government ..	Mental arithmetic..	Higher arithmetic to exchange.	Elementary language.
Middle class ..	Elementary algebra.	.....do	Higher arithmetic to series.	Higher lessons in English.
Senior class ...	Higher algebra.....	Natural philosophy.	Psychology.....	English grammar.

	1.20–2 p. m.	2–2.40.	2.40–3.20.	3.20–4.
Junior class ...	Penmanship.....	United States history.	Reading	Intermediate geography.
Middle class ..	Higher physiology..	Physical geography.	Elocution.....	Bookkeeping.
Senior class ...	Rhetoric.....	Geometry.....	English literature ..	General history.

SPRING TERM.

	9.10–9.50.	9.50–10.30.	10.40–11.20.	11.20–12.
Junior class ...	Elementary algebra begun.	Mental arithmetic..	Higher arithmetic to series.	Elementary language.
Middle class ..	Higher algebra to powers.	.....do	Higher arithmetic..	Higher English.
Senior class ...	Theory and practice school law.	Natural philosophy.	Psychology.....	Grammar.

	1.20–2 p. m.	2–2.40.	2.40–3.20.	3.20–4.
Junior class ...	Penmanship.....	United States history.	Elementary English literature.	Intermediate geography.
Middle class ..	Higher physiology..	Geometry begun ...	Higher English literature.	Bookkeeping.
Senior class ...	Rhetoric.....	Mensuration and trigonometry.	English literature ..	General history.

The academic course is understood to be equivalent to a preparatory college course, and is accepted as such by the State university.

Tuition is free to all regular normal students. The number of free appointments is regulated by the board of regents and distributed among the several counties of the State according to population. Each normal school is entitled to seventy free scholars, selected by the county superintendents and approved by the State superin-

tendent. "Male pupils must not be less than 14 and females not less than 13 years of age."

State Normal School, Fairmont.

The State normal school at Fairmont was opened in 1868. A bill proposing the establishment of such a school at this place was introduced into the legislature in the session of 1865–66, but failed to pass. Not discouraged by the failure, the citizens formed a joint stock company under the title of "The Regency of the West Virginia Normal School," secured a charter, purchased a lot, and commenced building, but before the house was completed the normal school passed under the control of the State. In 1872 a new and much larger building was erected, 80 by 40 feet and three stories high. The cost was about $20,000, of which one-half came from the State treasury and the other from the citizens of Fairmont and Marion County.

The course of study at Fairmont, though conforming to the requirements of the regents' course, is elastic and very accommodating:

Can pupils be accommodated in any course they may desire to pursue? Most certainly they can; and if classes are not formed ready for them to enter, such classes will be organized for their advantage. The plan of the school is to meet the demand of its patrons. * * *

To what extent can pupils pursue branches of learning? To this inquiry our reply is: To the same extent they can in any other institution. In this school there are both normal and collegiate departments. * * *

Is it better to remain out of school and teach a year, or to teach a term of four or three months each year and try at the same time to keep up with the classes in the normal school? We have no hesitation in saying it is best in every respect for the student, whether lady or gentleman, to teach but three or four months in the year and to hold his position in the classes of the normal school at the same time. This a young man of energy and good health and application can do by an extra effort. * * * The only plan to secure success on the part of young persons in gaining an education by their own efforts is to join the normal school at once, become identified with its work, and then avail themselves of the provisions of its regulations, which allow students to teach four months during the year.[1]

Shepherd College, Shepherdstown.

During the spring of 1871 Mr. Shepherd Brooks was asked to give the buildings erected by his grandfather, and which had been used as a court-house for some years, for the purpose of opening therein a classical and scientific school, and the request was readily granted. A board of trustees was incorporated, a charter obtained, and the school opened in September. In the following February the legislature authorized the organization of a branch State normal school at Shepherd College; but owing to legislative changes the school did not get fully into operation until September, 1873.

In addition to the normal and academic departments common to all the normal schools of West Virginia, Shepherd College has, according to the catalogue, a collegiate department, and an "ornamental department," which includes a course in vocal and instrumental music, a course in French, a course in botany, a course in drawing, and a course in art embroidery. The music course requires four years for its completion and the French course three years. The last catalogue has the names of twenty-three students in the "ornamental department."

Shepherdstown is a very interesting place. It is the oldest town in West Virginia. The college bears the name of one of the original settlers, Thomas Shepherd, who led a colony of emigrants from Pennsylvania in 1734. The battlefield of Antietam is but 3 miles distant. South Mountain is in sight, and farther east is Harper's Ferry. One of the cliffs, just outside the corporation, is known as Rumsey's Walk. Pacing its heights, an inventive genius, James Rumsey, conceived the plan of the

[1] Catalogue of the Twenty-first Annual Session of the Fairmont Branch of the West Virginia State Normal School at Fairmont, Marion County. Charleston, 1890.

first steamboat, and built a boat which antedates Fulton's by more than twenty years, and launched it on the Potomac in 1785.[1]

State Normal School, Glenville.

The State Normal School at Glenville was established by an act of the legislature passed in February, 1872, and was opened in pursuance thereof in January, 1873. In 1885 there was a State appropriation of $5,000 made for a new building, and in 1887 $2,000 additional were granted for the purchase of furniture and apparatus. As in the other normal schools of the State, there are two courses, the normal and the academic, arranged on the lines prescribed by the board of regents; but "any studies desired may be pursued in addition to those in the normal curriculum, and every pupil is always furnished with all the studies he can successfully pursue." Boarding, with room, fuel, and light, can be had at from $2 to $2.50 per week. "Boarding is lower priced here than at any other school of high grade in the State." Term reports, containing the number of days absent, the number of times tardy, and the average grade in each branch studied, and the results of examination in each branch, made up from the records of the school, are transmitted through the pupils to the parents or guardians of every pupil. There is a small but very useful library of reference books, and a cabinet of philosophical apparatus complete enough for the illustration of ordinary text-books on natural philosophy[2].

The students registered (1889–90) numbered 96; 19 seniors, 23 middle class, and 54 juniors. The faculty consists of the principal, two regular assistants and two assisting students.

NORTH CAROLINA.

State Normal and Industrial School, Greensboro.

The constitution of 1776 contained the following (Article XLI):

A school or schools shall be established by the legislature for the convenient instruction of youth, with such salaries to the masters, paid by the public, as may enable them to instruct at low prices; and all useful learning shall be duly encouraged and promoted in one or more universities.

The constitution of 1868, Article IX, section 16, declares that—

The general assembly shall establish and maintain, in connection with the university, a department of agriculture, of mechanics, of mining, and of normal instruction.

A considerable amount of normal instruction was given previous to 1888, in connection with the University of North Carolina, by means of teachers' institutes, summer normal schools, and a normal course of three months in the university; and in 1888 a chair of pedagogy was established. But as the university is open to men only, this step increased the urgency of the demand for a school for women. It was said, as had been said in Virginia some years previously, that it took the State more than a century to learn that "youth" means girls as well as boys; that from three-fourths to nine-tenths of the money used to employ instructors in higher education for boys is paid by State and national appropriations, or by the income from endowment funds; and that if the State proposed to pay for nearly all a boy's higher education, it ought to do at least as much for his sister. The justice of these views was clearly, forcibly, persistently, and one might almost say authoritatively, urged by the teachers of the State. The fourth annual session of the North Carolina Teachers' Assembly was held at Morehead City in June, 1887. It was one of the largest and most intelligent assemblages of teachers of one State ever seen in the

[1] Sixteenth Annual Catalogue of Shepherd College, branch of the State Normal School, Shepherdstown, W. Va. Charleston, 1889.

[2] Catalogue of the West Virginia State Normal School at Glenville, Gilmer County, W. Va., for the year 1889–90.

South. The chief topic discussed was the need of a State normal college for both sexes. The committee appointed at a previous meeting (1886) to memorialize the general assembly for the establishment of a normal college was continued, with instructions to keep the subject before that body until the college was established. Each succeeding teachers' assembly passed similar resolutions and appointed similar committees. One is reminded of the importunate widow whose "continual coming" worried the judge. But though the argument of the committee was reenforced by the governor and the State superintendent, it was not until 1889 that the subject was seriously taken up by the general assembly. At that session the legislature was "almost persuaded," the bill presented by the committee of the general assembly having passed the Senate, and failed in the House by but a few votes. At the next session, 1891, with the aid of the King's Daughters, Dr. J. L. M. Curry, and the North Carolina Farmers' Alliance, the assault was renewed and the fort surrendered.

The act establishing the institution required that it should be located "at some suitable place where the citizens thereof will furnish the necessary buildings or money sufficient to erect them." The town of Greensboro offered $30,000 cash and a 10-acre lot within the corporate limits—the last being a donation from two public-spirited citizens of Raleigh.

The buildings are beautiful without and comfortable within, and were expected to be ready for occupancy on the 28th of September, the day named for the opening of the school. The faculty consists of the president, Charles D. McIver, professor of (1) principles and history of education and the science and art of teaching, and professors in the following chairs: (2) history and English literature; (3) mathematics and German; (4) natural sciences; (5) physiology and hygiene, physical culture; (6) Latin and French; (7) vocal music and elocution; (8) industrial art; (9) domestic science.

It is intended that the school should embrace three departments: (1) The normal department; (2) the business department; (3) the domestic science department.

The object of the normal department is not only to give the very best literary and scientific training, but also to give such a course in the principles and history of education and in the science and art of teaching as will give the student the ability and the inclination to teach others.

The business or commercial course embraces stenography, typewriting, telegraphy, and bookkeeping, and is intended for women who wish to make their own living but have no desire to become teachers.

The domestic science department recognizes the fact that the natural and proper position in life for the average woman is at the head of her own household. It includes theory and practice in sewing, cutting and fitting, cooking, care of the sick, and general household economy.

To complete the full course of instruction will require four years of work, and graduates will receive a diploma equivalent to a life certificate to teach in the public schools of North Carolina.[1]

SOUTH CAROLINA.

The winged seeds of the "normal idea" had been wafted as far south as Charleston before the war; but what good seed could flourish amid the flames of civil strife? The people of South Carolina had a State normal school, not in idea merely, but in actual existence, in 1860. It was called the "Girls' High and Normal School;" but as each Congressional district was authorized to send fifteen students to the normal department, it was de facto a State normal school.

The commissioners of free schools, C. S. Memminger, chairman, in explaining the purposes of the school, say: "It is proposed to form into a special class all those [young women] whose purpose is to devote themselves to this honorable work [teach-

[1] Prospectus of the Normal and Industrial School of North Carolina, 1892.

ing], and whose qualifications admit of their receiving the proper course of instruction. * * * The power of teaching well comes not by intuition. * * * It comes as other arts come, by special training."[1]

Of course the school expired amid the flames.

In 1874 a State normal school was opened at Columbia, and after a short career, full of promise, was closed by the withdrawal of the State appropriation.

Winthrop School.

In the summer of 1886, Prof. D. B. Johnson, superintendent of the graded schools of Columbia, went north on a professional visit to several normal schools, and, in an interview with the trustees of the Peabody fund, was assured of an annual appropriation of $1,500 for the purpose of establishing, in Columbia, a training school for the teachers of South Carolina. In December, 1886, an act of the legislature was passed entitled, "An act relating to the Winthrop Training School for Teachers." The preamble and first section read thus:

"*Be it enacted by the senate and house of representatives of the State of South Carolina, now met and sitting in general assembly, and by the authority of the same:*

"Section 1. That there is hereby founded and established, at Columbia, S. C., 'The Winthrop Training School for Teachers;' that the particular aim and object of said school shall be to educate and train persons desirous of following the profession of teaching."

Section 2 constitutes the board of school commissioners of the city of Columbia ex officio "Trustees of the Winthrop Training School for Teachers," and confers upon them the most ample powers for the execution of the trust.

Section 3 provides that the functions and duties of the trustees of the Winthrop Training School for Teachers shall be separate and distinct from those of the school commissioners of the school district of the city of Columbia.

Section 4 authorizes and empowers the trustees to receive donations and bequests, and to hold real and personal property to the amount of $100,000 for the use and benefit of the school.

Section 5. "The said trustees are authorized and empowered to grant diplomas to all persons who satisfactorily complete the prescribed course of study and training in said school; and persons holding such diplomas will be entitled, without further examination, to teach in any of the public schools of the State as first-grade teachers."

The school was named in honor of Robert C. Winthrop, the venerable chairman of the trustees of the Peabody fund.

The school is not altogether a free school; there is a fee for tuition of $2 a month, or $5 a term for each of the three terms of twelve weeks, if paid in advance at the beginning of the term. One young lady from each county is received free of tuition charges on the recommendation of the county board of examiners. The State of South Carolina makes annual appropriation for 34 scholarships, of the value of $150 each, a scholarship to be given to one student from each county of the State; $30 of this sum is given to the school for tuition, text-books, etc., and the remaining $120 is given to the student in installments of $40 each at the beginning of each term, to assist her in defraying her personal expenses of traveling, board, etc. This money is paid out to the students only upon the order of the State superintendent of education. The beneficiaries of the scholarships are selected by competitive written examinations in the different counties. In addition to the State scholarships, a scholarship for tuition is given by the school to the young lady in each county who receives second rank in the county examinations. Neither the State scholarship nor the tuition scholarship is given unless the examination proves satisfactory, and no scholarship is allowed to any person for more than one session. On the completion

[1] Annual Report of United States Bureau of Education, 1867–68.

of their course beneficiary students are required by law "to teach for one year in the common schools of the respective counties from which they were appointed, provided positions are offered them as first-grade teachers in such schools."

COURSE OF STUDY.

The curriculum (catalogue 1889–90) includes the following studies and the methods of teaching them: Reading, spelling, English language, arithmetic, geography, physiology, history of the United States, lessons on form and color, lessons on plants and animals, elements of physics, penmanship, drawing, vocal music and calisthenics, psychology, history of education, school organization and management, and practice in teaching.

Applicants for admission are required to be not less than 17 years of age, and must express their intention of engaging in the profession of teaching. They must also pass a satisfactory entrance examination in reading, spelling, arithmetic, grammar, geography, history of the United States, and penmanship.

The school [says the superintendent] is a normal training school in all its courses. Its aim is strictly professional, and only those pupils are wanted who are ready to undertake the work with a feeling of personal interest in teaching as a profession. * * * The design of the school is to prepare for teachers young women who already have a good education by training them in methods of teaching and school management. * * * The normal class work extends through the course, and includes logical reviews of all subjects of common-school study from the teacher's standpoint. In each study the subject is analyzed into its divisions and subdivisions, arranged topically in logical order. In most of the common-school studies the outline is divided into an elementary course for the primary grades, and a secondary or scientific course for the higher grades. * * * The practice teaching is intended to be an application of the principles studied in the normal class, so that the whole course of training may give, not a servile imitation of methods now in use, but such independent, progressive teaching ability as will enable one to adapt herself to the needs of any school, whether graded or ungraded, in city or country.

The practice department of the school contains about 100 children, forming classes in the first, second, and third primary grades. These children are taught by the pupil-teachers, subject to the constant supervision of two of the teachers of the school. Opportunity is also given to the students to observe thoroughly the work done in the higher grades of the Columbia graded schools.[1]

The Hon. James H. Rice, State superintendent of public instruction, says in his report for 1888:

The legislature established a normal college for males within the South Carolina University. * * * The Winthrop Training School for Females was established two years ago. * * * By a happy arrangement with the trustees of the Winthrop Training School the students of both institutions have the privilege of attending upon the lectures of both colleges. It [the Winthrop Training School] was founded by Superintendent D. B. Johnson with slender means, and seemed as frail a bark as the *Mayflower* of the Pilgrim fathers. To the timid it promised nothing but disaster to mariners and crew. Under the skillful and practiced hand of the president it has weathered the storm. * * * This movement is rich in promise alike to the State and the young lady students. We secure trained talent for the schools and they have the means of making an honorable living. This is the first dollar South Carolina has given to educate her daughters, and it has been most worthily bestowed. * * * It is proper to say that this effort was made possible by the liberality of the Peabody trustees, through their accomplished secretary, Dr. S. A. Green. * * * Institutions for normal training are now a part of the ordinary educational machinery and need no vindication. * * * It is presumed that the State has only begun this work. Modifications may and will be needed in the plan of operations and the methods of assistance. She can never retrace her steps.[2]

GEORGIA.

Normal and Industrial College for Georgia Girls, Milledgeville.

The original bill for the establishment of this institution was introduced into the Georgia legislature in July, 1889, and became a law in the following November. The corner stone of the college building was laid in November, 1890, and the college was opened on the 30th of September, 1891, with 88 pupils. The year closed with 171 regular matriculates, including 64 normal students proper, and 92 special students. The second session (September, 1892) opened with 272 pupils coming from 94 different counties in Georgia. The college seems to have sprung, like Pallas from the head of Zeus, full grown and fully armed.

The building and grounds cost $100,000. The annual appropriation from the State amounts to $18,000, which is supplemented by a donation from the Peabody fund of $1,800.

The title "Normal and Industrial" indicates the purpose of the college, which is to enable girls—

(1) To do intelligent work as teachers, according to the best modern methods.

(2) To earn a livelihood by the practice of some of the industrial arts suitable to women.

(3) To exert an uplifting and refining influence on the home circle and on general society.

(4) To acquire skill in those domestic arts that lie at the foundation of successful housekeeping.

The four principal departments, normal, industrial, collegiate, and domestic, do not form four distinct and separate schools; they are coordinate parts of one complete system, and are so related to one another as to form one harmonious whole.

The full normal course extends through four years. The professional studies for each year are: *Freshman*, Baldwin's School Management; *Sophomore*, Baldwin's Educational Psychology and observation visits to model school; *Junior*, Compayré's History of Pedagogy and observation visits to model school; *Senior*, Practice teaching in Model School.

The model school was established and is maintained entirely by means of an annual donation from the Peabody fund. It serves both as a school of observation and as a practice school for students of the senior normal class. It is composed of forty children from 6 to 11 years of age divided into four grades.

The general, or literary and scientific course for normal students is identical with the collegiate course.

COLLEGIATE DEPARTMENT.

Freshman class.—Elementary algebra, Meiklejohn's English Language, Parts I and II; physics, American classics, Roman history, Cæsar, prose composition.

Sophomore class.—Algebra, completed; English Language, Parts II and III; chemistry, History of England; studies in Scott and Tennyson, Cicero and Virgil.

Junior class.—Geometry, plane and solid; critical study of Shakespeare's plays, geology and physical geography, ancient and mediæval history, Horace, Livy, Tacitus.

Senior class.—Trigonometry, arithmetic reviewed, critical study of English classics, astronomy, civics and current history, standard current literature, cooking.

All pupils who take the college course only, without the normal course, are expected to devote at least five hours a week to the study of some one of the industrial arts.

Care has been taken not to overcrowd the curriculum with a multiplicity of studies. The plan of instruction has been intensive rather than extensive. Every art and science is a microcosm, containing in itself the principle and essence of all other arts and sciences; for instance, study chemistry well and you have the principle and essence of all science; study Shakespeare well and you have the principle and essence of all poetry; study the story of ancient Rome well and you have the principle and

essence of all history. Another reason for making the studies fewer than are usually found in college courses is that time may be had for the industrial arts, to which every pupil is required to give a fair share of her attention.

INDUSTRIAL DEPARTMENT.

The studies in this department are, (1) stenography and typewriting; (2) telegraphy; (3) bookkeeping; (4) dressmaking; (5) free-hand and industrial drawing; (6) cooking.

In selecting these from all the available industries, the authorities of the college had regard primarily to their business value and secondarily to their culture value. * * * Carefully compiled statistics show that the first four arts mentioned have a greater business value for women than any other employments whatever. * * * Cooking, the sixth and last in the list, was selected, of course, almost entirely for its domestic or household value. * * * The design of this institution, however, is to educate the head as well as the hand, and its firm purpose is to avoid turning out mere workwomen, ignorant of everything except the narrow craft by which they earn their living. No pupil, therefore, will be allowed to devote herself to the industrials to the exclusion of all other studies unless she can demonstrate to the president that she has already a fair English education.[1]

FLORIDA.

The legislature of Florida passed an act in 1851 establishing two seminaries of learning, "one upon the east, the other on the west side of Suwanee River; the first purpose of which shall be the instruction of persons, both male and female, in the art of teaching all the various branches that pertain to a good common-school education; and, next, to give instruction in the mechanic arts, in husbandry and agricultural chemistry, in the fundamental laws, and in what regards the rights and duties of citizens." Four townships of land were granted to the State of Florida by the General Government (acts of 1823 and 1845) for the purpose of endowing two such seminaries, and the sale of those lands produced a fund for their support. The East Florida Seminary was located first at Ocala, Marion County, and was removed to Gainesville by an act of the legislature passed in 1866. The normal element, which was never strong, soon died out, and the need of it has not been much felt since 1887, when provision was made for the organization of two State normal schools, one for the white teachers and one for the colored.

In that year the legislature passed an act appropriating $4,000 a year for the support of a normal school for white teachers, and locating it at De Funiak Springs, in Walton County, on the Pensacola and Atlantic Railroad, about midway between the Chattahoochee River and Pensacola.

The course of study covers two years. Graduates receive a diploma as licentiate of instruction, which is equivalent to a first-class life certificate within the State. The minimum age of admission is 16 years, and applicants must pass an examination in the common-school branches. Before being admitted students must pledge themselves to teach for two years in the State if a suitable opportunity is offered. Such students pay no tuition fees if residents of the State; nonresidents pay $5 a quarter (ten weeks). The faculty consists of the president, two professors, and one assistant teacher. The last catalogue contains the names of ninety students, young men and young women.

The studies of the normal departments are as follows:

Junior, first term.—(1) Rhetoric and composition, four hours a week; (2) general history, four hours a week; (3) algebra, four hours a week; (4) Latin, four hours a week; (5) physiology, two and a half hours a week; (6) drawing, one and a half hours a week.

Junior, second term.—(1) Rhetoric and history, four hours a week; (2) algebra,

[1] First Annual Announcement of the Georgia Normal and Industrial College, 1891–92.

four hours a week; (3) Latin, four hours a week; (4) physics, four hours a week; (5) geometry, four hours a week; (6) drawing, one and a half hours a week.

Senior, first term.—(1) English literature, history and essay writing, four hours a week; (2) algebra, four hours a week; (3) Latin, four hours a week; (4) physics, four hours a week; (5) geometry and plane trigonometry, four hours a week; (6) drawing, one and a half hours a week.

Senior, second term.—(1) Chemistry, four hours a week in class room and four in laboratory; (2) Latin, four hours a week; (3) spherical trigonometry, surveying, navigation, four hours a week; (4) astronomy, four hours a week; (5) civil government and Florida school law, four hours a week.

Psychology and pedagogy extend through the two years' normal course.

The following are stated as the "special features" of the school:

"(1) Tuition is free; (2) highest board only $10 per calendar month; (3) no uniform required; (4) open to both sexes; (5) curriculum covers a period of two years; (6) diploma a life certificate in this State; (7) a school for mature persons—pupils 28 years of age in attendance; (8) a State institution under the direct supervision of the State board of education."[1]

IV.

NORMAL SCHOOLS IN THE NORTH CENTRAL DIVISION.

OHIO.

There is no State normal school in Ohio, although it was among the first, if not the very first, to recognize by legislative action the need of such an institution and to take some preliminary steps for its establishment. The general assembly in 1836 requested Prof. Calvin E. Stowe,[2] who was then about to visit the countries of Europe, "to collect during his contemplated tour such facts and information as he might deem useful to the State in relation to the various systems of public instruction and education which had been adopted in the countries through which he might pass, and to make a report of the same, with such observations as he might offer, to a future general assembly." On his return Professor Stowe presented a report warmly advocating training schools for teachers as an indispensable factor of any State system of common schools, and especially recommending the establishment in Ohio of a normal school with model schools and schools of practice.

Two years later, Samuel Lewis, State superintendent of common schools, presented a report to the legislature in which he favored the establishment of a State university for the education of teachers and others.

In 1841, William Trevitt, secretary of state, urged the legislature to follow the example of Massachusetts in the establishment of normal schools. One of his successors, Mr. Galloway, recommended the planting of one normal school at Columbus. In 1851, Henry W. King, secretary of state, advocated the establishment of as many normal schools as the school system of Ohio should demand.

The only result of these earnest and long-continued efforts was the increased popularity of the cause, especially among teachers, which was evidenced by the upspringing of a number of independent normal schools, some of which, or their successors, are now doing good service.

In 1866, in response to the request of the general assembly, the Hon. Emerson E. White, then State school commissioner, presented a report containing a most lucid, elaborate, and convincing argument in favor of normal schools. He had made himself familiar with their organization and practical results by visits to some of the

[1] Sixth Annual Catalogue of the State Normal College at De Funiak Springs, 1892.

[2] Report of the United States Commissioner of Education [Dr. Henry Barnard] to the Senate and House of Representatives. Government Printing Office, 1868.

most celebrated State normal schools then in operation, at Westfield, Framingham, Albany, Oswego, Trenton, N. J., New Britain, Conn., and Ypsilanti, Mich., besides the training schools at Boston and Philadelphia. He quotes, in support of his views, the opinions of some eminent educators: Rev. James Fraser, of England, who had been sent to this country by the royal commission on education to investigate our system of common schools; Hon. Egerton Ryerson, chief superintendent of public education for Upper Canada; M. Guizot, then minister of public instruction in France; Victor Cousin, Horace Mann, Josiah Quincy, Edward Everett, George S. Boutwell, Mark Hopkins, Barnas Sears, George B. Emerson, Joseph White, Birdsey G. Northrop, John D. Philbrick, and others. But the testimony of this cloud of witnesses weighed not a feather with the legislators of Ohio. Dr. White then goes on to set forth his plan for maintaining one State normal school in connection with ten State normal institutes at an expense of $20,000 a year, "a sum altogether insignificant when compared with the grand object it is to promote. The law making the appropriation might be called 'an act appropriating $20,000 to keep the half of three millions of dollars from being squandered on incompetent teachers.'"

The lack of a State system of normal schools is to a certain extent compensated by teachers' institutes, independent normal schools, and the opening of a normal department in the Ohio University with an experienced teacher as principal and professor. Among the independent normal schools may be mentioned the

National Normal School at Lebanon.

In the summer of 1855 some of the leading teachers of southwestern Ohio called a convention for the purpose of establishing a normal school in the vicinity of Cincinnati. The call also contemplated an institute of three weeks to be held in the buildings of the Miami University at Oxford, Ohio. About 350 teachers assembled in answer to the call. Among them were John Hancock, now gone to his rest, to his gain and our great loss, and Andrew J. Rickoff, still (1891) happily preserved to us. During this institute an organization was effected and legally incorporated, called The Southwestern State Normal School Association. The purpose was to establish and sustain a State normal school in southwestern Ohio until State aid could be obtained. Lebanon was selected as the most eligible site for the school. The trustees of the Lebanon Academy transferred their building and grounds to the normal school trustees, with an agreement to furnish eighty pupils for five years to aid in sustaining the school. Alfred Holbrook was elected principal, at a salary of $1,200 a year, which he was expected to make out of the tuition fees. The school was opened in November, 1855, with about 95 pupils. For the first year the principal received, for his own and his wife's services, $320. The school was then given entirely into the hands of the principal, who received for his services the second year $800, the other teachers getting the same proportion of their nominal salaries. The number of pupils registered during the year was 257. In the third year 335 pupils were enrolled. During the war the attendance fell off, but in 1866 the number of pupils was 709, and the twentieth annual catalogue gives the names of 1,500 different pupils. The catalogue for the year 1890 specifies the following "departments:"

School of common branches.
Preparatory school.
College of business.
College of teachers.
College of science.
College of engineering.
College of liberal arts.
College of law.
College of medicine.
College of Bible study.
Conservatory of music.
School of phonography and typewriting.
School of telegraphy.
School of elocution and oratory.
School of modern languages.
School of pharmacy.
School of elocution.
School of photography.
School of theology.

These departments are supervised and administered by the president with the aid of 53 instructors and officers.[1]

In 1885 the legislature of Ohio made an appropriation for the establishment of a normal department in the Ohio University, the oldest collegiate institution northwest of the Ohio River. This action was a distinct recognition of the claims of normal education upon the State, and an indication that teachers are in need of professional preparation and are entitled to reasonable facilities for obtaining it. In accordance with this idea the college formulated two courses of study, a short course leading to a certificate, and a longer course leading to the degree of bachelor of pedagogy. The following are the required subjects for the degree of bachelor of pedagogy:[2]

Exercises per week.

FRESHMAN YEAR.

	Fall term.	Winter term.	Spring term.

Astronomy	.....	4	.....
Science of education	.....	.....	4

As students who receive this degree are expected to have not only a theoretical knowledge of education as a science, but also some practical knowledge of it as an art, they are urgently recommended to acquire some experience by teaching before completing the course. For such teaching, if done under the direction of the professor in charge of this department, the student may receive credit as a part of his elective work.

Psychology and the history of philosophy are regarded for the present as belonging to the normal department of the university; and, therefore, the methods of instruction in psychology may probably be taken as typical of the whole normal course. The following brief extracts from a monograph by the professor of psychology in the university throw some light on this important subject of "methods."

Text-books.—The extent of text-book work in psychology is one of the first practical questions that presents itself to the teacher. There is great danger that the work may become set, mechanical, and irreclaimably fixed in the lines of thought, and even of expression, of a text-book. Such abject servility may, to be sure, be

[1] Catalogues of the National Normal School, Lebanon, Ohio, 1876–1890.

[2] Catalogue of the Ohio University for 1891. Athens, Ohio.

averted in some degree by original thought on the part of the instructor, but he will be singularly successful who entirely liberates his students from authorial despotism. Statements printed in cold type acquire a certain authority and repress independent unprejudiced thought. The tyrannical text-book is, moreover, very likely to banish from the class room the freshness and vivacity which distinguish oral discussion.

These objections to text-books are, however, balanced by many considerations. As a fixed and permanent basis for class-room work, text-books are invaluable. It is only with great difficulty that a course which proceeds entirely by lecture and discussion is thoroughly followed and systematized. * * *

Lectures or discussions?—Granting, then, that a considerable portion of the recitation period should be devoted to independent work, the alternative of lecture or of discussion is offered. In very large classes the lecture is the more effective way of covering a subject, for discussion being necessarily more or less individual is, owing to the numerous views presented, very liable to degenerate into aimless, profitless talk. * * * Certainly, if properly used, the lecture is invaluable in presenting clearly and systematically to a large number an otherwise unwieldy mass of material. The lecture, however, in affording no opportunity for the expression of the doubts and perplexities of the student, betrays a fundamental weakness. Error will persist far longer, and be eradicated with much more difficulty than by the Socratic dialectic, for the lecture does not educe and thus correct or eliminate the student's mistakes. It leaves him to stumble along by himself, and deprives him of close intellectual contact with the instructor. * * *

The three auxiliaries.—An ideal alliance of the instructor's three auxiliaries might be negotiated somewhat on the following terms: The text-book should be used only in preparation for the recitation, and not, except in a very general way, for the conduct of the recitation itself. Lectures intended to throw the subject under consideration in fresher and stronger lights should be frequently given and should form an important, and indeed a vital, part of the course of study. The greater part of the class-room work, however, should assume the form of discussion of the subject-matter furnished by text-books and lectures, while by the suggestive questions of the Socratic dialectic the student may be further aided and stimulated. * * * By some such judicious combination of methods the field of psychology may be clearly and fully placed before the mind of the student, his interest roused and concentrated introspectively, and his power of original thought educed and developed.[1]

The supreme place which the study of psychology holds in the normal department of the Ohio University may be inferred from the following extracts from "An open letter to young teachers:"

Never before in the history of the world has such emphasis been laid on the importance of studying mind and pedagogy and the history of education as at the present. Not merely in such highly civilized countries as France, England, Germany, and Italy, but in Mexico, in the South American Republics, even in Jamaica, there is abundant evidence to show that men are coming to see the absurdity of mind doctors who have made no study of mind, of educational practitioners who have made no study of the art of education and the science that underlies it. * * * Do you intend to be a live teacher, determined to live by the best light of your own generation, or a fossil contented to make such preparation as was deemed sufficient a hundred years ago? If you are determined to succeed, then you will try to give yourself the qualifications necessary to success. You are living to-day and what you need is an outfit suited to to-day and not to a hundred years ago. Where will you get this preparation? * * * You ought to attend an institution which *makes a specialty of preparing teachers for their life work. How many institutions are there in the State which make a special study of mind in its relations to education and which make a special study of the art and science of education?* Unless I have been misinformed, there is but *one*, and that is the *Ohio University at this place.* [The italics are the author's.] There are indeed other colleges which have normal departments, and there are normal schools, but it is not the name but the *thing* that you want, and the *thing*—an institution which makes a specialty of preparing teachers for their life work, by making a careful study of mind in its relation to education and of the science and art and history of education—is to be found in this State at Athens.[2]

[1] Methods of Inducing Introspective Power: One aspect of the Pedagogics of Psychology. W. F. Peirce, Athens, Ohio, 1892.

[2] An open letter to young teachers by J. P. Gordy, Ph. D., principal of the normal department and professor of pedagogy in Ohio University, Athens, Ohio.

INDIANA.

STATE NORMAL SCHOOL, TERRE HAUTE.

The first section of the constitution of Indiana contains the following article: "Knowledge and learning generally diffused throughout a community being essential to the preservation of a free government, it shall be the duty of the general assembly to encourage, by all suitable means, moral, intellectual, scientific, and agricultural improvement, and to provide by law for a general and uniform system of common schools wherein tuition shall be without charge and equally open to all." In accordance with this constitutional provision it was enacted by the general assembly in 1865 "that there shall be established and maintained a State normal school, the object of which shall be the preparation of teachers for teaching in the common schools of Indiana." This act provided for the location and erection of a building, the admission of students, the organization of the school, and the annual appropriation of funds for tuition and expenses. The diploma of the normal school is by law equivalent to a State certificate, relieving the holder from county examinations. The board of trustees has authority to grant certificates of proficiency to such teachers as have completed any of the prescribed courses of study, and to give diplomas to graduates who have taught satisfactorily for two years. By a recent order of the board of trustees, all candidates for graduation are required to hold a county license to teach for a period of not less than two years.

The departments of the school are the following: Department of history and philosophy of education, of grammar and composition, of biology and geology, of reading, rhetoric, and literature, of history, of geography, of mathematics, of Latin, of mental science and methods, of music, of drawing and penmanship, of physics and chemistry. Each department is under the charge of a separate professor, with such assistants as are found necessary from time to time.

Courses of study.

FOUR YEARS' COURSE.

First year:				
First term	Educational psychology (general nature of mind).	Orthoepy (penmanship).	Arithmetic	Grammar.
Second term	Educational psychology (stages of knowing).	Physical and mathematical geography.	do	Do.
Third term	Educational psychology (feeling and will).	Physical and political geography, with map drawing.	Reading	United States history.
Second year:				
Fourth term	Methods (reading and language).	Physiology	Composition	Do.
Fifth term	Methods (number and form).	do	Latin	General history.
Sixth term	Methods (geography and history).	Latin	Rhetoric	Do.
Third year:				
Seventh term	Latin	Physics	Music and drawing	Literature.
Eighth term	do	do	Algebra	Advanced composition.
Ninth term	History of education.	Botany	do	Latin.
Fourth year:				
Tenth term	do	Zoology or chemistry.	Geometry	Do.
Eleventh term	Philosophy of education.	Zoology or chemistry (qualitative analysis).	do	Do.
Twelfth term	do	Practice in training school.	Trigonometry	Latin graduating thesis.

THREE YEARS' COURSE.

First year:					
First term	*Educational psychology (general nature of mind).	*Reading, penmanship.	*Arithmetic	*Grammar	
Second term	*Educational psychology (stages of knowing).	*Mathematical and physical geography.	do	do	
Third term	*Educational psychology (feeling and will).	*Physical and political geography, with map drawing.	*Reading	*United States history.	
Second year:					
Fourth term	*Methods (illustrated by reading and language).	*Physiology	Composition	do	Latin.
Fifth term	*Methods (illustrated by number, history, and geography).	do	Algebra	General history.	Do.
Sixth term	History of education.	*Music, drawing	do	General history or rhetoric.	Do.
Third year:					
Seventh term	do	Chemistry	Geometry	Literature	Do.
Eighth term	*Philosophy of education.	Physics or botany.	do	*Advanced composition.	Do.
Ninth term	*Practice in training school.	Physics	Botany	*Graduating thesis.	Do.

NOTE.—Thirty-six terms' work is necessary to complete this course. The subjects marked thus * are required; the remaining subjects may be elected by the student.

The four years' course is designed to meet the needs of those students who wish to make thorough and extended preparation for public school work.

The three years' course is intended for young persons of limited scholarship who expect to confine their teaching to the district and graded schools of the State.

There is also a two years' course for graduates of commissioned high schools. Many cities do not maintain a training school for educating their own teachers, and this course is designed to supply the place of training schools for such cities, and thus to relieve the school officers from the necessity they feel of employing as teachers the graduates of their high schools who have had no training in teaching.

In addition to the courses described, there is a course of one year for college graduates, to meet the needs of those graduates who wish to enter the field of teaching and superintending schools and who feel the need of professional training for this work. This course assumes that the student has already acquired a liberal knowledge of the subjects taught in the public schools, and that his purpose is to add such professional knowledge as college professors and school superintendents peculiarly need.

The "practice work" continues through two terms. It consists of observation and teaching in the practice schools, which form one department of the normal school. The pupils taught are children belonging to the regular grades of the Terre Haute school system. This work consists of three kinds—(1) Lessons given daily by the students before the practice class as a whole; (2) lessons given daily at different hours when none or only a part of the practice class is present; (3) the observation of lessons given by the teacher in charge of the room. While a lesson is being taught the other members of the class take careful notes. On the following day it is carefully discussed by the members of the practice class and the teacher in charge of the room. In this discussion four things are done. (*a*) The point of the lesson is distinctly stated; (*b*) it is classed as favorable or unfavorable; (*c*) the principles that are the ground for considering it favorable are stated; (*d*) an explanation is made in order to show that the principles stated underlie the given act of teaching.

The average term enrollment for the session 1890–91 was 526. The whole number

of different students was 932. The total number of different students since the organization of the school in 1870 is 6,943.[1]

ILLINOIS.

State Normal University.

A general meeting of the friends of free schools assembled in Bloomington, Ill., on December 26, 1853. Three topics were thoroughly discussed at this meeting: The duty of the legislature to create the office of State superintendent, to establish and maintain a normal school, and to organize a State teachers' association. The normal school question provoked a long and spirited debate, the same objections being urged as had been made twenty years before in other States and have been annually repeated in some quarters ever since.

After the adjournment of the convention the Illinois State Teachers' Association was organized. The most prominent topic in all the early meetings of this association was the organization of a normal school. There were three parties in the contest: The normal school men, who wanted a separate institution for the exclusive purpose of training teachers; a large class of educators, who desired to have either an industrial university with a normal department or a normal school with an industrial department, and, thirdly, those who favored the founding of normal departments by the State in connection with denominational colleges already established.

At the meeting of the association in 1856 it was resolved "That the educational interests of Illinois demand the immediate establishment of a State normal school for the education of teachers." In the following February the legislature passed, and the governor approved, "An act for the establishment and maintenance of a normal university."

This act of the legislature provided for a university, although what was established was in fact a normal school. The intention was to gather around the new institution the different colleges—classical, agricultural, industrial, law, medical, etc.—which should finally constitute a great university.

It was the duty of the State board of education "to fix the permanent location of the normal university at the place where the most favorable inducements are offered for that purpose." The board advertised for proposals, and several cities and towns competed for the prize. The bid of McLean County ($141,725 in real estate and subscription pledges) was so far ahead of the others that the board located the university "on the 160 acres of fine rolling land within three-quarters of a mile from the junction of the Illinois Central and Chicago and Alton railroads," upon the condition that the full amount of the McLean County subscription of $70,000 should be legally guaranteed within sixty days, in default of which the location was to be made at Peoria. They employed Abraham Lincoln to draw up a form of bond or guaranty to be signed by responsible citizens of Bloomington.

The corner stone of the university building was laid on September 29, 1857, but the financial crisis of that year caused the work to be temporarily discontinued, and hence the buildings were not thoroughly completed until the early part of 1861. The total cost of the buildings, with all the incidental expenses, books, and furniture, was about $200,000, a large part of which was raised and utilized by the strenuous and persistent efforts of Gen. Charles E. Hovey. The courts having decided that the normal university was a private institution belonging to the board of education as a corporation, and therefore that the State was not liable for the debts of the board, the legislature of 1867 enacted and declared that the State Normal University is a State institution, the property of the State of Illinois, and held in trust by the board of education.

[1] Twenty-second Annual Catalogue of the Indiana State Normal School, Terre Haute. 1891.

During the long years while the great building was rising to completion the school work was carried on in a cramped and inconvenient building called Major's Hall. It must have been a queer old place, and many of the inhabitants, teachers, and students were sui generis. H. B. Norton, one of the students of those early days, wrote thus to the committee of the Quarter-Centennial Celebration:

We were daily convened in the upper story of Major's Hall. I suppose that these younger generations of normalites are not aware that such a building ever existed. The walls of the old house were rickety, and iron girders with huge S's at the ends held in place the brick masonry. Our assembling room was the third story. In the second story were recitation rooms, rather dark, and ill adapted to our needs. Grocery and hardware stores occupied the first floor. The building was heated by a coal stove in each room, and as Illinois coal is gaseous and explosive, the stove doors were frequently blown open with loud sounds and clouds of yellow smoke. C. E. Hovey was principal in those days, but Ira Moore was the one most directly in charge. Dr. Willard, looking very pale and frail, soon began to open his wonderful budget of philological knowledge. Hewett came within a month after my arrival, I think. He was a small man with a big head in those days. He had very demonstrative boot heels, and especially hated cats, and went to sleep in Baptist meetings. He used to give us prodigious lessons in history and geography. He couldn't draw maps, but made us draw very nice ones. I remember his geography lessons even unto this day. The names of the branches of the Amazon, the forms and heights of the Andean and Himalayan plateaus—these are mine yet, and will be to all eternity. My history work has not stayed with me so well. There was once a slight unpleasantness between my class and their teacher as to how General Greene got away from Cornwallis. It was quite a double and twisted business anyhow, and we inwardly vowed that we wouldn't learn it. The teacher gave us hard words and low marks, but our obstinate stupidity won the day. * * * We were shabbily dressed in those days. I think my pantaloons were generally too short, and my coat seemed to have been made for some other person. We were very poor but very plucky. We boarded ourselves, mainly on corn mush; washed the floors and built the fires at the normal hall, worked hard, lived hard, and were poorly provided with all things. Our parents were sad-faced, struggling pioneers of the prairies, but we were cheery, resolute, and happy in our life and our work. To the toiling youth of frontier homes thirsting for knowledge the Illinois Normal University opened the gateway to a new life. We loved it, rejoiced in it, and were thoroughly loyal to its name and fame.

The school saw but little of its principal in those years. Two miles to the northward, across the sodden prairies, in the rainy autumn of 1858, were clay pits, heaps of brickbats, half complete foundations for a stately structure yet in embryo. The construction fund was exhausted, the State heavily in debt, business everywhere distressed and languishing—truly a somber prospect for the completion of a building demanding, on the basis existing before the war, $100,000. It would be as easy to-day to raise a million. To secure these needed funds was the task which Charles E. Hovey set before himself. It was a labor for Hercules. His own fortune was pledged over and over. Had his plans failed he would have been weighted for life with hopeless bankruptcy. This enormous task he undertook and carried through. He had a place on the programme of the school's daily work, but his classes generally wrought out their own salvation. But in the winter of 1860–61 the building was completed. * * * We of the pioneering days need no reminder of the grand work which could hardly have been performed by another than Gen. Charles E. Hovey.

We were free in our conduct to a singular extent. No school rules rested upon us. Our hours and methods were wholly our own. We lived as we pleased, formed our friendships and associations, made our calls and managed our affairs entirely at our own choice and pleasure. Very few schools were ever so slightly governed. I do not believe that our successors of to-day can be journeying under any similar slackness of reins. Nevertheless, the record of those years was a thoroughly Spartan one. We were from Puritan households, disciplined in self-restraint. Industry and poverty were our safeguards.

A magnificent park, stately buildings, a beautiful and prosperous city, methods well ordered and polities established, splendid museums and laboratories, a wealthy and more cultured generation of students—these are the pleasant things that greet the view as you gather to the silver wedding of our Alma Mater. It is not true that the former days were better than these, but we who saw the working out of the beginnings had also our joys, struggles, and coronations, and we received a training

which, if less orderly and exhaustive than that rendered now, nevertheless gave us some measure of fitness for our life work.[1]

The first president of the university was Charles E. Hovey, but at the beginning of the civil war he entered the Army as colonel of the Normal Regiment, which he had organized. Nine of the instructors—Leander H. Potter, Ira Moore, J. H. Burnham, Aaron Gove, Julian E. Bryant, Joseph G. Howell, Edwin Philbrook, Samuel Willard, and E. R. Roe—accompanied him as officers, and a majority of the male students as privates. Dr. Richard Edwards was president from 1862 to 1876; Dr. Edwin C. Hewett from 1876 to 1891.

John W. Cook is the present president (1892).

The faculty of 1892 consists of the president and 22 professors and assistants. The "summary" of the normal department shows 5 special students, 39 seniors, 21 middle class A, 36 middle class B, 117 middle C, 91 junior A, 138 junior B, 241 junior C; total in normal department, 688.

The * shows that the study is pursued at the time indicated.

Latin, Greek, German, astronomy, advanced algebra, trigonometry, surveying, analytic geometry, calculus, advanced science study, political science, and advanced pedagogy are optional studies.

The model department has enrolled 613 pupils in high school, grammar school, intermediate school, and primary school. Deducting names counted twice, the whole number of different students for the year is 1,236.

