CHAPTER XXVIII.

COEDUCATION OF THE SEXES IN THE UNITED STATES.

TOPICAL OUTLINE.

Coeducation in the public schools.—Coeducation, a policy characteristic of the public-school system of the United States, practically universal in the grades below the high school, and with few exceptions the policy also in the high schools; extent of the policy in private schools; testimony of State and city superintendents as to the effects, social and economic, of this policy, and explanations of the exceptional cases of departure from the policy; coeducation as affecting the teaching service; classes of school officers for whom women may vote and supervisory positions for which they are eligible.

Coeducation in colleges and universities.—Relation of the policy to the general movement for the higher education of women, especially as fostered by the Government land grant of 1862 and by the demand for professionally trained teachers; influences in the Northwest making for coeducation; in the East making for separate colleges for women; rapid increase in the number of coeducational colleges and universities from 1833 to 1880, and from 1880 to 1900; statistics showing relative proportion of women students in secondary schools and in colleges and universities, also relative proportion of women teachers and professors; scholarship and fellowship funds available for women.

Literature of coeducation.—(1) Citations from officials in charge of public-school systems: Dr. W. T. Harris, St. Louis, 1872–73; Dr. E. E. White, 1872; Dr. Edward Brooks, Philadelphia, 1902; Dr. John D. Philbrick, Boston, 1885; majority and minority reports of a special committee of the Boston school committee, 1890. (2) Opinions of foreign experts, delegates to the Chicago exposition and educational congresses, 1893: Dr. E. Schlee, Prussia; Mlle. Marie Dugard, M. Jules Steeg, Dr. G. Compayré, France; Miss Anna Bentzen, Norway. (3) Citations from discussions relative to the physiological bearings of coeducation: Dr. E. H. Clarke (from Sex in Education); Thomas Wentworth Higginson (from Sex and Education); Association of Collegiate Alumnæ, health statistics of women graduates; Mrs. Henry Sidgwick, health statistics of women students of Cambridge and Oxford; opinions of physicians, Boston school document, 1890. (4) Citations relative to coeducation in universities, annexes for women, and coordinate education: Cornell University, Sidney Sherwood, Ph. D.; Dr. William F. Warren, president of Boston University; Dr. David Starr Jordan, president of Leland Stanford Jr. University; Dr. Edward M. Moore, president of University of Rochester; Dr. Daniel Bonbright, acting president of Northwestern University (1901); Dr. William R. Harper, president of Chicago University; Dr. Timothy Dwight, president of Yale University (1892); Dr. F. A. P. Barnard, president of Columbia College, report of 1879; status of Barnard College, report of the president, 1901, and of the acting dean, 1900; Radcliffe College, under the auspices of Harvard University; the system of coordinate education at Western Reserve University, President C. F. Thwing; at Brown University, President W. H. P. Faunce. (5) The American woman from a German standpoint, Prof. Hugo Münsterburg.

Coeducation in certain foreign countries.—Great Britain and Ireland, France, Germany; admission of women to German universities, cited from article by Mrs. Martha Krug Genthe

Bibliography.

COEDUCATION IN PUBLIC SCHOOLS.

The policy of coeducation, or the education of the youth of both sexes in the same schools and classes, is a marked characteristic of public education; that is, of education maintained by public funds in the United States. The practice prevails also in private institutions to a noticeable extent. Therefore, while coeducation is a policy not peculiar to the United States, it has here an extension both as regards the proportion of the population and the grades of institutions affected which readily explains the fact that all persons interested in the conduct of education look to this country for information in respect to this particular feature. The demand for information on this subject on the part of foreign investigators and officials is constant. From time to time, also, the subject becomes one of special inquiry in our own country, particularly in the sections where public provision for education is comparatively recent. It is the purpose of this chapter

to meet these demands by a rehearsal of facts and of arguments drawn from previous publications on the subject, with modifications and additions bringing the survey down to the present year. In the consideration of this subject the public schools naturally take precedence, not only because of the vast proportion of the people who are instructed in them, but also because of their consequent influence upon public opinion. This influence is even more important in respect to a matter which like coeducation affects the most delicate social relations than in respect to purely scholastic interests.

The enrollment in the public schools of the United States reached in 1900 a total of 15,341,220 (7,734,739 boys, 7,606,481 girls), 91 per cent of all pupils enrolled in elementary and secondary schools. The great body of these young people are instructed together, without distinction of sex. In the elementary grades of our public schools—that is, in the grades below the high schools—coeducation is practically universal and excites no comment. Exceptions are indeed found in a few cities situated for the most part on the eastern border of the country, but these exceptions are in the main due to accidental conditions, such as the location or structure of school buildings. In some cases they are survivals from the period of feeble beginnings, when experiments in the direction of public schools were cautiously begun by the establishment of schools for boys.

When we consider the high schools, which are of later origin than the lower grades, we find not only the same causes for the existence of separate schools for boys and girls, but in a few cities, also, as will appear from the appended statements, the conviction that this separation is desirable.

The statements referred to, which confirm in detail the general view here presented as to the status of public schools in respect to coeducation, are taken from the replies of State and city superintendents to special inquiries with respect to this particular feature of the schools under their charge. An inquiry issued by this office in 1891 brought very full responses from every part of the country; the information thus elicited has been here supplemented by replies to an inquiry of the present year addressed to superintendents of those cities which showed exceptional conditions in 1891, and to a few other superintendents in cities which by reason of rapid growth are liable to encounter unforeseen conditions in providing school accommodations. Use has also been made of the answers to a similar special inquiry on the part of Superintendent Edward Brooks, of Philadelphia.

STATE SYSTEMS.

The inquiry of 1891[1] was answered specifically by the school superintendents of 40 States and 4 Territories.

The superintendents of the following 23 States and 3 Territories reported coeducation in all public schools, a few exceptions being noted: Arkansas, Connecticut, Idaho, Illinois, Indiana, Indian Territory, Iowa, Florida, Kansas, Maine, Minnesota, Missouri, Montana, Nebraska, Nevada, New Hampshire, New Jersey (excepting in the high schools of a few cities), New York (all country schools), North Dakota, Ohio, Oklahoma (Territory), Oregon, Rhode Island (excepting the high school of Providence), South Dakota, Tennessee, Utah (admitted as a State 1896), Vermont, Washington, West Virginia, Wisconsin, Wyoming.

The superintendents of the following 12 States and 1 Territory reported coeducation excepting in the few cities named:

California.—Two grammar schools, 1 high school exclusively for girls, 2 grammar schools for boys, San Francisco.

Delaware.—Wilmington.

Georgia.—High schools of Atlanta, Augusta, Savannah, and Columbus.

Kentucky.—High schools of Louisville and common schools of Russellville.

---

[1] The inquiry comprised the two following questions:

(1) In what cities and towns of your State are the boys and girls taught in separate classes in the public schools?

(2) In how many country public schools in your State are the boys and girls taught in separate classes?

A request was also made for additional information or opinions bearing upon the subject.

Louisiana.—High schools, New Orleans.
Maryland.—High schools, Frederick City and Hagerstown.
Massachusetts.—Boston, Latin school and English high school for boys; girls' Latin school and high school.
Mississippi.—Natchez, Vicksburg, Yazoo City, and Columbus; mixed schools in some of the departments.
New Mexico (Territory).—One school in Santa Fe, 1 in Old Albuquerque, and 1 in La Mesilla.
North Carolina.—One public graded school. Raleigh; boys not allowed after they have passed the second grade. Normal and industrial school at Greensboro; this school is part of the public-school system.
South Carolina.—Columbia.
Texas.—Atlanta.
Virginia.—One city.

Official reports and the statements of city superintendents made it evident that coeducation was the general policy in the remaining 5 States and 1 Territory—Alabama, Arizona (Territory), California, Colorado, Michigan, Pennsylvania.

The replies above considered were generally limited to the statement of the facts and a strong indorsement of the policy of coeducation by the superintendents.

The following citations present all the additional information offered in response to the inquiry of 1891 by the State officials:

Hon. Edward Porter Thompson, State superintendent, Kentucky:

The tendency now and for some years past has been toward coeducation of boys and girls in same school and same class.

Hon. E. B. Prettyman, State superintendent, Maryland:

Early in this century the general assembly established male academies in the counties, but the majority of these have been changed into high schools, teaching the sexes together. Washington College, at Chestertown, Kent County, established in 1782, and based on a flourishing academy which was established in 1723, for the first time adopted coeducation about three years ago, and in 1892 reported 90 male and 20 female students. Dr. Reid, the president, informs me that the faculty and the board of visitors are entirely satisfied with the change. The Maryland State Normal School, located in Baltimore, has had both male and female students in the same classes since its establishment in 1865. This arrangement continues to have the approval of the faculty and of the State board of education.

Hon. J. R. Preston, State superintendent, Mississippi:

Natchez, Vicksburg, Yazoo City, and Columbus are the only towns in which boys and girls are taught in separate classes in the public schools. Even in these towns the practice is disappearing and mixed classes are taught in some of the departments.

Hon. Amado Chaves, superintendent of schools, New Mexico:

In a year or two there will be no separate classes for boys and girls in this Territory. Better results are obtained by teaching both boys and girls together.

Hon. E. B. McElroy, State superintendent, Oregon:

We have, likewise, coeducation of the sexes in special lines of State school work; for example, in the State blind school and in the State school for deaf mutes the boys and girls are taught together and receive their instruction in the same classes from day to day.

Hon. C. W. Bean, State superintendent, Washington:

There are a few schools for separate education of the sexes in this State, but they are under the control of churches. These supply the demand for such teaching, and under these circumstances the public sentiment in favor of coeducation in the public schools is very strong. Most of those who favor separate education do not appear as very strong advocates of a public-school system at all.

CITY SYSTEMS.

The inquiry addressed to city superintendents in 1891 sought not only to ascertain whether coeducation or separate education was the rule, but also the grades, if any, in which boys and girls were not taught in the same classes.

The following table summarizes the information from 628 cities, and indicates also (columns 10–12) changes that have taken place during the decade as disclosed by the inquiry of the present year.

Status of the public schools in cities with respect to the coeducation of the sexes (i. e., the instruction of boys and girls either together or separately), 1891–92.

	Total number of cities reporting.	Number which have adopted coeducation in all grades.	Number in which boys and girls are taught separately in some or all grades.						Number of cities reporting in 1891–92 in which changes have been made from separate to coeducation schools, as reported in 1902.[1]		Number of cities reporting separate schools in 1891–92 which have since established coeducation in high schools.[1]
			Total.	Distributed.

[1] Inquiry addressed to 24 of the 41 cities included in column 4.
[2] In Baltimore for colored pupils.
[3] In one city a few changes both ways, i. e., from separate to mixed schools and the reverse.

By reference to the foregoing table (column 4) it will be seen that 41 cities reported separate schools in one or more grades in 1891.

The replies to the inquiry of 1902 show that three cities (see column 10) have adopted coeducation in the formerly separate high schools, leaving 12 cities out of 628 reporting with separate high schools, as against 15 in 1891.

A few changes have been made in the lower grades, but as a rule the situation in these grades remains practically the same as at the beginning of the decade.

The circumstances that have given rise to separate schools where these exist are explained in the letters of city superintendents referred to above, here cited in the geographical order of the cities. It will be noticed that the citations include letters written in response to the inquiry of 1891, and also to that of the present year.[1]

Boston, Mass.—Hon. Edwin P. Seavers (1891):

First. Boys and girls are taught separately in the Latin schools.

Second. They are taught separately in the high schools of the old city, namely, in the girls' high and in the English high (boys).

Third. They are taught together in the suburban high schools in Roxbury, Dorchester, Charlestown, West Roxbury, Brighton, and East Boston.

Fourth. They are taught separately in 25 of our 59 grammar schools. In the other grammar schools they are taught together.

Fifth. They are taught together in all primary schools and kindergartens.

This unsystematic state of things was brought about by Boston's annexing the neighboring cities and towns without changing the organization of the schools more than was absolutely necessary.

Superintendent Seavers, in answer to the inquiry of 1902, states that no change has taken place during the last decade in schools that have been in existence more than ten years, either from separate to coeducation schools or the reverse. The following information relates to two schools recently established:

Within ten years two high schools have been established: The Mechanic Arts High School in 1894, which is a boys' school, and the South Boston High School in 1901, which is a school for boys and girls.

The subject of coeducation does not excite discussion in this city. Everybody, so far as I know, appears to be satisfied with the present condition of things.

There are at the present time in this city three high schools for boys, namely, the Public Latin School, the English High School, and the Mechanic Arts High School, and two high schools for girls, namely, the Girls' Latin School and the Girls' High School. The remaining seven high schools are for both boys and girls. The number of grammar schools for boys alone is 12, and the number of grammar schools for girls alone is also 12. The remaining 34 grammar schools are for boys and girls. The primary schools universally are for both boys and girls, and so are the kindergartens.

Salem, Mass.—Dr. William A. Mowry, 1891:

The old school (grammar and primary) was for boys; later arose a girls' school. So now, "down town," as we call it, there are (1) one grammar school for boys; (2) one grammar school for girls; (3) one primary for boys, and (4) one for girls. In the rest of the city are three grammar and ten primaries for boys and girls both. The high school is for both, although the boys sit in separate rooms from the girls. They recite together.

Superintendent Perkins states, 1902, that no changes in respect to coeducation have taken place during the decade. He adds:

The only discussion with us concerning this subject of coeducation is in regard

[1] The inquiry of 1902 comprised the following questions:

(1) Has there been any change during the last decade from separate to coeducation schools in the elementary or high schools under your charge?

(2) Has there been any change in the same period from coeducation to separate schools?

(3) Have any new high schools been established during the decade; and if so, are they separate or coeducation schools?

(4) Does the subject of coeducation, especially in high or secondary schools, excite much discussion in your community; and if so, what appears to be the present trend of opinion on the subject?

to two of our grammar schools—one for boys, the other for girls. It is probable that these will be consolidated within a few years.

Newburyport, Mass.—Hon. William P. Lunt, 1902:

During the past ten years many of our schools below the high school have been changed from separate schools to schools for both sexes.
There have been no changes in the opposite direction.
No new high schools have been established during that period.
At present there seems to be no interest in the subject.
From my own observation I should say that the boys have been benefited by the presence of the girls, but that the girls have not gained by the change. In fact, I believe in all grades the girls have been the losers in many ways by coeducation.

Providence, R. I.—The somewhat anomalous classification which formerly existed in the high schools of Providence seems to have been an outcome of the policy of elective courses.

In 1891 Superintendent Tarbell wrote:

The classical department of our high school teaches both sexes. The English department teaches a portion of girls separately, 413 in number. The manual training high school teaches boys only, 150 in number.

The complete consolidation of the separate classes took place shortly after, and with respect to this action Hon. Thomas B. Stockwell, the State commissioner of public schools, said:

I consider the change of policy here in Providence very suggestive, for the plan of separate schools for boys and girls in the high school has existed ever since the school was started and has been most ardently advocated by some of those most interested in the schools. I think it shows that coeducation is being more and more recognized as the proper method in all grades.

Superintendent Tarbell, after an experience of ten years with the mixed high schools, writes (1902):

The high schools of Providence were changed about ten years ago from separate to coeducational schools. The elementary schools of this city have been coeducational for the last sixty-five years. There has been no change from coeducation to separate schools. We have established during the last ten years three new high schools, which are all coeducational. The subject of coeducation in high schools is not a matter which excites much discussion in this city. Personally, I favor coeducational institutions.

New York City.—Hon. John Jasper, superintendent of schools (1891):

As a rule boys and girls are taught in separate classes, but there are classes of grammar grades in which both sexes are taught together, and there are many more classes of primary grades in which the same state of affairs is found. It is impossible from the nature of our reports to determine the number of classes in which both sexes are taught together. It is an almost invariable rule to teach the boys and the girls in separate classes where the numbers are large enough to permit this separation.

Brooklyn, N. Y.—Hon. W. H. Maxwell, superintendent of schools (1891):

It is the policy of our board of education to teach boys and girls in separate classes. It is not, however, always practicable to do this under our scheme of class organization. Out of a total registry of 96,054, at the close of last year, 16,160 were taught in what we denominate as "mixed" classes; that is, boys and girls in the same class. The sexes are quite evenly divided, being at the close of the year 47,963 boys and 48,091 girls. The proportions of boys and girls in the mixed classes will probably hold about the same.

In answer to the inquiry of 1902, Mr. Maxwell, who is superintendent of schools in the consolidated city or Greater New York, states that no change in respect to coeducation has taken place in the schools under his charge during the decade. He says:

Six new high schools have been established during the decade—four coeducational, two separate.
The subject of coeducation, especially in high or secondary schools, does not

excite much discussion in this community. The present trend of opinion appears to be toward coeducation.

In reply to your invitation for a statement of my personal observation relative to coeducation, I would say that in the more densely inhabited parts of New York City there is a good deal of opposition to coeducation, particularly where there is a large foreign element present in the schools. In the outlying and more thinly populated parts of the city there is a very strong feeling in favor of coeducation.

Newark, N. J.—In Newark there were originally separate classes for boys and girls in some of the grammar schools in the upper grades, i. e., seventh and eighth years. These were, however, mixed prior to 1891, the separation being maintained only in the high school.

In reply to the inquiry of 1902, Hon. A. B. Poland, superintendent of schools, answering the questions seriatim, writes as follows:

Our high school, which formerly was maintained in separate departments, was consolidated about four years ago.

There has been no change from coeducation to separate schools.

No new high schools have been established during the last decade.

The subject of coeducation does not excite any interest in the community.

I am of the opinion that boys and girls are best educated together during the whole period of the elementary and secondary course.

Philadelphia, Pa.—Separate high schools for boys and girls are still maintained in Philadelphia as in 1891–92, and the policy has had in the past strong advocates in that city.

Dr. Edward Brooks, superintendent of schools, writes under date of April 8, 1902, that there has been no change in the high schools during the decade, but a few changes both ways in the elementary schools. "Such changes," he says, "were merely incidental and not in accordance with any change in respect to coeducation."

He reports the following new schools or departments established during the decade: "A commercial high school for girls, a department of pedagogy, and a department of commerce in the boys' high school." "The subject," he says, "is now under discussion, as I have recommended the organization of territorial high schools on the basis of coeducation."

[In order to strengthen his position and give the members of the board of public education fuller information on the subject, Dr. Brooks wrote to a number of the larger cities of the country to ascertain the practice in those cities and the views of educational experts upon the question. The results of this investigation were published in a "supplementary report," copious citations from which are republished in this chapter, together with Dr. Brooks's own views submitted in his annual report. See pp. 1249–1250.]

Lebanon, Pa.—Hon. R. T. Adams writes (1902):

In reply to your inquiry of April 8, I would say that we have had coeducation in all grades for some years—I think ten or twelve. The high school was united in 1890 and has been coeducational since that time. There seems to be no inclination on the part of any to have the boys and girls separated in the high school or any other school. In fact, I believe that a move to separate them now would call forth as much discussion, or more, than the move to unite them did some years ago. In my three years' term of service here I have not heard anyone say anything about the subject, and feel that the general opinion is that a move toward separation would be a move backward, at least in a city of this size.

Chambersburg, Pa.—Hon. Samuel Gelwix writes (1902):

Nine years ago our high schools were united, and coeducation has proven an advantage. * * *

The consolidation of our high schools was criticised at first, but at present I hear of no unfavorable comments.

Wilmington, Del.—Hon. Geo. W. Twitmyer (1902):

For many years the boys and girls in the grammar and in the high schools were separated; in the primary schools coeducation has always existed in this city.

On the reorganization of our schools in February, 1901, the coeducation plan was adopted.

A new high school on the coeducation plan was established in 1901. A few of the upper classes, for convenience, are still seated in separate rooms for study, but for recitation, music, and general exercises are all together.

The change from separate to coeducation schools in 1901 caused some discussion, but the trend of opinion of teachers and parents is now decidedly in favor of the plan.

The plan has not been in operation long enough to determine the ultimate results, but we can see gains in improved deportment, refinement of manners, easier control, better work by pupils, larger freedom, and a more homelike atmosphere. There has been little friction incident to the change, but much has been gained.

Washington, D. C.—Coeducation is the general policy in the white schools of the capital city, but owing to the location and arrangement of schoolhouses boys and girls are separated in a few of the grade schools. In 1891–92 less than one-eighth of the pupils were in separate schools. As regards the colored schools, Hon. G. T. Cook reported as follows:

In my opinion a very material factor in the promotion and maintenance of good discipline in these schools is its system of coeducation of the sexes, which, beginning with their establishment, has since uninterruptedly continued.

Not only in the advantages accruing to discipline, but in other respects essential to progress, has the wisdom of this coeducation of the sexes been shown. Healthy competition has been stimulated and keen, active thought awakened. To the rougher nature of the boy have been imparted tone and refining influences; to the gentler nature of the girl, strength and elasticity. The enrollment of boys is less than that of girls, being about as 43 to 57. In the primary schools they are more nearly balanced than in the grammar, in the former the ratio being about 12 to 13 and in the latter 17 to 33.

The enrollment of boys to girls is now as 44 to 56.

Raleigh, N. C.—Hon. Edward P. Moses reported in 1891 as follows:

We are limited in Raleigh by special legislative enactment to seven grades, or seven years of school work. In the colored schools boys and girls are taught together in every room. The sexes are not separated, because of the fact that the different buildings are widely scattered. In our white schools the pupils during the first three years of school are permitted to attend that building most convenient to their homes, the boys and girls being taught together. In the fourth, fifth, sixth, and seventh years of schools, the sexes are taught in different buildings. It is proper to add, however, that at the request of parents, girls are permitted to attend the boys' school, though no boys are allowed in the girls' school beyond the third grade.

Atlanta, Ga.—Hon. W. F. Slaton writes (1902) that no changes have taken place in the elementary schools during the decade:

New buildings have been erected, but the sexes are kept separate and taught in separate buildings. * * *

Little discussion has been held on the subject. The entire community are of one mind that the sexes should be taught in separate buildings after they have reached the high schools. The sexes are taught together in the grammar schools.

It is my decided opinion that it is better that the sexes should be separate and taught entirely apart after they have reached the high-school age. I am very sure, from both experience and observation, which extend over a period of fifty years, that we pursue the better plan.

Montgomery, Ala.—Hon. C. L. Floyd (1891):

Previous to 1889 in all grades above the third elementary the sexes were separated. Since 1889 the sexes have been mixed in all the elementary grades. In the high schools the sexes are separated and have always been. * * *

No objection is raised to mixed classes in the elementary schools, and, so far as I know, the question is not discussed.

There is opposition to mixing the sexes in the high school.

Under the best conditions—that is, with buildings properly arranged and a strong corps of teachers—I am inclined to the opinion that there would be no objection to a mixed high school. I entertain this opinion without having had any connection with a mixed high school.

Under ordinary conditions I should be opposed to a mixed high school.

Covington, Ky.—In 1891 Hon. W. C. Warfield, at that time superintendent of public schools, wrote as follows:

Our eighth-year grade pupils are taught in separate classes; 62 boys and 71 girls are now enrolled in this grade.

A part of our seventh-year grade pupils are taught in separate classes; 31 boys and 38 girls are so taught. I am now watching the results of separate classes for boys and girls. If a school were provided with A 1 teachers, I think separate classes would not be necessary. At the present time I am of the opinion that little or nothing is gained by separating the boys and girls into different classes or rooms.

The present superintendent, Hon. John Morris, reports (1902) that no changes have taken place during the decade, and adds: "If I had the power I would not have the girls and boys together the first two years of high school."

Louisville, Ky.—Hon. E. H. Mark (1902):

There has been a decided change during the last decade in the Louisville public schools with reference to coeducation in our elementary schools. Eight years ago, when I accepted the position of superintendent of schools, all the children from the first grade through the high schools were separated according to sex, the boys were placed on one side of the school building, known as "the boys' side," and the girls placed on the other side, known as "the girls' side." In the eight years I have been in charge I have been able to bring about a change, and now boys and girls are placed in the same room in nearly all the schools in the city. However, there has been no change so far as the high schools are concerned, the boys and girls are still taught in separate schools. * * *

Within ten years we have had one new school established, which is practically a high school, known as the Commercial School. This school is a coeducational school.

The subject of coeducation, especially with reference to high and secondary schools, does not excite much discussion in this community. I think I can specifically say that the present trend of opinion on the subject, especially with the board and many of the patrons of the schools, is toward coeducation. Our high schools, because they are separate, are necessarily central, compelling pupils to travel over long distances in order to reach them. There is a growing feeling that high schools should be established in various parts of the city, and that these high schools be coeducational. I sincerely hope that some action will be taken in the near future that will place our high schools nearer to the pupil population. I am certain that if we were to have high schools established in various parts of the city that our high-school attendance would be increased nearly one-half. A comparison of the attendance in our city with that of other cities will show that we are below cities of much smaller size.

Chicago, Ill.—Hon. E. G. Cooley writes in 1902 that there has been no change from separate to coeducational schools or the reverse during the decade, but three new high schools have been established as coeducational. He adds:

There is not much discussion of the subject of coeducation in our community. The trend of opinion on the subject favors coeducation. The only separate schools which we have are the English High and Manual Training School for boys, which has been established for more than a decade, and the John Worthy School, an elementary school for the education of delinquent boys at the city Bridewell.

St. Louis, Mo.—Hon. F. Louis Soldan, superintendent of schools in St. Louis, where coeducation has long been firmly established, writes (1902):

We have established no new high schools during this decade, but we are now contemplating the erection of two new high schools in St. Louis, and the board of education has authorized their construction. In these schools no change will be made from the old system of coeducation.

To my knowledge there has been no extensive discussion of the question of coeducation among St. Louis educators, nor has there been any observable adverse interest manifested in this phase of education.

It is my opinion that coeducation is more firmly intrenched in popular favor to-day than it was twenty-five years ago.

Denver, Colo.—This city, with a population of 133,859 (1900), is divided into three school districts, each having its own superintendent. The schools, as in other Western cities, are coeducational. In answer to the inquiry of 1902, Hon. Aaron Gove, the superintendent of district No. 1, writes as follows:

In the light of my life's work I am compelled to express an opinion contrary to that held in my earlier life. I think coeducation of youth in their teens is not productive of the desired results. I should not object to the assembling of both sexes under the same roof and in the same classes, under proper restrictions. I think the training and culture of that sort of education, properly governed, is good training for adult life. I do object, however, to identical courses of instruction for the sexes. I also object to an identical amount of time for both sexes. The girls should do their school work in less time per day than the boys. This will require a longer term of years for accomplishing the average high-school course. The requirements and duties of the girl demand a training over and beyond that demanded for the boy. The boy 15 years old can well afford to put in six hours a day in study and class work; his sister, 15 years old, has duties of which he knows nothing, but which are important and which demand time for execution.

Throwing aside altogether the consideration of modified physical functions, the other duties of our young people are widely separated by sex. Practically the typical high school can have its courses so adjusted that every girl in the house can be excused at noon, the boys doing the regular afternoon's work; the girl taking six years to complete the course which the boy accomplishes in four.

The chief objection to this is not valid but popular, namely, that the woman is equal to the man, the sister equal to the brother. Therefore, she should do as much work as he in the same time, and not be discomfited by being distanced by him; while the real truth would be that she accomplished in the four years quite as much as he, and in the two years additional, even reached him in mental intellectual training. * * *

Taken altogether, I would prefer separate high schools for the sexes rather than see them as they are for many reasons, a few of which I have mentioned.

San Francisco, Cal.—Hon. R. H. Webster writes (1902) that during the last decade only one grammar school has been changed from a separate boys' school to a coeducation school. Two new high schools have also been established during the period, both being coeducational.

The subject of coeducation has not evoked much discussion in this community but among teachers there is a division of opinion. Two large grammar schools and one high school are maintained exclusively for girls. Personally I am in favor of separate schools, especially for high-school work and even grammar.

The following additional statements are cited from the supplementary report comprising the replies received by Supt. Edward Brooks, of Philadelphia, to a special inquiry on the subject, addressed to the superintendents in a few typical cities:

Supt. Newton C. Dougherty, of Peoria, Ill.: "There is better discipline, more ambition, and more thorough work in coeducational high schools."

Supt. Richard G. Boone, of Cincinnati, Ohio: "I am thoroughly in favor of coeducational high schools."

Supt. Irwin Leviston, of St. Paul, Minn.: "Coeducational schools are in every way preferable."

Supt. Charles M. Gordon, of Minneapolis, Minn.: "I have had no experience in schools in which boys and girls are separated."

Supt. Amos Hiatt, of Des Moines, Iowa: "All schools in Iowa are coeducational. I do not think there is an educator in the State so rash as to advocate separating the girls and boys during their school life."

Supt. B. D. Gregory, of Trenton: "I do not believe it wise to keep the sexes apart in education. Each sex alone intensifies its own peculiarities. The presence of the other sex modifies this process, and the result is exactly what is now in the world. * * * Intellectually, the influence of the sexes upon each other

is most marked. Girls in the presence of boys have a higher intellectual ideal. They unfold intellectual possibilities that society did not think they possessed, and that they themselves were not aware of. The boy is, of course, stimulated by the unexpected competition of the other sex."

Supt. Warren Easton, of New Orleans, where coeducational schools have not yet been established: "I favor coeducation, as I believe better work can be maintained, therefore better results reached at a much smaller cost. Higher education in separate schools is very expensive, and here creates a strong opposition to high schools. I hope to consolidate our high schools within the next two years."

Supt. J. H. Van Sickle, of Baltimore, where there is only one coeducational high school: "My experience until last year was with coeducational high schools, both elementary and secondary. I am not able yet to see any advantage in separating the sexes."

Supt. W. N. Hailmann, of Dayton, Ohio, an eminent educator of the West, says: "I am of opinion that high schools should be coeducational to the extent of having both girls and boys in the same building, with opportunities for joint work in certain directions and for general exercises, but that in the majority of subjects girls and boys should work separately."

"This," says Dr. Brooks, "does not really differ from my own views and recommendations, for when the boys of the high school have manual work the girls may have stenography, typewriting, etc. So also a modern language could be substituted with girls for advanced Latin or Greek, and also girls that have no taste for mathematics could substitute literature for some of the more abstract subjects in that branch."

The following table summarizes the facts with reference to coeducation in the high schools of cities responding to the inquiry of Superintendent Edward Brooks:

Cities.	High schools.		Per cent of high-school pupils in coeducation schools.
	Total number.	Number coeducational.	
			Per cent.
Boston	12	7	50.
New York	10	6	45.7
Brooklyn	6	3	42.8
Chicago	15	14	[1]93.3
St. Paul	4	4	100
Cleveland	5	5	100
Minneapolis	4	4	100
Cincinnati	3	3	100
Buffalo	3	3	100
Providence	4	4	100
Des Moines	4	4	100
Kansas City	4	4	100
San Francisco	4	3	----
Baltimore	5	1	----
New Orleans	3	0	----

[1] The remaining pupils (651) are in a separate high school for boys.

Of 86 high schools included in the foregoing tabulation, 75 per cent are coeducational. Considering the entire country, the proportion is found to be much larger. Thus, in 1900 this office received reports from 6,005 public high schools, of which number 5,933, or 98 per cent, were mixed. These schools enrolled 93.6 per cent of all the pupils in high schools (486,478 out of a total of 519,251). The majority even of private secondary schools reporting to the office the same year were also mixed schools, viz, 1,121 in a total of 1,978, or 56.7 per cent.

The facts here presented leave no doubt as to the position of our public schools with respect to the coeducation of the sexes. It is the policy generally pursued, heartily indorsed by the great majority of supervising officers, and strongly supported by the people in all sections of the country. The "common" or public

school of the United States is, as it has ever been, a school where boys and girls mingle as they do in the family. If additional proof were needed that parents favor this policy, it would be found in the fact that more than half of the secondary private schools of the country are coeducational. Since the public school is the only school that three-fourths of the people ever attend, the association of the two sexes as there maintained must have a very great influence upon their social and business relations in after years. It explains in a great measure the freedom that women enjoy in this country with respect to the pursuit of careers, and especially the large share which they take in the educational work of the country. Where boys and girls are accustomed from early years to compete in intellectual exercises, they entertain a due respect for each other's powers, and false notions as to the natural endowments of each are dissipated. Relations which would cause great irritation and annoyance in countries where separate education is the rule, here come about naturally and without friction.

The extent to which women participate in the teaching service of secondary and higher institutions is indicated in the table on page 1234, which shows the proportion of women teachers in all classes of institutions above the elementary grade of the public schools. In the public schools (all grades included) 69 per cent of the teachers are women. Their relation to the public schools does not stop here. They participate as school officials, and also, through the exercise of the ballot, in the local conduct of school affairs.

The extent of this participation is shown in the following table:

Status of women with respect to the direction of public education in States and Territories.[1]

States in which women may vote for school officers or are eligible for the same.	Classes of school officers for whom women may vote.	School offices to which women are eligible.	Number of women serving as county superintendents in 1900.	Remarks.
North Atlantic Division:				
Maine		Town[a]		[a] Town in the New England States signifies a division of a county; similar to township in Western States.
New Hampshire	District[2]	All		
Vermont	County, town, district[2].	County, town, district.		
Massachusetts	Town[2]	Town[a]		[b] If possessing the legal qualifications.
Rhode Island		Town[a]		
Connecticut	Town and district.	Town and district.		[c] In districts organized under the general school laws; i. e., nearly all in the State.
New York	District[2]	All[b]	12	
New Jersey	District[2]	District[c]		[d] As directors or comptrollers women vote for county, city, or borough superintendents.
Pennsylvania		County, district[d]	1	
South Atlantic Division:				[e] Limited to widowed mother or female guardian of a child of school age. (Statement of State superintendent, 1893.)
Florida	District[e]			
South Central Division:				[f] Inferred by the superintendent (1893) from their right to vote. By sufferance women have also served as county superintendents.
Kentucky	District[3]	District[f]	16	
Tennessee		County, city, and district.	9	

[1] Compiled from replies received at the Bureau of Education in response to a special letter of inquiry addressed to State superintendents February, 1893, revised by latest school laws and reports.

[2] Vote affects disposition of school money.

[3] Widows or spinsters who are taxpayers and guardians of children of school age vote on district tax.

Status of women with respect to the direction of public education, etc.—Cont'd.

a Women teachers are eligible for appointment upon these boards, but are never appointed.

b Limited to women who are heads of families.

c Apparently includes only city superintendents. There appears to be no legal barrier to women serving as district trustees, but it is not attempted.

d Limited to listed property owners.

e Women can not vote for State officers, as these are named in the constitution, which limits the votes to electors.

f On the condition that no other officers are voted for at same time.

g The courts have held that women are not eligible to the office of county superintendent, that officer being chosen at a general election. Women have, however, been elected to the office.

h Women can not vote for school officers. A bill authorizing them to do so was passed by the legislature in 1893, but was vetoed by the governor owing to lack of provision for distinguishing the vote for these officers from other civil officers.

[1] Vote affects disposition of school money.

REMARKS UPON THE TABLE.

From an examination of column 2 it will be seen that women have the right to vote for school officers in 27 States and 2 Territories. The extent of the right is indicated by the class of officers specified. In 9 States and 1 Territory women may vote for all elective school officers. The right thus broadly stated goes no further, however, in its essence than the apparently more restricted suffrage of the following States: New Hampshire, Massachusetts, New Jersey, and Minnesota, since, in these, offices not included in the woman's vote are filled by appointment.

It would seem probable that women would be eligible to the offices for whose incumbents they may vote. This is the case (column 3), excepting in Mississippi, where women who are the heads of families may vote for district school offices, but may not fill the same. We catch a glimpse here of the underlying conviction which has given rise to the whole movement. It begins with a recognition of woman's right, as a natural guardian of children, to exercise her judgment in respect to their education, and ends with the demand for her service as a public

expediency. In a few States, included in the above list, women are eligible to school offices other than those included in the suffrage accorded them.

These additional positions are filled by appointment, by vote of school boards, or by vote at a general election, in which women can not participate. This reminds us that, while there is a strong disposition to separate the educational from other civil affairs, the end has not been completely attained. Thus, questions of school tax and school appropriations can not always be managed apart from financial matters in general.

The number of women serving as district school officers appears to be comparatively large, but there are no complete statistics on this point. The number of women serving as county school superintendents in States having this office (column 4) has increased during the decade. For 18 States which reported this particular, both in 1891 and 1900, the increase is from 152 to 245.

It should be noted that in many States cities form districts under special school laws; where this is the case they are not included in the table. As a rule, however, women are eligible to the school boards of Northern and Western cities.

From the latest official reports it appears that women were serving on the school boards of 11 cities of over 100,000 inhabitants. In two States, Colorado and Idaho, women are at the head of the public school system, holding the position of State superintendent.

COEDUCATION IN COLLEGES AND UNIVERSITIES.

The policy of coeducation in colleges and universities of this country is intimately related to the history of the general movement for the higher education of women. The policy was inaugurated by Oberlin College, Ohio, founded in 1833. The original plan of this institution included a special department for women, who were to be allowed the privileges of such professorships in the several departments "as shall best suit their sex and prospective employment." This modified form of coeducation gave way before the pressure of circumstances, and in 1837 four women were admitted as full students to the freshman class of the college.

At that time there were a few seminaries or academies in different parts of the country in which girls might pursue courses of study in the classics, modern languages, ethical and esthetic branches.

Bradford Academy, Bradford, Mass., founded in 1803 as a school for boys and girls, offered a four years' course in Latin and Greek, but laid no claim to being more than a preparatory school. It was conducted as a school for both sexes until 1836, when the boys' department was closed.

Troy Female Seminary, opened in 1814, but not chartered until 1837, made no pretensions to collegiate rank. Its founder, Mrs. Willard, was, however, an ardent advocate of higher education for women and did much to stimulate public action in the matter, not alone by her eloquent appeals, but by the practical work of the seminary. As early as 1820 she welcomed a distinguished company of visitors to the school for the novelty of hearing a class of girls pass an examination in geometry.

Wesleyan Female College, Macon, Ga., may be called the pioneer institution of the South for the collegiate education of women, as it received a charter in 1836, three years after Oberlin was founded, authorizing it to confer degrees upon women.

In the same year Mary Lyon won from the Massachusetts legislature the coveted sanction of a charter for Mount Holyoke Seminary. Her administration of this institution and her public advocacy imparted a powerful impulse to the general cause of woman's education which was beginning to agitate many earnest

minds in different sections of the country. Seminaries for women rapidly multiplied in the period 1836 to 1860. These institutions filled, as they still continue to fill, a very important place in the educational provision of the country, but as time passed it became evident that their work and aims were incompatible with those of higher education in the college or traditional sense of that expression. They emphasized the need of special endowments, equipments, and professorships for that work and of the associated efforts of students all alike prepared for advanced studies.

The development of public schools during the same period, 1836 to 1860, must be counted among the influences that were revolutionizing the ideal of woman's education. As early as 1825 a high school for girls had been opened in Boston. The city council appropriated $2,000 for the experiment, but before the end of the second year the school had become so popular, the pressure for admission was so great, and the expenditure which it threatened so alarming that the school committeee, under the lead of the mayor, Josiah Quincy, abandoned the project. This early experiment furnished a strong argument for coeducation in high schools as a measure of economy. The subject was not, however, revived in Boston until 1848, when a separate high school for girls was established on a permanent basis. This school had a normal department, and was, in fact, an outcome of the movement for improving the teaching service of the public schools.

This movement, inspired by Horace Mann in Massachusetts and by Henry Barnard in Connecticut, achieved its first practical results in the establishment of a normal school at Lexington, Mass., in 1839. The academic work of the school was maintained on a high plane, and furnished practical proof of the capacity of young women for serious and systematic intellectual efforts. This evidence was increased by the work of the medical school for women, which, started as a class in 1848, was incorporated in 1850 as the New England Female Medical College.

Thus prior to 1860 the subject of the higher education of women was practically before the people in two classes of institutions, the one aiming at the development of character and power through intellectual discipline, the other offering special preparation for professional careers. The movement for the higher education of women received unexpected stimulus and resources by the land-grant act of 1862, appropriating about 10,000,000 acres of land for the endowment of colleges "to teach such branches of learning as are related to agriculture and the mechanic arts in such manner as the legislatures of the States may respectively prescribe in order to promote the liberal and practical education of the industrial classes in the several pursuits and professions of life."

In the Northwestern States this land grant was generally regarded as a provision upon which women had the same claim as men. The democratic spirit of the Western States and the general influences of pioneer life tended irresistibly toward the policy which, started by Oberlin, had already spread to the State universities of Iowa and Wisconsin, endowed by the earlier Government reservation of 1787. With few exceptions the land-grant colleges of the West were coeducational from the start, and, following the precedents of Iowa and Wisconsin and the later but notable example of Michigan University, the State universities of that section adopted the same policy. In the East, on the contrary, where the demand for collegiate education for women had become equally urgent, the influences made for the opposite course. Vassar College, founded in 1861, was the pioneer of a group of separate colleges for women whose requirements were of the same order as those of the older colleges for men.

Between the two extremes of coeducation institutions, as maintained in the West, and the separate colleges for women, characteristic of the Eastern States, two modified systems have developed. The one is that of distinct colleges for men

and for women forming integral parts of a university organization, illustrated by the colleges of Western Reserve University, Cleveland, Ohio, and by the Women's College of Brown University, Providence, R. I.; the other modification is that of a separate college for women annexed to, but not an integral part of, a university, as Barnard and Radcliffe. These modifications show how strong and universal is the demand that women shall enjoy the largest opportunities for culture and training; at the same time they illustrate the disposition everywhere manifested to adjust these opportunities to prevailing conditions and sentiments.

The most impressive fact in the history of the general movement for the higher education of women is the increase in the number of coeducation colleges and universities. In 1880, that is, forty-seven years from the founding of Oberlin, more than half the colleges of the country—51.3 per cent (technical schools not included)—had adopted the policy. In the decade 1880 to 1890 the proportion increased to 65.5 per cent. In 1900 it had risen to 71.6 per cent.

In the number of coeducational institutions reporting to this office in 1891–92 were included 24 State universities and 8 private foundations of the highest order. Since that time there have been added to the list 6 State universities, 3 Territorial universities, and 6 private institutions of high order. Several colleges have also adopted coeducation during the last decade which in respect to scholastic standards and present equipments might well be classed with some of the State institutions included above, but for obvious reasons the latter must exert an influence in the development of their States beyond what is possible for any local college.

The list of coeducational State, Territorial, and private institutions referred to comprises the following:

State and Territorial universities: Alabama (coeducation, 1893), Arizona (Territorial, opened 1891), Arkansas (changed to State University 1899), California, Colorado, Idaho, Illinois, Indiana, Iowa, Kansas, Maine (changed to State University 1897), Michigan, Minnesota, Mississippi, Missouri, Montana (opened 1895), Nebraska, Nevada, New Mexico (Territorial, opened 1892), North Carolina (adopted coeducation 1896), North Dakota, Ohio, Oklahoma (Territorial, opened 1892), Oregon, South Dakota, Tennessee, Texas, Vermont, Washington, West Virginia, Wisconsin, Wyoming.

Private universities: Boston University, Brown, Chicago (1892), Columbian (Washington, D. C.), Cornell, De Pauw, Leland Stanford Junior (opened 1891), University of Pennsylvania, Rochester (1900), Vanderbilt.

Graduate departments or professional schools only: Clark (women admitted 1900), Yale, Columbia (graduate department 1900), Johns Hopkins (medical school 1893).

Of the institutions that have been added to the above list since 1890, as indicated by the parenthetical explanations, 2 have simply been converted into State universities, and remain coeducational as they were previously; 6 have been established during the decade, and 6 have adopted coeducation either in the undergraduate or some graduate department. It will be seen that while Vanderbilt University and the universities of Mississippi, Tennessee, and Texas were the only Southern institutions of high repute or large possibilities included in the list published in 1892, two Southern universities, namely, University of Alabama and University of North Carolina, have since adopted the policy.

The comparative view presented in the table (p. 1234) would seem to indicate that coeducation is more general in the South Atlantic and South Central divisions than in the North Atlantic. The significance of the showing is, however, modified by the special character of the courses in the institutions of the two former-named sections in which many of the women students are enrolled.

The colleges for colored people, which form about 15 per cent of the whole number included in the statistics of the South Atlantic and South Central divisions, also lessen the force of the comparison, as these must of necessity be adapted to the special circumstances of their students.

In several Southern States opposition was formerly made to the opening of the universities to women, on the ground that the number of women desiring these privileges would be too small to justify the changes involved. To this was replied that the expense and labor incurred would be offset by the advantages of retaining at home the girls who sought in Northern institutions the opportunities denied them in their own States. This consideration has undoubtedly had weight in determining other Southern universities to admit women on the same terms as men.

It should be observed with respect to coeducation in the higher institutions that rumors of a reaction in sentiment which from time to time arise have always proved upon investigation to be grossly exaggerated or absolutely groundless. It often happens that special provisions or adjustments, such as are required in all institutions, give rise to statements that totally misrepresent the significance of the action. Such is the case with respect to the recent action of the authorities of Leland Stanford Junior University in limiting the number of women students. The actual causes of this action, as explained in a letter (dated May 8, 1902) from the president of the university to the Commissioner of Education, are as follows:

A rule has been established in this university by which the attendance of women is limited to 500 at any one time. This is not because of any opposition to women, or to the principle of coeducation, which the university fully indorses. The action of the university is in accordance with a promise made to Mr. Stanford. He was anxious that the institution should be partly technical and partly graduate in character, subordinating the college work and general-culture courses to the higher and more specialized work. At the beginning Mr. Stanford was opposed to the admission of women, not as women, but because he was afraid that they would tend to detract from the specialized and technical aims of the institution, as the demands of women students are more distinctively in the line of general culture. Mrs. Stanford, on the other hand, from the first favored the admission of women, but promised her husband that if the number ever increased so as to affect the character of the university she would consent to a limitation of the number. In accordance with this promise, when the number of women reached 500, or a little more than one-third of the total number, Mrs. Stanford felt that it was necessary to fix a limit, and the figure of 500 was selected. As in the carrying out of this limiting rule we shall make it apply to the entering class of young women, it will not debar any young woman from attending the university for the higher and more important work for which the institution will ultimately come to stand. The whole matter has no significance whatever in relation to the present criticisms on coeducation.

DAVID S. JORDAN, *President.*

Female teachers and professors and students in several classes of institutions.

[1] Secondary and normal schools, 1890-91.
[2] Includes colleges endowed by the land grant of 1862 and private technical schools not included under universities and colleges.

The foregoing table shows the extent to which women are engaged in the teaching services of the higher institutions. An interesting outcome of the movement for the college and professional education of women in the United States is the admission of women to other professional careers. According to the census of 1890 there were at that date 143 women ministers, 4,557 physicians and surgeons, 337 dentists, and 203 lawyers. In this connection should be noted also the profession of librarian, which has not yet been included in the census returns. This service increases the careers open to college women.

Funds for the assistance of women students.—In respect to the aid extended by means of scholarship and other funds women students have comparatively little advantage. Experience has abundantly proven that without such aid many of the most promising students among young men would never be able to push their studies beyond a very elementary stage. This is equally true with respect to women students. During the last decade the funds available for the latter have been considerably increased, but they still remain relatively much inferior in amount to those allotted to men.

The following tabulations for the year 1890 were made from a careful analysis of all the data bearing upon this subject at that time available. No complete analysis of these somewhat complicated accounts has since been attempted. With respect to the institutions included in the summaries for the year named the situation presumably remains about the same. The tables for the later dates relate chiefly to institutions that have been founded or opened to women since 1890 or to institutions that were not included in the earlier tabulations, which latter are indicated by stars. As regards the few institutions included in the later tables and also in the summaries for 1890 the increase or decrease in the number of funds available for women has been indicated so far as known. The particulars, by institutions, are from a report of the Association of Collegiate Alumnæ for 1899, excepting when otherwise indicated.

[4] Fund for fellowships.

The following additional particulars are from the report of the Association of Collegiate Alumnæ, already specified:

ARCHÆOLOGICAL INSTITUTE OF AMERICA.

[Secretary's office, 312 West Eighty-eighth street, New York City.]

AMERICAN SCHOOL OF CLASSICAL STUDIES AT ATHENS—AMERICAN SCHOOL OF CLASSICAL STUDIES IN ROME.

Fellowships in Greek archæology.—Two in number. Open to men and women, Bachelors of Arts of any college or university in the United States, and to other American students of similar attainments. For the study of Greek archæology at the American School of Classical Studies at Athens. Tenable for one year. Value, $600 each.

Agnes Hoppin fellowship.—Available 1900-1901. Open to women only. For the study of Greek archæology at the American School at Athens.

Fellowships in Roman archæology.—Two in number. Open to men and women. Value, $600 each. Tenable for one year.

Fellowship in Christian archæology.—For study at the American School in Rome. Open to men and women. Value, $500. Tenable for one year.

ASSOCIATION FOR MAINTAINING THE AMERICAN WOMEN'S TABLE AT THE ZOOLOGICAL STATION AT NAPLES.

[Secretary's office, 1 Berkeley street, Cambridge, Mass.]

This association maintains at the Zoological Station at Naples a table for research, and is entitled to appoint to the table qualified students, who are furnished by the station with all materials, apparatus, and assistance free of cost.

ASSOCIATION OF COLLEGIATE ALUMNÆ.

[Secretary's office, Richmond Hill, N. Y.]

European fellowship.—For advanced study in a foreign university. Open to women graduates of colleges belonging to the Association of Collegiate Alumnæ. Value, $500. Tenable for one year.

Scholarship in German.—A scholarship in German in the American Home School in Berlin is offered to the Association of Collegiate Alumnæ by Mrs. Mary Bannister Willard and Frau Dr. Hempel. Candidates must be women graduates of colleges belonging to the association.

BALTIMORE ASSOCIATION FOR THE PROMOTION OF THE UNIVERSITY EDUCATION OF WOMEN.

Foreign fellowship.—For study in a foreign university. Open to women only. Value, $500. Tenable for one year.

WOMAN'S EDUCATION ASSOCIATION OF BOSTON.

Foreign fellowship.—Value, $500.

The foregoing facts and statistics answer in part only inquiries as to coeducation in colleges and universities. As regards the conditions under which this policy may be maintained and its effects upon students and scholastic standards, only those having personal experience in the conduct of the institutions can speak with authority. Hence copious citations from the reports of college presidents, statements of professors, etc., are included in the next division of this chapter, under the head of the "Literature" of the subject.

Their general tenor shows that wherever coeducation has been tried the apprehensions respecting its effects have been dispelled. There are no instances of the abandonment of the policy after adoption in colleges or universities that had made suitable provision for the new class of students.

The "Literature" of the subject includes also discussions of coeducation by men who have shaped the public-school policies of our country and by specialists who argue from physiological and social standpoints.

THE LITERATURE OF COEDUCATION.

I.—CITATIONS FROM OFFICIALS IN CHARGE OF PUBLIC-SCHOOL SYSTEMS.

In selecting from the accumulated literature of coeducation material for insertion here the purpose has been to bring together for ready reference the strongest arguments and the widest experience pertaining to this important feature of our educational life.

Although, as we have seen, experiments in coeducation were made in the first half of the last century, general interest in the subject was not manifested until the movement for the higher education of women had become really national in extent. The public schools were naturally affected by this movement, since a larger proportion of college students received their preparation in public high schools, and the first important utterances on the subject emanated from officials in charge of city systems which had afforded practical experience in the conduct

of coeducational classes. Our survey of this literature begins, therefore, naturally with citations from these authoritative sources.

COEDUCATION OF THE SEXES.

[Dr. W. T. Harris, in the Report of Public Schools, St. Louis, Mo., 1872-73, pp. 105-120.]

Previous to 1858, in our grammar schools, the sexes had been entirely separated. Only in the primary schools and in the high schools, then recently established, had the experiment of coeducation been made. In that year the Franklin Grammar School was opened as a "mixed" school, and after it, one by one, the other grammar schools were reorganized until all except the Eliot School were "mixed" schools, receiving into the same rooms and classes both sexes. Having had an unusually good opportunity to watch the results, and having been educated myself partly in "mixed" schools and partly in schools open only to the male sex—the former being sundry district schools in country towns, villages "academies," and city grammar schools, the latter being three classical schools or academies and a college—I felt considerable confidence in the views then presented. My observations had led me to indorse the statement of Richter:[1] "To insure modesty I would advise the education of the sexes together; for two boys will preserve twelve girls, or two girls twelve boys, innocent, amidst winks, jokes, and improprieties, merely by that instinctive sense which is the forerunner of natural modesty. But I will guarantee nothing in a school where girls are alone together, and still less when boys are." I had noticed that the atmosphere of "mixed" schools was desexualized, where that of separate schools seemed to have a tendency to develop sexual tension. Again, whatever tendency toward indecency might manifest itself was far more easily checked in "mixed" schools by reason of the cross fire of watchfulness which made intrigue far more difficult to keep secret. The brothers and sisters and other relatives and intimate acquaintances of the pupil attended the same school, and every act was scanned from two points of view—the boys being participant in boys' gossip, and the girls being participant in girls' gossip, and the barriers being removed within the precincts of the family, parents could not fail to have a more faithful account of the behavior of their children than when isolated in different schools. Brothers and sisters mutually protect each other from shame. Besides this, the fact that the chief association between the sexes in "mixed" schools takes place under the eye of the teacher and in recitation, wherein the contest is purely intellectual, and where the manifestation of mere femininity—softness and sentimentalism—would cause the pupil to lose rank as a scholar, and where mere masculinity—roughness and willfulness—would make an unattractive spectacle, leads one to expect that the tendency of coeducation is to elevate the standard of admiration from mere external charms of person to the spiritual graces and gifts which lie deep in the character.[2]

---

[1] Recently cited from Richter's "Levana," by Dr. Clarke in his Sex in Education.

[2] The following statements were made in the report alluded to (1870), and I have had no occasion to modify the views therein expressed:

"That which theory establishes and experience verifies may be safely followed. The coeducation of the sexes within the limits of certain ages and within certain sections of the United States may be considered approved by the twofold demonstration of theory and practice. Whether these limits of age and place may be transcended with advantage is a question for practical experiment to solve. Theory is in favor of the extension of coeducation far beyond present practice, and, as a fact, the latter is creeping along conservatively up to the standard of the former. The admission of females into colleges and scientific institutions, heretofore open exclusively to males, is the straw on the moving current, and tells what is coming. It is in accordance with the spirit of our institutions to treat women as self-determining beings, and as less in want of those external artificial barriers that were built up in such profusion in past times. We give to youth of both sexes more privileges or opportunities for self-control than are given to the Old World society. Each generation takes a step in advance in this respect.

"Occasionally, as in San Francisco, there is a returning eddy which may be caused by the unbalanced condition of society found on frontiers. Old cities like New York and Boston may move very slowly in this direction, because of enormous expense required to change buildings and school yards so as to adapt them to the wants of 'mixed schools.' In fact, the small size of school yards in many cities renders this change next to impossible. Western cities take the lead in this matter and outstrip the East. Within fifteen years the schools of St. Louis have been entirely remodeled on this plan, and the results have proved so admirable that a few remarks may be ventured on the experience which they furnish. I wish to speak of the effects on the school system itself, and of the effects upon the individual pupils attending.

"I. Economy has been secured through the circumstance that the coeducation of the sexes makes it possible to have better classification and at the same time larger classes. Unless proper grading is interfered with and pupils of widely different attainments brought together in the same classes, the separation of the sexes requires twice as many teachers to teach the same number of pupils. This remark applies, of course, particularly to sparsely settled districts. The item of economy is very considerable, but is not to be compared with the other and greater advantages arising.

"While it is conceded by the opponents of coeducation that primary schools may be mixed to

But the question of healthy moral tone is not the only one involved. Granting the most favorable view of this phase of the subject, we have not yet settled the question whether it is desirable for women to have the same course of study that men have, nor have we touched that other much-debated question arising from physiological differences.

The question of education has always pointed back to that of vocation and destiny, for education is a process of preparation for an end. Thus it involves the theory of the life sphere of the pupil. Again, besides "vocation and destiny," there is an "absolute state of man," as Pestalozzians tell us, for which every human being has a right to educate himself and be educated. The culture of the rational soul, the intellect, the will, and the affections, is the privilege of every human being, whether male or female. More than this, it is a duty; and the materialism, at present so fashionable, that finds its delights in chilling the fervor of an aspiration by suggesting physiological limitation as that which should determine the question of the culture of the rational soul and of participation in the spiritual heritage of the race, will have exactly the opposite effect from that intended. It will produce an asceticism proportioned to the amount of conviction occasioned by such physiological doctrines, and to the consequent intensity of the recoil. If our highest norm is "chiefly clinical," and the mind with its culture is subordinate to the organization of the body, as is believed by (shall I say) a great majority of physiologists and physicians at the present day, at the least there are very many things relating to human history and institutions which become at once insoluble contradictions, the nearest example of which is the evolution, in the brain organism, of the theory in question.

One does not need to be reminded that human history is a record of deeds done in the cause of spiritual ideals, and that these ideals are the bases of all our institutions of civilization. The deeds of history, moreover, that are considered worth recording are most strangely subversive of physiological and hygienic laws, most of them involving such waste of human life as to lead even the materialistic spectator to believe that life as such is of small moment compared with some phantom

---

advantage, they with one accord oppose the system for schools of a higher grade. Now, what is singular in our experience is the fact that our high school was the first experiment on this plan for classes above the primary. Economy and better classification were the controlling reasons that initiated this experiment, and from the high school the system has crept down through all the intermediate grades. (In our high school the sexes are assigned to separate study rooms, and meet only for actual recitation in the same room.) What had been found practicable and satisfactory in the highest grades could not long be kept away from the lower ones.

"II. Discipline has improved continually with the adoption of mixed schools. Our change in St. Louis has been so gradual that we have been able to weigh with the utmost exactness every point of comparison between the two systems.

"The mixing of the male and female departments of a school has always been followed by improvement in discipline, not merely on the part of the boys, but on that of the girls as well. The rudeness and abandon which prevails among boys when separate at once give place to self-restraint in the presence of girls. The prurient sentimentality engendered by educating girls apart from boys—it is manifested by a frivolous and silly bearing when such girls are brought into the society of the opposite sex—this disappears almost entirely in mixed schools. In its place a quiet self-possession reigns. The consequence of this is a general prevalence of milder forms of discipline. Boys and girls originating, according to nature's plan, in the same family as brothers and sisters, their culture should be together, so that the social instincts may be saved from abnormal, diseased action. The natural dependence of each individual upon all the rest in society should not be prevented by isolating one sex from another during the most formative stages of growth.

"III. Instruction is also greatly improved. Where the sexes are separate, methods of instruction are unbalanced and gravitate continually toward extremes that may be called masculine and feminine. The masculine extreme is mechanical formalizing in its lowest shape, and the merely intellectual training on its highest side. The feminine extreme is the learning-by-rote system on the lower side and the superfluity of sentiment in the higher activities. Each needs the other as a countercheck, and it is only through their union that educational methods attain completeness and do not foster onesidedness in the pupil. We find here that mixed schools are noted for the prevalence of a certain healthy tone which schools on the separate system lack. More rapid progress is the consequence, and we find girls making wonderful advances even in mathematical studies, while boys seem to take hold of literature far better for the influence of the female portion of the class.

"IV. Intellectual development is, as already indicated, far more sound and healthy. It has been found that schools kept exclusively for girls or boys require much more surveillance on the part of the teachers. The girls, confined by themselves, develop the sexual tension much earlier, their imagination being the reigning faculty and not bridled by intercourse with society in its normal form. So it is with boys on the other hand. Daily association in the class room prevents this tension and supplies its place by indifference. Each sex testing its strength with the other on an intellectual plane in the presence of the teacher—each one seeing the weakness and strength of the other—learns to esteem what is essential at its true value. Sudden likes and dislikes, capricious fancies, and romantic ideals give way for sober judgments not easily deceived by mere externals. This is the basis of that 'quiet self-possession' before alluded to, and it forms the most striking mark of difference between the girls or boys educated in mixed schools and those educated in schools exclusively for one sex.

"That the sexual tension be developed as late as possible, and that all early love affairs be avoided, is the desideratum, and experience has shown that association of the sexes on the plane of intellectual contest is the safest course to secure this end."

idea secreted by the cells of the brain. To such a view, human history is a record of uninterrupted fanaticism, and the fruits of preaching the physiological gospel to young men or women in the nineteenth century will only produce fanaticism of a kind that is not needed. By these remarks one would not intend to deprecate the study of physiology and hygiene, nor deny the function of the brain and nerves as instruments of manifestation, nor the application of hygienic laws to education. One objects only to the "animus" with which the thing is done, and to the theory of life and mind which is implied as their major premise by certain prolific writers on the subject, and one insists upon the doctrine that mind is essential self-determination whose responsibility extends so far as commonly to make it liable for the proper hygienic determination of the physical conditions of its manifestation. The physiological motto should be—Know thyself, not as a product of organism, but as a producer of organism.

In our district schools the ages of pupils range from 6 to 15 years, averaging only 10 years. In the high school the ages range from 12 to 20 years, averaging about 16. The physiological question, therefore, scarcely affects the district schools. But the pupils of the high school are just at those ages which the physiological question touches most vitally. So far as it concerns the question of coeducation at those ages, it is simply this: Whether the necessities of class recitation, with its regular recurrence and steady progress from week to week, impose any conditions upon one sex that can not be borne by it without unreasonably taxing the physical organism. It is claimed in the affirmative that the regular work which young men perform without injury is unsuitable to young women. "Identical coeducation" is therefore to be forbidden. Persistence being the type of the man and periodicity the type of the women, it is argued that they can not be educated together, nor in the same manner. Stated in plain school language, classes imply regularity or persistence in work, and this is injurious to girls of the ages between 14 and 20 years. But this statement at once relieves the question of any special reference to coeducation of the sexes in the same school. When one can point out a plan for a girls' school wherein there is no necessity for regular recitation and regular work, and wherein the organization is such that three-fourths of the class do not suffer by the constant absence of one-fourth of the class, he will have discovered a new organization which wise educators will hasten to adopt, even for boys' schools. For the average attendance of boys on recitations is less than 75 per cent, when the schools throughout the country are considered, although it is common for city schools to secure 90 per cent and over. This per cent of irregularity has forced educators to organize careful systems of grading and classification, by which there may be secured an amount of elasticity sufficient to save the regular pupil from the injurious effects of his neighbor's absence, and likewise to save the irregular pupil from the necessity of overwork to keep up with the former. As it is, after all has been done, the evil of irregularity is counted the most serious drawback that we have to contend with. But the statistics of the attendance of girls in the St. Louis high school, compared with that of their percentage in scholarship, does not allow us to conclude that the progress of the classes suffers on their account. No satisfactory comparison can be made between the work of girls and that of boys; the problem involves too many elements; not only quantity and quality of work, but a consideration of the aims and motives that stimulate its performance. It is safe to say that no practical difficulty is experienced in the high schools on account of the larger per cent of absence of the girls. There are, it is true, "clinical cases" that form the exceptions to this rule. Such cases, however, are no more difficult to manage in mixed schools than in separate schools. Of course it is out of the question to adopt a system of individual instruction for all girls between the ages of 14 to 20. It would practically shut out from a fair education nine-tenths of the entire sex, and the remaining tenth, lacking the discipline of class work, would not acquire a thorough education.

Leaving the consideration of the physiological phase of the subject, it remains to be considered whether the vocation of women necessitates a different course of study from the general one already marked out for the primary and secondary schools. The question of vocation again involves the physiological question and the duties arising from particular natural functions. Under all circumstances woman's sphere must include a closer relation to family life than the sphere of man does. The intermediate province of civil society including the various phases of productive industry through which the wants of food, clothing, and shelter are provided may or may not by its nature belong to woman. The third province, the state, is farthest removed from the sphere of nurture, which is the peculiar function of the family. In order to discuss intelligently this question we must regard it in its historical evolution and study the attitude of the sexes toward the

three great institutions above named, the family, civil society, the state, under the different stages of human progress.

The savage or barbarous stage of society—the age previous to that of productive industry, or the triumph of labor by means of division—is to be characterized as an age in which whatever is fixed and routine, whatever can be accomplished by patient endeavor confined to prescribed forms or conventionalities, falls to the lot of woman. Man is driven by the sudden and severe exigencies contingent to savage life to hold himself in reserve for violent and temporary efforts such as leave him unfit for routine work. War and hunting being the necessary pursuits of man, it is necessary to leave to the woman what little agriculture and manufactures there may be carried on.

The slow growth of peoples from the savage state is marked by the division of labor: first, slavery appears, and its advent partially relieves woman as a sex; the slaves of both sexes labor together at the same tasks, while the women of the free class begin to retire within the family. From this stage on there is a growth of the antithesis between the family and civil society. In the former (the family) is found more and more the sphere of woman, in the latter (that of civil society), that of man, until the culmination of the epoch of productive industry which closes the second stage of human development or of progress in society.

From the second step of development arises the third epoch, that of machinery, wherein more is produced with less industry. Man gets emancipated from physical labor, but is compelled by the conditions of his civilization to compensate for it by activity of thought. But the ideal activity of thought is the activity of man's essence, and hence in being compelled to energize scientifically and with organizing ideas he achieves indirectly the very highest aim of his being.

This distinction of the civilization connected with the age of machinery from that of productive industry, in its special sense, is very important. It brings with it the elevation of woman to more general activities, to a sphere above the tension of sex, and above the limitations incident to peculiarities of natural organization. Not merely the vanishing of the distinctions in spiritual life that are founded on sex takes place in this epoch, but the disappearance of those that are founded on caste and occupation of race, of birth, or wealth, altogether throughout the human family.

In the savage state of man the vocations of the sexes separate widely into the extremes of drudge and warrior. The education of woman in this period consists in acquiring a knowledge of the few arts and dexterities in the possession of the tribe, arts representing the whole sphere that will subsequently separate into the antithesis of family life and civil society, while the education of savage man relates to war and the chase, a field of activity wherein may be found the germ of the future political organization and the directing power of civil society. Thus in this phase of life the division of sex is the basis of a conservative side of society (the sphere of woman), which provides for the finite wants, such as food and clothing, and nurtures the young, thus forming the internal economy. Over against this is a negative and a destructive side (the sphere of man), which is turned against external foes and shields society from the violence of man and beast. Thus the province of man in this state of society has its positive aspect in the fact that it marks out the channels and sets up the limits or prescribes the forms of routine work which, as before stated, falls mainly to the share of woman in savage life. Thus the savage man fills the rôle of the lawgiver and defender; he deals with the general or universal interest, the state of society as a whole, while woman deals with the particular or finite interests, the sphere of wants and necessities.

Ascending above this into the stage of industrial civilization, we find in progress an intermingling of the two former spheres. On the one hand the man who occupied the position of director and defender, and who appeared in the rôle of the generic or universal, now descends to the extreme of particularity, and, through division of labor, takes on himself the limitation which is required by special branches of industry. He descends to the particular and specific so far that he limits his whole life activity to the creation or production of some part or portion of a product of industry that may be joined to a hundred other parts before it becomes an article of any use whatever. His whole occupation, for instance, may be that of tying threads or of cutting off pins. Man thus limits himself, as individual, to the finite and particular, in order that he may, through combinations with civil society, make up a concrete whole of surpassing grandeur. In this second stage of society woman withdraws more and more within the family and finds in it a whole—inasmuch as each family contains a sphere or circle of duties and occupations separable from the sphere of civil society as a whole. In the total or whole of civil society each laborer performs some one function, however minute,

that contributes to form that whole; there is only one total—that of the whole industrial community; on the other hand, in the institution of the family, each family is a whole, a reflection of the general type. On this account woman represents a generic or universal interest—that of the totality of the family—in the second stage of historic development, while man represents a particular interest in his functions as member of civil society. Each woman in the family has the entire round of duties of that sphere to learn and perform, while the man has not to know all the trades and vocations of society, but only his infinitesimal fraction thereof.

From this distinction between the family and civil society flows a well-defined difference in education. While the boy is to be educated to concentrate all his energies in the pursuit of one specific end—educated to limit himself in order that he may manage with intensity of force and high achievement of skill some special department in the articulated whole of the grand process of society—the girl must be educated to be versatile, quick to turn from one thing to another, to be on the alert for emergencies, and not so absorbed in a single aim as to be oblivious of any one of the manifold phases of her entire sphere—the sphere of the family. Thus it will appear that her culture in the second stage of the growth of society resembles, in general outline, that of a man in the first stage. Since man, as savage, faced the uncertain, the indefinite, and was obliged to be constantly on the alert, he dissipated his force and utterly unfitted himself for dealing with the definite routine task and the prescribed duty, and hence these were assigned to woman.

No writer has penetrated deeper into this relation of occupation to sex than Goethe. He enunciates clearly the principle as he finds it in his time, and his deep-seeing mind catches a few glimpses of the coming epoch wherein the antithesis of the second stage of human society is to be canceled and solved.

"Men," he makes one of his characters say, "should wear a uniform from their childhood upward. They have to accustom themselves to work together; to lose themselves among their equals; to obey in masses and to work on a large scale. Every kind of uniform, moreover, generates a military habit of thought and a smart, straightforward carriage. All boys are born soldiers, whatever you do with them. * * * But woman should go about in every sort or variety of dress, each following her own style and her own likings, that each may learn to tell what sits well upon her and becomes her, and for a more weighty reason as well—(N. B.) because it is appointed for them to stand alone all their lives and work alone. * * * Observe a young lady as a lover, as a bride, as a housewife, as a mother—she always stands isolated. She is always alone and will be alone; even the most empty-headed woman is in the same case. Each one of them excludes all others. It is her nature to be so—(N. B.) because of each of them is required everything which the entire sex have to do. With a man it is altogether different. He would make a second man if there were none. But a woman might live to an eternity without even so much as thinking of producing a duplicate of herself." In these words we see how completely Goethe comprehended the spirit of the civilization in which he lived—a civilization now just beginning to show signs of transition to a new one. Generalizing his statements, he might have said "when that upon which one labors is universal, i. e., a general element in the supply of a general want, association may come in and the individual limit himself to a uniform particular activity, to a trade or special branch of a trade. But not so when the object of labor is a diversified one, a totality of contingent particulars; there each laborer must perform all; no division of labor can transpire within that sphere—the sphere of the family, for example." In the spirit of his time Goethe adds: "In how few words the whole business of education might be summed up, if people had ears to hear. Educate the boys to be servants and the girls to be mothers, and everything is as it should be." "To be servants"—that is to say, to subordinate and limit themselves to special, prescribed occupations; "to be mothers" would mean to cultivate that provident foresight and wealth of resources constantly required in the family.

In another passage Goethe hints at the possibility of ascending above these limitations which arise from the tension of sex and which are thus presupposed by the organization of society in his and our own age. "There is no doubt," says he, "that in all civilized nations women in general are superior to men, for where the two sexes exert a corresponding influence over each other, man becomes effeminate, and that is a disadvantage; but when a woman acquires any masculine virtue, she is the gainer, for if she can improve her own peculiar qualities by the addition of masculine energy, she becomes almost a perfect being."

Out of the completest realization of the division of labor arises the conquest of nature by machinery. In this conquest man becomes truly free and independent, inasmuch as he does not any longer have to employ direct struggles to force nature

to yield her products in a form suitable for his use; he now makes nature do this. Fastening a machine to nature, he harnesses the elements, and thus produces an activity whose product subserves his rational intelligence. Instead of enslaving himself in this particular, in order to become free in the aggregate of society, he now finds his whole activity to be a directive or supervising activity, and thus an activity of thought and ideas, as well as of mechanical exertion. This third epoch is continually arising from the second one, just as fast as the ultimatum of simplicity is reached in any occupation and the labor-saving machine comes in to relieve the hand.

Man thus is continually ascending into the realm of thought and directive power. In this region there is no longer any unmodified physical nature. Ideas are neither male nor female; they are universal. So, too, is directive power. Culture in universals is the necessary education for it.

While in the division of labor the feminine organization has special adaptations, and special unfitness for one sphere or another; on the contrary, in the world of directive activity, the special fitness or unfitness arising from sex is a vanishing element, and there approaches an ideal wherein a concrete identity of spheres and vocations is to be found. Not that this implies annihilation of nature and sex, but only a complete and thorough subordination of them, just as now it is quite as feminine as masculine to attend school and learn to read. Sex will always remain in its narrow sphere, its modifying tone or tinge will extend into several higher spheres; but in science, in religion, and art its effects will be scarcely traceable. And the ascent from direct manual labor to directive labor, through the introduction of machinery, is accompanied with such increase of productivity in labor as practically to lift all individuals into easy circumstances, having most of their time for higher pursuits.

To the mere animal, sex is the most important fact of his existence, and with good reason, for he lives only in the species, and does not possess individual immortality. A conscious being is, by the fact of consciousness, elevated above the sphere of sex, and becomes immortal as individual.

To sum up the views here advanced, there seem to be three epochs in education derived from the changing status of the sexes toward each other as determined by vocation:

1. There was the condition of women in the savage state when division of labor within civil society existed only in germ, and the functions of family nurture and of providing food and clothing and shelter—the sphere of productive industry and civil society—belonged to women. Man gave his whole attention to defense, the province of the State, and the police function. He also hunted in the forests for a supply of meat. Hunting was partly industry, partly defense from wild animals.

2. Out of the savage state rises the epoch wherein civil society becomes fully developed, the era of productive industry and division of labor. The nation takes the place of the tribe, and frees man from perpetual police service. He settles into productive industry, and as he occupies civil society, woman retires within the family. Persistency is the type of labor in civil society. Periodicity the type of labor in the family; repetition of the same thing, concentration upon one thing, the characteristic of labor in the industries; diversity and versatility the characteristic of the labor within the family; engaged this hour preparing the breakfast and washing the dishes; the next making the beds and sweeping the rooms; the next cleansing and mending the clothing; the next knitting or weaving; the next, and at intervals the whole day, attending to the myriad wants of childhood. The labor within the family is as diversified as in civil society, and could be improved in skill by division of labor; but it does not admit of division of labor to the same extent. The woman prepared for the life of the family would therefore seem to need an education which would give her versatility, while the boy should have an education which would fit him for infinite concentration upon one thing. The girl should be educated to stand alone and to work at the confusing variety of tasks in the family. But the boy should learn to work in combination with others, to subordinate himself as a member of an organization.

For the second stage of social development, therefore, persistence and periodicity would seem to characterize, respectively, the spheres of labor of men and women.

3. But this phase of civilization is not the highest and final one. Out of the extreme division of labor arises the possibility of machinery. When labor is divided so minutely that each branch of it consists in a simple movement of the hand, arm, or body, the human intellect contrives a cunning mechanism and harnesses some natural power to it, perhaps water power or steam power, and straightway he becomes a mere manual laborer—a supervisor. From a slave he becomes a master. The machine gets thrust in everywhere between the human

hand and the raw material. More than this, the intellect contrives combinations, and complicated machines grow out of simple ones. The human being becoming more and more powerful again, physical force is less and less needed in the supervision of the machines. Versatility and agility come more and more into play. The female is needed again in the industries, and she comes back to tend the power-loom and to make Waltham or Elgin watches. In the third and highest period of industrial development, therefore, where physical strength is less and less in demand and alertness more and more in demand, woman's sphere comes to be common with that of man, and she needs an education in the sciences, arts, and accomplishments necessary to the man. Besides this the realm of productive industry and division of labor, aided by labor-saving machines, encroaches upon the domain of special labor confined within the limits of the family and conquers one after another its drudgery, and reduces it to a general branch of industry. The power loom, the sewing and knitting machines, the washing machine, the baker, the tailor, the manufacturers of preserved and prepared food, etc., are rapidly emancipating the slavery inside the family. We can not ignore the effect of great social changes arising through the invention of labor-saving machinery, and the consequent aggregation of population into the towns and cities where cooperation may be availed of. Out of social changes arises the necessity of modifications in our systems of education. The demand of women for equal advantages in education with men is not a mere temporary demand arising out of the sentimentalism incident to the epoch, but only an index of the social movement that underlies our civilization. The demands on the woman of the present day are such as to compel her to educate herself in science, art, and history. Her natural proclivity to versatility and alertness of mind fit her in a peculiar sense for the sphere of teacher of children. Their arbitrariness and caprice can be best watched and foiled by her. Their feeble strength demands intermittence and periodicity, and their training must, above all, be gentle. To enter into the spheres of productive industry opening for her; to assume the place of director in the management of the family economy now offered her in exchange for that of drudge; to fill her sphere of hostess and conversationalist in polite society; to fill the sphere of teacher in the school; to enter into the literary domain recently conquered by such writers of social novels as George Eliot and George Sand, or into the art domain of music and the drama, conquered long since; all these conspire to demand for woman discipline, insight, and information, studies such as are necessary to initiate man into the "conventionalities of intelligence." The demand for the same course of study is paramount, that for coeducation subordinate, although of considerable importance.

THE COEDUCATION OF THE SEXES.

[By Dr. E. E. White.]

The coeducation of the sexes has become one of the live questions, and the arguments pro and con are numerous and various. One of the arguments against education is based on the difference between the male and the female mind. It is affirmed that the minds of men and women differ, and it is inferred that this difference necessarily demands a difference of education. Is this inference a necessary consequence of the fact affirmed? Let us see. The physical organization of the two sexes is diverse. Does it follow that they require a diversity of food? Boys and girls sit at the same table, eat the same kinds of food, and breathe the same air, and their bodies are equally well nourished and strengthened. The mere fact of mental diversity no more necessitates a diversity of education than physical diversity necessitates a diversity of food and air. What must be shown is, that the mental difference of the two sexes is such as to necessitate a difference of education, and this necessity must be proved; it can not be inferred. It is not axiomatic. The fact that there is sex in the mind does not necessitate sex in courses of study and instruction.

Equally defective is the argument against coeducation based on the diversity of pursuit and mission. It is affirmed that the sphere of action of men and women as a class is diverse, and it is inferred that they consequently require a different preparation, and hence a different education. Are these inferences necessary consequences? Why may not diverse minds derive a diversity of preparation from the same course of education? Almost every family is an illustration of the fact that different persons receive different influences and advantages from the same surroundings and circumstances. The oak and the elm grow in the same soil. The same is true in education. The two sexes derive a diversity of preparation from a like course of study, each eliminating and appropriating according to its own law and its own life's needs and duties. This argument is eminently absurd when

applied to elementary and general education. The fact that a boy is to do a man's work in life, and a girl a woman's work, hardly proves that they should not study arithmetic, geography, and geometry together. When applied to special or professional education the argument may have weight. Moreover, the difference in man's and woman's sphere of action may require a difference of education, but this is precisely the fact to be established.

The argument against coeducation based on the difference in the physical strength and endurance of men and women is more logical. If it be a fact that women, as a class, have not the necessary physical stamina to endure a course of education as thorough and extensive as men, then it follows that women, as a class, must receive an education less thorough and extensive than men, as a class, are capable of receiving. But it does not follow that the education of women should be less thorough than that which men are receiving: nor does it follow that women who are physically capable of competing with men in the highest culture should be denied the privilege. But where is the average limit of woman's physical capacity in education? So far as our common schools, high schools, academies, and normal schools are concerned, this limit has not been ascertained. In these grades of study she does her work as easily as her brother, and equally well, though not precisely in like manner. If her inferior physical strength practically limits her educational progress, such limitation must be found in the college or university course, and this fact can only be settled by experience. It does not fall within the scope of logic.

It will be noticed that we do not deny the facts which form the premises of this triple argument against the coeducation of the sexes. We admit that the intellectual, moral, and physical natures of men and women are not precisely identical, and this difference may be sufficiently marked to justify some diversity in their higher education. While we would give a daughter an education every whit as thorough and complete as a son, we are not sure that we would have their education in every respect precisely the same. The diversity would not, however, be sufficiently great to necessitate their attending separate schools. Whether all our colleges and professional schools should be opened to men and women alike, we are not prepared to decide. We would like to see enough of them so opened to afford the women of the country the highest educational advantages; and yet, could our word do it, we would, in addition to the Oberlins and Michigan universities for both sexes, endow Harvards and Yales for women.

We feel sure that such institutions would be attended by many more women than the mixed colleges. Experience indicates that but few women, comparatively, wish to take a regular college course. Oberlin, and a few other colleges, have for years welcomed women to their classes, but very few have availed themselves of the advantages offered. Meanwhile, Vassar and other higher seminaries for women have been well attended. There seems, at least, to be little danger that the opening of college doors to women would overcrowd college classes. A few girls, possessing as a class superior abilities, would be added to the class rolls. What will be true in the future, when woman's pursuits and mission are enlarged, we can not say.

We intended to notice the logic of several of the current arguments in favor of coeducation, but a want of space forbids. Suffice it to say that the non sequiturs are not all on one side. The logic that can jump from the fact that boys and girls are brought up together in the family to the conclusion that the sexes should be similarly associated in boarding schools will not pay puncturing. It is sufficient to say that there is not a higher institution in the country that adopts, or can adopt, the unrestricted freedom and social community of the family. This sort of talk is, however, a good deal better than the clap-trap which denounces colleges for men as "relics of barbarism." Such a performance requires neither brains nor sense. The truth is the universal coeducation of the sexes is, to some extent at least, a question of moral elevation and enlightenment. There are evident advantages in bringing together young men and women of high moral character and refinement in the same institution, and even under the same roof, but such an arrangement would hardly do in Peru or Mexico, since the essential condition would be wanting. We are not sure that it would work well in all the institutions of this country. The arrangement requires an all-controlling and vitalizing moral and Christian influence, and where this is wanting coeducation, involving coboarding, is a doubtful good; at least there are two sides to the question. We would give every woman the opportunity to acquire the highest and best education possible, and leave experience to settle the rest. (National Teacher, June 1872, pp. 214–216.)

In respect to public schools, the discussion of coeducation pertains almost exclusively to its effects in high schools. The proposal for new high schools in

the large cities or for rebuilding and organizing old high schools has led frequently to exhaustive consideration of this policy. The latest instance is afforded by Philadelphia, whose school superintendent, Dr. Edward Brooks, as already stated, has recently canvassed the subject in view of a proposition to establish "territorial high" schools in various parts of the city. The replies to a special inquiry on this subject sent out by Dr. Brooks were cited in the first part of this chapter. His own argument in support of his recommendations is as follows:

The increasing demand for the higher education of the children of the city during the last decade has filled our higher schools to an overflow. To meet this demand, which will continue to increase year by year, additional high-school facilities must be provided in the near future. These facilities should be distributed throughout different sections of the city in order to properly accommodate the public. Our present high schools when established were properly located in the center of the city; but the city has grown away from them to such an extent that it is now inconvenient for pupils in the outer sections of the city to attend them. The time and expense required to reach these schools are so great as to actually prohibit many parents from giving their children a higher education. We need two or more high schools that can be attended without this sacrifice of time and money, and so located as to be easily accessible to pupils residing in the several localities selected.

The necessity of these so-called "territorial schools" is now being generally recognized, but their establishment is a problem not so simple as it may at first seem. Aside from the selection of a proper locality, other questions arise that need consideration. More high schools are needed for both boys and girls; and this immediately presents the question of the uniting or separating of the sexes in the new high schools. Shall we put up two distinct buildings with two distinct principals and faculties, thus doubling the expense; or shall we erect one building in which the boys and girls shall be educated together, with one principal and faculty for such a school?

Another question that presents itself is, shall these new schools give to boys a general education or an education in manual training; or shall the two courses be combined in the same school? So also in respect to the girls—shall the new school afford only a general education or only a commercial education, or shall both these courses be combined? The answer to these questions suggests several distinct plans of organizing these new high schools.

1. If the boys and girls are to be educated separately, there must be of course two distinct buildings, with two distinct school organizations. In the school for boys there should be two courses of instruction, a general course and a manual-training course. The two classes of students could recite three hours a day in the same branches, while during the other two hours one section would be doing manual work while the other would be pursuing special studies of the general course.

In the high school for girls there should be a three years' general course and a three years' commercial course, the two sections reciting together three hours a day, while during the other two hours one section would be taking distinctly business subjects like stenography and typewriting, and the other section advanced studies in the general course. I think also that the graduates of the general course should be eligible for admission to the fourth year of the present high school to complete a fourth year's course when the student desires to do so either for general culture or to enter the normal school.

2. If the board should decide to adopt the principle of coeducation in these new high schools, the problem is greatly simplified, and the expense largely reduced. Then I would recommend three distinct courses of study in each school—a general course for boys and girls, a commercial course for girls, and a manual course for boys. All three classes of pupils could recite in similar branches for about three hours a day, while during the remaining two hours the girls of the commercial course could take typewriting and stenography and the boys of the manual course could take the shop work, while the girls and boys taking the general course could go on with its distinctive branches. Any boys desiring to take the commercial course could enter the regular class in that subject. This undoubtedly would be the most economical arrangement in providing for additional high-school facilities, and in my judgment comes nearest to the most advanced ideals of the age.

I do not think it would be best at present to establish a classical course in any of these high schools, since as a rule those who desire a classical course are looking forward to a collegiate education, which indicates financial circumstances

that would enable their parents to bear the expense of the pupils attending the two high schools already established. The new schools should provide for the general needs of the communities in which they are established, and not for the exceptional demands of the few.

I realize that I am touching upon a mooted question when I advocate coeducation in our high schools; and yet from the experience of many years in the management of a large institution where young men and young women were educated together, reciting daily in the same classes, I do not hesitate to recommend that these new high schools should be open to both boys and girls. The system is a natural one, and when properly conducted is found to be conducive to better discipline and a higher standard of moral thought and feeling. While I believe it is in accordance with a true theory of education, I advocate it in respect to our new high schools on the ground of economy and convenience. It would seem to be a needless and unpardonable waste of money to double the expense in providing facilities for the higher education of the children of the city on account of an old prejudice, now rapidly passing away, against the education of boys and girls together in the school as in the family. What God hath joined together in the family why should we separate in the school? I believe if such a school could be opened as an experiment, with a suitable man as principal, it would be a great success, and demonstrate beyond question the correctness of the system of coeducation in these new high schools. I would therefore strongly recommend to the board of education the establishment at an early date of a new high school in some suitable location of the city for boys and girls, with the three courses of study as suggested above. The success of this school would pave the way for the establishment in a few years of other "territorial" high schools, so that in time we shall have four or five of these high schools distributed throughout the city. (From Supplementary Report to the Board of Public Education on Coeducational High Schools. 1902.)

The most extensive inquiry into the subject of coeducation, as related to public schools, was conducted by a special committee appointed in 1890 by the Boston school committee. Particular interest attached to this action, as the policy of separate high schools had been adopted in Boston and was earnestly advocated by Dr. Philbrick, whose superintendence of the Boston schools[1] forms one of the most important chapters in the history of educational administration in this country. Dr. Philbrick regarded the specialization of the high schools of his city as the climax of an evolutionary progression which had already been attained in the most advanced educating countries.

His position is shown by the following citations from a circular of information published by this office in 1885. The reader should keep in mind the statement by the present superintendent of the Boston schools as to the status of the high schools,[2] and also that of the superintendent of Salem schools,[2] to which Dr. Philbrick refers. In respect to the foreign precedent, it should be remembered also that provision for higher education of women has not yet been developed in the German States, which alone are mentioned by Dr. Philbrick, and consequently their example has really little bearing upon the question before us.

CITY SCHOOL SYSTEMS IN THE UNITED STATES.

[By John D. Philbrick, LL. D., in Circular of Information of the United States Bureau of Education, No. 1, 1885.]

We have seen that in Boston the foundation of the high-school system was begun by a specialization of institutions instead of a specialization of courses within an institution. In harmony with this method a separate classical high school for girls was opened in 1878, although this plan was opposed by the friends of coeducation, who urged as a substitute the admission of girls to the Latin school for boys. In the meantime the first high school for girls, above mentioned, having been set up in advance of public sentiment, had a short life, being abolished under the lead of a very eminent and public-spirited citizen, who represented the aristocratic sentiment, which is always anxious to keep the education of the people within pretty narrow limits. A quarter of a century later the establishment of a city female normal school was immediately followed by the demand of the people for a girls' high school. This demand was met by the makeshift method of reorganizing the normal into a girls' high and normal school, the result

[1] From 1857 to 1874, inclusive, and again from 1876 to 1878. [2] See p. 1221.

being a good high school and a poor normal school. In time the specializing process took the poor, pinched normal department out of this double organization and organized it into a separate school, which soon became vigorous and efficient. We find here also another interesting illustration of the process of specialization in the development of the high-school system by the annexation of adjacent municipalities. The Boston system was by this means increased by the addition of five high schools, mixed both as to sexes and courses; and, besides, the old, endowed Roxbury Latin Grammar School above alluded to was opened to the inhabitants of the whole city as a free classical school for boys.

The annexed mixed schools were allowed to remain mixed as to sex, but their courses were unified in conformity with that of the English high school, the elements of Latin, however, still being permitted in addition, for the local convenience of beginners in the classical course, who must later go to the central Latin schools in order to complete the preparation for college. At the same time an advanced course of two years was added to the original course of three years in the central boys' English high school and in the corresponding school for girls, to which the graduates of the local high schools were admitted, and finally a new high school of the local type has been recently established to accommodate the inhabitants of an outlying district of the city.

The system as it now stands, then, exclusive of the free corporate school above referred to, consists of 6 local mixed schools of the lower order and the 4 central schools of the superior order, a classical and a nonclassical one for each sex.

This central group of four high schools may be regarded as the normal type of high-school organization. It is in harmony with the organization of secondary education in the most advanced educating countries, which educates the sexes in separate schools and provides separate classical and nonclassical schools for boys, of which the representative types are the German gymnasium and the Realschule. Considerations of economy will prevent this specialization in the small cities. In the largest cities, as we have seen, the progress toward this specialization is already considerable, and the history of education justifies the prediction that it will continue to advance in proportion as the inhabitants comprehend what is best in education and demand it for their children.

The ancient and cultured city of Salem is the only city where a fair trial of the specialized and doubly mixed systems has been made. The former was tried first for many years; it was exchanged for the latter twenty-five years ago, to save expense. The result has not been satisfactory, and a movement is now on foot for restoring the specialized system, which is said to meet with no serious opposition, except from the economical point of view.

But the specialization of the high-school system in our large cities is not to stop here. We see already that Baltimore has incorporated into her system an institution for higher education, patterned after the corporate manual training high school at St. Louis. It seems quite probable that high schools of this kind, with such modifications as experience may suggest, will be established in all the principal cities. Such a school will, no doubt, meet the wants of a certain class of pupils, but if adopted it should be in addition to the standard types of classical and nonclassical high schools, and not as a substitute for either of them. And the reasons for establishing a supplementary high school of this kind for boys hold equally good for establishing a corresponding school with appropriate hand work for girls.

* * * * * * *

Free secondary education having now become a fixed fact, attention in the future will naturally be given in larger proportion to the work of perfecting its organization and management, so as to adapt it more completely to the wants of all classes of citizens and render it an instrument of the greatest possible good, accompanied by the least possible evil. In my view, the evil connected with the high school which most loudly calls for a remedy is the harm which it is doing to the health of the girls who attend it. This evil is not of recent origin. It dates back to the time when girls were first admitted to high schools; it is not limited to any particular description of high schools; it is found in both small ones and large ones, in separate schools and mixed schools. Nor is it restricted to any one region or section of the country; wherever there is a high school, there the evil is found, and there the application of the remedy should begin. Of course, the harm inflicted has it degrees. There may be schools under very judicious management of parents' committees, superintendents, principals, and teachers where the injury to the health of girls has been reduced to a minimum. I am not aware, however, that such a school has come under my observation. On the other hand, there is a large number of schools, among which are some of the most noted in the country, where the injury inflicted upon the health of the female pupils is a very serious evil. What I mean is precisely this: That the evil of which I am speaking is gen-

eral in our high schools and that the reform in this respect should be general; not that the evil reaches every individual pupil, but that it affects injuriously some pupils even in the best schools, and a large percentage of the pupils in that large class of schools where as yet hygiene is only a word and not a reality. In justice to the public high schools, it should be said, however, that the evil is not confined to them. It is quite serious, if not more so, in the whole body of thoroughly organized institutions for the higher female education.

The causes of this evil are manifold. The following are some of them: Injudicious application of the marking system; injudicious system of examinations; too many studies; too many home lessons; an injudicious method of teaching, which confounds thoroughness with exhaustiveness; too much pressure to secure punctuality and regularity of attendance; rolls of honor printed in annual reports; competition for honors and medals; too long abstinence from substantial food and nourishing drinks; bad air; cold drafts; too many flights of stairs. These manifold causes suggest the manifold remedies. The remedies can be more easily and effectually applied in separate schools than in mixed. To remedy the evil in question effectually in mixed schools without too great laxity toward the boys is no easy task. Higher female education has come to remain. It is a new element in modern civilization. It is a great boon. It has been attended with a lamentable evil which has largely offset its blessings. Let the remedying of that evil be one of the chief tasks of all earnest promoters of higher female education.

The reports of the special committee on the subject of coeducation, already referred to here, are as follows:

BOSTON SCHOOL DOCUMENT NO. 19, 1890.—MAJORITY AND MINORITY REPORTS OF THE SPECIAL COMMITTEE ON THE SUBJECT OF COEDUCATION OF THE SEXES.

MAJORITY REPORT.

IN SCHOOL COMMITTEE, *September 9, 1890.*

At the regular meeting of the board, March 25 of the present year, on motion of Mr. Winship, it was ordered "that a special committee of three be appointed to consider and report upon the subject of coeducation of the sexes, with special reference to future school buildings."

In compliance with this order we submit the following:

It appears that not until 1790 were girls admitted to our public schools, when they were permitted to enter the grammar schools then established, on an equal footing with boys. A few years prior to 1830 several unsuccessful attempts were made by members of the school committee to separate the sexes. It was not until the latter date that Lemuel Shaw succeeded in influencing the committee to make the departure. The school committee, January 15, 1830, directed a subcommittee "to inquire whether essential improvements may not be introduced by a modification of the present system, or by the adoption of some other." This subcommittee reported, May 11, 1830, through their chairman, Lemuel Shaw.

From this report the following abstracts are taken:

"The last defect which the committee will notice arises from the attendance of children of both sexes on the same masters, at the same houses, and pursuing in all respects the same modes and branches of study.

"The committee recommend that an entire separation be established between the schools designed for children of different sexes. By this management we think some evils and dangers will be avoided, and decisive advantage gained. Under the present system, through the strict attention of the masters, little evil, perhaps, has been experienced.

"It is well understood that until the year 1790 there was no public provision whatever for the education of females in this town. The Latin grammar schools and the public writing schools, being the only schools supported by the public, were designed exclusively for boys. By the system then adopted an English grammar department was added to each of the three public writing schools, and then, for the first time, a provision was made that girls might attend these schools for six months, and no more, in each year. This system continued in operation, with some slight alteration, by enlarging the term for the attendance of girls to eight months in each year, until two years since, when it was determined by the committee that girls should be privileged to attend the whole year.

"The committee have thought that all the girls who now attend the seven schools may all be accommodated in the three largest schoolhouses, the Franklin, Bowdoin, and Hancock, which would be conveniently situated for the purpose, in the southerly, central, and northerly parts of the city, and that the other four, namely, the Adams, Boylston, Mayhew, and Eliot, would conveniently accommodate all the boys."

The following resolution was proposed by Judge Shaw for his committee:

"That the present arrangement of the Eliot, the Hancock, the Mayhew, the Bowdoin, the Adams, the Boylston, and the Franklin schools be changed, and that the system set forth in the foregoing report be substituted therefor."

The main propositions of the report were adopted by the school committee June 30, 1830.

By the regulations adopted by the school committee, February, 1833, it appears that the Eliot and Mayhew schools were exclusively for boys, while the Bowdoin and Hancock schools were used for the instruction of girls only, the other five grammar schools remaining as formerly, for boys and girls.

Thus was rooted in our school system an error which may take years to fully eradicate.

Since then this objectionable departure, this rut, has broadened and deepened, with no obstacles in its way, no influential objection to its sway, until we have 30 normal, high, and grammar schools, or school buildings, in 15 of which boys alone are taught, while in the other 15 buildings girls alone are admitted; and in the buildings intended for boys and girls together there are 74 classes, containing nearly 3,700 scholars, of which 39 classes are formed of boys alone, and the remaining 35 classes of girls.

This gives only about 12,547, or 36 per cent, of our scholars in the schools mentioned who are coeducated.

Thus this city of Boston, that spends relatively more money for the education of her children than any other city of the Union, if not of the world, that prides herself upon her educational facilities, hampers more than any other city the rightful advance of girls and lessens the refining influences in boys by this separation of the sexes in our schools.

The subject is of far weightier importance than a casual or superficial view would give it. It involves the question of the development of the maximum ability of the scholars in moral, intellectual, and physical training. Underlying it is that subtle psychological element which should not be lost sight of, and it is therefore to be hoped that each member will give it grave consideration.

In these modern times of push there is, in certain localities, a great lack of delicate courtesy or chivalry, particularly among young people.

The refining influence of woman is well exemplified by Wendell Phillips's story of the young man in the smoking car, who excused himself for using questionable language by emphasizing the fact, "There are no women here." A like story is attributed to Grant. This check upon questionable utterances and acts is noticeable in all places where boys or young men are in companionship with the opposite sex; and herein lies the greatest good resulting from coeducation. Such constant companionship represses or subdues the rough and gross nature in young men.

It is either right or wrong to have coeducation in our high and grammar schools. There is no middle ground in considering this subject. If a lower quality of scholars attends school in a certain district, that quality applies to the girls as well as to the boys; and if the boys are separated from the girls, still the low quality remains, and is only divided.

If it is right for brothers and sisters to live in the same house and eat at the same table, then it is right that they should attend school together. Let them be brought up separately, and if they meet only clandestinely, great harm is likely to result.

If wedlock is right and proper, then coeducation is right and proper. If men and women are to marry, they should know each other summer and winter before marriage, and the more they know of each other the less likely will divorces result.

The serious objection raised by physicians to coeducation is based upon the delicate organic conditions of girls, but by the introduction of the excellent system of physical culture made in our public schools the weak and delicate girls will become strong, and the objection will ultimately vanish.