Candidates for admission to the normal department are required:

1. To be at least 17 years of age, if young men; 16, if young women.

[1] History of the Illinois State Normal University, by John W. Cook and James V. McHugh, Normal, Ill., 1882.

2. To produce a certificate of moral character.
3. To sign the following declaration:

I hereby solemnly declare that my purpose in attending the normal university is to fit me for teaching in the public schools of Illinois and that I will carry out this pledge in good faith; and I do further pledge myself to report to the president of the university semiannually where I am and what I am doing for three years after graduating at said institution.

4. To pass an examination before the county school superintendent in reading, spelling, writing, arithmetic, geography, United States history, and the elements of English grammar sufficient to entitle them to a second-grade teachers' certificate.

Each county in the State is entitled to gratuitous instruction for two pupils in the normal university, and each representative district for as many pupils as there are representatives in the district. The selection is made in the following manner: The school superintendent of each county receives and registers the names of all applicants; these applicants are examined, and from the number found to possess the requisite qualifications the pupils are selected by lot. The same mode of selection obtains in the representative districts. If vacancies occur in any county or representative district the president of the university is authorized to fill them.

Graduates from the normal department are entitled to receive a State certificate good for five years.

LABORATORY METHODS.

The pupil enters the laboratory and finds on the table before him some apparatus, accompanying which are some printed directions of what he is to do with the material before him. After seeing that his apparatus is in proper order he proceeds as directed, and having completed the experiment, at once writes out neatly, accurately, and tersely the experiment in full, embracing these points: (1) What I did; (2) What I saw; (3) What I conclude. (Ruled tablets of uniform size are used for this work, and at the close of the term the leaves which are daily detached for the separate exercises are bound in permanent form.) The pupil writes up his work without consulting the text-book or his fellow pupils, and hands his results to the instructor before beginning another experiment. (Should his work be unsatisfactory, he is required to perform it again until the intended facts are made clear to him. After a few days' work, repetition is seldom needed.) The pupil is thus taught to be independent in his efforts and to cultivate his reasoning powers. He acquires control of his hands; he learns how to put things together and get results; he studies things in relations; he prepares himself for everyday life, whether it be in the schoolroom, in the workshop, or in whatever department of life.

The experiments are arranged in systematic order, so that the pupil is led step by step into a more complete knowledge of the subject under consideration. The apparatus is as simple and inexpensive as it is possible to use and be assured of good results; and pupils are taught how to construct it, so that they can teach this work in the common schools without waiting for expensive, showy apparatus to be furnished by school boards. * * * About one hundred experiments are performed each term.[1]

SOUTHERN ILLINOIS NORMAL UNIVERSITY, CARBONDALE.

The act of incorporation was passed in 1869, but classes were not opened till 1874, owing to unavoidable delays in the commencement and in the completion of the building. It was a magnificent building—almost too magnificent. The young ladies complained of the fatigue of climbing four lofty stories, and the height of the ceilings prevented the comfortable heating of the rooms by the furnaces originally used. Sixteen thousand dollars expended in steam-heating apparatus put an end to all complaints on the last count, and an accidental fire November 26, 1883, reduced the height of the ceilings to zero. It broke out in the mansard story over the Museum. Water tanks had been provided for such emergency, but unfortunately they were below the fire, and water will not rise above its level even in a university. An effort was made to bring into service the small fire engine belonging to the university, but

[1] Thirty-fourth Annual Catalogue of the Illinois State Normal University, for the academic year ending June 23, 1892. "N. B. The statements made in this catalogue are to be interpreted *literally*." Page 70.

owing to "a defect in the construction of the water pipes" a stream could not be thrown on the fire. Four elements of safety were present, water, hose, engine, and willing hands, but they could not be correlated, and in less than two hours the house was in ruins. The willing hands saved all that could be saved—books, furniture, apparatus, even doors and windows, valued at $75,000, including the basement and the walls that were still standing.

Two days rest, or rather, indeed, two days change of work, and recitations went on as usual in rooms in some of the business blocks kindly provided by the citizens.

The † indicates the place of the study in the course.
The ‡ means half-term study.
The "English course" differs by the omission of Latin and Greek, and is comprised in three years.

On the evening of the fire, while the embers were still smoking, the mayor of Carbondale called a mass meeting of the citizens. It was resolved to build a temporary schoolhouse, and in less than forty working days the students were installed in their new quarters, a comfortable frame building with fourteen rooms. Here the school rested for four years till the completion of the permanent building, for which the general assembly in 1885 made an appropriation of $152,065.

The school work is conducted in three distinct departments—the normal, the high school, and the preparatory. The preparatory is subdivided into grammar school, intermediate, and primary. By the last catalogue (1891–92) there were in attendance in the normal department 342 students; in the high school, 41; in the preparatory, 315 (grammar school 239, intermediate 38, primary 38)—total, 698. The average per term was 452.

To be admitted to the normal department students must have completed their sixteenth year and must be able to pass an examination equivalent to the requirements of a second-grade certificate. To obtain free tuition a student must sign a

pledge to teach in the public schools of the State for three years, or at least as long as he has been a student of the university. The pledge comes into effect only after graduating and on the expressed condition that "a situation can be had with reasonable effort." All graduates recommended by the faculty and approved by the board of trustees are entitled to a State certificate, granted by the State superintendent of public instruction, good in any county of the State for five years.

TRAINING DEPARTMENT.

The strictly professional work of our normal school is made up of three distinct parts, in the first of which are found practical and economic pedagogy. In practical pedagogy our pupils are given, by text-book and lecture, a knowledge in outline of the child's powers and the order of their development. By the same methods, also, they are given a knowledge of the methods of teaching the branches usually found in the common schools. In economic pedagogy the attention of pupils is directed to the organization and management of schools and classes, to the end that every child in school or class shall secure his individual and personal right to instruction and training. The discussion of special subjects in both practical and economic pedagogy is followed by reports of observations made in the training school, the reports covering the special topics previously discussed. After the economic pedagogy, and as a supplement to it, the school law of the State is taken up and its chief provisions mastered.

The student of pedagogy, having completed the elementry course pointed out in the preceding paragraph, is put in charge of a class, and his work as teacher is carefully supervised. The preliminary study of methods has put him in a state to teach and manage his class intelligently, and has given him increased power to profit by the superintendent's instructions. One year of this practice teaching is required of all who are graduated from our school. The daily task, not counting the preparation, covers about half an hour of time. This teaching work covers the second section of the course in pedagogy.

Having completed the first two divisions of the professional course, the student is prepared to take up the higher pedagogical studies. These include a full course in psychology, a thoughtful discussion of the conditional principles of all right teaching, and a study of men and methods prominent in past educational efforts. For the advanced course, then, the studies are psychologic, philosophic, and advanced pedagogy. As an aid to easy reference the three branches of the higher course are grouped and known as theoretic pedagogy, and for the same reason the three in the elementary course are collected and recognized as practical pedagogy.[1]

MICHIGAN.

STATE NORMAL SCHOOL, YPSILANTI.

The State Normal School of Michigan was established by the legislature in 1849. The organic law reads as follows:

Be it enacted by the senate and house of representatives of the State of Michigan, That a State normal school be established, the exclusive purpose of which shall be the instruction of persons, both male and female, in the art of teaching and in all the various branches that pertain to a good common-school education; also to give instruction in the mechanic arts and in the arts of husbandry and agricultural chemistry, in the fundamental laws of the United States, and in what regards the rights and duties of citizens.

Commenting on this enactment, Superintendent Gregory, in his report for 1859, says:

The main design is to be a school for teachers, where they may receive instruction peculiarly adapted to their profession, though the law contains some rhetorical flourishes about giving instruction in the mechanic arts and in the arts of husbandry and agricultural chemistry, etc. The normal school is to the primary schools what theological seminaries are to the churches. It is simply the teachers' college and a school for professional training.

But the desire for normal schools was manifested long before the enactment of this law. In 1836 Superintendent Pierce, in his official report, wrote enthusiastically on

[1] John Hull, president elect of Southern Illinois Normal University, in report to the superintendent of public instruction, 1884.

the merits of the Prussian system and recommended the adoption of a similar plan in Michigan. His successors, Superintendents Sawyer, Comstock, and Mayhew kept up the agitation, and it was during the superintendency of the last that the law just quoted was passed by the legislature.

Proposals were received by the board of education from several points in the State, each offering to donate lands and sums of money to secure the location of the school. The most favorable came from Ypsilanti, offering an eligible lot for a building site, a subscription of $13,500, the use of temporary buildings, and the payment of the salaries of the teachers of the model school for five years. The State board of education enlarged the grounds and erected a brick building at a cost of $15,200, which was ready for use in the autumn of 1852. This building was partly destroyed by fire in 1859, but was rebuilt and ready for the reception of students in September, 1860. An additional building was finished in 1869. Other much-needed buildings were added in 1878 and 1882. The entire cost of all the buildings from the establishment of the school to the last-named year was about $84,000. Since that time extensive alterations and additions have been made at the cost of $60,000, and there is now ample accommodation for an annual attendance of 900 students in the normal and 300 in the other departments.

The management of this school was for several years a series of experiments. It was not intended at first to be a purely professional school. It occupied the educational field in common with other literary and scientific institutions, but provided in addition some training in the science and art of teaching. The question was seriously discussed in the State Teachers' Association and elsewhere whether it was not time for the normal school to abandon academic work and maintain a true American normal school, devoted exclusively to professional instruction and training. The State board of education was requested by the faculty to prepare a course of study adapted to the proposed new departure. The committee appointed by the State board to investigate the subject reported that the normal school should, if possible, be brought more into sympathy with the high schools of the State, and should assume a more purely professional character. For the accomplishment of these objects two plans were suggested. One was to elevate the standard of academic attainment required for admission and to remodel the course of study so as to combine academical and professional study during the entire course. The other plan was to require all academic preparation to be made prior to admission to the normal school. The committee did not recommend either plan, but proposed a compromise, which was adopted and met the fate of all compromises—failure to attain either object. It was abandoned after a trial of about two years. There were many districts in Michigan, as there are still in every State, in which it is impossible for young persons to obtain academic instruction suitable in kind and adequate in extent to serve as a basis for a purely professional normal course; and these are the very places where the need of trained teachers is most urgent.

In the summer of 1871 a new departure was made in the constitution of the school of observation and practice. A plan similar to that followed at the Oswego Normal School was tried for two years, but proved unsatisfactory and was abandoned. It was found that the practice school must be entirely under the same management and control as the normal. Divided authority is fatal to efficiency.[1]

As the normal school is now organized (register of 1890) students are offered a choice from several courses of study, arranged to meet the demands of the various grades of schools and the needs of different classes of teachers. Students graduating in any of the courses are entitled to a certificate of qualification to teach in the public schools of Michigan. The three-year courses lead to such a certificate, good for five years. The four-year courses lead to a life certificate and a diploma. The advanced (six-year) courses and the course for college graduates lead to the degree

[1] The Semicentennial of Michigan, Prof. J. M. B. Sill's address, Detroit, 1886.

of bachelor of pedagogy. In all the courses certain studies are "required" and certain others are "elective;" that is to say, chosen by the student, with the advice and consent of the principal. Any person holding the degree of bachelor of pedagogy in this school may upon application receive the degree of master of pedagogy upon the following conditions: (*a*) He shall furnish evidence satisfactory to the State board of education that he has been engaged in teaching or in school supervision continuously and with pronounced success for five years since receiving the bachelor degree; (*b*) he shall prepare and present a thesis acceptable to the State board of education upon some subject connected with the history, science, or art of education, the board reserving the right to assign the subject of such thesis.

In defending the right of the normal school to give advanced academic instruction the principal says:

> The function of the normal school is to equip teachers both professionally and academically for duty in any place in these public schools to which they may be called, whether such schools are primary or secondary in the character of the instruction offered by them. No teacher is so equipped unless his own studies have been carried considerably beyond the limit to which he is required to conduct his own pupils. It follows, then, that the normal school graduate ought to be furnished with an education that carries him considerably beyond the limits of any secondary education that he may be called upon to give. In other words, he ought to pursue his own course of training so far that there shall be an ample margin between what he knows and what he may at any time be called upon to teach. * * * This margin of knowledge in case of those who complete advanced courses in this normal school comprises a liberal course in literature, art, and science.[1]

COURSES OF STUDY.

Studies offered in the three and four years' courses, showing also the number of weeks which each study regularly occupies.

	Weeks.
Art and manual training:

106–109. Greek, 4 terms, each 20
110. Studies in German and French literature 20

Program of recitations and exercises.

FIRST TERM.

First hour.—Advanced drawing. Algebra I. Algebra II. Elementary physics. French IV. Geology. German I. History and civil government. Latin I. Latin IV. Old and Middle English. Psychology. Reading and orthoepy. Rhetoric. Training in physical science. Voice culture I.

Second hour.—Algebra I. Algebra II. American literature. Chemistry. German II. General history. Greek II. Higher algebra. Psychology applied. Practice teaching. Vocal music. Zoology, first ten weeks. Comparative zoology, second ten weeks.

Third hour.—Arithmetic, preparatory. Arithmetic, first ten weeks. Arithmetic, second ten weeks. Chemistry. German III. Geometry I. Geometry II. Grammar, first ten weeks. Grammar, second ten weeks. Harmony. History of education. Latin I. Physiology and hygiene. Practice teaching.

Fourth hour.—Arithmetic, first ten weeks. Arithmetic, second ten weeks. Civil government. Elementary drawing. Elementary physics. French III. German I. Grammar, preparatory. Grammar, first ten weeks. Grammar, second ten weeks. Greek and Roman history. Latin II. Latin III. Practice teaching. Training in physical science. Voice culture II.

Fifth hour.—Advanced English literature. French II. Geography, first ten weeks. Geography, second ten weeks. Greek III. Latin II. Musical composition. Penmanship, first ten weeks. Penmanship, second ten weeks. Rhetoric. Reading and orthoepy, first ten weeks. Reading and orthoepy, second ten weeks. Training in physical science.

Sixth hour (afternoon.)—Professional work in arithmetic, grammar, reading, geography.

SECOND TERM.

First hour.—Algebra I. Algebra II. Advanced vocal music. Advanced drawing. Elementary physics. English literature. German I. German IV. Latin I. Latin IV. Physiology and hygiene. Psychology applied. Physical technics, second ten weeks. Rhetoric. Surveying, second ten weeks. Trigonometry, first ten weeks. United States constitutional history.

Second hour.—Algebra I. Algebra II. Advanced physics. Botany. English constitutional history. French II. French III. Geometry I. Geometry II. Greek II. History of education. Political science, second ten weeks. Practice teaching. Training in physical science. United States history. Voice culture.

Third hour.—Arithmetic, first ten weeks. Arithmetic, second ten weeks. Botany. Civil government. German II. Grammar, first ten weeks. Grammar, second ten weeks. Latin I. Latin II. Psychology. Practice teaching. Training in physical science. Vocal music.

Fourth hour.—Arithmetic, preparatory. Arithmetic, first ten weeks. Arithmetic, second ten weeks. Advanced harmony. Elementary drawing. Elementary physics. German I. General history. Grammar, first ten weeks. Grammar, second ten weeks. Literature of music. Latin III. Physiology. Practice teaching.

Fifth hour.—Advanced chemistry, first ten weeks. Astronomy, second ten weeks. Geography, first ten weeks. Geography, second ten weeks. German III. Greek III. History and civil government. Latin II. Penmanship, first ten weeks. Penmanship, second ten weeks. Rhetoric. Study of masterpieces. Training in physical science. United States history. Voice culture IV.

Sixth hour (afternoon.)—Professional instruction in arithmetic, grammar, reading, geography.

The enrollment in the normal school proper in 1870–71 was 231, and the number increased gradually and regularly till the end of the year 1876, when the number was 449. In each of the next seven years the enrollment was less than 400, but in the year 1883–84 it sprung up to 475, and every succeeding year has shown an annual increase, the number in 1890-91 being 909. During its existence it has graduated 1,761 young men and women, nearly all of whom became public school teachers in Michigan. The average number of graduates in the last five classes exceeded 100.

The general supervision and control of the school is in the hands of the State board of education, consisting of three members elected by the people and holding office for six years, together with the State superintendent of public instruction, who is a member and secretary of the board, ex officio.

Current expenses for the year ending June 30, 1891, were	$64,636.40
From the interest on the permanent fund	5,260.19
From admission fees, etc	5,451.21
Balance	53,918.00

Met by legislative appropriation.

The training school is a department of the normal school. It is organized as a regular eight-grade school of 250 pupils and a well-equipped kindergarten of 24 children below regular school age. The course of study extends from the kindergarten to the high school, and embraces the subjects and amounts of work usually required in first-class city graded schools. The work in the training department is under the charge of the director, assisted by two critic teachers, a model primary teacher, and a kindergartner. Under careful supervision of this normal corps the actual teaching is, in the main, in the hands of the senior class. These are assigned to the work of teaching and observing by the director, and are daily met for criticism and instruction by him or by the critic teachers. The model primary room is conducted as a school of observation.[2]

WISCONSIN.

Normal Experiments.

The legislature of Wisconsin in 1857 passed a law entitled "An act for the encouragement of academies and normal schools," appropriating 25 per cent of the interest arising from the sale of the swamp lands of the State for the purpose of aiding such colleges and academies as might comply with certain regulations. The design of the law was twofold: First, to aid institutions of learning which had labored efficiently in the cause of education, although they had hitherto been entirely dependent on private enterprise for their support. Second, to enable such institutions to render an equivalent for the funds received from the State by preparing persons for teaching. For the carrying out of this law a board of regents was established, consisting of the Governor and the State superintendent of public instruction ex officio, but without a vote, and 9 members appointed by the Governor, by and with consent of the Senate. This board of regents had authority to make all by-laws and needful regulations for carrying into effect the provisions of the act not inconsistent with the constitution and by-laws of the State. Section 10 provided that all the income of the fund contemplated by the act shall be distributed to the colleges, universities, and academies severally (except the State University) which shall establish and maintain normal classes in proportion to the number of pupils instructed in such classes, according to regulations prescribed by the board of regents, until the amount awarded to any one of such schools shall reach the sum of $3,000 annually. It was further provided that whenever any town, city, or village in the State shall propose to give a site and suit-

[1] Prof. John M. B. Sill, ubi supra.

[2] Register of the Michigan State Normal School 1889–90.

able buildings and fixtures for a State normal school, the board of regents may in their discretion apportion to the same annually a sum not exceeding $3,000 for the support and maintenance of teachers therein.

The board of regents, looking doubtless to the experience of the New York academies, appear to have been anxious to prevent the academies aided under this act from becoming mere high schools with a normal annex—on paper. They say that the following subjects must be studied in the normal department: "Education, its nature and design; physical education; intellectual education; moral education; æsthetical education; the history of education; an examination of the powers of the mind, especially with reference to receiving and communicating knowledge; schoolhouse architecture; organization and classification of schools; modes of teaching different subjects; rewards and punishments; the office of teacher, his duties to himself, his school, and the public; the duty of the State in reference to educating its citizens; the educational policy of Wisconsin." It was proposed that these studies should be carried on chiefly by the aid of lectures and in connection with the two years' course in ordinary academic branches. Students, before being admitted, were required to pass an examination on reading, spelling, arithmetic, elementary algebra, physiology, history of the United States, descriptive geography, and composition.

At the meeting of the board of regents in 1859 the following course of study was adopted:

First year.—Higher arithmetic, algebra, Latham's English Language, plane and solid geometry, drawing, Anglo-Saxon roots and derivations, chemistry, theory and practice of teaching.

Second year.—Trigonometry and surveying, botany, physiology, natural philosophy, geology, meteorology, rhetoric, physical geography, theory and practice of teaching.

Third year.—Constitutional history; Latin, French, or German; comparative philology, logic, intellectual philosophy, analytical geometry, calculus, descriptive geometry, drawing, educational history.

In 1859 Dr. Henry Barnard, of Connecticut, was appointed agent of the board of regents with instructions "to visit and exercise a supervisory control over the normal departments of all such institutions as should apply for a participation in the normal-school fund, and to conduct county teachers' institutes and give normal instruction in the same." Dr. Barnard's labors had a stimulating and encouraging effect, but they were unfortunately cut short by a long period of severe illness.

In 1860, twenty institutions presented claims for a share in the normal fund in proportion to the number of pupils in each who had pursued normal studies according to the requirements of the board of regents. Among these institutions $4,640 were distributed, in sums varying from $40 to $740. The institutions to which these sums were distributed were Beloit College, Lawrence University, Galesville University, Wisconsin Female College, Milwaukee Female College, Platteville Academy, Milton Academy, Walworth County Institute, River Falls Academy, Richland City Institute, Allen's Grove Academy, Horicon High School, Kenosha High School, Oshkosh High School, Racine High School, Janesville High School, Fond du Lac High School, Beaver Dam High School. Five of these expanded afterwards into State normal schools—Platteville, River Falls, Oshkosh, Walworth (Whitewater), and Milwaukee.

State Normal School System.

In Wisconsin, as in Pennsylvania, the county institutes were the immediate ancestors of the normal schools. In the year 1860 there were held 47 institutes, reaching 31 different counties and bringing together 4,346 teachers and persons interested in the cause of education. In connection with these institutes there were delivered 200 public addresses, which reached at least 10,000 persons directly interested in the

cause of public instruction. By these means new life was given to the school system of the State. Patrons of the schools were led to know what good schools are and how they are to be obtained. Teachers were led to think and to strive to qualify themselves better for their responsibilities. In the schools new and more rational methods of instruction began to be adopted in place of the old-time rote system. The demand for institutes was greater than the supply, and the desire found its satisfaction only in the establishment of normal schools.

The State Normal School at Platteville was opened in 1866, at Whitewater in 1868, at Oshkosh in 1871, at River Falls in 1875, and at Milwaukee in 1885.

The exclusive purpose of these normal schools, as expressed in the organic law of 1857, was "the instruction and training of persons, both male and female, in the theory and art of teaching and in all the various branches that pertain to a common-school education, and in all subjects needful to qualify for teaching in the public schools; also to give instruction in the fundamental law of the United States and of this State in what regards the rights and duties of citizens." It will be seen from this that in these schools academic instruction was at first not only permissible but mandatory; consequently they were obliged to maintain preparatory departments. The following are at present the requirements for admission:

1. Any applicant holding the diploma showing that he has satisfactorily completed the course of study for common schools as laid down in the manual of the department of public instruction will be admitted to the junior preparatory without examination.
2. Any candidate will be admitted without examination to the senior preparatory (*a*) who holds a full third-grade certificate gained within one year, or (*b*) who furnishes satisfactory evidence of having completed the second year's work in any free high school of this State, or one of equivalent course.
3. Any candidate who holds a duly signed diploma of graduation from any high school in the State, or who holds a first-grade certificate, still in force, granted by any school superintendent in Wisconsin, will be admitted to normal courses without examination.

Other candidates for admission are examined thoroughly in arithmetic, geography, spelling, penmanship, reading, and English grammar. The following set of questions will indicate the standard for admission in arithmetic. The questions in other subjects are nearly of the same grade.

Entrance examination—Arithmetic—Time, 3 hours.

[From catalogue of Oshkosh Normal School, 1890.]

1. From a cask of wine worth $1.20 a gallon one-sixth part is drawn and replaced by wine worth 80 cents a gallon; what is then the value of the wine in the cask?
2. What per cent of the area of the floor of a room 35 feet square would be left uncovered by 147 yards of carpet 30 inches wide, allowing 5 per cent waste of carpet in fitting?
3. If stock bought at 10 per cent discount pays 5 per cent on the investment, at what price should the same stock be bought to pay 6 per cent?
4. An estate agent bought two houses; the first cost three-fourths as much as the second; in selling, he gained 20 per cent on the first and lost 5 per cent on the second; his net gain was $160. Find his net gain per cent.
5. A society collected for charitable purposes a fund of £960; each member paid as many pence as there were members in the whole society. How many members were there?
6. A miller exchanged flour worth $5.40 a barrel for hay worth $9 a ton. If the farmer asked $10.50 for the hay, what price should the miller put on his flour?
7. It cost $800 to fence a farm 80 rods square. How much more will it cost to fence a farm of equal area in the form of a rectangle four times as long as it is wide?
8. A speculator bought a piece of land at $1,500 and afterwards sold it for $1,795.40; the buying and selling were done through a broker who charged 2 per cent for each transaction. Find the broker's fee.
9. Two trains start at the same time from London and Exeter and go toward each other at the rate of 24 and 32 miles an hour, respectively. When they meet it is

found that one train has run 24 miles more than the other. How far is it between the cities?

10. A dealer imported 50 chests of tea containing 30 pounds each, invoiced at 45 cents a pound. It paid a duty of 15 per cent on the invoiced price, and $17.50 freight; he found 5 chests were damaged so that he had to sell them for 50 cents per pound. At what price per pound must he sell the remainder to gain 20 per cent on his entire outlay?

The attendance at the several schools on the 1st of September, 1890, was as follows:

	Normal students.	Teachers.
Platteville	204	14
Whitewater	184	16
Oshkosh	206	20
River Falls (including preparatory)	130	11
Milwaukee	72	11

Three courses of study have been provided by the board of regents:

I. An elementary course of two years and a half.

II. An advanced course of two additional years.

III. A professional course of one year. This course is intended principally for graduates of the University of Wisconsin, or of a college having an equivalent course, and who have had one year's experience in teaching; but applicants who pass a satisfactory examination at the school in all the branches required by law for a first-grade county certificate and who furnish proof of three years' successful experience in teaching are admitted.

The ordinary professional work of the schools is distributed through the elementary course and the last year of the advanced course, and includes school economy, school organization, school management, school law, theory of teaching, history of education, mental science, and twenty weeks' practice in the model school for each student. The instruction in this department is given partly by conversation lectures and partly from text-books. The text-books of this class used in the Whitewater school are Raub's School Management, Wisconsin School Laws, Burke's Laws of Public Schools, Swett's Methods of Teaching, Sully's Psychology, Quick's Educational Reformers, Browning's History of Educational Theories, White's Elements of Pedagogy, Bain's Education as a Science.

The general arrangement of studies as to years will be best understood from the subjoined table.

Course of study, State Normal School, Whitewater, Wis.

ELEMENTARY.

First year.		Second year.		Fifth term.
Arithmetic, 10 weeks; algebra 10 weeks.	Arithmetic, 13 weeks; algebra, 7 weeks.	Plane geometry..	Book keeping, 10 weeks; physical geography, 10 weeks.	Algebra, 10 weeks.
Descriptive geography	Geography, 10 weeks; physiology, 10 weeks.	Botany, 10 weeks; word analysis, 10 weeks.	Physics, 10 weeks; reading, 10 weeks.	Physics, 10 weeks; physiology, 10 weeks.
Language lessons, 10 weeks; orthoepy, 10 weeks.	Reading, 10 weeks; English grammar, 10 weeks.	Composition.....	History of United States.	Civil government, 15 weeks.
School organization; observation in model school.	School economy, 10 weeks.	Theory of teaching.	Methods of teaching.	Practice teaching.
Vocal music.....	Drawing.....	Drawing, 10 weeks.	Practice teaching.	Drawing, 10 weeks.

Course of study, State Normal School, Whitewater, Wis.—Continued.

ADVANCED.

Junior year.		Senior year.	
Rhetoric	English literature	Geometry	Political economy.
Zoology, 10 weeks	Chemistry	Geology, 10 weeks	Geology, 10 weeks.
Latin	Latin	Latin	Latin.
General history, 10 weeks.	General history, 15 weeks.	Mental science	History of pedagogy.
Algebra, 10 weeks		Practice teaching	Practice teaching.

Calisthenics and chorus practice throughout the course. Composition and recitations. Classes in penmanship and spelling are maintained constantly for students of all grades who need such practice.

The training department or model school in the several normal schools is conducted in three divisions, primary, intermediate, and grammar; there being three grades (one year each) in the first, three in the second, and two in the third. Some idea of the "methods" used and recommended may be formed from the subjoined outline of the primary course in reading, taken without abridgment from the catalogue of the State Normal School at Oshkosh, for the year 1889.

Reading.

PRIMARY GRADE, FIRST YEAR.

I. Before coming to school the child has made progress in spoken language to such an extent that he can enunciate the words of a vocabulary more or less extended, and he associates with those words the ideas they express.

As reading, in its beginnings, is learning to recognize in written or printed signs words already familiar to the learner in spoken language, economy, simplicity, and the necessity of interesting the child all demand that the words chosen for this first work should come from the child's own vocabulary and possess a lively interest for him. This vocabulary may be ascertained and interest secured by leading the child, by conversation upon some familiar object—one present is best—to furnish the words for his own first lesson; and, as ideas in isolation are less instructive than those in relation, get him to furnish a sentence, thus leading him from the first to use the unit of expression.

This sentence should be written upon the board with its initial capital and terminated with its appropriate punctuation mark.

Lead the child to talk about the idea expressed that the association between form and sound and sense may be fully established.

II. Isolate the word that has the liveliest interest for the pupil and have him copy it upon his slate.

This primarily to impress the outline of the word upon his memory.

Incidentally, writing and spelling are begun.

After a few words have been taught, compare the form of those words in such a way that the pupil will begin to realize that words are made up of parts. For example, erase the h in hat and ask what the word thus obtained is. Then place c before the last word and ask what it now is. Call the letters which you erase and substitute by name that the pupil may learn the names of any which he does not already know.

III. By easy work in phonic comparison enable the child to master the pronunciation of new words. For example, the child is acquainted with the word *at;* also with the powers of b, f, m, and p in words already known. If these elements are uttered and followed by the word "at" the pupil will easily recognize the words bat, fat, mat, and pat thus formed.

IV. Draw out the pupils to make stories about present objects, or familiar objects not present, or pictures, thus cultivating language and furnishing reading matter in which they will take an interest. This should be written upon the board and read one or more times by the members of the class. For seat work, this should be copied by the class upon their slates.

V. Change from script to print, preparatory to taking up the reading book, by using a chart having words in both texts side by side, or by means of cards prepared by the teacher for that purpose.

VI. Work should early be begun in helping the child to *quickly* recognize the form of words with which he is already somewhat familiar, thus preventing a drawling and unnatural style in reading. To accomplish this, the teacher may point out and the child pronounce the most difficult words before he begins the reading of any particular passage or paragraph. Keep a list of the words studied upon the blackboard where it can easily be seen by the class. Make sentences from this list, varying the arrangement as much as possible. Add the new words as learned. Review constantly. He should by some or all means be led to discriminate between word pronouncing and reading.

VII. As it is easier to prevent than to cure, from the first pay careful attention to enunciation, correct pitch, and correct inflections.

See that the pupil reads in distinct, *pleasant* tones, with distinct articulation. Do not allow a high, strained key. By arousing the child's imagination, get him to use the same key and inflections which he would use were he talking instead of reading.

The teacher should, as often as necessary, assist by furnishing a model. A good motto is, "Talk when you read; read as you should talk." This necessitates an understanding, on the part of the pupil, of what he reads.

Make sure by questions and explanations that he understands what he is to read before he begins. Encourage him to find out all he can for himself, by examining the pictures illustrating his lessons.

VIII. Voice culture should begin with the child's school work. Attention should be paid to the position of the child, whether sitting or standing, while producing tones. Judicious breathing exercises and vocal gymnastics should be practiced. *Pleasant*, natural, flexible tones should be secured and practiced by pupil and teacher. Singing and reading should go hand in hand, and it is desirable that the same teacher should teach both. Occasional exercises in simultaneous reading should be given, but the teacher must carefully guard against harsh tones and indistinct utterance.

IX. Finish the First Reader, and before taking the Second be sure that the child has had all the supplementary reading that is necessary to make him thoroughly familiar with the meaning, pronunciation, and spelling of all the words he has thus far had.

PRIMARY GRADE, SECOND YEAR.

I. The method given in the first year's work for pronouncing new words by means of phonic comparison should be continued and expanded. If the books in use furnish no lists for phonic spelling the teacher should select such a list from the lesson to be read, and by comparing these new or unfamiliar words with those already known, lead the child to determine for himself their pronunciation. This phase of the work may well be emphasized, however, not beyond the point of lively interest for the pupil.

Provide seat work for pupils of this grade by selecting from the succeeding lesson, and arranging in lists those words which have parts in common, as *rack*, *lack*, *back*, *whack*. Head these lists by similar words familiar to them and set them to determining for themselves the pronunciation of the unfamiliar ones. Ask them to copy upon their slates those which they thus determine and bring them to class.

II. Continue the method given in the first year's work for securing a *ready* pronunciation of words which are pronounced only with hesitation.

For creating and sustaining an interest in the lesson, precede the reading it by some carefully considered questions.

These should be of such a nature as will stir the imagination to see what is really in the lesson, and secure an interest in it. Care should be taken that the impression gained should not be dimmed by too much questioning or the admission of irrelevant questions.

If the pupil *understands* what he reads he will be interested if the selection is suitable.

III. Methods for securing expressive reading may be extended in this year's work, and may be considered under two heads, viz, the physical element and the mental element.

(A) As physical power is so large a factor in expressive reading, as good a degree as possible should be secured by attention to the following exercises: (1) Good standing position, including carriage of the head and shoulders. (2) Good supply of breath, secured by judicious breathing exercises. (3) Good articulation. The work in phonic spelling will do much toward the accomplishment of this. Classify lists of words or phrases involving skill in articulation, and give the class a three or five minute drill before beginning the reading lesson.

Secure good pronunciation and enunciation by a similar drill.

Pupils readily engage in and are profited by gymnastic drill of the speech and vocal organs

(B) Mental element. Cultivate this element by the following means: (1) By the methods used for making the pupil understand what he reads (see II). (2) By assisting the pupil's imagination. The following are a few of the many ways in which this may be done. Let pupil A ask a question or make a statement to B, standing by his side. Then let B go across the room or outside the door while A repeats his remark or question. This would constitute a lesson in force. Let a pupil read something expressive of joy and follow it, at once, by something expressive of pity, thus getting him to use different degrees of pitch. Compare pure and whispered qualities of voice by reading something expressive of joy, followed by something expressive of fear or secrecy. Teach degrees of rate in a similar way.

Assign the different parts of a colloquy to different pupils and have them take their places before the class to read it.

NOTE.—Strong force, low pitch, and impure quality should not be taught to immature voices.

(3) By relieving the mind of the task of doing too many things at once.

Have the pupil recite selections from memory.

In this way he may expend his mental energy in expressing thought and feeling and be relieved of the task of recognizing word forms, of keeping the place in the book, and of holding the book itself.

IV. As the object of all this is *good reading*, and as this can be secured only by much practice, get as much reading as possible done by the class.

Have the reviews read by one pupil, the others listening.

If the teacher will sometimes read the review to the class, the pupils will be interested and profited.

Let the class read selections at sight, or those to which they have given no previous study. This will aid them in *quickly* recognizing word forms and enable them to do more reading than they otherwise could.

Care should be taken, however, that the selections for sight reading should not be too difficult.

Appoint individuals to prepare and read before the class selections which the others in the class have not seen.

V. Finish the Second Reader and furnish supplementary reading sufficient to make the pupil thoroughly familiar with the vocabulary thus far gained. Narratives are better for this purpose than additional readers of the same grade.

PRIMARY GRADE, THIRD YEAR.

I. The methods of work at this stage suggest themselves when we attempt to answer the following questions:

(1) What has the lesson told the child?

(2) Can he express by means of the voice, and with distinctness and fluency, that which the lesson has told him?

II. To make the results under the first head as full as possible, the following steps are suggested:

(1) An explanation by the teacher of those allusions which the pupils do not understand.

(2) Lead the pupils to determine for themselves the *new* idea in a sentence when it contains one that is obvious.

(3) Get at the meaning of difficult words by aid of the context or by placing these words in such sentences that more light will be thrown upon their meaning.

Call out from the class synonyms for these difficult words, if possible.

(4) Have the pupils paraphrase the little poems in their readers.

NOTE.—These suggestions assume that the reading matter is on a level with the comprehension of the pupil, and that, therefore, this will aid, not crowd out, the actual practice in reading.

As sentences are vehicles not only of thought, but emotion, no pupil should be allowed to feel satisfied with his work when he has expressed thought *only*, especially in sentences where the emotion predominates, as is often the case in the reading for this grade. It is not easy to give general directions for the accomplishment of this desirable result, but it can be done, if the teacher and pupils are in such close sympathy that she can interest them strongly in that which interests her.

If the above conditions can be established, then give simple directions, good examples, and abundant practice.

III. For the purpose of securing distinct, fluent utterance, practice the exercises given for that purpose in the first and second year's work.

Let them also give short whispering exercises.

Have the final consonant, or consonants, distinctly given; but do not emphasize this practice to the sacrifice of fluency.

During this year require the pupils to establish the habit of looking up from the text while reading. A valuable sight drill and greater naturalness of expression are secured by this.

Teach the marking of the long and the short vowels.

IV. The power to articulate clearly and easily, and to command varied rate, pitch, force, and quality, must become automatic or no such thing as expressive reading is possible. *Early* training may make these processes as automatic as walking or the use of the pen; but if the consideration is deferred until late in school life it will only be accomplished in those cases where the ambition is strong enough to submit the pupil to a long and tedious discipline.

V. Finish the Third Reader and increase the amount of supplementary reading.

Practice Teaching.

The principal of the Oshkosh school, in his report for 1878–79, writes:

The work of practice teaching has been increased and improved until the problem whether a student teacher could ever be trained to control and discipline a class as in his own school has ceased to be a question. As in other phases of training, some learn the art with difficulty, and are required to work a longer period, but nothing is more clearly proved than the fact that tact in teaching is a cultivable trait.

The Kindergarten.

After much deliberation and discussion of the principles, objects, and practices of the kindergarten, the board of regents determined to establish a kindergarten in one of the normal schools as a model for observation and practice. Accordingly, they opened at Oshkosh what they claimed to be the "first kindergarten officially and directly connected with any State normal school in the United States."[1]

Kindergarten culture [says the report for 1880] is designed to correct many of the faults of our common schools, where knowledge is generally imparted in a concentrated form by teachers and text-books; where the child is crammed with the greatest possible amount of what might be termed positive knowledge in the least possible time, in many instances to the detriment of his healthy development. Kindergarten work will develop healthfully and harmoniously all the faculties of the child, as an organism that needs but to have its surroundings brought into harmony with its nature to grow into beauty and usefulness. It does not drive, but leads. The restless disposition of a child, so trying to the parent and the teacher, and so often firmly repressed, is made useful and a source of happiness and pleasure to the true kindergartner. The methods and discipline ordinarily pursued in our common schools have a tendency to dwarf the physical development of a child. The kindergarten cultivates the same by frequent changes and a wise combination of exercises of body and mind. * * * Kindergartening in the common schools of our State may not be an accomplished fact for many years to come, but the board of regents have thought it wise to give our normal pupils a theoretical and practical knowledge of its principles, aims, methods, and apparatus, in order that they may be able to apply those methods and principles in their future school work as far as circumstances will permit. If our students are to be missionaries for higher views of education, they should certainly be made acquainted with all the educational systems and methods deserving consideration. Among these systems none have received more earnest attention at the hands of prominent educators than Froebel's system of kindergartening.

The experience of the school more than fulfilled the expectations of the board of regents. The kindergarten was at first used as a school of observation merely; but a few years later it was used, as the other model departments were used, as a school of practice; and it was found that the lessons learned in the kindergarten by the normal students gave them a much clearer insight into the underlying principles of all school work and helped to solve many vexatious problems in school management.

State Normal School, Milwaukee.

The State Normal School, located in Milwaukee, was authorized by an act of the legislature passed in 1880. The grounds and buildings, provided by the city of Mil-

[1] This is a mistake. A kindergarten was opened in Baltimore and "officially and directly connected" with the State Normal School of Maryland in the fall of 1876, and was maintained until closed for want of room, caused by large increase of numbers in other departments.

waukee at an expense of $53,000, were presented to the State in 1885, and the school was opened in September of that year. It is claimed as a great advantage to this school that it is situated in a great and growing city, in which there are large commercial and manufacturing industries, a public library of 60,000 volumes, an art museum, and a museum of natural history. Every school is largely controlled by its local environment, and one of the chief functions of this school is to take the place of a city training school. Accordingly, students are admitted from the high school, without examination, on presenting a certificate of having completed the first three years of one of the existing courses of study in the high school at Milwaukee. The regular normal course may be completed in two years, and comprises (*a*) a review of all the branches of study taught in the common schools; (*b*) a critical study of physics, chemistry, and natural history, with the methods of presenting these subjects in the schoolroom; (*c*) a course in English language and literature, history of the United States, civil government, and political economy; (*d*) a course in school management, history of education, science of education, and psychology. Every student is required to spend at least forty weeks teaching in the model school under the supervision and direction of the training teacher, but no one is permitted to begin the work of teaching until he has studied psychology.

The following is a syllabus of the lessons on the "Elements of political economy," mentioned in (*c*) above:

ELEMENTS OF POLITICAL ECONOMY.

1. Fundamental notions of value, wealth, labor and capital. The three forces or factors that enter into the production of wealth. Advantages, disadvantages, and limitations of division of labor.
2. The mechanism of exchange: Various forms of currency. Banking functions. Bimetalism. Some common errors in regard to money. Regulation of production and exchange by legislative enactment, and popular fallacies respecting the same. Nature and cause of panics.
3. Distribution of profits: Rent, interest, natural and legal rate, usury laws, profits on capital and on business. Wages, real and nominal, of skilled and unskilled labor; of men and women. The "wage-fund" doctrine. Cooperative societies. Trades unions and strikes. Principles and methods of taxation. Revenue of the State, and of the United States.
4. The use of wealth: Productive and unproductive consumption. Economic significance of luxury. Subsistence and population.

Debates upon topics pertaining to this study encouraged, and students led to read both sides of disputed questions. Text: Laughlin, Walker.

It is to be regretted that the catalogue from which this admirable syllabus is taken contains in its "Arrangement of Studies" no notice of the place or time it occupies in the school work.[1]

MINNESOTA.

State Normal School, Winona.

Near the close of the session of the first legislature of the State, August 2, 1858, an act was passed preparing for the establishment of three normal schools. This legislation was suggested by Dr. John D. Ford, of Winona, and secured by his efforts through the legislative delegation from Winona County. At the first meeting of the State normal board of directors it was resolved, "That the first normal school be located at Winona, provided the subscription from Winona of $7,000 be satisfactorily

secured to the uses of said school." This was at that time the only State normal school west of the Mississippi.

On the evening of the 9th of November, Lieutenant-Governor Holcombe, president of the board of directors, delivered an address on the subject, "Education with reference to the establishment of the first normal school of Minnesota," which is said to have done much to elevate, if not to create, that sentiment of earnest support of educational interests which has marked the history of the city of Winona.

In the first annual report of the normal board to the governor the claims of the school to generous support and its vital relation to the common schools of the State were set forth in a clear and forcible manner. The board also urged in this report that "a competent superintendent of public instruction be appointed;" that "a general supervision of the subjects of schools, school-teaching, and school lands is absolutely necessary," and that "the school lands should be put into a condition to realize the largest possible annual fund." To the credit of this normal board and its secretary, Dr. Ford, it may be said that the first State tax for school purposes was authorized and levied upon their urgent recommendation.

An appropriation of $5,000 having been secured, it was decided to open the school on the first Monday in September, 1860. Prof. John Ogden, of Columbus, Ohio, was elected principal at a salary of $1,400. In his inaugural address, Professor Ogden said:

It shall be the leading object of the normal school so to distribute its labors and other exercises that all the faculties of the pupil, physical, intellectual, moral, and spiritual, shall be addressed in due proportion, at the proper time and in the proper manner; and so to develop, strengthen, elevate, and purify these powers in the student and so train him in the educational processes that he may readily apply them to the education of the children and youth committed to his care. More pains shall be taken to make teachers than mere scholars, well knowing this to be the point upon which normal schools fail more frequently than upon any other. Here, then, fellow-teachers and friends, in this brief outline, behold my ideal of a school. Behold my type of a national education. Behold what your schools ought to be, and every school must be, if we ever expect to meet a tithe of that weighty obligation resting upon us, the public servants of this great and growing Commonwealth.

At the session of the legislature in 1861 a special act was passed creating the first board of education of Winona. This board was to consist of one school director from each ward of the city, with the principal of the normal school and such members of the normal board as were residents of the city. The idea was to copy somewhat after the Oswego plan of uniting the jurisdiction of the normal and the public schools of Winona, and using the public schools as graded and model schools; but in the following year this law was repealed and the joint jurisdiction ceased.

Professor Ogden resigned the principalship of the school in December, 1861, for the purpose of entering the Union Army. In his letter of resignation he said:

My distracted and dishonored country calls louder for my poor service just now than the school does. * * * My brethren and fellow-teachers are in the field. Some of them, the bravest and the best, have already fallen. Their blood will do more to cleanse this nation than their teaching would. So will mine. I feel ashamed to tarry longer.

The school was continued for another term under a temporary principal and was then suspended until November, 1864. The reasons for this suspension were: (1) The interest in the great struggle then pending overshadowed everything else; (2) competent teachers could not be found to take charge of the school; such men were generally in the war; (3) the means for the support of the school were inadequate—the State had made no appropriations beyond the first $5,000; (4) the State was too busy in the war to care for its educational interests.

During the session of the legislature in the spring of 1864, at the earnest solicitation of the citizens of Winona, an act was passed renewing the appropriations to the school and reestablishing it on a permanent basis. This act provided that the sum

of $3,000 be appropriated for the current year, $4,000 for the following year, and $5,000 annually thereafter. No movement, however, was made to reopen the school until the following September, when Prof. William F. Phelps, formerly principal of the State Normal School of New Jersey, was elected principal, and entered immediately upon the duties of his office. His rare ability as an organizer and disciplinarian was at once apparent in the prompt and efficient measures taken to reestablish the school and to raise it to the high standard which it subsequently attained. The following extract from his first annual report indicates the policy of the school under the administration of twelve years which followed the reopening:

The normal school aims to educate and train teachers to a proper conception of the principles and to a skillful execution of the practice of their difficult art. It seeks to impart to them an accurate knowledge of those subjects which they are required to teach, that they may teach with intelligence and taste. It must, moreover, labor to develop in them all those excellences of character which will make them fit examples to those who are to be brought under their influence and molded into intelligent and virtuous citizens. It must thoroughly imbue them with a love for their work. It must generate in them the true esprit de corps. It must make them acquainted as far as possible with those multifarious and complicated processes which are best calculated to draw out the faculties of the young and bring their threefold natures into harmonious and healthful activity. In fine, the normal school should inspire its pupils with those comprehensive views of education which should shape all their measures and methods, and thus enable them, by an intelligent and judicious adaptation of means, to aim directly at the development of all that pertains to a noble and symmetrical manhood and womanhood.

Up to this time the school had been held in one of the city buildings (now the Winona library building), the use of which was given without cost — another evidence of the friendliness of the citizens to this struggling institution. The legislature of 1866 made the first appropriation of $10,000 for a school building. The whole of this sum was used in constructing a foundation, an important measure which committed the State fully to the completion of the building. The corner stone was laid on the 19th of October, 1866. In the spring of 1867 an appropriation from the legislature of $50,000 was secured for building purposes, and the building was occupied by the school in September, 1869, though not completed till the following December. It is acknowledged to be, even at this date (1892), one of the most nearly perfect buildings of the kind in the Northwest. Its admirable adaptation to the existing and prospective wants of the school and its nearly faultless construction are largely due to the experienced judgment and wise forethought of the principal.

The growth of the school in numbers, in reputation, and in all the characteristics of an excellent training school continued without marked interruption until 1876, when the legislature failed to make the usual annual appropriation for the support of the three normal schools of the State. The normal board was called in extra session, and several propositions to close the schools at once were voted down by a bare majority. The opposition to these proposals was led by the Hon. Thomas Simpson, the resident director at Winona. Finally the board took action, which was intended merely to give the schools a chance for continuance if they could find any means of existing without involving the board or incurring a debt. The resident director at Winona determined that the school should not go down. He made a temporary reduction of the teaching force, some abatements of salaries, and some extra charges for tuition. By these means the school was kept in vigorous operation until the following year, when the appropriation was not only restored but was made permanent. The action at Winona had much to do with inspiring a like spirit and determination on the part of the local management of the schools at Mankato and St. Cloud.

During the summer of 1876 Principal Phelps resigned to accept the presidency of the State Normal School at Whitewater, Wis., and Prof. Charles E. Morey was elected to the principalship, which he held until his resignation in 1879.

Principal Morey made an important change in the organization of the school by extending the elementary course; establishing an advanced four-years' course of study (designed to prepare teachers for the principalship of high and graded schools), and a professional course of one year for graduates of high schools and colleges.

On the resignation of Mr. Morey, Prof. Irwin Shepard, the present incumbent (1892), was elected president, and since that time the growth of the school in numbers, efficiency, and popularity has continued without interruption. The first teachers' institute in the State, in 1859; the first State convention of county superintendents, in 1866; and the first institute of normal instructors, in 1872, were all held at the Winona Normal School.

The first class which finished the course of this school numbered 16 members, and was graduated in June, 1860. Since that date 34 classes, numbering about 1,000 members, have been graduated, and nearly 6,000 other students received instruction for one or more terms. These students, as well as the graduates, have fulfilled their pledges to the State with fidelity and success.

The school was the first in the West to follow the example of Massachusetts in introducing industrial drawing as an essential part of the course. The laboratory methods of studying the natural sciences have always been followed, and from the very first objective teaching took the place of memoriter recitations. In 1880 a kindergarten and a kindergarten training department were organized.

In 1871 an association was formed for the promotion of the knowledge of art, science, and literature, in which the residents of the city cooperated with the authorities of the normal school. The plans of the society provided for "the fitting of rooms in the first State normal school building for a museum of natural history and physical science and for a department of drawing and the arts of design; the collection, classification, and arrangement of specimens in natural history and archæology, and of models in physics and the fine arts; the collection of facts and objects pertaining to local or general history; the establishment and support, on the grounds of the normal school, of a botanical garden; the arrangement and ornamentation of the grounds; the gathering of a library of standard works in all departments of science, literature, and art; the preservation of all collections; and the elevation of the public taste by lectures and other appropriate means."

Previous to the organization of this society citizens of Winona had placed in the normal school building for the use of the students private collections of minerals and other specimens. The proprietorship of these collections was vested in the new society. The collections were increased from time to time by additional contributions, and were arranged in the geological hall of the normal building in 1878. The museum has now become one of the most extensive in the West. The principal sections are, (1) numismatics, (2) archæology and ethnology, (3) mineralogy, (4) geology and paleontology, (5) zoology.

Two spacious rooms in the fourth story are devoted to the exhibition of art subjects — autotypes from the old masters, many fine engravings and paintings, and a small collection of busts, casts, and models.

State Normal School, Mankato.

On the 6th of October, 1868, there were gathered in the vestry of the Methodist Episcopal Church at Mankato, Minn., 27 young people who had presented themselves in response to notices given at teachers' institutes to enter the second State Normal School of Minnesota. The school was then and there organized under the principalship of Prof. George M. Gage. Actual work was begun the next day and for some time the daily sessions of the school were held in the vestry, while a brick building for its use was being erected by Mr. John J. Shaubut. From day to day the attendance increased, and when the school took up its abode in Mr. Shaubut's building

the normal class numbered upward of 40. The State normal board had been notified at its meeting in June, 1868, that the citizens of Mankato had complied with the law relating to the establishment of normal schools, and $5,000 were deposited with the treasurer of the prudential committee. The committee selected and purchased the present site, and erected in 1869 a building which for several years furnished ample room for the growing school. In 1873 Professor Gage was succeeded as principal by Miss Julia A. Sears, who held that position for one year and was followed by Dr. D. C. John. In 1880 Prof. Edward Searing became the principal, afterwards styled president, and has since continued at the head of the school. Its growth was steady and continuous, from 27 pupils to over 600, including a model school of 239, and from 3 teachers to 13.

The chief purpose of the school is special instruction in the science and art of teaching, but, as in nearly all other normal schools in the country, a thorough system of academic instruction is at once the basis and, to a large extent the medium of professional instruction. Few pupils come with sufficient attainments and intellectual discipline to qualify them for immediate entrance upon a purely professional course of instruction. In the normal department there are two courses of study, one of three years, called the elementary course, and one of four years, known as the advanced course. The studies of the two courses are identical for the first two years, and correspond almost exactly to those of the State Normal School at St. Cloud, given below.

The number of normal students, according to the last catalogue, was 305.[1]

State Normal School, St. Cloud.

This school was opened in September, 1869, in the hotel building known as the Stearns House, where it was conducted until the completion of the present building in 1875. The old building has since that time been used as a ladies' home. The object of the school is to train teachers for the public schools of the State, and no effort is made to secure students for the academic course alone, for, while such are admitted as "tuition students," they simply share in the education expressly provided for those who are to become teachers.

There are two courses of study—the elementary and the advanced. The elementary course comprises three years, the advanced course four years. It is the settled policy of the school to raise its standard of admission from year to year until the time shall come when all students can devote themselves wholly to professional work.

ELEMENTARY COURSE.

First year.—Drawing, syntax, composition, word analysis, arithmetic and algebra, physiology, penmanship; physical, mathematical, and political geography; botany.

Second year.—Psychology and methods, botany or algebra, English history or Latin, United States history, English literature or Latin, bookkeeping, civil government.

Third year.—Elemental principles of and methods in arithmetic, grammar, geography, and reading; physics, chemistry, psychology and practice, moral philosophy, geometry.

ADVANCED COURSE.

Junior year.—Elemental principles of and methods in arithmetic, grammar, geography, and reading; chemistry or Latin, physics, psychology and practice or Latin, moral philosophy, geometry.

Senior year.—Latin, geology, history and science of education, practice, English history and literature, astronomy, general history, drawing.

---

[1] Alumni Association Condensed History, 1870–1890. Twenty-first Annual Catalogue of State Normal School, Mankato, Minn.

PROFESSIONAL COURSE.

Methods, psychology, history and science of education, school economy, practice, elemental principles of and methods in arithmetic, grammar, geography, and reading; drawing.

Exercises in vocal music, elocution, essay writing, and spelling are maintained throughout these courses of study.

The professional course is intended especially for graduates of high schools and colleges. It consists of the strictly pedagogical branches, with practice teaching and a review of the elementary subjects from the teaching point of view.

In the regular course a full half year is given to the subject of detailed methods of instruction in the branches which involve the elements of knowledge. These "methods" are not empirical, but are the result of a careful application of the laws of mind to the arrangement and grading of work, to the art of questioning, to the acquisitive and elaborative processes, and to the recitative or reproductive states of knowledge. Pedagogy is regarded as applied psychology.

A full half year is given to practice teaching in the model school. This work is done under the immediate supervision of a skilled teacher, who helps the student to apply the laws of mind in the actual work of the schoolroom. "It is thus not blind experimentation, trusting to luck that somehow the right way will at last be discovered or hit upon by experience, but it is scientific prevision and insight applied to work. It is work with a conscious purpose, with the advantage of a preformed ideal and a definite knowledge of its conditioning laws. It is no more blind than is the work of a Faraday or a Tyndall in natural science."

The school is well furnished with apparatus for work in physics, physiology, and chemistry, and a carefully selected cabinet for illustrations in geology, mineralogy, and natural history. Chemistry is taught by a combination of class work and laboratory practice. The student during the afternoon of each day performs all the experiments for himself in the laboratory; on the following morning, in the classroom, he reports upon his researches, and, aided by the teacher, text-book, and classmates, he corrects his judgments and prepares for the experimental work of the afternoon.

The total number of students in the normal department (1890) is 195, 26 being in the advanced course and 169 in the elementary. The model department is divided into three grades, averaging about 40 each. The faculty consists of the president, Thomas J. Gray, and 13 professors and instructors.[1]

IOWA.

State Normal School, Cedar Falls.

On the 6th of September, 1876, the State Normal School of Iowa was opened at Cedar Falls with an enrollment of 27 students At the end of the year the enrollment was 155; at the end of the second year, 237; at the end of the third year, 252; fourth year, 339; fifth year, 334; sixth year, 352; seventh year, 301.

The site and buildings, owned by the State and previously occupied as a soldiers' orphans' home, were transferred to the normal school for its accommodation. It was known at the time that the buildings were inadequate to the requirements of a great school such as this was destined to be; but it is the beginning that costs, and here was at least a beginning. It is not surprising to learn that for many years the cry of the school was that of the horse-leech, "Give, give!" In the second biennial report the board of directors asked for a library and reading room, a room for a museum and apparatus, a room for general assembly, a room for chapel, more rooms for recita-

[1] Catalogue of State Normal School, St. Cloud, Minn., for year ending June, 1890.

tions, and more rooms for dormitories. They asked also for an increased appropriation, because the school had doubled in size since it was organized, necessitating the employment of students to assist the overworked teachers, and because it was difficult to obtain competent teachers at the salaries the board could afford to pay. In the third biennial report the same requests were repeated in almost the same words.

In 1881 the board asked the general assembly for an appropriation of $30,000 for the construction of an additional normal building. The request was granted, and the new building was ready for occupation and was formally dedicated in June, 1883. The board expressed their gratitude, but reiterated their request for a larger appropriation to enable them to pay the teachers better salaries—"a sum sufficient to make their compensation equal to that paid for like services in similar institutions in adjoining States." The board was well pleased with the new building. "It is three stories high and is furnished with all modern improvements. It contains a chapel, a model school room, a library, two society halls, chemical and physical laboratories, offices, cloakrooms, music rooms, recitation rooms, and dormitories." But while acknowledging the obligation, the legislature is gently reminded that increased accommodations will bring in an increased number of students, and an increase of students necessitates an increase of teachers, and an increase of teachers means an increased appropriation for current expenses.

The sixth biennial report keeps up the demand. The principal needs a residence, a cottage outside of the college walls within which he has been compelled to reside to the great discomfort of his family. The school needs a new dormitory to accommodate not less than a hundred sleepers. It needs an addition to the library, for one-half of the books were the personal property of the retiring principal and retired with him. It needs a liberal appropriation for a chemical laboratory. It needs a new supply of pianos; "the board are certain that could the proper authorities overhear them they would quickly replace them with the best." (It is to be hoped that the "proper authorities" were spared the infliction.) Next to music comes cleanliness. The school needs a laundry with modern appliances, for "washerwomen quit without notice, and the weather at times prevents drying." The school being a mile and a half from the city, and the team in use being old (one horse, over 20 years), a new team and bus are indispensable. The main hall must have a new roof, the floors must be renewed or repaired, electric lights must be furnished, and for the supply of all these wants the board asks only an appropriation of $61,800. Most of the above-mentioned requests were granted by the legislature; but the seventh biennial report—the latest that the editor has seen—renews the application for a cottage for the president, for electric lighting, for an additional number of teachers, for more books in the library, and for additional apparatus for the illustration of the natural and physical sciences. The estimate of expenses for the next two years is $62,100.

The growth of this school in popularity, efficiency, and professional character has more than kept pace with the growth of its environment; it has been always ahead of the latter. Like an endogenous plant, it has grown from within. Every call for additional external facilities has been preceded by a call from the living organism that admitted of no refusal. The school was opened in 1876, with five teachers: The principal in the chair of mental philosophy, moral philosophy, and didactics; a professor of ancient languages and natural science (though ancient languages do not appear in the printed curriculum); a professor of mathematics and English literature; a teacher of geography and history; and a professor of vocal and instrumental music. The students were arranged in two classes—senior elementary and junior elementary. In 1879 two teachers were added: A teacher of elocution, drawing, and accounts; and an assistant. In 1883 another teacher was added for natural science and as assistant in mathematics. In the same year the elementary course was discontinued, and the school became more decidedly professional, and next year the model school was opened. At this time the normal course was taught in three classes, each occupying

one year—senior didactic, middle didactic, and junior didactic, with a post-graduate didactic course attended by one student. The enrollment had now reached 408 in the normal and 68 in the model school. "Careful count," says the principal in his report for this year, "justifies me in saying that 92 per cent of all whom we enroll enter upon the work of teaching." The principal also expresses his opinion that "the greater benefit derived by the State from the school is derived from the nongraduates and not from the graduates." The reason given is that there are nine times as many of them, and the limited preparation of the many will, in the aggregate, exceed in usefulness the extended preparation of the few.

After ten years' service the principal, J. C. Gilchrist, retired and Homer H. Seerley took his place with eight colleagues, the new chair being that of "methods." There are now (1892) four courses of study open to those who are preparing for the profession of teaching:

(1) The scientific course, of four years.
(2) The didactic course, of three years.
(3) The supplementary course for high-school graduates, of two years.
(4) The professional course for college graduates, of one year.

The following table exhibits in detail the work of the several successive years:

Course of study—English course.

Departments.	First year.			Second year.		
	First term.	Second term.	Third term.	First term.	Second term.	Third term.
Language	English grammar.	English grammar and composition.	Etymology and word analysis.	English literature.	English literature.	
Mathematics.	Arithmetic.	Arithmetic.	Bookkeeping	Algebra	Algebra	Algebra.
Science	Geography.	.....	Physiology.	Physical geography.	.....	Botany.
History	.....	United States history.	Constitution of United States.	.....	Ancient history.	Mediæval history.
Art	Blackboard work.	Reading and music.	Penmanship and drawing, books.	Reading and music.	Penmanship and drawing, advanced.	Elocution and music.
Didactics	Theory of education.	Primary methods.	Methods of instruction.	School economy.	Principles of education.	School laws.[1]

Departments.	Third year.			Fourth year.

Language	.....	.....	Rhetoric	English classics, history of English language.	Ancient literature.	
Mathematics.	Geometry.	Geometry	Trigonometry,[2] surveying.	Advanced algebra, spherical trigonometry.	Analytical geometry.	Logic.
Science	Physics	Zoology, physics, and chemistry.	Geology, chemistry.	Laboratory work.	.....	Astronomy.
History	Modern history.	.....	.....	.....	Political economy.	Moral science.
Art	Drawing, perspective.	.....	.....	.....	.....	
Didactics	Psychology.	Philosophy of education.	Philosophy of education.[3]	True order of studies.	History of education.	

[1] Half-time study with constitution and laws of Iowa.
[2] Three lessons per week.
[3] Two lessons per week.

There is also a "Latin elective course," which differs from the English course principally in substituting Latin (Cæsar, Virgil, and Cicero) in the second, third, and fourth years for some of the language lessons in the other course.

The last available catalogue (1890–91) contains the names of the faculty for that year: The president, professor of psychology and didactics; a professor of English language and literature, a professor of mathematics, a professor of geography and history, a professor of methods, a professor of the Latin language, a professor of physical science, a professor of natural science, a professor of didactics and methods, an instructor in the English language, an instructor in mathematics, an instructor in penmanship and drawing, an instructor in vocal and instrumental music, an instructor in elocution and physical culture, an instructor in applied English, and an instructor in history and civics. A comparison of the functions of this faculty with those of the first and subsequent faculties will give a good example of evolution and differentiation in normal-school work. The career of this school has been traced more minutely and in greater detail than that of some others because it seemed typical of natural growth in accordance with the necessities of the environment.[1]

MISSOURI.

State Normal School, Kirksville.

In 1870 the legislature of Missouri made provision for two State normal schools, one to be located north and one south of the Missouri River. The school for the first normal district was located at Kirksville, and opened as a State institution on the 2d of January, 1871. Adair County voted $100,000 to secure the location of the school, with the understanding that the annual current expenses would be met by the State. The first annual State appropriation was for $5,000; the last (1890), for $12,500.

Previous to the legislation which provided for the establishment and maintenance of the State normal schools, a private normal school had been conducted for three years and a half by Prof. J. Baldwin with such efficiency and popularity that it was adopted as the State normal school of the district without any change in the faculty or the course of study. The building is 180 by 90 feet and four stories high. With the grounds, furniture, apparatus, and library, the cost was $150,000. All the movements of the school are regulated by bells rung by an electric clock, the first clock of the kind ever used by any school for a similar purpose.

There is no boarding hall or dormitory. Board in respectable private families costs from $2.50 to $3 a week. Tuition for the year costs $20, payable in four quarterly installments of $5 each. The work of this school is special. It does not offer a general, academic, college, preparatory, or seminary education. Those, and those only, are invited to attend who want to learn how to teach.[2]

The means employed for the training of teachers are:

(*a*) Thorough study by the students: They are expected to study their lessons and to become familiar with hard study.

(*b*) Careful and critical recitation under the direction of the teacher: Students are expected to recite without assistance from the teachers.

(*c*) The study of teaching: This includes three distinct courses of study. The first embraces the object, means, and methods of teaching; the motives of the teacher and the methods of organizing, conducting, and governing schools. The second treats of the methods of teaching the various branches of study. The third relates to the study of the mental and moral powers, their nature and culture.

a The elementary graduating class will observe and teach in the model school.

MODEL AND TRAINING SCHOOL.

The model department was established in November, 1882, for the purpose of exhibiting the best methods of classification, teaching, and discipline, which the normal students could observe and take part in as instructors and afterwards imitate when they become teachers of public schools. Members of the graduating classes are required to teach under the careful criticism of experienced teachers, and no one is graduated or licensed to teach in the schools of the State who does not satisfactorily stand this test. Each day a meeting of the student teachers is held by the principal of the model school, when the criticisms of the day are read and discussed and the work for the next day arranged. This school of practice is necessarily a local school, composed almost entirely of small children. It was not established for the convenience of Kirksville, but because it was considered to be "just as necessary an instrument of a normal school as a library, laboratory, or gymnasium." Several times a week classes from the model school are taught by members of the method classes of the normal in the presence of the class, the principal of the model department, and other members of the faculty. At the close of the lesson the class is dismissed, and the method and manner of the teacher are freely and fully discussed by all present—faults pointed out and improvements suggested. The following "directions" are given to student teachers in the model school:

A. Require and secure: (1) Good conduct in class room. (2) Quiet and orderly movements passing to and from class room. (3) Erect position of pupils. (4) Promptness and accuracy. (5) Neatness of blackboard work.

B. (1) Make a careful preparation for each lesson, including both matter and method of the recitation. (2) Stand before the class. (3) Request rather than command. (4) Ask definite questions and give positive directions. (5) Show pupils how to study and how to recite. (6) Be energetic, thorough, firm, clear, and efficient.

C. Cautions: Guard against much talking, dependence on the text-book, scolding, and fault-finding.

D. Strive to secure: (1) Thorough study, clear recitation, a lively interest, close attention, rapid progress. (2) Use visible illustrations and illustrative objects as much as you can with profit. (3) Keep the recitation room in good order.

Reading: Require pupils to sit and stand erect. (2) Have a short preliminary drill in vocal sounds, phonetic spelling, exercises in articulation, pitch, force, and rate. (3) Give frequent examples of good reading. (4) Require pupils to understand both the meaning of the words and the thought of the reading lesson. (5) Require pupils to read naturally and with pure tone. (6) Have variety in manner and method. (7) Let the pupils bring choice extracts from books, papers, and magazines and read them in class.

Spelling: (1) Use the written spelling method. (2) Pronounce each word distinctly and but once. (3) Require the writing to be neat and plain. (4) Have missed words rewritten at each lesson. (5) Review misspelled words daily. (6) Keep a list of missed words and use them at review.

Geography: (1) Have a map before the class. (2) Have the pupils draw maps on the board. (3) Have the lesson written on the board by parts of the class. (4) Have the lesson recited by topics, and without questions. (5) Use the globe, objects, and pictures for illustrations. (6) Drill upon the pronunciation and spelling of the difficult names.

Arithmetic: (1) Have much blackboard work. (2) Aim at accuracy and neatness first, rapidity next. (3) Aim to secure intense mental action. (4) Give original examples as tests. (5) Require definite and logical explanations and analyses. (6) Let pupils acquire ability to perform the operation before drilling on rules and explanations.

Grammar: (1) Have all definitions illustrated by original examples. (2) Keep the blackboard in use. (3) Dwell on new points until well understood. (4) Practice writing sentences, abstracts, correspondence, etc. (5) Dwell on common errors.[1]

STATE NORMAL SCHOOL, WARRENSBURG.

This school was established in the spring of 1871 in pursuance of an act of the general assembly dividing the State into two normal-school districts, and authorizing

[1] Twenty-third Annual Catalogue of the Missouri State Normal School, first normal district, for the year 1890-91, pp. 23-31.

the establishment of one normal school in each district. After a sharp competition between different points, the school for the second district was located at Warrensburg, in Johnson County. In order to secure this location, the citizens of Johnson County voted $128,000 in county bonds, the citizens of Warrensburg voted $45,000 in city bonds, and private citizens donated a campus of 16 acres within the city limits, valued at $8,000, making the original cost to citizens of county and town $181,000.

The first session of fourteen weeks closed on the 18th of August, 1871, with an enrollment of 87 students. The last catalogue (July, 1892) shows an attendance of 874 students in the normal department, 341 men and 533 women.

Applicants for admission must be at least 16 years of age, present satisfactory evidence of good moral character, and pass a satisfactory examination in spelling, reading, descriptive geography, English grammar, United States history, and arithmetic to percentage. They must also execute in good faith a declaration to teach school in the State of Missouri.

The course of study consists of four years. The first two years constitute the elementary section; the last two the advanced section. Students completing the work of the elementary section receive a "certificate of graduation," which is valid as a State certificate for two years. Those who complete the advanced course receive a diploma with the degree of "bachelor of scientific didactics," which is equivalent to a State certificate for life.

Like other normal schools the school at Warrensburg has had to fight its way to popular recognition. It was charged with being only a local institution, and therefore undeserving of State support. It was alleged that the graduates did not teach, and that they preferred to teach outside of the State. Even the practice departments encountered strong opposition on the ground that the children of the town in the immediate vicinity of the school were receiving their education at the expense of the State. But these and other allegations of like character have been shown to be baseless, and the success of the school seems to be fully established, as it has certainly been deserved.

State Normal School, Cape Girardeau.

The State Normal School for the third district was established by an act of the legislature approved March 22, 1873. This act created a board of regents for the management of the school, consisting of the State board of education and four regents appointed by the governor. There were several bids for the location, and the board selected Cape Girardeau. Pending the erection of a new building the school was opened in one of the public schoolhouses of the city. The new building is an elegant and substantial structure, four stories high, and sufficient for the accommodation of 500 pupils.

The course of study, constructed with special regard to the preparation of teachers for common and high schools, is substantially the same in the three State normal schools, though each school makes a special adjustment for its (real or supposed) special needs. The full course occupies four years—three in the "elementary" and one in the "advance" course. Those who complete the elementary course receive a certificate which authorizes them to teach for two years in the public schools of the State. Graduates from the advance course receive a diploma attesting the degree "Bachelor of Scientific Didactics." The "bachelors" who teach successfully in the public schools in the State after receiving their diploma, and who complete a course of post-graduate reading prescribed by the board of regents, may be granted the degree of "Master of Scientific Didactics." The post-graduate course is comprised in four divisions—history, poetry, fiction, and professional, as follows:

First Year.—*History.*—Prescott's Conquest of Mexico, Lossing's National History of the United States, Motley's Dutch Republic, Hume's England. *Poetry.*—Homer's Iliad, Thompson's Seasons, Pollock's Course of Time, Coleridge's Ancient Mariner. *Fiction.*—Scott's Waverley and Ivanhoe, Irving's Knickerbocker History of New York, Dickens's David Copperfield, Johnson's Rasselas. *Professional.*—Holbrook's Normal Methods, Tate's Philosophy of Education, Northend's Teacher and Parent, Porter's Elements of Intellectual Science, Root's School Amusements.

Second Year.—*History.*—Macaulay's England, Guizot's History of Civilization, Irving's Life of Washington. *Poetry.*—Moore's Lallah Rookh, Tennyson's Harold, Longfellow's Hiawatha and Evangeline. *Fiction.*—Henry James's Portrait of a Lady, Howell's Undiscovered Country, George Eliot's Mill on the Floss, Goldsmith's Vicar of Wakefield. *Professional.*—Fitch's Lectures on Teaching, Gregory's Christian Ethics, Barnard's Object Teaching and Methods, Herbert Spencer on Education, Bain's Logic, Quick's Essays.

From 1883 to 1889, inclusive, 26 graduates received the degree of master of scientific didactics, and between 1877 and 1890 (both inclusive) 95 received the degree of bachelor of scientific didactics.

The enrollment of students the first year (1873–74) was 57—28 ladies and 29 gentlemen; for the last year (1889–90), 361—164 ladies and 197 gentlemen.

Tuition is free, but an "incidental fee" of $3 a term ($6 a year) is charged.

KANSAS.

State Normal School, Emporia.

In the first month of the second year of her statehood, Kansas laid the legislative foundations of three great institutions—the State University, the State Agricultural College, and the State Normal School. There were grave doubts of the ability of the State to make the necessary appropriation to start the normal school at an early day; but in 1864 the legislature passed an act appropriating $1,000 to the State Normal School to be used exclusively for the salaries of teachers. Prof. Lyman B. Kellogg was the first principal. In his report five years later, Principal Kellogg says: "On the 15th day of February, 1865, 18 students (15 more than were

greeted by Father Peirce in Lexington, when the first normal school of Massachusetts was opened, and 1 less than President Hovey had at the beginning of the Illinois University), were gathered in a room belonging to the district school of Emporia. With them there was one teacher. The 18 students had settees borrowed from a neighboring church. The teacher's seat was a chair, borrowed from the county treasurer's office. There was no teacher's desk; there were no text-books, maps, or other appliances. The parable of 'The Sower' was read, the Lord's Prayer repeated, and the normal school of Kansas was opened."

One room of the public schoolhouse of Emporia was occupied by the normal school during the first term. An assistant teacher being needed and no room being available, a citizen, whose children were attending the school, built a one-story frame building, 14 by 20, near the school and gave the use of it to the school without charging rent.

A new building for which the legislature had made an appropriation of $10,000 was occupied by the school in January, 1867. The assembly room was capable of seating comfortably 120 pupils, and was the best audience room at that time in the city. The school, as usual with normal schools, outgrew its accommodations. In 1872 the legislature appropriated the sum of $50,000 for the purpose of erecting a new normal-school building at Emporia, in addition to and connected with the building then occupied by the school. This appropriation was conditional on the city of Emporia contributing $10,000 to the same purpose. The condition was complied with and a handsome building erected, the dedication exercises being held in June, 1873.

In 1876, instead of the usual appropriation bills for salaries and other expenses of the State normal schools, the legislature introduced a section into the miscellaneous appropriation bill allotting several sums to each of the three normal schools to pay current expenses up to March, 1876, with the provision that these appropriations shall be received in full for all claims against the State, and that said schools cease to be maintained at the expense of the State; and the State shall not be liable for any expense in excess of this appropriation, and that the Leavenworth and Concordia normal schools cease to be State institutions. These two schools had been established under laws of 1870 and 1873, respectively.

Being without funds to pay a faculty, the board discharged all the teachers with the exception of the president, Dr. Pomeroy, who was continued without salary to conduct the school. He was authorized to charge tuition fees and employ such teachers as he deemed necessary, but without expense to the board. Notwithstanding all these difficulties over 100 pupils were enrolled in the various departments during the year. The school was carried on for seven years on the tuition fees received from students and whatever money might be raised from the sale of normal lands.

The building completed in 1873 was an unlucky one. The tornado of April, 1878, tore off nearly half the roof of the stone building, rolled up two-thirds of the tin roof of the other, and demolished several chimneys and windows. The rain went through the ceilings from roof to basement, loosening the plastering and damaging the furniture.

The heating apparatus was very unsatisfactory, and yet on the morning of October 26, 1878, the entire building was destroyed by fire. Nothing was saved of the normal property—library, museums, apparatus all perished, with the library of the president and his household goods.

During the week following the fire the citizens of Emporia at a public meeting declared in favor of early steps for the erection of a new building. The result of their earnest efforts was that the legislature appropriated $25,000 for the rebuilding of the State Normal School, provided that the city of Emporia and Lyon County

should contribute the sum of $20,800. The erection of the building occupied about a year, and the house was so near completion by May, 1880, that the school took possession on that day.

There was no more room in this building than there had been in the other. Students continued to crowd in until the enrollment reached 746, three times the number that had been registered before the fire.

In 1887 the legislature made an appropriation of $25,000 for the purpose of adding a wing to the building. The new building is a stately and beautiful edifice, admirably adapted to the purposes of the school. The main corridor is about 200 feet long, and the entire building contains 50 rooms. The rooms devoted to the kindergarten and the model school are furnished with all the modern appliances in the way of modeling boards, sand pans, number rods, reading boxes, balances, measures, charts, maps, geometrical forms, gifts, collections of the most common and most interesting minerals. The gymnasium is well supplied with apparatus for physical exercise. Besides wands, clubs, and dumb-bells for light gymnastics, there is suitable apparatus for heavy gymnastics. From $1,000 to $1,500 a year are now appropriated for apparatus and museum.[1]

Great attention seems to be paid to the physical condition of students, as would appear from the following blank:

Albert R. Taylor 1882

NEBRASKA.

State Normal School, Peru.

The germ from which the Nebraska State Normal School sprung was the seminary at Peru, Nemeha County. The trustees offered the seminary building to the State for normal school purposes, and the legislature, in 1867, accepted the offer, established the State normal school at Peru, appropriated $3,000 to aid in fitting up the building, and assigned 20 sections of land as an endowment fund. A new building was erected in 1873, and enlarged in 1885. The seminary idea predominated at first. Tuition in the seminary was charged at $8 a term; in the normal department, $8; in the model school, $6; Latin, extra, $2. "Music on melodeon, $10; ornamental branches at usual rates." State students, two from each State senatorial district, who signed a declaration to teach for three years in the public schools of the State, were admitted at half rates.

But the normal idea finally prevailed, and the school is now purely professional,

and is free to all students properly qualified on paying $5 for matriculation fee and a contingent fee of $1 to cover breakage in the laboratories. There are two courses of study, the elementary and the higher.

The elementary course, which embraces two full years of study, is designed to prepare teachers for common ungraded and lower grade schools, and hence, in addition to a critical study of all common branches, it comprises a thorough course of instruction in the organization and management of ungraded schools, the methods of teaching the different branches, the art of rendering the elements of learning pleasant to the young, and the use of illustrative apparatus for primary schools.

The higher course is designed to furnish students wishing to become strictly professional teachers such education and training as will thoroughly qualify them for the discharge of the duties of any educational position in which they may be called to labor; and hence, in addition to the elementary course, it comprises a three years' course in the higher branches, including professional instruction in the laws of mental development with their application to teaching; the science, philosophy, and history of education; school laws in general, and the school system of Nebraska in particular; and school gradation, supervision, and management.

Each year is divided into three terms. The figures indicate the number of terms given to the several studies in the year. It is to be regretted that no intimation can be given of the number and length of the weekly recitations.

Elementary Course.—*First year.*—Arithmetic, 3; geography and map drawing, 3; language and composition, 3; reading and word analysis, 1; civil government, 1; bookkeeping, 1.

Second year.—Arithmetic, 2; physiology, 1; United States history and geography, alternately, 2; drawing, 1; grammar and sentential analysis, 2; general reviews, with methods and practice, 2; school economy and general principles of education, 1.

Higher Course.—*First year* —Algebra, 3; physics and chemistry, 3; rhetoric, 1; English composition, 1; botany, 1; Latin (optional), 3.

Second year.—Geometry, 2; trigonometry, 1; zoology and botany, 1; geology, 1; school laws, zoology, 1; general history, 1; English literature, 1; political economy, 1; Latin (optional), 3.

Third year.—Psychology, 3; astronomy, 1; moral philosophy, 1; logic, 1; science of education, 1; art of instruction, 1; methods of teaching, 1.

Vocal music, penmanship, and orthography are daily exercises, and constitute part of the regular course. Laboratory practice is required of all students in the higher course.

During the year 1891 there were 454 students in attendance, including 95 students in the practice school who were admitted without matriculation, and whose names do not appear in the catalogue. Of these, 12 graduated from the higher and 48 from from the elementary course.

The faculty consists of the principal, George L. Farnham, A. M., and twelve professors and instructors.

The annual appropriation from the State is $17,550.[1]

SOUTH DAKOTA.

State Normal School, Madison.

The State Normal School was located at Madison during the session of the legislature of 1881–82, the citizens of Madison agreeing to donate to the Territory one quarter section of land 1 mile from the city limits as a site for school buildings. The location being thought too far from town, a lot of 20 acres within the city was chosen and work upon the building commenced in the spring of 1884. In the meantime the normal school had been opened in 1883, with 11 pupils. The second year closed with 42 pupils on the register. The legislature of 1884–85 having made an appropriation of $13,600 for finishing the building and $14,000 for running expenses for two years, the school moved into the new building on the 2d of November. On the 4th of February following the building was entirely destroyed by fire. Before the

[1] Catalogue of the Nebraska State Normal School, 1891.

fire was extinguished the board of education called a meeting. Accommodations were secured in the opera house, the Methodist Church, and the Baptist Church. Next morning the school went on as usual. Not a recitation was lost. On the 6th of March the citizens of Dakota voted to raise $25,000 to rebuild the normal schoolhouse and finish the dormitory. The corner stone of the new building was laid on the 20th of July. It is a massive structure of granite and is the handsomest building of its size in the State. It is thoroughly ventilated and well warmed by steam.

The act establishing this normal school provides that its "exclusive purpose shall be the instruction of persons, both male and female, in all the various branches that pertain to a good common-school education; also, to give instruction in the mechanical arts, in agriculture, in chemistry, in the fundamental laws of the United States, and in what regards the rights of citizens." Candidates for admission must be 14 years of age, of good moral character, and well versed in the common-school studies. It is stated in the last annual catalogue that the sole design of the school is to educate and train competent teachers for the public schools of the State; that all studies are selected for their pedagogical value, that there are no optional studies, and all the professional studies, the methods, and practice work must be actually taken.

The following is the programme of daily recitations for the fall term of 1892:

Programme.

Professor.	First period.	Second period.	Third period.	Fourth period.	Fifth period.
Beadle.....	General history.	Psychology.....	United States history.	Pedagogy.....	.....
Dempster...	Ad. Arithmetic.	B. Algebra.....	A. Algebra.....	Geometry	B. Arithmetic.
Goff	Composition and rhetoric.	Ad. grammar...	English literature.	B. Grammar	American classics.
Mawson	Elocution	Zoology and physiology.	.....	Drawing.....	Vocal music.
Pryne	B. Geography ..	B. Reading.....	.....	Ad. geography..	Civil government.

Miss Herrig will give methods in the fifth period, and penmanship will be given in the third period.

Each student in the normal school, who is a citizen of the State, pays $12 a year for tuition, and nonresidents of the State pay $30 a year. Board and furnished rooms in the city of Madison cost from $2.50 to $3.25 per week. The cost in the dormitory, which is exclusively for ladies, is only $2.35 per week.

The model school is a graded school of eight years, in which students from the normal department are required to put their methods and principles into practice, with the aid of critic teachers, who plan the subjects and supervise their daily work. The aim of the faculty is to make the model school the best elementary school in the State.

The average daily attendance in 1889–90 was 118; in 1890–91, 122, and the same in 1891–92. The number of first-year students on the last register was 125; second year, 33; third year, 22.[1]

V.

STATE NORMAL SCHOOLS IN THE SOUTH CENTRAL DIVISION.

TENNESSEE.

Peabody Normal College, Nashville.

The trustees of the Peabody fund, being convinced by an actual examination of the facts, as well as by the logical conditions of the question, that the greatest want of the South was a supply of trained teachers, authorized their agent, Dr. Barnas

[1] Catalogues of the State Normal School, South Dakota, 1888, 1889, 1890, 1891, 1892.

Sears, to establish and foster normal schools. The State of Tennessee seemed to him to offer many advantages as an "experimental station." Accordingly he came to Nashville in 1873 and proposed to contribute from the Peabody fund $6,000 a year for the support of a normal school if the State legislature would appropriate a like sum. A bill for this purpose was introduced into the senate. It passed three readings in the senate, and would have passed the third reading in the house had the session lasted two days longer.

A bill of the same purport was introduced into the next legislature and was defeated on its first reading. The State was not in condition to make an appropriation of $6,000 in addition to other and more imperative claims. The bill was amended by leaving out the appropriation clause and passed without difficulty. It was under this act that the normal school was established. The State board had neither money nor buildings, but the trustees of the University of Nashville came forward and tendered the use of their building and grounds; and so under the auspices and by the mutual cooperation of three boards—the State board of education, the university trustees, and the trustees of the Peabody fund—the Peabody Normal College was opened on the 15th of September, 1875, with Dr. Eben S. Stearns, chancellor of the University of Nashville, as president and two lady teachers as assistants.[1] At first there were only 13 students enrolled, but the school grew steadily and in 1887 numbered 177 students. After the death of Dr. Stearns, in 1887, Dr. William H. Payne, of the University of Michigan, was elected to the presidency. The school has an annual appropriation of $10,000 from the State, which was first given in 1881; the other expenses are met by the Peabody board of trust and the University of Nashville. For a few years after the opening of the college it received $3,000 annually from the Peabody fund, and in October, 1876, Dr. Sears, the general agent, announced that a limited number of scholarships, worth $200 each, would be given under certain conditions. Next year, 19 students from various States took advantage of this offer, and the number increased gradually until it reached 114. Tennessee had no Peabody scholarships until 1883, but as early as 1880 the legislature had established 25 scholarships of $100 each for the students of that State. The Peabody scholarships are distributed at present (1892) as follows: Alabama, 13; Arkansas, 10; Georgia, 14; Louisiana, 8; North Carolina, 14; South Carolina, 10; Tennessee, 14; Texas, 9; Virginia, 14; West Virginia, 8. They are awarded on competitive examination by the respective State superintendents upon a uniform set of questions prepared by the president of the college and sent to the State superintendents. Applicants are required to be not less than 17 years of age nor more than 30; of irreproachable moral character; in good health, with no physical defects, habits, or eccentricities which would interfere with success in teaching, and have a purpose to follow teaching as a vocation. The minimum literary qualifications for securing a scholarship are the following: The ability to read fluently, to spell correctly, and to express thoughts in grammatical English; to solve problems of moderate difficulty under all the ordinary rules of arithmetic, and to demonstrate any ordinary arithmetical principle; to locate the principal cities, rivers, and mountains of the world, and to give the boundaries of any specified State of the Union; to parse the words of any ordinary English sentence, and to correct ungrammatical English; to solve equations with two unknown quantities, and to describe the leading events in the history of the United States. It is expected that the standard for entrance will be raised from year to year. For the year 1891–92 scholarship students are advised to come with one year's preparation in Latin. A scholarship is good for any two successive years above the freshman class.

[1] Proceedings at the inauguration of William H. Payne as chancellor of the University of Nashville and president of the Normal College, Nashville, Tenn., 1887.

The general curriculum is divided into the following departments:

	Courses.
Greek, one year, three times a week	4
Latin, one year, three times a week	15
Psychology, half year, three times a week	1
Pedagogy, one year, three times a week	7
Mathematics, one year, three times a week	10
English and rhetoric, one year, three times a week	15
French, one year, three times a week	4
German, one year, three times a week	4
History and geography, one year, three times a week	9
Chemistry, one year, three times a week	7
Biology, one year, three times a week	4
Physics, one year, three times a week	3
Astronomy, half year, three times a week	1
Drawing, one year, three times a week	4

Vocal music, two years, two hours a week.

Each department is divided into several courses; Greek, for example, into 4; pedagogy into 7. A full course comprises 5 exercises a week, whether in recitations, laboratory work, or lectures. It is not necessary that the exercises constituting a full course should be in one and the same branch of study.

The college degree proper is that of licentiate of instruction. To obtain this degree the student must complete 18 full courses, of which the following are prescribed:

	Courses.
In Latin	$2\frac{2}{5}$
In psychology and pedagogy	2
In mathematics	$3\frac{4}{5}$
In English	$2\frac{4}{5}$
In chemistry	$\frac{3}{5}$
In physics	$\frac{3}{5}$
In biology	$\frac{4}{5}$
In music	$1\frac{3}{5}$
In history	2
Making	$16\frac{4}{5}$

From the other courses offered the student must choose and complete enough to make in all 18 full courses.

Scholarship students are credited on entrance with 5 full courses, and students have the privilege of being examined for advanced standing in any prescribed study if application is made within two weeks after entrance. If the examination is satisfactory credit is given for the study thus passed.

The main purpose of this college is the professional education of teachers for the more responsible positions in the public-school service of the South. In its academic work it aims to give its students a liberal education of the collegiate type, and to impart to them an appreciable measure of the scholarly spirit. But while a generous scholarship is indispensable to high excellence in teaching, the Peabody College recognizes that a teacher must be something more than a scholar. He must add to his general scholarship a comprehensive knowledge of educational doctrine, history, and methods; and this constitutes the professional work of the college. It is intended that this professional instruction shall be a characteristic feature of the college and that it shall be of a higher grade than has hitherto been given in any institution in the South.[1]

[1] Catalogue of the Peabody Normal College, Nashville, Tenn., 1890.

The aim, purpose, and tendencies of this great normal school can not be thoroughly understood without reference to the views of the celebrated educator now at the head of the institution. Referring to the grafting of a normal school upon the ancient stock of the University of Nashville, Dr. Payne said in his inaugural address:

The transformation of the literary department of this university into a normal college, while at first sight an innovation in scholastic history, is really a return to the primitive purpose of university organization. In its origin and purpose the ancient university was a corporation of student teachers—of young men who sought the very highest intellectual culture of the time in order that they might become the teachers of the ignorant. A necessary condition imposed for obtaining the bachelor's degree was that the candidate should have taught previous to his graduation, and the condition on which the master's degree was subsequently granted was the express obligation to teach a certain number of years after graduation. Even to-day we hear an English educator of high rank asserting that the "true function of universities is to teach and to supply the world with teachers." To what nobler use, then, could this venerable university be converted than to the preparation of young men and women for the higher and more responsible places in the public-school service. * * * There is no better place than this to reaffirm a truth that is in danger of being forgotten, that the primary and fundamental qualification for teaching is generous scholarship, a confirmed love for the scholarly vocation, a high degree of intellectual training. * * * So far as my knowledge goes, this is the only normal school in this country which proposes to make its academic work of collegiate grade, and it is in such a school, placing before it such an aim, that I can most heartily labor. Normal schools of the ordinary type, with an academic course of the secondary or high school grade, have their manifest place and function, and should be established and liberally sustained in every State, but these will never suffice to give proper tone and inspiration to public education. For this necessary purpose there must be schools whose intellectual training is of the collegiate or university type. In this institution the middle, senior, and baccalaureate classes represent the higher aims to which I refer, while the junior class constitutes the normal school as distinguished from the normal college.