At Wellesley College, by its special attention to physical and hygienic culture, over 1,000 young women are required to enter into a thorough course of physical training, and it is represented that these students pride themselves on their excellent physical condition, which they first endeavor to attain before subjecting themselves to serious mental strain.

To gain the most impressive conclusions upon this subject it was decided by your committee that persons interested in education—intellectual, moral, and physical—be invited to give their views. Accordingly circulars were sent to the several masters of our schools, superintendents, pastors, physicians, and others.

The following table gives the names of the several normal, Latin, high, and grammar schools; the number of teachers in each school in favor of or opposed to coeducation; the sex of pupils attending each school; the sex of pupils in the sev-

eral classes, and the average age of the pupils in the first and second classes of the grammar schools:

Schools.	Number of teachers in favor of or opposed to coeducation.				Sex of pupils attending.	Number of classes composed of—			Average age of pupils in the—

Total		421	254	62		208	18	242				

The foregoing table shows:

Masters in favor of coeducation	44
Masters opposed to coeducation	14
Masters undecided or favorable in part	7
	65
Teachers in favor of coeducation	422
Teachers opposed to coeducation	254
Teachers undecided	51
	727

It will be observed by the above that the masters who are opposed to coeducation, with but one exception, have charge of either boys or girls alone, while the exceptional master, having boys and girls, has unmixed classes.

SUMMARY.

	In favor.	Opposed.
Supervisors	3	
Masters	44	14
Teachers	422	254
Presidents of colleges and professors	12	3
Superintendents	18	1
Clergymen	37	9
Physicians	29	10
Total	565	291

Of the 254 teachers opposed to coeducation, 122 are teachers of girls alone and 109 instructors of boys only. They may be considered ex parte in their views, and should be ruled out.

It appears that certain opponents of coeducation have, by an acquired interest in teaching boys or girls alone, warped their minds into the belief that the sexes should be separated, while others, through a lack of knowledge which experience gains, conclude theoretically that coeducation is wrong.

To teach boys alone requires far more concentrated energy, will power, and nerve force or tension, than to teach girls, or boys and girls. The only advantage in having the sexes separated may be to give inferior teachers easy positions in girls' schools. This is not intended to indicate inferior teachers in our schools devoted alone to girls, for the masters of such schools are as anxious as any to gain the best teachers the State affords, but it is a fact that certain masters of mixed schools have separated boys from girls in order to aid inferior teachers.

A very large majority of the opinions gained coincide with the views entertained by a majority of your committee. The committee recommend the passage of the following orders:

1. *Ordered*, That the normal school be so arranged that young men may enter and join the young women in the same course of study.
2. *Ordered*, That the boys in the Latin and English high schools, and the girls in the girls' Latin and high schools, be united in mixed classes as soon as practicable.
3. *Ordered*, That the grammar schools in districts where the boys are taught in different buildings from the girls be arranged for mixed classes as speedily as the necessary changes in the buildings will warrant.
4. *Ordered*, That in the grammar-school buildings where boys and girls attend, but where the boys are taught in separate rooms from the girls, the change be made by having mixed classes.
5. *Ordered*, That all newly erected buildings, and buildings to be erected, be arranged for the coeducation of the sexes.

J. P. C. WINSHIP.
EMILY A. FIFIELD.

MINORITY REPORT.

The undersigned, a minority of the special committee on coeducation, unable to agree with the conclusions or to support the recommendations of the majority of the committee, respectfully submits the following report:

It is not deemed necessary by the minority to traverse the whole subject of coeducation of the sexes. The subject has been so fully and frequently discussed in recent years that the opinion of those interested is undoubtedly already formed. Indeed, as to the wisdom or unwisdom of educating together boys and girls, or

young women and young men, it does not seem probable to the writer that there will ever be any substantial agreement. It is one of those questions about which there will always be wide differences of opinion, according to personal experiences and the conditions of population in different localities.

It is easy to see that in small and homogeneous communities the conditions are entirely different from those obtaining in large, cosmopolitan cities; and looking at the subject from the point of view of the parent, it is obvious that while in certain localities where the population is homogeneous a parent will unhesitatingly send his children to a mixed school, he would be unwilling to do so if he lived in a community where the conditions of population are quite different.

In small towns and villages economic reasons seem to make mixed schools necessary; but in cities the question of expense in maintaining separate schools for the sexes is not an issue, and in such places it would seem to the minority a manifest injustice to compel a parent to send his children to mixed schools, if he strongly objected to doing so. Unless, therefore, it can be shown that there is a principle at stake—that it is unjust and wrong to separate the sexes—expediency would certainly dictate that the wishes of a very large proportion of this community which does not believe in mixed schools should be respected.

For many years it has been the wise policy of this city to maintain separate schools for boys and girls after they have passed the primary-school age, except in the suburban districts, where for financial reasons the local mixed high schools and some of the mixed grammar schools have been retained: but as it is allowed that suburban high-school pupils may attend the large city schools where the sexes are separated, provided the parent so desires, it would seem that our present policy is an eminently fair one, and that it should not be changed, as recommended by the majority of the special committee, unless it can be shown that to separate the sexes is wrong, unjust, and unwise.

Does the report of the majority show this? The statistical evidence of the report seems to the minority of little worth, for the reason that while a very large proportion of those interested in changing an existing state of affairs is always active to accomplish their object, those who are not in favor of a change seldom take the trouble to defend the status quo until they are driven to do so.[1] The minority has made no attempt to collect statistics other than those presented; but he ventures to predict that if such changes as the majority recommend were found to be seriously thought of by this board, a flood of remonstrances would be forthcoming, not from other States and country towns, but from our own educators and from parents of this city, which would make the majority's statistics seem futile indeed.

Large numbers of letters have been received from teachers in favor of mixed schools chiefly on the grounds that it is easier to maintain discipline when boys and girls are together, and second, that the influence of the sexes is mutually salutary. In regard to the first supposed advantage, the minority would reply that a good teacher has no difficulty in maintaining discipline in separate schools, in witness of which statement attention is directed to the central high and Latin schools of this city, in which the sexes are separated. As to the beneficial influence of boys and girls on each other, there is a difference of opinion. That there are certain mutual benefits in the association of the young of opposite sexes, under judicious supervision and under proper conditions, no one can deny; but whether the judicious supervision and the proper conditions are generally obtainable in public schools is another question; furthermore, it remains to be shown whether the supposed advantages of association in schools are not by far overbalanced by certain evils of such association.

A favorite argument of those who favor mixed schools is, that as brothers and sisters are brought up together in the same family, boys and girls should not be separated when they go to school. It seems idle to take time to consider this argument: it is enough to point out that parents who delight in the brotherly and sisterly relations of their own children may naturally prefer to have some choice in their children's associates, and may be unwilling that their sons and daughters should mingle freely in the mixed public schools with children of opposite sex. There are those who take the position that, as marriage is the ultimate destiny of most boys and girls, they ought to be given an opportunity of meeting each other in early life in order to enable them to understand each other better, and thereby to make their choice more intelligently. To all this the writer would reply that the duty of the State is to educate her children in the

[1] There were sent to physicians, who are largely opposed to coeducation, 165 circular letters of inquiry. Out of this number replies were received from only 48; so that the majority report can hardly be said to correctly represent the opinions of the medical profession.

public schools in the branches of common-school education, and not to provide for social intercourse between the sexes, however desirable that may be.

The proper place, in the opinion of the minority, for the young of both sexes to meet and to learn to know each other is in the home and in the smaller circles of social life, under the eyes of judicious parents and with their approbation. The responsibility of the maintenance of proper relations between the sexes, then, rests where it belongs—with the parents and not with the state. If it is argued that whether boys and girls attend the same school or not they are sure to meet and associate more or less out of school hours, the natural reply would be that wise parents control their children out of school and restrict their associations in accordance with their own judgment.

It is stated or implied in the majority report that a certain injustice is done to girls by not allowing them to attend school with boys. The writer fails to see the truth of this implication; so far as his knowledge of our schools goes, the curriculum is the same in all our schools of similar grade, except that girls are taught sewing and cooking, while boys are given lessons in the use of tools. If the implied injustice consists in withholding from girls the stimulating influence of good boys, let us be thankful that they may thereby escape certain evil influences of bad boys.

That the writer may not be thought to overestimate the possibilities for evil in the mixed school, let him state briefly the result of his personal experience. He passed through all the grades of the public schools and was graduated from the high school in a flourishing suburban town, where the schools were second to none in the State, and where the teachers were faithful and judicious. Even in the primary schools, but more especially in grammar and high schools, words and actions came to his notice that no good boy or girl could hear or see without blushing. There were, so far as he knew, no overt acts of positive immorality; but in addition to much foolish flirting and frivolity, there were not infrequent instances of outrageous offense against good manners and morals. It did not appear that any of these offenses could have been prevented by the teachers; but they could not have occurred in schools where the sexes are separated. Passing from this atmosphere it was the writer's happy fortune to enter one of our Boston schools of which we all are proud—the Boston Latin school. In his three years' experience in that school there was a conspicuous absence of anything of a low or immoral nature, and the contrast with his former experiences was as refreshing as it was startling. Can it, then, be wondered at that when some thirteen years ago it was sought to admit girls to this school the writer united with other alumni and did all in his power to avert such a catastrophe? The minority would certainly not imply that the pupils of our prosperous girls' Latin school could possibly be guilty of any impropriety of conduct if sent to the boys' school; but he wishes to express in the strongest way his belief that schools are places in which to educate the young, that all possibilities of harm should be kept out of them, and that there should be in them no sexual distractions.

There are other objections to teaching the young of both sexes in the same schools besides those based on moral considerations; but the minority does not consider it necessary to dwell upon them. Much could be said of the unwisdom, considering the differing aptitudes and mental attributes of boys and girls, of teaching both sexes after the same methods, even if the studies pursued are identical. Much, too, could be said of the unhealthful rivalries between boys and girls, and of the baneful stimulus to delicate girls to overwork their minds at times when they should be allowed to rest. But enough has been said, it is believed, to show why the undersigned can not support the changes proposed by the majority, and to warrant him in recommending to this board that no action be taken in the direction of coeducation.

CHARLES M. GREEN.

By reference to the tabulated summary of replies to the inquiries sent out by the Boston committee, it will be seen that 58 per cent of masters and teachers whose opinions were given favored coeducation, 7 per cent were undecided, and 35 per cent opposed the policy. Of 122 other persons, including ministers, doctors, college presidents, and professors who responded, 81 per cent favored the coeducation policy.

The report of the committee embodied numerous and copious extracts from the replies to their inquiry. In general, these are of similar character to the letters from superintendents cited in the first division of this chapter. A few of the

letters from school officers and teachers replying to the Boston committee are here reproduced, because of their historical bearings, or their value as expert testimony. To these citations are added a few letters from representative persons not connected with the public schools.

Opinions of superintendents, supervisors, and teachers.

SUPERVISORS.

I was submaster in the Adams school from 1856 to 1864. At that time, as now, both sexes were educated under the same roof, but not in the same classes. I requested the master (Mr. P. W. Bartlett) to allow me to try the experiment of teaching both in my room. Previous to that date (about 1858–59) the boys and girls were mixed in the first class only. My request was granted, and the experiment was so successful that soon it was the common practice in other schools. Of late years I have watched the high schools in the outlying districts, where boys and girls study and recite in the same rooms, and I feel sure that the results are very satisfactory. I am heartily in favor of the coeducation in well-disciplined schools.

R. C. Metcalf.

I believe in coeducation of boys and girls. The mutual influence is refining and strengthening to both. The natural emulation is a healthy stimulus and motive to study and thought. The moral effect is purifying and elevating, making the relations between them less artificial and giving each a true appreciation of the other, leading to juster comparisons of the sexes and more hearty respect and good will on both sides. Coeducation corrects some of the most troublesome incidents of school discipline and throws increased interest into school work; it also develops symmetrically and naturally the social feelings and cultivates courtesy and helpfulness in all the relations of life.

Louisa Parsons Hopkins.

Ann Arbor, Mich., *May 5, 1890.*

In our Western schools—grammar and high schools—we know nothing by experience of separate education of the sexes. Our pupils are all treated exactly alike, have the same course of study, the same teachers, recite in the same classes, have the same questions in examination, and participate in the same public exercises.

This is true up to and through the high school.

In the high school there is this degree of separation: The girls have their own "session rooms," presided over by women; and the boys, their own, presided over by men; but in all school work the sexes mingle.

In the junior and senior classes of the high school the pupils have class organizations, partly literary, partly social.

These class organizations make arrangements for occasional class social entertainments, which are held, by invitation, at the homes of class members. No evil seems to develop from any of these interminglings of the boys and girls, while their general influence upon each other seems to be salutary. Especially is the presence of genteel, cultured girls a great benefit to some of the boys, in restraining, softening, humanizing them.

We believe that boys and girls were intended to be brought up together in families, educated together in schools, and yoked together in the same fields of duty and usefulness in the world.

W. S. Perry, *Superintendent.*

Philadelphia, *April 30, 1890.*

In the Philadelphia public schools the sexes are educated separately, not only in the high schools, but, with few exceptions, in every grade of the elementary schools. Public sentiment is, however, gradually changing on this question. My own conviction is that boys and girls can be taught to better advantage in every way together. Experience shows this to be the case, and coeducation is becoming universal throughout this country.

Jas. MacAlister, *Superintendent.*

CLEVELAND, OHIO, *May ?, 1890.*

Formerly the practice in this city was to separate the sexes in all the grades, from the time of entering the school until the pupil left school, except in instances where the smallness of the school rendered it too expensive to so conduct the schools. Pupils of both sexes were obliged to recite together in the same room in the high school, and in many cases were obliged to be placed in the same general session room, the city having but one high-school building on each side of the river. No bad effects whatever resulted from this coeducation method, but rather the reverse. As rapidly as the old ideas could be overcome, the coeducation of the boys and girls in all the grades—high, grammar, and primary schools—was introduced. For the last fifteen years at least the coeducation plan has been uniformly followed.

I have no hesitation whatever in commending it to all who are interested in the question, either practically or theoretically. No bad results have followed. On the other hand, there is a better tone and higher moral standard among the pupils.

I shall be pleased to receive a copy of the report of your committee, when printed, if the same is for distribution.

L. W. DAY, *Superintendent.*

TEACHERS.

NORMAL AND HIGH SCHOOLS.

NORMAL SCHOOL, *Boston, May 5, 1890.*

I think all the teachers in the normal school agree with me in the opinion that it would improve the training school as such to introduce girls. It would give the normal pupils an opportunity to observe the modes of discipline adapted to both boys and girls in a grammar school. Whether the change is practicable at the present time I am not prepared to say.

SPRINGFIELD, MASS., *April 28, 1890.*

I have always been in favor of such coeducation; and whilst I have had supervision of schools in which the sexes were kept separate, from the primary schools up through the high schools, I have not seen any good reason for changing my views on the subject.

I have observed in schools where the sexes are educated together, as is the case in this city, that they have a mutually beneficial influence upon each other. I have not found any evils of a serious character at all to result from such association in school.

I have further observed in places in which the sexes were separate, that such separation in school had the effect of leading to evils in other unavoidable associations on the street and on social occasions; evils which, but for this artificial separation in school, I believe would not have existed. I believe that what objections there have arisen in certain localities to coeducation are due to evils which are not due so much to the effect of coeducation, as they are due to the fact that there are weak teachers in the schools who have not the power to create either a stimulating, intellectual, or a wholesome moral atmosphere in the school. Wherever the separation of sexes appeared to be a necessity I have found weak teachers and poor schools in general. I believe that they are related as cause and effect.

THOMAS M. BALLIET, *Superintendent.*

I should be in favor of having boys and girls in all grammar schools if there were schools in which the more vicious boys were required to attend. It is a serious question how far it is our duty to assist the vicious by association with the good.

I am pretty well satisfied in my own mind that the discipline of a school is made easier by the presence of both sexes.

LARKIN DUNTON.

BOYS' LATIN SCHOOL, *Boston, June 6, 1890.*

On general principles and under ordinary circumstances I am not opposed to the coeducation of the sexes. I am opposed to it in the Latin school.

Several years ago a protracted and exhaustive hearing was given by the school board on this very question, so far as the Latin school is concerned. A happy solution of the question, as it has always seemed to me, was made by the school board in the establishment of a separate school for girls.

The boys' Latin school is large enough already. The schoolhouse is constructed for boys alone. Some of the work in the Latin school seems better adapted for boys than for girls. I have always had considerable sympathy with the objectors

to the coeducation of the sexes in a classical course of instruction, though I do not consider their reasons as conclusive. Under the present peculiar and favorable condition of the two Latin schools in this city I should consider it unfortunate to have them united.

Three teachers are in favor and eleven are opposed to the coeducation of the sexes. I understand that this expression of the teachers' opinion is in most cases, if not all, confined to coeducation in the Latin school, and not to the question in its general application.

MOSES MERRILL.

GIRLS' HIGH AND LATIN SCHOOLS, *Boston, April 25, 1890.*

To my mind coeducation in secondary schools is largely a question of balancing advantages against disadvantages, and so is to be viewed with favor or disfavor according to the local conditions under which it is tried. In towns and small cities having a substantially homogeneous population coeducation works well in the main, for there the conditions approach in simplicity the conditions of family or neighborhood life. In large cities, however, the case is different. There the population is not homogeneous, the families represented in the school are not known to one another, the numbers brought together in a single school are much larger, and the proportion of coarse natures among the pupils is apt to be somewhat greater. All this tends to make the question of morals and manners a more complicated one, and it is upon morals and manners—in other words, on the formation of character—that the question of mixed or separate classes, as it seems to me, chiefly turns.

Now, evils in the domain of morals, though perhaps they occur no oftener in mixed than in separate schools, are more serious when they do occur there. As such evils can be dealt with more directly, more quietly, and with a nicer adaptation of means to ends in separate than in mixed schools, I am inclined to think that for large cities like Boston the former are to be preferred.

I am confident that in such subjects as physics and civil government boys are more appreciative, more alert, and more responsive than girls, and the latter would unquestionably derive great benefit from association with the boys in the study of these subjects.

In schools established for boys exclusively the teachers seem to feel under the necessity of resorting to artificial means of stimulating their pupils to industry; whereas, in schools established for girls exclusively, artificial pressure is not only not helpful, but is positively injurious. It is difficult for me to believe that the sex which needs spurring and the sex which needs curbing should be trained together.

Miss Shaw and Miss Foster, also three other teachers in our school, express their opinion that girls become intellectually more alert and less passively receptive when associated with boys in the same classes than when taught by themselves. Neither Mr. Thurber nor Mr. Williston makes this observation, and I should not have thought of doing so myself as the result of my personal experience. As the result of my observation, however, I recognize the statement as true. This leads me to say that, other things being equal, I am inclined to think that girls are somewhat more responsive to the teaching of men than to the teaching of women.

JOHN TETLOW.

GIRLS' HIGH SCHOOL, *Boston, April 24, 1890.*

I have had long experience in schools for the separate sexes and also in mixed schools. My opinion is decided that the advantages are, on the whole, on the side of the separation of the sexes in upper schools.

The tastes, the natural tendencies, the ways of receiving the subjects of instruction, the prospects of employment hereafter, all differ in the two sexes, and, whether he is aware of it or not, the teacher's methods take a coloring from his environment and adapt themselves to the circumstances of the case, with wholesome results, so far as this is possible. Many things in high-school teaching take their shape from the conditions as determined by sex. Only as teaching grows mechanical does it come to concern itself less with individual and sexual characteristics. It is a great gain in any school when it can be so organized as to make the classes homogeneous in all the respects that determine the ways and means of instruction. It is an economy not to have to consider the boys and the girls as needing somewhat different, but parallel, treatment in the same classes.

Girls grow more reserved when boys are present, as do boys when girls are present. Something of naturalness has been sacrificed when the sexes are mixed in secondary schools. I am sure that many of the topics which girls choose to write

their compositions about they would never take if they thought their exercises were to be heard by young men. They are tolerably free to write on domestic employments, cooking, sewing, kindergartening, and other such topics—the topics that really interest them. Were boys in the classes, the girls would grow altogether conventional, and write without real personal interest, but only with the aim of avoiding the fate of becoming the objects of a smile.

S. THURBER.

CHARLESTOWN HIGH SCHOOL, *May 5, 1890.*

I am in favor of mixed classes.

My experience covers about twenty-one years in Boston schools, about equally divided between boys' classes and mixed classes.

This experience has convinced me that in mixed classes a better degree of scholarship can be maintained, and that the discipline is better, more wholesome, and higher in tone.

The life and spirit of a well-conducted mixed class is simply delightful to me, and there is the same satisfaction to me in the gentlemanly and lady-like bearing of the pupils to each other that I derive from the society of ladies and gentlemen in the world outside of school.

I believe in mixed classes because I believe in mixed teachers.

I do not subscribe to the sentiment that teachers should all be men.

Some of the best teachers I have ever known are women, and aside from their ability to teach, they exercise a most excellent influence.

I am sure that boys and girls of the age of high-school pupils need the higher lessons of character, of noble sentiment, of unselfish service which women are quite as ready to give in their lives as men.

As I look back over my boy life, I remember with gratitude the great influence of certain women as decided, as energizing, as directing, as that of any men who guided and assisted me: and I like to believe that in youth nature is much the same now that it was then.

J. O. NORRIS.

JOHN A. ANDREW SCHOOL, *May 5, 1890.*

This has been a mixed school from the beginning, but until within a few years the sexes have not been together in the same rooms except in the first class. From time to time the number of mixed classes has been increased, and the results have been such as to lead me to believe that coeducation is better, at least in the grammar schools. It follows the ordinary structure of the family and society, and is the way that three-fourths of all children are educated.

In rural communities, from necessity this has been the custom, and certainly in morals, manners, and intellect the country child is the equal of the city child. It is confirmed by the habits and customs of daily life; they are together at home and out of school, and should be taught together in school. To educate separately is to change the order of nature.

My experience tells me that it is best for the harmonious development of both sexes. In mixed classes each sex exercises a healthy restraint upon the other. Girls admire a manly boy and boys a womanly girl. And "What the child admires, the youth endeavors, and the man acquires." Mean actions, which with either sex alone might be applauded, would be frowned upon in a class of both sexes, and not repeated. Thus the influence of each sex upon the other is healthful. Good discipline comes from evolution, not repression. Self-control is the key to success in school as in life. Coeducation begets self-control.

To state briefly, coeducation is best because it is natural; it gives each sex the same opportunities; it cultivates the best in each; it develops self-control; it gives a more harmonious development.

J. M. DILL.

BUNKER HILL SCHOOL.

It is natural for children to grow up together, and up to a certain age, say about 13 years (or indeed so long as it is thought advisable to teach boys and girls precisely the same subjects), I think mixed classes preferable, especially in schools where there is no great difference in the moral standard of the pupils. But when the time comes in the age of children, as I think it should come, that subjects are taught with some reference to their future employment, I think separate classes are preferable, in order to accomplish more (better results) in the same time.

The committee has already recognized, in part, this difference in the needs of the sexes, by providing a course of sewing and cooking for the girls, and another

one in carpentry, etc., for the boys. I would go somewhat further in this direction. I would make a difference in drawing, working in a less mechanical and more artistic course for girls than for the boys. So in physics and arithmetic. The practical needs of the housekeeper are unlike those of the mechanic and builder, and while general principles should be taught to each, the illustrations and applications should be largely adapted to future requirements.

SAMUEL J. BULLOCK.

LOWELL SCHOOL, *April 22, 1890.*

For fifteen years I was principal of the Comins School, where the sexes were in separate rooms. In this school, seventeen years, we have had mixed classes. My experience leads me to pronounce in favor of mixed classes, for the following reasons:

1. The weak points in the character of the pupils of either sex are corrected by the presence of the other.
2. The character of the boy is refined; that of the girl strengthened.
3. The rudeness of the boy and the frivolity of the girl are restrained, and the manners in both are elevated.
4. There is no good reason why the good effects that flow from the mutual influence of mingling the sexes in the family circle should not be looked for when we imitate nature in the school.
5. There is no longer any doubt of their being able to go on together with the same work.
6. I feel sure that the suspicion which some have, that the character and manners of each may be injuriously affected, is not worthy of a moment's thought.
7. The members of a family going to the same school, having the same master, and being governed by the same discipline, tend to peace and good feeling by all concerned.

DANIEL W. JONES.

We subscribe to the above.

EDWARD P. SHERBURNE.
ELIZA C. FISHER.

WINTHROP SCHOOL, *April 21, 1890.*

I am not in favor of mixed classes. As society is constituted in our cities, there are necessarily many children in our schools who are ignorant of the amenities of life, and others who are wholly indifferent concerning them. It is better that such pupils should be associated in classes with others of their own sex, in order that the improprieties of conduct may not demoralize the opposite.

The citizens in general can have no conception of the manner in which many, many of the children live, whole families crowded together contrary to the laws of decency, so that the gross immoralities of the community become subjects familiar to the sight, and thus those witnessing them lose, in a great degree, the idea of their enormity. Things have transpired in my primary schools, even, that have led me, when possible, to separate the sexes in the upper class. The argument that both sexes are reared together in the family loses its force when the family is made up of hundreds of children from many different homes.

My own experience when my children were in a mixed school greatly strengthened my convictions on the subject.

Teachers for a boys' school, peculiarly adapted to the work, would often be less successful with the other sex, and vice versa. In the proper conduct of a school lies the great success of the instructor. The teacher's ways must be agreeable to the pupils, their ideas must be in harmony in order to accomplish the best results, and I am thoroughly convinced that but very few teachers can be equally adapted to both sexes.

Instruction in sewing and in manual training generally can be better arranged when the school is made up of one sex; and so with physical exercises, boys would enjoy and profit by many movements less suitable for girls.

Young girls should not be subjected to the sight of corporal punishment as inflicted upon boys in mixed schools. I think parents are often deterred from sending daughters (or should be) to the public schools on account of the punishment witnessed there.

The personal preferences of boys and girls for each other, and the intercourse to which its leads, are detrimental to close attention to study.

I spent eight years as usher and submaster in the Mayhew School for Boys, and, therefore, do not speak exclusively from the standpoint of a girls' school.

ROBERT SWAN.

CLERGYMEN.

ROXBURY, *May 30, 1890.*

I have been for many years one of the trustees of Antioch College, in Ohio. The system of the coeducation of the sexes was introduced in that school at its foundation, and has been continued ever since. I do not think that any person acquainted with the college would wish to change it. This seems to me a fair instance for your purpose, because a large part of the students in this institution are connected with a preparatory school, which receives pupils at about the age of those who would attend high schools here.

As is very well known to you, the practice of all the towns in the Commonwealth, excepting Boston, has always been to receive pupils of both sexes whatever was their age. The old country academies thought of no other system, and are all organized on that basis.

I wish somebody would say why the Boston schools were ever organized on any other basis. I have paid a good deal of attention to our daily school education here, and I never knew. This is, however, certain, that Boston is the exception to the policy and habit of the Commonwealth for two hundred and fifty years.

EDWARD EVERETT HALE.

JAMAICA PLAIN, *June 3, 1890.*

In my opinion the "coeducation of boys and girls in high and grammar schools" is a good thing for the boys and not harmful to girls. Most boys have much of the barbaric in them. The presence of and association with girls helps to humanize and civilize them. So far as the mere acquisition of knowledge and intellectual development are concerned, I do not think it makes any difference whether boys and girls are associated or separated.

Yet, of course, the acquisition of knowledge and intellectual development are not the only things for which our schools are maintained. We want our boys to grow up gentlemen. The society and presence of girls is a powerful means to this end.

As regards the attraction which each sex has for the other, which, I take it, is the supposed source of the evil that may arise from the coeducation of the sexes, I think the separation of the sexes has a tendency to lead to the very evils it is supposed to guard against.

As a boy and youth I was in both kinds of schools, and that is my judgment of the two systems.

The male sex, whether young or old, is greatly benefited by association with the female sex, and so society as a whole is benefited. And to be a benefit to the body politic is, I take it, one purpose of the public schools. One of the most public sources of the degradation of oriental countries is the separation of the sexes.

I was three years in the army during our civil war, and could not help noting the baneful effect upon men of separation from the influence of women. There was a marked tendency to retrograde in all that has to do with refinement and the finer elements of our nature.

Thus, you see, I believe in the coeducation of the sexes, for the sake of the boys. I hold that it is in many ways helpful to girls, but not in such marked degree as to boys.

S. N. SHEWMAN,
Rector St. John's Church.

61 CUSHING AVENUE, *Boston, April 29, 1890.*

I am not aware that any institution that has tried coeducation has ever abandoned it. I believe that in every case the results have been favorable.

For ten years I had the superintendence of the schools of a large town, so that I can speak from experience.

There seems to be no more reason for an arbitrary separation of the sexes during school life than during the period before and after it. They are together in the family and mingle in society, not only without harm, but to their mutual advantage. In the nature of things, boys and girls should be trained up together, since they are to live together as men and women, and need to be taught their true relationship. Separate schools for boys and girls are relics of a monastic age, when women were regarded as inferior beings. But in our day it is proved that woman has the capacity for the highest culture and ability to engage successfully in the various affairs of life. The sphere of woman has so enlarged that many avocations that formerly were held exclusively by men are now open to

women, and women are pursuing them with success. Hence women, as well as men, need a broad and high education.

But while coeducation offers equal advantages to both sexes, it does not compel a dead level of uniformity. Eclecticism is now dominant in the higher schools of learning. This elective system affords ample scope for choice of studies to meet the special needs of women.

I am confident that the objection made to coeducation on moral grounds has been proved to be groundless.

The testimony from the schools where coeducation has been practiced is to the effect that not only no harm comes from the mingling of boys and girls in the class room, but that the results are positively good. Personal observation has led me to the conviction that coeducation is better for mind and morals than education of the sexes in schools apart. There is less rowdyism and more earnestness among boys and less unladylike conduct and fewer escapades among girls in mixed than in separate schools. There is danger for the young of both sexes anywhere, but there is nothing gained and much lost by their separation in the class room. There one is both a stimulus and a restraint on the other. Jean Paul Richter says: "To insure modesty I would advise the educating of the sexes together. But I will guarantee nothing where girls are alone, and still less where boys are alone." Coeducation means a development of life into manly and womanly completeness.

R. J. ADAMS, D. D.,
Pastor Stoughton Street Baptist Church.

FIRST BAPTIST CHURCH, COMMONWEALTH AVENUE,
Boston, Mass., April 29, 1890.

I know of no valid reason why coeducation should not be a universal and permanent feature of our common school system. The separation of the sexes is detrimental to both. It belongs to the very essence of free government and a Christian civilization that the sexes should be mutually respectful and mutually helpful (with proper supervision a school may be as innocent as a home), and this they can be only through a proper education together. The world moves forward, not backward. Coeducation is increasing in the higher institutions of learning. The coeducation ought to begin in the grammar school, and continue. Life is a coeducational school.

I did not know that the question of coeducation was any longer debatable, at least as far as regards the earlier stages of education.

PHILIP S. MOXOM.

57 RUTLAND STREET, *Boston, Mass., April 29, 1890.*

I unhesitatingly record myself as in favor of coeducation of the sexes. I have two daughters in attendance upon the Everett School and a young son in the Rutland street primary department. I do not know that coeducation is important so far as the girls are concerned, but believe it to be of incalculable advantage to the boys. And yet I am persuaded it is better even for the girls.

WM. NAST BRODBECK,
Pastor of Tremont Street M. E. Church.

109 COLUMBIA STREET, *Dorchester, May 5, 1890.*

I am a firm believer in coeducation of the sexes in all grades from the kindergarten to the university, also in professional schools. I am unable to understand why in our educational institutions we should adopt a principle of separating the sexes which does not obtain anywhere else in life. It seems to me that beneficial effects only are seen where the sexes are together, as in Cornell University, Ann Arbor, and the Meadville, Pa., Theological School.

GEORGE H. YOUNG,
Pastor New South Church.

CHARLESTOWN, *May 14, 1890.*

I think, on reflection, that the question of coeducation of the sexes in high and grammar schools admits of a variety of answers, according to conditions.

1. Age of pupils: Up to 10 or 12 years of age children may safely and profitably be educated together. Whether in city or country, in bad or good neighborhoods, the benefit outweighs possible danger (always excepting the worst localities).

I would keep the children together in grammar schools as long as the teachers think it best to do so, always seating boys and girls apart, but mixing them in recitations according to scholarship.

2. In bad quarters of a city (where the state of moral and social life is low), when the pupils need much discipline, boys and girls may wisely be wholly separated in schools; also when some more respectable children are in the school.

3. In high schools: (*a*) If a school is quite limited in numbers let the sexes study, recite, come, and go together. High schools generally draw pupils from the better classes of the people. (*b*) In large high schools the two sexes are better apart, each in a school by itself.

Because (1) supervision on so many pupils is more difficult.

(2) With each sex by itself discipline can be better enforced when pupils are numerous, and study will be less interrupted.

(3) Emulation is sufficient when many are together, without the additional stimulus of sex rivalry, which, in a smaller school, keeps up the standard to some extent.

(4) In large schools more danger of the influence of reckless pupils and teachers have less personal influence on individuals.

4. The teachers can tell better than anyone else whether the conditions in any given school are favorable or unfavorable to coeducation. It is a subject on which general conclusions are theoretical rather than practical.

5. Separate college education by all means.

A. S. TWOMBLY,
Pastor Winthrop Church.

ADDENDA.—Sex susceptibility affects students less than many suppose when they are kept hard at work in schools.

Boys and girls are generally shy of each other (except among the lower classes) between 14 and 19 years of age. Youths at that age segregate by sex. The question of coeducation at that period is more concerning its influence on effective study than as a matter of moral and social expediency.

38 DARTMOUTH STREET, *Boston, April 29, 1890.*

My opinion is not favorable to the coeducation of the sexes in our grammar and high schools. Admitting its possible intellectual stimulus, I deprecate its effect upon morals. The objection does not hold with reference to coeducation in our colleges and universities any more than to our primary schools, but only to that class of our youth presumably between the ages of 13 and 17. Of course I concede exceptions to the rule, but, speaking in general terms, observation, and experience would lead me to negative such a proposition as the one suggested.

JAMES M. GRAY,
Rector First Reformed Episcopal Church.

209 W. CANTON STREET,
Boston, Mass., April 30, 1890.

From the time that boys and girls are old enough for the grammar school until they are ready for college they should be kept apart. I was "coeducated" from the time that I began to go to school until I was graduated from Boston University, and I am fully persuaded that free association during the time that I have indicated is fraught with danger to both sexes.

GEORGE A. CRAWFORD,
Pastor Broomfield Street M. E. Church.

SOUTH BOSTON, *April 28, 1890.*

While I can bring forward no new argument, yet I feel that the old ones are sufficient to justify me in condemning coeducation. The argument of propriety is all sufficient in my judgment. There are dangers at an earlier period of life in our grammar schools; how much greater are not such dangers apt to be in high schools? And while I admit that youths may receive a stimulus to study, and also, perchance, a certain refinement, if you will, by coeducation, yet do I perceive also dangers which may more than balance such advantages. What these dangers are parents and educators and others experienced in affairs may easily surmise. In short, I have no difficulty in condemning coeducation, and deem the separation, which now happily exists, the very best.

D. O'CALLAGHAN,
Rector St. Augustine's Church.

72 Alleghany Street, *May 1, 1890.*

The following considerations are of influence with me as against any greater commingling of the sexes:

1. Many of the children come from unregulated homes, and it is questionable how far other children should be compelled to hear and learn from unfortunate remarks and incidents which arise from want of early discipline in every mixed class.

As far as possible children should have the advantages of common school education without risks.

2. The association of boys and girls in the same building, but not in the same classes generally, furnishes the best elements to be derived from some education of boys and girls, brothers and sisters in the same set of companions.

3. Many teachers—perhaps most—have distinct fitness for girls or boys, and do much less satisfactory work with the opposite sex or when they are mingled in the class room.

William R. Campbell,
Highland Congregational Church.

Nonprofessional opinions.

Cambridge, *May 29, 1890.*

I am very strongly in favor of the coeducation of the sexes.

This opinion dates back to my early life, when, as a day schola, in what was then considered the best boarding school near Boston (that of William Wells, in Cambridge), I was struck with the greater decency and refinement of the day scholars, who lived at home and with their sisters, as compared with those who lived only among boys. Afterwards, as usher in another large boarding school (that of Stephen M. Weld, of Jamaica Plain), I noticed just the same superiority. This impression has never passed away from my mind.

Since then, while on the school committee of three different places—Newbury and Worcester, Mass., and Newport, R. I.—I have seen the process of abolishing separate schools and bringing the sexes together; and always with satisfactory results as to discipline, manners, and morals.

I am satisfied that there is in each sex an instinctive desire for the good opinion of the other, and that this is a very powerful aid and stimulus in the hands of the teacher. As a remarkably good teacher, Mr. William Reed, now of Taunton, said to me forty years ago at Newburyport: "I never yet saw a school which I could not manage by the waving of a finger, if I could only have boys and girls together."

This is now generally admitted as to boys; but there is often an impression that what the boys gain the girls lose. Here again I must quote a very able teacher, Mrs. Caroline C. Leighton, sister of the well-known educational authoress, the late Jane Andrews, and as good a teacher. When in Worcester, about 1855, we changed her girls' grammar school into a mixed school, she said soon after: "I was willing that the change should take place, because I thought we owed it to the boys, although I thought it would be bad for the girls. But now I am satisfied that it is for the benefit of both, and has done as much for the girls as for the boys."

When I was on the school committee of Newport, one of our very best grammar-school principals, a woman, took a day to visit Boston grammar schools. After her return she said to me, "I should never wish to teach a public school in Boston. They seem to me perfectly tame and uninteresting, from having one sex only." When I questioned her farther she said: "I rely on my girls to give steadiness and regularity to my school; they are more punctual and get their lessons better. But I rely on the boys to bring outside life into the school, to know what is going on in the world, to illustrate the lessons from what happens in the streets and on the wharves. Neither would be sufficient alone; both are needed for the material of a good school." I thought I had never heard the precise state of the case better put.

Thomas Wentworth Higginson.

Milwaukee, *June 8, 1890.*

In the West there has never been any doubt as to the feasibility or advisability of coeducation. In Wisconsin and Michigan both, this system has been fully in practice, and the University of Wisconsin gives equal privileges to both boys and girls. I have never heard of any difficulty or scandal arising from this intermingling of the sexes at school.

I was educated in such a school myself, and my experience teaches me that there is a certain emulation or desire to stand well in the eyes of the opposite sex, which stimulates the pupils in such a school to greater mental exertion, and makes them more zealous in the pursuit of knowledge. Girls are usually quicker in their perceptions than boys of the same age; consequently boys derive the greatest benefit from this comradeship. Contact with the gentler sex also smooths the rough edges of a boy's manner, and develops the chivalrous side of his character, making him more manly, more honest and straightforward than he would be if accustomed only to the society of boys like himself. There is still a good deal of the savage in man, and this trait is more likely to develop itself when men herd together.

On the contrary, a girl who is brought up in the companionship of boys is more likely when she arrives at womanhood to estimate men at their true worth, and is less likely to become the prey of the first designing adventurer whom she meets.

Your inquiry strikes a Wisconsin man or woman somewhat as would an investigation into the advisability of allowing men and women and boys and girls to occupy the same pews in church. Coeducation has been so thoroughly accepted and so long practiced in the West that we have to speculate as to the probable effects of a return to the old monastic system.

Mrs. D. H. Johnson.

In regard to the coeducation of boys and girls in high and grammar schools, I am entirely in favor of it, believing it to be for the advantage of both sexes to mingle freely in all departments of education.

I have not had a very large personal experience, but have had under my care a boy and a girl who were passing through a coeducative high school. In neither case did I see any evil or disadvantage arising from coeducation; but on the contrary a natural healthy friendship with those of the other sex. I should entirely approve of the principle of coeducation, from the lowest primary school to the highest university or professional school.

Ednah D. Cheney.

II.—OPINIONS OF FOREIGN EXPERTS.

The Chicago exposition and congresses of 1893 brought to this country many foreign experts deputed by their governments to study our school systems. To these critical observers coeducation appeared the most striking feature of our educational systems. They realized also that it arose out of social conditions radically unlike those that exist in the Old World, which differences are in turn strengthened and perpetuated by this policy.

COEDUCATION OF BOYS AND GIRLS.

[From report of Dr. E. Schlee, of the Realgymnasium of Altona, Prussia, delegate to the Educational Congress at Chicago.]

A very common, although not universal, feature of the American public school is the coeducation of the boys and girls, not only in the primary schools (cities) and in the country schools, as is also the case with us, but also in the grammar and high schools of cities. Furthermore, the sexes are not separated in the normal schools (*Lehrer-Seminarien*), in colleges, and even in universities. In Chicago coeducation is the invariable rule; in Boston and New York union and separation are both found. To us it seems strange, at least, to see, if only in photographs, boys and girls not only of 13, but even of 16 years of age, sitting together or standing in mixed rows, going through free gymnastics and exercises with wands. It is to be noticed, however, that they have single desks; also, that generally the teacher is a lady, even for the free gymnastics. All special rooms (i. e., toilet rooms, etc.) and the playground are strictly separate for boys and girls. This coeducation has not been without opposition; especially in Boston where the system has already been twice severely attacked. Ten years ago Dr. Clarke attributed to this the fact, which, however, was elsewhere disputed, that American ladies of the higher class were not very good housekeepers and mothers. The Commissioner of Education[1] obtained reports from 300 cities and town, and these were, on the whole, favorable to mixed schools. He therefore commended this policy,

[1] Gen. John Eaton.

arguing that if we must live together we must be educated for that purpose; to educate the sexes separately is to change the natural order of things.[1]

Later Dr. Philbrick stated that by this means (coeducation) the peculiar form of education best suited to the different sexes was prevented. But the Commissioner responded[2] that Dr. Philbrick had had no experience in mixed schools and that the statistical returns showed only favorable results as far as regards conditions of health. At the same time the good effects upon morals were mentioned, which had resulted from coeducation in Norway and Finland, and reference was made to the unfavorable effects of the monastery education in France.

A schoolman of large experience also personally told the writer that coeducation had a favorable effect on the general behavior, on the bearing of the pupils toward each other, and on the whole discipline. Germany takes in this respect, perhaps, the right medium between France and America, but if one observes how beneficial in general is the comradeship of the children of intimate families one might, where the nature of the studies and where outer circumstances, especially in smaller places, make the union desirable, consider that the American way would be advantageous in our country also.

The discipline, indeed, is not as strict as in Germany. While formerly in America corporal punishment is said to have taken place often enough, it is now everywhere forbidden in the public schools.[3] Also deprivations of liberty seem not to be practiced. Where admonition does not avail temporary exclusion from school by the principal of the school for not more than a month, by the school superintendent as long as a quarter of a year, or expulsion from school is the only means. And yet the American educational method, by reason of the many recitations of the individual scholars, gives abundant cause of disturbance and trouble of which much complaint is made.

In discussing the teaching force of our schools, Dr. Schlee dwelt also upon the spectacle, novel to a foreigner, of the general presence of women side by side with men in various business and professional pursuits. He expressed the opinion that this transfer of women from the domestic circle into careers competitive with men increased "the restlessness, haste, and intense strain in all relations of life."

Prof. Stephan Waetzoldt, of the University of Berlin, chief commissioner of the German educational exhibit at Chicago, says:

"No distinction in the quality, kind, and aim of instruction is made in any of the elementary schools for boys and girls. In the old States the sexes are not, as a rule, instructed together in second schools, but in the Central and Western States they sit together from the primary school to the university, the latter included. This is the system of coeducation, the education common for both sexes so highly commended by Americans. At the congress of education at Chicago this subject was often discussed, and not one disapproving voice was heard. At first I was altogether misunderstood when I explained that our views on the education of girls differ essentially from those of Americans. They see only the advantages of coeducation, believed to refine the boys and strengthen the girls, and we must accept these peculiar conditions just as in domestic life. The intercourse of boys and girls, of adults and children, is altogether different from what it is among us, and I doubt whether it has a moral advantage. Certain it is, however, that the girls on the average are more intelligent than the boys; they go to school longer. In the high school of Chicago the proportion of girls to boys is 3:2. As business and politics take up the men's entire time, the women have become the supporters of the higher intellectual interests and the protectors of intellectuality in domestic life."

Prof. Emil Hausknecht, of Berlin, for several years professor in the National University at Tokyo, says on the subject of coeducation in America:

"As a makeshift, coeducation is better than nothing. As a principle, it entirely ignores the needs of the separate sexes, arising from the differences in the development of boys and girls. Boys and girls from the ages 14 to 18 must be differently

---

[1] Hon. Andrew Jencks, superintendent of schools, Pawtucket, R. I., in Circular of Information, No. 2. 1883.

[2] The reference here is to the following observation by Dr. Harris in response to an inquiry from Dr. Voss, of Norway: "With regard to Mr. Philbrick's judgment on the subject of coeducation, I think that he stood almost alone among our ablest writers on education in his opinion. The Boston schools under his charge educated the sexes separately. It may be that his experience in that city had undue influence on his opinion." [Ed.]

[3] Corporal punishment in public schools is forbidden by law in the State of New Jersey, and in many cities by school law or by school boards. The prohibition is far from universal, but public opinion is very generally opposed to this form of punishment. [Ed.]

treated, both in regard to the intellectual and emotional nature. Coeducation is possible, however, in America more than in Germany or elsewhere, because custom and education have given to the girl and the woman greater freedom and determination in their manners and appearance, but also give them strong protection against encroachments and improprieties. Coeducation is possible in America also, because the week has only 5 school days, Saturday being a holiday, and the school day has only 5 lessons, of which one is usually a study hour. Besides, grammar and high schools require much less severe intellectual efforts, and a much more concentrated and simple exertion of the mind than is required in our secondary schools for boys."

THE COEDUCATION OF THE SEXES IN THE UNITED STATES.

[Extract from a report to the minister of the public instruction, France, by Mlle. Marie Dugard, delegate to the Chicago Congresses of 1893.]

Of all the features which characterize American education, perhaps the most striking is the coeducation of young men and young women, whether in the public schools (primary and grammar schools) and in the high schools, or in the colleges, the scientific schools, and universities. At least it is most striking to a French observer, for it reveals to him a state of mind and of habits which is entirely strange to him. The sight of youths of 16 to 18 years, almost men, working, chatting, and enjoying daily comradeship with young ladies, who, by reason of their distinction, elegance, and often a precocious beauty, seem not at all like students, confounds all his ideas. He is astonished that such an ideal should have sprung up in the healthy American mind, and he does not dare to think of the results, so opposed do they seem to his moral sense. How the United States have come to adopt coeducation, a glance at their origin enables one easily to understand.

When the settlers fixed themselves in America, their first concern after having cleared a place, built log houses, and provided for the necessities of the material life, was to organize schools to the end, according to an expression of an ordinance of Massachusetts, "that the knowledge of their fathers might not be buried with them in their tombs;" but as they were too poor to give to every village two school buildings, they opened only mixed schools, where the pupils of the two sexes received the same instruction. This system, which offered real pecuniary advantages without any moral danger—as the children were restrained by the bonds of relation or friendship between their families—was extended, and outlived the causes which had created it. Rich and prosperous cities covered the prairies of the settlers, palaces took the place of the log cabin of the first builder; but, among all these changes, coeducation remained.

Harmless as it is for small communities and for elementary classes, is it so still when transplanted into the new conditions of the modern life and into all orders of instruction? This is a question much agitated in the United States. It would be indeed a mistake to believe that the mixed education is so inwrought into the American customs that it never encounters opposition. In certain communities it is, on the contrary, much criticised, and several cities, especially in the East, have entirely discarded it; others retained it only in the grammar and primary schools, sometimes in the latter only.

The controversy is worth analysis, for it enables us to see the possible results of coeducation and illuminates one of the most important problems of American pedagogy.

"The organization of a being is always in harmony with the functions which nature assigns to it," say the opponents of mixed education. Now the organization of woman differs much from that of man, therefore she has different functions and should not receive the same education. These principles do not involve in them the thought that woman is inferior to man.

"The highest ideal of humanity," wrote an ardent adversary of the mixed school in a book which was formerly considered an authority, rejecting any comparison of inferiority or of superiority between the sexes, "demands that each be perfect after his nature. The lily is not superior to the rose, nor the oak tree superior to the clover; neither is the beauty of the lily the beauty of the oak, nor the purpose of the oak tree the same as that of the clover." It would be a poor horticulturist who would treat them in the same way. And he adds: "If woman subjected to masculine education intended for the development of the male organization can equal man, she ought to surpass him if she receives feminine education designed to develop the organization of woman."