But academic work of a high grade does not of itself constitute a normal college. This is a distinctly professional school in its constitution and purpose, and so the instruction it offers must be in part professional. The teacher must be a scholar and something more—more by that special kind of knowledge which fits him for his specific duties. This special knowledge is the theory, the history, and the art of education.[1]

These sentiments of Dr. Payne are reiterated and emphasized in his baccalaureate address of May, 1890:

The teaching profession is composed of two very unequal classes: the few who are leaders in educational opinion, and, compared with them, the almost innumerable host of teachers who carry into effect the plans and orders of their superiors. All well-conceived plans for the education of teachers must take this distinction into practical account, and there must be two classes of professional schools based on these two orders of endowment and duty; there must be a few West Points for educating the commissioned officers of the great army of teachers, and a much larger number of subordinate schools for the dissemination of "true opinion," for teaching subjects and methods to the rank and file of that mighty host of men and women who are the world's teachers. It is not conceivable that the entire teaching class can ever be inspired by the scientific or the professional spirit—that spirit which animates the discoverer and sets him apart for life service in the schoolroom. * * * I merely state a fact, and I state it in the mildest way, when I say that university and college men have but little respect for the scholarship that is produced in normal schools. This lack of respect does not proceed from rivalry, for any real rivalry between schools of such radically different grades is wholly out of the question. I think the feeling is caused for the most part by the assumption on the part of normal school students of scholarship and learning which they do not have. * * *

Normal schools profess to do work which their rank and organization make it impossible for them to do; their graduates are in some sort compelled to assume a competence which they do not have; and so they forfeit the respect of men who are really scholarly. I wish to say explicitly that so far as intent goes, the only fault that can justly be attributed to the State normal schools of the day on the score

[1] Proceedings at the inauguration of William H. Payne as chancellor of the University of Nashville and as president of the Normal College, Nashville, Tenn., October 5, 1887.

named is that they are overambitious. Without exception, so far as I know, these schools are administered by men whose good intent and honesty of purpose are beyond the slightest question. * * * But there are other so-called "normal schools or normal colleges" of whose honesty of purpose I can not speak with so much confidence. They are merely academies labeled with the trade-mark, "normal," and their advertised excellence consists in their being more than the equivalents of the "old-time" colleges and universities. In other words, they propose to do in two years what Harvard and Yale attempt to do in four. In these "independent" schools the word "normal" connotes a mode of diagramming a sentence, a short cut to a mastery of Latin, or some mere mannerism in teaching.

I have assumed that in its rank, organization, and aim this institution belongs to the smaller and higher class of schools whose function is the education of men and women for the more commanding places in the public-school service of the country. * * * It is not the province of this college to duplicate any normal school of the existing type.[1]

The Peabody board of trust has lately made an appropriation of $12,000 for a model school building, and this school is now in successful operation. It is a school of primary grade containing 40 children, from 6 to 10 years of age, taught by the most approved modern methods. It is a school of "observation" merely, in which students can study the work done by accomplished teachers; not an experimental school, "where children are to be practiced on by novices."

There is now in the South a demand for men who are competent to act as city and county superintendents, and one of the functions of the Peabody College is to train men for this useful and honorable career. Ample opportunities are presented for thorough instruction in scientific school supervision.

A commodious gymnasium has been erected and furnished with the most approved apparatus. Besides the general exercises, in which all are expected to participate, unless for good reason excused, special exercises are prescribed for individual cases, based on a careful diagnosis of each student's physical condition. The gymnasium also furnishes a pleasant diversion from study, and gives recreation of mind as well as exercise of muscle.[2]

ALABAMA.

State Normal College, Florence.

The Alabama State Normal College was established in 1873 as the "State Normal School" with an annual State appropriation of $5,000. In 1881 the State appropriation was increased to $7,500 per annum. In 1887 the board of directors was delocalized, no two members being appointed from the same county, and the name was changed to "Alabama State Normal College." Prior to 1886 the course of study was largely academic, little attention being paid to professional instruction. This was in part due to the fact that such instruction was best adapted to the students in attendance. Even as late as 1891 we are told:

The experience of all [?] normal schools is that they must do academic work. Teachers, consciously or unconsciously, imitate their instructors. This is especially true if they have been educated in schools where no particular attention is paid to methods of imparting knowledge. They come forth with no awakened thought upon the importance of correct methods, and with all their attention fixed upon the matter to be taught; consequently they repeat what they have seen, both as to the art of instruction and the management of the school. Many of the schools from which the normal college is supplied with students can not send forth those who are thoroughly prepared in the various branches of study, while not one in twenty of the teachers in these schools has had any special training for his work. Theoretically it may be desirable to confine the work of the normal college to strictly professional subjects, but practically it is not as yet possible.

Since 1886 more attention has been given to the professional training of teachers, and such instruction is now the leading feature of the institution.

---

[1] Baccalaureate address by William H. Payne, Ph. D., LL. D., May, 1890.

[2] Catalogue of the Peabody Normal College, May, 1890.

There are in the same building two distinct schools, each with its own organization, the State Normal College and a Model Training School. The president and critic of the former are, respectively, superintendent and principal of the latter. This arrangement is mutually advantageous; it affords for pupil teachers of the normal college a field for observation and practice in teaching, and it secures to children in the model school better instruction than they would otherwise be likely to have.

The course in pedagogics proper covers a period of three years. The work of the second year is largely practice work; in the third and fourth years practice and theory are combined. In the second year the aim is to teach pupils to prepare and give lessons as regards matter, method, and manner. The lessons are written, submitted to the teacher for correction, and given to classmates, who endeavor to act the part of the pupils for whom the lesson is intended and who afterwards present criticisms to be reviewed by the teacher. In the third year the philosophy of methods is discussed.

There are two courses, the advanced and the professional. The advanced, or regular course, occupies four years. The professional course requires but one year and is intended for teachers of experience and graduates of high schools and colleges who do not wish to take the regular course, partly because it traverses a large field with which they are already acquainted, and partly because they do not wish to be placed in the same "form" with boys and girls of 15, the minimum age for admission. In the following table the right-hand column is the professional course; the advanced course includes the whole:

Curricula.[1]

Year.	Term.	Mathematics.	Science.	Language.	Form study and drawing.	Pedagogics.
First.....	Each ...	Arithmetic .	Geography; map drawing; physical geography.	Language lessons; grammar; composition.	Study of type forms, modeling in clay; stick and tablet laying; paper folding and paper cutting; drawing (Prang's shorter course.)	During two recitation periods the pupils are taught a variety of subjects according to improved methods. This teaching is done by members of the senior class, under the supervision of critic teachers.
Second ..	Fall	Algebra	Physiology ...	Grammar critically reviewed; rhetoric.	Study of type forms; expressing ideas of form by making, by drawing, by language; first principles of decoration; conventionalizing; color (Prang's course.)	Lessons on the senses, objects, and qualities. Lessons on place, number, form, color, and force. Lessons on occupations, minerals, plants, and animals.
	Winter .	Algebra	Physiology ...	Rhetoric.....		
	Spring..	Algebra	Botany	General history.		
Third....	Fall	Algebra	Natural philosophy.	United States history or Latin.	Object drawing; working drawings; constructions; perspective (linear); beauty in ornament; arrangements in colored paper; original designs. (Prang's course.)	Methods in geography. Methods in arithmetic. Methods in language.
	Winter .	Plane geometry.	Natural philosophy.	Civil government or Latin.		
	Spring..	Plane geometry.	Natural philosophy.	Bookkeeping or Latin (Cæsar).		

[1] Eighteenth Annual Catalogue of the State Normal College and Model Training School, Florence, Ala., 1890-91.

Curricula—Continued.

Year.	Term.	Mathematics.	Science.	Language.	Form study and drawing.	Pedagogics.
Fourth ..	Fall	Solid geometry.	Chemistry....	Writings of select English and American authors or Latin (Cæsar).	Outline of art history; how to introduce drawing in our public schools; how to teach children to observe, to think, and to express their thoughts by drawing; review of primary and intermediate work (Prang's course.)	Recitations; school government; applied psychology; practice teaching.
	Winter .	Trigonometry.	Chemistry....	Essays, orations, and select readings, or Latin (Cicero).		School organization and management; the teacher; school ethics; applied psychology; practice teaching.
	Spring..	.....	Chemistry....	Preparation of theses or Latin (Virgil).		School laws; school systems; history of education; applied psychology; practice teaching.

The income of the school is derived from several sources, as exhibited in the "Annual report of the president to the board of directors" at the annual meeting, June 10, 1890:

State appropriation	$7,500.00
From Peabody educational fund	1,200.00
From tuition fees	2,396.93
From incidental fees	1,538.00
From miscellaneous sources (specified)	1,301.95
	13,936.88

To students not less than 15 years of age who take the required course of study and pledge themselves to teach for two years in the public schools of Alabama, tuition is free; to others it is $6 for each term of twelve weeks in the Model Training School, and $8 for each term of the same length in the Normal College. Each student, however, is required to pay an incidental fee of $2 at the beginning of each term. Boarding in pleasant private families can be had at from $10 to $13 a month. The number of students in attendance in the normal department in the session of 1890–91 was 218.

State Normal School, Troy.

The legislature of Alabama, in 1887, authorized the establishment of a State normal school at Troy on the condition that the city should furnish grounds and buildings adapted to the requirements of the school. The city complied with this condition at an expense of $25,000 and the school was opened in 1888. The State appropriation of $3,000 was found to be entirely inadequate, but was supplemented by $1,200 from the Peabody fund and by tuition fees averaging over $2,000. Students who take the legal obligation to teach two years in Alabama are free of tuition, with the exception of an incidental fee of $3 a term. Those who enter for general education only are charged $30 a year.

Like many of the Northern schools, the school at Troy has had to fight its way. An effort was made in the legislature of 1891 to withdraw the appropriation, and a committee was appointed to investigate the subject of normal schools. The report was highly favorable, as will be seen by the following extract:

The State may choose as to the manner of caring for her poor and vicious. She may take the children of the poor and so strengthen them by education as to save

them from the poorhouse, or she may enlarge the poorhouse to receive them and their progeny. Alabama must build more schools or more jails and penitentiaries. Which it shall be is a question for your decision. As to your present decision, you know better than any others what it is to be; we may all be assured of the final decision as to public schools in Alabama. They have come to stay and grow as in other sections of our country, and this means that they will get more than a niggardly support. Alabama will yet attain greater things in the education of her masses.

The public school, once seen and admitted to be a necessity, we may better judge as to our next point—the means of rendering effective this great agent of the people's intellectual, moral, industrial, and material well-being—good and well-trained teachers. There are some good teachers who became so by their own self-training, just as there are some people who become great scholars without attending school, or as some lawyers, physicians, or ministers become professionally skilled without taking a course at a professional school. But it has been found that schools are helpful to scholarship, and that few ever get scholarship outside of their walls. It has likewise been found that professional schools give more systematic and extensive training than is likely to be secured without them. The normal school is the teacher's professional school, as is the medical the physician's, the mechanical the machinist's, the military the soldier's, the naval the sailor's. The State aids in the maintenance of schools for other professions, although these do not enter her direct employment after graduation, but are dependent upon fees derived from practice for all their remuneration. Not so with the teachers. They are to be employed by the State. In this they are like army and naval officers. The Army and Navy are Government enterprises, and to secure success in the management of these the Government trains her own officers in schools erected and supported by the Government for that purpose. This insures skill, uniformity, and efficiency. When the State undertakes a vast system of public schools to insure skill, uniformity, and efficiency in management she trains her own commanders (teachers) like the Government, at least in part. * * * In view of the facts heretofore enumerated, we hereby express it as our best judgment that it would be unwise to abolish the normal schools, and we recommend their continued and increased support, as their necessities may be made to appear from time to time in the future.[1]

The report of the committee was adopted by a close vote, and the normal schools are safe, at least for the present.

The State Normal College, as it is now called, of Troy, Ala., embraces two schools.

I. Normal College, including the departments of (1) pedagogy and ethics; (2) English and civics; (3) pure and applied mathematics; (4) Latin language and literature; (5) natural science; (6) vocal and instrumental music; (7) physical training and education; (8) art, painting, and drawing; (9) penmanship and business.

II. Model schools: (1) High-school department; (2) intermediate department; (3) primary and kindergarten department. The entire work from the entrance of the kindergarten to graduation from the normal college is carefully graded and occupies twelve years.

The departments of elocution, music, art, and business receive no support from the funds of the board before mentioned.

The number of students in the normal school proper seems to have been, in 1890, 177; in the high school 124, and in special departments (music, elocution, art, and business), 239.[2]

A late circular gives the following:

Courses of study.

(1) Pedagogic, elementary and complete, three and four years, respectively; leading to the degree of bachelor of pedagogy.

(2) Scientific, four years, embracing the branches most essential to a modern education, thorough and practical. Degree, bachelor of science.

(3) Philosophic, five years, embracing both pedagogic and scientific courses. Degree, bachelor of philosophy.

(4) Music, vocal and instrumental, a thorough two years' course.

(5) Art, painting and drawing in its various forms, a two years' course.

---

[1] Report of joint committee on normal schools to the general assembly of Alabama, February 6, 1891.

[2] Catalogues of the State Normal School, Troy, Ala., 1888, 1889, 1890.

(6) Commercial bookkeeping, penmanship, business forms and laws, et al., as demand may be.

(7.) Elocution, embracing voice, gesticulation, physical culture, all on the Delsartean theory.

To such as complete the elementary, the pedagogic, or the philosophic course, a State life certificate is granted, which relieves the holder from further examination, and is an evidence of professional training and qualification which is recognized throughout the State.

Philosophic course of study.

	Pedagogic course.		Scientific course.		
Class term.	Pedagogic.	English civics.	Mathematics.	Latin language.	Natural science.
Junior:					
Summer...	Methods of teaching.	Rhetoric and elocution.	Algebra and plane geometry.	Cæsar, composition.	Zoology.
Fall	School management.	Rhetoric and elocution.	Algebra and plane geometry.	Cæsar, composition.	Zoology and entomology.
Winter	School government.	English literature.	Plane geometry	Cæsar, composition.	Physics.
Spring.....	Readings.....	English literature.	University algebra and solid geometry.	Virgil, scansion	Botany.
Middle:					
Summer...	Practical psychology, methods of teaching.	Civics	Applied geometry and conic sections.	Roman history.	Physical phenomena, easy experiments.
Fall	Science of education.	.....	Applied geometry and conic sections.	Roman history, Virgil, scansion.	Chemistry.
Winter	Philosophy of education.	Civics and United States history.	Plane trigonometry.	.....	Chemistry.
Spring.....	Practice teaching.	Civics and United States history.	Spherical trigonometry and surveying.	Cicero, Amicitia, composition, higher syntax.	Physical geography.
Senior:					
Summer...	Practical psychology, history of education.	Lectures in political economy.	Analytical geometry.	Horace, odes....	Geology.
Fall	Logic.....	.....	Analytical geometry.	Horace, odes, meters, Roman literature.	Geology.
Winter	Ethics.....	Political economy.	Analytical geometry.	Horace, satires, Latin philosophy.	
Spring.....	School supervision and institute work.	General history lectures.	.....	Selections from Latin poets, meters, mythology.	Astronomy.

N. B.—The philosophic course (B. Ph.) covers both the pedagogic and scientific. The pedagogic (B. P.) exeludes middle and junior Latin. The scientific (B. S.) exeludes junior pedagogy and fourth terms, middle and senior.

The model school is divided into three departments—primary, intermediate, and high school. The number of students in the normal department for the year 1889–90 was 177, excluding high-school pupils, "irregulars," and special collegiates (music, elocution, art, and business). The grand total enrollment of different names was 506.

Alabama Normal College for Girls, Livingston.

The Livingston Female Academy, which was incorporated in 1840, is now called the Alabama Normal College for Girls. The State legislature of 1882–83 made to the girls of Alabama the first gift which the women of the State had ever received from the public treasury—an annual appropriation of $2,000 and a donation of $500 to

enable the directors of the Livingston Academy to add a normal department to the existing institution.

The full course of the college includes three departments—primary, intermediate, and collegiate. The normal course is identical with the collegiate, but with the addition of methods of teaching common-school studies, history of education, school laws of the State, and practice teaching.

The number of normal students (1891–92) is 35.

The whole number of normal graduates since 1884 is 72.[1]

LOUISIANA.

State Normal School, Natchitoches.

The Louisiana State Normal was founded by an act of the general assembly in 1884. Under the provisions of that act the State board of education located the school at Natchitoches and appointed a board of administrators, but in 1888 it was enacted "That the board of administrators of the State Normal School shall consist of six competent white citizens, who shall be selected and appointed by the State board of education—one from each of the five circuits of the courts of appeals, and one from the city of Natchitoches." The school was opened in November, 1885, under Dr. Edward E. Sheib as president, who continued in charge till 1888, when he resigned and was succeeded by Prof. Thomas D. Boyd, who is now at the head of the institution.

The school grounds contain about 20 acres under fence and 80 acres of open woodland. The property, formerly occupied as a convent by the Sisters of the Sacred Heart, was purchased by the town and parish of Natchitoches and donated to the State for the use of the normal school. The buildings are comfortable, but entirely too small for the accommodation of a school which is growing so rapidly as this has done. The attendance in the normal department for the years 1888–1892 (both inclusive) was as follows: 42, 44, 84, 138, 163. The State appropriation for the last two years was $12,500 each year; $2,500 of this amount for insurance and repairs. A liberal donation from the Peabody fund—$3,650 over that of former years—supplemented the State appropriation and enabled the school to continue without interruption in its prosperous career.

The faculty consists of the president, 5 professors, and 5 assistants and specialists. The course of instruction covers three years of eight months each, as follows:

First year.—Arithmetic, English grammar and composition, geography, history of United States, physiology and hygiene, penmanship, and bookkeeping.

Second year.—Advanced arithmetic, algebra, rhetoric, English literature, zoology, botany, general history, psychology, civil government, and history of education.

Third year.—Geometry, English literature, physics, chemistry, psychology, ethics, pedagogy, methods of teaching, school management, and practice teaching in the practice school.

PRACTICE SCHOOL.

In the practice school, consisting of four primary grades, the usual branches of such grades, including drawing, vocal music and calisthenics, are taught by the most approved modern methods. These grades are in charge of trained normal graduates, and form as indispensable an adjunct to a normal school as is the workshop to a school of practical mechanics, or the hospital to a medical college. For an hour each day the members of the senior normal class, divided into groups, are required to give lessons in these grades. This work is not mere experiment nor observation, but bona fide teaching under the direction of trained specialists. The work is reduced to a system, each student teacher being required to prepare the lesson beforehand in all its details, according to a plan devised by the training teacher. At the expiration of the practice hour the members of the senior class again assemble in their

[1] Catalogue of Alabama Normal College for Girls for the year 1891-92. Miss Julia Strudwick Tutwiler, principal, Livingston, Ala.

class rooms, when their work is subjected to the criticism of their classmates and of their training teacher, who point out all errors both in government and in instruction. No young teacher could go through this daily experience for months without acquiring much of that presence of mind, that self-control, that fertility of resources, and that ready knowledge of methods and devices which give the surest guaranty of success, not only in the schoolroom, but in any other field of human endeavor.[1]

Admission.—The school is open to students of either sex. Applicants are required to be at least 16 years of age, and of good moral character; they must declare their intention to remain at the normal school until graduation unless sooner discharged, and must certify in writing their full intention to teach in the public schools of Louisiana for one year after graduation; they are also required to pass a satisfactory examination in the ordinary common school branches, "unless exempt from such examination by virtue of an adequate diploma or teacher's certificate." On successfully completing the course of study the student receives a diploma which entitles the holder to a first-grade teacher's certificate, which is valid for four years.[2]

VI.

STATE NORMAL SCHOOLS IN CALIFONIA, OREGON, AND ARIZONA.

CALIFORNIA.

When the first normal school in California was opened, July 1862, but eight out the thirty-four States then in the Union had established State normal schools. These schools numbered 14 in all, distributed in the order of the date of opening as follows: Massachusetts, 4; New York, 2; Pennsylvania, 3: Connecticut, 1; Michigan, 1; New Jersey, 1; Illinois, 1; Minnesota, 1. Besides these, Philadelphia, Boston, and St. Louis each had a flourishing city normal school.

The necessity for the establishment of a State normal school in California was first urged by a few gentlemen in San Francisco, among whom were the State superintendent, Andrew J. Moulder; his successor, John Sweet; and the city superintendent, Henry B. James. By the earnest efforts of these gentlemen a city normal school was established in San Francisco in 1857. The sessions of the school were held weekly and the attendance of the city teachers was made compulsory. This school was continued until 1862; its graduates numbered 54.

In his annual school reports of 1859 and 1860 State Superintendent Moulder recommended the establishment of a State normal school, but both of the succeeding legislatures adjourned without action. When he appealed personally to the members of the legislature to pass the law organizing the school, not a few of them admitted that they did not know what a normal school was.

During the session of the first California State Teachers' Association, held in San Francisco, May, 1861, a committee was appointed to examine and report upon the subject of normal schools. This report was embodied by Superintendent Moulder in his report to the legislature of 1862, and earnestly commended by him to their consideration, with the statement that an appropriation of $5,000 would be sufficient to establish the school and put it in successful operation. The result of the combined efforts of the State superintendent and the teachers' institute was that an act was passed by the legislature, May 2, 1862, providing for the establishment of a State normal school and appropriating $3,000 for its support for five months. The first and second sections of this act read as follows:

1. The board of education of the State of California, together with the superintendents of common schools in the cities of San Francisco, Sacramento, and Marysville, are hereby constituted, ex officio, a board of trustees for the normal school of the State of California, as hereinafter provided.

---

[1] Reports of the Louisiana State Normal School, Natchitoches, La., to the general assembly, 1890 and 1892.

[2] Catalogue and Circular of the Louisiana State Normal School, 1890-91.

2. Such board of trustees shall be known and designated as the "Board of trustees of the State Normal School," and they shall have power to establish and maintain in the city of San Francisco, or at such other places as the legislature shall hereafter direct, a normal school for the free instruction in the theory and practice of teaching of such citizens of this State as may desire to engage as teachers in the public schools thereof; to prescribe a course of study for such normal school, and the text-books to be used therein; to examine, employ, and fix the salaries of teachers therein; to hold stated examinations of the pupils attending such normal school, and to award certificates and diplomas as hereinafter provided; to arrange and carry into effect all the details necessary to carry out the purposes of this act.

San Francisco.

In pursuance of this act the board of education accepted the offer of the San Francisco board of education, tendering to the normal school the use of a vacant room in the high school building, together with apparatus. The offer was accepted, and the board advertised that the school would be opened on the third Monday in July. A large attendance was anticipated and there was much discussion as to the proper apportionment of seats, so that each county in the State might secure its proportionate privileges in the school, while at the same time sufficient advantages should be afforded "to the greater number of persons who will undoubtedly seek admission to the school from our large cities." The number of pupils to be admitted during the first term was finally limited to 60, provided that at least 1 pupil shall be admitted from each county. The expectation that a large number of students would apply for admission was not realized. On the day appointed for examination only 5 applicants presented themselves. Three days afterwards the school was organized in a room on the ground floor of the high school building, with Ahira Holmes, of San Francisco, as principal. The number of students increased until at the close of the term the school numbered 31, of whom 3 were young men. A considerable number of those admitted were found to be exceedingly deficient in the knowledge of the common-school branches, as well as in the mental discipline and intellectual vigor necessary to pursue the studies of the course to advantage. The declaration required by the trustees at admission was as follows: "We, the subscribers, do hereby declare that it is our intention to engage permanently in teaching in the common schools of this State, and that it is our object in resorting to this school to prepare ourselves for the discharge of this important duty; and we moreover pledge ourselves to remain at least one term in the school, and to observe faithfully all the regulations of the institution so long as we continue members thereof."

The unfortunate and unnecessary word "permanently" no doubt frightened off many girls who were also candidates for matrimonial honors, but who might have taught school for several years with great success. In the pledge now in use the objectionable word is omitted.

The act establishing the school provided for but one session of five months, but the board decided to open a second session and trust to the liberality of the legislature to carry it through. Their expectation was not disappointed. During the term three special teachers were employed—in music, drawing, and calisthenics, respectively. The whole number of students in attendance during the year was 50. The subjects taught were practical and mental arithmetic, physical and descriptive geography, English grammar and analysis, rhetoric, composition, reading, penmanship, algebra, plane geometry, physiology, natural philosophy, vocal music, and theory and practice of teaching.

The school began its second year no longer an experiment but an established State institution. Its first year of work had proved both the necessity for its existence and its possibilities of usefulness. The legislature of 1863 repealed the first act establishing the school and passed a second act, substantially the same, embodying it as part of the State school law and making an appropriation of $6,000, which was double the original appropriation for the first year.

In January, 1864, the school was reorganized and divided into senior, junior, and subjunior classes, and a regular course of study for each class was prescribed by the board. By the new regulations each member of the senior class was required to spend one week in the model school and to write a full report of the work done while there. The haste of pupils to graduate was a great hindrance to the best success of the school, as it has been even in the best of schools to the present day.

The following extracts from a letter written by a graduate of the class of 1864 will give some idea of the difficulties encountered in the early days of this school:

My introduction to the school was made in the fall of 1862. It was then held in a side room of the high school of San Francisco. The room resembled a hat room deprived of its racks and improvised with rickety seats. The normalites were intruders upon the domain of the high-school pupils; hence had no rights that they could call their own. Ahira Holmes was principal, vice-principal, assistant, and professor to all the 25 normalites—that is, when they were in attendance.

In the beginning of 1863 we were moved to a tumble-down, two-story wooden structure on Fourth street. The place we went to was worse than the place we left; for while it stood on what may well be termed a *stable* foundation, it was shaky, and its outside stairs upon their two posts were shaky. When vehicles went rumbling over their cobbled way we suspended our class exercises; we had to, for the tremble, rattle, roar, and clatter drowned human voices. We had other misfortunes—there were no maps, apparatus, nor books of reference in or about our school. We had one piece of furniture in addition to our seats and desks—a piano, hired by the pupils.

During the first term the school waned and waxed. In waning it went down to about 20 pupils; then it ran up to 30; it trembled in the balance. The pupils held council what to do—to forsake the institution in a body, or continue faithful to the end. The decision was to stay with the school—old house and all. We were faithful to the end. From that time the school has gone on to prosperity.

The year of 1864–65 shows a continued increase of attendance and in the general efficiency of the school. The growing interest and confidence throughout the State in normal-school work are shown by the fact that twenty-three counties were represented by the new students admitted during the year. An arrangement was made with the San Francisco board of education by which four normal students were detailed each week to teach either as substitutes or assistants in the public schools of the city. This arrangement did not prove altogether satisfactory.

In June, 1865, Mr. George W. Minns, principal of the Boys' High School of San Francisco, was elected principal of the California State Normal School. The school opened for the year on the 10th of July, in Dashaway Hall, the model school being for a time disbanded. After six weeks it was transferred to the Lincoln School building, then just completed. In September it was again removed, this time to a primary-school building. Here the normal school found a permanent home during the remainder of its stay in San Francisco, and sang the song of the Psalmist (Rouse's version)—

Woe 's me that I in Mesach dwell
A sojourner so long,
That I in tabernacles dwell
To Kedar that belong!

By an act approved March, 1866, the State board of education was made to consist of the governor, the State superintendent of public instruction, the principal of the Normal School, the superintendents of schools of San Francisco, Sacramento County, Santa Clara County, San Joaquin County, and two professional teachers nominated by the State superintendent and elected by the board. By the same act the State board of education, with the exception of the principal of the State Normal School, was constituted the board of trustees of the State Normal School.

The revised school law provided that the graduates of the Normal School should receive State certificates of a grade to be determined by the State board of examination. Under this provision some graduates received diplomas, and others, first, second, or third grade certificates, the standing of each member being determined

by taking into consideration the recitation records during the term, the report of success in the training school, and the result of the written examination at the close of the term.

San José.

In May, 1868, Dr. William T. Lucky being principal of the Normal School, the subject of a permanent location for the school began to be agitated, and in 1870 the legislature selected San José as the location and enacted a law providing for the selection of a site and the erection of a building. Some amendments were made to the laws governing the school, the principal change being in the constitution of the board of trustees, which was made to consist of the governor, the State superintendent of public instruction, and five others to be appointed by the governor. The same act appropriated $24,000, biennially, "which said appropriation shall be set apart at the commencement of each fiscal year to support the State Normal School."

The corner stone of the first California State Normal School building was laid October 20, 1870, with imposing Masonic ceremonies conducted by the Grand Lodge of the State. The first session of the school in San José was opened in June, 1871, in rooms temporarily furnished by the city board of education. The new building was completed in 1876 at a cost of about $285,000. Though but imperfectly adapted to school purposes, it was a handsome building, both in architectural design and in details of finish, with numerous porticoes supported by Corinthian pillars, handsome entrances, wide corridors, and spacious halls. It is unfortunate that so large an amount of time, money, and skill should have been expended on a building constructed almost entirely of wood. In November, 1873, a preparatory class was organized, whose special work was a thorough review of the elementary branches in preparation for the work of the junior class. During this year the senior class began regular practice work in the training school, the classes of which were made up of pupils from the public schools of the city. But in the following year the training school was opened as a pay school independent of the city schools, and soon became nearly self-sustaining.

In 1876 the course of study was extended to three years—junior, middle, and senior. In this year the legislature raised the annual appropriation to $24,000.

With the school year of 1879–80 came a catastrophe which resulted in giving the strongest possible proof of the vitality of the school and of its hold upon the confidence of the people. On the morning of Tuesday, February 10, 1880, the building was totally destroyed by fire, originating, it is supposed, in a defective chute. The total loss was estimated at $304,000. The board of education of the city of San José promptly tendered the high-school building for the use of the normal school, making arrangements to accommodate the high-school classes in other schools. Thus the school was enabled to continue its work with but one day's interruption.

On the 12th of April, 1880, the legislature passed a bill appropriating $100,000 for the erection of another building at San José for the use of the State Normal School, and work on the new building was at once begun.

During the legislative discussions in reference to the normal school two assertions were made which did the school great injustice. One was that the normal school was a San José or Santa Clara County high school, and therefore should not be sustained by the State. In answer to this it was shown that during the current year 275 students had entered from counties outside of Santa Clara. The other allegation was that the graduates of the normal school were not as well qualified as many graduates of high schools; that they could not pass the examination to enter the junior class of the university, etc. To this it was replied that the normal school is not a high school, nor is it a preparatory school for the university. It has for its object the preparation of teachers for the district schools of the State. The most advanced graduates of the high schools find it hard work in one year to complete the review

studies and the training required in the normal school. One-third of the time of this year is devoted to the study and practice of teaching. The mere assertion that after this year's work students are not as well prepared to teach as those who know a little more Latin or French can carry but little weight.

Work on the new building was begun in May, 1880, and was prosecuted with such vigor that the school was able to occupy its new quarters in May, 1881. The new edifice, though plainer in its exterior than its predecessor, is well adapted to the purposes of the school, being modeled after the most approved normal-school structures in the East, and it has been pronounced by well-informed persons who have had ample opportunities for observation to be inferior to none on the continent at the time of its erection. Notwithstanding its spaciousness the school gave promise of rapidly outgrowing its accommodations.

In February, 1881, the legislature made an appropriation of $25,000 for improving and fencing the normal-school square. The grounds were carefully laid out, walks and drives graveled, flowers and trees planted. New lawns have from time to time been laid out and additional flower beds and trees planted, so that the grounds are now a place of delightful recreation to the students and an ornament to the city.

In no way is the intellectual life of a school more clearly indicated than in the increasing use of the library. With the occupation of the new building came the employment of a special librarian, who kept the library open all day. The arrangement in the course of study of a study hour at the school building for each pupil opened the door to an increased use of reference books and gave some additional time for general reading. Visiting committees from the legislature, seeing both the usefulness of the library and the need of more books, recommended special appropriations for the benefit of the library, which were cheerfully granted. This in turn reacted upon both teachers and students, who, finding that more and better books were provided, were induced to make more and better use of them. In addition to these inducements the topical method of study, now growing in use and favor, by which the student is given a subject to investigate rather than a portion of some book to master, necessarily led to the demand for many books on each subject. The importance to the student of this familiarity with books can scarcely be overestimated. The library numbered in 1889 about 3,500 volumes. By the continued liberal appropriations of the legislature new books are added yearly, and an additional building is now needed.

By the course of study adopted in 1884 it is provided that each member of the senior class should spend one recitation period each day for three-fourths of the year in the training department — the first ten weeks in observation and the last five months in teaching. During the half term spent in observation, the pupils write out, as regular exercises, criticisms upon the work of pupil teachers and analyses of model lessons given by the regular critic teachers, besides receiving special lectures upon the work they have observed. During the five months of actual practice work they are required to make special preparation for each recitation under the supervision of the regular critic teachers, who give both class lectures and individual criticism. From the one class with which it began, the training department grew until it included four distinct subdivisions—primary, intermediate, grammar, and advanced grammar. From the time the pupil enters the lowest junior class until he graduates his attention is kept fixed on the fact that he is learning each subject with a view of imparting it to others, and the method of presentation is made a subject of continued observation. The pupil is thus from the beginning trained to teach. The philosophy of the work he has not at first culture enough to appreciate, or even to understand. As he advances to riper scholarship he receives about one hundred and twenty lectures, beginning with an outline of mental philosophy, upon methods of teaching, grading, and disciplining a school. These lectures cover not only the philosophy of education, but practical and detailed instruction in the minutiæ of

teaching. Students are required to take copious notes of those lectures and to rewrite them for future reference. They thus are enabled to carry away with them voluminous notebooks of original work, intended and fitted to be guidebooks to young teachers when they come to reduce theory to practice.

In 1887 a workroom was fitted up and provided with tools for the use of pupils. For the first year instruction was given only by the regular teachers, but this not proving satisfactory, a skilled mechanic was employed during a part of the year to superintend the workshop. Attendance was entirely optional, but the results were satisfactory. An exhibit of students' work at the close of the term showed fancy tables, easels, footstools, etc., all of creditable workmanship.[1]

Los Angeles.

In March, 1881, an act was passed by the legislature establishing a "Branch State Normal School in Los Angeles County," the site to be selected and the building located by the board of trustees at San José. The school was opened in August, 1882, in a handsome and convenient building in the city of Los Angeles. The attendance the first year was 126 in the normal department, and 150 in the training school. The course of study arranged was the same as that of the school at San José, and both in the organization of the school and its management the parent institution was closely followed, and with most satisfactory results.

The legislature of 1890 made an appropriation of $10,000 for building and furnishing a gymnasium. Each student is required to practice calisthenic or gymnastic exercises for one recitation every day under the supervision of a skilled and careful instructor.

The number of students entered on the catalogue of 1890–91 was, in normal classes, 288; in model and practice school, 200.

Chico.

The legislature, in 1887, created another branch normal school, to be located at Chico, in northern California. It was opened in 1889 with 80 pupils, under the principalship of Prof. Edward T. Pierce; this number had increased to 120 by the end of the school year.

OREGON.

State Normal School, Monmouth.

Monmouth, the seat of the Oregon State Normal School, is in Polk County, 2 miles west of the Willamette River and 70 miles from Portland by rail. The State Normal School was established at this place in 1883. The necessity for such an institution was manifested by the fact that as soon as the school was opened students began to gather in from different parts of the State, and during the first year 104 were enrolled. The enthusiasm spread, and the number in attendance the second year was double that of the first; the fourth year showed an enrollment of 227; the fifth year, 261; the sixth year the attendance was so large that it was found necessary to suspend the model school until the new building should be completed. The new

[1] Historical sketch of the first State Normal School of California.

building is a magnificent brick structure especially adapted to its peculiar purpose, and is the gift of Polk County to the normal school.

The normal curriculum is divided into three courses. The elementary occupies one year; the regular, two years; and the advanced, one year. The elementary course includes, as professional studies, object teaching and use of apparatus, methods in arithmetic and grammar, methods in geography, reading, and history, and school organization; in mathematics, arithmetic; in sciences, geography, map drawing, and history; in English, grammar, analysis, and composition; in art, etc., elocution, vocal music, penmanship.

In the regular course the studies of the first year are, professional: school management, teaching in graded schools, hygiene of schoolroom, methods in mathematics and science; mathematical: algebra; science: philosophy and chemistry; English: rhetoric, English literature, ancient and mediæval history; art: elocution, vocal music, penmanship.

Second year, professional: civil government, Orgeon school law, constitution of Oregon, history of education; mathematical: geometry and bookkeeping; science: physiology, geology, astronomy, botany; English and mental science: ancient and mediæval history, modern history, mental science; art: elocution, vocal music, penmanship.

The studies of the advanced course are, school gradation, school supervision, institute work, philosophy of education; trigonometry, surveying, mechanics; commercial law, political economy, moral philosophy, logic; German, French; Cæsar, Cicero, Virgil.

The graduating class of 1889 numbered 36; that of 1890, 21.

Graduates of the State Normal schools of Oregon receive diplomas good for six years in any public school of the State; after which, if successful in teaching, they are entitled to life diplomas.

There are four other State Normal schools in Oregon, located, respectively, at Drain, Weston, The Dalles, and Ashland.[1]

ARIZONA.

Territorial Normal School, Tempe.

This school was established by an act of the thirteenth legislature, amended and reenacted in 1887. The objects of the school are declared by said act to be the instruction of persons, both male and female, in the art of teaching and in all the branches that pertain to a good common school education; also to give instruction in the mechanical arts and in husbandry and agricultural chemistry, in the fundamental laws of the United States, and in what regards the rights and duties of citizenship. Applicants for admission are required to be not less than 15 years of age, and should be able to parse the words of any ordinary sentence; to solve any problem in arithmetic up to and including decimal fractions; to bound any State or Territory and to locate the principal rivers and cities of the world; to write a legible hand, and to read intelligently.

The Normal School building is a brick structure, 60 by 70 feet and one story high. A 10-foot hall extends through the building from north to south. The building is surmounted by a high roof, leaving a space of 8 feet between the roof and the ceiling. The entire structure is surrounded by a veranda 12 feet wide. Ventilators admit the passage of air in every direction.

Tuition is free to those who obtain an appointment from a member of the legislature and to those who sign the declaration that they attend the school for the purpose of preparing themselves for teaching in the public schools of Arizona.

[1] Ninth Biennial Report of the Superintendent of Public Instruction of the State of Oregon, Salem, 1891.

All others are charged $1 per month. In order to graduate the student must be at least 18 years of age, must have attended the school for a period of at least twenty-two weeks, and must pass a written examination in all the studies of the course. Graduates receive certificates which entitle them to teach a grammar school in any county in the Territory.

The regular course of study requires three years for its completion. The studies of the first year are reading (3), geography (3), grammar (3), history (3), drawing (3), arithmetic (3), spelling (3).

The studies of the second year are geography (1), arithmetic (2), spelling (3), writing (1), rhetoric (1), zoology (1), bookkeeping (1), physics (1), physiology (1), algebra (3), botany (1), pedagogy (1).

The studies of the third year are grammar (1), arithmetic (1), pedagogy (2), algebra (2), geology (1) (optional), school law and ethics (1) (optional), geometry (2), chemistry (1), civil government (1), astronomy (1), English literature (1).

Each school year is divided into three terms, and the figures above indicate the number of terms devoted to that subject in each year.

The following is the syllabus of the lessons in pedagogy:

Practical pedagogy.—Brief study of the mind; the teacher; the pupil; the parent; the school house and grounds; school management; discipline; recitations.

Theoretical pedagogy.—More complete study of the mind and senses; cultivation of the mind and senses; cultivation of memory, judgment, reason, imagination, etc.; the emotions; the will; nature and use of punishment.

History of education.—Biographies of noted educators; discussion of their methods, theories, and attainments; a thorough examination of the educational value of common public schools.

School law and ethics.—The right; the conscience; motives; passions; habit; different ethical systems. An analysis of the school law of Arizona.

The faculty consists of the principal, filling the chairs of language, mathematics, and pedagogy; and one professor, teacher of reading, history, literature, and natural science.

The number of students, session of 1890–91, was 30; 27 in the junior class, and 3 in the senior.[1]

VII.

NORMAL SCHOOLS FOR COLORED TEACHERS.

The preceding chapters have been devoted to the consideration of normal schools for white students controlled by the State and supported wholly or in great part by the State. It was considered unadvisable to take up the history of normal schools for colored people in the same connection, because the two classes are so different that they afford no grounds for comparison. They arose under different circumstances, were carried on by different agencies, and were actuated by different purposes. The former sprung out of a growing conviction of the necessity of better teachers for the common schools; the latter from the want of any teachers. The one had a single purpose in view—the elevation of the common schools by the agency of qualified teachers; the other had for its purpose the elevation of a race by the creation of suitable schools. The progress of the one has been largely professional and intellectual, with occasional deviations in the direction of higher education, the industries, and æsthetics; the progress of the other has been in a small degree purely professional; in still larger measure academic, moral, religious, and industrial, with occasional flights into the region of classical and scientific learning and considerable dalliance with music. There are few institutions of the latter class known by title as "normal schools." There are "normal universities," "normal colleges," "normal and collegiate institutions," "normal seminaries," and many universities and colleges with "normal departments."

[1] Catalogues of the Arizona Territorial Normal School, 1890–91.

The establishment and maintenance of the State normal schools hitherto considered have been due either to the State solely, or to the State aided by local communities, and occasionally to local communities aided by the State. The origin of colored normal schools (the phrase is used for brevity and not by preference) was due to one or more of the following instrumentalities:

1. The National Government.
2. Religious or philanthropic associations.
3. Individual generosity.
4. State governments.

It is obviously impracticable, within the limits necessarily prescribed to this essay, to notice all the normal institutions or departments included in these classes. A selection of typical instances will be made, but the actual conditions and prospects of practical normal training will not be accurately represented without carefully weighing the report of the Hon. J. L. M. Curry to the trustees of the John F. Slater fund, from which the following extracts are made:

In some of the towns and cities there is possibly an unwise multiplication of denominational or independent schools. Christian denominations are rivals in their establishment, in getting the largest number of pupils, and in making the most attractive exhibition. It seems to be a weakness and an error common to all to seek to catalogue as many names as possible. The aggregate names, not the habitual and average attendance, but all who for any time, one day or several months, have matriculated. This militates against the usefulness and popularity of the free schools. In so far as these institutions not under State control impair the efficiency of, or divert attendance from, the public schools, they are mischievous; for the great mass of children, white and black, must more in the future than at present depend almost exclusively upon the State schools for the common branches of education. These schools, permanent, not subject to caprice or varying seasons, incorporated into the body politic, must be the chief factor in the education of the people. * * * The schools aided by the Slater fund give instruction in the primary grades, and a preponderant percentage of the pupils never get beyond what should be taught in a good public school. *The normal work is generally superficial, and is appended to the curriculum more as a future expectancy than as a present realization.* [The italics are the editor's.] These schools have unquestionably improved the negro teachers in the South. Teaching always derives benefit from the discipline, the knowledge, the culture of those who teach, and it would be unjust and unkind to withhold proper acknowledgment of the improvement of the teachers and of the cause of it. Nevertheless it is indisputable that the normal training is lacking in system, thoroughness, and the application of educational psychology. Persons are called and commissioned as teachers because they have passed creditably through the literary course of these schools. Such preparation for their work is excellent, essential, because professional skill must rest on scholarship, but it does not come up to modern requirements and possibilities. The normal work, as aided by us, should be more professional and more systematically and concentratively adapted to the preparation of teachers for school work. The higher literary instruction should be supplemented by a course suited to training teachers to teach. Improved teaching is the prime need of our school; and the surest and cheapest method of advancing general education and of meeting our obligations as a board is to aid in providing qualified teachers.

In all the schools some industries are taught, rather for the purpose of preparing the pupils for making a living by a trade, and of aiding in the maintenance of the schools by the sale of products, than for the development of the powers of the mind, and gaining a truer and ampler knowledge of the world "and of things as they exist in nature and are used in the industrial arts." These industries, thus pursued, do good to the individual negro, but they are an infinitesimal factor in working out the problem of "uplifting the lately emancipated population of the Southern States." Physical labor has been found advantageous in restraining appetites and preventing vicious indulgences, in dignifying and elevating manual labor as proper in itself, in economic production, in the manufacture of products, the sale or consumption of which helps in the difficult and ever recurring problem of how the school shall live from year to year; but the rationale of the use of tools and of construction, with examples of the application of science to art, may often be the best function of the manual-training school. Even where skillful and intelligent superintendents were found by us, the foremen were often merely mechanics, without general education, performing their work without understanding the principles involved. A blacksmith heats and

hammers and welds iron and puts it into shape, but he does nothing more. It is a wrong to the men, to the schools, to the race, to allow such superficiality, such weary apprenticeship. The first need in a shop, as in a school, is a competent instructor. . . . I venture to recommend strongly larger appropriations for strictly normal work, and that what is given for that end be applied to the salaries of teachers of whose competency the educational committee is satisfied.

The Miner School, Washington, D. C.

The first attempt at the education of colored girls as teachers was made in Washington, D. C., about the beginning of the year 1852.

Miss Myrtilla Miner, a lady of Northern birth and an experienced teacher, had been for some years previous to this time a governess in a Southern family. There she became impressed with the conviction that colored children had need of education, that they were capable of education, and that, under the conditions then prevailing, they could be educated only by teachers of their own race. So she came, alone and unknown, to Washington on the 3d of December, 1851, to carry her convictions into practical operation. She began on a small scale. She rented a small house, and gathered some 25 girls into it, and by rigid economy made the enterprise nearly self-sustaining. Contributions from personal friends in the North supplied what was lacking.

So the school went on for four years amid many discouragements, but gradually gaining strength, when, by Miss Miner's influence, a society was formed styled "The Washington Association for the Education of Free Colored Youth." The trustees were Samuel M. Janney, Loudoun County Va.; Johns Hopkins, Baltimore; Samuel Rhoads and Thomas Williams, Philadelphia; G. Bailey, M. D., and L. D. Gale, M. D., Washington; W. W. Bellows, D. D., New York; A. E. Stowe, D. D., Andover, and Henry Ward Beecher, Brooklyn. The association issued a circular in 1856 making a strong appeal for "funds to build an edifice for a normal school for the education of colored female teachers already established in the city of Washington." Their design was "to receive the more intelligent daughters of this [colored] people, educate and return them to their homes, to extend as parents and teachers the blessings of knowledge and religion." "They would open an asylum where they may be brought, emancipated, educated, taught housewifery as well as science, and thus be prepared to become teachers." An eligible site of 3 acres within the city limits had already been purchased, and the association asked for $20,000 to erect a suitable building. The enterprise was retarded for some years by the ill health of Miss Miner. Work and worry had undermined a constitution naturally delicate, and in 1861 she went to California hoping to regain her lost vigor. But an injury caused by being thrown from a carriage robbed her of her little remaining strength, and she returned to Washington in July, 1864, to die. The Miner School is her only monument, and a few words will complete its history to date (1892).[1]

In 1863 Congress passed an act to incorporate the institution for the education of colored youth in the District of Columbia. This was the original Miner School.

In 1877 an agreement was entered into between the trustees of the Miner School fund and the trustees of the public schools by which the former undertook to build a suitable schoolhouse between Fourth and Seventeenth streets west and R and P streets north, upon plans prepared by a joint committee of the two bodies, and the latter to take entire charge of the building. The trustees of the Miner School reserved the right to appoint teachers.

Dual managements are rarely successful. The contract was terminated in 1887. The Miner School has now no connection with the public schools, and as a normal school has ceased to exist.[2]

[2] Report of the Public Schools of the District of Columbia, 1887–88.

HOWARD UNIVERSITY NORMAL AND PREPARATORY DEPARTMENT, WASHINGTON, D. C.

The Thirty-ninth Congress conferred upon the Howard University a charter with the most liberal provisions, specifying the following departments: Normal, collegiate, theological, law, medicine, and agriculture. The normal department was opened in May, 1867, in a building leased by the Freedmen's Bureau for that purpose, on Seventh street, near the northern limits of the city. A farm of 150 acres, situated on the heights on Seventh street north, and overlooking the city and the surrounding country, was afterwards purchased and the university buildings were erected thereon.

The report of Howard University for the year 1874 states that the normal department is conducted under a joint committee of the university and the institution for the education of colored youth. The aggregate attendance for the year was over 300, the average for each term being 107, and the number of graduates for the year 7. In 1886 the number of normal students was 31, arranged in three classes, junior, middle, and senior. In 1887 there were 43 names in the normal department. In 1888 there were 53 names. The last catalogue, 1891, has 150 students in the "normal and industrial department," but it is impossible to say how many are "normal" and how many are "industrial." The normal students proper can not, however, exceed 34, being the number in the junior, middle, senior, and post-graduate classes. The normal department has a principal and 5 instructors in the following chairs: English grammar, arithmetic and civics; mathematics and history; English composition, French and German; geography, and United States history. The industrial department has a superintendent, a matron and preceptress and 7 instructors, 1 in sewing, 2 in mechanical drawing, 1 in printing, 1 in bookbinding, 1 in carpentering, and 1 in tin work.

There is nothing in the normal course in the junior and middle years to distinguish it from an ordinary high-school course. In the senior year students may take, in the second term, "theory and art of teaching or chemistry;" and in the third term, "methods of teaching or natural philosophy." History of education is the only prescribed pedagogical study in this normal school. Even the post-graduate course has no pedagogical element.[1]

MARYLAND.

The Baltimore Colored Normal School is a survival of the "Baltimore association for the moral and educational improvement of the colored people." On the 28th of November, 1864, 26 philanthropic citizens of Baltimore met in a private house, pursuant to an invitation by printed circular, "to consider the best means by organized effort, in view of the present condition of the colored people of the State, to promote their moral, religious, and educational improvement." At this meeting a permanent organization was formed under the title given above, a constitution adopted, officers appointed, and a "special finance committee of ten to proceed at once to raise money." A special executive committee was also appointed and instructed "to start a school for the colored people, to rent rooms for the purpose, to procure teachers and furnish the school; also to rent and furnish rooms for the permanent occupancy of the board of managers, for which purposes they are authorized to draw upon the treasurer at their discretion."[2]

Immediately after the Christmas holidays, January 3, 1865, a school for colored children was opened under the auspices of the association in the rooms of one of the colored churches, and a few days later ground was broken in the counties by the opening of a colored school in Easton, Talbot County. At the end of the year there were 7 colored schools in the city—16 rooms crowded to their utmost capacity—and 18 schools in the counties. The total expenditure for the year was $17,556.95. This

[1] Catalogues of Howard University, Washington, D. C., 1867, 1874, 1886, 1887, 1888, 1890, 1891.

[2] Minutes of the Association for the Moral and Educational Improvement of the Colored People. MS.

amount was raised from several sources—collections by the finance committee, donations from Society of Friends in England, Pennsylvania Freedmen's Relief Association, appropriations from the city treasury, etc. A circular had been sent to 250 ministers in charge of congregations, Christian and Hebrew, asking for aid and sympathy, and specially requesting "whatever you may think or do, please acknowledge the receipt of this note." Twenty-three of the 250 did acknowledge it, but the only material aid from this source came from 2 rabbis—Rabbi Hockheimer and Rabbi Shold—each of whom sent a "contribution" with his reply to the circular.

Outside of collections by the finance committee and the annual appropriation of $10,000 from the city treasury, the main reliance of the association was on the New England Freedmen's Aid Association. "They have never failed us, nor have we ever called on them for assistance without receiving a cheerful and liberal response. Without their constant sympathy, encouragement, and generous aid our work would have amounted to but a small result, and very likely not have been continued."

One great difficulty with which the executive committee had to contend was the lack of competent teachers. White teachers met with no encouragement. Colored teachers were but poorly qualified. Both white and colored had to run the gauntlet.

Owing to the still existing prejudices of our people, many of these teachers who have left comfortable homes to devote themselves to this great missionary labor have, instead of sympathy and encouragement, met with much harsh treatment. We instance the stoning of the children and teacher at Easton; the rough handling and blacking of the teacher at Cambridge; the indignation meeting held at Church Creek, Dorchester County, when resolutions were passed to drive out the teacher at that place; and last, but not least, the burning of church and schoolhouse at Millington, Kent County. These, with such outrages as the burning of colored churches in Cecil, Queen Anne, and Somerset counties, to prevent schools being opened in them, and the impossibility to obtain board for a white lady teacher in Annapolis add no little to the troubles of your committee.[1]

A normal school for colored teachers was felt to be a necessity, and with the promptitude which characterized all the operations of the association and its officers a normal school was opened in the second year of the association schools. Its first shelter was in a rented building, but in December, 1867, it was removed to the permanent home which it still occupies—a Friends' meetinghouse, altered and specially adapted to its new uses. The secretary of the executive committee, Joseph M. Cushing, in the third and last annual report, says to the members of the association:

In presenting this third annual report of our association we welcome you to this normal-school building, just now ready for your occupancy. It seems eminently fitting that this old meetinghouse, which for so many years has witnessed the peaceful assembling of the Friends for spiritual communion, should hereafter be devoted to the dissemination of light and knowledge among those who have all their lives sat amid darkness and ignorance; that from this place the peaceful influences of education should issue to supplement and improve the results of war. This school is the legitimate result of our exertions for the past three years and is necessitated by our success in the work we have aimed to accomplish. We have now in operation in the counties of Maryland 73 schools, numbering nearly 5,000, and at the same time there are 50 new schoolhouses ready for occupancy and 39 others in course of erection, which will be finished during this year. * * *

To supply this immediate need of teachers in Maryland and also to answer the calls that will speedily come from the States farther South this normal school is open. Hence will go forth men and women thoroughly trained for the work of teaching, to carry to their own race the mental freedom from superstition and ignorance needed to perfect the freedom from bodily thraldom which emancipation has accomplished. This building will stand, a protest eloquent in its silence against all assertions that the African race will not learn and can not be taught.

The operations of the association in the city, the Colored Normal School excepted, were terminated in the fall of 1867 by the schools being incorporated into the public-school system of the city. There were remaining 73 schools in the counties which

[1] First Annual Report of the Baltimore Association for the Moral and Educational Improvement of the Colored People, November, 1865.

were running at an expense of about $50,000 a year. These also were taken off the hands of the association in 1868, and became part of the State system of public education. Nothing is now (1892) left in visible and tangible form of the work of the old association but the normal school and the schoolhouses scattered over the State, many of them still used for their original purposes. But the stirring memories of those early days, the enthusiasm which carried the actors beyond the limits of what sober-minded people deemed possible, the brotherly feeling that brought help from North and East and from beyond the Atlantic, the dangers and the glories of "Timbuctoo"[1] will never pass away.

"For freedom's battle once begun,
Bequeathed from bleeding sire to son,
Though baffled oft, is ever won."

The normal school is fortunate in having no sensational history. It lost two principals by resignation and one by death, but still continues on the even tenor of its way. The income is derived partly from a State appropriation and partly from tuition fees. The instruction given is principally academic; it has been found practically impossible to retain pupils long enough for them to benefit by purely professional studies. There are three grades, normal, grammar, and primary. Graduates from the normal department have no difficulty in obtaining places, and in general they make very acceptable teachers. The number of pupils in all grades has for many years averaged about 200.[2]

VIRGINIA.

HAMPTON NORMAL AND AGRICULTURAL INSTITUTE.

The Hampton Normal and Agricultural Institute stands on the east shore of Hampton Creek, not far from Fort Monroe. The earliest English civilization on this continent was established at Hampton, and the first slaves brought to America were landed only a few miles off. The American Missionary Association purchased the site on which the institute now stands—an estate of 120 acres, then known as "Little Scotland"—fitted up the necessary buildings, and opened the school in April, 1868, with 20 scholars, on a manual-labor basis. Through liberal grants from the Freedmen's Bureau and donations from Northern friends a large schoolhouse was erected, in which 300 students could recite. The farm was supplied with buildings, stock, and tools. An industrial department for the manufacture of clothing was built up, and a printing office was established, in which the various branches of the printing trade were taught. In June, 1870, the institute received a charter from the general assembly of Virginia creating a corporation with power to choose their own successors and to hold property without taxation. In 1872 the general assembly passed an act giving to the institute one-third of the agricultural college land grant of Virginia. Its share was 100,000 acres, which was sold for $95,000. Nine-tenths of this money was invested in bonds bearing 6 per cent interest. The other tenth was expended in the purchase of additional land, increasing the size of the farm to 185 acres. The number of pupils at the close of the fifth annual session was 213, representing different sections of Virginia and North and South Carolina.

The normal course of study at this time included an academic course in the English language, elementary mathematics, natural science and history. Among the eight additional "miscellaneous" studies is one called "drill in teaching."

---

[1] A pet name given to a select coterie of the executive committee, noted both in council and in the field, where, as vile propagandists, they were met with unsavory epithets and still more unsavory missiles—not to speak of threats of lynching, fortunately not executed.

[2] First, second, and third annual reports of the Baltimore Association for the Improvement of the Colored People.

The receipts of the institute from its organization to June 30, 1873, were as follows:

1. From American Missionary Association	$34,600.00
2. From societies and individuals, through A. M. A	21,378.16
3. From Bureau of Refugees, Freedmen, and Abandoned Lands	58,327.89
4. From interest of endowment fund	2,244.34
5. From interest of State Agriculture College land fund	7,480.50
6. From trustees of Peabody fund	3,400.00
7. From Hampton students (vocalists)	10,971.30
8. From other sources	89,623.86
9. From donations for endowment fund	43,941.22
	271,967.27

The following extracts from the first report of the principal, Gen. S. C. Armstrong, made to the trustees in 1870, will show the ideas which, being logically followed for over twenty years, have made this institute the greatest school of the kind in this country, or in any country, and the model of many other great schools of similar purpose:

What should be the character of an educational institution devoted to the poorer classes of the South? * * * Plainly a system is required which shall be at once constructive of mental and moral worth and destructive of the vices characteristic of the slave. What are these vices? They are improvidence, low ideas of honor and morality, and a general lack of directive energy, judgment, and foresight. * * * His deficiencies of character are, I believe, worse for him and the world than his ignorance. But with these deficiencies are a docility and enthusiasm for improvement and a perseverance in the pursuit of it which form a basis of great hope and justify any outlay and the ablest service in his behalf. At Hampton we are trying to solve the problem of an education best suited to the needs of the poorer classes of the South by sending out to them teachers of moral strength as well as mental culture. To this end the most promising youths are selected. The poverty of these pupils has required the introduction of manual labor.

The plan of combining mental and physical labor is a priori full of objections. It involves friction, constant embarrassment, and apparent disadvantage to educational advancement, as well as to the profits of various industries. But to the question, "Do your students have sufficient time to study all their lessons faithfully?" I should answer, "Not enough, judging from the common use of time, but under pressure they make good use of the hours they have; there is additional energy put forth, an increased rate of study which makes up for the time spent in manual labor, while the physical vigor gained affords abundant strength for severe mental labor." Nothing is of more benefit than this compulsory waking up of the faculties. * * * However the future may decide the question, our two years' experience of the manual-labor system has been satisfactory. Progress in study has been rapid and thorough—I venture to say not excelled in any school of the same grade; there have been a steadiness and solidity of character and a spirit of self-denial developed, an appreciation of the value of opportunities manifested, which would not be possible under other conditions. * * * There are two objective points before us, toward one or the other of which all our energies must soon be directed as the final work of this institute. One is the training of the intellect, storing it with the largest amount of knowledge, producing the brightest examples of culture; the other is the more difficult one of attempting to educate in the original and broadest sense of the word—to draw out a complete manhood. The former is a laborious but simple work; the latter is full of difficulty. It is not easy to surround the student with a perfectly balanced system of influences. The value of every good appliance is limited and ceases when not perfectly adjusted to the higher end. The needle, the broom and wash-tub, the awl, the plane, and the plow become the allies of the globe, the blackboard, and the text-book. * * * But what should be studied in a course like this? The end of mental training is a discipline and power not derived so much from knowledge as from the method and spirit of the student. I think too much stress is laid on the importance of choosing one of the great lines of study—the classic or the natural sciences—and too little upon the vital matter of insight into the life and spirit of that which is studied. Latin, as taught by one man, is an inspiration; by another, it is drudgery. * * * Our three years' course, with but little preliminary training, can

not be expected to furnish much. Our students can not become advanced enough in that time to be more than superficially acquainted with Latin and Greek; their knowledge would rather tend to cultivate their conceit than to fit them for faithful educators of their race. The great need of the negro is logic and the subjection of feeling to reason; yet in arranging his studies we must exercise his curiosity, his love of the marvelous, and his imagination as means of sustaining his enthusiasm.

An English course, embracing reading and elocution, geography, mathematics, history, the sciences, the study of the mother tongue and its literature, the leading principles of mental and moral science and political economy, would, I think, make up a curriculum that would exhaust the best powers of nineteen-twentieths of those who would, for years to come, enter the institute. * * * Of all our work that upon the heart is the most important; there can be no question as to the paramount necessity of teaching the vital precepts of the Christian faith and of striving to awaken a genuine enthusiasm for the higher life that shall be sustained and shall be the strong support of the young workers who may go out to be examples of their race. * * * I think we may reasonably hope to build up here, on historic grounds, an institution that will aid freedmen to escape from the difficulties that surround them by affording the best possible agency for their improvement in mind and heart, by sending out not pedagogues, but those whose culture shall be upon the whole circle of living, and who, with clear insight and strong purpose, will do a quiet work that shall make the land purer and better.

The trades taught are carpentry and woodworking, harness making, shoemaking, the trades of the wheelwright, blacksmith, and tinsmith, house painting, printing, tailoring, steam engineering and gas fitting, and the rudiments of the machinist's trade.

The normal department employs 19 teachers in the following subjects: Mathematics, English literature, reading and elocution, history, grammar and composition, writing, geography, civil government, political economy, natural philosophy, natural history, physiology, and methods of teaching. The senior class receives daily lessons in the art of teaching and members of the class visit the training school daily for observation and practice.

The estimated cost of tuition is $70 a year for each pupil. This does not include board, clothing, or books.

The total enrollment for the year ending July, 1890, was 692—443 men and 259 women. Of these, 85 men and 46 women were Indians.

NORMAL AND COLLEGIATE INSTITUTE, PETERSBURG.

The Virginia Normal and Collegiate Institute was established by an act of the general assembly of 1881 and 1882 for the higher education of the colored youth of the State and with special reference to the training of teachers. The act of incorporation appropriated $100,000 of the proceeds of the sale of the Atlantic, Mississippi and Ohio Railroad for the erection of suitable buildings and $20,000 annually for the support of the institute. The corner stone of the main building was laid July 4, 1883, and in October of the same year the institute was opened in the three departments—academic, normal, and preparatory. The extreme length of the building is 367 feet, and the width through the center building is 126 feet. It is four stories in height, including a mansard roof, which contains a lofty observatory. It is calculated to accommodate 750 pupils.

The act of 1881 was supplemented by another, which was approved May 20, 1887, which provided "that the school shall be known as the Virginia Normal and Collegiate Institute, and shall embrace a normal department and a collegiate department, and also such professional departments as may be deemed expedient and proper. In the normal department shall be taught such branches as are usually taught in well-organized normal schools, and in the collegiate department shall be taught such branches as are usually embraced in a college curriculum." The act makes the institute subject to the government and control of a board of visitors consisting of seven members, of whom the superintendent of public instruction is a member and ex officio chairman. The other six members are well-qualified colored men, appointed by the State board of education, subject to confirmation by the senate.

The president of the institute and all professors and teachers are required to be colored persons. The board of visitors are given ample powers for the management and control of the institute, and are required to act under the direction and supervision of the State board of education, by whom they may be removed for failure to perform their duties. The board of visitors has the power to appoint a number of State students (colored) equal to twice the number of members of the house of delegates, and apportioned in the same manner. Such students must be between 15 and 25 years of age, and are selected by the superintendents of schools of the respective counties and cities. They are required to enter into a written contract to engage in teaching school or other educational work.

Another act of the same assembly provides that the president, professors, and teachers of the Virginia Normal and Collegiate Institute shall be required during every year to conduct a summer normal school, without additional salary, for the benefit of the colored teachers of the public schools and those who expect to become teachers; said school to commence not later than the 1st of July and to continue for a term of five weeks. Students attending this summer normal school are allowed to occupy the institute buildings and to board in like manner as the regular students of the institute, the charge for board and lodging not exceeding $2 a week.

The number of students in the college department (catalogue of 1889) was 11—all men; in the college preparatory, 20—17 men and 3 women; in the normal, 295—138 men and 157 women. The number of "State students" was 145. The model school consists of pupils—about 40 in number—between 6 and 15 years of age, who are taught mainly by the graduating class of the normal department. The normal course is completed in three years, and embraces arithmetic, geography, English grammar, United States history, reading, drawing, writing, and physiology in the junior year. The additional studies for the middle year are physics, algebra, general history, English classics, civil government, botany, and bookkeeping. In addition to the studies already mentioned, students of the senior year learn chemistry, rhetoric, psychology, Latin grammar and reader, school management, methods of teaching, moral science, astronomy, and political economy.

West Virginia.

STORER COLLEGE, HARPERS FERRY.

The story of the founding of Storer College, as told by Miss Kate J. Anthony, of Providence, R. I., is full of instruction and as interesting as a romance. Only a brief sketch can be given here.

In February, 1867, President T. B. Cheney visited Mr. John Storer, of Sanford, Me., in behalf of Bates College. During the conversation he said to Dr. Cheney: "I have determined to give $10,000 to some society which will raise an equal amount toward the founding of a school in the South for the benefit of the colored people." Dr. Cheney pointed out the advantages of Harpers Ferry as a location for such an institution and pleaded for time to raise the necessary supplement of $10,000 among the friends of the colored people in the Free Baptist Church, of which he was a minister. Mr. Storer extended the time to the 1st of January, 1868. It was Mr. Storer's wish that the institution should eventually become a college, and be so chartered; with a proviso that it be operated as a normal school or seminary till the endowment fund should be adequate for college purposes, and that it be open to both sexes without distinction of race or color. The greater part of the necessary amount was raised during the year, and Harpers Ferry was settled on as the location most advantageous for the school. Dr. Cheney received hearty sympathy and encouragement and a promise of $6,000 from the Freedmen's Bureau. The Government had four large brick mansions on Camp Hill, and in one of these—the Lockwood House—the school was opened on the 2d of October, 1867. Finally, through the earnest support of Mr. Fessenden in the Senate and of General Garfield in the

House, the four buildings, with 7 acres of land, became the property of the institution. But for Government aid and the fostering care of the Freedmen's Bureau, the college could not have been maintained. Before the time had expired for the collection of the additional $10,000, Mr. Storer died, and Senator Fessenden, with whom Mr. Storer's bequest had been deposited, decided that he could not legally transfer it until the conditions were legally fulfilled. Double the necessary amount had been pledged, but pledges could not be received as equivalent to cash. On the last day of grace the executive committee was nearly $3,000 short, and this amount had to be raised before midnight. "There are emergencies," says Miss Anthony, "when men wrest success from seeming impossibility. We can not now enter into details, but the requirements were met and Storer College saved, though that day is often referred to as the black Wednesday."

The next important step was to obtain a college charter. After much opposition this legislation was secured from the legislature by a majority of 1.

The school grew rapidly. It began in October with 19 pupils; in January it numbered 36, and in March 75. Lockwood House proved inadequate for the increasing numbers, and one of the other buildings was fitted for chapel and school purposes, and opened in 1869. In 1882 a new school building was erected with money raised from church auxiliaries and young people's societies in the North.

It is unpleasant to remember, and yet it would be unwise to forget, the opposition which such schools met in the early postbellum days. Let Miss Anthony tell the story, "with considerable abridgment by the present editor:"

> We have mentioned opposition. Perhaps it is not well to dwell much upon this in these better days, but some reference is requisite to a true comprehension of what has been achieved. Shortly before the normal school was established a teacher in the vicinity wrote home: "It is unusual for me to go to the post-office without being hooted at, and twice I have been stoned on the streets at noonday."
>
> It was considered necessary that our lady teachers have a military escort as they went from place to place. But when Storer College was set in their midst prejudice and opposition intensified to fever heat. * * * We can only hint at facts; the thrilling incidents and experiences of those early days would fill a volume. Naught but an unfaltering trust, an undaunted courage, and noble self-sacrifice could voluntarily endure and cope with these adverse elements, and such was the spirit that permeated and upheld our brave workers.
>
> The change in public sentiment is indeed marked and wonderful. To-day the inhabitants of Harpers Ferry hold a true interest and even a pride in the college. Some of its old opponents are now numbered among its most devoted friends. And no person in the community is held in higher honor or warmer esteem than Mr. Brackett [principal], once of all men most hated and despised.[1]

The college is (1892) organized in three departments—academic, normal, and preparatory. By the last catalogue on hand there were 47 pupils in the academic, 180 in the normal, and 68 in the preparatory. The whole number of different pupils was 273. The normal course covers three years; it is mainly a grammar-school course, but instruction in the theory and art of teaching is given in the third year. The State of West Virginia provides annually for eighteen scholarships, including tuition and the use of books. The school gives eighteen scholarships.

The industrial department was commenced in 1887, originating in a donation of $2,000 from Mrs. Mary L. De Wolf, of Illinois, made in memory of her deceased husband, whose name it bears. There is also a sewing department for girls.[2]

North Carolina.

ST. AUGUSTINE'S NORMAL SCHOOL, RALEIGH.

The St. Augustine's Normal School and Collegiate Institute was incorporated in 1867 and opened at Raleigh in 1868. Its purpose was declared to be "the education

[1] Our Work at Harpers Ferry; Its History and Promise, by Miss Kate J. Anthony, of Providence, R. I.
[2] Biennial catalogues of Storer College.

of teachers for the colored people of the State of North Carolina and elsewhere in the United States." The first trustees, 11 in number, were the bishop, 5 clergymen and 5 laymen of the diocese of North Carolina. "The board, thus constituted, filling its own vacancies and perpetuating itself, the religious character of the school and its relation to the church as one of its institutions were amply secured." In 1869 the board received a bequest by the will of the Rev. Charles Avery, amounting to $25,000, upon condition that it should be securely invested and the interest used for promoting the education and elevation of the colored people of the United States. The Freedmen's Bureau gave to the school $6,248 to be expended in buildings. In 1870, and subsequently, the school received from the Barry fund gifts amounting to $26,716. The last available catalogue of the school states that its object is threefold: "To afford young men and women of the colored race superior advantages for obtaining a thorough academic education, to train and equip teachers for efficient service, and to prepare young men for the holy ministry."

There are four buildings belonging to the institution—the main school building, the boarding hall for the female students (called the Smith building after the founder of the school), and residences for the principal and the vice-principal. The main school building is of brick, four stories high, 85 feet front by 44 feet deep.

Candidates for admission to the lowest grade are required to be able to read and write and to perform the four fundamental operations of arithmetic in whole numbers. The normal course extends through four years. In the first year, in addition to the common-school studies, physical geography, natural philosophy, and bookkeeping are taught; in the second year, algebra, geometry, rhetoric, physiology, history of England, civil government, and the art and science of teaching; in the third year, geometry, astronomy, chemistry, psychology, general history, and the art and science of teaching; in the fourth year, trigonometry, geology, English literature, political economy, moral science, and the history of pedagogy. Vocal music and English composition are continued through the whole course. Instruction in dressmaking is given to all the girls in the boarding department, and there is a carpenter shop for boys. The number of students in the several departments, by the catalogue referred to, was as follows:

Theological department (candidates, 3; postulants, 9)	12
Collegiate department (males, 12; females, 5)	17
Normal department (males, 33; females, 23)	56
Primary department (males, 23; females, 22)	45
	130

STATE NORMAL SCHOOL AT FAYETTEVILLE.

The general assembly of North Carolina passed an act, which was ratified on the 9th of March, 1877, for the establishment of normal schools. The first section provides for a normal school for white teachers in connection with the State university, and appropriates $2,000 a year for its support. The second section enacts "that it shall be lawful for the State board of education to establish a normal school, at any place they may deem most suitable, either in connection with some one of the colored schools of high grade in the State, or otherwise, for the teaching and training of young men of the colored race, from the age of 15 to 25 years, for teachers in the common schools in the State for the colored race; and to aid in the expense of carrying on such normal school the State board of education is authorized and instructed

[1] A Brief Statement of the History and Present Condition of St. Augustine's Normal School and Collegiate Institute. Raleigh, 1883. Catalogue of the same, 1890.

to draw upon the treasury for an amount not to exceed $2,000 annually for the years 1877 and 1878." An amendment was passed in 1879 authorizing the admission of females and the establishment of a preparatory department in connection with the normal school. The appropriations for the years 1877 and 1878 were by the same act directed to be paid annually until the general assembly should otherwise provide.

In accordance with this legislation the State board of education established at Fayetteville a normal school for the training of teachers for the colored schools of the State. The school was held in a large and commodious building provided by the colored people of the city. The attendance for the first term was 58; for the second term, 67; for the third term, 85. In 1890 the attendance had increased to 145, of whom 75 were in the normal department proper. The course of study includes the usual grammar-school branches in English and mathematics, with Latin and first lessons in Greek and Wickersham's "Methods of Teaching." All students are required to give a written pledge to engage in teaching in the public schools of the State for at least three years, but it has been found that this pledge was hard to keep; many of the students engaged in teaching during the vacation and many others were anxious to do so, but could get no employment.

STATE NORMAL SCHOOL, SALISBURY.

This is one of the four schools established by the legislature of North Carolina in 1881 for educating and training colored teachers in the arts and methods of imparting instruction in the several branches of study taught in the public free schools of the State. The course of instruction embraces four years of three terms each—preparatory, junior, middle, and senior. Methods of teaching and kindred subjects have no definite place in the printed curriculum, but "map drawing, object lessons, composition, and lectures on pedagogics" are given during the entire year. The subjects of the senior year are Latin, Greek, algebra, geometry, astronomy, chemistry, zoology, botany, history, rhetoric, and civil government. Boarding, lodging, fuel, and lights are given to young women at the institution boarding house at $6 per month. The number of students in the normal department is 21.[1]

STATE NORMAL SCHOOL, PLYMOUTH.

The State Normal School for colored teachers at Plymouth, N. C., was established in 1881 by an act of the general assembly appropriating a small sum for that purpose. Applicants are required to be at least 15 years of age and to possess a knowledge of addition, subtraction, multiplication, and division, and also to be able "to read pretty well in Holmes's Fourth Reader." Tuition is free to all students who are residents of the State. There is a three-years' course of study in addition to a preparatory year. The junior and middle years are confined principally to common-school studies, with algebra, moral science, botany, and civil government. The senior year adds English and American literature, general history, rhetoric, logic, geometry, bookkeeping, natural philosophy, political economy, Latin, and pedagogics.

The new building is a large and beautiful structure and will accommodate 250 students.

Boarding in private families costs from $5 to $8 a month.

The number of students enrolled in 1890, exclusive of the preparatory class, was 87, of whom 5 were seniors. The faculty consisted of the principal and two professors.[2]

STATE NORMAL SCHOOL, GOLDSBORO.

In accordance with an act of the general assembly of North Carolina the State board of education established a State normal school at Goldsboro in the fall of 1888 for

[1] Catalogue of State Normal School, Salisbury, N. C., 1890.

[2] Catalogues of State Normal School, Plymouth, N. C., 1889–1891.

the education of teachers for the colored race. It is hoped that this school will help to furnish teachers properly equipped for their work. In many of the eastern counties the proportion of the school fund assigned to the colored people had been allowed to lapse for the lack of competent colored teachers. Rooms were provided and comfortably furnished in the graded-school building belonging to the city, and in the fourth year the number of students in all the departments was 139. Only 15 of them, however, could be fairly reckoned as normalites. An industrial department has recently been added; the boys are taught carpentry and painting, and the girls needlework, laundering, and cooking.[1]

South Carolina.

AVERY NORMAL INSTITUTE, CHARLESTON.

The Avery Institute was opened on the 1st of October, 1865, in the State Normal School building in Charleston, which was offered for the purposes of the school by Gen. Rufus Saxton, assistant commissioner of the Freedmen's Bureau. The school commenced with a corps of 20 teachers and 1,000 pupils, who occupied all the available space in the building. The school was removed from the normal building in September, 1866, and transferred to the military hall in Wentworth street, which could only accommodate 800 pupils. In 1868 it was removed to a new building on Bull street and its name changed from the Saxton School to the Avery Institute, in honor of the philanthropist who had given a large part of his fortune for the benefit of the colored race. The Rev. F. L. Cardozo, the first principal of the school, was aided the first year by a corps of 20 teachers, 10 Northern whites and 10 Southern colored teachers. The third school year, there being but 400 scholars and the school assuming the position and condition of a normal school, there were but eight teachers besides the principal, and all from the North.

The building to which the school was transferred in 1868 was erected at a cost of $25,000 by the American Missionary Association, by which the property is owned and the school supported.

The total enrollment of pupils for the year ending June, 1891, was 395, 156 being in the normal department. The normal course of study is academic for the first and third years. The second and fourth years include school economy and methods and science of education. The college preparatory course adds Latin and Greek to the full normal course.

The design of the school is stated to be "mainly professional; that is, to prepare in the best possible manner the pupils for the work of organizing and teaching public schools." It consists of five subnormal grades and four normal department classes. Parallel with the normal course is the college preparatory course, which covers four years. There is no boarding department, and the patronage, therefore, is mostly local.[2]

SCHOFIELD NORMAL AND INDUSTRIAL INSTITUTE.

This school was established in 1868 by Martha Schofield, under the Germantown branch of the Freedmen's Union Commission. The object of the school is not only to impart book learning to the boys and girls, but to teach them the everyday duties of life, so as to fit them for filling honorable and useful positions in the home, in the church, in the schoolroom, and in the community. The course of study may be completed in four years. In the first three years the ordinary grammar school studies are pursued; in the fourth or senior year geometry, natural and moral philosophy, civil government, rhetoric, methods of teaching, and school economy. The principal industries are printing, carpentry, cobbling, sewing, and painting. The

[1] Catalogues of the school for the years 1889-90 and 1890-91.

[2] Catalogues of the Avery Normal Institute, 1876-1891.

expenses of the school are about $5,000 a year, of which $500 come from the John F. Slater fund and two-thirds of the remainder from voluntary contributions.

In 1890 there were 360 pupils, of whom 40 were in the normal department. The teaching corps consisted of the principal and seven assistants—four in the literary and three in the industrial department.

The Rev. A. D. Mayo visited this school in 1886, and writes: "I regard it in some respects the best of its kind I have seen in the South. Unlike the majority of this class of institutions, the Schofield School has not come up by the backing of a religious denomination, but has been established by the devoted and energetic services of its founder, Miss Martha Schofield, and her associate, William T. Rodenbach, continued through seventeen years."[1]

GEORGIA.

ATLANTA UNIVERSITY.

The beginning of the Atlanta University was made by the American Missionary Association, aided by the Freedmen's Bureau. The original design was to establish one central institution for higher education, beginning with normal and preparatory departments, which were to grow into a college and finally into a university. A charter was obtained in 1867, and the first building was completed in 1869—a substantial four-story brick building with boarding accommodations for 40 women. The number of students the first year was 89. The legislature of 1870 voted an annual appropriation of $8,000, a part of which was used in erecting a new building similar to the first. In 1871 a wing was added which accommodated 40 additional pupils. The legislature of 1872 refused to grant any aid, and the school became dependent upon the American Missionary Association and private benevolence. The legislature of 1873 passed almost unanimously an act making an annual appropriation of $8,000 to this institution. The appropriation was made on condition that the money should not be paid till a commission consisting of certain members of the faculty of the University of Georgia had approved the plan of the trustees for its expenditure, and the further condition that there should be educated, free of tuition, one pupil for every member of the house of representatives, to be nominated by the members. In 1871 one young man graduated from the preparatory department and entered Oberlin College, where he was graduated in 1875. In 1872 another left the freshmen class and entered West Point. In 1873, 1874, and 1875 a class of four was graduated each year from the higher normal department. In 1876 the whole number of students was 240, of whom 68 were in the higher normal department. In 1879 the university received an official visit from a committee of the State board of examiners. The following extracts from their report may be interesting:

Your committee were impressed with the fact that the colored race, whether of pure or mixed blood, are capable of receiving the education usually given at such institutions. Whether they will be able to build, and build usefully, upon the foundation thus laid remains to be seen. * * * Referring to the very able report of your committee of last year, your present committee desire to express their gratification that it has apparently been heeded by those in immediate control of the university. The objectionable sectional books have disappeared from the library, and your committee are assured not only that "those Northern teachers do not try to alienate their pupils from old masters and homes and from their native State," but that every effort is used to counteract any tendency toward such alienation. * * * Your committee recommend that the State commissioners of the university be instructed to examine the text-books used with power to reject such as may prove objectionable; and it is believed that the faculty will heartily approve such a plan, as your committee feel satisfied that such books (if there be such now in use) have been adopted with a perfect unconsciousness of any objectionable feature. Your committee so think because free and candid conversations with the president and various members of the faculty have convinced them that the faculty are animated by a sincere desire

[1] Catalogues and Reports of the Schofield Normal and Industrial School, 1884, 1886, 1887, 1889, 1890.

to elevate the colored race upon its own merits, are free from any leveling tendencies, and recognize the fact that their pupils' true interests are to live in harmony and accord with their late owners, now, as in the past, their best friends.

The report of the State board of examiners for the following year states "that they were much gratified to learn that the future of the institution is very flattering. It is your committee's opinion that the State has acted wisely in her appropriation to the Atlanta University, and that a continuance of it is to her best interests."

The State appropriation of $8,000 a year was continued until January, 1888. The following extract from the report of the board of visitors in 1887 will show the probable reason why the appropriation was discontinued:

We find in attendance at the Atlanta University a number of white students of various ages and both sexes, most of them having more or less connection with the members of the faculty or other officers, and one at least entirely unconnected with the officials. We mention these relations of the white students, not with the intention of suggesting that there is any real difference between allowing the attendance of children of the faculty and children of those other than the faculty, but in order that all the facts may be known. We have ascertained by conference with members of the faculty that it is their avowed intention to receive all white children who apply for admission into the school; and we interpret this, in connection with certain publications of theirs, as a desire to break down the existing barriers against the coeducation of the two races. We desire to say that we regard this practice as not only intrinsically wrong, but as being in this case an improper use of the money appropriated by the State to this institution. In every enactment which the legislature has made upon this subject since and including the year of 1874, as well as in the constitutional delegation of authority to make it, the appropriation has been made for the benefit of the colored race alone. Indeed, the act of 1874 in terms devotes the sum of $8,000 per annum solely to that people, and that act is in the nature of a contract by which they receive that sum in lieu of other moneys. It occurs to us that the admission of white children to a participation in the benefits of this appropriation, aside from any violation of the general policy of the State, is in this case a misuse of public moneys.

The catalogue from which this extract is taken (1887–88) contains the following note:

Three facts may be properly cited as illuminating this passage in the report of the board of visitors:

First. Only one-fourth of the money for the current expenses of the school came from the State, the remainder being largely furnished by the gifts of benevolent friends of education.

Second. Only 7 children, to whom the objections of the committee would apply, were in attendance out of more than 400, of whom 1 was the child of a missionary of the American Missionary Association residing in the city, and 6 were children of teachers in the school, some of whom were reciting to their own parents.

Third. The class of children to which objection was made was in attendance when the law under which the committee acted was passed thirteen years before; and, to a very limited extent, has been in attendance ever since, with the full knowledge of all parties and with no objection or criticism.

The whole number of pupils in attendance in 1891 was 596, representing sixty-two counties in Georgia. There were in the—

College course	20
Preparatory course	51
Mechanical course	6
Normal course	82
Grammar-school course	354
Model school	85

The normal school includes, besides the usual high-school branches in English and science, "School economy and primary methods" in the junior class and pedagogics with practice teaching in the senior class.

The mechanical course covers three years, two of wood working and one of metal working; it is required of all boys above the third grade, in addition to their regular studies in other courses. Seven and a half hours each week are given to this work.

Boys are also taught some of the principles of farming and gardening, and attention is given to the raising and care of stock. The girls are taught various branches of household science, such as plain sewing, dressmaking, cooking, and laundry work, under experienced teachers. There is a large and well-appointed printing office in the principal University building, in which instruction is given to optional classes, both of boys and girls, without extra charge.[1]

Florida.

STATE NORMAL COLLEGE FOR COLORED STUDENTS, TALLAHASSEE.

The constitution of the State of Florida, adopted in 1885, requires, Article XII, section 14, that the legislature at its first session shall provide for the establishment, maintenance, and management of such normal schools, not to exceed two, as the interests of the public education may demand, In accordance with this constitutional requirement, the legislature of 1887 passed an act establishing a normal school for white teachers at De Funiak Springs and a normal school for colored teachers at Tallahassee, similar in all respects to the normal school for white teachers and subject to the same supervision and direction by the State board of education. The same annual amount ($4,000) was appropriated to meet the current expenses of each school.

The school was opened in 1887 in a building erected for the purpose, a comfortable and well-arranged structure, furnished with the most improved furniture and apparatus. It is organized in two departments—preparatory and normal. The normal course covers a period of two years. Graduates receive the degree of licentiate of instruction and a teacher's certificate of the first grade, good for life. The normal course for the junior year includes algebra, geometry, Latin, general history, physics, and English composition; and in the senior year, astronomy, moral and mental philosophy, science of government, theory and practice of teaching, and a continuation of Latin and history. Candidates for admission are required to be 16 years of age or more, to be thoroughly grounded in all the common-school branches of study, to have a rudimentary knowledge of Latin, algebra, and general history, and to possess the requisite moral and physical qualifications.

A joint committee of the legislature visited the school officially in May, 1889, and made a very favorable report, from which the following extracts are taken:

> Though less than two years have passed since this institution was established, yet even now the wisdom of such an undertaking is demonstrated by the results. Much of the work at present is of necessity academic in its nature, for the reason that many of the students have not had the opportunity to acquire that thorough and intelligent knowledge of the branches to be taught which is absolutely essential to the successful teacher. * * * The preparatory department is devoted principally to a review of the common English branches, conducted in the improved methods of normal instruction. It thus serves the double purpose of a training school and an academic course. The normal department is occupied with the higher branches of education and pedagogics. * * * The needs of the school we find to be: First, dormitories, where students from outside the town can be accommodated, protected, and controlled; and, second, an industrial department, where a knowledge of tool craft can be given to the teachers, who in turn can give to the youth of the common schools such manual training as will enable them to become intelligent and skillful producers of wealth.

The number of students enrolled the first year was 52, and the second year 55.[2]

Kentucky.

STATE NORMAL SCHOOL, FRANKFORT.

This school was opened in 1887. Its object, as stated in the act of assembly by which it was established, is the "preparation of teachers for teaching in the colored public schools of Kentucky." Candidates for admission are required to be at least

[1] Catalogues of the Atlanta University, 1869–1891, inclusive.

[2] Annual catalogues of the Florida State Normal School for colored teachers, 1880, 1890.

16 years of age, to be of good health, to give satisfactory evidence of good moral character, and to sign a pledge to teach in the colored common schools of Kentucky a period equal to twice the time spent as a pupil in the normal school. In addition to these requirements, every applicant for admission must hold a teachers' certificate or a certificate of graduation from a common school or pass an examination by the faculty on the subjects of instruction prescribed for common schools and attain an average of not less than 65 per cent, but on no subject less than 50 per cent. The school numbered 58 students in 1890, under the care of a principal and three assistants. Tuition is free to all colored residents of Kentucky who fulfill the required conditions; to nonresidents the tuition fee is $2 per month.[1]

TENNESSEE.

FISK UNIVERSITY.

The American Missionary Association opened a school among the escaping fugitives that took shelter under the guns of Fortress Monroe only five months after the war began. This was the first freedmen's school in the United States, but missionaries and teachers followed up the march of the Army and schools quickly took the place of encampments. The first freedmen's school in Nashville was established by the Rev. J. G. McKee, of the United Presbyterian Church, in October, 1863, but his school was abandoned when city schools were opened to colored children. The Fisk School was opened in January, 1866, and took its name from General Fisk, who was chief of the Freedmen's Bureau for Tennessee and the adjoining States. The school was then and is still supported by the American Missionary Association of New York. In August, 1867, a charter was obtained for Fisk University, with the expectation that it would grow with the growing wants of the colored people, and the expectation was not disappointed. In 1871 the old hospital buildings, which the school had used for five years, were so sadly out of repair as to be incapable of further service. At this crisis George L. White, a music teacher in the institution, conceived the idea of training a company of colored singers and carrying them through the Northern States on a concert tour. For some months he made scarcely money enough to meet current expenses, but at length the tide turned, his troupe became famous, and at the end of their first concert season they had netted $20,000. Another season brought in $20,000 more. The troupe then made a tour through Great Britain and returned with $50,000. Thus Jubilee Hall was sung into existence, and was dedicated on the 1st of January, 1876.

The building is situated about 1 mile northwest of Nashville, and the surrounding grounds, belonging to the University, cover 25 acres. The greater part of the work of construction was done by colored men connected with the University.

At the dedication service Gen. Clinton B. Fisk made a very interesting address, from which room can be found only for a few sentences:

It is a decade since many of us, who share in this day's joys, participated in the inauguration of Fisk School, established in yonder vacated army barracks, under the auspices of the American Missionary Association by two of its most faithful, sagacious representatives, Rev. E. M. Cravath and Rev. E. P. Smith, who, after a survey of many inviting fields, decided that here, in this central city of the South, they would plant a university for the higher education of the freed people. It was the day of small things; and to an observer who did not with prophetic soul scan the future, the idea that a university should be the outgrowth of the beginning of ten years ago was absurd. Let us not despise the day of small things. When a young clergyman, centuries ago, landed from the Old World on the shores of New England in search of health, and failing to obtain it exchanged both the Old and the New World for Heaven, and in dying bequeathed £400 sterling for the founding of a college, he little knew how well he was building, and that Harvard would become a household word the wide world over. And when a few poor ministers of the gospel in Connecticut brought together each a few books and said, "We give these for the founding

[1] Second Annual Catalogue of State Normal School for Colored Persons, Frankfort, Ky.

of a college," they had no conception that their act was the first step in the creation of Yale. * * * The history of the rise and progress, successes, disappointments, and triumphs of Fisk University would reveal a story replete with illustrations of heroic Christian faith and a sublime courage which knows no such word as fail. The demand from every section of the country inhabited by the freed people for educational facilities exceeded the ability of the American Missionary Association and kindred organizations to supply. * * * Year by year, after the undertaking of ten years since, grew upon us the perplexing problem of obtaining the means to purchase a new site and erect the permanent initial building of Fisk University. When, through decay of the old buildings and the urgent demands for increased facilities, the solution of the problem became imperative, there was found one man equal to the emergency.

The son of a village blacksmith who, from limited advantages of culture, had risen to the position of a successful country school teacher, a brave and gallant soldier of the army of the Union, and a most faithful staff officer in my own military family, became the man of all work in the hour of our greatest need; and to no human agency nor to all other human agencies combined are the triumphs of this glad hour so much indebted as to George L. White. He conceived the idea of coining the slave melodies of the old plantation and the camp meeting into gold and silver wherewith to purchase this commanding site and upon it erect Jubilee Hall. How well do I remember when this good brother wrote me at my home in St. Louis and asked me to loan him $300 to take his singers north of the Ohio River. I wrote him not to think of such a thing; that he would bring disgrace upon us all, and told him to stay at home and do his work. He wrote back that he trusted in God and not in General Fisk. Next we see him marching onward with his little band. Reaching the city of Cincinnati destitute, he went down to our old friend Halstead of the Commercial, and said to him, "You are a friend of General Fisk; I have some students of his who are going to sing Sunday morning at such a church. I have no money to pay for the advertisement, so you will please say in your paper that they are here." This was on Friday, and they were to sing on Sunday. Saturday morning's paper announced that General Fisk's Negro Minstrels from Tennessee were in the city and would sing at such a church next morning at 10.30 o'clock, and advised everybody to go. Everybody did go, as it was something really wonderful to witness a negro minstrel performance in a church on Sunday. The story of the Jubilee Singers fills a volume. In America they conquered social prejudices, and by their modest, Christian demeanor, which they have so happily retained, commanded the respect and generous patronage of the best and highest in the land. Beyond the sea, they have twice received hearty welcome and God-speed from the noblest and best of England, Scotland, and Ireland.[1]

The first class was graduated from the college department in May, 1875, ten years after the founding of the Fisk School, 2 young men and 2 young women receiving the degree of B. A. The same year 3 were graduated from the normal department. The normal faculty is composed of the president, Rev. E. M. Cravath, and 7 instructors. The number of students in this department in 1890 was 67. The total attendance in all departments was 523, representing nearly all the States of the South and Ohio, Illinois, Indiana, Nebraska, and Minnesota. The normal curriculum is in two divisions, elementary and advanced, each occupying two years: First year, Latin, algebra, English history, and physical geography; second year, in addition to the above, arithmetic, English literature, bookkeeping, physiology, school economy, and primary methods; third year, ancient history, rhetoric, plane and solid geometry, practice teaching; fourth year, review of arithmetic, grammar, geography and history, mental science, moral philosophy, astronomy, geology, physics, practice teaching.