From these general arguments proceeds a long series of objections—physiological, intellectual, and moral—which we will summarize:

Coeducation is injurious to the health of the young girls; less strong than the boys, they can not endure the same work without hurting their organism; and to oblige them to study together is to substitute for the sound emulation, which reigns in the separated schools, a morbid rivalry from which their nerves must suffer. Their excessive pride prevents them from admitting that this régime exhausts them; desirous to equal young men and even to surpass them, they study with great zeal and constantly strain the activity of their brains. The results of this overpressure one can see to-day in the American woman, intellectual, refined, brilliant indeed, praised by Europeans on account of her spirit and grace, but pale, feeble, of a delicate beauty which soon vanishes, and incapable of having a large family. Therein lies an imminent danger for the future of the race, and if this is not remedied there will soon be a race of women capable of being doctors, journalists, advocates, architects, engineers; in one word, everything except wives and mothers.

More than this, the woman, having different functions from the man, has not been endowed with masculine intelligence, and consequently it is not reasonable to impose upon her the studies and methods which are suitable for the masculine mind. "The boys should work as boys and the girls as girls. Mary can master Virgil and Euclid as well as George, but both of them would be weakened and would not attain their legitimate end if they were condemned to the same methods. In all their work women should respect their characteristic organization and remain women and not strive to be men, or they will fail utterly. For the two sexes there exists no exception to the law that their greatest power and their greatest perfection lie in the complete development of their organism."

The difference in the intellectual development of the young people of either sex is also opposed to their common education. Until the age of 16 or 17 years the young man has a mind less developed than the young girl; if he works with her he will be discouraged and give up efforts which do not offer him any success.

From the moral standpoint the consequences of coeducation are still more dangerous. It is a law that if two individuals live together the one who has the strongest personality becomes the model for the other. Educated with boys, the young girl, having a temperament weaker and more supple, copies the manners of the boys and loses her graces, while the boys do not become softer by the feminine association. Finally, it is impossible that between young men and young women, associated every day in the familiarity of classes, there should not be formed some romances, which the American education, it is true, renders inoffensive as far as regards manners, but which will nevertheless have disadvantages.

These objections seem judicious, and in the light of them it seems that coeducation ought to be abandoned, but it is necessary to hear how its partisans defend and justify its continuance.

It must be observed, in the first place, that besides the advantage of conforming to the historical origin of the United States and to the habits of the majority, it has unquestionable advantages; it is economical and permits the use of a part of the school funds for the purchase of books, apparatus, etc.; it conforms to the natural method; that is, to the organization of nature and society; finally, in uniting the minds of the two sexes in the same culture, it gives them common thoughts and tastes, and so prepares for the happiness of family life, where the principal cause of dissensions is the barrier which is raised between the ideas, the sentiments, and the belief of husband and wife.

Taking up the objections of the opponents, the defenders of the policy reply to them by considerations which are not without value.

It is assumed, they say, that woman not having the same nature as man, must not be educated in the same way. That is a poor argument, for in reality the soul has no gender. But let us admit that there exist between the man and the woman great differences on the intellectual side as on the physical; we can not draw from this an argument in favor of separate education, as the resemblances are, in spite of all, more numerous than the oppositions.

If the lily and the rose, following the figure of Dr. Clarke, require different culture, does not their common need of air, of sun, and of dew permit the horticulturist to let them bloom in the same garden? Some maintain that if woman can accomplish much with a masculine education, she would accomplish more with a feminine education. Ought one not to say the contrary, that the more dissimilar the two sexes, the more useful it is to woman to be educated with man, in order to acquire certain virile qualities which she will never possess if she remains shut up in her femininity?

It is asserted that the excessive work and the morbid rivalry of the mixed schools are injurious to the health of young women; but this dangerous emula-

tion, and this overpressure, are not due so much to coeducation as to the general organization of modern instruction.

In the schools where the scholars of the two sexes are separated the programmes are so arranged that the girls study as much as the boys, and it is often seen there that emulation degenerates into unwholesome jealousy. The delicate health of women, of which advantage is taken in this discussion, originates from causes that have nothing at all to do with mixed education. It is caused rather by the enervating dryness of the climate; by the feverish activity and the unhealthful habits of American life, habits from whose debilitating influence the less robust female suffers most, and by the unhealthful dress which custom imposes upon young women and which prevents their taking as much exercise as young men, while it makes work harder for them.

"Women, and even girls at schools," says C. H. Dall, "take their studies in addition to their home cares. If boys are preparing for college, they do not have to take care of the baby, make the beds, or help to serve the meals. A great many girls at the high schools do all this."

To all these causes must be attributed the weak health of the American women, and it is entirely unjust to make coeducation responsible for it.

Resting upon the principle that woman has not the same mission as man, some contend, also, that it is not desirable for her to receive the same instruction. This reason had formerly some weight when woman remained at the fireside, confining her activity to domestic duties and depending upon her father, her brothers, or her husband for the care of her future; but times have changed; in the present state of our social organization many women are obliged to provide for their own needs and often for those of their families. Forced to work for their living like men, it would be unjust to refuse to those whom nature has made more feeble the same means of defense; that is, the same culture, the same knowledge. The opponents of mixed instruction acknowledge entirely this truth; several concede to the women the right to have the same knowledge as man, but they add immediately that as her mind is not the same she must not acquire them in the same way, and from this difference they derive the necessity of separate education—a false conclusion, for there exists often among certain children of the same sex greater mental differences than between young men and young women, taken as a whole, and yet no one thinks on that account of providing a special teacher for them. It is the duty of the professor to use a method flexible enough to accommodate itself to the different intellectual necessities of his pupils.

To this the answer is, that when the young men work with young women whose livelier minds are more capable of assimilation, young men are discouraged. Experience has proved, on the contrary, that the feminine quickness excites the slower intelligence of the boys. If there really have been young men repressed by the success of women, it is certain that the success of a comrade of the same sex would have had the same effect.

There remain the moral objections. According to the testimony of educators, who for a long time have directed mixed schools, young women, far from becoming masculine by the contact with boys, have, on the contrary, greater dignity and reserve, and the young men, in their turn, lose in the society of young girls that roughness of manner and that carelessness in attitude and language which characterize the men educated apart from women. As to the last objection, the gravest of all, we have here the reply of an educator whose words have special authority, because he was partly educated in mixed schools, partly in those open to boys only, and he directed for several years the mixed schools of St. Louis:

"My observations have led me to indorse the statement of Richter: 'To insure modesty I would advise the education of the sexes together, for 2 boys will preserve 12 girls or 2 girls 12 boys innocent amidst winks, jokes, and improprieties, merely by that instinctive sense which is the forerunner of natural modesty. But I will guarantee nothing in a school where girls are alone together, and still less where boys are.' I had noticed that the atmosphere of 'mixed' schools was desexualized, where that of separate schools seemed to have a tendency to develop sexual tension. Again, whatever tendency toward indecency might manifest itself was far more easily checked in 'mixed' schools, by reason of the crossfire of watchfulness which made intrigue far more difficult to keep secret. The brothers and sisters and other relatives and intimate acquaintances of the pupil attended the same school, and every act was scanned from two points of view—the boys being participants in boys' gossip, and the girls being participants in girls' gossip—and the barriers being removed within the precincts of the family, parents could not fail to have a more faithful account of the behavior of their children than when isolated in different schools. Brothers and sisters mutually protect each other

from shame. Besides this, the fact that the chief association between the sexes in 'mixed' schools takes place under the eye of the teacher and in recitation, wherein the contest is purely intellectual and where the manifestation of mere femininity—softness and sentimentalism—would cause the pupil to lose rank as a scholar, and where mere masculinity—roughness and willfulness—would make an unattractive spectacle, leads one to expect that the tendency of coeducation is to elevate the standard of admiration from mere external charms of person to the spiritual graces and gifts which lie deep in the character."

To these judicious considerations must be added certain observations which the opponents of coeducation do not seem to have taken into account, and, first, that the habit of being educated together is for young people of both sexes a better safeguard against love than continued separation. A young girl whose companions are almost exclusively of her own sex becomes romantic and is easily enamored, but one who has been always associated with young men, having experience and maturity, does not yield to extravagant enthusiasm. Moreover, in the love that may spring up in the mixed school there is nothing to alarm the severest moralist, and this because the oversight, as Dr. Harris has shown, is much greater there than anywhere else, and because the young American girl has a profound sense of her dignity, the young man a great respect for the woman, and both together the habit of self-control, there will result only a marriage in which the tenderness is the more enduring because the husband and wife have so long known each other. It would be well if such marriages should happen often.

But will not the preoccupations of such attachments hurt the studies? This is a chimerical fear. As the relations are above all intellectual, a rising love, far from fostering idleness, will inspire more earnest work in order to secure the appreciation of the loved one—daily witness of failure and successes.

To these theoretic arguments in favor of coeducation there is added a final consideration more important than the others: It has triumphed in all the cities of the Middle States and the far West, and even in the East it has a tendency to extend in spite of opposition. Some Americans speak of a reaction, but this triumph in the Western States, numerous and extensive and called to an important part in the future of America, does not justify this prediction. It is not for me, certainly, to judge of this. It would also be presumption for me to pretend to settle the question of the inferiority or the superiority of the mixed schools after having seen the greatest educators of the United States divided as to the subject. Therefore I will offer only in conclusion my impressions.

It did not seem to me that in the mixed schools the hygiene, the work, and the order suffered from the presence of the pupils of another sex, and the appearance of the classes seemed to me even better than in the separate schools. But what disturbs the pedagogical sense is the greater excess of the female sex in the high schools, both among the scholars and among the teachers. The majority of American youth—entering there at the age of 15 or 16 years—two-thirds, even three-fourths, of the pupils in the higher classes, are girls. This disproportion is bad for the young men. If it is good for their manners not to be separated from the women, it is dangerous to their manliness to be always in contact with young girls. Moreover, if the guidance of a female teacher is best for them when they are very young, at about 14 or 15 years, and perhaps younger, they ought to have different control.

It is impossible, at least without seeing it, to realize how painful is the spectacle of a young woman, who has not yet in her tone and attitude the authority which age and long experience give, directing young men from 16 to 18 years of age. Certainly, neither the discipline nor the respect suffer from that, so profound is the deference of the American scholar to his lady teachers, but it is nevertheless true that in this ideal of instruction something is wanting. The female teacher can not secure from the young men all the intellectual work of which they are capable, she can not come into intimate relation with their adolescent minds, nor can she give them a manly development. Thus one whole part of education, the most fruitful and the best, is eliminated, and the occasion is lost forever. It is right to acknowledge that these faults are not inherent to the system of coeducation. They arise from the particular conditions of American life, and in other countries it would doubtless be easy to avoid them. But would coeducation be acclimatized anywhere else? And in France, where it exists already in some departments of instruction, should it be extended to all? This is a question which I shall not consider here.[1]

[1] In the continuation of the report the author considers the conditions under which coeducation is possible, and comes to the conclusion that it is impracticable for France.

M. Jules Steeg, director of the Musée Pédagogique, who had charge of the installation of the educational exhibit of France at the Chicago Exposition, and Dr. Gabriel Compayré, delegate from the minister of public instruction to the educational congresses, have simply noted the fact of coeducation in articles upon America published since their return to France.

The former says:

The girls are educated in America together with the boys. They sit on the same benches, pursue the same lessons and the same exercises without any distinction whatever, for the boys even take part in the sewing exercises and are very proud to exhibit their needlework every year beside that of their female companions. They would be astonished, I was told, if anyone seemed to be surprised at this. I refer here to the first school years. Later some separation takes place in spite of all the theories in the world, and I have seen embroideries made by the girls and works in wood and iron by the boys. (Chicago et l'Exposition. Notes d'un visiteur français. Rev. Pédagogique, June, 1893, p. 487.)

Dr. Compayré, in an article upon the educational congresses, says:

We cast our eyes over the audience—women predominate. The coeducation of the sexes, commenced in the schools, is continued in the congresses. (Rev. Pédagogique, November, 1893, p. 387.)

[Extracts from a report by Anna Bentzen, of Norway, who visited the United States for the purpose of studying the system of coeducation.]

The first school I visited was the Toledo High School. Here, as usual in the West, all public schools are mixed, and even the private schools do not class the boys and girls separately.

* * * * * * *

I noticed that the high school in Toledo (average age of pupils from 15 to 18), and in many other places, presented an overwhelming majority of girls. In many classes I saw from 5 to 6 boys among 40 girls. The question forced itself upon my mind if this condition was due to coeducation. I addressed inquiries to principals and teachers as to the cause of this phenomenon, and I received the answer that practical life has much greater attractions for a lively boy than the school. * * *

Mixed schools are undoubtedly not the only form of schools in the United States, but when one observes the tendency thereto in all places where coeducation formerly found no sympathy, in most of the Southern States (whose history deviates in general from that of the Northern States), one can see how the system has prevailed there also theoretically; practice follows later wherever it is possible. That separate, as well as mixed schools, are found in the cities of the Eastern States, e. g., in Boston, shows simply the possibilities of a large city as to satisfying various views and wants. * * * It is plain that the cause obtains footing more and more, instead of losing it. All school authorities, superintendents and directors, who were so obliging as to enter more thoroughly into the question with me, pronounced themselves unconditionally in favor of the policy, and presidents of colleges and universities expressed themselves in the same terms wherever coeducation had been introduced. In vain they look for intellectual inferiority of women, even in the highest educational institutions.

It is true that fewer women than men go to universities after having finished the high-school studies. However, the percentage is constantly increasing, and, in comparison to the number of men, an equal number of women take their degrees with the highest credit. In the fall of 1890 there were 198 female students at the Wisconsin State University in Madison, and about four times as many men. At Ann Arbor, Mich., there was about the same proportion upon a total of 2,153 students. Coeducation in Wisconsin dates only from 1863, after the university had been in existence for many years (from 1838), and in the beginning it was not coeducational in the exact sense of the word, since the young women were instructed in a so-called normal department. At last, in 1873, all peculiarities in the instruction of women were done away with, and the university was opened to both sexes without any restrictions. The president of Ann Arbor University told me that the first woman student entered the university in 1871, and passed the fiery trial of public criticism and the university examinations with the greatest honors. Her example was soon followed by others, and for the last ten years coeducation at this university, as well as at many others, has been an established feature, and no more comments are made upon the subject, at least none

that are unfavorable. Even the professors, who were most opposed to the new arrangement, confess that experience has conquered their opposition.

In some universities they are from principle opposed to coeducation. Harvard College, near Boston, has established a so-called annex for women students, but refuses stubbornly to give lectures before a mixed audience; for what reasons, the author has not been able to find out. This annex arrangement does not give satisfaction; it savors too much of "second hand," even although the privileges are the same as those bestowed upon Harvard proper. The women students up to this time have shown most interest in the branch of philology, but natural sciences gain more and more attention and original scientific investigations by single individuals have already been undertaken. The law schools are not attended by many women students, but in those of medicine there have been numerous women students for quite a number of years, and now and then some follow even the course of engineering. But the professions whose courses are followed by women in isolated instances only are of little consequence in the question of coeducation. When it is fully established in future, the woman's inclination will prove to be equally as good and safe a guiding star as that of man, and there is no reasonable foundation for the apprehension that she will follow studies not befitting her sex. * * *

In some places I noticed a strict separation of sexes, both in respect to their seating in schoolrooms and their marching in or out, and in most places there are separate playgrounds for boys and girls. One can easily recognize the necessity of the latter upon seeing that the pupils are but little supervised during the recesses. Separate cloakrooms are found everywhere. But as far as I could find out these trifling arrangements were the only ones thought necessary for the sake of order and morals.

One should remember the rough material which American schools receive. Recent immigrants, no matter if from the east or west, and without knowing a word of English, are received in the common schools or high schools. In the meantime there is something in the surrounding air that softens the uncouth nature of the child, and at the same time, as he becomes familiar with the language of his new fatherland, he imbibes the respect for his own worth as a human being and for the rights of his comrades, which is the profoundest principle in an American community. If those from the lowest classes of the community were kept aloof and the two sexes kept separate, would the teacher in such a case be able to bring about such changes? * * *

It must not be imagined that all schools possess a class of clean, well-situated, well-educated children, who might be sent to an exhibition; but although there are schools which use up all the energy of a teacher within a short period of time, destroying her good humor and tempting her to use a cane, we find that such is most often the case in those schools where no coeducation is advocated, and where now, as in some schools in Boston, they are afraid of introducing coeducation because wildness and roughness seem to be their inheritance and possession. * * *

In America young boys and girls associate in a friendly way together from their earliest childhood. They have all opportunities to become acquainted in school. * * *

I had special opportunities in the Western States to observe these natural relations, both in university cities among the students and other young people who were following practical careers. The young girls were strikingly easy and natural in their manners. From a moral standpoint, I discovered only healthy results from the American coeducation. It still remains to examine its effect in a physical aspect. * * *

I have been much impressed in American schools (both in lower and common schools) by the weakly, pale-looking children with bad carriage of the body and much nearsightedness, judging by the distance of the books from the eyes. But I did not receive the impression that the girls looked more delicate, nor do statistics report to this effect. * * *

Both boys and girls suffer from overcrowded classes (being pinned down to the desk for long hours), from bad ventilation and severe drafts, the want of playgrounds, and one-sided mental work. * * *

Finally, I will add a remark on the economical feature of coeducation:

When I consider the equipment of the American high schools, as I saw them in most cities, and then imagine these expensive buildings doubled in order to accommodate each sex separately, there arises a strong doubt in my mind. Would it be possible to furnish these schools with expensive laboratories (not with one, but with three), with excellent microscopes, well-supplied libraries? Hardly in smaller cities where there is at present only one high school; however well the boys' high

school might be equipped. the girls' high school would no doubt leave much for improvement.

III.—CITATIONS FROM DISCUSSIONS RELATIVE TO THE PHYSIOLOGICAL AND HYGIENIC BEARINGS OF HIGHER EDUCATION FOR WOMEN, WITH SPECIAL REFERENCE TO COEDUCATION.

The widespread interest excited in the problem of the higher education of women by the land-grant act of 1862 and the founding of separate colleges for women (Vassar, 1861; Wellesley, 1870, and Smith, 1871) caused every phase of the question to be earnestly canvassed. The physiological and hygienic aspects of the problem were brought into special prominence by Dr. E. Clarke, of Boston, whose book, Sex in Education, was virtually a protest against coeducation. His arguments carried great weight at the time by reason of their scientific tone, and they are still the strongest that are adduced against the policy from the physiological standpoint.

In the opening chapter the author discussed the physiological constitution of woman, and set forth conclusions which he had formed from clinical observation. In the fourth chapter he marshaled the "laws of development," which, he says, "we have found physiology to teach," and his personal conclusions as an argument against coeducation. With respect to the public discussions then in progress, the pith of the book was in this chapter, since it was immediately seized upon as presenting an unanswerable argument against opening to women institutions originally designed for men alone.

The citation from this chapter, given below, is interesting as showing the manner in which Dr. Clarke applied his argument, and also the care with which he avoided open opposition to the general movement for the higher education of women that had already become irresistible. Against Dr. Clarke's position little more could be adduced, at the time, respecting coeducation, than individual convictions. Mr. Thomas Wentworth Higginson, however, considerably lessened the effect of Dr. Clarke's argument by exposing the small basis of fact upon which it rested and pointing out, categorically, the classes of facts which were required in the premises and which, in his opinion, were already attainable. This portion of Mr. Higginson's article, which formed a chapter in Sex and Education, is also reproduced. It should be added that the subsequent investigations by the Collegiate Alumnæ Association were the natural outcome of this call for facts. The data collected related to the health history of 705 graduates from 12 colleges or universities open to women, 9 of the institutions claiming 247 of the graduates being coeducational.

The Massachusetts bureau of statistics and labor, at that time (1885) under the direction of Hon. Carroll D. Wright, undertook the preparation and publication of the material, and it is to be found in full as Part V of the sixteenth annual report of that bureau. The summary of results, which, under the circumstances, must be regarded as entirely impartial, is inserted after the citation from Mr. Higginson.

Two years after this report was published the similar inquiry already noted was undertaken by a committee of women's colleges at Oxford and Cambridge (England). These colleges are indeed not coeducational, but this fact does not lessen the significance of the investigation so far as regards the strain of scholastic work, since the students are prepared for the same examinations as their brothers at Oxford and Cambridge.

The results of this investigation are presented in a pamphlet report, of which the summary is also cited below, together with a single table in which the results of the American and the English investigations are compared.

SEX IN EDUCATION.[1]

[By Dr. Edward H. Clarke.]

Before going further, it is essential to acquire a definite notion of what is meant, or at least of what we mean in this discussion, by the term coeducation. Following its etymology, con educare, it signifies to draw out together, or to unite in education; and this union refers to the time and place rather than to the methods and kinds of education. In this sense any school or college may utilize its buildings, apparatus, and instructors to give appropriate education to the two sexes as well as to different ages of the same sex. This is juxtaposition in education. When the Massachusetts Institute of Technology teaches one class of young men chemistry and another class engineering, in the same building and at the same time, it coeducates those two classes. In this sense it is possible that many advantages might be obtained from the coeducation of the sexes that would more than counterbalance the evils of crowding large numbers of them together. This sort of coeducation does not exclude appropriate classification, nor compel the two sexes to follow the same methods or the same regimen.

Another signification of coeducation, and, as we apprehend, the one in which it is commonly used, includes time, place, government, methods, studies, and regimen. This is identical coeducation. This means that boys and girls shall be taught the same things, and at the same time, in the same place, by the same faculty, with the same methods, and under the same regimen. This admits age and proficiency, but not sex, as a factor in classification. It is against the coeducation of the sexes, in this sense of identical coeducation, that physiology protests; and it is this identity of education, the prominent characteristic of our American school system, that has produced the evils described in the clinical part of this essay, and that threatens to push the degeneration of the female sex still further on. In these pages coeducation of the sexes is used in its common acceptance of identical coeducation.

Let us look for a moment at what identical coeducation is. The law has, or had, a maxim that a man and his wife are one, and that the one is the man. Modern American education has a maxim that boys' schools and girls' schools are one, and that the one is the boys' school. Schools have been arranged, accordingly, to meet the requirements of the masculine organization. Studies have been selected that experience has proved to be appropriate to a boys' intellectual development, and a regimen adopted, while pursuing them, appropriate to his physical development. His school and college life, his methods of study, recitations, exercises, and recreations are ordered upon the supposition that, barring disease or infirmity, punctual attendance upon the hours of recitation and upon all other duties in their season and order may be required of him continuously, in spite of ennui, inclement weather, or fatigue; that there is no week in the month, or day in the week, or hour in the day, when it is a physical necessity to relieve him from standing or from studying, from physical effort or mental labor; that the chapel bell may safely call him to morning prayer from New Year to Christmas with the assurance that if the going does not add to his stock of piety it will not diminish his stock of health; that he may be sent to the gymnasium and the examination hall, to the theaters of physical and intellectual display at any time; in short, that he develops health and strength, blood and nerve, intellect and life, by a regular, uninterrupted, and sustained course of work. And all this is justified both by experience and physiology.

Obedient to the American educational maxim that boys' schools and girls' schools are one, and that the one is the boys' school, the female schools have copied the methods which have grown out of the requirements of the male organization. Schools for girls have been modeled after schools for boys. Were it not for differences of dress and figure it would be impossible, even for an expert after visiting a high school for boys and one for girls, to tell which was arranged for the male and which for the female organization. Our girls' schools, whether public or private, have imposed upon the pupils a boys' regimen, and it is now proposed in some quarters to carry this principle still further by burdening girls after they leave school with a quadrennium of masculine college regimen, and so girls are to learn the alphabet in college as they have learned it in the grammar school, just as boys do. This is grounded upon the supposition that sustained regularity of action and attendance may be as safely required of a girl as of a boy; that there is no physical necessity for periodically relieving her from walking, standing, reciting, or studying; that the chapel bell may call her as well as him to a daily

[1] Pages 121-127.

morning walk, with a standing prayer at the end of it, regardless of the danger that such exercises, by deranging the tides of her organization, may add to her piety at the expense of her blood; that she may work her brain over mathematics, botany, chemistry, German, and the like with equal and sustained force on every day of the month, and so safely divert blood from the reproductive apparatus to the head; in short, that she, like her brother, develops health and strength, blood and nerve, intellect and life, by a regular, uninterrupted, and sustained course of work. All this is not justified, either by experience or physiology. The gardener may plant, if he choose, the lily and the rose, the oak and the vine, within the same inclosure. Let the same soil nourish them, the same air visit them, and the same sunshine warm and cheer them; still he trains each of them with a separate art, warding from each its peculiar dangers, developing within each its peculiar powers, and teaching each to put forth to the utmost its divine and peculiar gifts of strength and beauty. Girls lose health, strength, blood, and nerve by a regimen that ignores the periodical tides and reproductive apparatus of their organization. The mothers and instructors, the homes and schools, of our country's daughters would profit by occasionally reading the old Levitical law. The race has not yet quite outgrown the physiology of Moses.

SEX AND EDUCATION—A REPLY TO DR. EDWARD H. CLARKE'S SEX IN EDUCATION.

[Article by Thomas Wentworth Higginson, pp. 35-44.]

It has been pointed out again and again in the Woman's Journal and elsewhere that there are whole classes of facts to be had bearing most closely on this question which neither Dr. Clarke nor any physiologist opposed to coeducation has yet attempted to obtain. Instead of shrinking from these facts, we are constantly begging for them. Until they are obtained, systematized, and displayed the whole argument of Dr. Clarke has but an insufficient basis of facts. They are such as these:

1. We need facts as to the comparative physiology of American women in different localities. There are highly educated communities and very uneducated communities. Has Dr. Clarke, or any one, compared the health of women in cities and in country towns, in cities with good schools and cities with poor schools, or in highly educated States like Massachusetts and Connecticut, as compared with States where the climate is similar but the school system less thorough? The standard of female education is not very formidably high in Pennsylvania, where they also have an equable climate, no east winds, and most comfortable living, and yet one of Dr. Clarke's severest statements as to female debility (p. 112) comes from Pennsylvania.[1] In country villages I could name, where there are only very poor district schools, kept for less than half the year, the traveller constantly observes among the farmers' daughters cheeks as pale and vitality as deficient as in the best educated metropolis.

2. Again, we need facts as to American-born women of different races. Dr. Clarke says of a century, "that length of time could not transform the sturdy German fräulein and robust English damsel into the fragile American miss" (p. 168). How does he know it could not? I have seen this change very nearly effected in a single generation among the children of English, Irish, French Canadians, and even the Nova Scotians, whom he so praises; and this in families where even reading and writing were rare accomplishments. As far as I can observe, the effect of climate, change of diet, change of living, on all the classes, is almost sure to produce the same result of delicacy, almost of fragility, in the second generation, with or without schooling: and among the boys almost as much as among the girls. A physician in a large manufacturing town once told me that the unhealthiest class of the community, in his opinion, consisted of the sons of Irish parents.

3. We need also the comparative physiology of different social positions. As a rule, the daughters of the wealthy in America, who are sent to private schools, or taught by governesses, are far less severely taxed as to their brains than the daughters of the middle classes who go to the public schools. Is Dr. Clarke prepared to show that those of the former class are decidedly more healthy? If so,

[1] "To-day the American woman is, to speak plainly, physically unfit for her duties as woman, and is, perhaps of all civilized females, the least qualified to undertake those weightier tasks which tax so heavily the nervous system of man. She is not fairly up to what nature asks from her as wife and mother. How will she sustain herself under the pressure of those yet more exacting duties which nowadays she is eager to share with the man?" (Wear and Tear, by S. Weir Mitchell, M. D., of Philadelphia, quoted in 1873.)

this is another point that would have a direct bearing on his argument. My own impression is that he would find it hard to prove this.

4. But there is still a fourth class of facts, only to be obtained by an extensive record of individual instances. Letting go all discriminations of locality, race, and social position, and looking only at individuals under similar conditions, is Dr. Clarke prepared to assert that as a rule it is the hardest students in the school who become invalids? He would say, on a priori grounds, that it must be so. But do facts show it? Looking over families and schools that I have known, I certainly can not say that the young girls who have lost their health were the most studious—quite as often the contrary. I have asked teachers of wide experience, "Have you observed that your best scholars have furnished the larger proportion of invalids?" and they have always said, "No." Yet who that knows the affection with which teachers are apt to follow the later career of their pupils will deny that this evidence has much value. Here is a fourth class of facts which have a direct bearing upon the subject, and the ignoring of which weakens the value of our author's statement.

5. I am struck with the further point that Dr. Clarke seems to have entered on his inquiry in the spirit of an advocate, not of a judge, and to have taken absolutely no account of the physiological benefits of education for women. There certainly are many instances—all teachers have known them—of great benefit to health, in case of girls, under the stimulus given by study. Either Dr. Clarke knows such instances, or he does not. If he knows them, he is bound to state them in such an argument; and, if possible, to arrange and tabulate them, in order to set them against the instances on the other side. If he does not know them, it simply shows that, while the facts of disease impress the physician, the facts of health may elude him.

SUMMARY OF RESULTS OF A SPECIAL INQUIRY INTO THE HEALTH OF FEMALE COLLEGE GRADUATES, BY THE ASSOCIATION OF COLLEGIATE ALUMNÆ.

[Sixteenth Annual Report of the Massachusetts Bureau of Statistics of Labor, pp. 528–532.]

Referring briefly to the results shown by the tables, it appears—

That the graduates are largely of American parentage; that the greater part of them spent their childhood in the country and had a fair amount of outdoor exercise daily.

That 57 per cent began study in a school and 41 per cent at home, the remaining 2 per cent failing to answer; that the average age at which they began study was 5.64 years: at entering college, 18.35 years; at graduating from college, 22.39 years; and that the average present age is 28.58 years.

That during college life the majority studied but moderately; that 44 per cent did not worry over their studies or affairs; that they were generally regular as regards hours for eating and sleeping, took a proper amount of physical exercise daily, and, as regards nearly one-half of them, abstained from exercise wholly or in part during the menstrual period; that, as a rule, they entered society but little, and for the most part had college roommates.

That since graduation all seem to have found congenial occupation, a great many as teachers, while 8 only are occupied with social duties to the exclusion of other occupation.

That about one-fourth have married, and that of the whole number of children borne by them the greater part are living and in good health.

That, for all the various periods of their lives, the health of over three-fourths of the graduates has been either excellent or good; that during college life a slight falling off from excellent or good health is apparent, resulting in an increase in number reporting fair health, while, on the other hand, the number reporting indifferent or poor health is smaller than for any preceding period, and but slightly in excess of the number reporting the same conditions of health for the succeeding period or since graduation.

That over one-half of the graduates are not and have not been troubled with nervousness, and that nearly 25 per cent have had no trouble at any time during the menstrual period.

That about 60 per cent have had some disorder; the more common disorders reported relating to the stomach, liver, bowels, lungs, nervous system, generative organs, neuralgic and rheumatic affections, and, to a certain extent, to the heart and brain.

That the most prevalent cause of disorders is constitutional weakness, the other causes being bad sanitary conditions, intellectual overwork, emotional strain, and physical accident.

That the varying conditions of childhood, as shown in the comparison tables, have had no marked influence for good or evil upon the present health of graduates.

That the present health of graduates seems to have been affected according as their parents have enjoyed either good or poor health, the figures showing 3 per cent increase in the health for those whose parents were both in poor health.

That so far as inherited tendency to disease is concerned, a decline in health has also taken place, as compared with the average good health of all the graduates, those inheriting tendency to disease from either parent showing a decline in health of 3 to 5 per cent, those inheriting tendency to disease from both parents of nearly 20 per cent, while in the case of those who have no hereditary tendency to disease there has been an increase of nearly 3 per cent in good health.

That during college life about 20 per cent show a deterioration in health, 60 per cent no change, and 20 per cent an improvement; that for those who entered college at 16 years of age and under, an increased deterioration in health of between 10 and 11 per cent as compared with those who entered at a later age is observed, and of over 8 per cent as compared with the whole number whose health deteriorated.

That during life there was nearly 2½ per cent less deterioration in health as compared with the deterioration in health reported during working time by the working girls of Boston.

That those who studied moderately show an increase in health of over 3 per cent as compared with average good health during college life for all graduates, while those who studied severely or moderately to severely show a decline of from 5 to 7 per cent as compared with average health during college life.

That, as compared with average good health during college life for all graduates, those who worried over personal affairs, a decline in health of over 10 per cent; those who worried over both studies and affairs, a decline in health of 15 per cent, while those who worried over neither studies nor affairs, show an increase in health of 10 per cent.

That for those graduates who studied severely during college life, as compared with the average good health of all graduates, a decrease in health of 7 per cent at time of entering college is shown; during college life a decrease in health of over 5 per cent, and since graduation of exactly 6 per cent; that if, on the other hand, the health of these graduates at time of entering, during college life, and since graduation are compared with each other, without regard to the health of all the graduates for the three periods, there was a decrease in health during college life of less than 2 per cent, an increase in health since graduation of three-fourths of 1 per cent as compared with health at time of entering college, and of over 2¼ per cent as compared with health during college life; and, finally,

That although the average good health of these graduates who studied severely was considerably less than the average good health of all the graduates for the three periods considered, their health did not suffer material deterioration during college life, and has more than recovered since graduation its normal state at time of entering college.

The facts which we have presented would seem to warrant the assertion, as the legitimate conclusion to be drawn from a careful study of the tables, that the seeking of a college education on the part of women does not in itself necessarily entail a loss of health or serious impairment of the vital forces. Indeed, the tables show this so conclusively that there is little need, were it within our province, for extended discussion of the subject.

The graduates as a body entered college in good health, passed through the course of study prescribed without material change in health, and since graduation, by reason of the effort required to gain a higher education, do not seem to have become unfitted to meet the responsibilities or bear their proportionate share of the burdens of life.

It is true that there has been, and it was to be expected that there would be, a certain deterioration in health on the part of some of the graduates. On the other hand, an almost identical improvement in health for a like number was reported, showing very plainly that we must look elsewhere for the causes of the greater part of this decline in health during college life. If we attempt to trace the cause, we find that this deterioration is largely due, not to the requirements of college life particularly, but to predisposing causes natural to the graduates themselves, born in them as it were, and for which college life or study should not be made responsible. A girl constitutionally weak is always at a disadvantage, and naturally would suffer a deterioration in health, temporary possibly, or even permanent, if, at the most trying period of her life, from 18 to 22 years, she seeks superior education. At the same time we should not fail to emphasize the fact

that fully 30 per cent of the total deterioration in health during college life was from excellent to good only. In the case of those graduates who studied severely even, the facts reported concerning their physical condition do not show that they have suffered materially from the effects of close application, but that they have since graduation returned to the normal condition reported by them at the time of entering college.

In conclusion it is sufficient to say that the female graduates of our colleges and universities do not seem to show, as the result of their college studies and duties, any marked difference in general health from the average health likely to be reported by an equal number of women engaged in other kinds of work, or, in fact, of women generally, without regard to occupation followed.

Summing up the results of our investigation, we may, I think, say with confidence that there is nothing in a university education at all especially injurious to the constitution of women, or involving any greater strain than they can ordinarily bear without injury. Women generally pass through it without its affecting their health one way or the other. As was to be expected, however, some

improve in health and some deteriorate, both improvement and deterioration being sometimes the effect of conditions of college life and of circumstances more or less connected with it, though probably more often due to constitutional or other causes for which college life can not be either praised or blamed. The net result of the change is that as large a proportion of the women who have had a university education enjoy good health now as did so at the time they entered college, while the number in poor health, among those who have read for honors, is somewhat reduced. These results confirm those of the similar inquiry previously conducted in America.

As mothers of healthy families we have seen that the students are more satisfactory than their sisters, and so far as we can judge quite up to the average of women.

We have set down as a fact unfavorable to a university education for women, a temporary falling off during college life of about 5 per cent in good health as compared with either health at entering or present health. This, to some extent, depends on illness or other things occurring accidentally during the college course, and to some extent is probably due to the relaxing climate of our universities; but it is also partly caused by overwork and want of attention to well-known laws of health, and to this extent both could and ought to be prevented by reasonable care on the part of students themselves.

That any serious alarm as to the effect of university education on the health of women is groundless is clearly shown by the fact that the net amount of increase in good present health, as compared with health between 14 and 18 years of age, is greater in the case of students than of their sisters.

In 1874 Professor Fairchild, of Oberlin, wrote as follows:

"A breaking down in health does not appear to be more frequent with women than with men. We have not observed a more frequent interruption of study on this account, nor do our statistics show a greater draft upon the vital forces in the case of those who have completed the full college course. Out of 84 who have graduated since 1841, 7 have died, a proportion of 1 in 12. Of 368 young men who have graduated in the same time, 34 are dead, or a little more than 1 in 11. Of these 34 young men 6 fell in the war, and leaving out those the proportion of deaths remains 1 in 13. Taking the whole number of graduates, omitting the theological department, we find the proportion of deaths 1 in 9¼; of ladies 1 in 12, and this in spite of the lower average expectation of life for women, as indicated in life-insurance tables."

The Boston School Document already cited (No. 19, 1890) presented the opinions of 49 physicians of that city, of whom 30 favored coeducation, 2 of the number with some reservations, and 19 opposed the policy. The following citations present substantially the special arguments advanced by this class of professional men:

OPINIONS OF PHYSICIANS.

[From Boston School Document No. 19, 1890.]

16 UNION PARK, *Boston, April 30, 1890.*

I consider the coeducation of boys and girls in grammar and high schools not only permissible, but highly beneficial to both sexes.

First. I consider it of moral importance that the influence of the boy and the girl upon each other should be exercised from early youth, so that each sex would become familiarized with the other's way of thinking, speaking, and feeling.

Second. Such an influence would materially strengthen the health through the intellectual discipline produced, while the physical condition of the girl would necessarily be improved through the association with the boy, because she will be less likely to hurry on nervously with her studies; the intellect of the boy being somewhat slower in its development, the girl will find in the boy's nature a wholesome counterpoise; thus to both boy and girl will be assured a slower and more thorough advance in study, and more time either for physical rest, physical development by culture in plays and games, or outdoor recreation. This latter is sadly lacking in girl's schools, as usually the ambitious pupils and their teachers strive simply for one object, namely, to be equal to or in advance of the boy's schools. The result too often produced is an early ripeness of intellect without a corresponding ripeness of physical conditions.

MARIE E. ZAKRZEWSKA, M. D.

ROXBURY, *April 29, 1890.*

1. My personal experience of coeducation has been favorable. It was the method pursued in the public schools of Brookline, where I was brought up, and in the high schools of which I subsequently taught. I believe it has advantages over the separate system, and in schools representing the well-to-do middle classes of society I see no objections to it.

2. The only considerable argument against it, that girls require at certain periods special exemption from work for physiological reasons, falls through when, even though the sexes are separately educated, yet the standard for both sets of schools is identical, so that no indulgence can be, or at any rate is, granted the girls over what is given to the boys.

3. I am inclined to think that in certain localities of large cities where the social and moral tone is very low, and teachers have no aid from parents in restraining pupils out of school hours, coeducation might be open to some objections on the score of morality.

CHAS. F. WITHINGTON, M. D.

93 MOUNT VERNON STREET, *Boston, May 2, 1890.*

It seems to me there are three general questions to be considered: First, the effect upon the health; second, the effect upon morals and manners; and, third, the effect upon the mental training and development. I am unable to find any conclusive evidence that the morals of either sex are vitiated by coeducation, and I believe that the manners of the boys and young men are improved. It seems the natural way that the two sexes should be educated together, at least so far as the grammar and high schools go. In the family where there are boys and girls, both sexes seem to develop more normally. To be sure one hears of grave moral deflections happening occasionally among school girls or boys; but this does not prove, it seems to me, that the coming together, as they do in mixed schools, is the cause of it; is not the true cause, rather, bad outside influences and the neglect of wholesome home influences?

I have been a teacher in a mixed high school myself (the Cambridge High), and I have talked with others who have been connected with mixed schools in one way or another, and from our experience we can find no evidence of any general lowering of the moral tone, and the single cases which have occurred are not proven to have been the result of coeducation. Looking at it from a purely medical and physiological side, one has to consider this question: Is it prejudicial to the normal development of either sex to bring them together at school at and after the age of puberty? Puberty is a critical time with both sexes, perhaps more so with the girls; then it is that the nervous system has to be especially guarded against overexcitement; then it is that the girls are likely to be morbid, etc. The home influence ought to be the guarding and guiding hand which safely brings the boy and girl through this period, and with tolerable care at home I can not see how the bringing together for the comparatively short time of the school hour will act injuriously on either sex. On the contrary, may it not obviate those morbid tendencies so common to the age of development?

Lastly, there is the question of partial rest once a month for the girls at the menstrual epoch. Is not this an objection to the mixed systems? Will not the girls feel compelled to do the same work at such times as in the intervals, to their injury and suffering? The girls are, as a rule, more ambitious than the boys, and do more work, and can afford to relax a few days each month and still keep up with the boys. Of course, just what should be each girl's plan as to work during these times must be determined by her sensations and feelings, together with wise advice at home, if possible. Here, also, I believe morbid conditions are less likely to arise if, as in a mixed school, less attention is attached to this physiological function.

As to the mental training and development, I believe it makes very little if any difference in the results whether the boys and girls are educated separately or together; this so far as the purely school work is concerned. In addition, however, with coeducation, I believe, as I have mentioned, that the manners of the boys are improved; they learn to be more gentle, and the girls learn some "robuster virtues."

While writing this I have had the opportunity to speak of the matter with Prof. Sedgwick, of the Massachusetts Institute of Technology, and from his experience in mixed grammar and high schools, and in his own department at the institute, he quite emphatically concurs in my opinion.

EDWARD O. OTIS, M. D.

138 BOYLSTON STREET, *Boston, May 15, 1890.*

At the age when the most of the pupils of our high schools—and the same might apply to a certain extent to the grammar schools—are sent there, the natural functions of the adolescent organism are undergoing more complete development, and the person of either sex is passing from the period of childhood toward that of maturity, or at least of perfect development; and certain functions which have lain dormant until this time are awakening into life, and arouse new and unknown sensations and emotions. There is also at that time an increased need of careful and appropriate training, of judicious restraint over the associations and surroundings, both moral and physical, which form the environment of the individual. The boys of our community are at this time more restless than heretofore, and often traits of character of new and sometimes uncontrollable nature are developed. To a certain extent this is also true of the opposite sex.

The high schools take their pupils from various districts of the city, and often from out of the city, and these pupils are thereby removed from the influences which have thus far surrounded them; they are brought into association with other boys or girls whom their parents can not know, and often they are exposed to influences which parents or guardians would strive to protect them from if this were possible. I am in a position to speak from experience, and I think that vast harm is done to many pupils in the high schools from the mingling of boys from so many directions, and I have seen many, many cases of impairment, both of health and character, which are traceable to this cause. This was not long ago illustrated in a most alarming manner among the pupils of Eaton, and I could mention examples in our own city. If, now, the membership of our higher schools were made up of both boys and girls, I can not but think that the absence of knowledge on the parents' part of the associations which might be formed between the individuals of such a homogeneous collection of pupils would operate to the detriment of educational ends, and would not infrequently cause great misfortune. In an institution which I have visited, in which the education of the pupils of 15 to 20 years is carried on in common, I was told by one of the teachers that great trouble is experienced in the regulation of the relations between the pupils, and that often very embarrassing situations are encountered.

For these reasons, and others which I do not think it necessary to mention in this inquiry, I would express the opinion that coeducation of the sexes in our higher schools or in the grammar schools is not, under existing circumstances, either judicious or advisable.

ALBERT H. BLODGETT, M. D.

IV.—CITATIONS RELATING TO COEDUCATION IN COLLEGES AND UNIVERSITIES.

Cornell University, which owes its existence to the combined bounty of the United States Government (by land-grant act of 1862) and of the Hon. Ezra Cornell, was opened in 1868. At the inaugural ceremonies both Mr. Cornell and the president of the new foundation, Mr. Andrew D. White, expressed the hope that the university might speedily offer every advantage necessary for the higher education of young women equally with young men. "Speaking entirely for myself," said Mr. White, "I would say that I am perfectly willing to undertake the experiment as soon as it shall be possible to do so." The mere expression of this hope seems to have been the instigating cause of its realization. The event and its effects are set forth as follows in the History of Higher Education in New York:[1]

Mr. Henry W. Sage, upon the evening of the inaugural day, went quietly to President White and said: "When you are ready to carry out the idea of educating young women as thoroughly as young men I will provide the endowment to enable you to do so." Mr. Sage's purpose strengthened with the growth of the university, and shortly after, all other difficulties being then practically removed, he renewed his offer. A committee, of which President White was chairman, made an exhaustive study of all questions relating to coeducation, visited the leading institutions in which it had been tried, corresponded with eminent educators, and in a report, which reviews at length the whole problem, recommended the accept-

[1] Contributions to American Educational History, edited by Herbert B. Adams, No. 28: History of Higher Education in New York, by Sidney Sherwood, Ph. D. (published by Bureau of Education as Circular of Information No. 3, 1900).

ance of the offer. That offer was of an endowment of $250,000 upon the simple condition that "instruction shall be afforded to young women by the Cornell University as broad and thorough as that now afforded to young men." In April, 1872, the offer was formally accepted by the trustees, and women were admitted to all the privileges of the university.

Probably this action by the trustees conferred no privileges upon women which they might not already have claimed under the charter; but the noble gift of Mr. Sage made it possible to offer such as should come the comforts and conveniences which, however dispensable in the case of men, were absolutely necessary for the care of any considerable number of young women. The Sage College is simply a home for women students, and in no sense an "annex." The women go into all classes with the men, pursue the same studies, hear the same lectures, work in the same laboratories. Mr. Sage simply provided them with a home where, under the care and advice of a lady principal, they are freed from the vexations and embarrassments of the ordinary boarding house.

This fine building was erected and furnished by Mr. Sage at a cost of $150,000, and received from him for its care and management $100,000 more. It was opened for the reception of the women students in the fall of 1875. Eighteen young women applied for entrance to the university the same year (1872–73) that the trustees passed the formal resolution for their admission. From that time the number has steadily increased. In 1872–73 the proportion of women students was 1 in 40; in 1882–83 it was 1 in 8; in 1892–93 it was a little over 1 in 8. The total number in attendance in 1892–93 was 221.

In the report of President Adams for 1890–91 occurs the following passage:

"In former reports I have frequently called attention to the general good standing in their classes of the young women in the university. It is gratifying to know that the average proficiency of this class of students continues to be highly creditable. Indeed, if we were to judge of the comparative rank of the young women from the number of those who are unable to pass the examinations, we should be obliged to infer that their proficiency was considerably greater than that of the young men. Of those dropped from the university or from one class to another for deficiencies in scholarship, the proportion is far less than the proportion of the class as a whole. For obvious reasons this is not a correct means of comparison; but when every modifying circumstance is taken into consideration, we are forced to conclude that the average standing of the classes is made somewhat higher by the presence of women" (pp. 22-23).

In the report of President Schurman for 1897–98 is the following:

"Coeducation is as firmly established and so thoroughly accepted at Cornell University, it is so much a fundamental idea of the institution, that any reasoning in favor of the principle or indication of it drawn from experience could not but seem a wasteful and ridiculous excess of words. There is no call even to discuss the workings of the system, as the presence of women at Cornell on equal terms with men has not created any specific problems for the authorities of the university."

Boston University.—Boston University was opened in 1874 with identical facilities for men and women, and its president, Dr. William F. Warren, has been one of the most earnest and consistent advocates of this policy. The principle upon which the university proceeded is very clearly set forth in the statement of fundamental ideas in the first Yearbook. As regards coeducation the Yearbook says:

A fourth fundamental idea with the organization of Boston University was and is that a university should exist not for one sex merely but equally for the two.

Class schools are very well in their place. Schools for the feeble minded, reform schools; schools for deaf mutes—no one should object to these. So if any class of philanthropists feels called upon to organize special schools for girls or boys constitutionally too delicate to bear the nervous shock of school association with the other sex, let no one oppose. Such institutions may serve to illustrate the tender and gentle charities to which our Christian civilization gives origin. But a university exists for altogether different purposes. It is not instituted for the benefit of a class. It is the highest organ of human society for the conservation, furtherance, and communication of knowledge; for the induction of successive generations into its possession; for the service of mankind in all highest social offices. To artificially restrict the benefits of such an institution to one-half of the community by a discrimination based solely upon a birth distinction is worse than un-American. It is an injury to society as a whole, a loss to the favored class, a wrong to the unfavored.

Boston University, therefore, welcomes to all its advantages young women and young men on precisely the same conditions. It welcomes women not merely to the bench of the pupil, but also to the chair of the professor. It is the first institution in the Commonwealth of Massachusetts to admit the two sexes to common advantages in classical collegiate studies; the first in the world to open the entire circle of post-graduate professional schools to men and women alike. Nor is any fear whatever felt lest the newly enfranchised class prove in the end incapacitated, either intellectually or by physiological constitution, for making a wise and beneficent use of these new-found facilities. Boston Yearbook, 1874, p. 24.

The president of Leland Stanford Junior University on coeducation.—Dr. David Starr Jordan, president of Leland Stanford Junior University, in his Care and Culture of Men, devotes a chapter to the "Higher education of women," in which he discusses the policy of coeducation from the standpoint of the ideal aims of a university.