Industrial training is not made a prominent feature, but all students who board in the University are required to devote one hour every day to such forms of labor as may be required of them. By a special appropriation from the John F. Slater fund, a printing office has been properly furnished, and the art of printing is taught to 15 young men every year.

Systematic instruction in woodworking, according to the most approved modern methods, is given to young men, the course lasting for three years. Nursing, cook-

[1] History and Services of Dedication of Fisk University at Nashville, Tenn., January, 1876.

ing, plain sewing, and dressmaking are taught to the girls. A department of physical training for both men and women has also been lately opened.[1]

CENTRAL TENNESSEE COLLEGE, NASHVILLE.

At the close of the war, in 1865, the condition of the emancipated slaves attracted the attention of patriots, philanthropists, and Christians, North and South. All the leading religious denominations of the North entered this field of missionary work. The Missionary Society of the M. E. Church appropriated $10,000 to establish a school for freedmen in the South, and placed the money under the direction of Bishop D. W. Clark, who purchased a church building in Nashville and opened a school under Rev. O. O. Knight as principal and three colored women as assistants. The school was composed of scholars of all ages and sizes—grandparents and grandchildren were in the same class. They were poorly clad, and mostly homeless wanderers from the plantation. They found shelter in the army barracks, in abandoned houses, in cellars or garrets, in stables or other outhouses. Yet, in the midst of this destitution, they were hungry for education. Local preachers were taught some Biblical truths while they were studying the primer and the spelling book. This was the beginning of the theological department.

This school was chartered in May, 1866, by the legislature as the Central Tennessee College. The charter contains a provision that "not less than two-thirds of the members of the board of trustees shall at all times be members in regular standing in the Methodist Episcopal Church in the United States of America." The trustees are authorized to confer such literary, professional, and scientific degrees and diplomas as are usual in such institutions, with the proviso that "they shall at all times maintain a biblical department for the education of young men who have been properly approved as candidates for the Christian ministry." Medical, law, and other departments were also organized subsequently.

It is said that in 1866 over 800 pupils were enrolled, but in September, 1867, the school opened with a small attendance, as a fee of $1 per month was charged, and the public free schools for colored children were opened for the first time in Nashville. But with the smaller attendance the character of the students began to change for the better, and the demand for teachers being very great, the normal department was organized in harmony with the main object of the school, which was to educate teachers and preachers. The first catalogue was issued for the year of 1869–70. It reports an enrollment of 241, 9 in the preparatory, 17 in the theological, 76 in the academic, and the remainder in the intermediate course. In 1872 the buildings would no longer accommodate the students. To meet this emergency a band of students of the college, known as the Tennesseeans, sung through the North so successfully that $18,000 were raised, and a new building erected, which was occupied at the opening of the school year of 1875. During this year the medical department was opened in the basement of the new building. The dental department was opened in 1886, and the department of pharmacy in 1889. The John F. Slater industrial department was opened in 1884 for the practice of carpentry and printing. A blacksmith and wagon-making shop was opened in 1888, and a tin shop in 1889. In October, 1890, the mechanic-art shop was dedicated to the training of young men for useful work in wood, iron, brass, and steel, in the manufacure of steam engines and scientific and philosophical apparatus. This was the first shop of the kind opened to colored youth in this country.

Since the opening of the free schools in Nashville, the number in attendance has increased with great regularity every year from 150 in 1869 to 613 in 1891. The whole number of students, reckoning from the beginning of the school in 1865, is about 6,000. The number of graduates in the different departments is, junior nor-

mal, 39; senior normal, 11; academic, 13; scientific, 3; college, 18; theological, 14; pharmacy, 4; dentistry, 13; medical, 119.[1]

LE MOYNE NORMAL INSTITUTE, MEMPHIS.

In 1870 Dr. F. Julius Le Moyne, of Washington, Pa., gave $20,000 to the American Missionary Association for the purpose of founding an English school for colored youth at Memphis, Tenn. From this fund the necessary buildings were erected, leaving about $11,000 as an endowment fund. The school was opened in September, 1871, and has since been sustained by the association and this endowment fund. For the first two years the school was under the immediate care of Prof. J. H. Barnum, formerly of Oberlin. In October, 1873, Mr. Barnum was succeeded by D. E. Cottle, of Connecticut. Soon after Mr. Cottle assumed the duties of principal, yellow fever began its ravages in the city. The teachers remained at their work, although directed by the association to leave the city if they thought best. They were unwilling to desert their work in the hour of danger, but early in November Mrs. Cottle was attacked and died. Mr. Cottle survived her only a week, and the school was closed till January, 1874.

The school has had several names. It started as "The Le Moyne Normal and Commercial School." It was afterwards "The Le Moyne Normal School," and it is now known as "The Le Moyne Normal Institute." The school was designed to accommodate 250 pupils, but it became necessary to enlarge it from time to time, until now over 500 pupils are in regular attendance, It is declared to be the purpose and plan of the school to give a thoroughly practical English education, with special normal training for those who intend to engage in teaching. The normal course is in two divisions, elementary and advanced. The advanced course includes plane geometry, astronomy, physics, geology, history (sacred and profane), mental and moral philosophy, pedagogics, and practice teaching. In addition to these studies there is a special professional or teachers' course, of which the following is an outline:

1. (*a*) A knowledge of the human mind and its application to the work of education. (*b*) The order and conditions of the development and growth of mental faculties. (*c*) General principles of education. (*d*) Methods of school government and organization.
2. Object and aims of education.
3. Motives to mental activity.
4. Laws that govern attention, and the conditions of its proper training.

Each student-teacher receives thirty-two weeks of practice teaching under the direction of a critic teacher.

Manual training or industrial education has an important place in the course of study, both in the normal and in the lower grades. The girls have a systematic course of lessons in plain needlework of all kinds and some fancy work. In the eighth school year they have daily recitations in the theory of household economy and in cooking. Girls of the ninth year do practical work in the experimental kitchen. In addition to daily lessons of forty minutes, the class has actual practice in cooking certain days of the week, when the class time is extended to two hours. On each practice day four dishes are usually prepared by the girls under the supervision of the regular instructor.

Provision has been made to give the boys some practice in the use of woodworking tools and in typesetting and printing. For the woodworking classes fourteen benches and as many sets of carpenters' tools are provided. The shop is also furnished with a number of lathes and other foot-power machinery. The main object of this work is to train the eye and the hand of the pupils, and to make them perfectly familiar with the construction, care, and use of the tools. The entire time

[1] Twenty-fifth Annual Catalogue of the Central Tennessee College, Nashville, 1891.

of a special instructor is required in this department, as is also the case in the printing office and in the girls' department of industrial instruction.

The total number of students for the year in the normal department, including two preparatory classes, is 158. In the grammar and primary grades there are 450 pupils.

The faculty consists of the principal, A. J. Steele, with 16 instructors and assistants.[1]

NORMAL DEPARTMENT OF ROGER WILLIAMS UNIVERSITY.

On the 13th of February, 1883, the Nashville Normal and Theological Institute was incorporated under the laws of the State of Tennessee as The Roger Williams University, and trustees were chosen under the direction of the board of the American Baptist Home Mission Society, by which the university is chiefly sustained. Candidates for admission are required to be able to read in the fourth reader. Young men and women, whose abilities and characters give promise of special usefulness, and whose circumstances render it necessary, are furnished with help sufficient to enable them to remain in school. In order to receive this assistance a student must commend himself to the faculty by diligence and progress in his studies, by freedom from bad habits, and by the manifestation of a good conscience and a worthy Christian character. The State of Tennessee has established for "children of Tennessee of African descent" fifty normal scholarships worth $50 each, and the Roger Williams University is one of the schools which students may attend and enjoy this bounty. A State scholarship gives a student in this university his board and tuition for six months. State normal pupils "must be at least 17 years of age, of irreproachable moral character, of gentlemanly or lady-like habits, presumed good health, declared intention to make teaching a profession, and intention to teach at least two years in the public schools." Applicants for scholarships are examined in spelling, reading, penmanship, English grammar, rhetoric, geography, arithmetic, algebra, bookkeeping, physiology, United States history, elements of geology, and elements of agriculture, with the understanding, however, that, if no applicants are able to satisfy all these requirements, those who come nearest to the standard will be appointed.

In 1891 there were in the theological department 21 students; in the college department, 17; in the college preparatory, 25; in the normal department, 39. The total number of registered students was 226—101 men and 125 women—coming from 12 different States, but a majority from Tennessee. The normal course provides for the teaching of "pedagogics" in the senior year only, where it takes its place with 10 other studies.

FREEDMEN'S NORMAL INSTITUTE, MARYVILLE.

This school is under the management of the Religious Society of Friends. It was opened in 1876. In 1877 it had an enrollment of 125 students. It is claimed that "those who go out from this institution to teach have been so thoroughly trained by actual class and school work done by themselves, under the supervision of the principal, that their own schools will compare favorably with those taught by our best modern teachers."

Three courses of instruction are provided—a teacher's elementary course of two years, a teacher's advanced course of one year, and a classical course of three years. In the last available catalogue there were 68 students registered in the first year of the elementary course, three in the second year, two in the advanced course, and three in the classical course. A great majority of the pupils are in the preparatory and primary departments. The institute is conducted by the principal with 10 assistants. The theory and practice of teaching finds a place in the elementary but not in the advanced course.

---

[1] Catalogues of Le Moyne Normal Institute, Memphis, Tenn., 1872–1891.

George Sturge, an English Friend, gave to the Yearly Meeting of Friends for New England a fund, the income of which enables the committee having charge of the Freedmen's Normal Institute to reduce the expenses of students. Forty students for the fall term and 60 for the spring term are admitted to the normal class and receive 75 cents per week toward their expenses. Such students are expected to remain until they are qualified to teach in the common schools, and to teach in such schools for as many weeks as they were in the normal class receiving the benefit of the Sturge fund.[1]

ALABAMA.

STATE NORMAL AND INDUSTRIAL SCHOOL, HUNTSVILLE.

The State Normal and Industrial School at Huntsville, Ala., was organized in May, 1875. It had then only two teachers, an income of $1,000 from the State, and no property. The State appropriation was raised in 1878 to $2,000. For the first two years the school occupied a little church and some small rented houses. By the practice of the strictest economy a sum sufficient to purchase property was saved. A beautiful location was selected and a fair prospect of permanence was secured. Although the school received help from the Peabody education fund and the John F. Slater fund, and from friends North and East, the aim was, from the beginning, to draw its support mainly from the State, and all expenditures are estimated upon the basis of State funds. The legislature of 1885 raised the annual appropriation to $4,000. The school grounds comprise about 4 acres fronting on one of the prettiest thoroughfares in the city. Palmer Hall, the principal building, is one of the best school edifices in the State. The chapel has a seating capacity of 500. The general assembly of Alabama of 1890-91 made this school the beneficiary of that part of the Congressional grant given under the act approved August 30, 1890, "to the more complete endowment and support of the colleges for the benefit of agriculture and the mechanical arts." The institution is thus a normal, mechanical, and agricultural school for the colored people of Alabama. The new era of the school was inaugurated by the purchase of 182 acres of land 3 miles north of Huntsville on which the necessary buildings have been erected. The president's report for the session ending August 31, 1891, records the following departments:

I. Department of mechanic arts.—Section 1, carpentry; section 2, printing; section 3, mattress making; section 4, shoemaking.

II. Department of Agriculture.—Section 1, farming and horticulture; section 2, dairy and live stock.

III. Department of English language and literature.

IV. Department of mathematical science.

V. Department of physical science.

VI. Department of natural science.

VII. Department of economic science.—Section 1, laundering; section 2, cooking; section 3, sewing.

Among these "departments" the "normal" is conspicuous by its absence, but among the "courses of study" will be found a normal course of three years, the first year giving "practice in training school;" the second year, theory and practice of teaching, and the third year, theory and the practice of teaching with "school law." Comparing the title, "State normal and industrial school," with the printed programme, one is reminded of Falstaff's poor "half-pennyworth of bread."

In order to be admitted into the normal and industrial departments of the institution, a pupil must be 14 years of age, of good moral character, and able to read and write and understand arithmetic to fractions. Tuition is free, and boarding expenses are $8 a month, of which $7 are paid in cash and $1 in work. "The aim of instruc-

[1] Catalogues of the Freedmen's Normal Institute, Maryville, Tenn., 1876, 1879–1889.

tion," says the president in his last report, "is to turn out practical men and women. Our plan is a combination of the constructive and instructive methods. The student sees his efforts constantly producing useful articles for home use or for the market. In the construction of an ordinary table there are all the steps from the first lesson of the apprentice to the finishing touches of the skilled cabinetmaker, and so on through all the departments of industry. Hence, the various industries soon return something to the institution and offer opportunities for students to help themselves through school."

Schedule of daily exercises.—Rising, dressing, and arranging rooms, 5 to 5.30 a. m.; study hour, 5.30 to 6.45; devotion, 6.45 to 7; breakfast, 7 to 7.50; school, 8 a. m. to 1 p. m.; dinner, 1 to 2; general work, 2 to 4; recreation, 4 to 6; tea, 6 to 7; devotion, 7 to 7.15; study, 7.15 to 9; retiring taps, 9.

The school employs 16 teachers, and the last catalogue registered 326 pupils, of whom 96 were in the normal department proper. The teachers are assigned as follows: To mechanic arts, 4; to agriculture, 2; to English language, 4; to mathematical science, 1; to physical science, 1; to natural science, 1; to economic science, 3.[1]

TUSKEGEE NORMAL AND INDUSTRIAL INSTITUTE.

The Tuskegee Normal School was established by an act of the legislature of Alabama, passed in 1880, and was opened in a church July 4, 1881, with 30 students and 1 teacher. The school has now (1891), including the night school and the training school, 730 pupils, of whom 212 are in the normal department. The normal course includes reading, spelling, arithmetic, geography, grammar, history, physiology, rhetoric, literature, algebra, geometry, physics, botany, bookkeeping, school laws of Alabama, theory and practice of teaching, music, drawing, civil government and political economy, mental and moral philosophy. The theory and practice of teaching is one of the eight subjects pursued by the senior class. The industrial department has advanced to a high state of efficiency; it is subdivided into the following branches:

1. *Agriculture.*—The farm of 1,480 acres not only furnishes valuable employment for students, but supplies largely the demands of the school.

2. *Brickmaking.*—On the farm have been found beds of clay suitable for making brick. From these beds the students have made bricks enough (and have laid them themselves) to build four substantial buildings for school use.

3. *Carpentry.*—The shop is furnished with several sets of tools, and the students are taught to make fences, build cottages, make and repair furniture, etc.

4. *Printing.*—The office is well furnished and is under the management of a first-class printer. The students do much job work for the school and the surrounding country.

5. *Blacksmithing.*—At present the blacksmith and wheelwright shops are combined. This department does all the work for the school and farm, and much for the town and country.

6. *Tinsmithing, shoemaking, harness making.*—All the roofing is done by students from the tin shop, and a large quantity of tinware is furnished the boarding department.

7. *Sewing.*—Much of the dressmaking for the girls and all the plain sewing of the school are done in this department. In connection with it is a sales room, in which the products of the sewing room are offered for sale to the students.

8. *Laundry.*—Here the girls are taught the art of washing and ironing after the most improved methods. Very little machinery has been introduced.

9. *Sawmill.*—A large portion of the farm is covered with pine forest, which supplies the mill with timber. A planing mill is attached which dresses the lumber for

[1] Annual catalogues of the State Normal and Industrial School, Huntsville, Ala., 1883, 1884, 1885, 1886, 1890. President's Report, 1891.

use. Without the sawmill, the brickyard, and the carpenter's shop it would have been impossible, with restricted means, to put up the buildings required by the institute.

Tuition is free. The price of board, including washing, lights, fuel, etc., is $8 per month. Students are given an opportunity to work out $2 or $3 per month, so that with a good outfit of clothing $50 is sufficient to carry an industrious student through the school year of nine months.

The appropriation of $2,000 annually made by the State legislature at first was increased in 1883 to $3,000 annually. The whole State appropriation is used to pay tuition, for all other expenses the school looks to its friends, North and South. The school property is (1892) valued at $125,000, and is entirely free of debt.[1]

EMERSON INSTITUTE, MOBILE.

The Emerson Institute is one of a large number of schools organized soon after the war by the American Missionary Association for the benefit of the freedmen in the South, and kept up after the special need for such aid ceased to be severely felt. The building known as the "Blue College," on Government street, was at first occupied as a primary school, and afterwards (1873), by the liberality of Mr. Emerson, of Rockford, Ill., it developed into a normal and academic institute. In the same year the building was destroyed by fire, but the school was maintained under great disadvantages until 1878, when it was removed to a new building in Holley's Garden. Four years later this house also was burned, and the school work was carried on in church buildings. In the summer of 1882 another and larger building was erected, and in 1889 an industrial building was added, in which the boys are taught wood-working and the girls to sew and cook. The "normal course" includes geometry, physics, general history, English literature, mental science, geology, astronomy, and the "science of education." The whole number of registered students (1891) is 322, of whom 28 are in the normal department.[2]

MISSISSIPPI.

TOUGALOO UNIVERSITY.

In 1869 the American Missionary Association purchased 500 acres of land, with a fine mansion upon it, at Tougaloo, 7 miles north of the State capital, and proceeded to open a school for the education of colored persons. There is a little romance connected with the early history of the place. Prior to the war a wealthy bachelor owned a valuable plantation of over 2,000 acres in the very heart of the State of Mississippi. A charming young lady, to whom he was paying his addresses, promised to become his wife if he would build her the finest house in the State. The condition was accepted, and the house soon began to show its grand proportions; but while the ardent lover was preparing a $25,000 cage for his bird a rival carried off the bird. The cage remained stationary, and was used as a storehouse for cotton, until the officers of the American Missionary Association had their attention called to it as a favorable location for their projected school.

Two other buildings were soon after erected, and when the school was chartered by the State in 1871, there were comfortable accommodations for 60 boarding students. In the early history of the school it was adopted by the State as one of its normal schools, but, on account of the difficulty created by having two boards of trustees to run the same institution, the State withdrew its support in 1877. Two years later a board of visitors was appointed to visit the school annually and report

[1] Catalogues of the Tuskegee State Normal School, 1882, 1890. Report of the principal to the State commissioners, 1890.

[2] Catalogues of Emerson Institute, 1876–1890.

directly to the legislature. Since that time the State has appropriated from $2,000 to $3,000 annually for the support of the school. The foundation of a new hall, to replace Washington Hall, which had been destroyed by fire, was laid in 1882. It was called Strieby Hall, in honor of the oldest living secretary of the American Missionary Association. In the fall of the same year a blacksmith's shop was built, and in the next two years carpenter and tin shops were added, making a good beginning of an industrial department, which has since been liberally aided from the "Slater fund." In 1888 a small building was fitted up as a "Girls' Industrial Cottage," which served to make a beginning in that line of work. During 1886–87, through the generosity of Mr. Stephen Ballard, of New York City, a two-story building was put up on the old site of Washington Hall, and was called "Ballard Hall." This building furnishes ample accommodations for the schoolroom work in all the grades below the normal department. The "Ballard shops" were also completed during the year, furnishing ample room for all the shops under one roof. These two buildings were completed with the $5,000 given by Mr. Ballard. They are substantial, commodious, and cheap. All of the work upon them was done by students trained in the industrial department.[1]

The school is arranged in four grades—primary, intermediate, grammar, and normal. The normal course also embraces four grades of one year each. The subjects in the first grade are composition, algebra, physiology, and physical geography; in the second grade, algebra, rhetoric and literature, natural philosophy, and bookkeeping; in the third grade, geometry, geology, general history, and botany; in the fourth grade, political economy, mental science, moral science, pedagogics, Scripture history, review of common branches, and composition.

The number of students in June, 1890, was, in the normal grade, 33; grammar, 90; intermediate, 160; primary, 100; total, 383.

The course of training in the industrial department is, first year, carpentry; second year, blacksmithing and wheelwrighting; third year, painting, turning, and tinning. All the young women are taught to sew and mend. Dressmaking is taught to a limited number. Class instruction and practical lessons in cooking are given every day. Four girls each month have the privilege of keeping house in the "Cottage," and while learning to cook and plan for themselves, they also lighten their expenses.

STATE NORMAL SCHOOL, HOLLY SPRINGS.

The State Normal School at Holly Springs was opened in 1870 for the purpose of training teachers (colored) for the public schools of the State. Only such persons as intended to become teachers were admitted to full membership. The enabling act of the legislature provided that "each representative in the State shall be entitled to send one pupil each term of twenty weeks of said school, said pupil to be recommended by the representatives to the board of trustees. The person thus admitted shall be free of tuition: Provided, The applicant shall be of good moral character and shall sustain a satisfactory examination and sign a declaration of intention to follow the business of teaching common schools in this State for at least the term of three years."

The last catalogue (1891) gives the number of registered students as 170—young men, 93; young women, 77. There are reported as studying geometry, 8; algebra, 24; Latin, 6; theory and practice of teaching, 9; pedagogy, 4; psychology, 8; English grammar, 108; reading, writing, and spelling, 120.

The course of study as published in the first catalogue of the institution is worthy of preservation. It is in some respects a model.

Optional studies: Latin, Greek, algebra (advanced), trigonometry (advanced), analytical geometry, calculus, zoology.

JACKSON COLLEGE.

This institution was at first known as the Natchez Seminary. It is one of the 17 institutions founded and sustained for the education of preachers and teachers for the colored people of the South. It was opened in 1877, but no catalogue was issued until 1880, when the seminary had on its roll 31 students preparing for the ministry, 46 preparing to teach, and 40 general students. The design of the seminary was declared to be "to aid those men who have a divine vocation to the sacred ministry to obtain a better understanding of the Holy Scriptures; to aid them to take a connected view of the Christian doctrines; to learn the best methods of teaching the way of salvation; to study the composition of persons; to become practically acquainted with the usages of the Church of Christ, etc."

Another design of the school was "to afford a good opportunity for study and instruction to young men and women who wished to be prepared to teach the public schools." The courses of study extended through five years, embracing the ordinary grammar school and high school branches of study, with mental and moral philosophy, biblical interpretation, sermon-making, preaching, church polity, and systematic theology. The expenses were very low—tuition, $1 a month; room rent, $1 a month; washing, $1 a month, and board $5 a month. Among the 23 rules for the seminary and family, the first deserves special notice: "There are no penalties for misconduct; none remain who fail to regard our simple rules."

In 1882 the "art of teaching" was added to the normal course, but it has no place in the printed curriculum of 1884. In 1885 the seminary took possession of its new building in Jackson, Miss., a fine brick structure three stories high, with a basement, erected by the Home Mission Society. It was then called Jackson College.

Though the name of a "normal department" has been kept in the catalogues to the present time, there is no evidence of any distinctive normal instruction being given. The following are the subjects assigned to the several instructors: Theology,

natural sciences, history, mathematics and music, and English studies. The normal department, so called, is really preparatory to the academic department, for "the academic course comprises all the studies of the normal course and two years of study in addition."

The John F. Slater fund provides for the industrial department. Students of both sexes are taught such branches of useful and practical knowledge as will enable them to earn their living by the labor of their hands. The young women have a sewing room and the young men have shops in which work is done in carpentry, lathe work, tin work, and brick laying.[1]

The following summary is from the catalogue of 1890:

Preparing for the ministry	23
Preparing to teach	42
In industrial department	213
Converted to Christ	19
Males	114
Females	149
Total	263

Louisiana.

STRAIGHT UNIVERSITY, NEW ORLEANS.

In the spring of 1869 a few gentlemen conceived the idea of planting this university to meet an acknowledged want of the colored population. The Freedmen's Bureau and the American Missionary Association at once pledged their cooperation. A site was selected on one of the most beautiful streets in the city. The American Missionary Association purchased the grounds, and the Government assured the erection of buildings to the value of $20,000. An act of incorporation was secured "with the power to confer all such degrees and honors as are conferred by universities in the United States of America." While the buildings were in process of construction a normal department was opened in one of the churches, and 60 students were registered. The institution bears the name of one of its most liberal benefactors, Seymour Straight. From the first there was contemplated the organization of a law department, a medical department, a collegiate department, a normal department, an academic department, and an elementary department. Time has not quite fulfilled all the expectations of its founders. The theological department is still in existence, with 6 students; the college with 9, including 2 preparatory classes, and the normal with 64. The academic and lower grades number 483. The faculty of the college department is the same as the faculty of the normal department, and the printed curriculum of the normal course indicates no strictly professional training, with the exception of psychology and science of education, in the fourth year, which divide the attention of the student with civil government, astronomy, geology, and English literature.[2]

NEW ORLEANS UNIVERSITY.

The New Orleans University was chartered by the legislature in 1873, but a regular normal department was not opened until 1883, when there were 25 normal students on the roll, the course of study being "a review of the studies of the grammar department with lectures on managing schools and teaching, together with practical exercises in the same." In 1885 the department was arranged in two divisions, the normal scientific and the normal language divisions. The difference is sufficiently indicated by the titles. The whole number of students in the normal department was 14. In 1888 the number registered was 9. In 1889 the number of normal students was 27,

[1] Catalogues of Natchez Seminary and Jackson College from 1880 to 1891.

[2] Catalogues of Straight University, New Orleans, La., 1870, 1877, 1886, 1890, 1891.

and the course was extended from two years to three, "methods of instruction and practice teaching" forming part of the curriculum in each term of every year. The number of normal students in the next two years was 38 and 39, respectively. The aggregate number of students attending the University was 562.[1]

ARKANSAS.

BRANCH NORMAL COLLEGE OF THE INDUSTRIAL UNIVERSITY, PINE BLUFF.

The Branch Normal College is a department of the Arkansas Industrial University, established pursuant to an act of the general assembly approved April, 1873. It has been in operation since September, 1875. The enabling act requires the branch college to be governed by the same rules and regulations as the principal college, and makes it the duty of the board of trustees "to furnish the branch college with professors and teachers and other necessary employees, equal in numbers, attainments, and other desirable qualifications to those furnished and employed in said principal normal college;" "to prescribe the same books and the same course of study," and "to confer upon graduates thereof like honors, commendations, and degrees to those had or given in said principal normal college." The appointment of students to this branch college, like appointments to the parent university at Fayetteville, is vested in the county courts. All students thus appointed are entitled to four years' free tuition upon the payment of $5 matriculation fee at the time of entering the school. The number of possible beneficiaries is about 400, and the average number of actual beneficiaries about 200, of whom one-third are in the normal department proper and two-thirds in the preparatory. The course of study has two divisions—the normal, leading to the degree of licentiate of instruction, and the classical, to the degree of bachelor of arts, the former occupying four years and the latter six. Pedagogics has a place in the second year of the normal course, history of education and school management in the third, and science of education in the fourth. The optional studies are reading and spelling, elementary chemistry, elementary botany, zoology, surveying, and ethics. Latin, geometry, plane trigonometry, algebra, physics, general chemistry, and psychology are obligatory.

The "normal course of study," according to the last announcement, "is not what goes by that name in many of our institutions—that is, a mere preparation for teaching the common-school branches—but differs from the usual college curriculum merely in the omission of one or two branches of higher mathematics, and having less in Greek. The institution is strictly confined to the higher branches, and children who are not somewhat advanced in the common-school branches are not admitted."[2]

It is interesting to compare the course of study outlined above with the printed programme for the year 1879–80, when the "real work of the normal" commenced.

First year.—Latin, algebra, plane geometry and trigonometry, physical geography, history, English diction, and elocution.

Second year.—Latin, plane and spherical trigonometry, descriptive geometry, inorganic chemistry, chemical physics, zoology, rhetoric, botany, and analytical geometry.

Third year.—Latin, solid geometry, differential calculus, integral calculus, mineralogy, geology, organic chemistry, English literature, and logic.

Fourth year.—Latin, natural philosophy, mental philosophy, moral philosophy, political economy, history of civilization, civil polity, evidences of Christianity, Constitution of the United States, international law, philology, and history of inductive sciences.[3]

Must we sometimes apply the definition of *faith* to school catalogues—"the substance of things hoped for, the evidence of things not seen?"

SOUTHLAND COLLEGE AND NORMAL INSTITUTE.

This institute was established by the Indiana Yearly Meeting of the Religious Society of Friends in 1864. The normal grade was instituted in 1869. The college department was organized in 1872.

For admission to the preparatory or normal course the student must have completed McGuffey's Fourth Reader, Swinton's Language Lessons, Eclectic Primary Geography, and Ray's Practical Arithmetic to decimal fractions. The course of study in the "preparatory and normal department" can be completed in three years. The first year is devoted to arithmetic, geography, and grammar; the second, after completing arithmetic and grammar, to history of the United States and bookkeeping; the third year to algebra, physics, physical geography, physiology, and civil government. Pedagogy is added for those who desire the diploma of the normal course. There are 5 students in the college department and 89 in the "preparatory and normal." The number of students in the normal department (1890) is 89.[1]

TEXAS.

TILLOTSON COLLEGIATE AND NORMAL INSTITUTE, AUSTIN.

This school was founded by the American Missionary Association and is conducted under its auspices. It takes its name from the Rev. George J. Tillotson, of Weathersfield, Conn., who contributed largely in money and personal efforts to the erection of the main building. It was opened on the 17th of January, 1881, and at the end of the second year had an enrollment of 283 students, of whom 50 were pursuing the normal course.

The object of the institute is to furnish to the colored people an opportunity to acquire a thoroughly practical common-school education; to prepare those who propose to take a more extended course for entrance to the highest educational institutions of the land; to train teachers for all positions in the public schools.

There are two normal courses, "elementary and higher," each occupying two years. The studies of the first year are arithmetic, algebra, physical geography, reading, rhetorical exercises, history of Texas, vocal music, carpentry, sewing, cooking. Second year: Algebra and arithmetic completed, rhetoric, rhetorical exercises, physiology, botany, school economy, primary methods, carpentry, dressmaking, cooking. Third year: Plane geometry, physics, English and American literature, general history, elocution, rhetorical exercises, carpentry (optional). Fourth year: Astronomy, zoology, mental philosophy, civil government, rhetorical exercises, methods of teaching, practice teaching.

The number of students in the elementary course (1891) was 24; in the higher, 3.[2]

STATE NORMAL SCHOOL, PRAIRIE VIEW.

This school owes its origin to an act of the legislature of Texas approved April 19, 1879, which authorized the establishment at Prairie View (formerly called Alta Vista) of a normal school for the preparation and training of colored teachers. The act requires the board of directors of the Agricultural and Mechanical College of Texas to organize such a school as soon as practicable, so as to admit one student from each senatorial district, and at least three students from the State at large, to be taken from the colored population of the State, and to be not less than 16 years of age at the time of their admission. All students admitted are required to sign a written obligation binding each student "to teach in the public free schools for the colored children of their respective districts at least one year next after their discharge from the normal school and as much longer than one year as the time of their

[1] Catalogue of Southland College and Normal Institute, Helena, Ark., 1890.

[2] Catalogues of Tillotson Normal and Collegiate Institute, Austin, Tex., 1882-1891.

connection with the normal school shall exceed one year," and for the same rate of compensation as other teachers of such schools receive. The directors are also required to make rules by which students can obtain certificates of qualification as teachers, which will entitle them to teach without further examination. The sum of $6,000 a year was appropriated for the support of the school. This sum was afterwards increased, the appropriation for 1889–90 being $10,000 for the normal and $5,000 for the industrial department.

Candidates for admission must sustain a satisfactory examination, conducted by a board of examiners appointed by the senators of the several districts of the State, in arithmetic as far as decimal fractions, orthography, English grammar and composition, history of Texas, and history of the United States. The course of study embraces three years. In the first year reading and spelling, grammar and geography, inventional geometry, drawing, writing, vocal music, and calisthenics. In the second year the same studies are continued, with algebra, physiology, and lectures on professional work and school management. In the third year there is a general review of common branches, with special reference to teaching them, and, in addition, natural philosophy, plane geometry, bookkeeping, rhetoric, English literature, general history, psychology, and civil government.

The industrial department is made subordinate to the normal features of the school. No attempt is made to equip students thoroughly in any particular line of the industries, but liberal provision has been made and shops have been furnished for the instruction and practice of young men in the principal operations of wood and iron working.

Girls have a special teacher who instructs them in the different kinds of sewing, both by hand and on machines, in cutting and fitting, in cooking, laundering, and general housework.

There are 225 acres of land belonging to the school. About 100 acres are cultivated in farm and garden. Lectures are delivered to the students on soil, fertilizers, cultivation of different crops, the care of orchards, stock raising, and care of cattle. A branch of the United States experimental station has been placed in charge of the agricultural department of this school.

The number of students enrolled in June, 1890, was 129. One student from each senatorial district and 15 from the State at large were admitted free of charge for board and tuition, and those who show a decided ability for teaching may be returned for a second year. The number of graduates from 1885 to 1889, inclusive, was 78, of whom all but 7 were reported in 1890 as "teaching" and 6 as "having taught."[1]

Missouri.

LINCOLN INSTITUTE, JEFFERSON CITY.

Lincoln Institute had its origin in a fund of $6,379 contributed by the Sixty-second and Sixty-fifth regiments of United States Colored Infantry when discharged from service in January, 1866. The school was opened in September of that year and was taught in rented buildings. In June, 1871, the present Lincoln Institute building was completed. It is a substantial brick structure, 60 by 70 feet, conveniently arranged and eligibly located upon a prominent hill just outside the limits of Jefferson City. The grounds contain 20 acres. The legislature of 1879 appropriated $15,000 for the support of the institute; but this appropriation was found to be unconstitutional, being a grant of public money to a corporation. At the suggestion of Governor Phelps the board of trustees met and unanimously voted to transfer the institute to the State. The bill was then immediately approved, and the legislature

[1]Annual Catalogue of the Prairie View State Normal School, Hempstead, Tex., 1890.

in succeeding years made liberal appropriations for its current expenses and also for repairs, buildings, library, and apparatus.

There are four departments—the college, the preparatory, the normal, and the elementary. The object of the normal department is to prepare teachers for the colored schools of the State. It has two courses of study; the first covers two years and the second four. Students who complete the two years' course receive graded certificates, entitling them to teach the branches named therein for two years from the date of graduation. Graduates from the four years' course receive diplomas which authorize them to teach in any county in the State without examination. Pedagogics has no definite place in the printed course of study, but "principles and methods of teaching, class management, and school government receive attention throughout the course, also spelling, elocution, and composition;" and normal students are required to participate in the teachers' institute, which is held biweekly.

By an act of the thirty-sixth general assembly an industrial department was established in connection with the institute. The object of this department, which was opened in October, 1891, is "to give the students an opportunity to learn trades and to study those branches of knowledge pertaining to agriculture."

The faculty consists of the president, 4 professors, and 2 assistants. The superintendent of the industrial department is a graduate of the manual training school of St. Louis.

The number of pupils enrolled in the normal department (catalogue of 1891) is 42; in the elementary, 151; in the preparatory, 11; in the college, 1; total, 205.[1]

VIII.

CITY NORMAL AND TRAINING SCHOOLS.

The city training school, call it by what name we may, would seem to be the simplest of all normal school problems. Given a city of a certain population, increasing at a certain probable rate, a definite school system, a printed course of instruction, a number of principals selected by merit or by personal or political favoritism, it should not be difficult to train a sufficient number of assistants every year to aid these principals in the instruction and government of the schools. But the evolution of the training school has not been accomplished on purely professional lines. The need of good assistant teachers is the ostensible cause and furnishes the public with a sufficient motive; but other ends have also to be served. The school government is a close corporation; the school-teachers must be selected from among qualified residents of the city; the outside world must be kept out that home labor may be protected. But this very protection adds to the embarrassment of the school authorities in the selection of teachers, for there are three home applicants for every vacancy. The training school weeds out some of the incompetents, and the choice becomes more restricted and less embarrassing. The work of the training school, however comprehensive in theory, is practically restricted to the graduating of young teachers who will satisfy the demands of the principals and the superintendents in numbers not too large for the needs of the schools and yet not so small as to give the school directors no opportunity for choice. The school curriculum must not be too modern, for that would offend the old-fashioned principals; neither must it be antiquated, for that would not suit the progressive superintendents.

As if the problem were not already sufficiently complicated, the public steps in and demands that young people who are not to become teachers should have equal opportunities of higher education with those who are to receive professional instruction, hence the title "high and normal school," with which nearly all such institutions have been ushered into the world, and which has connected them as closely as were the Siamese twins. But the general, if not the universal experience, has

[1] Catalogues of Lincoln Institute, Jefferson City, Mo., 1879, 1880, 1881, 1882, 1884, 1886, 1887, 1891.

been that a school, like a locomotive, can not run on two lines, however slightly divergent, at the same time. It will be switched off either to the high school track or to the normal track. In the end the trains are divided, to the great advantage of both.

It has not been thought advisable to give many samples of the city training school. One might almost say, ab uno disce omnes. The Report of the United States Commissioner of Education for 1889 gives a list of 58 city training schools and classes, attended by 538 students. Most, if not all of these, are connected with city high schools and have no independent history. The experiences of the cities of Philadelphia, Boston, New York, and Chicago contain valuable lessons, and the history of the New York College for the Training of Teachers is exceedingly interesting.

GIRLS' NORMAL SCHOOL, PHILADELPHIA.

The act of the legislature of Pennsylvania, passed in 1818, providing "for the education of children at public expense within the city and county of Philadelphia," gave to the controllers of public schools the power "to establish a model school in order to qualify teachers for the sectional schools and for schools in other parts of the State." At that time the Lancasterian system was in the prime of its popularity, and the "model school" allowed by the act was organized by Joseph Lancaster himself in a building still standing on Chester street above Race. This model school was used as a school of practice to train teachers and monitors, and to serve as a pattern to other schools of the same class. [One of the earliest recollections of the writer is of a visit made when he was a boy to a great Lancasterian school in a manufacturing city. The master stood on a high platform brandishing his rod of office in full view of some 300 pupils. Six small galleries, seated with benches raised in three or four ascending tiers, gave accommodation to from 12 to 20 small urchins in each gallery, over which presided 12 monitors. The children conned their lessons under monitorial supervision and the noise was like the distant roar of the much vexed ocean. The presiding genius on the platform touched a little bell and called, "Sand class, come up!" The sand class came up, and gathered around a shallow trough, 3 by 4 feet and 4 inches deep, filled with molding sand of the best quality, on which the master proceeded to illustrate the mysteries of the alphabet. Years passed on, and the galleries became recitation rooms, about 12 feet square, arranged around a central hall, and the boy monitors were supplanted by ladies. For many years the school buildings of Philadelphia continued to attest their Lancasterian origin, but finally the pendulum swung around to the opposite side, and a schoolhouse became a series of rooms, each in many cases as independent of the others as if they belonged to different countries. This independence extended largely to the schools of the system, if system it can be called which had been compared, before the revolution of 1883, to a "fortuitous aggregate of educational atoms." So much "obiter dictum" may help to a better understanding of the history of the Philadelphia Normal School for Girls.]

About the year 1836, the model school, having lost its distinctive character as a school of practice, became in effect one of the grammar schools of the city, though it still retained its name. Twelve years later the controllers of the public schools converted the so-called model school into a normal school for the purpose of qualifying young ladies to become teachers. It is claimed that this is the first normal school not under State control established in any city in the United States. The school was opened on the 1st of February, 1848, under Dr. A. T. W. Wright as principal, with 6 assistant teachers and 106 pupils. The course of study required two years for its completion. The school was popular from the beginning and soon outgrew its accommodations; a new building was erected for its use and the normal school was transferred to it in 1854 along with the model school, which still kept up its connection with the normal. This model school was discontinued as such soon after, and in lieu thereof a school of practice was organized. In 1857 Mr. Philip A.

Cregar was elected principal, and in 1859 the "Girls' Normal School" became the "Girls' High School." In 1861 the name was again changed to "Girls' High and Normal School," and the course of instruction was so modified as to give professional training solely in the last year of the course. These changes indicate the gradual growth of public sentiment in respect to the higher education of girls and the fitting of them for teachers.

In 1865 Prof. Geo. W. Fetter, the present (1892) principal, was elected, and under his wise and efficient management the school has done a great work for popular education in Philadelphia. The school building, which was new in 1854, became antiquated before a score of years had passed, and in 1876 the school was transferred to a new home, one of the largest and best arranged schoolhouses at that time in existence. It was dedicated on the 30th of October, amid congratulations on past success and prophecies of future prosperity. The Hon. Simon Gratz gave voice to the sentiments and wishes of the people when he said in his opening address:[1]

And now, with a building which, in point of elegance and fitness, will rival any in the land, a corps of teachers who would do honor to any institution of learning, an enlarged and comprehensive course of study which will cultivate and sharpen the reasoning faculties, stimulate thought, and store the minds of the pupils with an ample stock of useful knowledge, and last, but of the first importance, that indispensable adjunct, a thoroughly organized school of practice in which constant opportunity may be had for testing the ability of the pupil to make practical application of her theoretical knowledge of methods of teaching and of discipline, may we not reasonably expect to achieve such results as will make the school worthy of the pride of our citizens?

The following is the course of study adopted in 1876, from which it will be seen that the word "High" need not have been removed from the official title, unless as a prophecy of good things to come:

Course of study in the Girls' Normal School of Philadelphia, 1876.

Class A, one year.	Class B, one year.	Class C, one year.	Class D, one year.
Mental science.	Algebra.	Algebra.	Algebra.
Literature.	Moral science.	Moral science.	Grammar.
Geology.	Physiology.	Grammar.	Drawing.
Logic.	Drawing.	Drawing.	Arithmetic.

	Physical exercises.	Physical exercises.	Penmanship.
	Penmanship.	Penmanship.	
		Constitution of United States.	

The course of study has naturally changed during the many years of the existence of the school, both in its academic and its professional work, in order to keep pace with the advance of educational thought throughout the country. This school was among the first in the country to introduce a course of physical training, and for a number of years has had a complete and systematic course of instruction in this department. It was also one of the first institutions to introduce several forms of manual training suitable for girls. Sewing was introduced in 1881, and has been taught with success since that time. Cookery became one of the regular branches in 1887, and thus pioneered its introduction into the grammar schools of the city. Other changes are gradually made in the course of study to meet the demands of the time, until in 1887 the following quite complete course in academic and pedagogical training was adopted.

[1] Address delivered upon the occasion of the dedication of the Philadelphia Normal School for Girls, Philadelphia, 1876.

Course of study in the Girls' Normal School.

A, fourth year	History of education.	Mental and moral science in their relations to education.	Methods of teaching.	Philosophy and method of the kindergarten.	Drawing, with instruction in methods of teaching this study.	School organization and management.	Modeling in clay, instruction in the gifts and occupations of the kindergarten.		Music.
	English language and literature.		Mathematics.	Science.		History.	Drawing.	Sewing.	Music.
B, third year	Literature, theme writing, reading of English classics.	Elocution	Higher arithmetic (including mensuration, principles of accounts, and bookkeeping), geometry.	Chemistry, natural philosophy, astronomy, human physiology and hygiene.		.....	Drawing	Sewing	Music.
C, second year	Rhetoric, theme writing, history of the English language (including the study of the derivations, formation, etc., of words), English literature, reading of English classics.	.....do.....	General review of arithmetic, geometry, algebra.	Zoology, geology, natural philosophy.		General history	....do.....	Sewing, cooking.	Do.
D, first year	Grammar, composition, history of the English language (including the study of the derivation, formation, etc., of words), reading of English classics.	.....	Algebra, arithmetic....	Physical geography, botany.		History and civil government of the United States, general history.	....do.....	Sewing	Do.

1. Physical exercises throughout the first, second, and third years.
2. Laboratory work in chemistry when possible.
3. Laboratory work as far as possible in physics.
4. Drawing to include the treatment of geometric drawing, construction, decoration, representation, and object drawing.

The growth and work of the school will be indicated by the following facts: The school opened February 1, 1848, with 106 pupils and 7 teachers, including the principal. In 1865 it contained 270 pupils and 10 teachers. Since that time the most remarkable increase in numbers has been made that can be found in the history of any normal school in the country, with the possible exception of the one in New York. It now (December, 1892) contains 1,850 pupils, with 54 teachers. Since its establishment 5,772 pupils have graduated. Of that number 4,878 have been engaged in teaching in the public schools of the city. At the present time nearly 2,400 of the teachers in Philadelphia are graduates of the school, including a large majority of the women principals of the city.

The school has also done a great work for Philadelphia in addition to its training of the teachers of the public schools. One of the graduates has filled the pulpit, quite a number have distinguished themselves in literary work, several have studied medicine and are successful practitioners, many have adopted art work as their profession, and a few have gone as missionaries to foreign lands. Two of the 7 assistant superintendents of the public schools of the city are graduates of the institution. But perhaps the greatest work of the school is found in the many happy homes into which the mother educated in the school has carried the influence of its culture, sending out of refined home circles the future citizens and rulers of the city.

With the growth of population and the increased interest in education, it was seen some four or five years ago that the building was inadequate to meet the demands for the higher education of the young women of the city. It was then proposed to reorganize the school by making of the present school a girls' high school and erecting a new building for the girls' normal school. Superintendent MacAlister, in his report for 1889, says: "The necessity for some radical changes in the normal school is now realized I believe by a large proportion of the members of the board of public education." The idea of a division of the institution into two different schools—a high school and a normal school—soon became the prevailing one. Professor Fetter, in his report for 1890, says: "A new building and a division of the school are now imperatively demanded."

The reorganization contemplated by the friends of the school is being carried into effect by Superintendent Brooks. The high and the normal schools are to be separated, making of them two distinct schools under different supervision and control. The new building for the normal school, which will be ready for occupancy in September next, will be one of the finest edifices of the kind in the country. The present building will then be used for a new girls' high school, which, in accordance with the present plan, will probably embrace three distinct courses of study—one intended to prepare young women for admission into the normal school, a second to qualify them for a business or a commercial life, and a third to give a higher education to such as do not desire to become teachers or enter upon business pursuits.

The normal school will have a two years' course, including the science and the art of teaching. The following outline will indicate the proposed scope of the normal course:

A.—*The science of teaching.*

I. *Methods of culture.*—(*a*) Physical culture, (*b*) mental culture, (1) intellectual, (2) æsthetic, (3) moral.

II. *Methods of instruction.*—(*a*) Language, (*b*) mathematics, (*c*) physics, (*d*) history, (*e*) the arts.

III. *School economy.*—(*a*) School preparation, (*b*) school organization, (*c*) school employments, (*d*) school government, (*e*) school authorities, (*f*) school systems.

IV. *The philosophy of education.*

B.—*The art of teaching.*

(1) Observation of model teaching.
(2) Practice in model schools.
(3) Preparation of school apparatus.

Each of these topics will be subdivided into departments of instruction to be completed in the two years.[1]

BOSTON NORMAL SCHOOL.

Dr. Edwin P. Seaver, superintendent of schools in Boston, writes as follows in his report for 1891:

One chief function of superintendent and supervisors is to provide a supply of competent teachers for the schools. This is the function of the normal school, too; but the normal school furnishes only a portion of the supply, namely, that which comes from the city itself. There has always been and there always will be a portion of the supply coming from outside the city.

This latter portion is in some respects the more important of the two. It happens sometimes that the policy of taking teachers from outside the city is discouraged, such a policy being supposed to make against the interests of the normal school or of its graduates; at other times the same policy is favored because of the pressing need to appoint experienced teachers rather than beginners in the most difficult places. So practice fluctuates, but within limits; for the necessity of employing some teachers from outside the city never wholly disappears even in the primary and grammar schools. With the supply of male teachers for these schools and of all teachers for high schools the normal school has little or nothing to do.

A normal school was established in 1852 by the city council, on the recommendation of the school board, as a part of the public-school system of Boston. In 1854 the school board, with the view of adapting the school to the double purpose of giving to its pupils both high-school and normal instruction, introduced a few additional branches of study, made a slight alteration in the arrangement of the course, and called it the Girls' High and Normal School. Under this name the school was continued until 1872, when the school board, finding that the normal element had been gradually absorbed by the high school, and had almost lost its independent, distinctive, and professional character, returned the normal school to its original condition as a separate school. Since then, under the name of the Boston Normal School, its sole work has been the fitting of young women for the office of teaching.

The course of study in this school is all pursued with special reference to teaching, and is as follows: (1) Psychology and logic, (2) principles of education, (3) methods of instruction and discipline, (4) physiology and hygiene, (5) the studies of the primary and grammar schools, (6) observation and practice in the training school, (7) observation and practice in the other public schools, (8) science of language, (9) phonics, (10) gymnastics, (11) vocal music, (12) drawing and blackboard illustration, (13) special study of the theory and practice of the kindergarten for those members of the postgraduate class who desire to qualify themselves for teaching in that department.

There is a postgraduate course of one year in this school for the further study of the principles of education and methods of instruction, and for observation and practice in teaching; and pupils attending this course may be employed as substitutes or appointed as permanent teachers.

In 1876 the Rice district was constituted a training school, where the normal pupils have an opportunity of gaining by observation and practice a familiar acquaintance with the discipline and instruction of the Boston schools. The training school contains eleven grammar and seven primary classes, numbering about 1,000 pupils.

[1] Reports of the public schools of Philadelphia; personal observation and correspondence.

A certificate that a candidate has completed the fourth year of the high-school course is accepted as proof of qualification for admission. The course of study in the Boston high schools embraces the following subjects: Composition; rhetoric; English literature; ancient, mediæval, and modern history; civil government; botany; zoölogy; anatomy and physiology; chemistry; physics; astronomy; arithmetic, including the metric system; algebra; geometry; plane trigonometry; Latin, or French or German; vocal music, and drawing.

The board of supervisors do not admit to an examination for a situation as teacher any person who is not a graduate of the Boston Normal School, or of one of the State normal schools, unless such person has had at least one year's experience as a teacher.

The following table shows how the time of the students is occupied:

FIRST TERM.

Subjects.	Hours per week.	Number of weeks.
Psychology	5	20
Physiology and hygiene	4	16
Arithmetic	4	4
Language:		
Oral expression and composition	3	9
Penmanship	3	3
Grammar	3	8
Geography	4	20
Drawing	2	20
Vocal music	1	20
Gymnastics:		
Theory	1	20
Practice (12 minutes daily).		

SECOND TERM.

Principles of education	5	16
Language:		
Reading, including phonics	4	8
Spelling	4	2
Literature	4	4
Grammar	4	2
Arithmetic	4	16
Elementary science:		
Minerals	3	5
Plants	3	11
Drawing	2	12
Form	2	4
Vocal music	1	16
Gymnastics:		
Theory	1	16
Practice (12 minutes daily).		
Observation and practice in the public schools (all day, 4 weeks).		

THIRD TERM.

Principles of education	5	7
Logic	5	3
Language:		
Oral expression and composition	4	3
Science and language	4	4
History	4	3
Arithmetic	3	10
Elementary science:		
Plants	4	2
Animals	4	6
Color	4	2
Drawing	1	10
Kindergartening	2	10
Gymnastics:		
Theory	1	10
Practice (12 minutes daily.)		
Observation and practice in public schools (all day, 10 weeks.)		

POSTGRADUATE COURSE.

The work of the postgraduate class includes: (1) A further study of the principles of education, with special reference to their appplication in teaching the different subjects of the regular course, and in school discipline; (2) the history of education.

THE NORMAL COLLEGE OF NEW YORK CITY.

The statute empowering the board of education to establish the free academy (now the College of the City of New York) for boys also empowered it to establish one or more similar institutions for girls. The legislature of 1847 intended to extend to each sex equal educational advantages, but the board of education neglected to carry out the provisions of the statute as regards girls. More than twenty years after the passage of the law the board of education established an institution for girls, in some respects similar to that for boys and in some respects inferior. Twenty years later the legislature passed a bill making the Normal College for Girls a real college, with all the powers appertaining thereto, and thus carried out the intention of the men who governed the State forty years previously.

In the fall of 1888 the board of trustees established an academic course of study, and an academic class was formed from volunteers from the normal freshman class. It started with 83 students; in 1892 it numbered 51. The falling off was caused by removals from the city and by the return of a few to the normal department.

Of late years the college has been embarrassed by the difficulty of limiting the admissions to the number which the building could accommodate. The number enrolled in 1890 was 1,766, but the number which could be efficiently instructed and comfortably seated was only 1,500. The simplest remedy seemed to be to raise the scholastic requirements for admission, but this would have been resisted by the principals, and would have been very unpopular. The difficulty was evaded temporarily by changing the "plan of marking," and as this contains some valuable pedagogic suggestions, it is quoted in full from President Hunter's report of 1892:

The plan of marking.—The plan was as follows: 1,000 was made the maximum mark that could possibly be attained; and this number was divided into 250 for arithmetic, 250 for English grammar, 150 for geometry, 100 for English composition, 100 for drawing, 100 for spelling, 25 for geography, and 25 for history. The subjects requiring reason and judgment received a value equal to two-thirds of the whole, while the purely memoriter subjects received only one-twentieth. The power to draw and the ability to spell are not infrequently natural endowments, they are certainly not signs of intellectual development; and yet on account of their importance, especially to teachers, each received a value of one-tenth. English composition, being really a part of English grammar, received also a tenth, for the reason that to the latter a very high mark had already been assigned. The low value given to geography and history, even had they been regularly taught, was perfectly correct; for the instruction heretofore in these subjects was little more than memorizing, which a child of 12 could accomplish perhaps better than a student of 15. Many candidates, weak in arithmetic, which is the foundation of the mathematical studies, and in English grammar, which is the foundation of the study of the English language, crept into the college on the strength of their memories, and at the expiration of a few months were compelled to request a leave of absence on account of personal illness, which simply meant inability to cope with the college curriculum. It goes without saying that geography and history could be so taught as to develop the higher mental powers—reason, judgment, and imagination. But the fact remains that as a rule they are not so taught, and until they are it seems wise to give them a minimum value as factors for admission. The proof, however, lies in the result. The introductory class, formed from the admissions under this method of marking, is the best and strongest the college has ever had.

Detailed schedule of the course of study.

NORMAL COURSE.

Department.	Subject.	Topics.	Text-book.	Time.
		INTRODUCTORY.		
		First term—First year.		
English	History	Ancient empires, Greece, Rome		3
	Grammar	Analysis, errors in speech, synthesis	Bain	1
Ancient language	Latin	Easy Latin methods	Harkness	4
		Elementary grammar and exercises.	Harkness	
Modern language	French or German	Progressive and practical course, Part I. Regular verbs. Translation. Reading. Colloquial exercises.	Duffet, Sauveur, Aubert	4
		Elements of grammar. Exercises in reading and writing.	Schlegel	4
Mathematics	Algebra	Elementary course	Ray	5
	Geometry	Books III and IV	Hunter	
Physical science	Astronomy	Elementary course	Gillet & Rolfe	2
		Second term—First year.		
English	Composition	Exercises in prefixes, suffixes. Use of capitals. Letter-writing. Making abstracts and expansion.	Murison	4
Ancient language	Latin	Easy Latin methods	Harkness	4
		Grammar continued. Exercises	Harkness	
Modern language	French or German	Progressive and practical course, Part I. Regular verbs completed. Irregular verbs begun. Translation. Reading. Colloquial exercises.	Duffert, Sauveur, Aubert	4
		Elements of grammar continued. Conversational phrases.	Schlegel	4
Mathematics	Algebra	Elementary course continued	Ray	5
	Geometry	Book V. Geometrical proportion	Hunter	
Physical science	Astronomy	Elementary course continued	Gillet & Rolfe	2
		FRESHMAN.		
		First term—Second year.		
English	History	England and contemporaneous events in France. Outline of modern Europe.	Freeman	2
		History of United States and the Constitution of the United States. Mythology from dictation. Lectures.		
Ancient language	Latin	Sallust	Herberman	4
		Colloquial exercises	D'Ooge	
Modern language	French or German	Progressive and practical course, Part II. Irregular verbs continued. Translation. Reading. Colloquial exercises.	Duffet, Sauveur, Aubert	4
		Grammar. Translation. Reading. Conversation.	Schlegel	4
Mathematics	Algebra	Problems	Wentworth, Olney	1
	Geometry	Solids and conics	Wentworth	3
Natural science	Botany	Systematic and physiologic	Gray's Lessons	2
Physical science	Chemistry	Elmentary course. Lectures	Remsen	2
		Second term—Second year.		
English	History	England, France, and modern Europe completed.		2
		United States completed. Mythology from dictation. Lectures.		
Ancient language	Latin	Virgil, Books I and II; Prosody	Frieze	4
Modern language	French or German	Progressive and practical course, Part II. Verbs completed. Translation. Reading. Colloquial exercises.	Duffet, Sauveur, Aubert	4
		Grammar. Reading. Translation. Conversation on the geography of Germany.	Schlegel	4
Mathematics	Algebra	Problems continued	Wentworth, Olney	1
	Geometry	Conics and solids	Wentworth	3
Natural science	Botany	Systematic and physiologic continued.	Gray's Lessons, Wood's Class Book	2
		Use of the microscope		
Physical science	Chemistry	Elementry course continued. Lectures.	Remsen	2

Detailed schedule of the course of study—Continued.

NORMAL COURSE—Continued.

Department.	Subject.	Topics.	Text-book.	Time.
		SOPHOMORE.		
		First term—Third year.		
English	Composition		Bain, Vol. I	
	Rhetoric			
Ancient language	Latin	Virgil, Books V and VI	Frieze	3
Modern language	French or German	Grammar. Letter-writing. Translation. Dictation. Literature; seventeenth century.	Noël et Chapsal; Aubert	3
		Grammar reviewed. Reading. Translation. Conversation on history of Germany.	Schlegel	
Pedagogy	Psychology	Elements of, applied to primary teaching. Object lessons. Manual training.	Calkins; Fitch	2
Natural science	Physiology	Elementary course, including hygiene. Lectures.	Martin's Human Body.	3
Mathematics	Trigonometry[1]	Plane. Lectures	Wentworth	4
		Second term—Third year.		
English	Literature	Writers from Chaucer to Dryden. Poetic selections. Quotations. Composition.	Brooke; Ward	
Ancient language	Latin	Cicero; first oration against Catiline. Oration for Archias.	Harkness	3
Modern language	French or German	Grammar continued. Dictation. Translation. Reading. Conversation. Literature continued.	Noël et Chapsal; Aubert	3
		Grammar. Reading. Translation. Conversation. Literature.	Schlegel	3
Pedagogy	Psychology	Elements of, applied to teaching. Object teaching. Manual training.	Calkins; Fitch	2
Natural science	Physiology	Elementary course, including hygiene, continued. Lectures.	Martin's Human Body.	3
Physical science	Natural philosophy.[1]	Light and heat. Lectures	Gillet & Rolfe	4
	Foods	Composition and preparation of. Lectures.	Notes	
		SENIOR.		
		First term—Fourth year.		
English	Composition		Bain, Vol. II	
	Rhetoric	English writers, from Pope to Thackeray. American writers, from Franklin to Bryant. Roman literature. Lectures.	Brooke; Ward	2
	Literature			
Ancient language	Latin	Cicero's select letters	Jeans; Harkness	3
Modern language	French or German	Grammar continued. Dictation. Translation. Selections of pedagogy. Conversation. Reading. Literature of eighteenth century.	Noël et Chapsal; Aubert	3
		German literature. Translation. Selections on pedagogy. Conversation. Letter-writing.	Schlegel	3
Pedagogy	Methods	Special in (1) language. (2) Arithmetic. (3) Geography (including modeling in sand, etc.), and (4) history of United States.	Calkins; Fitch	3
	Practice	In the training department. Model lessons by critic teachers. Lessons by pupil teachers. Criticisms and discussions of lessons. Modeling and carving.		(2)
Natural science	Physical geography.	With especial view of teaching geography, geology, and zoology. Lectures.	Maury	3
Mental science	Psychology	The intellect. Elements applied to teaching. Lectures.	Janes; Sully	3
Physical science		Electricity. Lectures	Notes	2
		Second term—Fourth year.		
English	Rhetoric	Continued	Bain, Vol. II	
	Literature	English and American writers continued. Essay. Lectures.	Brooke; Ward	2
Ancient language	Latin	Horace; selections from Odes, Epistles, and Satires.	Wickham	3

[1] Mathematics the first term and physical science the second term.
[2] Every third week.

Detailed schedule of the course of study—Continued.

NORMAL COURSE—Continued.

Department.	Subject.	Topics.	Text-book.	Time.
		SENIOR—continued.		
		Second term—Fourth year—Cont'd.		
Modern language ...	French ..... or German	Grammar completed. Dictation. Translation. Selections on pedagogy. Conversation. Reading. Literature of nineteenth century.	Noël et Chapsal .. Aubert	3
		German literature. Translation. Composition. Letter-writing. Selections on pedagogy. Conversation.	Schlegel	3
Pedagogy	History	The educational reformers, Comenius, Pestalozzi, Froebel. Lectures.	.....	3
	Training ..... Practice	Moral and physical, of children ... Same as first term.	Fitch	
Natural science	Physical geography.	First term's course continued. Geology and zoology. Lectures...	Maury	3
Mental science	Psychology	Emotions and will. Applications to morals and school government. Lectures.	Janes ..... Sully	2
Physical science	.....	Electricity. Lectures	Netos	2

Drawing.—Instruction in drawing is given one hour a week in every class throughout the course. The lessons are of such a nature as to enable teachers to illustrate on the blackboard with ease and facility, and to cultivate the eye and hand with the view of preparing pupils for industrial pursuits. There is also instruction in modeling during the second and third years.

Music.—During the freshman, sophomore, and pedagogic years instruction is given in the science and art of music, including musical notation, relation of musical sounds, musical scales, musical intervals, elements of harmony, exercises in reading and writing music, and methods of teaching music.

Chorus singing in all the classes one and one-half hours a week.

All students are obliged to study Latin during the entire course. A choice is permitted of French, German, or Greek, so that, in addition to English, only two languages can be pursued. The total enrollment of the college in 1891 was 1,748 students, of whom 1,333 elected French, 574 German, and 41 Greek.

COOK COUNTY NORMAL SCHOOL, ILLINOIS.

"The Cook County Normal School has weathered many storms and has survived the test of nearly a quarter of a century," says the president of the board of education in a late report. Under the superintendence of Col. Francis W. Parker it has become, as was to be expected, a school sui generis. It will be difficult, therefore, to give a satisfactory account of it on conventional lines. Colonel Parker, as principal, occupies the chair of psychology and pedagogics. The vice-principal teaches mathematics, history of education, civics, and political economy. The other studies and exercises are provided for as follows: (*a*) History and literature; (*b*) the natural sciences; (*c*) elocution and the Delsarte system of expression; (*d*) drawing and methods in art; (*e*) physical culture; (*f*) painting, modeling, wood carving, illustrative drawing; (*g*) Sloyd and pasteboard work; (*h*) principles and methods of the kindergarten; (*i*) vocal music; (*j*) kindergarten; (*k*) geography; (*l*) curator of museum and assistant teacher of sciences; (*m*) assistant teacher of history and literature; (*n*) assistant teacher of mathematics; (*o*) assistant teacher of vocal music, penmanship, and primary methods; (*p*) librarian, secretary-treasurer, and assistant teacher of literature; (*q*) assistant teacher of language; (*r*) assistant teacher of science; (*s*) superintendent of home handwork; (*t*) assistant teacher of reading; (*u*) teacher

of taxidermy and collector for museum; (*v*) assistant teacher of elocution; (*w*) assistant teacher of elocution and reading; (*x*) manager of students' hall. The vice-principal is also principal of the practice school.

The central motive of the normal school is to prepare candidates for vacant positions as teachers in Cook County. The conditions of graduation are: "(1) Attendance for one year (forty weeks) on the professional training class; (2) satisfactory evidence of a high appreciation of the duties, responsibilities, and possibilities of the teacher's profession; (3) sufficient knowledge and skill to warrant the beginning of the work of teaching; (4) ability to control, govern, and teach a school fairly well; (5) a knowledge of the principles of education sufficient to guide the candidate to the discovery of right methods; (6) a love for children and a devotion to the work of teaching; (7) tact to adapt one's self to the circumstances and at the same time courage enough to cling to a growing ideal of the teacher's functions; (8) a close, earnest, indefatigable study of the science of education and of the subjects taught. A habit of preparing very carefully every lesson and all other work; (9) good health and an excellent character."

Graduates of a university, a college, or an accredited high school are admitted to the professional training class; also teachers of three years' successful experience holding first-grade certificates.

Ideally [says Colonel Parker] a pupil should enter the training class equipped with knowledge and skill sufficient to begin the work of learning how to teach. They should also have the mental power to study economically the laws of the mind and the principles of mental growth. Long experience has fully demonstrated that very few graduates, if any, of a four years' high-school course have this requisite knowledge, skill, or power. Four years' course in a good college should supplement the high-school course before a student enters upon professional training. It is far preferable to have a college course without professional training than to have only a high-school course with professional training. The true requirements should be a college course and professional training. But the standard of admission to a normal school is governed by circumstances which do not admit of an ideal standard. When a majority of candidates for positions as teachers attain their purpose by two years in a high school and an examination it is obvious that an ideal standard of admission to professional training would close the doors of every normal school.

The legitimate studies and work of a normal school, according to Colonel Parker, are the history of education, psychology, pedagogics or the science of education, pedagogy or the art of teaching, and practice teaching. "Theoretically it is much to be preferred that a good knowledge of the science of education should be gained before a candidate enters upon the functions of his office, but, when there is such short time for preparation and there is also a failure of mental power to grasp the principles of education, apparently the only feasible plan to pursue is to use the most efficient means to arouse a strong desire to know these principles. This is done by practice teaching."

Unprepared, desultory, fragmentary teaching in practice schools is considered to be worse than worthless to the pupils taught and profitless to the pupil teachers; consequently the school endeavors to make the practice work of great profit to the pupils taught, as well as the best possible means on the part of the pupil teachers of learning to teach. The practice school is a regular public school, belonging to and supported by the city of Chicago. It embraces the usual eight grades of a public school and is divided, for the practice teaching, into groups of pupils, from six to eight in each group. Two groups are made into a section, and two sections form a division. Each group, each section, and each division has a leader, chosen from the training class by the critic teachers. There is a regular line of promotion, measured entirely by skill in teaching, from the lowest assistant of a group to the highest assistant; from assistant to group leader, then to section leader, division leader, and lastly to special assistant in a room. The time of practice teaching is one hour each day. The primary grades have three lessons in the hour of twenty minutes each; the grammar grades have two lessons of thirty minutes each; thus when there are 40 groups, 100 different

pupil teachers can give lessons during the practice hour. The reasons given for this arrangement of groups are that the teaching of small classes is better adapted to the abilities of novices, that pupil teachers have more practice in teaching than by any other plan, and that pupils receive more individual attention.

Every third week the group leaders are moved up one group, and by this plan the successful members of the training class teach in all grades during the year. Each of the rooms of the practice school is under the direct charge of a critic teacher. The critic teachers are chosen for their knowledge and skill as teachers of their respective grades, and for their ability to teach and train pupil teachers. Each regular member of the faculty has the general supervision of the work done in the practice school in the subject which that member teaches.

The professional training class works in three divisions. The first division consists of pupils who require least help from their teachers. The third division requires the most help. Whenever a pupil of the second or third division is capable of doing the work of his division he is promoted. If a pupil of the first or second division fails hopelessly, he is demoted. When one gives evidence of incapability for the work of a teacher he is advised to withdraw.

The three divisions of this class are divided into eleven working committees each, with a chairman and vice-chairman, and to each committee is assigned by its chairman some special work, such as the preparation of maps or the construction of illustrative apparatus.[1]

NEW YORK COLLEGE FOR THE TRAINING OF TEACHERS.

The normal school in its latest and highest development may be most profitably studied in connection with the New York College for the Training of Teachers, which was chartered by the board of regents of the University of the State of New York in January, 1889. Unlike many so-called normal schools, normal colleges, and normal universities, its name strictly defines its purposes and fixes its rank. It does not propose a scheme of universal education, but simply to train for the profession of teaching those who have obtained elsewhere the elements of a liberal education. It is not a school. It is not a university. It is strictly a college; and a plan is now perfected by which it will become to all intents and purposes a department of Columbia College, under the control of Columbia College, under the control of the faculty of philosophy of that university. At the very outset the founders expressed their intention to establish a purely professional school (not a normal school "in the usual sense of that term"), in which the elements of a secondary education were not to be taught, but to be required of candidates for admission. A similar requirement is the condition of admission, at least on paper, to most of the State normal schools, but is seldom strictly enforced. Indeed, to have insisted on this password would in bygone days have closed the doors against almost every applicant, and even at present such a preliminary would prevent a large majority of those who are most in need of normal training from crossing the threshold. But while excluding secondary education as such, the New York College offers a very wide range of professional instruction—the kindergarten, the primary school, the high school, manual training, physical training, music, domestic economy, form and construction, physical and natural science, language and literature, English and Latin, as well as psychology, philosophy, and history of education, and organization of schools. It seems to have taken its motto from Terence—the reader will excuse the hackneyed quotation—"humani nihil a me alienum puto."

The history of the development of this college is extremely interesting. An association of philanthropic ladies and gentlemen of New York City had been formed in

[1] Reports of the Cook County Board of Education and the Principal of Cook County Normal School for 1890.

1885 to promote industrial education. The work of this body grew rapidly, and in 1887 it found itself unable, through lack of means and trained teachers, to answer all the demands made upon it. At this juncture the association, known as the Industrial Education Association, invited Dr. Nicholas Murray Butler, then as now professor of philosophy and pedagogy in Columbia College, to become its president. He accepted the position and began at once to organize the work so as to carry out two plans that he had long cherished—one to put the steadily growing manual-training movement upon a strictly educational basis, the other to found an institution of high grade for the professional training of teachers. The New York College for the Training of Teachers was then founded by him, and his plans were accepted by the Industrial Education Association, which thereupon dissolved, some of its members becoming trustees of the new institution. At first its means were small and its quarters cramped, and it devoted itself largely to preparing competent teachers of the several manual-training subjects. The college rapidly won the confidence of the community and of the country, and large sums of money were raised for its support and development. In two years (January 12, 1889) it was able to meet the conditions imposed by the regents of the University of the State of New York, and obtained from them a formal charter. In 1890 Dr. Butler, having accomplished the task that he had set before himself, resigned the presidency of the college in order to devote himself exclusively to the work of his Columbia professorship.

The students cover a wide geographical range. The register for 1892 contains the names of students from eighteen States, from Canada and from South America.

The habitat of the college at present is No. 9 University place, New York, formerly the location of the Union Theological Seminary; but it has already outgrown its environment, and a new site has been obtained, the gift of Mr. George W. Vanderbilt, twenty-one city lots on block bounded by One hundred and twentieth street, One hundred and twenty-first street, Amsterdam avenue and the Boulevard, opposite the location chosen for the new buildings of Columbia College. One hundred and fifty thousand dollars are in hand for the promotion of this enterprise, $60,000 pledged, and New York is asked for $450,000 more, which will doubtless be forthcoming in good time.

The public-spirited men and women who have founded and sustained this college are planning to make it yet stronger and better. * * * In the art of large giving which men and women of wealth are coming more and more to exemplify, there has been no lack of diversified experiment, from which experiment two principles, among others, have clearly emerged: First, that no form of beneficence can outrank gifts for education, for education does much to abolish the opportunity for charity, while it increases the quantity and refines the quality of life; second, that it is well to give to some educational agency with initiative in it, something which by virtue of new excellence will be widely imitated, either in generous emulation or through simple competitive sagacity. The college for training teachers has already had an influence for good on the public education of this city, State, and country. Its influence will grow in direct proportion as its faculty is increased and strengthened.[1]

Candidates for admission must be at least 18 years of age, must present a certificate of good moral character, and pass an examination in the following subjects unless exempted from examination under rules given below.

ENTRANCE EXAMINATIONS.

English language and literature.—Grammar, analysis and the writing of a composition correct in spelling, punctuation, expression, and division by paragraphs. In 1892 the subjects for composition were taken from Shakespeare's As You Like It, Longfellow's Courtship of Miles Standish, Irving's Alhambra, Addison's Sir Roger de Coverley Papers.

[1] From the New York Evening Post, April, 1892.

Mathematics.—Arithmetic, including the metric system of weights and measures, plane geometry, five books of Davies' Legendre or Wentworth's Geometry, algebra as far as quadratic equations.

Geography.—Physical and political geography, especially that of the continents of North America and Europe.

History.—General history, so much as is contained in Swinton's Outlines; United States history, so much as is contained in Johnston's History of the United States.

Physiology and hygiene.—An elementary knowledge, such as is given by any of the school text-books ordinarily used.

Drawing is not insisted on, but it is considered desirable that candidates should be able to draw intelligently a group of models and possess a general knowledge of the principles of construction and design.

Graduates of colleges and scientific schools in good standing are admitted without examination; also graduates of high schools and academies in the curriculum of which all the subjects of the entrance examination are included; and candidates who hold a college entrance certificate given by the regents of the University of the State of New York.

Students of both sexes are received on equal footing.

Departments.—The following departments are now in operation (1892):

I. Department of the history and institutes of education.
II. Department of the science and art of teaching.
III. Department of natural science.
IV. Department of mechanic arts.
V. Department of vocal music.
VI. Department of form study and drawing.
VII. Department of physical culture.
VIII. Department of domestic economy.
IX. School of observation and practice.

I. The department of the history and institutes of education offers six courses, of which the first and third are required of all students.

Course 1.—Elements of psychology, two periods each week. James's Briefer Course is used as a text-book; but the class is led to base conclusions upon the Baconian system of observation and experiment rather than upon the use of books.

Course 2.—Devoted to advanced psychology and pedagogy, two periods each week. The aim of this course is to enable students to deal with children as individuals, by the application of psychologic principles, and by simple experiments in attention, association, imagination, and discrimination.

Course 3.—Two periods each week for half a year. Studies the principles of education in the light of their development. The text-book is Quick's Educational Reformers, but references are made to works on the history of education, systematic pedagogy, general history, and periodical literature.

Course 4.—One period each week. Takes up the principles of education on the basis of Rosenkranz's Philosophy of Education and Rosmini's Method in Education, with discussions of special topics in pedagogy and psychology.

Course 5.—Two periods each week. Is occupied with the history of educational institutions, theories, methods, and individual educational leaders, with critical reading of educational classics.

Course 6.—Gives a briefer course of elements of psychology. This is a Saturday class, and gives an opportunity to teachers who are engaged in the active duties of their profession during the week to renew and extend their theoretical studies in educational psychology. In this connection opportunity is afforded to advanced students to meet for one hour each week the professors of the department, members of the faculty, instructors and resident alumni for reviews of current literature and discussion of educational topics. The subjects discussed during the year 1891–92 related to the moral development and training of children.

II. In the department of the science and art of teaching there are eight courses, which, however, are not mutually exclusive. The first and third are required of all students; the second and fourth of all who are candidates for a diploma. The work of this department is closely related to that of the preceding, inasmuch as it makes a practical application of the philosophical principles therein formulated, and shows the connection between theory and practice. Observation and practice at every step in the work of the college accompany theoretical instruction. School organization, gradation and classification, courses of school study, and the preparation of programmes belong to this department.

Course 1.—Two periods each week. Methods of teaching language, number, and geography; elementary course.

Course 2.—Two periods each week. Methods of teaching literature, geometry, and history; advanced course.

Course 3.—One period each week. Principles of teaching with special reference to the application of the psychology of the feelings and the will to school organization and discipline.

Course 4.—Five periods each week. Practice teaching.

Course 5.—A Saturday class. Methods of teaching; briefer course.

Course 6.—A Saturday class, for half the school year. Methods of teaching literature in secondary schools; study of typical authors, with discussions of methods, devices, and values.

Course 7.—A Saturday class, for half a year. Methods of teaching history in secondary schools; discussion of civil government, practical economics, and the concrete study of social problems in their relation to the work of the schools.

Course 8.—A Saturday class. Methods of teaching Latin; critical reading of typical passages from Latin authors; the essentials of etymology and syntax; prose composition and Latin rhetoric; methods in elementary work.

III. In the department of natural science the major course aims to prepare students to become—

(1) Teachers of science in State and city normal schools.

(2) Teachers of science in high schools and academies.

(3) Supervisors of elementary science instruction in all grades of public schools. Candidates for admission must show an ability to comprehend, without instruction from the college, the elements of chemistry, physics, physiology, zoology, botany, and geology, so far as they can properly be taught in the common schools. Mere text-book knowledge is not sufficient. Some reputable laboratory work showing an ability to acquire knowledge at first hand is necessary to admission.

Some of the practical problems on which students labor in this department are these: How shall science be taught in public schools where the appropriation for equipment is insufficient; how to manage where there is no laboratory and everything has to be done in the ordinary class room; how pupils in large city schools may be brought into contact with nature; how to manage the details of a laboratory; how to make experiments educative and not simply a diversion; how to reconcile an inflexible prescribed course of study with gratuitous information and illustrative experiments.

The head of the deparment and his assistants give the entire instruction in science in the school of observation and practice in the presence of the college students. Major students in this department observe this teaching at least nine periods a week during the year, making a selection, after consultation with the head of the department, from the following programme:

Chemistry, twice a week, each lesson eighty minutes.

Physics, twice a week, each lesson eighty-five minutes.

Zoology and physiology, twice a week, each lesson eighty-five minutes.

Botany and geology, twice a week, each lesson eighty-five minutes.

Nature lessons, in lower grades, once a week, each lesson thirty-five minutes.

A lecture on methods of teaching science is given once a week. Special instruction in the art of experimenting and in the construction of home-made apparatus is given once a week, and two periods a week in individual laboratory practice are required from every student in this course. A major course in science thus includes fourteen periods a week for one year, and a few weeks of practice teaching in the second year.

A minor course in science is arranged for students who desire a side light for courses in other departments of the college, or who seek preparation to teach some one science or to give object lessons in connection with the work of elementary schools. It consists of selections from the work offered in the major course.

On Saturdays, from October to Easter, a lecture on methods of teaching natural science is given to teachers of New York City and the vicinity.

IV. The department of mechanic arts offers seven courses:

Course 1.—Four periods a week of eighty-five minutes each. A course in mechanical drawing designed for students who desire a practical knowledge of drawing and for those who intend to teach drawing in grammar and high schools.

Course 2.—Two periods a week. Mechanical drawing; in advanced courses.

Course 3.—Four to ten periods a week. In woodworking; (*a*) a course in mechanical drawing and woodworking for elementary schools which can be performed in the ordinary schoolroom at any school desk; and (*b*) a course of joinery and elementary wood carving suitable for grammar and high schools.

Course 4.—Four to eight periods a week. An advanced course involving joinery, carving, turning, and pattern making.

Course 5.—A Saturday class for teachers who can not attend the regular classes; an abridgment of course 3.

Course 6.—Two periods a week. Given to the construction of simple apparatus for scientific experiments.

Course 7.—Four periods a week. Wood carving; a study in wood of some typical ancient and modern relief designs.

A conference of instructors and students in this department is held once a week to discuss important questions relating to drawing and manual training.

V. In the department of vocal music the tonic sol-fa system is employed as a means of training and developing the musical powers of the student, and also as the best medium for leading to an intelligent understanding of the staff notation. Two periods a week for one year are devoted to this study.

VI. The department of form study and drawing comprises a systematic course of study in the models and type forms given to children in the three years of the primary school, modeling in clay, elementary decoration in the arrangement of simple geometric figures, cutting these figures from colored paper and pasting them, studies belonging to the kindergarten and primary schools especially, but useful as a foundation for more advanced teaching. Students who desire to become special teachers of form should be able on entering the college to pass an examination in free-hand drawing and light and shade.

The advanced course in this department embraces constructive drawing, patterns of typical solids, decorative drawing, conventional plant forms, drawing in charcoal, examples of ornaments in water colors, study of the schools of historic ornament, and principles of design. Throughout the course it is steadily kept in view that the purpose is not to make artists, but to train students to become teachers of drawing. The time devoted to this work is four periods a week for one year.

VIII. The department of domestic economy is maintained as a part of the manual-training system of the college. The major course covers two years, the first year being devoted to psychology and methods of teaching (six periods a week), and chemistry and physiology with laboratory work (twelve periods a week). The second year gives four periods a week to physics and household hygiene, and fifteen periods a week to cooking, sewing, and practice teaching.

It will be noticed that the same professional training is given in this department as in other departments of the college. After attending lectures on psychology and methods of teaching, the student in the second year teaches classes in the model school, under the supervision of the professor of science and art of teaching, before teaching classes in cooking and sewing. By the study of physics and chemistry in connection with domestic economy the student acquires habits of close observation and careful experimenting and learns how to apply scientific methods to kitchen work. The course of six periods a week for one year includes practice in all branches of cookery; but more attention is given to economical and wholesome cooking than to the preparation of elaborate dishes. Students learn to operate with coal, gasoline, and kerosene, as well as with gas. In all the processes the aim is to study the conditions and learn to control them until uniform results are obtained.

Two periods a week are given to sewing—instructions in plain hand sewing, making patterns, study of textile fabrics and their manufacture, observation of sewing lessons given by an expert teacher, and practice teaching.

An elementary course in cooking or sewing may be elected by regular students who desire to equip themselves as broadly as possible for general school work.

IX. The Horace Mann School is related to the New York College for the Training of Teachers as its school of observation and practice. In this department every stage in the school life of a child, from the kindergarten through the high school, is represented, and the complete curriculum may be studied as one organic whole. The proper adaptation and adjustment of the school of theory to the school of practice has long been felt to be the crucial task in the arrangement of the normal-school curriculum. So difficult has been this problem that some schools have never attempted the solution; some have made the attempt and have abandoned it; some have accomplished the feat—on paper; some have established a school of practice without observation, and some a school of observation without practice; while some are still conscientiously strugggling with the experiment, and realizing that the "school of observation and practice" is like a loose tooth, more noticed for the pain it creates than for the service it renders. The New York College seems to have succeeded in solving the difficult problem. It has reversed the usual conditions, and in place of instruction with incidental training, it gives training with incidental instruction. In many normal schools, though the number is growing smaller, the students consider every hour not given to class recitations as so much time lost; but in schools like the New York College the time given to observation and practical teaching is felt to be all gain.

Students receive their practical training in the several grades of the Horace Mann School—the kindergarten, the intermediate school, the grammar school, and the high school. None are admitted to the kindergarten except such as present a high-school certificate, or its equivalent, or pass the entrance examination to the college. The course covers two years, and includes the theory of Froebel's system, psychology, kindergarten gifts and occupations, songs and games, vocal music by the tonic sol-fa method, form study and drawing, clay modeling and color, physical culture, and practice teaching.

Degrees.—It was formerly intended that the full course of the college should lead up to the degree of bachelor of pedagogy, but this degree has never been given by the college, and, under the conditions on which Columbia takes charge of it, probably never will be. The college diploma is conferred upon such students as have completed a course of study covering two years, as follows:

Required:	Periods.
Department of history and institutes of education	8
Department of science and art of teaching	11
Department of kindergarten, Course I	2
Department of form study and drawing, Course I	1
Department of physical training	4

Elective:

A major course or minor courses.

The college certificate is conferred upon such qualified candidates as have completed a course of study covering one year, as follows:

Required:	Periods.
Department of history and institutes of education	4
Department of science and art of teaching	2
Department of physical culture	2
Elective:	
In any department a major course together with such minor courses as will suffice to make up the required amount of work	14
Total	22

In the session of 1891–92 there were in attendance 119 regular students and 96 special, with 264 pupils in the school of observation and practice. For their instruction and government there were 11 professors, 2 lecturers, and 21 instructors and other officers.[1]

The New York College for the Training of Teachers (says the New York Evening Post, in April, 1892) is not to be considered as an individual institution whose chief influence is confined to its own students and to the schools that these students enter as teachers, although it has already drawn its students from 18 States, and numbers among them both experienced teachers and graduates of colleges. This college is to be regarded as a type, an object lesson, and an experiment station. There are not lacking evidences that by its aggressive work it has helped to elevate standards in many quarters and to stimulate and guide the progress of educational reform.

Applying the principle of extension, the college has organized classes for the study of the kindergarten system in New York and in neighboring cities and towns and has sent specialists in manual training to numerous schools in the vicinity, so that more than 2,000 pupils are now under this instruction in 17 places within 50 miles of this city. By this means and through correspondence and independent investigation, the principles and methods of the college are being diffused over the country. The interest and approbation with which its development is watched by eminent educators are signified by the strongest testimony from the highest sources.[2]

IX.

PRIVATE NORMAL SCHOOLS.

The Report of the Commissioner of Education for the year 1888–89, page 961, contains the statistics of 46 private normal schools, distributed as follows:

Arkansas, California, Kansas, Louisiana, Michigan, Missouri, Pennsylvania, Tennessee, Texas, Washington, West Virginia, each 1	11
Alabama, Georgia, Kentucky, Nebraska, North Carolina, Wisconsin, each 2	12
Mississippi, South Carolina, each 3	6
Illinois, Indiana, Ohio, each 4	12
Iowa	5
Total	46

Several of these have already been noticed in these pages under the caption of "Colored Normal Schools."

The number of normal students, "pupils in the science and art of teaching," is given in the report as 4,487, and it is to be noted that about half of these are found in two schools, one in Indiana and the other in Iowa.

Of the 46 schools, 20 report no graduates for the year 1888–89; the remaining 26 report 315 graduates. The number of graduates for that year is, therefore, 7 per

[1] New York College for the Training of Teachers, Circular of Information, 1892–93. Personal observation.

[2] New York Tribune, April 17, 1892.

cent of the whole number of students in attendance, or, rather, the whole number enrolled.

One of these schools was opened in 1833; 5 between 1865 and 1869 (both inclusive); 16 between 1870 and 1879, and 24 between 1880 and 1888.

The most prominent must be regarded simply as business enterprises, and not as normal schools properly so called. They propose to fill a known want; they are conducted on business principles, and should be judged by business standards. They receive all who apply for admission, and base their claims to public patronage on the ground that they give good value for the money received. A fair idea of their business methods may be obtained from a perusal of their catalogues and circulars. A few specimens are given, the names being withheld for obvious reasons:

A. "Our courses of study are the best arranged and best carried out of any private normal in this country." "They are especially adapted to the preparation of men and women for entering the study of law, medicine, the ministry, and editorial life." "No more desirable location for a school can be found anywhere." "There are many cultivated people who are prejudiced against private normals. This is very natural when we consider the number and character of many schools of this kind." "In making your decision examine courses of study and decide at once against any school that promises to do thirty weeks' work in ten weeks." "The men who have been in the institution since the present management took hold of it are teachers thoroughly prepared for their work in point of scholarship. In no sense were they place hunters. All were successful teachers." "The school is unexcelled in its mathematical, language, philosophical, chemical, and pedagogical departments, as compared with similar institutions. Our students who have attended elsewhere are foremost in their praise of this institution." "If you complete our course you will be well fitted for any position in life." "We have better buildings, better laboratory, and better location than our competitors. Our courses are more thoroughly carried out. We advertise nothing extravagantly. We claim that no normal school in the United States has a stronger course than ours, and that no school can offer as good advantages at so low a price. Students are allowed to enter any of the courses at any place, with the understanding that they are liable to be put back if the faculty decides they are not qualified to go on. We say come, and if, after you have given us a trial, you don't like the school, you shall have your money."

This school has 13 teachers in addition to the president, and advertises a preparatory course, a teachers' course, one year; a scientific course, two years; a classical course, three years; with a musical department, a commercial department, a fine-art department, and a phonographic department. The number of students is between 400 and 500.

B. "The location is one of the best in the United States." "No place could be found anywhere better suited for being the seat of a flourishing school than 'B.'" "It is noted for its remarkably healthy climate. During all the history of the school there have been but two deaths among the students. Many who come here weak and sickly go away strong and well." "The building is not surpassed by any normal school in the West." "An education can be secured here in three years which will better fit a student for success in life than is generally received from colleges in six years." "The teachers' course as presented in this school is one of the most complete courses of study offered by any school." "Not only does this course prepare teachers for their great work, but it gives all who take it such thorough and practical training in the various branches, such honesty, genuineness, and individuality in his [*sic*] work, such strength and force of character, and such mental discipline as will enable him to take up any line and pursue it successfully." "Those completing this course in a satisfactory manner will be awarded a handsome diploma." "The faculty are all specially qualified for their distinctive lines of work. They are known to be ladies and gentlemen of the highest moral character." "Pupils are

admitted to the school without examination and take any classes that they feel able to take." "Its name and influence is always a great aid to its students for securing good paying positions."

This school offers a preparatory course, a teachers' course, a scientific course, a classical course, a business course, and a shorthand and typewriting course. There are 9 teachers, with an enrollment of about 250 students. The school has changed proprietors five times in ten years.

C is a stupendous institution and counts its annual enrollment by the thousand. "It is practical and meets the demands of the times." "It is the best established, most widely known independent normal school in the West." "Its reputation is sufficient to secure ready employment for its graduates, and more students of 'C' are filling responsible positions than from any other." "The expenses at this school are less than at most schools." "We do as good work in every way as schools that charge twice and thrice as much, and incomparably more than most schools whose expenses are about the same." "Our graduates have made from $4,000 to $12,000 in the length of time that would have elapsed after they had completed the work here and before they had completed the same work in other colleges that do their work more slowly, but not more thoroughly than ours."

"No examinations are required for admission to any course or department in the college." "You can come at any time and find just such classes as you desire."

"We have the following well-equipped departments with an excellent faculty for each department: Classical, scientific, normal, common school, teachers' professional, review, elocutionary, civil engineering, business, pen art, phonographic, telegraphic, musical (piano, voice, organ, including pipe organ, guitar, violin, band, and orchestra), art, physical training. The members of the faculty are specialists in their respective departments."

"You can make no mistake by attending 'C.' If not as represented in this announcement, money will be refunded." "Don't pay extravagant school bills, but come to the cheapest, best school in the country." "Our students almost invariably leave school in better health than when they enter."

D. "'D' is the best place to obtain an education. Every year it grows better. Its methods are the best; its instructors are experienced, cultured, and successful; its expenses are as low as is consistent with proper living and instruction." "Now is the accepted time. The 'D' school offers a rare chance to obtain an excellent education. The time and money will be well spent, and we guarantee that you can not find elsewhere better inducements." "Only teachers of ability and successful experience are employed. We confidently assert that no similar institution can furnish instruction superior to that afforded by 'D.' We know that our methods are the best, the most conformable to the fundamental laws of education, and hence the most successful that can be employed."

"*We advertise nothing that we do not have.*" [The italics are in the original.]

"'D' invites all classes of pupils. Teachers, pupils from the common schools, young men and women preparing for business pursuits, or wishing to acquire a musical education, high-school graduates—all classes attend the normal at 'D,' and find work suited to their needs. No young man or woman, however backward in his studies, need feel any hesitation in enrolling among its pupils, as it adapts its work in the common branches largely to that class of students."

"No examinations are required to enter 'D.' Students upon entering will be assigned rank in the course they wish to pursue, according to previous preparation. Our work is so arranged that those entering in the middle of a term can find just such classes as they desire."