Higher education [says Dr. Jordan] is not alone a question of preparing great men for great things. It must prepare even little men for greater things than they would otherwise have found possible. And so it is with the education of women. The needs of the times are imperative. The highest product of social evolution is the growth of the civilized home—the home that only a wise, cultivated, and high-minded woman can make. To furnish such women is one of the worthiest functions of higher education. No young woman capable of becoming such should be condemned to anything lower. Even with those who are in appearance too dull or too vacillating to reach any high ideal of wisdom, this may be said, it does no harm to try. A few hundred dollars is not too much to spend on an experiment of such moment. Four of the best years of one's life spent in the company of noble thoughts and high ideals can not fail to leave their impress. To be wise, and at the same time womanly, is to wield a tremendous influence which may be felt for good in the lives of generations to come. It is not forms of government by which men are made or unmade. It is the character and influence of their mothers and their wives. The higher education of women means more for the future than all conceivable legislative reforms. And its influence does not stop with the home. It means higher standards of manhood, greater thoroughness of training, and the coming of better men. Therefore, let us educate our girls as well as our boys. A generous education should be the birthright of every daughter of the Republic as well as of every son.

Shall we give our girls the same education as our boys? Yes, and no [and the author proceeds with an extended discussion of the double proposition as to what is implied in the word "same"]. If we mean by "the same" an equal degree of breadth and thoroughness, an equal fitness for high thinking and wise acting, yes, let it be the same. If we mean this: Shall we reach this end by exactly the same course of studies? then my answer must be no. For the same course of study will not yield the same results with different persons. * * *

The great educational awakening of the last twenty years in America has lain in breaking the bonds [of the old conventional curriculum]. The essence of the new education is individualism.

Herein lies, he argues, the opportunity for adjusting the same institution to both men and women.

An institution which meets the varied needs of varied men can also meet the varied needs of the varied women. The intellectual needs of the two classes are not very different in many important respects. The special or professional needs, so far as they are different, will bring their own satisfaction. Those who have had to do with the higher training of women know that the severest demands can be met by them as well as by men. There is no demand for easy or "goody-goody" courses of study for women, except as this demand has been encouraged by men. In this matter the supply has always preceded the demand.

There is, however, the further question, "Shall women be taught in the same classes as men?" The answer is made from a double standpoint—the individual and the educational. Regarded from the former, the choice reduces to a "matter of taste." On the educational side the discussion continues as follows:

Considerable has been said for and against the union in one institution of technical schools and schools of liberal arts. The technical quality is emphasized by its separation from general culture. But I believe better men are made where

the two are not separated. The culture studies and their students gain from the feeling of reality and utility cultivated by technical work. The technical students gain from association with men and influences of which the aggregate tendency is toward greater breadth of sympathy and a higher point of view.

A woman's college is more or less distinctly a technical school. In most cases its purpose is distinctly stated to be such. It is a school of training for the profession of womanhood. It encourages womanliness of thought as more or less different from the plain thinking which is called manly. The brightest work in women's colleges is often accompanied by a nervous strain, as though its doer were fearful of falling short of some outside standard. The best work of men is natural, is unconscious; the normal result of the contact of the mind with the problem in question.

In this direction, I think, lies the strongest argument for coeducation. This argument is especially cogent in institutions in which the individuality of the student is recognized and respected. In such schools each man, by his relation to action and realities, becomes a teacher of women in these regards, as, in other ways, each cultivated woman is a teacher of men.

In woman's education as planned for women alone the tendency is toward the study of beauty and order. Literature and language take precedence over science. Expression is valued more highly than action. In carrying this to an extreme, the necessary relation of thought to action becomes obscured. The scholarship developed is ineffective, because it is not related to success. The educated woman is likely to master technique rather than art, method rather than substance. She may know a good deal, but she can do nothing. Often her views of life must undergo painful changes before she can find her place in the world.

In schools for men alone, the reverse condition often obtains. The sense of reality obscures the elements of beauty and fitness. It is of great advantage to both men and women to meet on a plane of equality in education. Women are brought into contact with men who can do things—men in whom the sense of reality is strong, and who have definite views in life. This influence affects them for good. It turns them away from sentimentalism. It is opposed to the unwholesome state of mind called "monogamic marriage." It gives tone to their religious thoughts and impulses. Above all, it tends to encourage action as governed by ideals, as opposed to that resting on caprice. It gives them better standards of what is possible and impossible when the responsibility for action is thrown upon them.

In like manner, the association with wise, sane, and healthy women has its value for young men. This value has never been fully realized even by the strongest advocates of coeducation. It raises their ideal of womanhood, and the highest manhood must be associated with such an ideal. This fact shows itself in many ways; but to point out its existence must suffice for the present paper.

University of Rochester.—For the first fifty years of its life the University of Rochester was a college for young men. In 1900 the trustees admitted women to the classes "on the same terms and conditions as men," subscriptions to the amount of $50,000 having been obtained by a committee of Rochester women to secure this end. All the opportunities and privileges of instruction in class room, lecture, and laboratory are open to the women equally with the men. It is the purpose of the college to maintain for young men all the advantages which were offered them prior to 1900, while extending its ministries to a new class of students, for whom it will aim to secure the fullest opportunity for self-development in connection with the educational privileges they share in common with the men. (Dr. Edward M. Moore, president; Catalogue 1901–2, p. 4.)

Northwestern University.—The following table, showing the growth of the attendance in the College of Liberal Arts for the last ten years, shows also the relative attendance of women for the same period:

College year.	Number of men.	Number of women.	Per cent of women.	Post graduates.	Under graduates.	Total.
1900-1901	247	296	46	44	597	643
1899-1900	308	306	[1]50	42	572	614
1898-1899	321	254	44	38	537	575
1897-1898	354	233	[1]40	36	551	587
1896-1897	313	208	[1]40	23	498	521
1895-1896	350	224	39	27	547	574
1894-1895	338	193	36	33	498	531
1893-1894	318	189	37	20	487	507
1892-1893	321	191	37	31	481	512
1891-1892	253	143	36	13	378	396

[1] Nearly.

For the first half of this period the ratio of the attendance of women appears to have been 37 per cent. For the last five years it is nearly 44 per cent. In the last year a decline is observed, a fall from 49 to 46 per cent.

The history of other like institutions does not support the belief that this ratio will continue to decline. There is reason to believe rather that it will increase. There are general conditions that favor this belief. There is, for example, the lack in the Western States of institutions of higher education designed for women exclusively. But Northwestern University is conspicuous for the special advantages which it offers to this class of its patrons. It has adhered to the policy announced at its organization, to spend no money and encourage no gifts to build dormitories for young men. But it adds building to building for young women. In this practice of liberality it also takes note of individual taste and financial necessity, and offers to young women a choice of residence adapted to the requirements of either. It may be claimed that this hospitality toward the class of students benefited rests on just grounds of reason. Yet it can not be doubted that it is a discrimination that tells on the relative attendance and helps to account for the ratio in the foregoing table.

At the opening of the next academic year, in September, the university will be in possession of a new building, the gift of a friend whose name has become eminent throughout the land for his benefactions to education. The generous addition that this building will make to the present accommodation for women revives a question of policy that may deserve notice in this report. It is the question whether the enrollment of young women might not be wisely limited to the capacity of the buildings supplied for their residence, and which it has been thought that a wholesome regard for their well-being requires. The limitation would relieve some of the various difficulties that at present perplex administration. But to those who look with concern on the tendencies shown in the statistics, it may commend itself also as promising some practical relief. (Acting President Dr. Daniel Bonbright, Annual Report 1901, p. 5.)

Chicago University—Plans suggested for increasing the advantages of university life for women students.—During the present quarter the women of the university, officers, students, and wives of members of the faculty, have organized a women's union. The purpose of the union is to unite the women of the university for the promotion of their common interests.

It is hoped that at no distant time a clubhouse for women, in connection with a new women's gymnasium, may be erected. Such a clubhouse would furnish the appropriate headquarters for the women's union. Temporary quarters will be assigned the union next year in the building now occupied by the school of education.

The problems which are connected with the life of women in a university located in a great city are numerous and complicated. The experience of our nearly ten years of work has furnished an important contribution toward the testimony in favor of coeducation. Not a few members of our faculties, unfamiliar with the advantages of coeducation, came to the university prejudiced against it. A large majority of these have become ardent advocates of the coeducational policy. An extended statement might be made of the arguments and considerations drawn from our own experience, which speak unmistakably in favor of the successful working of the system. That coeducation is a permanent feature of higher education, not only in the West, but also, within a few years, in Eastern sections, no one can doubt, and there are few to-day who, with an actual knowledge of the facts, would have it otherwise. It is the simple and natural method of conducting educational work, and the benefits are equally great to men and women.

But it should be remembered that no apparent progress has been made during twenty years in adjusting the application of the general principles of coeducation to special situations. It may also be said that no very definite forward steps have been taken in securing a development of the principles and practice in coeducation along higher lines. As a strong believer in coeducation, convinced by an experience which has included work in connection with typical institutions of three kinds—those open only to men, those open only to women, and those open to both men and women—I am confident that in the future important progress is to be made in this department of educational thought and practice. It is hardly possible to suppose that the full significance of coeducation has yet been appreciated, or that its most complete form has yet been attained. The direction in which such forward steps may lead us can not, of course, be accurately predicted, but they will certainly include (1) a closer definition of the term itself; (2) a larger elective privilege on the part of women as to the extent to which they shall or shall not mingle with men; (3) a similar larger election on the part of men; (4) a larger possibility for the cultivation of what has properly been termed the feeling of

corporate existence in the institution concerned on the part of both men and women; (5) a larger opportunity for cultivating the life which is peculiarly woman's life, and, on the other hand, the life which is peculiarly man's life. Certain limitations have already clearly fixed themselves. It is not deemed proper that men and women should take physical exercise together in the gymnasium. It has never been proposed that they should occupy the same halls or dormitories. It is possible that experience will call attention to other limitations. It is enough, perhaps, to say that while coeducation is unquestionably to be recognized as a permanent element in American higher education, its exact nature and the limitations which attend it will, for a long time, furnish excellent subjects for consideration and experiment. It is important that our own university, situated in the heart of a great city, drawing its students from almost every State, enrolling almost as many women as men, should be one of the institutions which shall undertake to make contribution to the present knowledge and experience on the subject of coeducation. (Report, February, 1902.)

Graduate department of Yale University open to women.—The plan proposed for the opening of the courses of the study in the graduate department which lead to the degree of doctor of philosophy to graduates of all colleges and universities, without distinction of sex, was mentioned in the last annual report. This plan was brought before the entire body of professors connected with these courses, and was fully considered and discussed by them in the earlier part of the year. It was presented to the consideration of the members of the corporation at their meeting held in the month of March, and was favorably received by them, and, with unimportant modifications, adopted. The action by which these privileges were offered to graduates of the colleges for young women was everywhere appreciated very highly, as was made manifest both by the favorable comments of the public journals and by the assurances which came from these colleges and their officers and teachers.

At the beginning of the new academic year twenty-three young women connected themselves with this department of university. They represent all the leading colleges which have been established especially for the education of women, and also some of the most prominent institutions in which young women and young men are educated together. Two of them received fellowships, and three other scholarships, according to the provisions made by the corporation, which were stated in the last report. All of them are pursuing, with much energy and success, the various branches of study to which they have devoted themselves. (Report of the president for 1892, pages 30, 31.)

Citations Relative to Annexed Colleges.

Conditions preceding the establishment of Barnard College, an annex to Columbia University, New York.

[Dr. F. A. P. Barnard, president Columbia College. Report of 1879.]

Expediency of receiving young women as students.—The condition of the college is now such as to justify the suggestion of the question whether its advantages should not be open to young women as well as to young men. This question has been brought to the attention of the trustees heretofore by outside parties, and the reception which it met has been such as to indicate that the minds of the board are not favorably prepossessed in regard to it. There has been hitherto, however, no room for considering it upon its merits; for whether regarded favorably or not, so long as the college was confined within recent narrow accommodations the measure has been impracticable. Not that the admission of young women requires any considerable provision of space greater than that which is necessary for young men only, but that, in arriving at and leaving the building, they need their separate retiring rooms and cloak rooms, and no apartments could be found in the old building suitable for this purpose. That difficulty no longer exists. The measure has become practicable. There can be no harm in inquiring whether it is not also expedient.

Many considerations suggest themselves which make in its favor. In the first place, there can be no doubt that among many of our most judicious thinkers, and possibly with even a majority, there exists at this time a profound conviction that, in the interests of society, the mental culture of women should be not inferior in character to that of men. The condemnation of that kind of female education which in past years has been too prevalent, in which the useful has been made subordinate to the ornamental, and what are called accomplishments have taken the place of solid acquisitions, is all but universal. The demand has been

made and its reasonableness has been generally conceded, that the same educational advantages should be offered to young women which young men enjoy. But when the question is raised as to how that demand shall be met, there is no longer found to prevail the same unanimity.

One obvious method is to improve the female schools. Of such institutions there are, and have always been, a sufficient number; but the fault of most of these is that they furnish the merely superficial and ornamental education of which complaint is made. Such can not be improved except by reconstruction, for their instructors can not rise above their own level, and their proper level is indicated by the teaching they have been accustomed to give.

Another method is to create colleges for young women identical in form with the existing colleges for young men, embracing in the scheme of instruction the same subjects in the same order, and conferring at the end of the course the same academic degrees. Examples of this kind of institution are seen at Vassar College, in this State, and at Rutgers Female College, in this city. The objection to these is that they can not, or, at least, in general, will not, give instruction of equal value, though it may be the same in name with that furnished to young men in the long-established and well-endowed colleges of highest repute in the country, and that it is unjust to young women, when admitting their right to liberal education, to deny them access to the best.

* * * * * * *

Now it appears that at Cornell University, during the years which preceded the admission of young women, the losses during the year averaged 26 per cent, or more than a quarter of the entire number of the matriculates, per annum, while for the seven years that have passed since that date the losses have averaged only 16 per cent per annum. During this latter period the standard of attainment for admission has been twice raised, and the term examinations have been made steadily more and more rigorous. Either of these causes might have been supposed likely to increase the proportion of losses, yet no such effect has followed from both of them together. It has been added in a statement by an officer of the university recently printed that "these seven years have witnessed a marked improvement in the quality of the whole institution," and further, a very noteworthy fact, that during the entire period "no young woman has been dropped from the rolls through failure of examination." So far as the experience of this institution is concerned, the evidence is quite conclusive that the admission of young women as students into college classes has the effect to raise rather than to depress the standard of scholarship,

Another objection to the plan is found in the assumption that the course of study prescribed in colleges is too severe to be attempted without danger to the delicate constitutions of young women. This proposition has been elaborately maintained by an eminent authority, whose views have had a wide circulation, and have, to some extent, impressed the public mind. So far as these views are founded on *a priori* consideration, they are mere opinions, to which the opinions of other authorities no less weighty may be opposed. So far as they are founded on observation of injurious results presumed to have followed from overtasking the physical powers by excess of study, it would be easy to demonstrate by similar examples that the course of college study is too severe for young men as well.

But this argument, if it proves anything, proves too much. It is not the kind of study which harms, if study harms at all, either young women or young men, it is the quantity; and certainly, valueless as the teaching in many young women's "finishing schools" may be, it is usually heaped up upon its victims to an extent not inferior to that which the college course requires. It is inconceivable that the exercise of the mind upon the solution of an algebraic problem, or the interpretation of a passage in Homer, can be more exhausting than a similar exercise over the French irregular verbs, or even so much so as the confinement of hours daily in bending wearily over the drawing table or drumming on an ill-tuned piano. The argument of the objector, however, begs the whole question by assuming that this is really the case, while his opponent might reply that if he has proved anything he has simply proved that young women ought not to be educated at all.

Of course no one will contend that excess of study can not but be injurious to the young of either sex. If young women in college commit this error they will suffer for it, and so will young men. We see examples of this kind occasionally in the youth of our own college, but however we may regret these, we do not consider it advisable to discourage young men from entering college on that account. Could it be proved that the studies taught in college offer to young women a more dangerous temptation to excess than those which form the substance of the more ornamental education they have been heretofore accustomed

to receive, the fact might suggest the propriety of greater vigilance to arrest this tendency, but it certainly could not justify us in cutting them off from these so fascinating studies altogether.

There is one consideration bearing on the plan in question which is positively favorable, and is not without importance. The presence of young women in colleges is distinctly conducive to good order. Nothing is more certain than that the complete isolation of young men in masses from all society except their own tends to the formation of habits of rudeness, and to disregard of the ordinary proprieties of life. No degree of good breeding, no influence of social refinement in the family circle, can effectually secure a youth against this danger. It is this which explains the frequent participation of young men in college in acts which in other situations they could not be induced to countenance, and would even regard as reprehensible. Any circumstance, whatever it may be, which destroys this isolation, and subjects the youth to the wholesome influences which protect his moral tone in the ordinary environment of society, can not but be beneficial. Such is the effect of the presence of women in college. On this point the undersigned is able to speak with the authority which belongs to knowledge experimentally acquired. As an officer of the University of Alabama, it was his custom for years to invite the attendance on his lectures of classes of young women from a neighboring female seminary, and others resident in the town of Tuscaloosa. The advantageous effect of this upon the manners of the young men was a subject of common observation, and the results were so satisfactory that the example was followed by other officers of the same institution, so that scarcely a day passed without the presence of young women in one or another of the college classes. These were not matriculated students, it is true, and they did not directly mingle with the young men, but this circumstance tended rather to diminish than to increase the influence which their presence exerted, and yet this influence was very decided.

The elder Silliman, during the entire period of his distinguished career as a professor of chemistry, geology, and mineralogy in Yale College, was accustomed every year to admit to his lecture courses classes of young women from the schools of New Haven. In that institution the undersigned had an opportunity to observe, as a student, the effect of this practice, similar to that which he afterwards created for himself in Alabama as a teacher. The results in both instances, so far as they went, were good; and they went far enough to make it evident that if the presence of young women in college, instead of being occasional, should be constant, they would be better.

In more than half the colleges of the United States young women are admitted on the same terms as young men, and attend the same instructors in the same lecture halls at the same hours. The usage is more general in the Western than in the Eastern States. But we have two conspicuous examples, the Cornell and the Syracuse universities, in our own State, and there is one in Massachusetts, the Boston University, and one in Connecticut, the Wesleyan. Yale College admits young women to her school of the fine arts. In the Michigan University, which, in numbers and in standing, ranks among the leading educational institutions of the country, out of a total of more than 400 in the school of letters and science, between 70 and 80 are young women. The colleges of the country, excluding those under the control of the Roman Catholic Church, are, according to the latest enumeration, 355 in number; of these 183 are open to students of both sexes.

In many of these colleges the students are permanently resident, separate buildings being provided for the female students. The Sage College at the Cornell University, founded by the liberal friend of education whose name it bears, is a splendid edifice erected for this purpose. In others, as at Syracuse, the students of both sexes, with few exceptions, attend at the college only during the day, and out of class hours reside at home or in private families. This arrangement relieves the instructors of responsibility for general supervision and leaves no room for the occurrence of troublesome questions of discipline.

As to the practicability of adopting this plan in our college, no question will be raised; but doubts may be entertained as to its expediency. It would be difficult, nevertheless, to suggest any reason which will bear very close examination why it should not be adopted. The admission of young women into the classes would not, in any manner, interfere with and embarrass the processes of instruction as they are now conducted. No modification of the arrangements of the class rooms would be necessary. So many more units would simply be added to the number and so many more names to the class roll. In every scholastic exercise the young women would be regarded as the young men are regarded—merely as students.

It can not be denied that there is, in some minds, a feeling of aversion to this

proposition which does not seek to defend itself by reasons, but inclines those who entertain it to dismiss the subject without argument. This is probably owing principally to the fact that the admission of young women into colleges is an innovation upon immemorial usage. The spirit of conservatism never fails to rise up against novelties, no matter how cogent the arguments by which they may be recommended. That it is this spirit mainly which opposes the opening of colleges to women, rather than anything inherently objectionable in the proposition itself, is made quite evident by the fact that no such opposition manifests itself to the association of students of both sexes in the academies and high schools with which the country abounds, many of which profess to teach the same subjects as the colleges, to the same extent, and to pupils of similar ages, differing chiefly in the fact that they have not a determinate course of four years, and do not confer degrees in arts.

The opposition to the proposal which has its source in the feeling here referred to is no doubt the most serious of the difficulties in the way of its adoption, simply because feeling is not controlled by judgment, but remains often unchanged after the understanding is convinced. Objections are, however, sometimes made to the plan which appeals to the reason. Thus, there are those who hold that the average female intellect is inferior in native capacity to that of the stronger sex, and hence infer that the association of the sexes in the same classes will have a tendency to depress the standard of scholarship. It is unnecessary here to go into the general argument upon this point, for it is not in the effort to master those elementary facts of knowledge or principles of science which form the material and the instrument of early mental training that the relative ultimate strength of different minds can be tested. There is in some intellects a quality of activity, of quickness of perception, and readiness of combination which, within given limits of time, is more than a compensation for more slowly moving power. And this is a quality which observation has proved to be peculiarly characteristic of the female mind. Similar observation, moreover, has pretty well established that, as a rule, girls are more diligent in study than boys, a fact which has an important influence on the record of their scholarship.

The experience of institutions where this point has been practically tested proves, moreover, that the presence of young women as members of college classes tends to a result directly the reverse of that which the objection supposes, and has the effect to raise rather than to depress the average scholarship of the classes to which they belong. In regard to this matter, the results derived from a comparison of the record made in Cornell University during the years preceding and the years following the opening at that institution of the Sage College for women, which have been kindly furnished to the undersigned by Vice-President Russel, are exceedingly interesting as well as instructive.

In order to understand the significance of these it is necessary to bear in mind that in every college a larger or smaller proportion of the matriculates of a given year usually drop off before the close for a variety of reasons, among which are failure of health, failure of means, the disciplinary acts of the faculty, and loss of position in consequence of defective scholarship. All these causes, except the last, are pretty uniform in their operation; and, with the same exception, the effect of all of them united is never very considerable. The variations, then, in the total magnitudes of the losses, when successive years are compared with each other, must be mainly due to the operation of the cause last mentioned, the varying numbers who fail from deficient scholarship.

But it is still objected that though the association of young women with young men in college may be beneficial to the ruder sex, it is likely to be otherwise to the gentler. The delicacy and the reserve which constitute in so high a degree the charm of the female character are liable, it is said, to be worn off in the unceremonious intercourse of academic life, and the girl who enters college a modestly shrinking maiden is likely to come out a romping hoiden or a self-asserting dogmatist. Those who make this objection argue rather from assumed premises than from any facts of observation. It is sufficient to say that the experience of the high schools of the country fails to furnish ground for this impression, and that no such results have been observed in any of the numerous colleges in which the experiment has for years been tried.

There is another and final objection less frequently urged in these discussions than those above enumerated, yet probably often in the minds of those who do not urge it, which is founded on the supposed disturbing influence which sentimental causes may exercise over the spirit of study. If young people of both sexes are associated in the same institution, and thus permitted to meet frequently and familiarly, their thoughts, it is imagined, will be likely to be more

constantly occupied with each other than with their books. An appeal might here again be made to experience to show that this danger is exaggerated. And it might be said with justice that the comparative freedom of school intercourse tends far less to excite the imaginations of impressible youth, and clothe for them the objects of their possible admiration with unreal charms, than do the more constrained and less frequent opportunities of mutual converse afforded in general society.

But, however that may be, the argument is inapplicable to the circumstances of our particular case. Here no opportunities for intimate intercommunication exist at all. The students attend only during a limited number of hours daily, and during their attendance they are constantly in class and occupied either in listening to instruction or in the performance of their own scholastic duties. No common halls of assembly exist, in which they may gather either before the exercises of the day commence or after they are over. From their retiring rooms, which will be entirely cut off from every other part of the building, the young women will pass directly to the lecture room, and at the close of their daily tasks will retire in the same way. Throughout the entire duration of the college course they will be resident in their own homes and surrounded by every protecting safeguard that parental solicitude can provide. If it is really desirable that the educational advantages offered to young women should be equal to those which young men have been so long permitted to enjoy, it would seem to be neither reasonable nor right that they should be excluded from the institutions where such advantages exist. If it is not desirable, of course the argument falls to the ground.

The measure here under consideration, should it meet with approval, would not probably be productive of any immediate visible effect. Few young women would be likely to present themselves as candidates for admission within the next few years, because there are few in this community who are likely to have given attention to the studies required as preparatory to the college course. But after that period, in a great city like this, a very considerable attendance might be anticipated, and thus our college would enter upon a new and important field of usefulness.

Whatever may be the fate of the present suggestion, the undersigned can not permit himself to doubt that the time will yet come when the propriety and the wisdom of this measure will be fully recognized; and as he believes that Columbia College is destined in the coming centuries to become so comprehensive in the scope of her teaching as to be able to furnish to inquirers after truth the instruction they may desire in whatever branch of human knowledge, he believes also that she will become so catholic in her liberality as to open widely her doors to all inquirers without distinction either of class or sex.

STATUS OF WOMEN STUDENTS AT COLUMBIA COLLEGE.

[Report of Acting President of Columbia College, New York, N. Y., 1889, p. 16; also Barnard College Circular of Information, 1889-90, p. 4.]

The collegiate course for women.—This course, established in 1883, to meet an apparent public demand for the higher and better education of young women, has not in its present form proved successful. The college provided examinations, but required that preparation to be made elsewhere. The women students desired instruction rather than examination. Accordingly, after an experience of five years, it has been decided by the trustees to discontinue the collegiate course for women in its present form, and to approve the establishment of an associate but separate school, under the name of Barnard College, in which the instruction shall or may be given by the professors of the college under certain regulations and restrictions. This course will therefore be discontinued at the close of the present year, except for those who have already completed a part of the prescribed studies.

In accordance with this division funds were raised for the equipment and maintenance of a college for women.

The name, Barnard College, was adopted in grateful recognition of the faith and energy with which the late president of Columbia College, Dr. F. A. P. Barnard, for many years supported and promoted the cause of the higher education of women.

This connection of Barnard College with Columbia College was officially recognized by the trustees of Columbia College in March, 1889.

[Report of the President of Columbia University for 1900, pp. 5-6.]

Present status of Barnard College.—The year under review has been a year of exceptionally large fruition. Three or four things have been accomplished that are certain to exercise great influence upon the future: but when these things are considered in detail, they are seen to be only the natural culmination of movements which have been in progress, more or less consciously, for a number of years. New agreements have been made with Barnard College and with Teachers' College by which both of these corporations, while retaining their separate existence, have become in fact as completely a part of the educational system of the university as though the work that they are doing were being carried on under the university charter. It is convincing evidence of the flexibility and virtue of the organization that has been developed by the trustees during the last ten years that the university can thus assimilate the work of institutions like these, not only without embarrassment either to itself or to them, but, on the contrary, with distinct advantage to all the corporations concerned, and without depriving any one of them of its independent life.

Incidentally these agreements determine the relation of the university to the higher education of women and to the professional training of teachers in a way that can not be otherwise than satisfactory to those who have these interests at heart. Barnard College becomes a separate college for women, having its own faculty, which controls the instruction leading to the degree of bachelor of arts. This degree is conferred by the university upon the women who graduate from Barnard College in the same way and upon the same conditions as it is conferred by the university upon the men who graduate from Columbia College. The relation of Barnard College to the university council, and, through it, to the educational policy of the university, is in substance the same as the relation of Columbia College. On the other hand, women who have taken the first degree will hereafter become candidates for the degrees of master of arts and doctor of philosophy as students of the university itself instead of, as heretofore, as graduate students of Barnard College.

[Report of the President of Columbia University, 1901, pp. 7-8.]

As was pointed out last year, the women graduate students, who formerly registered as students of Barnard College, register now as students of the university. In my last report I called attention to the fact that an officer known as the adviser of women graduate students, had been appointed to be of such personal service to these students as circumstances might call for. The experience of the year has justified the appointment as a step in the right direction; but it has been thought wise to substitute for this officer, with the cooperation of the Woman's Graduate Club, a paid secretary of the Woman's Graduate Club. The problem is to bring the university into the most helpful touch with those whom it is desired to serve. On the educational side, the women need no different officers from the men, and the various deans are fully equipped to give them all the advice and information they require. On the personal side, also, few of them feel the need of special assistance, except in emergencies. But, on the other hand, it is important that the university should be equipped to deal adequately with emergencies; and it is believed that the usefulness of a competent and tactful lady to the women graduate students may often be of great value in many ways, especially to those who find themselves in a strange city and away from home. Something was undoubtedly accomplished along these lines during the year just closed; but it is thought that the secretary of the Woman's Graduate Club will be able to come into more natural relations with such students than any officer can. I am glad to be able to report the election by the club, upon the nomination of the president of the university, of Mrs. Frank G. Bryson as its secretary for the next academic year. Mrs. Bryson is a graduate of Barnard College in the class of 1894, and she has since been a graduate student in the university. By experience, therefore, as well as by reason of her personality, she is believed to be well equipped for the duties she is about to undertake.

[Report of the Acting Dean of Barnard College, 1900, pp. 281-282.]

The past year has witnessed what the friends of Barnard may flatter themselves is a final and altogether beneficent adjustment of the relations between the women's college and the university.

The creation of a separate faculty consisting of those professors in the university who give instruction at Barnard permits a far more satisfactory system of admin-

istration than has hitherto been possible. The responsibility no longer falls upon the dean alone, but is shared by the several standing committees of the faculty, which consider and act upon questions relating to the curriculum, scheme of attendance, award of scholarships, honors, etc., and all applications for admission to the institution now pass through the hands of the Barnard committee on admissions.

RADCLIFFE COLLEGE, UNDER THE AUSPICES OF HARVARD UNIVERSITY.

[From the Harvard Graduates' Magazine, March, 1894, pp. 339-342.]

On December 6, 1893, the board of overseers of Harvard College, by a unanimous vote, gave its consent to an arrangement to be made between the university and the Society for the Collegiate Instruction of Women. That arrangement had been approved by the president and fellows, and was set forth in certain votes which had been passed by the society and submitted to the president and fellows, and which were as follows:

"*Voted*, That it is desirable to change the name of this corporation (The Society for the Collegiate Instruction of Women) to Radcliffe College, and that proper legal steps be taken to effect that change.

"*Voted*, That it is desirable that this corporation give degrees in arts and sciences, and that a committee of three persons be appointed by the president to take steps to obtain from the legislature the necessary power.

"*Voted*, That the president and fellows of Harvard College be, and hereby are, made and appointed the visitors to this corporation, and are hereby vested with all visitorial power and authority as fully as if the same had been originally conferred upon the said president and fellows by the charter or articles of association of this corporation. This vote shall take effect upon an acceptance by the said president and fellows of the powers herein conferred, but with the provision that said president and fellows at any time may abandon and surrender or limit such powers upon notice to this corporation.

"*Voted*, That no instructor or examiner of this corporation shall be appointed, employed, or retained without the approval of the visitors of this corporation, manifested in such way as said visitors may prescribe.

"*Voted*, That in case the president and fellows of Harvard College accept the powers conferred by the foregoing vote the said president and fellows be requested to empower the president of Harvard University to countersign the diplomas of this corporation and to affix the seal of Harvard University to said diplomas."

By the arrangement embodied in these votes and now accepted and approved by the governing boards of the university, Harvard assumes definite and official relations with the work which has been prosecuted for some time in Cambridge under the popular name of the Harvard Annex. (Pp. 329–330.) * * *

In this year, 1894, the annex enters into a declared connection with the university. It has become plain to everyone that the institution had passed its phase of private experiment, and was entitled to some formal recognition by the university.

What shape this should take was a question with many difficulties, for the university scheme had no place ready for the newcomer. Two or three main points were gradually developed by discussion.

In the first place, of course, no one wanted to incorporate the annex bodily into the university and mingle its students with the young men. It was plain that the young women must be separately cared for, and that their household concerns and domestic economy must be in the hands of a board composed, at least in part, of women. Furthermore, the president and fellows of Harvard College were unwilling to add to their administrative work, already excessively heavy, by taking charge of the property or attending to the executive details of another enterprise, and they preferred for general convenience to commit to a distinct body the management of an undertaking which was to be detached, in many respects, from the present organization of the university.

It resulted from these considerations that the college for women should have a separate organization, formally independent, and distinguished by its own title. Such a separation does not preclude any relation which the university may wish to establish between itself and the new college, nor prevent changes in that relation whenever they may be found desirable. A college on this footing may hereafter stand toward the university in a position closely analogous to that held by a college in an English university.

What should be the nature of the connection between the two bodies was the next question and the chief one. The university was entirely ready to assume the

control of the work of teaching, the most vital matter for the women's college, and to establish, formally and officially, what had hitherto been informally permitted as a private arrangement, that the instructors of the women's college should be those already actually in the university, or specially approved by it, and that the standards and examinations should be identical in the two. It was not easy to express or define this arrangement by a comprehensive phrase. It finally took the shape of a visitorial power, to be assumed by the university over the new college. This power is, of course, but vaguely described in the word visitorial, but it is nevertheless, in fact, most substantial, and with the understanding which has been established by fifteen years of experience it is effectual and insures a close union in essential matters. In this view the vagueness of the term is, and was meant to be favorable to the growth of whatever further connection may hereafter be developed.

Some anxiety has been expressed by eager advocates of women's education because the university has not made a formal contract, nor specified in what way it will exercise its powers, nor enumerated the privileges it will give to women, nor even fixed the time for which it will abide by the new arrangement, which, on the contrary, is expressly made terminable at its pleasure. But the want of definite articles of agreement is by no means a ground of apprehension to those who know the history of the annex and appreciate how fully it is already a part of the university through adoption by the faculty, which is for this purpose the university. No one who understands university methods, and especially the character, traditions, and policy of Harvard College will be disturbed by the fear that she will abandon a work to which she has set her hand or allow it to languish. The very want of precision and limitation in the terms of the arrangement indicate a union, not a contract, and is an assurance of intimacy and identical interests in the one essential matter of education. The change from a private cooperative plan of individual professors to an officially determined connection with the university is a vital change for the annex and practically fixes it as a part of the university, whether in the present form or some other.

The question of university degree remained, and this was met in the only way now practicable. The graduates of the annex have always had a not unreasonable feeling of deprivation in that their thorough and systematic work, fulfilling the highest standard of college work in the country, was not marked by any degree or title, while the same work brought to men the distinction of a Harvard degree. The annex certificate did represent, to those who were well informed, the fact of education, but the symbol is also valuable, and is even of material value, for high employment as teachers is more readily offered to those who have a college degree.

The corporation of Harvard College, however, was not prepared to offer to women the university degree of bachelor of arts, and it must be admitted that there is reason for caution before taking a step so important and so irrevocable. Such a degree would probably at once attract a large number of women, and it is not clear how the scheme could stand a sudden accession of large numbers. To make anything like an impartial sharing of the resources of the university would cripple the present work for men even if no law or principle forbade such an application of the funds and property now devoted to the education of men alone. Nor is it clear that the opinion of the graduates and friends of the university is yet so settled as to justify this departure from the established constitution of the university.

In view of these and other considerations, the corporation of the university declared itself unwilling to offer its A. B. degree. It was, however, willing to give to the young women a formal certificate, establishing their position at even grade with the Harvard bachelor of arts by graduation from the college which Harvard University is to supervise. The degree, therefore, is to be that of the new college, but countersigned by the president of the university and bearing the university seal. Exactly what shall be the form of that degree has not been determined, but it is not likely to be less explicit than the certificate now used, as given above, in stating that the recipient has accomplished the full measure of undergraduate work which entitles a student of the university to its bachelor's degree. If experience of the new arrangement with the women's college shall hereafter justify any further recognition of its graduates, the university is likely to be ready to advance along the path on which it has now entered.

The matter of graduate instruction for women has not been made the subject of any definite arrangement, for the reasons given above, namely, that this is now complicated, for the university, with question of laboratory accommodation and the readiness of individual professors to arrange classes at once for women. Such classes are now made up in special cases, and difficulties in this direction are sure

to decrease with the adjustments which grow with experience, especially if money is furnished for a better provision of apparatus. It is expected that the opportunities for graduate work will be much extended under the care of the university, and to this extension the opinions of many members of the university faculty are known to be favorable.

The plan embodying the main features stated above was informally submitted by the president of the university to the faculty, and was heartily assented to by them, and this assent secured the continuance of that indispensable support upon which the annex has hitherto relied. It is this arrangement which, embodied in the votes of the society as given above, is now approved by both the governing boards of the university.

It now remains only to obtain an act of the legislature changing the name of the society, and giving it the power to confer degrees, and to enter into the proposed connection with the university. The society being already incorporated, no charter is sought. The act proposed does not fix any unalterable relations between the women's college and the university, but merely authorizes the former "to confer at any time upon the president and fellows of Harvard College such power of visitation, and of direction and control over its management, as the said corporation may deem it wise to confer and the said the president and fellows may consent to assume." This will leave it open for the university to adopt hereafter any arrangement it may choose and to change the plan as experience may show to be desirable.

The last scholastic year, 1900–1901, was made memorable in the history of Radcliffe College by the erection of a fine dormitory building with accommodations for 25 pupils.

As to the growth in attendance Dr. Eliot says in his report for 1900–1901:

The number of students in Radcliffe College increases slowly, but with reasonable steadiness. In 1901 116 candidates were admitted as freshmen, against 93 in 1900. Sixty-one graduate students registered during the year, 47 of whom were from other colleges.

THE SYSTEM OF "COORDINATE EDUCATION."

[Dr. C. F. Thwing, president of Western Reserve University, in The College Woman, pp. 124–131.]

Coordinate education represents a college for men as a part of a university and a college for women as a part of a university; each college complete in itself, each able to exist without the other, but both under one general administration, both dwelling in one scholastic atmosphere, both united in loyalty to the same ideals and joined in pursuit of these ideals by similar methods. Coordinate education is not coeducation, for the men and women do not recite in the same classes. Coordinate education is not separate education, for the teachers of the college for men usually teach also in the college for women, and the teachers of the college for women usually teach also in the college for men; the libraries are shared in common, and the administration of the two is identical. Coordinate education is not the annex system, for each college is able to live without the other's aid; neither is subordinate, each is coordinate. Coordinate education is as economical as coeducation, in case the number of students is sufficient to require two teachers in the chief studies. If the students are not thus numerous, the teacher is obliged to double his hours of work or the college to hire two teachers; either method is expensive. Coordination develops the masculine part of the boy or the feminine part of the girl as does separate education, for in the ordinary relations the two sets of students are distinct. It also does not promote the monastic type, for the endeavor is made to put the social relations of young men and young women on the basis of humanity. Both were human beings before they were students and will be human beings longer. Coordination is sufficiently close to coeducation to discipline the element of force which women whose life is to be more or less public should have. Coordination under this condition promotes a very sane health and healthfulness; it eliminates nervousness. Coordination promotes a high and broad scholarship; it offers no occasion for unwise squeamishness; its conditions are fine and delicate. It does not tempt to love giving or love receiving any more than humanity itself. It is a method more easy to administer than the coeducational. The students are not brought into relations so intimate that even wisest parents can ask questions of anxiety. The method allows and invites that natural and happy association of college men and women which wisest parents and col-

lege officers approve. The method also promotes a university spirit which the woman's college, as usually constituted and circumstanced, is not able to foster.

There is one consideration in favor of the coordinate system deserving special mention. The strength of a college lies largely in the strength of its teaching force. The simple truth is that it is far easier to secure first rate teachers for the college for women as a part of a university than for the independent college for women. It would be less difficult to secure the best teachers for Radcliffe College if it were an integral part of Harvard University than for the same college holding no relation to our oldest university.

The coordinate method is that which would prevail at Cambridge in case Radcliffe College were an integral part of Harvard University, having a faculty of its own and having the same president and corporation which the university itself has. The coordinate method is that which prevails in the College for Women of Western Reserve University in Cleveland.

The battle for the higher education of women is an old, old battle. The contest has raged mainly about the point of coeducation. This point was in the beginning more evident, more tangible, more real; for women wanted a college education. Colleges for men existed. It seemed more natural to open these colleges to women than to establish colleges for them. The battle for woman's education has been fought out on a preamble. The contest has been over a method, but over a method for the sake of an end. In this condition it has been easy for everyone interested in the college education of women to choose his side and his weapons. But it can be said no longer that questioning of the wisdom of the method carries along with itself doubt as to the excellence of the end. One can now decline to affirm that coeducation is the best method without laying himself open to the imputation of disbelieving in a college training for young women. The question of method need no longer be mixed up with the rightfulness of the end. The contest is closed. Women have secured a recognition of their right to have the best training which the colleges of the United States or England can provide. * * *

It is probable that for an indefinite period there will exist in the United States those three methods, the coeducational, the separate, and the coordinate. Each of them ought to exist; each of them has value; each of them possesses peculiar advantages for the needs of certain women; each of them also possesses peculiar disadvantages for the conditions and prospects of certain women. The choice of either method is largely a matter of taste. The question of method, too, is only one of several important questions in giving or withholding one's approval of a college. The question of the richness and fullness of curricula and the question of the personality of teachers are at least equally important.

What has been said respecting method applies to undergraduate work. Such objections as certain scholars and administrators hold against coeducation do not apply with equal force to graduate as to undergraduate students. The definiteness of aims, the increased earnestness, and the more mature character which belong to the greater age of graduate students may entirely or largely remove difficulties which are found in the way of men and women mingling in the undergraduate department. The faculty of Yale University knows very well that to admit women to its graduate school is quite unlike opening the doors of Yale College to girls of the age of 18.

EXPERIENCE OF COEDUCATION AT BROWN UNIVERSITY, PROVIDENCE, R. I.

[Annual Report of the President, June 29, 1893.]

The educational privileges which the corporation at its meeting last June extended to women have been very welcome. Ten women have been pursuing studies in the graduate department the entire year, and the number of regular candidates for undergraduate examinations has been 39. All those who passed the freshman examinations last year are continuing their studies. Of the regular candidates for this year's freshman examinations there are 14. The remainder of the young women making up the 39 are not at present candidates for any degree, though several of them will become such. The scholarship of all is remarkably high, averaging a good percentage, better than that of our men students. The considerable number of women candidates for undergraduate examinations has induced some gentlemen in the faculty to institute means for a systematic preparation for these examinations. Classes are formed in all the branches elected, and they are instructed by the same men who have charge of the corresponding classes inside the university. There has thus sprung into existence a woman's college, technically and legally under the university only so far as its examinations are concerned,

yet in effect a department of the university, so closely connected are examinations with the instruction therefor. * * *

While this establishment makes no drain whatever upon the university's financial resources, it adds greatly to its popularity and favor with the community. From present prospects another year will find no fewer than 100 women pursuing studies in connection with the university, either as full members of it, viz, in the graduate department, or as candidates for undergraduate examinations. Applications for registration begin to come in from a distance. In view of the rapid progress which this enterprise is making, I can not but request for it the most attentive consideration of this board and other friends of higher education. * * * The woman's department of the university requires and must soon have an ample, permanent home of its own, a well-endowed and commodious women's college, presided over by an accomplished lady principal. Not less than half a million dollars is needed for this purpose. The college must be part and parcel of the university, giving women students the full university status, and at the same time so furnished, endowed, and equipped as to offer them every facility for education, physical and social as well as intellectual, now within the reach of male students. It may be confidently asserted that no other expenditure of half a million dollars could possibly advance the higher life of Rhode Island society in coming time so much as the erection of such a college.

The following letter brings to date the account of the system pursued at Brown:

Commissioner W. T. HARRIS.
Bureau of Education, Washington, D. C.

MY DEAR DR. HARRIS: In regard to your inquiry regarding the statement that "students in several universities, including Brown, are manifesting their dislike to coeducation in ways that are more annoying than chivalrous," I beg leave to say that we do not consider that we have coeducation at Brown. We call our system "coordinate" education. Our women's college is in its financial management, its class-room work, and in its social life, wholly separate from the other departments of the university. The men and women do not recite in the same class room, except in very advanced classes, where the number of students is so small that duplication of the work is out of the question. In graduate work the separation is maintained. We are not conscious of any "annoyance" of women by men or vice versa. When the women's college was first founded there was doubtless objection to its founding among the undergraduate men, but that objection has dwindled from year to year until I doubt if it is in existence to-day.

Sincerely, yours,

W. H. P. FAUNCE.

V.—THE AMERICAN WOMAN FROM A GERMAN STANDPOINT.

In his book entitled American Traits Prof. Hugo Münsterberg devotes a chapter to the American woman considered from a German point of view.

The educational status of woman in America occupies a large space in this consideration; and while the views advanced are not professedly related to the policy of coeducation, they are logically so related, and therefore may very properly be considered in this connection.

In order to emphasize his view, the general importance of which is hardly a matter of question, Professor Münsterberg has purposely, it seems, exaggerated the tendencies which, in his judgment, are discoverable in our system and has forecast possible evil results should it ever be carried to the extreme imagined. Fortunately, as the author also foresees, no such extreme condition is to be anticipated.

The presentation necessarily loses much when separated from its full context, but the passages here cited will serve at least to draw attention to considerations which are both important and interesting.

The German standpoint, which Professor Münsterberg maintains throughout the discussion, is stated by him as follows:

The efforts of this new Germany in the interests of the woman have taken four different forms, four tendencies, which naturally hang together, but externally

are sometimes even antagonistic. The first movement, which applies to the largest number of individuals, is that which tends to soften the hardships of the female wage-earner, especially among the laborers; the second seeks to raise the character of the general education of girls in the higher classes; the third endeavors to open new sources of income to the better-educated women of narrow circumstances, and the fourth has as its aim the clearing of the way for women of special talent, that they may live out their genius for the good of humanity. I have said that these impulses move partly in opposite directions; to widen the horizon of the women of the higher classes and to prepare them for professional work means to draw them away from the hearth, while all the efforts in behalf of the women in the mills and shops tend to bring them again to the hearth of the home. The one group gave too much time to the mere household, in its narrowest sense; the other group had too little time for this. The progress in all four directions is almost a rapid one; the legislation in the interest and for the protection of working women is a model for the world; and—to point to the top of the pyramid—the conservative universities have opened wide their doors. Last winter 431 women were admitted to the University of Berlin alone.

These four tendencies, which ought to remain clearly separated in every discussion, as the usual mixing of them brings confusion, have nevertheless a single background of principles. One of these, which sounds, of course, utterly commonplace, is that it must remain the central function of the woman to be wife and mother; and the other is that public life and culture, including politics, public morality, science, art, higher education, industry, commerce, law, literature, the newspaper, and the church, are produced, formed, and stamped by men. * * * Every tendency that strikes against those two fundamental principles of German conviction has been paralyzed by the spirit of the country. It may be said, without exaggeration, that all the efforts toward the solution of the woman question in Germany strengthen and reenforce the family idea. The only exceptions to this are the liberal provisions for the highest development of women of unusual talent; but genius must always be treated as an exception, and such exceptions have existed at all times. The few who take the doctor's degree and who feel the mission for productive work in scholarship can thus be set aside in the discussion, while the situation as a whole suggests most clearly the irregularity of such a vocation and does not push the average woman into such a path. * * *

In both respects—in relation to the home and in relation to the standards of public culture—the movements in the interest of women have in America exactly the opposite tendency from those in Germany; even the same facts have, under the different social conditions, an absolutely different meaning. The whole situation here militates against the home and against the masculine control of higher culture, and seems to me, therefore, antagonistic to the health of the nation. I shall consider first the influence on the home. * * *

Of course I will not warm up the old-fashioned argument, which is repeated so often in Europe, that the higher learning makes a girl awkward and ill mannered, and that the man will never be drawn to such a bluestocking. I take for granted that no American girl loses in attractiveness by passing through a college or through other forms of the higher and the highest education. But we have only to look at the case from the other side, and we shall find ourselves at once at the true source of the calamity. The woman has not become less attractive as regards marriage; but has not marriage become less attractive to the woman? And long before the freshman year did not the outer influences begin to impel in that direction? Does it not begin in every country school where the girls sit on the same bench with the boys and discover, a long, long time too early, how stupid those boys are? Coeducation, on the whole unknown in Germany, has many desirable features; it strengthens the girls; it refines the boys; it creates a comradeship between the two sexes which decreases sexual tension in the years of development; but these factors make, at the same time, for an indifference toward the other sex, toward a disillusionism, which must show in the end. The average German girl thinks, I am sorry to say, that she will marry anyone who will not make her unhappy; the ideal German girl thinks that she will marry only the man who will certainly make her happy; the ideal American girl thinks that she can marry only the man without whom she will be unhappy, and the average American girl approaches this standpoint with an alarming rapidity. Now, is not the last a much more ideal point of view? Does it not indicate a much nobler type of woman—the one who will have no marriage but the most ideal one—as compared with the other, who in a romantic desire for marriage takes the first man who asks her? But in this connection I do not wish to approve or to criticise; we may post-

pone that until we have gathered a few more facts and motives. Coeducation is only one; a whole corona of motives surrounds it.