'D' has five teachers besides the principal. In the "literary department" it presents three courses—preparatory, teachers' advanced, and scientific. The following is the curriculum of the teachers' advanced course :

First term.—Natural philosophy, algebra, didactics, zoology, rhetoric, elocution.

Second term.—Natural philosophy, algebra, history of education, general history, elocution, rhetoric, and composition.

Third term.—General history, algebra, mental philosophy, plane geometry, vocal music.

Fourth term.—Botany, algebra, English and American literature, didactics, oration.

Ten weeks constitute a term.

E. "Our facilities are the very best, and our rates defy competition." "In any case where pupils hesitate about coming to us on the ground that they are not sufficiently well advanced, we would like to say that such persons will be more highly benefited than others. The majority of our young people are of moderate scholarship. All pupils of whatever grade can be accommodated." "The school employs only the best men and women as teachers in every department." "The classes are so arranged that students who may not be able to complete a full course in any department may enter at any time, study what is most desirable, and get full credit for what they accomplish." "Pupils can enter at any time with the assurance of finding classes suited to their needs."

"The managers of teachers' agencies tell us repeatedly that they can locate our graduates and undergraduates with much less difficulty than pupils from other sections." "Our graduates and undergraduates have passed the severest tests and always with the highest credit. They have met in closest competition the representatives of the best schools for positions in all walks of life, and have invariably sustained themselves. So true is this that the fact has become widely known, and the demand upon us for trained teachers is much greater than we can meet. Our best pupils are everywhere commanding higher salaries than others for the same grade of work."

"The young people trained in 'E' secure their positions more readily and give much better satisfaction than those trained in other sections."

"*Teachers' course.*—Ten weeks, arithmetic, geography, English grammar, theory and practice, spelling; ten weeks, physiology, mental science, history, theory and practice, penmanship."

The number of students registered in this course (catalogue of 1887) is 152.

The other courses and departments advertised are preparatory, engineering, commercial, music, scientific, elocution, and classic. The number of teachers is 12.

F is a "County normal school;" that is, an educational enterprise on business principles, having close relations with the school administration of the county. It was opened in 1870, and in 1892 had 318 pupils, of whom 248 were "normal," 56 in the high school, and 14 preparatory. The normal course extends through two years. The high school covers four. The normal studies of the first year are arithmetic, grammar, geography, history, reading, spelling, and physiology; art of school management, algebra, civil government, bookkeeping, Latin (elective), Shakespeare. The additional studies in the second year are geometry, literature, rhetoric, natural philosophy, botany, and mental philosophy.

"Before the establishment of this school many parents who wished to educate their children and who were not able to send them to college or State normal schools were compelled to keep them at home and confine their education to the narrow limits the district school then afforded. But this institution now offers them the same advantages as the State normal schools, with only half the expense. The teachers who have gone forth from this school have rendered universal satisfaction, and they have won for themselves and for the school at which they received their training a flattering reputation. Our teachers are in demand and are commanding the best positions and highest salaries paid in the county. The school boards in a number of townships have paid the school the high compliment of refusing to hire any teachers but those it has prepared. During the past year [1892] every township

was represented in the school, and more than three-fourths of the whole number of teachers in the county were in attendance. This class [class in theory and practice of teaching] is under the supervision of the county superintendent, who is careful to make his instruction so effectual that the number of failures in our common schools may be brought down to the lowest number possible. Connected with the normal school is a model school of 50 pupils. Students are required to teach and criticise in this department until they are perfectly familiar with the best methods of teaching primary schools."

F is one of the youngest of the "independent normals." It is a "normal university." It presents a full assortment of courses, schools, and colleges, some in præsenti, some in futuro—a preparatory school, a school of elocution, a school of fine arts, a school of music, a school of phonography and typewriting, a school of telegraphy, a college of teachers, a college of science, a college of literature or modern languages, a college of philosophy, a college of liberal arts, a college of business, a college of engineering and surveying, and colleges of law and medicine. The object of the college of teachers is to prepare young men and women thoroughly and speedily to teach a country school and all classes of a graded school up to the high school, and to pass the requisite county examinations for a certificate. The time required for this preparation is "two or three terms of eight weeks each." We learn from the catalogue (1890) that "F" "is authorized by law to issue diplomas and confer degrees usually conferred by educational institutions;" that it does not "depend on examinations, quarterly or annual, as giving any desirable or healthy stimulus to vigorous effort; that "here there is nothing to attract the attention from his work, and [he] has no less than twelve hours a day to devote to study," and that "all the teachers employed are of recognized ability."

The following gives the courses of study in probably the largest independent normal school in the United States. It will be noticed that the normal course proper occupies but one year of forty-eight weeks:

Courses of study.

Common-school course:					
First term, 10 weeks.	Arithmetic.	Geography and map drawing.	Grammar.	Reading and orthography.	Penmanship.
Second term, 10 weeks.	Arithmetic.	Physical geography.	Grammar and analysis.	Reading.	Penmanship.
Third term, 10 weeks.	Arithmetic.	Physiology.	Composition.	Vocal music.	Drawing.
Fourth term, 10 weeks.	Algebra.	Physiology.	Rhetoric.	United States history.	Didactics.
Fifth term, 8 weeks.	Algebra.	Review.	Rhetoric.	Civil government.	Didactics.
Normal course:					
First term, 10 weeks.	Arithmetic.	Geography.	Grammar and analysis.	Reading and orthography.	Penmanship.
Second term, 10 weeks.	Algebra.	Geology.	Rhetoric.	Reading.	Vocal music.
Third term, 10 weeks.	Algebra.	Anatomy and physiology.	Rhetoric.	Civil government and United States history.	Drawing.
Fourth term, 10 weeks.	Algebra.	Botany.	Latin grammar or German.	English literature.	Didactics.
Fifth term, 8 weeks.	Review.	Philosophy.	Latin reader or German.	American literature.	Didactics.
Scientific course:					
First term, 10 weeks.	Geometry.	Geology.	Cæsar or German.	English history.	Penmanship.
Second term, 10 weeks.	Trigonometry.	Chemistry.	Cæsar or German.	English literature.	Vocal music.
Third term, 10 weeks.	Analytical Geometry.	Physics.	Virgil or Mary Stuart.	English literature.	Drawing.
Fourth term, 10 weeks.	Astronomy.	Botany.	Virgil or Wilhelm Tell.	American literature.	Didactics.
Fifth term, 8 weeks.	Surveying.	Zoology.	Cicero or Wilhelm Tell.	Political economy.	Didactics.
Classic course:					
First term, 10 weeks.	Psychology.	Sallust.	Greek grammar.	Chaucer.	Public lectures at the close of each term.
Second term, 10 weeks.	Logic.	Cicero.	Homer.	Spencer.	
Third term, 10 weeks.	Ethics and æsthetics.	Horace.	Sophocles.	Milton.	
Fourth term, 10 weeks.	Political economy.	Tacitus.	Æschylus.	Shakespeare.	
Fifth term, 8 weeks.	Literary criticism.	Juvenal.	Demosthenes.	Shakespeare.	
Business course:					
First term, 10 weeks.	Bookkeeping.	Arithmetic.	English.	Letter writing.	Penmanship.
Second term, 10 weeks.	Actual business.	Commercial arithmetic.	Penmanship.	Reading and orthography.	Penmanship.
Third term, 10 weeks.	Actual business.	Commercial law.	Rapid addition, etc.	Penmanship.	Debating.
Civil engineering course:					
First term.	Higher algebra.	Geometry.	Geology.	Grammar.	Geometrical drawing.
Second term.	Trigonometry.	Land surveying.	Theoretical chemistry.	English literature.	Perspective.
Third term.	Analytics.	Material and bridges.	Physics.	English literature.	Projection drawing.
Fourth term.	Calculus.	Railroad engineering.	Botany.	American literature.	Penmanship.
Fifth term.	Review.	Leveling and city engineering.		Rhetoric.	Lettering.

CATHOLIC NORMAL SCHOOL OF THE HOLY FAMILY AND PIO NONO COLLEGE.

This school is located at St. Francis, 2 miles south of the city limits of Milwaukee, near Lake Michigan. It was founded in 1870 by Dr. Joseph Satzmann. The aim of the instruction given in the normal school, as stated in the catalogue of 1890, is (1) to ground the student in the knowledge and practice of Catholic faith; (2) to provide means of acquiring useful general knowledge; (3) to give such specific training as will best fit for work in the schoolroom. Students who complete the normal course of four years and otherwise show fitness to be intrusted with the instruction of children receive a diploma.

The following is the course of study:

First year.—Christian doctrine; Bible history; English; German; arithmetic; geography; penmanship; drawing; music.

Second year.—Christian doctrine; Bible history; English; German; arithmetic; United States history and civil government; physiology; drawing; music.

Third year.—Christian doctrine; Bible history; English; German; general history; natural science; algebra; elocution; pedagogy; music.

Fourth year.—Liturgy; general and ecclesiastical history; literature; English; German; natural science; geometry; pedagogy; music.

The aim of the work in pedagogy is to familiarize the student with the best educational methods of the present day. A course in psychology and science of education forms the basis of the work. The organization, classification, and management of numbers, the requirements in a course of study adapted to the capacity and wants of children in the parish schools, the relation of the teacher to the pastor and to the congregation, and his duties and responsibilities as a citizen are discussed in lectures, supplemented by a text-book.

This is one of the few normal schools in the United States open to young men exclusively. The register for 1889–90 contains the names of thirty-two normal students.[1]

---

[1] Catalogue of the Catholic Normal School of the Holy Family and Pio Nono College, St. Francis, Milwaukee County, Wis., 1889–90.

CHAPTER XLIX.

NECROLOGY FOR 1898.

AMERICAN.

Abbot, Levi, in Hollis, N. H., Mar. 11; b. in Wilton, N. H., May 28, 1818; graduated at Yale University in 1840; taught in Alexandria, Va., 1843–49; studied law at Harvard Law School, and was admitted to New Hampshire bar. Preferring teaching, in 1854 he went to Newark, N. J., first as teacher of classics in the Wesleyan Institute, later in an English and classical school of his own. In 1862 he removed to Hollis, where he was superintendent of schools until his death.

Andrews, Israel W., in Danvers, Mass., Nov. 24; b. there July 1, 1820; left penniless by his father's death, he gained his education by hard work, studying at the Danvers public school, Mr. Alanson Valentine's private school, North Hampton (N. H.) Academy, Topsfield (Mass.) Academy, and later took a course at the classical school in Danvers. He was always prominent in the affairs of his town, and for nearly forty years was on its school board.

Andrews, Rev. Mark S., D. D., in Mobile, Ala., May 18; b. in Oglethorpe, Ga., Feb. 23, 1826; graduated at Emory College; taught several years, read law, but entered the ministry. In 1855, as agent, he raised the money to build the Tuscaloosa Female College, and filled a chair in that institution the following year. The remainder of his life was spent in the ministry.

Apple, Rev. Dr. Thomas, at Lancaster, Pa., in Sept., aged 68 years; professor of church history and New Testament exegesis in the Reformed Theological Seminary, at Lancaster, Pa.

Archer, James, in Jefferson County, Miss., Dec. 30; b. in Harford County, Md., Dec. 23, 1811; graduated at Yale University in 1830; was a planter up to the civil war and afterwards a teacher.

Austin, Edward, of Boston, Mass. He bequeathed $500,000 to Harvard University, $400,000 to Massachusetts Institute of Technology, $30,000 to Radcliffe College, $30,000 to Roanoke College—in each instance the interest to be used to aid needy and meritorious students and teachers—$10,000 to the Harvard Bacteriological Laboratory.

Ayer, Josephine Mellin Southwick, in Paris, France, Jan. 3; b. in Medway, Mass., Dec. 15, 1855; came in possession of great wealth at the death of her husband, John C. Ayer, the chemist; aided a great number of struggling American artists and singers. She gave $50,000 for a clinical laboratory in Pennsylvania Hospital in Philadelphia, and $100,000 to the founding of a women's and children's home in Lowell, Mass.

Bailey, Chancellor, in Milldale, Va., May 11, aged 65 years; a native of Culpeper County, Va.; in business in Philadelphia; served in the Confederate army; a member of the Virginia legislature; for twelve years superintendent of Spottsylvania County, Va., schools.

Barclay, Thomas Dougall, in Kent, Conn., July 30; b. in York, N. Y., June 5, 1846; graduated at Monmouth College in 1867; was principal of academy, Walton, N. Y., taught in Kent, Conn., and was principal of academy, Gilbertsville, N. Y. The rest of his life was occupied in the ministry.

Bartlett, Rev. Samuel Colcord, D. D., LL. D., in Hanover, N. H., Nov. 16; b. in Salisbury, N. H., Nov. 25, 1817; fitted for college at Pinkerton Academy; graduated at Dartmouth College in 1836, and at the Andover Theological Seminary in 1842; principal Caledonia Grammar School, Peacham, Vt., 1836–38; tutor at Dartmouth College, 1838–39; pastor at Monson, Mass., 1843–46; professor intellectual philosophy and rhetoric at Western Reserve College, 1846–52; pastor Manchester, N. H., 1852–57, and at New England Church, Chicago, 1857–59; professor of Biblical literature, Chicago Theological Seminary, 1858–77; president Dartmouth College, 1877–92; and lecturer on the relation of the Bible to science and history and instructor in natural theology and evidences of Christianity, 1892–98. Dr. Bartlett was a large contributor to literature, both in periodicals and books. His work for Dartmouth College and Chicago Theological Seminary can not be overestimated. He was a Biblical scholar of eminence.

Beidler, Jacob, in Chicago, Ill., Mar. 15; b. in Bedminster, Pa., Dec. 20, 1815; acquired a district-school education; learned the carpentry and cabinetmaking trades; attained great financial success. Among the most important of his numerous public benefactions, always very quietly bestowed, were large endowments to Lake Forest University.

Bennett, Edmund Hatch, LL. D., in Boston, Mass., Jan. 2; b. in Manchester, Vt., Apr. 6, 1824; graduate of the University of Vermont in 1843; was admitted to the bar in 1847. He practiced his profession in Taunton, Mass., for a number of years, being mayor of that city 1865–67; judge of probate and insolvency of Bristol County, 1858–83. From 1865–71 he lectured at the Harvard Law School, and from the latter date was professor and dean of the Boston University Law School. He edited a large number of important law works.

Bennett, Joseph M., in Philadelphia, Pa., Sept. 29; b. in Juliustown, N. J., Aug. 16, 1816. He was engaged in the clothing business for a number of years in Philadelphia. Among his large benefactions was one of $500,000 to the college for girls in the University of Pennsylvania and another sum to the deaf and dumb institute.

Betts, George Frederic, in New York City, Jan. 18; b. in Newburgh, N. Y., June 14, 1824; graduated at Williams College in 1844; studied law, but failing health compelled him to forego its active practice, and he was clerk of the United States district court for nearly twenty years. He was actively connected with many philanthropic and charitable enterprises, being trustee for many years of the New York Institution for the Blind and the Five Points House of Industry.

Bissel, Wm. Church, in Humboldt, Nebr., Apr. 11; b. in Aurora, Ohio, June 8, 1810; graduated at Yale Divinity School, he turned to teaching as a profession. He taught near Lexington, Ky., 1837–41; in a young ladies' seminary at Ripley, Ohio, 1841–51; in eastern Illinois, 1851–68, and later at Humboldt, Nebr.

Blackmar, Edwin, in Newark, N. Y., Feb. 21; b. in Freehold, N. Y., Nov. 14, 1823; graduated at Union College in 1845; taught a number of years and then engaged in business.

Booth, Henry, in Minden, Nebr., Apr. 29; b. in Roxbury, Conn., Aug. 19, 1818; graduated at Yale University in 1840; taught for a year in Wellsboro, Pa.; graduated at Yale Law School in 1844; practiced that profession in Towanda, Pa., and Poughkeepsie, N. Y., and for two years had charge of the law department of the State and National Law School; assisted in organizing and had principal charge until 1870 of the law department of University of Chicago; was a judge of circuit court of Cook County, 1870–79, but still continued dean of the law school.

Bowker, Mrs. Sarah Lamson, in Newton, Mass., July 27; well known as a philanthropist. She gave to education two buildings bearing her name—one in Bombay, India, to the American Mission School, and the other to the American School for Girls, in Constantinople.

Brice, Calvin Stewart, in New York, Dec. 15; b. in Denmark, Ohio, Sept. 17, 1845; graduated at Miami University; served in the Army during the civil war; studied law at Ann Arbor; became prominent in railroad and financial circles, in association with Gen. Samuel Thomas; was United States Senator one term. He began his career teaching school. A scholarship in Marietta College is among his benefactions, the most of which were made to his alma mater.

Briggs, William Allen, in Providence, R. I., Jan. 12; b. in Pittsfield, Mass., July 12, 1834; graduated at Williams College in 1860; studied theology at Madison University; was engaged in ministerial work a large share of his life; was at one time superintendent of schools at Cranston, and was three times elected to the school board.

Bristow, George F., in New York City, Dec. 13; b. in 1824; for nearly fifty years was teacher of music in New York public schools; author of several musical compositions and member of a number of musical societies.

Brooks, Nathan Cavington, M. A., in Philadelphia, Pa., Oct. 3; b. in Cecil County, Md., Aug. 12, 1809; was educated at West Nottingham Academy and at St. John's College, Annapolis, Md.; was principal of Franklin Academy in 1831–34; next of the Brookville Academy; was editor of the American Museum; was elected principal, in 1839, of the Baltimore High School; attempted to organize, in 1848, the Baltimore Female College, and published a series of books of the classics and a history of the Mexican war.

Brooks, Wm. M., A. B., in Lincoln College, North Carolina, Dec. 15; b. Dec. 23, 1833; graduated at University of North Carolina in 1860; taught in North Carolina, South Carolina, and Mississippi.

Brown, Leroy D., in San Luis Obispo, Cal., Jan. 13; was commissioner of common schools for the State of Ohio for one term, president of University of Nevada, and superintendent of public schools at Los Angeles, Cal.

Bruce, Blanch K., in Washington, D. C., Mar. 17; b. a slave in Prince Edward County, Va., Mar. 1, 1841; removed to Mississippi with his master shortly before the civil war, and at its outbreak went to Hannibal, Mo., where he organized and conducted the first school in that region exclusively for negroes; acquiring a little money, he pursued his studies at Oberlin, but was unable to graduate; returned to Mississippi and became a planter, and at the same time entered politics. He filled the offices of sergeant-at-arms of the State senate; assessor, collector, sheriff, and superintendent of education for his county, and commissioner for the second levee district; was United States Senator 1875–1881, and was register of deeds during the Garfield-Arthur term, and President McKinley appointed him, in 1897, Register of the Treasury.

Brunot, Felix R., in Allegheny, Pa., May 10; b. in Newport, Ky., Feb. 7, 1820; graduated at Jefferson College at Canonsburg, Pa., and became a civil engineer; was engaged at Rock Island and Camden, Ill.; came to Pittsburg and engaged in steel manufacturing; performed an inestimable amount of relief work during the civil war; was president of the Indian Commission and of the National Reform Association, and at his death gave to philanthropy $237,000, of which Western Pennsylvania University received $30,000, Divinity School of the Protestant Episcopal Church $30,000, and the Evangelical Education Society of the Protestant Episcopal Church $10,000.

Buckingham, Rev. Samuel Giles, D. D., in Springfield, Mass., July; b. in Lebanon, Conn., Nov. 18, 1812; fitted for college at Plainfield Academy; graduated at Yale University in 1833, and at Yale Theological Seminary in 1836; pastor Millbury, Conn., 1836–46; Springfield, Mass., 1847–98; trustee of Williston Seminary forty years; member of Springfield school committee many years.

BURNHAM, BENJAMIN FRANKLIN, in Boston, Mass., May 21; b. in Groton, Vt., Nov. 30, 1830; graduated at Wesleyan University in 1852 and was admitted to the bar in Illinois in 1857; enlisting in 1864, he was detailed as assistant superintendent of education of freedmen in Louisiana. Subsequently he was detailed to the Freedmen's Bureau to establish schools among the negroes, and while thus engaged was mobbed in Monroe, La. He came to Boston in 1867, where he was an associate justice of the South Boston court. He prepared several digests and legal works and wrote several theological works; also treatises on chess.

BURT, HANNAH, gave to the Presbyterian board of aid for colleges and academies and Presbyterian boards of home and foreign missions the reversion of $15,000, in equal parts.

BUSH, Prof. GEORGE GARY, Ph. D., in Malden, Mass., Oct. 15; b. in Turin, N. Y., Mar. 19, 1843; fitted for college at Casenovia Seminary and graduated at Wesleyan University in 1866; was either principal or superintendent of schools for eight years; professor of Greek and Latin in the seminary at Montpelier, Vt.; studied abroad; filled the Latin chair at Middlebury for a time; was a frequent contributor to periodicals.

BUSHNELL, GEORGE, D. D., in New Haven, Conn., Apr. 5; b. in Washington, Conn., Dec. 13, 1818; graduated at Yale University in 1842, and at the Yale Divinity School in 1846; occupied pastorates in Worcester, Mass., Waterbury, Conn., and Beloit, Wis. He taught immediately upon his graduation from college, and from 1888 was a trustee of Yale.

CAMPBELL, JAMES ROBINSON, in Woodstock, Md., May 16; b. in Seharunpoor, North India, Feb. 18, 1840; graduated at Williams College in 1862; studied theology at Princeton, N. J.; was instructor in the New York City Institution for the Deaf and Dumb; was principal of Freehold Institute in Monmouth County, N. J. The larger part of his life was spent in the ministry.

CARPENTER, Gov. CYRUS C., in Fort Dodge, Iowa, May 29; b. in Susquehanna County, Pa., in 1829; was left a penniless orphan at 10 years of age; picked up a district school education; apprenticed himself to a tailor; removed to Iowa in 1854; engaged in surveying Government lands; taught the first school in Fort Dodge; was elected to the legislature; served through the civil war, and was governor of Iowa 1872–76.

CARTLAND, JOSEPH, in Newburyport, Mass., June 1; b. in Lee, N. H., in 1810; for many years was superintendent of Haverford Friends' College, Pennsylvania, and with his wife was joint principal of the Friends' school at Providence, R. I.

CATTELL, WILLIAM CASSIDY, D. D., LL. D., in Philadelphia, Pa., Feb. 11; b. in Salem, N. J., Aug. 30, 1827; graduated at College of New Jersey, Princeton, in 1848 and at Princeton Theological Seminary in 1852; took a post-graduate course there; was assistant principal of Edgehill Academy at Princeton, 1853–55; occupied the chair of Latin and Greek in Lafayette College, Easton, Pa., 1855–60; was pastor of Pine Street Church in Harrisburg, Pa., 1860–63; and was president of Lafayette College, 1863–83. Through his efforts over $1,000,000 was contributed to the institution, and the grounds, buildings, and equipment largely increased. During his incumbency of the corresponding secretaryship of the Presbyterian board of relief for disabled ministers and the widows and orphans of deceased ministers of the Presbyterian Church, his efforts increased its endowment by $1,000,000 and the annual income from $105,000 to $237,000.

CHASE, Dr. A. F., at Kents Hill, Me., Oct. 22; b. in Woodstock, Me., Oct. 26, 1842; graduated at Wesleyan University in 1869 with the highest honors; taught in Wilbraham, Mass., Academy, 1869–71; occupied the chair of mathematics and English literature in the Maine Wesleyan Seminary and Female College at Kents Hill, 1871–83; was principal of the high school, Millbury, Mass., 1883–84; president of the East Maine Conference Seminary, 1884–96; and from the last date until his death occupied the same position in the seminary and college at Kents Hill.

CHRISTIE, WILLIAM M., in Ottawa, Canada, Feb. 13; b. in Edinburgh, Scotland, July 23, 1820; graduated at Union College in 1845; studied theology under the Flamboro U. P. Presbytery, Canada; he preached in Chippewa, 1849–64, and in Beachburg until 1874, when he went to Ottawa and did missionary work until his death. KANNEGIESSER, K. ERWIN, in Cassel, Germany, Mar. 8; was privy councilor of state schools; was author of articles on supplementary education.

KRAMER, in Germany, Bingen on the Rhine, Mar. 25; was district school inspector.

LANGE, RUDOLF, Feb. 4; was a normal-school teacher in Weissenfels, Germany, and a composer of church and school music.

LANGE, Dr. THEODOR, Feb. 21; was school principal in Clendon, near Berlin, Germany.

LATENDORF, Dr. J. FR. TH., May 1; was head master in gymnasium at Schwerin, Germany; specialist in history of literature.

LATTMANN, Dr. JULIUS, at Göttingen, Germany, Aug. 19; was school councilor; author of Latin and Greek text-books.

LIEZEN-MAYER, ALEXANDER VON, a German painter; in Munich, Feb. 19; b. in Raab, Hungary, Jan., 1839; in 1880 was director in the School of Art; a professor in the Munich Academy in 1883; a member of Vienna Academy in 1887.

MADRAZO, FEDERIGO, a Spanish painter; in Madrid, Aug.; b. in Rome in 1815; was appointed court painter at Madrid; was director of Madrid Academy of Fine Arts.

MARCO, FERDINAND, at Branchstein, Germany, Aug. 31; was inspector of gymnastics.

MASCHER, Dr. H. A., at Hörde, Westphalia, Germany, Aug. 24; mayor of city of Hamm; author of pedagogical books and compiler of laws.

NEUENSCHWENDER, SAMUEL, at Thun, Switzerland, July 2; music teacher and popular composer.

REUTER, Dr. W., Jan. 9; was normal-school teacher in Boppard, Germany; author of a history of literature.

RIBBACK, Dr. OTTO, at Erfurt, Germany, July 18; was professor of philosophy in Berne, Basel, Kiel, Heidelberg, and Leipzig.

RIVIER, ALPHONSE PIERRE OCTAVE, a Belgian legal writer, in Brussels, Belgium, July 21; b. in Lausanne, Switzerland, Nov. 9; studied law at University of Lausanne and in Berlin; was professor in University of Berne 1863–67; was professor at University of Brussels; was the author of several publications.

RUHSAM, JULIUS, in Annaberg, Saxony, Germany, Nov. 17; was teacher in secondary schools; noted as reformer in methods of teaching natural history.

SCHIEBERT, Dr. KARL, in Breslau, Feb. 18; was privy councilor and school superintendent in Pomerania, Germany; author of educational works.

SCHILLING, Dr. MAX, at Züllichan, July 29; was head teacher in normal school at Züllichan, Germany.

SCHMELZER, Dr. KARL, in Berlin, Germany, Oct. 6; was principal of classical high school in Berlin; author of popular educational works.

SCHMIDT, P., April 26; taught in normal school at Pyritz, Germany.

SCHUMACHER, KARL, at Berlin, Germany, May 11; was rector of city school.

SCHWALBE, Dr. J., in Posen, Germany, Dec. 3; was school inspector.

SOMMER, Dr. OTTO, Apr. 18; was principal of girls' high school in Brunswick, Germany.

STEEG, JULES, in Paris, May 4; Protestant teacher in Paris; since 1896 director of normal school.

STEUDENER, Dr. HEINRICH, in Quedlinburg, Germany, May 13; was professor in the famous cloister school at Rossleben; author of historical works.

STOCKHARDT, E. TH., Mar. 27; was professor in Chemnitz, Saxony, Germany.

TASCHEREAU, ELZIAR ALEXANDRE, D. C. L., in Quebec, Canada, Apr. 12; b. in Sainte-Marie-de-la-Beauce Feb. 17, 1820; educated in Quebec and Rome; professor of moral philosophy in the Seminary of Quebec, 1842–54; director of the minor seminary in 1856 and of the great seminary in 1859; superior in 1860 and rector of Laval University; papal delegate, archbishop, and cardinal.

TEUBER, KARL, at Patschkau, Germany, Sept. 5; was teacher and author of juvenile literature.

TOPELIUS, ZACHRIS, in Helsingfors, Finland, Mar. 12; b. in Kuddnas, Finland, Jan. 14, 1818; was educated at Helsingfors University; editor, 1840–61; professor extraordinary of Finnish history at his alma mater, 1853; professor of the history of Finland and northern regions, 1863; professor of general history, 1876–78; author of several books of poems and novels.

UELLNER, Dr. JULIUS, at Düsseldorf, Germany, Oct. 24; was director of secondary schools for girls.

VOEBRODT, Dr. F., at Erfurt, Germany, Sept. 27; was city school councilor.

VRIES, J. F. DE, at Emden, Germany, Oct. 11; was rector of city school; became famous through his advocacy of home geography.

WOLF-DELITZ, B., at Magdeburg, Germany, Oct. 28; was head teacher and president of provincial teachers' association.

WALTER, F., at Berlin, Germany, June 13; was rector of city schools and contributor to educational press.

WOLF, K., at Steglitz, Germany, Jan. 1; was school councilor.

ZABEL, R., at Zerbst, Germany, Feb. 22; was founder of deaf-mute school.

ZIEPRECHT, HEINRICH, in Kössel, Germany, Jan. 1; was a teacher and a member of executive committee of the national teachers' association.

ZIMMERMANN, Dr. ROBERT, in Vienna, Sept. 1; was professor of philosophy in University of Vienna.

CHAPTER L.

PORTABLE SCHOOL BUILDINGS.

[From the Annual Report of the Superintendent of Instruction of St. Louis, Mo. (Hon. F. Louis Soldan), for 1898–99, p. 51.]

It seems advisable to provide a remedy for the trouble which the board have experienced in regard to this matter [of double daily sessions] in the past. It can not be the policy of the board to provide school room in advance before the necessity of it is felt in any part of the city. After a school, however, has become overcrowded and a new building has been decided upon, a year must necessarily pass before it can be completed and occupied. During this year temporary provision must be made for the surplus of children. In the city of Milwaukee the plan of portable school buildings for temporary purposes has been tried with satisfaction for many years. The idea of portable school buildings seems to have originated in Paris, when, after the Franco-Prussian War, a compulsory education law was passed, and the sudden influx of children into the public schools of that metropolis was so large that existing schoolhouses could not take care of the number. Under these circumstances the plan of temporary school buildings was tried and was found to meet the emergency. Several other large European cities, such as Munich, have tried this plan with good success. At a cost hardly greater than the rental of an adequate room for two years, such buildings, large enough to accommodate 50 children, well ventilated and heated and protected from cold by double walls, can be erected, and I believe they would present better sanitary conditions for the temporary accommodation of children than the ordinary rented rooms and would be much better economy than double-time sessions. They could be put into the yards of the school buildings that need relief and make use of the outhouses and of the janitor service provided for the main building.

[From the Annual Report of the Commissioner of School Buildings of St. Louis, Mo. (Mr. William B. Ittner), for 1898–99.]

PORTABLE SCHOOLROOMS.

I am pleased to report a successful trial of the portable schoolroom. Beginning with the present board (in June, 1897), a large number of rented rooms were maintained in various parts of the city. The addition of new school buildings has enabled the board to reduce the number of rented rooms at this time to 19. These rented rooms, though the best that can be procured in the neighborhood of the school needing relief, are at best ill adapted to the requirements, are expensive to fit up for school purposes and to restore to their original condition when given up. The building devised to relieve temporarily the overcrowded condition at any school will enable the board to properly provide for such overflow and, with the proper number of portable rooms on hand, to dispense with rented rooms entirely.

The buildings are constructed in such manner as will enable them to be readily taken apart where no longer required at one school and moved to another. They

are 24 by 36 feet, inside measurement, with a clear story height of 12 feet. The floor is constructed in 8 sections, the sides in 6 sections, the ends in 4 sections, and the pitched roof in 16 sections. Each section is built upon frames which are readily bolted together in such manner as to make a perfectly tight and secure room. All joints between the sections are covered both inside and out by movable pieces secured with screws. They are heated and ventilated by an indirect furnace with double casing. The fresh air is taken directly from the outside, which supply can not be cut off by the teacher. The vent is erected at the opposite end of the room from the furnace, and the draft of the vent is induced by carrying the smoke pipe from the furnace through the upper part of the vent flue. This not only makes a perfect method of ventilation, but effectually prevents any possibility of fire from the furnace smoke pipe. A test of the ventilation of the first room, set up at the Walnut Park school, shows that the air of the room is being changed every 9.74 minutes, thus supplying each of the pupils with 16 cubic feet of fresh warm air per minute.

The buildings thus far completed have been erected by our own carpenters, the cost being as follows:

Lumber	$372.00
Millwork	78.56
Hardware and iron work	69.50
Labor	123.20
Roofing	38.50
Painting and glazing	85.00
Heating and ventilating	86.40
Total	853.16

The rooms can readily be taken apart, moved, and reerected. They are fitted with 60 adjustable desks, and in all respects make a satisfactory and comfortable school room.

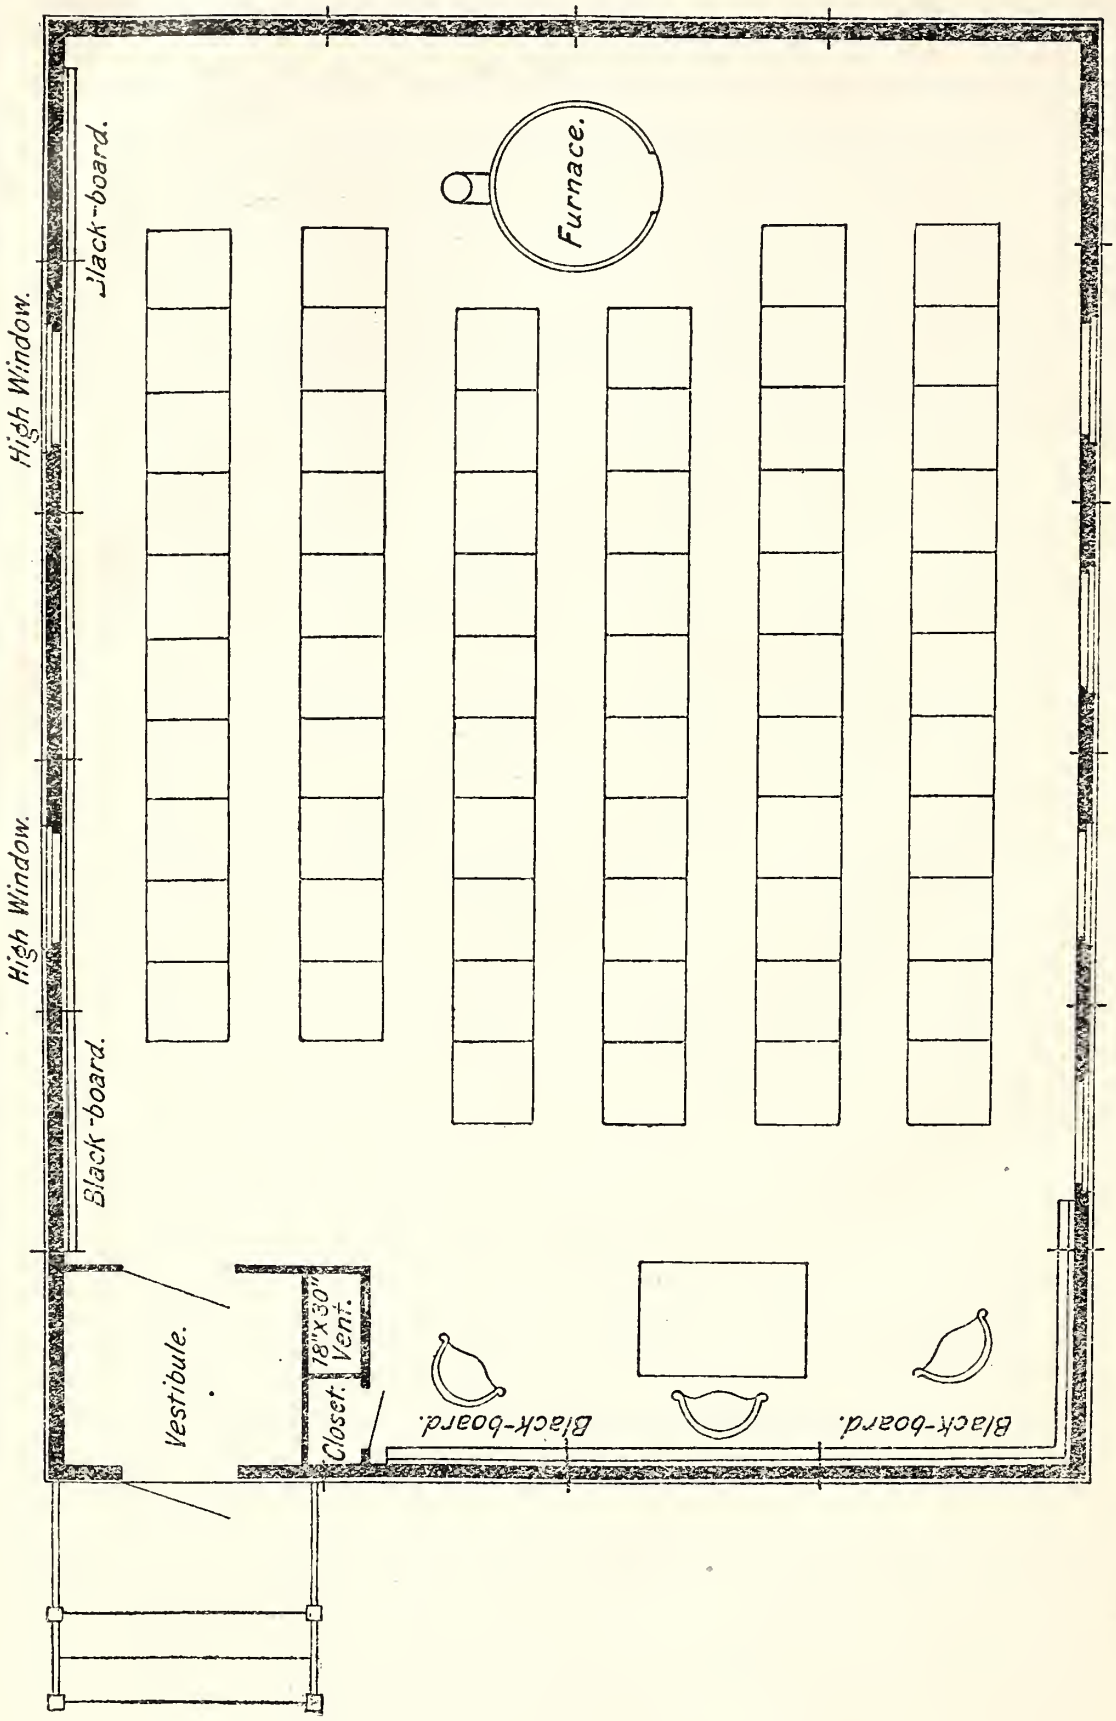
[From letter of Mr. William B. Ittner, commissioner of school buildings, June 14, 1900.]

I will add this description of the heating and ventilating apparatus, which is not explicitly covered in my report:

The furnace is known to the trade as a "room heater" and weighs 450 pounds. It has an outer casing (for appearance) of Russia iron; the exposed chimney in the class room being also of Russia iron. The inner casing surrounding the furnace is of heavy stovepipe iron; the same being corrugated and set with about a 1½-inch air space between the inner and outer casing.

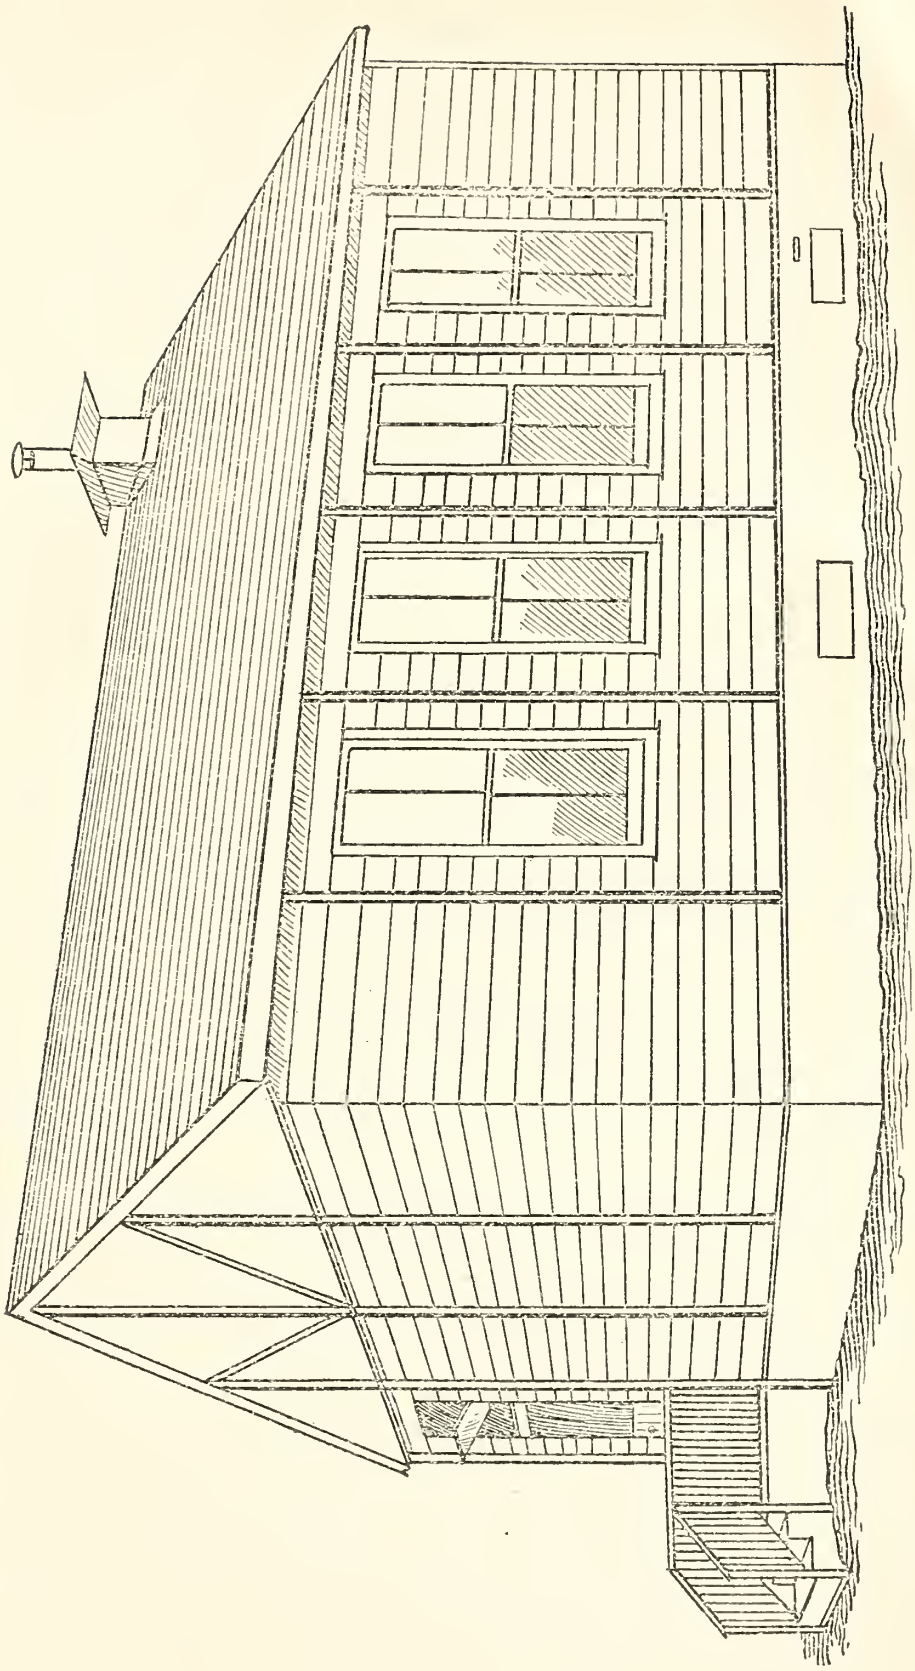
There is a row of 1-inch holes 3 inches apart through the outer casing just above the floor. This permits of a good circulation of air through the space between the casings and assists materially in keeping the outer casing cool.

We place a door about 6 by 12 inches on each side of the casing near the floor, so that when the room is not occupied, these doors can be opened up and the room quickly warmed before the fresh-air inlets are opened. We cover the top of the furnace with a No. 8 wire screen, to prevent mischievous youngsters from throwing papers, etc., over the casings. This has been found convenient also in suburban schools to warm coffee and the children's lunch.



The fresh air is brought in through a wood duct under the floor. The duct extends to both sides of the building, permitting the air to enter from both sides. Doors can be arranged to be opened and closed from the room by means of chain and pulley, giving the teacher easy control of the quantity of fresh air to be admitted.

The outer openings should, of course, be covered with heavy wire screens. The space in the floor under the heater is cut out for the admission of fresh air around the casing of the furnace and inside of the inner casing. The floor joists under the



heater are protected by wrapping them with several layers of asbestus paper and then covering them with stovepipe iron.

The vent outlet is placed at the opposite end of the room alongside of the book closet. While this location may not seem the correct position for the vent opening, yet tests of this apparatus have proved a thorough circulation of air throughout the entire room. By passing the smokepipe over the furnace through the vent flue, the air in that part of the flue is heated, thereby inducing and maintaining a constant flow of air through the room at all times.

Tests of the heater have shown that the air of the room can be changed every seven minutes; that the temperature varies only two degrees from maximum to minimum, using six thermometers, one of which was placed on the teacher's desk, the other five distributed about the room.

PLAN OF PORTABLE SCHOOLROOM.

PORTABLE SCHOOLROOM.

f The statistics, which include pay and free schools, are taken from "Census of Cuba," 1899, pp. 585, 618-619. It is stated (on p. 615), however, that there were in June, 1900, about 3,000 public schools, 3,500 teachers, and 130,000 pupils under instruction, and that the estimated expenditures for all school purposes were upwards of $1,000,000. The above estimates from the Tables are more conservative, and form a more complete estimate for the computations made.