Coeducation means only equality; but the so-called higher education for girls means, under the conditions of the American life of to-day, decidedly not the equality, but the superiority of women. In Germany even the best educated woman—with the exception once more of the few rare and ambitious scholars—feels her education inferior to that of the young man of the same set, and thus inferior to the mental training of her probable husband. The foundations of his knowledge lie deeper, and the whole structure is built up in a more systematic way. This is true of every one who has passed through a gymnasium, and how much more is it true of those who have gone through the university! Law, medicine, divinity, engineering, and the academic studies of the prospective teacher are in Germany all based essentially upon a scholarly training, and are thus, first of all, factors of general education—powers to widen the horizon of the intellect. All this is less true in America; the lawyer, the physician, the teacher, the engineer, obtain excellent preparation for the profession, but in a lower degree his studies continue his general culture and education, and the elective system allows him to anticipate the professional training even in college. And, on the other side, as for the business man who may have gone through college with a general education in view—how much, or better, how little of his culture can be kept alive? Commerce and industry, finance and politics absorb him, and the beautiful college time becomes a dream; the intellectual energies, the factors of general culture, becomes rusty from disuse; while she, the fortunate college girl, remains in that atmosphere of mental interests and inspiration, where the power she has gained remains fresh through contact with books. The men read newspapers, and, after a while, just when the time for marriage approaches, she is his superior, through and through, in intellectual refinement and spiritual standards. And all this we claim in the case of the man who has had a college education; but the probability is very great that he has not had even that. The result is a marriage in which the woman looks down upon the culture of her husband; and, as the girl instinctively feels that it is torture to be the wife of a man whom she does not respect, she hesitates, and waits, and shrinks before the thought of entering upon a union that has so few charms.

And can we overlook another side of the delightful college time? No noise of the bustling world disturbed the peace of the college campus; no social distinctions influenced the ideal balance of moral and intellectual and æsthetic energies; it was an artificial world in which our young friends lived during the most beautiful years of their life. Can we be surprised that they instinctively desire to live on in this peculiar setting of the stage, with all its Bengal lights and its self-centered interests? They feel almost unconsciously that all this changes when they marry, when they are mistresses of a household—a situation which perhaps means narrowness and social limitation. They feel that it would be like an awakening from a lofty dream. There is no need to awake; the life in the artificial setting of remote ideals can be continued if they attach themselves, not to a husband and children but to clubs and committees, to higher institutions and charity work, to art and literature; if they remain thus in a world where everything is so much more ideal than in that ungainly one in which children may have the whooping cough.

Of course all these are not motives that prohibit marriage; they may not even, in any individual case, work as conscious considerations; they are only subconscious energies, which show their effects merely if you consider the large groups; they are the little forces, the accumulation of which pushes the balance of motives perhaps so little that they remain unnoticed by the girl who is undecided whether to accept him; and yet they are efficient.

The college studies do not merely widen the horizon; they give to many a student a concrete scholarly interest, and that is, of course, still truer of the professional training. The woman who studies medicine or natural science, music or painting, perhaps even law or divinity, can we affront her with the suggestion, which would be an insult to the man, that all her work is so superficial that she will not care for its continuation as soon as she undertakes the duties of a married woman? Or ought we to imply that she is so conceited as to believe that she is able to do what no man would dare hope for himself; that is, to combine the professional duties of the man with the not less complex duties of the woman? She knows that the intensity of her special interest must suffer; that her work must become a superficial side interest; that she has for it but rare leisure hours; and no one can blame her, however much she may love her own home, for loving still more the fascinating work for which she was trained.

All these tendencies are now psychologically reenforced by other factors which have nothing to do with the higher education as such, but are characteristic of the situation of the woman in general. * * *

The American system injures the national organism, not only because it antagonizes the family life, and thus diminishes the chances for the future bearers of the national civilization, but it has, secondly, the tendency to feminize the whole higher culture and thus to injure the national civilization itself.

If I speak of public life here, I do not mean politics in the technical sense. The arguments for and against the participation of women in politics, the reasons for and against woman suffrage, are certainly of a peculiar kind; I have often listened to both sides in these discussions, and have always, as long as one side was pleading its cause, felt strongly in favor of the other side. If I am, on the whole, opposed to woman suffrage, it is because it belongs to those factors which we have discussed; it would help to draw the interests of individual women away from domestic life. But I do not think that it would have a serious bearing on that point which we have now to consider, the effemination of public life; politics would certainly be influenced as to its character if woman suffrage existed everywhere; it would, in some ways, probably suffer through hysterical sentimentality, illogical impulses, and the lack of consistent obedience to abstract law; but it would probably be, on the other hand, in many respects ennobled and moralized, softened and elevated. There would be, on the whole, no serious disadvantage to be feared for political life itself, because the men would always remain the backbone of the political parties. Politics in America so immediately and directly penetrates man's whole welfare, his commerce and industry, his income and his expenses, his rights and his duty, that there is no danger that he would ever allow the political life to pass from his hands into those of the woman; a real effeminizing of political life is thus no probable danger. * * *

The public life that I have in mind is the public expression of the ideal energies, the striving for truth and beauty, for morality and religion, for education and social reform, and their embodiment, not in the home, but in the public consciousness. In Germany no one of these functions of public life is without the support and ennobling influence of active women, but decidedly the real bulk of the work is done by men; they alone give to it character and direction, and their controling influence gives to this whole manifoldness of national aims its strenuousness and unity; to carry these into the millions of homes and to make them living factors in the family is the great task of the women there. Here, on the other hand, the women are the real supporters of the ideal endeavors; in not a few fields their influence is the decisive one; in all fields this influence is felt, and the whole system tends ever more and more to push the men out and the women in. Theater managers claim that 85 per cent of their patrons are women. No one can doubt that the same percentage would hold for those who attend art exhibitions, and even for those who read magazines and literary works in general, and we might as well continue with the same somewhat arbitrary figure. Can we deny that there are about 85 per cent of women among those who attend public lectures or who go to concerts, among those who look after public charities and the work of the churches? I do not remember ever to have been in a German art exhibition where at least half of those present were not men, but I do remember art exhibitions in Boston, New York, and Chicago where according to my actual count the men in the hall were less than 5 per cent of those present. As a matter of course the patron determines the direction which the development will take. As the political reader is more responsible for the yellow press than is the editor, so all the nonpolitical functions of public life must slowly take, under these conditions, the stamp of the feminine taste and type, which must have again the further effect of repelling man from it more and more. The result is an effemination of the higher culture, which is antagonistic to the development of a really representative national civilization, and which is not less unsound and one sided than the opposite extreme of certain oriental nations where the whole culture is man's work and the woman a slave in the harem.

The woman, and sometimes even the indolent man who wants to get rid of the responsibility of something he does not care about, says simply that this is all right. As the facts show—they argue—that the woman is not inferior in intellectual and æsthetic energies, not inferior in earnestness and enthusiasm, why not intrust her with the national culture, why not give her full charge of art and literature, education and science, morality and religion?—man has a sufficient number of other things to do. But it is simply not true, and can not be made true by any dialectics, that the minds of man and woman are equal, and can be

substituted the one for the other, without changing the entire character of the mental product. It is not true that men and women can do the same work in every line. Earnestness certainly the women have. However large the number of those who may meet their public duties in a spirit of sport or amusement or ennui, the majority take these duties seriously, and the college-girl especially comes home with a large amount of earnestness in the cause of reform and of the higher functions of the national life. The only misfortune is that earnestness alone is not physical energy, that good will is not force, that devotion is not power. But her lack of physical power and strength would be less dangerous to the undertaking if her intellectual ability were equal to that of the man. But here the social psychologist can feel no shadow of a doubt that neither coeducation nor the equality of opportunities has done anything to eliminate those characteristic features of the female mind which are well known the world over, and which it is our blessing not to have lost. The laws of nature are stronger than the theories of men.

To express the matter in a psychological formula, on which the observations of all times and all nations have agreed: In the female mind the contents of consciousness have the tendency to fuse into a unity, while they remain separated in the man's mind. Both tendencies have their merits and their defects; but, above all, they are different, and make women superior in some functions and man superior in some others. The immediate outcome of that feminine mental type is woman's tact and æsthetic feeling, her instinctive insight, her enthusiasm, her sympathy, her natural wisdom and morality; but, on the other side, also, her lack of clearness and logical consistency, her tendency to hasty generalization, her mixing of principles, her undervaluation of the abstract and of the absent, her lack of deliberation, her readiness to follow her feelings and emotions. Even these defects can beautify the private life, can make our social surroundings attractive, and soften and complete the strenuous, earnest, and consistent public activity of the man; but they do not give the power to meet these public duties without man's harder logic. If the whole national civilization should receive the feminine stamp it would become powerless and without decisive influence on the world's progress.

The evidences of the effemination of American scholarship adduced by Professor Münsterberg are, in general terms, the excess of the receptive, uncritical attitude of mind above the spirit of research and inquiry, the monopoly of primary teaching by women, and their "overwhelming majority" in the teaching corps of the high schools.

Professor Münsterberg closes his discussion of this question as follows:

Under the ordinary conditions, the material opening and settling of a country move parallel with the development of the inner culture, and the man is thus able to meet the requirements of this twofold public task. He gives his energies to the material and political necessities so long as the metal and spiritual culture is low, and in proportion as he is freed from the rudimentary needs that pertain to the support of the nation he turns to the inner culture, that of education and art, and so on, while the woman, at every stage, cares for the private life of the family. In America this normal course was changed, because the material opening of the country, the unfolding of its natural resources, coincided with the possession of a most complex inner culture brought over from Europe ready-made, not grown of the soil. Hence a new division of labor had to be discovered to meet those material exigencies which demanded man's full energy, and man's side function, the work of the higher culture also. This side function had to be assumed by the woman; she had to care for the inner culture of the nation, that the arms of the man might be free for the more immediate work, the settling of the continent, the political organization, and the development of the national wealth. This was, under these unusual conditions, the only way of preserving and fostering the high European culture. If women had not temporarily taken this function from man, it would have been wholly lost in the wear and tear of the commercial and political adolescence of the nation. It was, then, the special mission of the American woman to become the bearer of the higher, inherited culture of the nation by the artificial development of an intellectual superiority over the man.

But if this be true, it is clear that such vicarious functioning must cease as soon as those two peculiar conditions should arise which manifestly exist at the present time. The first of these conditions is that this female superiority should reach a point where it begins to effeminate the higher culture, and where it becomes

antagonistic to family life: thus positively injuring the organism of the race. The other condition is that the material establishment of the country should have attained its completion; the ground mastered, the sources of national wealth sufficiently developed to allow room for man's effort in other directions. No doubt this condition also is fulfilled to-day; the West is opened; the whole continent is economically subjugated; a net of transportation covers the whole land; wealth abounds in a sufficient number of families, down to the second and third generations, to insure the building up of a leisure class; and the time has come when the American man can take his share, like the European, in the spiritual culture of his country. If the American man will but turn his real energies to the world of spiritual goods, then the two great evils which we have discussed will both be cured by the one remedy, and at one time, while the woman will not in any respect be the loser. If man takes the part that belongs to him in the higher culture, this, instead of being emasculated, will show that perfect blending of human energies in which the strength of the man will be softened by pure womanhood, and, at the same time, the woman, who will feel the greater strength in the man of equal culture, will shrink no longer from marriage, and will feel attracted by that truer companionship in which the real labor is divided; the public function given to the man, the domestic function to the daughter and sister, to the wife and mother. That is the state at which we aim in Germany. Much has still to be done there to give to the average German woman the thorough education of the American, but that will soon come. In any case, even the best training of the woman must support in Germany the family idea, and the man will continue to be the mainstay of the ideal culture. We Germans feel sure that this will not be endangered, even if we fully imitate the splendid college life of American girls. Therefore, no one can suggest that woman's education in this country ought to take any steps backward; all the glorious opportunities must remain open, and only one practical change must come in response to the urgent needs of our period—the American man must raise his level of general culture. In short, the woman's question is in this country, as ultimately perhaps everywhere, the man's question. Reform the man, and all the difficulties disappear.

The force of Professor Münsterberg's discussion is modified by an examination of the facts relative to the number of women who attend colleges. The following estimates, based chiefly upon statistics for Massachusetts, where the ratio of such attendance is presumably large, have recently been made by the Commissioner of Education:

In each 1,000 inhabitants in Massachusetts. 15.2, says Dr. Harris, are in high schools or academies, and 4.2 are in colleges and institutions of like grade. This makes about 20 in the thousand or two persons in each hundred. The number of the population in Massachusetts who have received a full secondary education (that is, four years in the high school or academy) is only 1 in 25, and the number who have graduated from college is only 1 in 1,000. The number of boys who have graduated from the high school is about the same as the number of girls. At the present rate the girls are a little more numerous. The number of both sexes who have graduated from colleges or indeed attended college for any period of time is less than 1 in 1,000 of the population of the United States. Taking the present rates of attendance, of this number less than one-fourth are women.

Only 1 woman in 500 is a graduate of a college in Massachusetts, and only 1 woman in 20 is a graduate of a high school.

NOTES ON COEDUCATION IN FOREIGN COUNTRIES.

GREAT BRITAIN AND IRELAND.

In England 65 per cent of the departments into which the elementary schools are divided have boys and girls in the same classes; in Scotland, 97 per cent. Statistics for Ireland show that 51 per cent of the national schools have a mixed attendance of boys and girls.

Separate education is the general policy in English schools of secondary grade, and where both sexes are admitted to the same school it is generally to separate departments. The royal commission on secondary education advocate the extension of the coeducational policy, and since the publication of their report (1895) experiments in this direction have noticeably increased.

In the British colonies, with very few exceptions, both mixed and separate schools are found. In Ontario all the schools are mixed. In Quebec the schools for English children are, as a rule, mixed, but in the schools for the French children the sexes are separated. In the Australasian colonies the tendency to separate departments for boys and girls is noticeable in cities. In Cape Colony, while nearly all schools are mixed, separate schools for girls are encouraged.

University privileges for women.—At Oxford women are admitted by courtesy to the lectures of about 160 professors, readers, and lecturers in the university, and they have also been permitted to attend lectures in all the colleges save one. They are also admitted to the examinations for B. A., but are not eligible to the university degrees. Substantially the same arrangements have been adopted at Cambridge. Women are admitted on the same terms as men to Durham University and are eligible to all the degrees excepting those in divinity. Victoria University grants degrees to women on the same terms as men. In the University of Wales women have the same privileges as men.

The university colleges established in England since 1868 are open to men and women. By the "universities act" of 1889 the Scotch universities were authorized to open their doors to women. Edinburgh admits them to the classes with men. Glasgow has affiliated Queen Margaret College for Women, and more recently (1895) opened all lectures in the faculty of arts to women. The University College of Dundee, affiliated to St. Andrews, is coeducational.

Women are admitted to all the privileges of the Royal University of Ireland. Trinity College, Dublin, does not admit women, but "special examinations for women outside the course for students of the college were established about twenty-five years ago and are still continued."

In 1895 it was resolved to admit women to certain honor examinations of the undergraduate course as an experiment for three years (1896–1898).

The following table shows the attendance of women upon universities and university colleges in 1899:

Women's colleges and departments, 1899–1900.

Colleges.	Women students.	Colleges.	Women students.
Girton	110	Owens College	121
Newnham	165	Yorkshire	130
Bedford	[1]180	Alexandra Hall (Aberystwyth)	181

		Alexandria College (Dublin)	369

[1] About 40 resident.

[2] Not including medical students, as at Glasgow.

FRANCE.

In France separate schools for boys and girls are preferred even in the elementary grades. Every commune having 500 or more inhabitants is, indeed, obliged by law to provide a separate school for girls. In communes whose popu-

lation is less than 500 mixed schools are found. According to official statistics for 1897, there were enrolled in the public schools having both boys and girls 692,548 pupils (377,797 boys and 314,751 girls) and in private mixed schools 34,988 (12,652 boys and 22,336 girls). The total enrollment in mixed elementary schools was therefore 727,536, or about 13 per cent of all elementary pupils. The secondary schools are always separate schools; that is, distinctively for boys only or for girls only.

Women are admitted to all the French universities on the same terms as men and the same degrees are conferred upon them. The number of women students registered in the universities January 15, 1898, was 871 on a grand total of 28,782. The distribution of the women students, by faculties, was as follows: Law, 5; medicine, 469; sciences, 80; letters, 262; pharmacy, 55.

Of the total number of women students 579 were French and 292 foreigners. In the scholastic year 1897–98 the number of university degrees obtained by women was 72, viz: In letters, bachelor, 25, licentiate, 3; in medicine 16 doctorates were conferred and 8 inferior diplomas; in science, 1 bachelor's degree and 15 licentiates; in law, 1 licentiate; in pharmacy, 3 diplomas.[1]

GERMANY.

Separate education is the preferred policy in the German States, but is not practicable in the rural primary schools. According to statistics of 1891, in Prussia two-thirds of the children in the common schools were in mixed classes, but in the cities the proportion was only three-tenths. In Saxony only the two lowest classes are mixed, so that separation occurs generally at the tenth year of age—always by the twelfth.

In secondary schools separate education is the universal rule. An increasing number of universities permit women to attend some of the courses of lectures by special permission, as explained very fully in the appended citations from an article by Mrs. Martha King Genthe.

In the winter session of 1898–99 414 women were in attendance upon the 10 Prussian universities, as against 117 in 1895–96.

The following tabular statement, taken from the first volume of special reports

---

[1] The following account of an association of women students (Association des Étudiantes de Paris) illustrates the growing interest in measures for promoting the social welfare of women students in the French metropolis:

"It is pleasant to learn that success has waited on the efforts of the few public-spirited women, supported by at least one member of the Sorbonne, who founded L'Association des Étudiantes de Paris just two and a half years ago. The early meetings were held in the Rue de Savoie, a room being lent for the purpose by the union that aims at promoting social education. Now a permanent and commodious center has been secured in the Hôtel des Sociétés, and on the occasion of the inauguration here the presence of university professors and a deputation from the great association of men students familiarly known as 'L'A' bore witness to the standing the venture has won for itself in the academic life of the Latin Quarter. The object, as stated in the statutes, is twofold: First, to bring together students of the different faculties and certain schools in order to create ties of friendship and solidarity; second, to encourage students in their work by assuring moral support and material help. Members are required to be matriculated students of some one faculty or students at the National Academy of Fine Arts, the National Academy of Decorative Arts, or the training colleges near Paris—Sèvres and Fontenay-aux-Roses—the one for secondary and the other for primary teachers. Candidates for admission must be introduced by two members, and no minors are enrolled without the express permission of parents or guardians. Rules bearing on the club-room side of the scheme are of a more restrictive character than those generally adopted on this side of the Channel, but club life is, it will be remembered, far less familiar to the French woman than to the English woman. The rooms remain open from 10 in the morning till 10 at night. The annual subscription is 10 francs. The association now numbers some 50 members, of whom not a few are foreigners, chiefly, we believe, of Russian nationality." (Journal of Education (London), June, 1901, p. 376.)

issued by the English education department, summarizes in a convenient form the principal facts with respect to the admission of women to foreign universities:

SUMMARY.

	Number of universities to which the inquiries were addressed.	Number of universities about which information has been received.	Number of universities at which no (or unimportant) distinctions are made between men and women students.	Number of universities at which women students are admitted by courtesy or special permission to some lectures and examinations.	Number of universities at which women students are admitted by courtesy or special permission to some lectures only.	Number of universities to which women students are not admitted at all.

[1] The same rule applies to the other Italian universities.

[2] In one case the position of women students seems to be more strongly differentiated than in the other two.

[3] In one of these cases women are admitted to certain medical classes.

WOMEN AT THE GERMAN UNIVERSITIES.

The status of women with respect to the German universities is discussed by Mrs. Martha King Genthe in an article published in the Forum for April, 1902. Mrs. Genthe writes from personal experience, and her judicial treatment of the subject is valuable to the American reader, who is too apt to consider it from the very different standpoint of American policy. The principal facts relative to the opportunities now open to women for university study in Germany, as set forth by Mrs. Genthe, are cited below. In order to understand their bearings it is necessary to keep in mind the distinctive characteristics of German universities and their relation to the preparatory schools. Without following our author through the detailed consideration of this part of her subject, we quote here only her statement as to the special character of university studies in Germany and the requirements for admission to the university:

In the German conception of the university stress is laid almost exclusively upon the word "scientific," which in this connection always refers to pure science. The applied sciences are provided for in special institutions, such as the "Technische Hochschule," coordinate in rank with the university, or the "Handelshochschule," the "Bergakademie," the "Forstakademie," and others. A regular professional training is not given at the university except in what are called the learned professions—those of the clergyman, the lawyer, the physician, and the professor in the "higher" (secondary) schools. * * *

This extreme accentuation of the scientific tendencies of the German university has also excluded from it, in the course of time, all that concerns undergraduate work. Undergraduate studies are pursued in the "Gymnasium," a secondary school with a nine years' course, which may be defined as a combination of the American high school and the undergraduate work of the American college, excepting, of course, Harvard and its equals. * * *

The final examination of all these institutions [secondary schools preparatory to the university], which is very severe, is called "Maturitäts-Examen;" and as far as the amount of knowledge is concerned, it may be compared, mutatis mutandis, to the B. A. of the average American college. Thus the German system makes the division between secondary and university instruction at the end, the American at the beginning, of the college period. A German who wants his son to acquire a thorough mental culture before entering business will send him not to the university, but to the gymnasium or one of its equivalents. Thus, in any comparison with the German university we must take into consideration the graduate work only of the institution which bears the same name in America.

As women were not admitted to the German gymnasia it was necessary, as soon as the prospect of admission to the universities was open to them, that provision should be made to prepare them for the opportunity. This has been done by private efforts, in respect to which Mrs. Genthe says:

In all cities of importance the professors of the gymnasium or the university will deliver, every winter, series of lectures for women, by means of which many an industrious student has been able to prepare herself even for university work. The associations of women teachers generally organize such courses in order to keep up with the progress of science; and students outside the association, if interested in the subjects of the lectures, may attend them on payment of a contribution to the expenses. Some of these courses have developed into a kind of regular school work, as in the case of the "Victoria Lyceum" in Berlin and the "Lyceum für Damen" in Leipzig, which may be very strongly recommended, in preference to the university lectures, to foreigners who wish to do some advanced work in German, in order to get a thorough knowledge of the language, without contemplating advanced scientific study. It has also been the custom for the more ambitious girls, after completing their course at the high school for girls, to enter a normal school, or engage in kindergarten work, or take a course at a teachers' college and acquire a diploma there, just for the sake of learning and without any intention of teaching.

Of course, these studies could never equal the regular discipline of the gymnasium; and many women earnestly desired better opportunities, especially those who went later to the university, and saw how much better the young men were prepared for their work. But as long as such students were few, the curriculum of the old gymnasium, with its excessive devotion to the dead languages, did not seem very desirable for girls in general. With the beginning of a more urgent demand for the admission of women to university privileges, the question of the gymnasia for girls, as will be seen presently, was also quickly taken up. At present an animated discussion is proceeding in Germany as to whether the old high schools for girls or the gymnasia plan is the better for the general education of women. It will probably end in a reform of the girls' high schools through the influence of "gymnasial" points of view. For those intending to study, numerous regular gymnasia have been already founded. Accordingly, the lack of opportunity for sufficient preparation will no longer stand in the way of German women desirous of higher education. After years of hardship and conflict, the last decade has brought just such a change of conditions as comes when, after a slowly lingering spring, a few days of sunshine and warm showers call forth all the fragrance and beauty of nature. Those of us who have taken part in the struggle are tempted to exclaim, with Ulrich von Hutten, the chevalier of the Reformation: "Die Geister erwachen, es ist eine Lust zu leben."

I know of a few cases in which girls have been allowed to take part in the courses of the boys' gymnasium in small towns where there has been no prospect of the foundation of a gymnasium for girls—an instructive instance of how history always follows the same laws under similar circumstances.

With respect to the actual admission of women to the German universities, Mrs. Genthe says:

The first proposal, when the claims of women to a university education could be no longer overlooked, was that a separate university should be established for

them. But universities are not founded as easily as elementary and high schools, and nobody could predict whether such an institution would pay its way. The German is never very hasty in making innovations, and in education especially he thinks a certain steadiness of progress the only wholesome condition for developing all the good that may result. So, in order that a trial might be made, there was no other course open than to admit to the studies pursued by men students those women who could not be dissuaded from their strange purpose; and so almost imperceptibly coeducation stole into the long-defended stronghold of masculine intelligence.

In the period to which reference has just been made—about ten or twenty years ago—it was not the fault of the German women if their representatives at the universities were but few, nor was it due to any narrow-mindedness on the part of their fathers or professors if the few courageous pioneers had not an easy time. On the contrary, the comparatively few women who made the attempt and succeeded in it in spite of their inferior preparatory education, rank, in the estimation of the other sex at least, as high as dozens of those who now find the doors of the temple of science open before them and simply walk in.

A careful observer will even judge that it was well that the reform should have developed thus gradually, instead of every concession being made fully and immediately. For those women who were not intellectually fit for the work, or who sought in it nothing but an interesting amusement or an opportunity of acquiring glory for their own little selves—types which will always appear when new interests begin to occupy people's minds, as long as access to the new openings is easy—were soon frightened away from the task, and left behind those only who were properly fitted for it. The chaff was separated from the wheat. It has often been said by the opponents of women's studies that of 100 who make the attempt perhaps not more than 25 reach the goal. That is not an argument against the higher education of women, but rather in its favor; for it proves that the danger of an overproduction of women graduates and of their rivalry with men who have to support families is only imaginary.

Besides, the cause of progress gains enormously when only the best of its advocates are left to plead for it, and this not by speeches and public meetings, but by the work they achieve and by their own personalities. Such an advocacy accomplishes more than the best organized propaganda. Only a few months ago a German university which has been especially opposed to coeducation was thrown open to women because a woman student there had done such admirable work that the professor with whom she had studied was anxious to obtain for his own laboratory the reputation gained by her discoveries. Accordingly, he did all he could to obtain from the faculty permission for her to be admitted to the Ph. D. examination, which she passed with credit. This method of overcoming the objections of the university authorities does honor to the sex. * * *

The first successful attempts to obtain for women access to the lecture rooms of German universities were made by the "Allgemeine deutsche Frauenverein," which was especially assisted by the activity of the female teachers. The German woman teacher was constantly feeling herself at a disadvantage in comparison with her male colleagues, who are the majority in Germany, since she had access to normal schools only, while they might choose between the normal school and the university. The normal school diploma entitles a man to undertake elementary and grammar grade work only. For higher grades he must have studied at a university also, and for gymnasium teaching he must have passed through the complete gymnasium-university curriculum. The women's normal schools of Germany have a higher standard than the men's. They are, so to speak, a combination of normal school and teachers' college; and it depends upon the courses chosen and the diploma received whether a student leaves the institution as an elementary or a high school teacher. In the case of the high schools a candidate for a post would have to compete against university graduates, mostly doctors of philosophy; and so her right to undertake higher teaching would be in most cases merely nominal.

Many complaints were made against this system, especially as it compelled the girls, in those years when they most needed to be under a woman's care, to work almost exclusively with men. For this reason the Teachers' Association of Göttingen tried to interest some of the professors of the university of that town in the question, and induced them in 1892 to deliver special courses of lectures, the "Wissenschaftliche Fortbildungskurse für Lehrerinnen," by means of which, for a period of two years, women teachers of high schools were enabled to receive a regular university training. The enterprise proved successful. A constantly increasing number of teachers attended the courses, and more and more professors took part in them. Gradually the latter found it a waste of time to give the

same lectures twice, so many of them simply invited the women students to attend their regular lectures. The Prussian minister Von Bosse adopted the idea, and established a state examination for these women—the so-called Oberlehrerinnen-Examen, for which continuous study for at least two years was required. About the same time the first German woman teacher succeeded in taking her Ph. D. degree at Heidelberg.

The difficulty in the extension of the privileges of women students now lies principally in the independent position of the German universities and their professors. These universities, although they are all controlled by the State, are absolutely free as far as concerns their internal affairs, such as teaching, organization, degrees, etc. Every German university represents a small republic within the State, where no sovereign or minister can enforce his will against the objections of the senate. The Government may propose changes, but the university may refuse them as often as it pleases. The slightest encroachment in this line has always been met by unanimous opposition. Even the almighty German policeman can not meddle with university affairs—science is free in Germany. Therefore, in the matter of the woman student, as well as in all other matters, everything depends upon the opinion of the faculty, sometimes even upon that of a single professor, and it appears as if the position of women in the universities will not be regulated by uniform principles until the last professor in the last university has been convinced of their rights and abilities.

As a rule the opposition is no longer very strong. American women, who, being strangers, have generally been allowed a little more liberty than the natives—for whom the professor would feel too great a responsibility—have done useful pioneer work in this respect by accustoming the professors to see women's faces in their audiences. Now and then one meets an exception in the person of a man who replies to a woman asking admission to his lectures by saying that his lecture room is not a marriage agency, or who assures his colleagues that he would rather resign than consent to the conferment of a degree upon a woman. But such men are beginning to form a very small minority, and every woman who honorably gains her degree is adding more weight to the right side of the scale. A woman can now obtain practically everything at a good German university—lectures, laboratory and seminar work, books, sometimes even students' special prices for tickets to theaters and concerts. Above all, she will receive the kindest assistance from the professors whenever she is found to be a serious worker.

One thing only she can not get—matriculation. She formally ranks simply as a "hearer" by special permission, although practically everybody will treat her as a regular student. It is a university law that only the "Maturität" certificate of a gymnasium or corresponding institution may open the way to academic citizenship on the part of native Germans; no entrance examination being allowed as an alternative. Even the most generously disposed professor can not change this law; and surely no true German, man or woman, would ever plead for a change in this respect, as it would lower the standard of the German university. On the contrary, the "Allgemeine deutsche Frauenverein," seeing that the universities were beginning to be interested in the education of women, has founded gymnasia for girls which, partly as a supplement to the work of the high schools for girls, partly as institutions exactly parallel to the boys' gymnasia, will enable the female student of the future to acquire her "Maturität" so that she need rank no longer as a second-rate student, even formally.

The consequences of this wise step have been quickly seen. The last year of the nineteenth century brought from the Grand Duke of Baden, who is perpetual "Rektor" (President) of the universities of his country, a decree allowing women presenting a "Maturität" certificate to be matriculated like other students. Thus the universities of Heidelberg and Freiburg have been really transformed into coeducational institutions; and the increasing number of their women students has shown the timeliness of this concession. The other universities, most of which now confer degrees upon women, in spite of their not being matriculated, are sure to follow this example in the not distant future. Practically everything has now been accomplished. Even the medical State examination has been opened to women; and the fact that most of the female candidates pass it with great credit has won for them more and more sympathy from their examiners as well as from their fellow-students. "The young women excel our young men," one of the foremost professors of Heidelberg said to me, in a tone of high appreciation.

A field in which much still remains to be done is that of providing for the material welfare of German women students. While in past centuries hundreds and hundreds of donations were made for the benefit of the young men at the universities, it is not quite twenty years since there was opened the first opportu-

nity to make such contributions in aid of women. The old *stipendia* (fellowships) are prohibited by their charters from being shared by women. This is all the more deplorable because women generally have to pursue their studies under more stringent financial limitations than men.

Not only is there among the students a large number of girls with small means, because the daughters of well-to-do families are not often willing to give up the comfort of a pleasant home for the lonely cell of the true scholar, but the expense of living in a strange city is considerably greater for a young woman than for a man. A respectable girl must live in a respectable house, with a respectable family, and must have her meals at a respectable place. Such lodgings are always more expensive than the modest room which her male fellow-student may hire at a shopkeeper's or a shoemaker's, without suffering in general estimation for it. Few women, again, are fortunate enough to be able to earn their living while studying hard for a doctor's degree.

There are, however, some funds for the benefit of female students. The "Allgemeine deutsche Frauenverein" has a few bursaries to bestow on medical students, and the "Allgemeine deutsche Lehrerinnenverein" awards some to members who prepare for the "Oberlehrerinnen-Examen." But the competition for these stipendia is very keen, and most of them are allotted several years in advance. Very recently an association has been founded in Berlin which, although bearing the interminable name of "Verein zur Gewährung zinsfreier Darlehen an studierende Frauen," merits the cooperation of everybody interested in the education of women. The funds of this association are used for helping women students over periods of financial difficulty—especially when money is lacking to pay the high examination fees—by lending them the sum which they need, without interest, and for an indefinite time, to be paid back at an annual rate of 5 per cent when they have completed their studies and are earning their living.

As to the position of a young woman in a German university Mrs. Genthe says:

The personal life of a girl student in Germany is not a very easy one. She is a new phenomenon in the halls of the university; no social code has yet been established to regulate her own behavior or her treatment by others; and she does not seem as yet to have fully made good her right to be here. She has now to make her position permanent, and much either for success or for failure will depend upon the tact and personality of each member of the first set of girl students. As a rule, the young German is not accustomed to meet, outside of the traditional forms of society, a lady who is not his relative. He has been taught how to treat her as a cavalier only, and sometimes feels rather awkward in the position of comrade. He realizes that gallantry is out of place in the laboratory, and yet he is not quite sure whether she will not expect it here as she would in a drawing-room. Hence she will generally have to make her fellow-students what she wants them to be.

Education of Filipinos in the United States.—XXIII. Relation of educational work to that of other departments.—XXIV. Educational policy.—XXV. Educational outlook.

I.—INTRODUCTION.

Before the American occupation of the Philippine Islands there was a plan of education under the Spanish rule which, if carried out properly, would have been productive of substantial results in training the Filipinos.[1] The system included the establishment throughout the archipelago of schools for primary instruction, as ordered in the royal decree of December 20, 1863, and also the founding of higher schools for secondary instruction, special schools, normal institutions, and colleges. The growth of this system, however, was hardly a normal one, in which the primary and secondary schools were first thoroughly established and the higher institutions and colleges founded later to receive the graduates of the elementary schools; for as early as 1611, twenty-five years before the beginning of our oldest university—Harvard—the University of Santo Tomás was founded; and other colleges were likewise established long before there was even a plan for a general system of primary and seconday instruction. With these higher institutions in existence so much earlier than the great majority of lower schools—their necessary predecessors—satisfactory results were impossible. The natural, and indeed, the real tendency was to deny the masses even a good elementary education and to center efforts upon the few who were hurried to the college or university. The result of this policy has been that a few persons have stood out prominently as educated Filipinos, while the great mass of the people have either not been educated at all or only up to a certain point, namely, the acquisition of the mechanical processes of reading and writing. It is needless to say that these higher institutions did not have a standard equal to that of our colleges of to-day, yet they offered comparatively advanced courses which could have been pursued advantageously if the children in general could have secured the necessary preparation in primary and secondary schools.

The early work of the Jesuits in training the Filipinos was commendable, and along right lines in furnishing a common school education. It would have been productive of permanently good results if this order had not been supplanted by the local padres, under whose direction the common branches suffered through lack of attention.

[1] For full information concerning early education in the Philippines see Vols. I and II of the Report of the First Philippine Commission, and also the Report of the United States Commissioner of Education for 1897-98, together with such histories in Philippine matters as Foreman's Historical Information, *passim*.

A system of education was established in the Philippines by the royal decree, mentioned above, under date December 20, 1863, which, in brief, provided for the establishment of a normal school in Manila for training teachers, and of separate primary schools for both males and females in the various towns. Instruction was to be free to those unable to pay. The schools were classified as:

(1) Entrance (Entrada).
(2) Promotion (Ascenso).
(3) Second class finishing schools (Término de segunda clase).
(4) First class finishing schools (Término de primera clase).

The subjects taught in the primary schools comprised:

(1) Christian doctrine and principles of morality and sacred history suitable for children.
(2) Reading.
(3) Writing.
(4) Practical instruction in Spanish, including grammar and orthography.
(5) Principles of arithmetic, comprising the four fundamental operations, common fractions, decimal fractions, and instruction in the metric system, with its equivalents in ordinary weights and measures.
(6) Instruction in general geography and Spanish history.
(7) Instruction in practical agriculture as applied to the products of the country.
(8) Rules of deportment.
(9) Vocal music.

Religious instruction was first in the thought of those who had the schools in charge. In fact in many districts such was the only instruction given, and this was imparted in the local native dialect. The following quotations taken from the first Philippine Commissioners' Report show how slightly this curriculum was followed by the native teachers:

Ability to read and write a little of the local native language was comparatively common. * * * Instruction in geography was extremely superficial. * * * The only history ever taught was that of Spain, and that under conventional censorship. The history of other nations was a closed book to the average Filipino. * * * Vocal music was not taught, and the institution in practical agriculture was a sorry farce. * * * Girls were not given instruction in geography, history, or agriculture, but in place of these subjects were supposed to receive instruction in employments suitable to their sex.

The Spanish regulations provided that there should be one male and one female primary school-teacher for each 5,000 inhabitants. It is clearly shown in the Report of the Philippine Commission that even this inadequate provision was never carried out. "Taking the entire population at 8,000,000, we find that there is but one teacher to each 4,179 inhabitants." There were no schoolhouses, no modern furniture, and until the Americans came there were no good text-books. The schools were held in residences of the teachers or in buildings rented by the municipalities and used by the principals as dwellings. In some of the schools there were wooden benches and tables, but it was not at all unusual to find a school without any seats for the pupils.

Very little of the instruction in the schools outside a certain few towns was in Spanish, since the majority of the teachers did not understand this language. Under the Spanish régime no adequate provision was made for the training of teachers; for, although included in this decree of 1863, the plan was not carried out. In the larger towns the four elementary arithmetical processes were attempted, and in a few towns the geography was used as a reading book. The girls were taught embroidery and needlework. From the start the schools were entirely under the supervision of the religious orders, and there was no organized department of public instruction.

The little school instruction the average Filipino has had has not tended to broaden his intelligence, and has hardly developed independent thought and action. One could observe in the schools a tendency on the part of the pupils to give back like phonographs what they had heard or read and memorized without seeming to have thought for themselves. As a rule, they possess unusual mechanical skill, and they excel in writing and drawing. The Spaniards made very little use of this peculiar capacity.

When the Spaniards came here we have it on good authority that the Philippine Islanders could read and write their own languages. At the present time, after three hundred years, the mass of the people have been taught so mechanically that they can hardly do more than this. The Spanish minister for the colonies in a report made on December 5, 1870, points out that by the process of absorption by the religious orders education became concentrated in their hands. He says, "While every acknowledgment should be made of their services in earlier times, their narrow exclusively religious system of education and their imperviousness to modern or external ideas and influences, which every day become more and more evident, rendered secularization of instruction necessary."

It may be said here that in the average provincial school at first a kind of religious primer has been read in the native language, and later Christian doctrine has been taught. The text-books found in the schools were crude and embraced a considerable amount of religious instruction. The pupils were obliged tediously to learn by heart the exact words of the text-book. The teacher, with book in his hand, heard one pupil at a time; the others at the same time studied aloud, doing their best, it would seem, to drown out the voices of the teacher and the pupil reciting. The teacher asked only the questions that were written down in the book. To the visitor it would seem as if instruction, as carried on by the native teachers, was tediously mechanical, noisy, and hardly effective or economical. The teachers did not have fixed daily programmes, and so the school hours were not well distributed. On the average those who attended schools did so from their seventh to their tenth year. The teachers were classified according to the importance of the towns where they served. Compensation was so inadequate that the teacher's calling had come to be looked down upon. There were no courses for those engaged in teaching. As far as I am able to judge there was no professional enthusiasm. Appointments were governed too much by the terms of service of the teacher, while the quality of this service was not considered at all. It is asserted by practical parties that in 1897 there were in these islands 2,167 public schools. In judging the effectiveness of these schools it must be remembered that a school under the Spanish régime was a strictly sectarian ungraded school, with no prescribed courses and no definite standards for each year, under the charge of duly certified, but hardly professionally trained or progressive teachers, and housed in unsuitable and unsanitary buildings.

The act of 1863 provided for schools for girls, but this provision, together with others of the same act, never became a reality. Up to the year 1870, a significant fact in the history of education of any people, boys alone were considered; and not until then were definite steps taken toward educating girls.

In all this work there was lacking a centralized system; there was no body of information. Manila and Mindanao were subcenters, but independent of each other, and in no close connection with their respective fields.

Hence, under Spanish rule, the work of education lacked system, wanted completeness, and in great part lay dormant. A hopeful beginning in the right direction was taken under the Jesuitic rule, but, as has been said, it was short lived; all soon relapsed into the previous condition of incompleteness and insufficiency. And thus matters remained until the awakening and, indeed, renascence, which, although late, promises to be complete.

Education to-day as a science, as we know, has received the greatest contributions from the Anglo-Saxon, Teutonic, Romance (except Spanish), and Slavic elements: and in the life of these different peoples there came an awakening at a certain crisis which was in the nature of a revolution in the field of education, and which resulted in renewed effort, additional vigor, broader interpretation, and new ideas. And the outcome of all this is the present system known to us. Such a renascence took place early after the Angles and the Saxons combined: again, much later, when Germany became in a measure united after the peace of Westphalia: similarly, in the reconstruction period after our own civil war: and, again, after the Franco-Prussian struggle in 1870. This brief reference serves, perhaps, to illustrate my point: The history of education in any country, represented graphically, would show certain sudden departures from previous conditions, and these momentary changes would be found to coincide with events of great political import. Spain experienced such at various times, but, in my opinion, it remained for the Spanish-American war to bring about a thorough awakening to present needs and a new interest in matters educational in the Philippine Islands.

II.—MILITARY GOVERNMENT.

The transitional period from the old Spanish methods to the present American school system was that of the military government, under which educational matters received unexpectedly careful attention and experienced the first influences of the system working at the present time. Naturally these influences were weak and the Spanish system, particularly the text-books of that system, remained in large part. Yet the step from past to present methods can be traced in this interval of military rule; some American text-books were introduced and soldiers were detailed to teach in various towns. There originated a general conviction that English should be taught directly without the medium of Spanish and immediately; recommendations for trained teachers of English were made; the children, in fact, were given an introduction to the English language, and the people in part acquainted with the idea of American schools.

General Otis was very much interested in education, and it was his desire that the army officers open up as many schools as possible. He selected and ordered the text-books in use during this time. Several of the district commanders appointed officers to act as superintendents of schools. Among these were many chaplains. In a few instances these attempts at supervision of schools were successful. Capt. John G. Ballance, who had charge of schools in northern Luzon, worked with enthusiasm and intelligence. As a result 120 schools were opened and pretty well equipped with stationery and supplies. He found it a difficult matter to get teachers for English instruction, and soldiers were detailed for that purpose.

In the island of Cebu there was considerable activity in school matters, Colonel McClernand himself paying personal attention to the subject of education. The same fact was true in the island of Mindanao, General Kobbé giving a great deal of attention to the establishment of schools.

In general it may be said that education throughout the islands was in a chaotic condition. The schools that had been established were poor. There was no attempt at gradation of pupils, and the work, lacking proper supervision, was aimless. The reports on schools by the district commanders were incomplete, six out of the fifteen not making any report. According to these reports about 1,000 schools were in operation during the military rule. Where these schools were reopened the equipment was entirely inadequate, consisting ordinarily of old books used in Spanish times. Up to September 1, 1900, approximately $41,000 were expended for stationery and text-books ordered by the military governor, most of which latter were in Spanish. A considerable portion of this amount was used in Manila alone. The following is a complete list of supplies furnished to the

schools through commanding officers, together with a statement of their distribution:

Books received from various sources.

	Ordered from United States.	Ordered, not received.	Received from United States.	Received from Spanish Government.	Total received.
Spanish Arithmetics				1,714	1,714
Charts, sets				240	240
Divino Pastor				17,320	17,320
Higiénica				3,140	3,140

Includes part of those sent by Superintendent Anderson.

Outside of Manila very little was done in the way of English instruction. The commanding officers were unanimous in urging such, and in asking for English teachers, and frequently detailed soldiers for such work. To give one instance, Brigadier-General Young asked for 75 English teachers for the First district, Department of Northern Luzon. Similarly, other commanding officers saw the need for teachers, and asked that these be sent, as one of the chief aids in solving the problem on their hands. To use the words of General MacArthur in recommending that a large amount of money be expended for school purposes: "This appropriation is recommended primarily and exclusively as an adjunct to military operations calculated to pacify the people, and to procure and expedite the restoration of tranquillity throughout the archipelago." Many of the officers were early convinced of the superior value of the teacher to the soldier in certain parts of the field, and felt that the work of the latter was, although of course necessary, merely preliminary to that of the former. The natives were reported as eager to learn English, and the use of Spanish or the dialects was generally deprecated by officers reporting. They felt that teaching through the medium of Spanish was not only not a necessity but an impediment. Buildings of some sort were generally reported to be available but, except in a few cases, were said to be unsuitable. Throughout the islands the practice prevailed largely of allowing the principal and his family to live in the school building—a condition of affairs condemned by those reporting it. Often it was reported that the natives could do nothing for themselves, but yet in many cases they showed their willingness to provide schoolhouses. The salaries reported were low, but higher than those stated in the table in the report of the First Philippine Commission. Probably $12 Mexican per month for women and $20 Mexican per month for men would be a fair average. Books and stationery and English teachers had to be furnished by the Government. It was early evident that financial aid would have to be furnished to certain localities too poor to pay even the small salaries of the native teachers, until the land tax should become available.

The Manila schools were at first under the charge of Chaplain W. D. McKinnon, United States Army, who transferred his duties to Mr. George P. Anderson on June 1, 1899. Seven schools were organized about September 1, 1898. Spanish methods were continued, each school having one teacher in English. After June, 1899, there were 39 schools, with enrollment of 3,742. Besides public-school supervision the superintendent had oversight of the Ateneo and the high normal school, in both of which the instruction was by Jesuit priests; also, the girls' municipal school, under the direction of a religious sisterhood. All these institutions received allotments of insular funds.

The following statistics relate to the year ending June 30, 1900, for the city of Manila:

Filipino teachers	86
Jesuit professors	28
Dominican sisters	11
English teachers	24
Total	149

Daily attendance (average), 4,500.

Last year the city schools were increased in number, and the attendance was largely increased. A normal school was established, disconnected from religious supervision, and the Ateneo and Jesuits' normal school no longer received a subsidy from the insular treasury. By an act of the Philippine Commission, instruction in religion of any kind or creed was prohibited in public schools, and the removal of all religious emblems and pictures was required; but it was provided that priests and ministers could give instruction for one-half hour, outside official hours, three times a week, to those pupils who desired it.

The superintendent of city schools pointed out the very great lack of suitable buildings and urged that they be erected. Five night schools were established as an experiment, and were so successful that additional ones were organized shortly afterwards under the civil government. The school attendance during this period in the city of Manila reached 5,123.

Capt. Albert Todd, who was in temporary charge of public instruction under the military government, from whose report were obtained the salient facts of the educational situation under the American military rule, ends his report with the following recommendations:

(1) That a comprehensive modern school system for the teaching of elementary English be inaugurated at the earliest possible moment, and that attendance be made compulsory wherever practicable.

(2) That industrial schools for manual training be established as soon as fair knowledge of English has been acquired.

(3) That all of the schools under government control be conducted in the English language so far as in any way practicable, and that the use of Spanish or the dialects be only for a period of transition.

(4) That English teachers well trained in primary instruction be brought over from the United States in sufficient numbers to take charge of the schools of the larger towns at least.

(5) That a well-equipped normal school be established for instructing natives to become teachers of English.

(6) That in the larger towns, a portion, at least, of the schoolhouses be modern structures, plainly but well and properly equipped.

(7) That the schools supported by the government be absolutely divorced from the church. If the natives desire schools in which religious instruction is to be given, that they furnish the entire support for the same from private sources, but attendance at these latter schools shall not excuse the children from attendance at the public schools where English is taught. In addition, the parochial church schools, if such are maintained, shall be required to be equal in character of general instruction to the public schools.

Some of the comments of individual officers reporting were helpful and suggestive. Gen. J. H. Smith, in command of the department of the Visayas, said:

Education in the islands, to my idea, ought to be free so far as cost is involved, and compulsory so far as attendance is concerned. Education, to be of any value in securing advancement of the Filipino race, must be brought within the reach of the laboring classes and the poor. In many of the towns of Negros, at the

request of the superintendent of public instruction, soldiers have been detailed as instructors in English. Some of them succeeded fairly well, but to make substantial advancement teachers of experience are required.

Col. E. Rice, in command of the island of Panay, has been much interested in education. He reported that 210 schools had been established. "There are 10,803 pupils in attendance, but the number of children of school age in these towns is over 24,361." This showed that education should be compulsory. It may be said in passing that considerably less than one-half of the children of school age in these islands were attending even the very unsatisfactory schools that existed at the time. Colonel Rice reported:

Apparently there are sufficient teachers of all subjects save that of English; that is, sufficient for the rudimentary education which up to this time has been deemed all-sufficient. A higher grade for teachers, however, should be required later on. * * * The people, save among a very limited few, have very little idea of what education consists, and no idea as to the adoption of the methods to obtain it. After their long experience with ways that are dark and devious, well-built and well-equipped schools will be a benison to them. Appropriation for schools is recommended in order to place them in certain places where conditions prevailing will not admit of schools being established by local authorities therein. * * * Model school buildings thoroughly equipped with books, pictures, maps, globes, etc., which have so long been denied them, will have an influence not securable by force of arms. The school buildings should be models, both in interior and exterior, the stamp of Americanism on each town.

First Lieutenant Hixon, of Balanga, made a wise recommendation:

That the schoolhouses, convents, churches, and other such buildings occupied partly or wholly by the military forces be vacated and turned over to the people for their proper use at the earliest practicable moment. Such action would go far toward restoring the people's confidence in the good intentions of the United States and counteracting the bad effects of rumors circulated by vicious persons with design to make it appear that our Government desires to deprive the Filipinos of their churches and schools.

Captain Echols made a decided contribution to the subject of the qualifications of teachers of English. He says:

To teach English to the natives a knowledge of Spanish or Tagalog is not necessary. I at one time had charge of 4,000 American Indians, with six Government boarding schools. Not a child could speak a word of English on entering the schools, and in three months from entrance these children could speak it fairly well, and this was accomplished by teachers utterly unfamiliar with any one of the numerous Indian dialects.

As to the need of education and the intelligence of the children, the following statement of First Lieut. Russell G. Langdon represented the opinion of the majority of officers:

It would seem that the problem of amalgamation of the natives of the islands as American citizens can best be solved by promptly and properly taking hold of the work of educating the young. After close observation of the children of this town and elsewhere around here, I am of the opinion that the children between the ages of 6 and 16 are very bright and apt at acquiring languages, even though their intellectual faculties may become comparatively inferior as they become adults.

III.—BEGINNINGS OF THE PRESENT WORK.

Immediately upon his arrival in the islands the general superintendent began a study of the educational situation in Manila and vicinity. By personal observation and consultation and correspondence with army officers, presidentes, and others in a position to know, he endeavored to learn the exact situation and the general opinion as to the educational policy to be pursued. As he met a great diversity of opinions, owing in many cases, he feels sure, to the different social conditions existing in the archipelago, and as he had formulated in his own mind the educational problems to be solved, he came to believe that on some matters

judgment must be suspended until he himself should make trips of inspection throughout the islands; and, furthermore, he learned to recognize a new force in the familiar axiom about going slowly.

On September 1, 1900, he assumed the duties of general superintendent of education and acted at the same time as superintendent of the Manila schools. During the early months in his present position he gave the larger part of his time to the schools of Manila, visiting them frequently and making a study of the Spanish methods then still in vogue.

Shortly after entering upon his present duties, under date of November 1, 1900, he submitted to the commission the following on the educational outlook at the time, with certain definite recommendations:

A modified American public school system.—A well directed system of education will prove one of the most forceful agencies for elevating the Philippines materially, socially, and morally, and preparing them for self-government. Every effort should be made to adapt public school provisions to the conditions existing in the different islands. According to American standards the ideal school is a nonsectarian graded school with a prescribed course and definite standards for each year, under charge of trained teachers, and housed in suitable buildings, but modifications of this ideal must be made to bring the means of instruction within the reach of the entire child population. In the larger towns there must be six grades or classes. In some of the smaller towns schools will have to be organized under conditions which will preclude an immediate compliance with the standard to be set for the larger towns. It may be necessary in the sparsely settled portions of the country for teachers to journey from barrio to barrio, as is now done in Norway and Sweden. Common schools should be established everywhere, and, as a minimum standard, every child should be taught the reading and writing of the English language and arithmetic. It is to be hoped that at the same time many of the children will have acquired a good knowledge of the history of these islands, Spain, and the United States, a knowledge of geography, a fair acquaintance with nature, a training in hygiene and in the use of their hands. Educational practice is going to be greatly different from that common to American education. Those old time-honored lessons called "object lessons," which have been abolished altogether from the school course of many of our American towns, should be introduced into the Philippine schools, later to be superseded by a series of lessons known under various names, such as manual work, illustrated lessons, conversational lessons, constructive lessons, and kindergarten. Parallel with the text-books which tell about things should be the teaching from the things themselves. Work in nature study should be used to counteract the bookish tendency noticeable in the schools.

School organization.—The peculiar conditions existing here demand a centralized control of the public-school system. There should be careful State supervision of all public schools. Insular or provincial superintendents will be needed to assist the general superintendent. Town and city systems of superintendents will hardly be possible for some time. District superintendents, corresponding to our county system of supervisors, are needed at first. In the centralized system of school organization, which is best fitted for the archipelago, the general superintendent will find the district superintendency a most efficient channel in reaching the people of these islands and an opportunity for learning the needs of the various parts of the archipelago. The duties of these men would be to see that schools are established and proper buildings constructed, to regulate courses of study, to inspect schools regularly, to pass upon the qualifications of teachers, and to collect and transmit school statistics to the central school authorities. It is essential to the highest success of the school system that these assistant school superintendents shall be first-class men, and that they shall possess business ability as well as professional skill. Owing to the great diversity of conditions, deputy superintendents of skill, adaptability, and experience are needed. I have the honor to recommend that there be secured an assistant superintendent for each of the fifteen departments.

Local advisory boards.—The best way to insure the success of the schools throughout the archipelago is to enlist in every possible way the interest of local authorities. There should be a visiting and advisory committee appointed in every town, at present by the commanding officer and later by the provincial superintendent of public instruction, after consulting the municipal authorities. This visiting and advisory board should be charged with the duty of the general

supervision of the schools and the obligation of reporting monthly to the department superintendent their condition and the attendance of the pupils. It should advise the central authority as to the location of schools. Of course, at first local control may be impossible in some places, in others it may be highly developed. This, at least, is true—local effort should be stimulated.

Language basis of instruction.—It is hardly practicable to make native languages the basis of education, for it would necessitate the setting of a large corps of translators at work, putting not merely school primers but large numbers of books of every sort into all of the principal dialects. Most of the commanding officers in their reports state that "no instruction in native dialects is advisable," and also that there is no need of perpetuating the Spanish, for only a small proportion of the native population understands much Spanish. English is desired by the natives, and undoubtedly it should be the language basis of public-school work, but it should be introduced gradually, and no active steps should be made to exterminate any dialect. It is desirable that teachers sent out into the provinces should learn the dialects of the people with whom they are associated. The text-books which are now in stock have been selected largely on the principle that what is suitable for Manila is all right for other portions of the archipelago. Spanish editions of Wentworth's Arithmetic, Barnes' History of the United States, and Fry's Geography have been ordered in large quantities. These text-books in Spanish, which were ordered by the Military Department of Education, and are now being distributed to the schools, are unsuitable, as they tend to perpetuate the Spanish language and to delay the introduction of English as a basis of instruction. This supply is rapidly being exhausted, and I have the honor to recommend that very soon English arithmetics, histories, and geographies be ordered. It may be that some Spanish will have to be used at first, but there seems no good reason why it should be made the basis of instruction. It will be found, I believe, as time goes on that the best plan is to introduce gradually the English language all over the islands, and at the same time, so as to keep alive a proper sentiment, side by side with it, introduce as much as possible of our own literature into the native languages. If English is to be taught, a large corps of teachers is needed. Soldiers have been detailed, but some of the officers write that they have no competent soldiers to detail. I have the honor to recommend that some general law be made providing for English instruction throughout the islands. Manila should not receive the lion's share of the general appropriation. It should be possible for the general superintendent of education to furnish English instructors upon the requisition of any commanding officer.

Compulsory education.—Primary instruction should be obligatory for all children between the ages of 6 and 12 years. Parents who fail to conform should be compelled to do so by fines. This will be hard to carry out for some time yet, but in the larger cities great effort should be made to enforce such attendance laws. It will always be extremely difficult in some places, owing to the sparse and isolated population.

Religious instruction.—I have already had the honor to submit to the Commission, in a letter dated August 30, 1900, a consideration of the subject of religious instruction. In this letter I recommended that the schools supported on public funds should be nonsectarian.

Support of schools.—In the main the schools of a community should be supported by local taxation. Where this is not possible at first, appropriations should be made from the general treasury. For some time text-books, stationery, and teachers of English should be furnished to all of the municipalities. Financial aid should be in proportion to the number of pupils and their average attendance. In furnishing means of instruction the more prominent towns should be considered first, and the benefits extended as experience is gained where supervision can be exercised. The ultimate aim should be that each village shall support its own schools. The general government will always have to contribute to the maintenance of schools in localities where public sentiment and the poverty of the people would prevent their establishment under other conditions, and in localities that are frequently impoverished by the fact that their wealth flows into larger population centers to support nonresident proprietors. I believe decidedly that local taxation is necessary to maintain a proper public sentiment in the schools. I believe also that 25 per cent of the entire local taxation of the municipality should be devoted to public instruction. The procedure of our own States may be of interest. New Jersey raises a State tax for education amounting to $5 per head for each person in the State between 5 and 18 years; Pennsylvania, through its legislature, must raise at least $1,000,000, but it actually appropriates $5,500,000; Indiana raises 11 cents, and Kentucky 22 cents on each $100 of taxable property, and Michigan 10 cents.

School equipment.—I have already made recommendations concerning the need and wisdom of providing modern school buildings. There is great need also of school desks and school apparatus. At present, very little supervision of pupils' work is possible. The teacher can not pass behind the seats and see the pupils' work. Manual training in an elementary way should be introduced into the lowest grades; some of the so-called kindergarten methods are suitable for the children here, but no manual occupations can be carried on with the present school furniture. The economy of the teacher's time is one of the chief advantages of modern seats and desks. From the standpoint of health alone, provision in each schoolroom should be made for a desk and a suitable seat. At present, the little ones have to sit on benches without backs, and write on narrow desks. Such attitudes as they must assume are injurious to their healthy physical development, and lead to incorrect positions of the body, head, hand, and eye. To furnish a concrete instance of what the American graded school is, model school furniture should be purchased and model methods of teaching and school discipline, with the strict following of the programmes and systematic gradation of pupils, introduced.

Normal schools.—Here in Manila at the beginning of the next school year a normal school, founded upon the American plan, should be opened. Connected with this institution there should be an elementary school. This elementary school should serve as a practice school for the more advanced normal students, and in its material equipment and its teaching force it should be a model school. It should be possible for the students to enter this normal school from the provinces as well as from Manila. It may be necessary to arrange for a preparatory department where instruction in English may be given. Later, at some four or five strategic educational points, other normal schools will be needed. Possibly certain cities, in order to secure one, will donate some part of the cost of establishment.

Military school.—There is now a flourishing nautical school. In time military schools should be established.

Agricultural school.—That the Filipinos may be taught those things for which they have a capacity, i. e., industrial and mechanical pursuits, there should be established throughout the Philippine Islands schools of agriculture. It will be necessary to send to our agricultural colleges for instructors. These must be men who will study the agricultural conditions here, and teach practically the best means of cultivating and improving the products peculiar to this archipelago. These instructors should follow the plan of work of Hampton and Tuskegee. Especially should it be possible for students to pay their way through.

Trade schools.—Besides the schools of agriculture, there should be trade and commercial schools. Blacksmithing, tinsmithing, carpentering, cabinetmaking, painting, etc., should all be taught. In these establishments practical work should be done, and at the same time opportunity should be furnished the students to support themselves by their work. Work could be taken in from outside and done under competent supervision. Native and Japanese teachers could probably be found among the workmen now engaged at the depot quartermaster's to assist in this work. Americans would be needed as heads of these schools.

Destitute and criminal children.—Eventually orphanages, reform schools, schools for the deaf and dumb and blind, supported by public funds, should be established.

Examinations for teachers.—A form of examination for teachers will be introduced as soon as the schools are established on a firm basis. That many of the native teachers are not qualified to teach can hardly be doubted, but every one should be allowed to demonstrate his ability in the schoolroom itself, his removal being an important matter.

Certain principles have been touched upon in outlining the educational system for the Philippine Islands. They are:

First. The system should be a centralized one. There should be a general superintendent of education and as many assistant superintendents as there are departments.

Second. There should be a system of local advisory boards.

Third. Text-books, charts, maps and globes, stationery, and English teachers should be furnished to municipalities by the general government.

Fourth. As far as possible, the school buildings and native teachers should be supported by local taxation. For a time, some system of financial aid by the government should be inaugurated in the districts.

Fifth. All schools supported by public funds should be free and nonsectarian.

Sixth. Emphasis must be placed upon the elementary education of the masses.

Seventh. The education must be of a practical utilitarian character. What is attempted in the way of instruction must be done thoroughly, and the aim must

be in part to see that children acquire in school considerable skill in using their hands and their heads in earning a livelihood.

Eighth. Normal, agricultural, commercial, technical, and special schools must receive early attention.

Ninth. Native teachers must be paid more, and in every way possible teaching must be made a desirable calling. Native teachers in office must be taught a broader and more thorough conception of education. To this end teachers' courses, books, etc., must be provided. Teachers must be examined, certified, and classified.

Tenth. Modern school buildings must be constructed and equipped with modern school furniture and modern school apparatus. The immediate needs are:

1. Text-books in English.
2. Teachers in English.
3. Assistant superintendents.
4. School buildings.
5. Some temporary system of financial aid.
6. One normal school, one agricultural school, one manual-training school, one commercial school, each to serve as a pattern for other schools to be established later.

In conclusion, the present educational system needs to be modernized and secularized. There should be a gradual extension of a modified American school system throughout the whole archipelago. We should not be content until the entire archipelago is provided with an efficient system of public schools, organized as far as possible on the American plan and conducted in accordance with American methods.

Immediately after making these recommendations he was directed by the Commission to submit them in the form of a bill, and accordingly drafted the following:

AN ACT establishing a system of education in the Philippine Islands and appropriating one million five hundred and sixty thousand dollars ($1,560,000), in the money of the United States, for the maintenance thereof in the year 1901.

SECTION 1. The general superintendent of education shall exercise a general supervision over all schools and a more special direction over schools supported by public funds.

SEC. 2. District superintendents shall be appointed to assist the general superintendent of education.

SEC. 3. The general superintendent of education is hereby given authority to appoint, subject to the approval of the military governor, the said district superintendents authorized in section 2 of this act, one for each of the eighteen existing military districts of the archipelago where supervision is practicable.

SEC. 4. A district superintendent of schools shall receive an annual salary of not less than two thousand dollars ($2,000) and not more than two thousand and five hundred dollars ($2,500) and his necessary traveling expenses while in the discharge of his official duties. The exact salary of the various district superintendents shall be fixed by the general superintendent of education in accordance with the importance of their respective districts, subject to the limitations hereinbefore specified.

SEC. 5. The sum of forty thousand dollars ($40,000), in the money of the United States, is hereby appropriated to pay the salaries of the district superintendents for the year 1901.

SEC. 6. In the establishment of civil government in the municipalities of these islands provision shall be made in each case for a local advisory school board.

SEC. 7. The presidente shall be ex officio a member and chairman of said school board, which shall consist of the presidente and not less than four and not more than eight members. The district superintendent shall appoint for a term of two years all the other members of said school board, and prior to appointment of any district superintendent, or in event of a vacancy in the office thereof, the duty of the appointment of the aforesaid member of said board shall devolve upon the district commander, or such other officer as he may detail for this duty. On the occasion of their first appointment the term of office of one-half the members of said board shall be one year.

SEC. 8. The members of said school board may be removed at any time by the district superintendent, subject to the approval of the district commander and the general superintendent of education.

SEC. 9. It shall be the duty of said school board to visit from time to time all schools supported by the municipality; to report bimonthly to the general superintendent of education their condition and the attendance of the pupils; to distribute to the schools text-books and other supplies; to decide and make suggestions

concerning such matters as may be referred to it by the department of education, and to do all in its power to advance the interests of education in the municipality to which it belongs.

SEC. 10. The English language shall be made, gradually, the basis of all public-school instruction. To this end provision shall be made by law for English instruction in all schools supported by public funds.

SEC. 11. As far as practicable, soldiers shall be detailed as instructors of English until such time as they may be replaced by trained teachers.

SEC. 12. Authority is hereby given to the general superintendent of education to secure three hundred (300) trained teachers from the United States, at monthly salaries of not less than seventy-five dollars ($75) nor more than one hundred dollars ($100), in the money of the United States, the exact salary of each individual teacher to be fixed by the general superintendent of education in accordance with the importance of the position held, subject to the limitations hereinbefore specified. The necessary traveling expenses of said teachers from their homes to Manila shall be paid by the Government.

SEC. 13. The sum of three hundred thousand dollars ($300,000), in the money of the United States, is hereby appropriated to cover the cost of English instruction, outside of Manila, for the year 1901.

SEC. 14. The sum of one hundred thousand dollars ($100,000), in the money of the United States, is hereby appropriated for the purchase of English text-books and other school supplies, to cover the period from January 1 to July 1, 1901.

SEC. 15. In the establishment of civil government in the municipalities provision shall be made for the enactment and enforcement of school-attendance regulations.

SEC. 16. Beginning with January 1, 1901, the following shall become a law for the city of Manila:

All boys and girls between the ages of six and twelve years, inclusive, must attend school, either public or private, during the official school year. Parents or guardians failing to send their children to school in compliance with this section will be liable to a fine of not less than two dollars ($2) Mexican, and not more than five dollars ($5) Mexican.

SEC. 17. The subjects for study for the elementary schools may embrace reading, language, writing, arithmetic, geography, history, hygiene, gymnastics, music, drawing, sewing, and nature studies.

SEC. 18. No religious denomination shall have the right to teach its particular faith in schools partly or wholly supported by public funds.

SEC. 19. A system of financial aid by the government shall be established for the maintenance of schools in municipalities where there is satisfactory evidence that their poverty would otherwise prevent the establishment of schools.

SEC. 20. Application for the aid authorized in the next preceding section of this act must be made through military channels. The following data, based upon the personal inspection of some army officer, shall be furnished:

Estimated population of the municipality; estimated children of school age, viz, six to twelve years, inclusive; number enrolled at time of inspection; average attendance at time of inspection; itemized account of expenses, to include salaries of teachers, rents, and other incidental expenses; amount of internal revenue paid into the general treasury; amount raised by general subscription for educational purposes.

SEC. 21. The sum of fifty thousand dollars ($50,000), in the money of the United States, is hereby appropriated for the year 1901 and assigned to the department of education for allotment, subject to the approval of the military governor, to towns shown to be in need of aid, with the proviso that it shall be used solely for the salaries of native teachers.

SEC. 22. The sum of five hundred thousand dollars ($500,000), in the money of the United States, is hereby appropriated for the year 1901, to be expended, subject to the approval of the military governor, in the construction of school buildings.

SEC. 23. The sum of five hundred thousand dollars ($500,000), in the money of the United States, is hereby appropriated for the year 1901, to be expended, subject to the approval of the military governor, in the purchase of school furniture.

SEC. 24. Provision shall be made for the training of young persons among the native population who desire to become teachers.

SEC. 25. Pursuant to the provision of the next preceding section of this act a normal school shall be established in Manila and as soon as practicable, one at some central point in the archipelago and another in one of the southern islands thereof.

SEC. 26. The sum of twenty-five thousand dollars ($25,000), in the money of the

United States, is hereby appropriated for the expenses of the normal school to be established in Manila for the year 1901. The sum of fifteen thousand dollars ($15,000), in the money of the United States, for each of the other two normal schools to be established in the archipelago is hereby appropriated for the year 1901.

SEC. 27. Provision shall be made by law for the establishment of agricultural schools in these islands.

SEC. 28. Pursuant to the provision of the next preceding section of this act an army officer shall be detailed to look carefully into the agricultural conditions now existing in these islands and report thereon with a view to the founding of several agricultural schools where they are most needed. The officer so detailed shall, during the performance of such duty, be reimbursed for his necessary traveling expenses from the public civil fund.

SEC. 29. Provision shall be made by law for the establishment of trade and manual-training schools in these islands.

SEC. 30. Pursuant to the provision of the next preceding section of this act a trade and manual-training school shall be established in Manila in the year 1901, and as soon as practicable trade schools shall be opened in the larger towns of these islands.

SEC. 31. The sum of fifteen thousand dollars ($15,000), in the money of the United States, is hereby appropriated for the establishment of a trade school in Manila and the payment of its expenses for the year 1901.

SEC. 32. All sums appropriated in this act shall be expended by the general superintendent of education under direction of the United States military governor in the Philippine Islands.

SEC. 33. The insular treasurer is hereby authorized and directed to pay the warrants of the military governor for the sums so appropriated.

SEC. 34. This act shall take effect January 1, 1901.

After discussion of this draft some modifications were made, and as a result the educational bill, known as act 74, was enacted by the Commission and became a law January 21, 1901. The bill is as follows:

SECTION 1. A department of public instruction for the Philippine Islands is hereby established, the central office of which shall be in the city of Manila. All primary instruction in the schools established or maintained under this act shall be free.

SEC. 2. All schools heretofore established in the Philippine Islands, under the auspices of the military government, are hereby declared to be in the department of public instruction established by section one, and are made subject to the control of the officers of this department.

SEC. 3. The chief officer of this department shall be denominated the general superintendent of public instruction, and shall be appointed by the Commission. His annual salary shall be six thousand dollars ($6,000). He shall have the following powers and duties, to be exercised and discharged under the general supervision of the military governor:

(*a*) He shall establish schools in every pueblo in the archipelago where practicable, and shall reorganize those already established where such reorganization is necessary.

(*b*) He shall appoint, in accordance with act No. 25, enacted October 17, 1900, a city superintendent of schools for Manila, and division superintendents of schools for other parts of the archipelago, and the teachers and clerks authorized by law, and shall prescribe the duties of such teachers and clerks.

(*c*) He shall fix the salaries of the division superintendents and teachers within the limits established by law.

(*d*) He shall fix a curriculum for primary, secondary, and other public schools, and shall decide in what towns secondary schools shall be established.

(*e*) He shall divide the archipelago into school divisions, not more than ten (10) in number, and shall fix the boundaries thereof, with power to change the same when necessary; but the city of Manila and its barrios shall constitute one of such school divisions.

(*f*) He shall prescribe the authority to be exercised by the principal teacher of each school over the other teachers, if any, and his duties in caring for the schoolhouse and school property.

(*g*) He shall prescribe plans for the construction of schoolhouses to be built by the municipalities, the amount of land in each case, the rules of hygiene which shall be observed in connection with the schools of the archipelago.

(*h*) He shall make contracts for the purchase of school supplies authorized by law, and, whenever practicable, he shall invite bids by public advertisement and shall award the contract to the lowest responsible bidder.

(*i*) He shall have power to determine the towns in which English teachers, to be paid out of the insular treasury, shall teach. He may exercise this discretion in favor of those towns showing their loyalty to the United States by their peaceful condition, and in favor of those towns which shall construct and maintain suitable schoolhouses by local taxation or contributions.

(*j*) In case of a vacancy in the office of a division superintendent or that of the superintendent for Manila he shall discharge all the duties of such position during the vacancy or may make a temporary appointment to fill the same.

(*k*) He shall examine and pass upon all requisitions made for funds by division superintendents and forward them, with his recommendation, to the chief executive for submission to the Commission.

(*l*) On or before January first and July first of each year he shall make a report of his administration for the previous six months to the military governor and to the Commission and such special reports as may from time to time be called for by either. In the regular semiannual reports it shall be the duty of the superintendent to recommend changes in the school law which he deems expedient.

(*m*) He shall exercise general supervision over the entire department, and shall prepare and promulgate rules for the examination and determination of the qualifications of applicants for positions of division superintendents and teachers and for the guidance of the officers and teachers of the department adapted to carry out this law and not inconsistent with its provisions.

SEC. 4. There shall be a superior advisory board of education, composed of the general superintendent and four members to be appointed by the Commission. It shall be the duty of the board to hold regular meetings once in two months, on a day to be fixed by resolution of the board, and such special meetings as shall be called by the general superintendent. The general superintendent shall act as president of the board. The chief clerk of the general superintendent shall act as secretary of the board and keep minutes of its proceedings. It shall be the duty of the board to assist the general superintendent by advice and information concerning the educational needs and conditions of the islands; to make such investigations as the general superintendent may desire, and to make recommendations to the Commission from time to time as to needed amendments to the law. Each of the four members of the board, appointed by virtue of this section, shall receive as compensation ten dollars for each regular or special meeting which he shall attend. Any member of the board who is a nonresident of Manila shall be paid his actual and necessary expenses for travel from his residence to Manila and his return and hotel expenses. Requisitions for the amount required to pay such compensation and expenses shall be made by the general superintendent. The terms of office of the members of such board appointed under this section shall be for three years, or until their successors are appointed and qualified.

SEC. 5. There shall be a city superintendent of schools in the city of Manila, who shall receive an annual salary of three thousand dollars ($3,000).

SEC. 6. In each school division established by the general superintendent of public instruction there shall be a division superintendent, who shall receive an annual salary of not less than two thousand dollars ($2,000) and not more than twenty-five hundred dollars ($2,500).

SEC. 7. The actual expenses of the general superintendent and the division superintendents while traveling or absent from their usual places of residence on official business shall be paid out of the insular treasury.

SEC. 8. Except where otherwise provided, provisions of this act describing the duties and powers of division superintendents shall apply to the city superintendent for Manila.

SEC. 9. Each division superintendent shall, subject to rules prescribed by the general superintendent, under section 3 (*m*), appoint the native school-teachers to serve in the schools within his district and shall fix their salaries from year to year within the limits prescribed by law. He shall examine the schoolhouses occupied for public instruction within his division with a view to determining their suitableness and hygienic condition. Should the schoolhouse in which any school is conducted appear to the division superintendent to be unsuitable and dangerous for the health of the children, and should no other schoolhouse be available, he shall have power, subject to the approval of the general superintendent, to discontinue such school, and it shall be unlawful thereafter to use the schoolhouse thus condemned for public-school purposes. He shall pass upon and accept or reject or modify the plans for any new schoolhouse proposed by the local authorities to be erected, and for the proposed site thereof, and shall make report of his action thereon to the general superintendent of public instruction. If the local authorities or the local school board shall be dissatisfied with the decision of the division superintendent as to the suitableness of the plans or

site of the proposed schoolhouse, they may appeal to the general superintendent, whose decision shall be final. He shall make careful investigations into the agricultural conditions existing in his division and shall make reports thereon to the general superintendent of public instruction, with a view to aiding the general superintendent in making recommendations as to the places and number of the agricultural schools hereafter to be established. He shall see to it by personal visits and by requiring reports from the principal teachers of each school that the curriculum for primary and secondary schools prescribed by the general superintendent of public instruction is complied with. He shall make himself familiar with the supplies and text-books needed in each school in his division, and shall make a report of the same at as early a date as possible in order that they may be contracted for and furnished by the general superintendent. He shall appoint one-half of the local school board in each pueblo in his division, as provided in section 10. He shall have and maintain his residence and an office in one of the large towns in his division from which all the pueblos in his district can be most conveniently reached.

SEC. 10. There shall be established in each municipality organized under any general order of the military governor or under such municipal code as may be hereafter enacted, a local school board consisting of four or six members, as the division superintendent may determine, in addition to the presidente or alcalde of the municipality, who shall be a member ex officio. One-half of the members, except the member ex officio, shall be elected by the municipal council, and the remaining half shall be appointed by the division superintendent, and the term of office of all members, holding by appointment or election, shall be two years and until their successors shall have been duly elected and appointed.

SEC. 11. The appointed or elected members of the local school board may, after due notice and hearing, be removed at any time by the division superintendent, subject to the approval of the general superintendent of public instruction, who shall have power to suspend such members temporarily.

SEC. 12. It shall be the power and duty of the local school board:

(*a*) To visit from time to time the schools of the pueblo, and to report bimonthly to the division superintendent their condition and the attendance of pupils:

(*b*) To recommend sites and plans to the municipal council for schoolhouses to be erected;

(*c*) Where there are two or more schools in the pueblo, to adopt rules, subject to the supervision of the division superintendent, for assigning the pupils of the pueblo to the several schools;

(*d*) To report annually to the municipal council the amount of money which should be raised for the current year by local taxation for school purposes;

(*e*) To report, whenever it shall deem necessary, directly to the general superintendent, as to the condition of the schools of the pueblo, and to make suggestions in respect thereto as may seem to it expedient.

SEC. 13. Every pueblo shall constitute a school district, and it shall be the duty of the municipal council thereof to make as ample provision as possible by local taxation for the support of all the schools established within its jurisdiction. In exceptional cases, where the topography of the country or the difficulty of communication between parts of the same pueblo require it, the division superintendent may attach a part of one pueblo to the school district of another, and shall, in such case, fix the amount which it will be just for the municipal council of the former to contribute to the annual school expense of the latter.

SEC. 14. The English language shall, as soon as practicable, be made the basis of all public school instruction, and soldiers may be detailed as instructors until such time as they may be replaced by trained teachers.

SEC. 15. Authority is hereby given to the general superintendent of public instruction to obtain from the United States one thousand trained teachers, at monthly salaries of not less than seventy-five dollars ($75) and not more than one hundred and twenty-five dollars ($125), the exact salary of each teacher to be fixed by the general superintendent of public instruction in accordance with the efficiency of the teacher in question and the importance of the position held. The necessary traveling expenses of such teachers from their places of residence to Manila shall be paid by the Government.

SEC. 16. No teacher or other person shall teach or criticise the doctrines of any church, religious sect, or denomination, or shall attempt to influence the pupils for or against any church or religious sect in any public school established under this act. If any teacher shall intentionally violate this section he or she shall, after due hearing, be dismissed from the public service.

Provided, however, That it shall be lawful for the priest or minister of any church established in the pueblo where a public school is situated, either in per-

son or by a designated teacher of religion, to teach religion for one-half an hour three times a week in the school building to those public-school pupils whose parents or guardians desire it and express their desire therefor in writing filed with the principal teacher of the school, to be forwarded to the division superintendent, who shall fix the hours and rooms for such teaching. But no public-school teacher shall either conduct religious exercises or teach religion or act as a designated religious teacher in the school building under the foregoing authority, and no pupil shall be required by any public-school teacher to attend and receive the religious instruction herein permitted. Should the opportunity thus given to teach religion be used by the priest, minister, or religious teacher for the purpose of arousing disloyalty to the United States, or of discouraging the attendance of pupils at such public school, or of creating a disturbance of public order, or of interfering with the discipline of the school, the division superintendent, subject to the approval of the general superintendent of public instruction, may, after due investigation and hearing, forbid such offending priest, minister, or religious teacher from entering the public school building thereafter.

SEC. 17. There shall be established and maintained in the city of Manila a normal school for the education of natives of the islands in the science of teaching. The rules and plan for the organization and conduct of such school, and the qualifications of pupils entering the same, shall be determined by the general superintendent of public instruction.

SEC. 18. There shall be established and maintained in the city of Manila a trade school for the instruction of natives of the islands in the useful trades. The powers and duties of the general superintendent in respect to this school shall be the same as those provided in the section in respect to the normal school.

SEC. 19. There shall be established and maintained a school of agriculture in the island of Negros. The superior advisory school board shall recommend to the Commission for final determination a proper site for such school. The powers and duties of the general superintendent in respect to this school shall be the same as those provided in the section concerning the normal school.

SEC. 20. The general superintendent of public instruction is authorized and directed, under the supervision of the military governor, to procure the making of plans and estimates for the creation of such school buildings as he may deem necessary and practicable at the present time, including a building or buildings for the normal school in Manila, and a building or buildings for the trade school directed to be established in sections 17 and 18 hereof. The estimated cost of such buildings and their proper equipment shall not exceed four hundred thousand dollars ($400,000). Such plans and estimates shall be submitted to the Commission.

SEC. 21. The general superintendent of public instruction is directed to prepare and submit to the Commission, through the military governor, a statement showing the text-books and other supplies which will be needed for the year 1901, the estimated cost of which shall not exceed two hundred and twenty thousand dollars ($220,000).

SEC. 22. The sum of twenty-five thousand dollars ($25,000), or so much thereof as may be necessary, is hereby appropriated out of any funds in the insular treasury not otherwise appropriated, for the organization and maintenance of the normal school in Manila for the year 1901.

SEC. 23. The sum of fifteen thousand dollars ($15,000), or so much thereof as may be necessary, is hereby appropriated, out of any funds in the insular treasury not otherwise appropriated, for the organization and maintenance of the trade school in Manila for the year 1901.

SEC. 24. The sum of fifteen thousand dollars ($15,000) or so much thereof as may be necessary, is hereby appropriated, out of any funds in the insular treasury not otherwise appropriated, for the organization and maintenance of the School of Agriculture for the year 1901.

SEC. 25. Nothing in this act shall be construed to forbid, impede, or obstruct the establishment and maintenance of private schools.

SEC. 26. Whenever sums of money are mentioned in this act they shall be understood to be money of the United States.

SEC. 27. This act shall take effect on its passage.

Enacted January 21, 1901.

Meanwhile the general superintendent was engaged in gathering information as to the educational needs of the archipelago by means of a system of reports from the various departmental and district commanders, and in the enlargement of the work already begun by the military authorities. During this time, also, a voluminous correspondence was carried on with teachers and school officials in

the United States, for the purpose of securing data for the appointment of a large number of teachers for work here, and with publishers and stationers, with a view to purchasing text-books and supplies at the most advantageous prices.

Immediately upon the passage of act 74, and in accordance with its provisions, an estimate was submitted to the Commission through the military governor, under date of February 7, 1901, to the amount of $162,666.75 in money of the United States, for the purchase of text-books and school stationery and supplies. This amount was promptly appropriated by the Commission, and immediately, on a basis of competition invited from all available sources, purchases were made, and at a very favorable figure, especially in the case of text-books, which were secured on more liberal terms than could be secured in any of the States.

This purchase of supplies, aside from those secured by military authorities, was as follows:

TEXT-BOOKS.

50,000	Baldwin's Primer	$9,000.00
10,000	Baldwin's First Reader	1,500.00
25,000	Baldwin's Second Reader	5,250.00
10,000	Baldwin's Third Reader	2,400.00

2,000 square yards slated blackboard cloth	840.00
1,000 numeral frames	480.00
500 gross 2-ounce bottles ink	1,450.00
500 gross blackboard erasers	2,100.00
2,000 ink tablets	700.00
50,000 spelling blanks	1,440.00
100 gross metric rulers	175.00
1,000 maps Philippines, etc	2,500.00
1,000 United States flags	1,910.00
1,000 clocks, Seth Thomas	4,250.00
5,000 dozen composition books	1,450.00
100 composition books, record	15.00
1,000 white block pads	475.00
1,200 teachers' inkstands	400.00
100 gross box drawing crayon	400.00
10 dozen reporters' note books	25.00
5,000 gem paper clips	6.00
Primary school helps	500.00
Office stationery for district superintendents	500.00
Two large and one small letter cabinets and card index system for office of general superintendent of public instruction	500.00
Total	34,221.75

The first large consignment of these arrived April 20, 1901, and others continued to come until midsummer. In the meantime the supplies purchased by the military government, prior to the passage of act 74, were distributed throughout the islands.

Before the school law was passed, under the authority of the Commission and the military governor, 9 teachers from the States and 11 from applicants in the islands were appointed. And by the authority of act 74, 8 superintendents, 8 principals and assistants for normal, agricultural, and manual-training work, and 781 teachers in the United States were appointed, together with 2 superintendents and 80 teachers from applicants in the Philippines. This number of

both division superintendents and teachers has been increased as shown later in this report.

One of the early tasks was the division of the archipelago into school districts; and owing to the limited number of division superintendents, it was found very difficult to make an entirely practicable and convenient apportionment. The great area to be covered and the very inadequate transportation facilities presented many difficulties in the inauguration of a school system for these islands; and the conditions in reference thereto were carefully considered and all available evidence thoroughly examined. As a result 18 divisions were recommended, which were adopted, as the most practicable for administration at the time. The size, population, and particular conditions of these have been considered in a subsequent chapter; likewise the question of appointing the American teachers, which occupied a large part of the general superintendent's time during the earlier months of 1901.

The necessity of ascertaining the real needs of the various divisions by observation and acquaintance with the actual conditions became early evident. With a view, therefore, to such personal investigation, various towns throughout the archipelago were visited, and as a result the following additional recommendations were made:

The greatest present need is that of adequate and suitable school buildings. As soon as practicable, all rooms, buildings, or parts of buildings rented or assigned for school purposes should be used exclusively for school purposes, and no teacher or member of a teacher's family should be permitted to dwell therein. All school buildings occupied by soldiers or in any way used for military purposes should be vacated and turned over to school authorities at the earliest practicable moment, and arrangements should be made for the rent or vacation of all convents or other church property now used for school purposes. Nearly all of the buildings that have been used for military purposes are in poor condition. It will be necessary for the municipalities to spend money for their alteration and repair. Present school buildings consist generally of one or two large rooms, with several teachers carrying on work in each room. These rooms are everywhere overcrowded, and many have no windows or floors. Sometimes one teacher has 100 or 200 pupils. No teachers should be assigned to instruct more than 50 pupils. There should be a single room for each teacher. If we are to introduce modern methods and are to get away from the mechanical, concert method of instruction now used, we must partition the large room into two or three. Schoolhouses are usually central for children of pueblos, but the barrios have no school buildings. Until there are English-speaking Filipino teachers, the question of barrio schools is a difficult one.

The education of girls has not been thought as important as that of boys. Whenever a school for boys is established it will be the policy of this department to establish one for girls, either in a building near the boys' or under the same roof as the boys' school, but completely separate, with its own entrances and playgrounds. Indian education in the United States was not successful until just as good arrangements were made for the girls, the mothers of the coming generation.

In the latter parts of this report may be evident the realization of a number of these early recommendations and a certain progress in establishing a system of education in the islands.

IV.—THE PRESENT ORGANIZATION.

Centralization, a necessity under the circumstances, is the chief characteristic of the present educational system. The corps comprises the secretary of public instruction, a member of the Philippine Commission; the general superintendent of public instruction for the Philippine Islands, 18 division superintendents, 45 deputy division superintendents, 1,000 primary and 200 higher teachers of English, and about 3,400 native teachers, together with a superior advisory school board and local boards.

In the Commission, educational interests are represented by the secretary of

public instruction, who has general supervision of matters concerning the department of public instruction. All initiative in the way of school legislation or organization of new kinds of schools, together with the matter of expending insular funds for school purposes, is taken by this commissioner of education.

The general superintendent of public instruction has charge of the entire organization and the actual working system. His powers and duties (act 74, sec. 3) are in brief as follows:

He shall have general supervision over the entire department; shall appoint all teachers and supervising officers and fix their salaries; shall establish schools throughout the archipelago; shall prescribe plans for the construction of schoolhouses; shall pass upon requisitions for funds for school purposes; shall fix a general curriculum, and provide for the establishment of higher institutions.

The division superintendents have charge of school matters in their local divisions. Their powers and duties are in brief:

They shall have general charge of school matters in their divisions subject to the rules prescribed by the general superintendent; shall appoint native teachers and fix their salaries; shall see that schoolhouses are suitable; that the school curriculum is satisfactory, and shall appoint half the local school board in each pueblo.

Assisting the division superintendents and carrying out their work in the particular provinces are deputy division superintendents. They shall visit all the schools in their province at least once a month; they shall not have the power to appoint Filipino teachers, and shall not generally take action on any important question without the approval of the division superintendent.

The American and the Filipino teachers, finally, are those who do the actual teaching and come into closest contact with the Filipino children. The work of the American teacher is partly administrative and directive, and the native teacher is given considerable freedom in looking after the details of school work and management.

The superior advisory board is composed of the general superintendent of public instruction and four members appointed by the Commission, and acts as an advisory body to aid the general superintendent. The present board consists of Dr. Fred W. Atkinson, general superintendent of public instruction for the Philippine Islands; Tomás G. del Rosario; Pedro Serrano Laktaw; Demetrio Larena; and Mena Crisólogo y Pecson. The following sketches of the careers of the Filipino members show the quality of the present composition of this board:

Tomás G. del Rosario was born in Manila, P. I., in 1862. He spent seven years of his early life in the College of the Jesuits in Manila, where he secured the degree of B. A. Afterwards he continued his studies in Europe for ten years, visiting its principal cities.

In Madrid University he studied for six years civil law, jurisprudence, and canon law. He is a lawyer, and has practiced his profession for sixteen years. He has filled the offices of supervisor of public treasury in the province of Batangas, and has been successively, for a period of twelve years, justice of the peace, prosecuting attorney, and judge of first instance for the four courts of the city of Manila. Under the American Government, for over two years he was attorney-general in the supreme court, and elected civil governor of the province of Batangas. During the revolutionary government he was a congressman, vice-president of congress, and professor of political law in the University of Malolos. At present he is a member of the superior advisory board of public instruction for the Philippine Islands; president of the "Rizal Monument" committee; president of 67 committees of the Federal party, elected by the people; and Delegate and Representative of the Federal party to the Senate and Congress of the United States.

Pedro Serrano Laktaw was born in the town of Bulacan, province of Bulacan, P. I., in 1854. At the age of 20, during the Spanish régime, he taught in primary schools in San Luís (Pampanga), Malolos (Bulacan), and Trozo (Manila). While practicing his profession he filled the office of secretary of the board of assessors and census, and also acted as secretary of the city board. In 1885 he was appointed teacher of the Binondo school by competitive examination. In 1888 he was sent to Europe for three years to study pedagogy, and after traveling through France, Belgium, and Switzerland he was graduated in Spain as a "higher teacher" from the Salamanca University in 1890, and as "professor of normal school" from the Central University at Madrid in 1891. In 1892 he again assumed charge of the Binondo school, in 1893 of the Quiapo school, both of the city of Manila; and in 1895 he won two out of five prizes offered by the government in a public discussion of the science of pedagogy, held in the normal school at Manila. At the present time under the American régime, he is a member of the superior advisory board of public instruction.

Señor Demetrio Larena was born in the town of Dumaguete, eastern district of the island of Negros. He received his education in Manila, and applied himself later to agriculture. He filled, without compensation, several public offices under the Spanish Government. When the revolution broke out against the Spanish sovereignty, Mr. Larena led the insurgent forces of Dumaguete by their request, and, joining Mr. Diego de la Vina, leader of the forces of western Negros, carried on the revolution in the towns of eastern Negros, establishing soon the first provisional government in that district. By popular acclamation he was elected president of this government. Under the first American government organized in Negros Mr. Larena was appointed secretary of public instruction, and performed the duties of this office together with those of delegate of the government in the eastern district. The Commission appointed him governor of eastern Negros when the island was divided into two provinces under the civil régime. While in this position he was also appointed a member of the superior advisory board of public instruction.

Mena Crisólogo y Pecson was born in Vigan, Ilocos Sur, in 1845. He studied law in the University of Santo Tomás, and was graduated bachelor of jurisprudence, but did not finish the law course. He was a notary of the ecclesiastical council of Nueva Segovia for ten years, and under the Spanish rule was a member of the city council and syndic of the Vigan ayuntamiento. Lately he has been a member of the provincial board of Ilocos Sur. During the revolutionary government he was a representative of his province in the assembly of Malolos, and, after the pacification of all the provinces of northern Luzon and the establishment of the civil government there, was appointed provincial governor of Ilocos Sur by the Commission, August 16, 1901. Finally he was also appointed by the Commission a member of the superior advisory board for public instruction. He has been a member of the Federal party since its creation, and was the founder and first president of the provincial committee established in Ilocos Sur.

The powers and duties of this board are briefly:

It shall hold regular meetings once in two months, and such special meetings as may be called by the general superintendent.

It shall assist the general superintendent by advice and information concerning the educational needs and conditions of the islands and make such investigations as he may desire.

It shall make recommendations to the Commission as to needed amendments to the law.

Each member shall serve for three years, or until his successor is appointed and qualified.

At the present time this superior advisory board has no power to carry into

effect its recommendations, but can only advise and urge the enactment of such measures which to it seem necessary. In a consultative way it is of great aid to the general superintendent, since the members are thoroughly acquainted with the conditions and needs of the different parts of the archipelago. In discussing school matters and the desirability of measures intended to further educational interests, the board is of great service in presenting the other side of the question, speaking from the standpoint of the Filipinos. That such a board is a necessity and will rapidly prove itself a helping force in the progress of education here is, it is thought, beyond any question. Add to its present functions the power to carry out what it recommends, and its field is an essential one.

The following account of the meetings of the superior advisory board shows the kind of help the board lends, and gives a view, in part, of the field in which its future efforts are to be exercised:

SUPERIOR ADVISORY BOARD, DEPARTMENT OF PUBLIC INSTRUCTION.

First regular meeting.

MANILA, P. I., *November 25, 1901.*

Subjects for consideration:

1. American teachers. In what additional places are they needed? Places not deemed safe by military authorities—opinion asked.

2. Filipino teachers. Some conflict or lack of definiteness between school law and municipal code. Not understood in some cases that teachers appointed by division superintendents must be paid by municipalities.

3. Compulsory attendance. What legislation is recommended? Should this be left to municipal councils, subject to approval of division superintendents? What age limits for boys and girls should be established?

4. Secondary schools. What kind, where to be located, and how supported? Fees?

5. What additional normal schools are needed, and where?

6. Determine location of agricultural school in Negros. Where should other agricultural schools be established?

7. What means should be taken to reach the children of the wealthier parents? Should schools with dormitories be provided in Manila?

8. What supervision do you recommend for private schools?

9. Do you favor a law requiring English to be taught in all private schools?

10. School census—by whom should it be taken?

11. What provisions should be made for barrio schools?

12. How shall the office rent and miscellaneous office expenses of the division superintendents be paid? And by whom?

13. Schoolhouses and furniture. Encouragement to pueblos to build good schoolhouses.

14. Should the part of the land tax set aside for support of schools be disbursed by the municipalities, or paid into the provincial treasury, to be paid out? And on what basis?

15. Regular meetings of this board are to be held once in two months. What shall be the date?

16. At each meeting each member shall present a brief report on the special needs of his district, with recommendations as to action needed.

The first meeting of the superior advisory board was held in the office of the general superintendent of public instruction, in the ayuntamiento, on the above date.

There were present: Dr. Fred W. Atkinson, general superintendent; Señor Tomás G. del Rosario, of Manila; Señor Pedro Serrano Laktaw, of Manila; Señor Mena Crisólogo, of Vigan; Ilocos Sur; Mr. Frank H. Bowen, secretary of the board; and Señor Joaquin Aurteneche, interpreter.

Señor Demetrio Larena, of Dumaguete, oriental Negros, was absent.

The meeting was called to order at 10:15 a. m. by the general superintendent, who presented a statement of the questions to come before the board for discussion and recommendation. He mentioned the news that the conference of Methodist churches in the United States had appropriated $500,000 gold, for the establishment of a Methodist university in Manila.

Dr. Atkinson reviewed the work of the past year in opening primary schools throughout the archipelago, a normal and trade school in Manila, and an agricultural school soon to be opened in Negros. There are now 819 teachers of English in the islands, and more awaiting transportation from the United States.

Discussion of the question of safety of American teachers in the provinces brought out the opinion that such teachers would be safe from molestation even where there might be disturbed conditions, but considered advisable to supply pacific sections first.

The matter of differences between municipal and school laws was discussed, but was laid aside to permit the filing of written recommendations later.

Discussion of the question of compulsory attendance favored the making of a strong compulsory education law.

Compulsory school attendance being impracticable without supervision of private schools, the board favored legislation on this point also.

The board showed much interest in the question of establishing secondary or higher schools in the provinces and a university in Manila, to complete the system begun with the primary schools.

In connection with these higher schools, it was considered necessary to establish dormitories, as many children would necessarily remain at the schools, and parents prefer them to remain under the supervision of the teachers.

It was agreed that the insular government should pay the teachers and furnish the school supplies; that the provincial government should provide land, buildings, furniture; the support of the schools would come from board and fees, but funds are necessary to establish the schools. The large towns should be given an opportunity to compete by offer of lands or buildings, for the establishment within their borders of these higher schools, after the methods pursued in the United States.

After the discussion of the matter of normal schools, it was

Recommended: That normal schools be established in Vigan, Iloilo, Neuva Caceres, Cebu, and Zamboanga, in addition to Manila.

The question of location of agricultural school in Negros was referred to Señor Larena and the division superintendent of Negros. On account of the general rise in prices of everything, prompt action in buying land for agricultural work was recommended, if it is not donated by private individuals.

Recommended: That in addition to the agricultural school in Negros other agricultural schools be established in Magalan, near Mount Arayat, in Pampanga Province, and at San Ramon, in Mindanao.

Recommended by Señor del Rosario, and agreed to by the board, that a circular be sent to all teachers instructing them to compel the boys attending school to dress in the American way. The general superintendent dissented from this.

At 12 m. adjourned until 10 a. m. on Tuesday, November 26.

Second session.

The board met at 10 a. m. on Tuesday, November 26, in accordance with adjournment.

Present, the same as at first session.

Discussion of vacations. General assent to one long vacation, about April to June, and a two weeks' vacation at Christmas.

Recommended: That the 200 American teachers now appointed in the United States be furnished transportation to the Philippines at once, and on private liners if necessary. Also, that a sufficient number of teachers be appointed to supply the demands of the various pueblos, even though the number be in excess of 1,000.

Discussion of salaries paid to native teachers brought out the opinion that they are being paid entirely too small salaries in most towns; that they are able to supply themselves with only the necessaries of life, owing to the increased cost, and are not able to dress as a teacher should. The teacher should receive enough salary to enable him or her to present a creditable appearance, and the teacher should become a person of importance and influence in the community.

Recommended: That the native teachers should be paid by the insular government temporarily. When the provinces are in a prosperous condition, then the municipalities should be made to pay native teachers, and pay them at the rate established by the insular government, thus putting salaries on a more equal footing.

Suggested, that the native teachers be paid, say, one-half of the salary paid to American teachers.

Recommended: That attendance at school should be made compulsory for all children between 8 and 12 years, except children in barrios far removed from regular schools; that a penalty be provided for punishment of parent or guardian who does not send children to school—a warning for first offense, a fine of 1 peso for second offense, and a fine of 5 pesos for third offense, or imprisonment for five days in default of payment of 5 pesos. In case of repeated offense a fine of, say, $200 or one-half year's imprisonment. The head of the family to be responsible for attendance of its servants. This law to be made by the United States Philippine Commission, and the enforcement to be in the hands of the municipal authorities under the control and direction of the general and division superintendents.

Agreed that primary books are needed for use in native schools, printed in English-Ilocano, English-Tagalo, English-Bicol, English-Visaya, etc., with illustrations.

Recommended: That a committee be appointed by the United States Philippine Commission, or other steps taken, to secure a uniformity in the spelling of geographical names, with special reference to preserving the characteristic native names.

Recommended: That, if possible, there be established a complete free public-school system,

free from primary schools to university, with industrial and commercial courses in secondary schools in the provinces, and with normal school as agreed yesterday.

Recommended: That agricultural schools be established in each province where sufficient land can be secured by donation to furnish an adequate working farm. This because in agriculture is the principal wealth of these islands.

Recommended: That section 25 of act 74 be amended, adding thereto the following: "But these shall be under the control of the general superintendent of public instruction and the division superintendents."

Recommended: That a law be passed making compulsory the teaching of English in all private schools to an extent to be determined by the general superintendent of public instruction.

Discussion of the question of securing equality in the amount of funds available in each municipality from the land tax, for the building of schoolhouses, and for school purposes, developed the opinion that payment of this fund into provincial treasuries, to be disbursed therefrom on a basis of school population or otherwise, would be impracticable and would be in violation of certain rights granted to municipalities.

Recommended: That, instead of paying the entire expense of erecting schoolhouses at different places, provision be made to assist municipalities to complete buildings commenced by municipalities, thus giving encouragement and securing a more even distribution of financial aid.

At 12 m., adjourned to Wednesday, November 27, at 10 a. m.

Third session.

The board met at 10 a. m. Wednesday, November 27, in accordance with adjournment.

Present, the same as at previous sessions.

The date of regular meeting was left to be determined by the general superintendent; regular and special meetings to be held subject to his call.

Recommended: That an amendment be made to section 4, act 74, authorizing the members of the superior advisory board to visit schools for the purpose of inspection, the same as general and division superintendents; also giving authority to said members to make such trips as may be necessary, and fixing the compensation therefor and providing for the payment of actual traveling expenses during the performance of such duty; dividing the archipelago into four districts and assigning one member of the superior advisory board to each district.

Recommended: That the United States Philippine Commission be requested to appropriate $500,000 gold for the establishment of a university in the city of Manila, at first with departments of law and engineering, the latter to include civil, mechanical, electrical, mining, marine, and architectural; with other departments of medicine, etc., to be added as soon as practicable; a school of fine arts (music, painting, etc.) to be established later.

Recommended: That the ownership of the University of Santo Tomas be determined at the earliest opportunity; and, if decided to belong to the government, that this property be added to the university hereinbefore mentioned.

Recommended: That an amendment of the law be asked for, so that one-half of the lumber tax shall remain in the provincial treasuries, to be available for the construction of school buildings.

Agreed, that in the supervision of private schools especial emphasis shall be placed on hygienic conditions, competency of teachers, instruction in English, etc.

Adjourned at 11 a. m. until Saturday, November 30, at 10 a. m., to allow of putting the foregoing recommendations into shape to be presented to Hon. Bernard Moses, secretary of public instruction.

Fourth session.

The board met at 10 a. m. Wednesday, November 30, in accordance with adjournment.

Present, the same as at previous meetings; also Hon. Bernard Moses, secretary of public instruction.

The secretary of public instruction addressed the board, stating that he was in sympathy with most of the recommendations made, and especially speaking of the need of establishing more agricultural and normal schools, and finally a university, stating that a creditable law school could be established soon if buildings could be secured. He considered inadvisable the transportation of American teachers on commercial liners, and favored the increase in salaries of native teachers as they become more competent. He questioned whether a compulsory attendance law should be passed by the insular government or by the municipalities individually. After discussion, he stated that this point must be determined by the Commission when the subject is brought up for discussion and action. If compulsory education is obtained, there should be supervision of private schools by the general and division superintendents, but this supervision should not investigate or comment on religious instruction.

Further discussion of the matter of pay of native teachers ensued until the secretary of public instruction withdrew to attend a meeting of the Philippine Commission.

The members of the board were requested to make such additions and suggestions as they

wished and send them to the secretary of the board for presentation to the Commission. Señor Larena was also to be furnished records and specially asked for recommendation as to location of the Negros Agricultural School.

At 11.05 a. m. adjourned to meet at the call of the president.

FRANK H. BOWEN, *Secretary.*

Besides this central superior board local school boards are being organized throughout the divisions. These are composed of five or seven members, including the presidente of the municipality. They are to visit and report upon schools, recommend sites and plans for schoolhouses, report annually to the municipal council the amount of money to be raised for the current year by local taxation for school purposes, and look after local school interests in general.

The time is not yet ripe to look for results from these local school boards, since none of them have had more than a few months' existence, and a large number of them have not yet been organized, for the reason that the division superintendents wish their teachers first to become well acquainted with the people of their towns and thus be able to make wise recommendations of candidates for the boards. Some division superintendents feel that the organization of local school boards is premature, and ought to be postponed until the people have a better conception of the American school. Others find the work of the board helpful, and, although at present wholly advisory, steadily becoming an essential feature in local school administration.

The following account from one of the division superintendents shows the local school board in its present successful working form:

The school board in each municipality, according to law, shall consist of five or seven members, as the division superintendent may determine, one member of which is the presidente of the municipality ex officio. In towns having widely scattered barrios, or having a population of 10,000 or more, seven members constitute the board, but in the other municipalities a smaller membership is sufficient.

One-half of the members are elected by the municipal council and one-half appointed by the division superintendent. The qualifications are not named by law, but I have insisted that each member be a citizen and a responsible and influential landowner. The appointments are made by the division superintendent and sometimes also upon the advice of the chief of constabularly or of the commanding officer. In as far as possible, members are chosen to represent various parts of the municipality. Some of the larger municipalities contain barrios having a population of two or more thousand people. Care is taken to have these barrios represented on the school board. Each member is elected or appointed for a term of two years, but in case of misconduct, inefficiency, or other action unbecoming to his office may, after due notice, with the approval of the general superintendent, be removed from office by the division superintendent.

As soon as the school board is complete in its membership, the presidente is instructed to call a meeting for the purpose of organization and discussion of the duties of the board. They are directed to choose a chairman and a secretary for the year current, and to form such subcommittees as may seem necessary. At the same time the division superintendent presents the needs of the present schools, requests or suggests possible plans for the future development of the schools, explains concisely the purposes of the public schools, and thus gives sufficient ground for immediate discussion and action.

The first duty of the school board—to visit the schools—is important. Neither the people nor the board at the present time understand the purpose of the public schools. Education has to them been mainly ornamental. Education for life is a new idea. It is very important, therefore, that the influential men in each community visit the schools conducted by the American teachers. The school board, however, has no power to make improvement or to direct the teachers, but it is requested to make recommendations to the division superintendent and to the municipal council.

In regard to new school buildings the power of the board is limited to making recommendations of sites and plans to the council. This is sufficient unless the board may have the power to place contracts and direct the construction. At the present time the board may inspect the construction of new buildings and see that they are in conformity with the contract. The planning of the schoolhouses

is entirely in the hands of other persons, but in the present state of the laws it is very hard to determine what person or persons are responsible. The Filipino has no idea of the proper lighting and seating of a schoolroom. At present I am sending plans to the school boards, on which they secure estimates, which, when approved by the council, are returned to me for approval. The school boards have been very helpful in some cases in developing plans for the organization of all the schools necessary for the municipality. The school census shows the barrios and their approximate distances from the pueblo, together with the number of school children in each. A map of the municipality shows the approximate location of the barrios. The American teacher is also directed to visit each barrio and report upon the conditions for establishing new schools. From these materials the division superintendent forms a plan for the development of all the schools, showing the approximate location for each schoolhouse, the number of children which would attend it, and the number of rooms and teachers necessary in each. This plan is submitted to the school board for investigation and recommendations. Later it may present the plan to the council for approval and assistance. In a few cases this plan has been very successful. I think it is the best.

The common people generally desire education and opportunity. On the other hand, the richer people do not wish to see the poorer classes become educated. They desire to hold their supremacy unchallenged. These are very general statements, but it frequently happens that the council, representing the wealthy people of the municipality, look upon the development of the public schools very indifferently. They are no more interested than is necessary. Public education, when placed under their authority, therefore, will make but little progress. In each municipality men of influence are needed whose duty it is to awaken the interest of the people and secure the votes of the council for school purposes. This is the most useful work which the school board can do at the present time.

These boards are capable of assisting materially in the problem of education, and will work more effectively after a nicer adjustment of the powers and duties of local bodies, whereby the school boards may have the right to expend money for school purposes with the approval of the division superintendent.

The last feature in this centralized system is the regular series of communications between the officers and teachers in the field and their chief. Circular letters and telegraph facilities to all parts of the islands offer the means of directing operations in the field and keeping the general superintendent closely in touch with the actual work.

V.—WORK DONE UP TO DATE UNDER THE PRESENT ORGANIZATION.

The main part of this report now concerns itself with a description and discussion of the work that has been accomplished under the present organization; and this chapter serves merely as a brief introduction to what follows subsequently in detail.

The past year and a half has been a busy one, and the educational movement has gone forward with great strides in spite of many difficulties entirely fundamental in character. The work has been done under the disadvantage of having had practically no basis to build upon. It has been pioneer and creative work purely, and in consideration of this fact it was deemed wise to go slowly with reference to many questions that have arisen.

Briefly, the tangible results since September 1, 1900, are:

An educational bill has been enacted; the archipelago has been divided into 17 divisions and an American school superintendent placed in charge of each, with deputy division superintendents acting for them in each of the provinces; 1,000 teachers for primary work have been appointed, received in Manila, and been stationed, with consideration for their own comfort as well as for the needs of the towns; 200 additional teachers for secondary work are being appointed; about 200 soldier teachers had until recently been detailed from their regiments, and 3,400 Filipino teachers have been appointed; more than three-quarters of a million

of American schoolbooks have been purchased, together with an enormous quantity of school supplies, including 20,000 modern school desks; instruction in the English language has been provided for in about 1,500 schools, in which over 200,000 children are enrolled; night schools for adults and those unable to attend during the day have been opened throughout the archipelago, and are working successfully with an enrollment of about 25,000.

Salaries of Filipino teachers have been increased, and a definite announcement has been made to them that the American teachers are here not to displace them, but to prepare them to take charge of their own schools. The Filipino teachers have received daily instruction in English, and in addition to this, when they have progressed sufficiently with the language itself, have been taught the common branches and the methods of teaching these.

Vacation normal courses have been arranged in the various school divisions, principally to train the native teachers, but also to aid the American teachers. Permanent normal schools in the provinces tributary to the Manila Normal School have been established.

Industrial work is being conducted successfully and plans for additional trade schools in the provinces are maturing, hastened by a regular appropriation for this work which is now available. As a means of preparing the Filipinos for work in the Signal Corps, telegraphy is now a branch taught in these schools.

Sites for the principal agricultural schools have been chosen and the schools are now in process of organization, with the supervisor and teachers in the field.

Grammar high schools have become a part of the school system, and teachers for this work in secondary instruction are being appointed under an appropriation recently made for this purpose. Furthermore, recommendations have been made for the establishment of schools of painting, sculpture, drawing, and music, and the plan of a technical school and a university in Manila has been discussed as a preliminary move to further and more definite action in the near future.

Every portion of the archipelago has been visited by some member of the department, and the peculiar conditions and special needs of these localities investigated. Circulars of inquiry have been sent out to the presidentes, district commanders, provincial governors, and teachers, and a mass of valuable data is accumulating.

I now proceed to treat these various matters in detail.

VI.—CONDITIONS OF THE PROBLEM.

There are in the Philippine Islands three distinct races—the Negrito, with 21 tribes; the Indonesian, with 16 tribes; and the Malayan, with 47 tribes, making a total of 84 different tribes. Of these, the Negritos, which at one time populated the whole archipelago, are slowly disappearing, and probably less than 25,000 remain. They are physically weak and intellectually stand very low in the human scale.

The Indonesian, with its tribal population of some 251,200, live almost exclusively on the great island of Mindanao. They are not only physically superior to the Negritos, but to the people of the Malayan race as well, and are, as a rule, quite intelligent.

The Malayan race, with its admixtures, however, is the dominant one, and is found in all parts of the archipelago in greater or less numbers. The Visayans, with a population of 2,600,000, occupy the islands south of Luzon; the Tagalogs, with 1,663,000, the central part of Luzon; the Bicols, with 500,000, southern Luzon; Ilocanos and Cagayans, northern Luzon; the Pampangas and Pangasinans, northern central Luzon; the Moros, the Jolo (Sulu) archipelago and Mindanao.

Thus it will be seen that the problem of educating the peoples of three distinct

races, made up of many tribes, which, even in the same race, differ very greatly, not only in the degree of civilization, but in language, manners, customs, and laws, is no small task. The needs and conditions of the different provinces, and in some cases the different parts of a province, have to be studied carefully in order that the greatest amount of good may be given to those whom we have been set the task of educating.

Transportation, too, is an important factor. There are only 120 miles of railroad. Small, unclean steamers make irregular trips to harbors where landing is a difficult matter. There are but few good roads, and in the provinces a good bridge is unknown. These are the facilities for getting about this archipelago, made up of several hundreds of islands, equal to the combined areas of the New England States and New York, extending from north to south over about 15 degrees of latitude.

The church and religious affiliations, the seasons of harvesting, the customs and notions that have been handed down for centuries, and last, but not least, the natural inertia of these people, are all conditions which must be reckoned with and most carefully considered, necessitating different methods, different work, and different sessions in the school year in order to obtain the best results.

The following tables give some of the more important data concerning school divisions:

Number of school divisions	17
Estimated total area, square miles	114,792
Number of American teachers in the field	937
Number of American teachers en route or awaiting transportation	84
Number being appointed for secondary instruction	200
Total number of American teachers	1,221
Number of Filipino teachers (estimated)	3,400
Number of detailed soldiers (estimated)	19
Total teaching force	4,640
Number of children enrolled in day schools (more than)	200,000
Enrollment in night schools (approximately)	25,000

[1] Figures of Philippine Commission.
[2] Figures for teachers do not include those arriving after April 21, 1902, nor those employed in special schools. The arrival of the additional teachers brings total to approximately 3,400.
[3] A large additional number teaching, but not appointed by division superintendents.

THE FIELD AND THE PEOPLE.

Included here are extracts, taken here and there, from reports of division superintendents, which will give an insight into school conditions in various parts of the archipelago, such as can not be obtained in any other way. These extracts begin with the northern provinces and survey the archipelago to the southernmost islands.

From W. W. Rodwell, division superintendent of schools for Cagayan and Isabela.

This Cagayan Valley is very rich in soil, flood plains, iron, lime, sand, gravel, stone, and a great variety of valuable woods. In the mountains around the headwaters of the Cagayan and its tributaries are many outcroppings of copper and other minerals of value. Brown coal of fair quality appears in several places; but steam coal is unnecessary, for the many rapid-falling, swift streams—Pinacanauans, or clear waters—will furnish abundant energy for numerous electric plants that will afford ample mill power and run an electric railroad from San Vicente to Manila. I mention San Vicente because it is undoubtedly the finest natural harbor in Luzon. The Cagayan River is navigable the year round for vessels of light draft and powerful engines.

The natives in this division need to be shown the use of other implements than the bolo, carabao sled, and "Methuselah" plow. For generations these "children of the soil" have been compelled by law to raise tobacco for the Spanish tobacco monopolies. The present generations think nothing but tobacco and corn can be raised here. Tobacco is their sole source of revenue and corn their principal food stuff. Almost all the rice used is imported. In some places in the valley white rice is worth 25 cents gold per pound to-day. All commerce, aside from the tobacco business, is entirely controlled by Chinos. Chinos are rapidly encroaching upon the constituted monopolies, even in this; in fact, they have some trading and tobacco combines of their own. Imposed upon by the land claimants, tobacco monopolies, and Chinos, the rancheros are kept very poor. * * * Within 5 miles of Tuguegarao are growing cocoanut, cocoa, coffee, tobacco, rice, corn, sugar cane, bamboo, some large timber and American vegetables (the Chinos are beginning to cultivate them on a small scale).

This division contains a greater variety of soils and climatic conditions than can be found in any other division in the islands. There are high, mountain lands, rich alluvial valleys and plains, high and low rice lands, thousands of acres of easily irrigated rich dry land, miles of palm beaches waiting for seed, and "bino" swamps waiting for distilleries. I am of the opinion that many of the American fruits and vegetables can be grown here. I have seen fine lettuce, radishes, tomatoes, and potatoes grown in different parts of Cagayan in a small way. Also very fine small oranges and lemons are to be found growing in semicultivation in some places.

I have been over most of Cagayan Province once thoroughly. It is a large territory from a Filipino point of view. It takes from thirty to forty days of hard traveling to visit every pueblo and do any business at all. The transportation for persons, freight, or mail is something deplorable from an American view. I waited from Saturday afternoon until the next Thursday morning for a boat up the river. We got up 5 miles the first day out of Aparri, then waited twenty hours for the river to fall and lessen the current. At the very best, one can only count on getting from Aparri to Tuguegarao in three days—a distance of about 75 or 80 miles.

The only way I can make any time this season of the year is to hire a barangayan and go downstream; then I can stop at all the towns and go on when I wish, returning by "vapor" (steamboat).

Most of my traveling in this part of the year will have to be done by small boat. It is sometimes very risky for a single American to go alone on one of the long barangayan trips, partly in the night. * * *

During the dry season, from January on, I can get about on horseback. But most of the roads are mere trails. Where there is a road there are no bridges, and one has to swim or ford the swift mountain streams that run from the sides of the valley into the Cagayan.

If I had a good Mississippi River Quincy boat, I could make almost my entire territory by going up to the town of Echague on one of the "vapors" and rowing down. Or, better still, a small American launch, gasoline or steam, of about 18 feet length and 6 or 8 horsepower engine, would go from Echague to Sanchez Mira. If I had a $400 gasoline launch, I could make nearly all of this division.

As it is now, I could not get over the entire territory, depending on the steamboats for transportation, in six months' time—continuous waiting mostly.

Mail from Echague goes to Aparri and returns here in from four to six weeks, by the regular routes. * * *

There is not a public building of any account in the town. All the provincial and city buildings were destroyed several years ago. The old foundations indicate fine, large structures. At present the province has nothing, and the town only a small tribunal, with one large and two small rooms in it. * * *

As to schools, this whole province is very anxious for American school-teachers. The right kind of a man would be safe enough in any pueblo in the province without a soldier in existence. The only thing against the American school idea is the padres. * * *

In some of the pueblos the teachers keep reporting that the children come very irregularly. It is noticed that they seem to be alternating. For a day or so certain ones will come, then others, etc., until they have all been for a few days at a time. This is generally with the barrio and poor children. Most of the "principales" send their children to private schools. Evidently this is prearranged in some places. Less than 3 per cent of the children know any Spanish; yet the friars have filled the people with the idea that for them to learn English they must first study Spanish grammar.

Colonel Hood says the friar question is the question in this whole valley, and from all I have seen it seems to be so. These people look upon a friar as a second Christ. The children and women will run after them in the streets, bow down before them, and kiss their hands. Many of the men are open, however, in their hatred, or their declarations of that character, for the friars. * * *

The greatest need for the whole province is for educated native teachers. Very few of the teachers here have ever been in Manila except the ones left here by the insurrection. * * *

Not a pueblo in this province has any money to pay its teachers until the school tax is raised. * * *

It is next to impossible for me to get any mail to or from the teachers in this division during the rainy season. Many of the report blanks I sent out requesting the information you desired have not been returned yet.

From William E. W. MacKinlay, acting division superintendent of schools, Ilocos Norte, Abra, and Bontoc.

The province of Ilocos Norte, which comprises some 1,100 square miles, is about one-half occupied by the civilized Ilocos race, and one-half by the wild tribes known as Igorrotes. The latter are timid, and few in number.

The Ilocanos number some 125,000, and are settled in 15 municipalities, each with a pueblo or town for a center. The conditions at present are very good for school work. There is no disorder in the province, and rice transplanting for the ensuing crop is being energetically pushed. This labor now engages a majority of the people, young and old, and has reduced the school attendance nearly a half since the middle of July. * * *

I have made a tour of the province and have visited every place except Badoc, which I shall inspect en route to Abra. * * *

I shall review the towns as they are situated geographically, with Laoag as the center. There are three "groups" in the province, of which that of the south is most important. It embraces Laoag, with 31,000 people in jurisdiction; San Nicolas, 10,000; Batac, 10,000; Paoay, 8,000; and Badoc, 11,000.

Laoag has two good stone central schools, one each for boys and girls, and three auxiliary bamboo schools in the north, west, and east parts of the city, each with a boys' and girls' department. The central boys' school has three native masters, and the central girls' school has two maestras. * * *

The schoolhouses throughout the province are utterly inadequate to accommodate more children than usually attend now, and do not exist in some towns. * * * The schools are only travesties of American ideas of a school, with the exception of Laoag. * * * There are many teachers who are trying to do their best, but they are as children groping in the dark, and can only advance when led along the road by an American teacher. * * * On my landing at Ilocos Norte July 14 at Currimao, I inspected two barrio or rural schools there. I found two bamboo sheds in which the Spanish alphabet and a little Ilocano was being taught to some 100 children by two native teachers, who get 5 cents, American, monthly from each child. * * * Paoay has a good stone school for both sexes, which, however, is almost bare of school furniture, and the 150 children who attend are compelled to sit perched on crazy benches and packed like sardines. * * *

At Davila there is a school of 35 boys and 25 girls conducted on methods of the fifteenth century, but pleased beyond measure at my visit and advice. The writing lessons were conducted on bamboo leaves. * * *

The five towns of the eastern group seem more apathetic in school work than those of the first two. These places were more hostile than the coast towns, and suffered more in consequence. Except Dingras, they are poor at present, have few resources, and a small number of educated men.

San Miguel has an energetic presidente, who is practically rebuilding the double stone schoolhouse and has also put a bamboo shed up for temporary use. He wishes an American male teacher very much. There are two native teachers.

Piddig is at present in the throes of an epidemic of dysentery. On one day 16 deaths occurred, and the rate is still high. The people conceal their sick cases until too late to be cured, as they seem to be unable to realize the benefits of medicine. Lieutenant Stoney, acting assistant surgeon, has offered his services gratis, and has treated many, as has also a native doctor. This incident shows the baleful effects of ignorance. * * *

Banna is a small place of some 500, on a hill overlooking some Igorrote rancherias. It has two small schools, which are huddled up in two private houses, with few books and two middle-aged native teachers (man and wife) teaching a medley of Spanish and Ilocano and a few English words. An unfinished schoolhouse, left as it was the day the last American lieutenant departed, shows the little interest taken by the people in the work. This town needs an energetic American teacher badly. The natives can not get anything done, and no one else in the place cares. The garrison is of native scouts, and the few white men (scouts) are too busy to look after school matters. Banna is on the border of the Igorrote rancherias, and can be made a center for their elevation from their present savagery. * * *

From Jesse George, division superintendent of schools, Ilocos Sur, Union, Lepanto, and Benguet.

November 23, 24, 25, I visited the pueblos north of Vigan again, and on the 27th I left Vigan on horseback, going south through Ilocos Sur to Candon, then up through San José, Salceda, Concepcion, Angaqui, and Namitpit to Cervantes, and on through Lepanto and Benguet provinces and around to San Fernando, coming back to Vigan by steamer from the last-mentioned point. In these journeys I have consumed about fifty days on the road and have traveled fully 700 miles on horseback and about 500 on the water. I have visited every pueblo in the division except three small ones in Lepanto, many of them several times.

Geographically considered.—The district is divided in two sections, the lowlands, a district comprising Ilocos Sur and Union provinces, and being a long, narrow strip of level and very fertile coast land, stretching 150 miles along the coast and varying in width from about 4 or 5 miles to 30, and the highlands or mountain section, comprising Lepanto and Benguet provinces, lying in wide, irregular outline immediately back of this long, narrow strip, and having an elevation of from a few hundred to 7,000 or 8,000 feet, a very broken surface and comparatively little arable land. The former of these sections has about the same climate as Manila, the heat and the rainfall being a little less, perhaps, on account of the close proximity of the mountains; the latter is very much cooler, having an almost temperate climate and a far greater fall of rain than the coast region or even than Manila.

Agricultural products.—The agricultural products of the coast region are tobacco, rice, sugar, cocoanuts, and the tropical fruits. Those of the mountain sections are rice, coffee, potatoes, and the garden vegetables of the temperate zone. The mountain section, while having little arable land, yet affords considerable pasturage, and cattle raising is carried on to some extent. The chief resources of the mountain section, however, is believed to be its minerals.

Inhabitants.—The difference in the people, their mode of living, and general characteristics in these two sections is almost as great as the difference in climate and products. The population of the two coast provinces is almost wholly Ilocano, Christian, and has about the same degree of civilization and advancement that the Tagalo people have; that of the two mountain provinces is almost wholly Igorrote and Tinguinian, non-Christian tribes, with a few Ilocanos in each of the principal pueblos. The Ilocano population in Lepanto Province is more than double that in Benguet and the advancement is correspondingly greater. * * *

In addition to the above, there is what is known as the Amburayan district, a delta-shaped mountainous expanse lying directly east of Tagudin and Bangar and bounded by all four provinces of the division, with a population of non-Christian tribes variously estimated at from 15,000 to 20,000. This section was a distinct

district with separate government under the Spanish régime, but for the present I believe is attached to Ilocos Sur for administrative purposes. For school purposes this section should certainly be attached to the mountain district of which it is essentially a part.

This difference in geographical characteristics and population makes the problem of schools very radically different in each section, and on account of the widely scattered condition of the population in Benguet and Lepanto, the little advancement, primitive conditions, and limited resources of the people, the cost to the general government of bringing general education to them must be greater in proportion to their population than to the people of Ilocos Sur and Union.

It will be noted that the whole population above given is distributed among 66 pueblos, varying in inhabitants from a few hundred to almost 20,000. Thirty-nine of these pueblos are found in Ilocos Sur and Union, and are either situated on, or are easily accessible to, the old Spanish coast road, which follows up the coast from Dagupan to the northern limit of Luzon. The pueblos of the other two provinces are not so easily accessible, but at present a tour of them is best made by striking through Tildad Pass from Candon into Lepanto, on over the high divide at the headwaters of the Agno River into Benguet, down through that province to Trinidad and Baguio, coming out to the coast again at Naguilian. When the new road shall have been completed to Baguio, a circuit of the entire district can best be made by starting in at Sinait, the northernmost pueblo of Ilocos Sur, and following down the coast road to Santo Tomás in Union Province, thence across to the Baguio road by way of Rosario, up this road to Baguio, on through Benguet by way of the Agno River trail, across into and through Lepanto, coming out through Tilad Pass to the coast again at Candon. This trip, counting the necessary deviations from the main trail in order to visit all pueblos, would consume, I should say, not less than six weeks if anything like the necessary time were consumed in visiting each pueblo.

School conditions.—When I took charge of the division, there were, according to data in the office of General Bell, 42 of the 46 pueblos sustaining schools, with American teachers paid by the insular government actually teaching English in 7 of them. The total enrollment in these schools was 11,554 and the total daily attendance was 4,663. A total of 194 native teachers was employed at a monthly expense for wages of $543 gold. English was being taught by soldiers detailed for that purpose in 12 additional pueblos, making 21 pueblos in all, or half those sustaining schools in which more or less instruction was being given. Some few other pueblos had had soldiers detailed formerly and thus had had some instruction given in English, and a few of the more enterprising native teachers had picked up a smattering of the tongue and were endeavoring to give some instruction therein in their schools. Every pueblo in Union Province had received at least some English books sent out by the Department, but in Ilocos Sur, the pacification of the province having been only recently accomplished, very few of the pueblos had received books, and schools were in a more backward condition. Three pueblos in Benguet had received books and in Lepanto none. Of the 66 pueblos all but 1 in the coast provinces had some sort of a schoolhouse owned by the municipalty, and in the mountain provinces 11 pueblos had buildings, making a total of 50 pueblos with buildings. In Union Province the school buildings in many of the pueblos were destroyed in whole or in part during the insurrection, and temporary bamboo structures erected. These buildings had been erected through the efforts of the military, and I was struck with the interest the army officers had taken in the schools and the help and attention they had given them.

Judged from the standard in the United States, there would certainly be no great need of a high school for several years to come. But taking into consideration the fact that the Filipino must be carried through with a rush, that his school days are short, and that he will drift, and is drifting, constantly out of the public primary schools into secondary private schools of the Spanish order, thus sidetracking him, I believe secondary schools on the order of the one already in operation in Manila should be established during the coming year. These schools should, in my opinion, have a preparatory normal course to fit for entering the normal school at Manila, and as soon as possible some attention should be paid to industrial training.

The provinces of Lepanto and Benguet are not ready for a high school as yet. I believe, however, that in these two provinces schools for industrial training should early be established. The natural resources of these provinces are insufficient to produce more than the bare necessities of life for the population found there, nor will they ever be sufficient, in my opinion, unless there are great developments in the line of mines, cattle, and coffee. If we raise the ideals of the Igorrote up to things civilized without giving him the power of attaining to those

ideals, we have only made him miserable. The Igorrote should be given more diversified industries and taught the use of better tools and improved methods of agriculture and mining.

Buildings.—The present school buildings are generally very poorly adapted and the sanitation not good. The pueblos of Union and Ilocos Sur provinces have almost all of them had schoolhouses built of brick or stone. In the former province, in most pueblos, the schoolhouses have been wholly or partially destroyed by fire, generally only the walls being left standing. Most of these buildings can be repaired, but three of them are hopelessly ruined, namely, those of Santo Tomás, Agoo, and San Fernando. It is questionable if many of the others are worth repairing. These houses all seem to have been built on nearly the same plan, being long, low, damp, dark structures, exactly on the order of the sugar warehouses in Pampanga Province. There has been little attempt at architectural effect or adornment. I seriously question whether any money should be spent on many of these buildings.

All pueblos but one in Lepanto Province have schoolhouses, and for Benguet I have already submitted recommendations, and will only add that some pueblos there are going ahead and building houses without help.

From T. W. Thomson, acting division superintendent of schools, Nueva Ecija, Nueva Vizcaya, Infanta, and Principe.

The four provinces of the division embrace about 175 miles of the east coast of the island of Luzon, the main range of the Sierra Madre Mountains for about 200 miles, and the greater part of the plain of the Pampanga River, the largest river of Luzon. Naturally the division presents a great variety of interests, and may best be described by considering the provinces separately.

Nueva Ecija.—All of this province, except a strip about 20 miles wide across the northern part, and a strip from 1 to 5 miles along the eastern side, lies in the plain of the Pampanga River, and is low and nearly level. The river with its network of tributaries gives ample facilities for drainage, except during the rainy season, when the entire plain is often inundated. This plain is devoted almost entirely to rice growing, and the inundations are a benefit to the country. The streams are used for much of the transportation, and settlements are usually found near them.

In the central and southern parts of the province the people are Tagalogs, in the southwestern part they are Pampangas, while in the west central and northwest the Ilocanos are the predominating race. It is well to remember also that individuals of these different races are found among the other races. This mixture of different races, speaking different languages, often in adjoining or in different barrios of the same pueblo, presents difficulties in introducing English that are hard to appreciate by those not in the work.

In the extreme northeastern part of the province are four barrios or villages, numbering about 600 people, known by Americans and many Filipinos as Igorrotes. The Spanish and better informed natives call them "Tinguianes." The word "Bago" is also applied to them, to indicate that they are new Christians. Among themselves they are known as "Itnigs." In personal appearance they closely resemble the Ilocanos. For beautifying the person they file the teeth and practice tattooing. At home the men and women usually wear a "gee" string made of the bark of a tree, but when they have visitors or go to the pueblos on market days, they generally wear the usual Filipino costume. These people are very industrious, and in a primitive way raise rice, sugar, coffee, tobacco, and the usual garden vegetables found in the provinces. They manufacture cotton cloth, wicker baskets, and other articles of common use. They are peacefully inclined and know nothing of making themselves secure from attack.

The Tagalogs, Pampangas, and Ilocanos have been described so often that I shall not burden this report with a further description of them. At present the representatives of these races, which include the greater part of the population of this province, are peacefully inclined, and are taking great interest in American ideas and the spread of education and civil government. They are engaged in repairing and building houses, and in a small way, owing to scarcity of animals, in the cultivation of the land.

There are in the province 23 pueblos. All of these are in the plain country except Carranglan, Puncan, and Pantabangan. These are in valleys among the mountains. The total population is estimated at about 180,000. Through the municipal councils, I have made three attempts to take a census, but the returns are such that only an estimate can be made.

A few of the houses in nearly all the pueblos are built of wood, some having

stone foundations or basements and corrugated iron roofs, but the mass of the people live in bamboo-nipa houses. This house has a framework of round bamboo poles; the floor is made of narrow strips of split bamboo lashed to the joists with bajuco; the sides are made of split bamboo or palm leaves or grass lashed to a framework of bamboo, and the roof is made of palm leaves or grass. These houses are usually elevated on posts from 6 to 10 feet. The middle-class Filipino has little use for furniture; often a bench from 6 to 8 feet long and a fire pot are the only articles necessary to accommodate a large family.

As he does not need furniture, he accordingly builds his house small. His bed is a mat woven of grass and spread on the floor at night and rolled up during the day. A peculiar feature of their life is that while the women are not considered equal to the men socially, they do all the marketing, hold the family purse, and are, in fact, the controlling power in financial affairs. The American teacher who desires full and regular attendance and a successful school will obtain the results much easier by cultivating the good will of the women.

Mountain tribes.—The mountains of northern Nueva Ecija and southern Nueva Vizcaya and the range extending through eastern Nueva Ecija and between Nueva Vizcaya and Isabela and the range west and northwest of Principe are inhabited by various savage tribes, known in different localities by different names. All are called "Igorrotes" by those not well acquainted with them. East of Bongabong the distinctive name is "Aetas" or "Baluga" (Spanish sound to all the vowels). These people are of low stature, average about 4½ feet, have kinky hair, and are very dark. They live by hunting and fishing, trading wild tobacco, dried venison, and bajuco to the Tagalogs living near them for rice. The wild sweet potato is an important article of their diet. The men wear the usual "gee" string and the women wear a skirt about 18 inches long made of yellow bark.

These tribes are all very much afraid of a white man, especially if he be armed, and on his approach will disappear in the jungle or grass. Their fear does not extend to the unarmed Tagalog, however, and during February, March, and April—their mating season—the favorite pastime is to ambush small parties of their enemies and secure their heads for presentation to the father of the beloved maid. When a victim is secured, they cut from the upper point of the sternum, diagonally downward on both sides through the nipples, to the region of the last rib, then across, and remove the heart and lungs as a choice morsel for the feast. While at Carranglan in February I saw two victims of their savage lust, and last week they entered San Quintin and butchered five men.

North of Pantabangan the wild people are known as "Abalous." They have long straight hair and the men wear a mustache and some beard. Their customs are much like the Aetas.

North and east of Carranglan is a tribe called Ilongotes. These people are lighter in color than the others, and are as large as the average American. The hair is straight and cut off around the head about an inch above the ears. Below this line the hair is plucked. Their habits and customs are nearly the same as the other tribes. All are known as "head hunters." No estimate has been made of the number of any of these tribes; however, I think there are not more than 3,000.

Nueva Vizcaya.—This province, lying north of the Caraballo Mountains and west of Isabela, includes the valley of the Magat River and the slopes of two mountain ranges, one on the east and the other on the west.

In a letter dated January 15, Mr. W. B. Freer, deputy division superintendent, says:

"The province is considered by those who have traveled over Luzon to be the best in the island in perhaps every respect except its remoteness. The products are rice and coffee first, sugar, salt, camotes, Irish potatoes, and the usual tropical fruits. We see in the market also green and mature onions, beans, fish, poultry, eggs, cabbages, turnips, beets, and tobacco. Coffee is not cultivated but grows wild. Sweet potatoes are large and fine. The sugar is inferior to that around San Isidro.

"This is a good stock country, and there were numerous herds of Australian cattle before the insurrection, but practically all were lost.

"The climate is the coolest in the island. At present I am compelled to wear a flannel shirt all the morning and sometimes all day to keep warm.

"The people are superior. Of course the great majority are poor and ignorant, as elsewhere, but even they are superior to the poor in other provinces. In the towns there are many families who are educated and refined—of course the degree of refinement is not up to that of the Caucasians. A number of families here send their young people to Manila or Hongkong to be educated."

In this province there are about 50,000 Cagayans, 50,000 Ilocanos, 5,000 Guduungs, and 60,000 Igorrotes. The first three races are civilized, have comfortable houses, engage in agriculture, and some are educated.

The Igorrotes are inferior to the others, yet they are industrious and friendly, and desire American teachers.

Four American teachers were sent to this province in November, 1901. Under their management, and with the help of 20 native teachers, the school enrollment is more than 1,500 pupils. Old and young are anxious to study. On account of the difficulties of transportation the great problem has been to furnish them with school supplies.

Principe and Infanta.—These provinces, occupying the eastern slope of the Sierre Madre range and the narrow Pacific coast plain, have not the large prairie areas that are found on the western slope and in the Pampanga River plain, but are for the most part covered with a heavy forest growth. At Baler, Casiguran, and San José, in Principe, there are probably 1,200 civilized Tagalogs. The province is for the most part unexplored.

At Binangonan and on the Polillo Islands, in Infanta, there are approximately 5,000 people. The majority of these are civilized Tagalogs.

Educational matters.—Understanding a little of the topography of this division, remembering the alternate rainy seasons in the east and west slopes of the Sierra Madre range, with their consequent inundations, and the almost impossible transportation, and the many different languages spoken, we can appreciate a few of the difficulties which the division superintendent must overcome in establishing schools.

The people are generally anxious to learn the English language and at first are very enthusiastic over the idea of having an American teacher and American books; but as time progresses and they see that the learning of English means hard work, and that to have schools they must provide suitable houses and furniture, their ardor cools somewhat. Many of the municipal councils are so impressed with the importance of the municipal government that they think a large "presidencia" of more importance than a schoolhouse. For the past six months the greatest effort has been to provide suitable buildings. During the next half year we shall push the building proposition, and try to have 1,000 wooden desks made.

At present there are in the division 5 wood buildings owned by the municipalities, 9 bamboo buildings owned by the municipalities, 2 wood buildings under construction, 9 bamboo buildings under construction, 12 wood buildings rented, and about 55 schools in bamboo sheds or under private houses.

Of these houses, one, at Cuyapo, is furnished with sufficient homemade wood desks. With this I hand you a photograph of the desk. Two have a few old Spanish desks and the others have nothing but two to five long benches each, usually borrowed from the church. In many of these schools the children are compelled to sit on the floor. During April ten of the municipalities will be given a few American desks.

Attendance.—While the attendance has been all that the American teachers could care for with the poor facilities, it is not satisfactory from the standpoint of regularity. After the novelty of the school has worn away and the teachers require certain work every day, the pupils are inclined to drop out. In three municipalities compulsory laws have been enacted and a truant policeman assigned to look after the absentees. This plan is the best yet devised, but is not altogether satisfactory.

The actual enrollment in the schools of Nueva Ecija under the supervision of thirteen American teachers is 2,328. In schools where there are no American teachers the enrollment is approximately 3,500.

Progress.—The Filipino is a ready imitator, and in some things, as drawing and writing, makes better progress than the average American child. In studies which require the use of the reasoning powers he is slow, and much tact and patience are required on the part of the teacher.

Altogether, I think the young Filipino is quick to learn, and as soon as he shall have acquired a working knowledge of a sufficient vocabulary his progress will be rapid.

American teachers first commenced work in this division during the last week of September, 1901. A part of the results of their work is shown in the first provincial normal institute, now in its third week, here in San Isidro. There are 98 native teachers and aspirants enrolled. The decorum, attention, interest, and enthusiasm shown will compare favorably with that of any similar gathering of people anywhere in the United States.

From S. C. Newsom, division superintendent of schools, Pangasinan, Tarlac, and Zambales.

The leading people are called Pangasinans. The northern and western parts of the province have a large admixture of Chinese blood which produces a type almost as fair as a Caucasian. There are many Chinamen in the larger towns, and nearly all the business of Dagupan is done by them. The Pangasinan-Chinese mestizo is not usually bright, but he is sensible, peaceable, and industrious. In the eastern part of the province are the Ilocanos and a few Igorrotes. The Ilocano is considered an excellent worker. He is a good farmer. Near two places in Pangasinan are bands of Negritos, Mangatarem, and Pozorrubio. There are a few Tagalogs in the province. They are disliked by those "to the manor born" and in turn hold the Pangasinans in utter contempt. * * *

The province of Tarlac has 17 pueblos and 17 American teachers. * * * There is only one pueblo in the province without an American teacher, to which it is advisable to assign one. * * * In Tarlac Province many tribes are represented. The Pampangans are numerous in the south. There are many Ilocanos and Tagalogs. In the north, including Camiling and vicinity, the people are largely Pangasinans. * * *

The province of Zambales has 25 pueblos and 18 teachers. * * * Fourteen of the 25 pueblos are under the supervision of American teachers. * * *

Speaking of the whole province, Zambales is poor and uncultivated. The population is mixed. In the country north of Iba and south of Alaminos there are few people and the country, while magnificent in prospect and possibilities, seems almost barren of civilization. The people here are called Zambalians. They like to live in the hills and are exceedingly stupid and lethargic. * * *

South of Iba and north of and including Alaminos, the people are very different. Alaminos and Bolinao have many Pangasinans, who are generally intelligent and industrious. From Iba to Olongapo the Tagalog and Spanish-Tagalog mestizo predominate. These people are restless, bright, and intelligent. I was much pleased with the spirit of the officials. Doubtless they are "tricky," but there can be no doubt of their intelligence and intellectual superiority. The attitude of this section toward the American teacher is excellent and, I believe, more than half sincere. The presidente at San Marcelino is, I should say, seven-eighths Spaniard, and one of the most intelligent municipal officials I have met in my division.

From David Gibbs, division superintendent of schools, Pampanga, Bulacan, and Bataan.

The provinces of Pampanga, Bulacan, and Bataan have a population of 470,000. They are situated on the northern and western border of Manila Bay.

The province of Bataan is a peninsula between Manila Bay and the China Sea, formed by an extension of the Zambales Mountains. The coast on the China Sea is hilly and has but little cultivated land. The hills and the mountain slopes are well wooded. Lumbering is the important industry. On the bay side the foothills and a narrow plain form a strip of very fertile land. Rice, sugar cane, camotes, cocoanuts, and bananas are grown for the Manila market. The greater portion of the province consists of mountains densely wooded to the tops. Timber is a very rich source of income to the people. The methods of lumbering are laborious and very wasteful. The timber must be cut miles from the coast. The log is squared by hewing, often cutting away a large portion. It is then dragged through the narrow mountain trails to some stream and finally floated to its destination, where it is shaped into a banca or sawed by hand. Modern tools and methods of lumbering must be introduced. The valuable trees stand far apart in the forest. No timber is being planted. The mountain soil becomes unproductive when bared and allowed to wash away. The proper care of the forests should form a portion of our education of the people and will call for special attention from the government.

The provinces of Pampanga and Bulacan lie in a broad, fertile, well-watered plain, 40 to 50 miles wide, having the Zambales Mountains on the west and the Bulacan Mountains on the east, and extending from Manila Bay on the south to Dagupan on the north. This is the great rice field of the Philippines. Every portion of the plain can be irrigated. The provinces are crossed by many rivers.

In the region about the bay there are extensive nipa swamps. Here fishing is the great industry. Crabs and oysters are abundant. There are extensive fish ponds, which are regularly stocked, and the contents later sold at auction. The

products are of an inferior quality. Proper methods of culture, better varieties, and good methods of drying and preserving are greatly needed.

In the region extending from the swamps and gradually sloping to the foothills, agriculture is the great industry, and rice and sugar cane are the important products. The methods of gathering, thrashing, and hulling rice are crude, laborious, and wasteful. There is no idea of rotation of crops, no fertilization of the soil. There is great need of instruction in agriculture. Modern methods, tools, and machinery must be introduced. The relation of products and soils must be studied. The people are governed in agricultural and industrial matters as in their religion—largely by prejudice and superstition. There is no forethought, no planting for the years to come. The mango tree insures a profitable income, but the trees are not planted. There are no mango orchards. Banana orchards are common, but they are not cultivated, and are of a very inferior quality. Everything possible is left to nature.

In the manual industries there is also a good field for educational effort. The Filipino is not a manufacturer. With the exception of a few minor articles he imports all his manufactured goods. He can weave cloth, make water jars, hats, bolos, bancas, carriages, and bamboo furniture. Even these simple articles seem to be controlled by localities. In one barrio every house is the home of a potter. In another, blacksmiths dwell door to door and buy their jars from the neighboring barrio, or their hats from another. Potters' clay is common throughout the region, yet only in one locality is the making of pottery an extensive industry. The Filipino is quick to imitate, but lacks initiative and business enterprise. His constructive imagination must be awakened. Industrial education will introduce new ideals, increase the earning power of the individual, open the way to widening influences, and the suppression of superstition. Education for life is a new idea, but it is the idea most needed. The public elementary and provincial schools must interest the coming generations in the soil and in manual occupations. The Filipino will never be a philosopher, nor deeply a scientist. He may develop linguistic and literary powers, but on the whole he must remain a man of the soil and of the saw. Education for culture is also necessary that prejudices and superstitions may be overcome, and that the Filipino may understand his true position in the world and learn methods of self-development.

The public school has come to a people living in the most fertile country in the world, but who live from day to day on a little rice, whose children lack sufficient food for proper growth, who cultivate the soil with crude implements, and show little forethought in their planting; who, living in one of the most healthful countries, yet maintain a very high death rate, and who, dwelling in a beautiful land, have no literature, no poetry, and no art. Everything in the geographical conditions has favored the people. But they have been church-ridden for centuries, trained in superstition and deceit—industrial and political slaves. An education which will first bring the coming generations to understand and to take advantage of the natural conditions surrounding them, and secondly open the way to the culture and the progressive ideals of the civilized world, is necessary. The public elementary schools already established have made a good beginning and have done more than anything else to secure the good will of the people and to impress them with the importance of improving their condition as the first necessity.

From F. T. Clark, division superintendent of schools, Rizal and Laguna.

The division of Rizal and Laguna includes the territory immediately surrounding Manila and Laguna de Bay. It is a beautiful and picturesque country, in many places capable of almost unlimited natural development. The division extends but a little way south of Manila, where the fishing towns of Malibay and Parañaque are situated. Las Piñas is the most southern town, and lies close to Cavite. Pasay is regarded as a sort of suburb of Manila, and here there is an extensive race track.

To the north is Caloocan, with its huge cockpits. Malabon (Tambobong), a town of nearly 20,000 souls, furnishes fish for Manila from Manila Bay. Navotas, just across the river from Malabon, is regarded as wealthy for a fishing village.

The country toward the east is crossed by the Pasig River, and the entire course of this stream is marked by villages which might almost be regarded as one large, loosely connected town. The Mariquina River flows into the Pasig just below the town of Pasig. It follows a rich valley far into the mountains in the north of Rizal, and much of its course is marked by rich paddies of rice. The town of Mariquina makes many of the native shoes found in the Manila markets, and has

a thriving, industrious population. Pasig itself, the capital of Rizal Province, manufactures much coarse pottery, such as the native red water jars.

Farther on toward the east, and reached by carromata over a fine road through splendid rice fields, is the town of Cainta, historically interesting as having for its inhabitants the descendants of those Sepoys who revolted from their English leaders during the English occupation of Manila, and settled in this town, where many of them still boast of their pure Indian blood. They have fine, regular features, quite different from the neighboring Tagalogs, and but for their dark skins might belong to the Caucasian race. Farther still is Taytay, and beyond that, Antipolo, a mountain town which owes its existence to the celebrated statue of Our Lady of Peace, carefully guarded in the church. The value of the jewels of this statue is variously estimated at from $50,000 to $4,000,000, and certainly she is a splendid sight as she stands in her niche, lighted by candles, and gazes calmly down upon her worshipers. Morong, the ancient capital of Morong Province, is a rather desolate place now, though its people are happy and hopeful of better things. Near it in the mountains are several villages of Negritos, the primitive inhabitants of the islands. The country north and east of the lake as far as Laguna is poor agriculturally, but its mountains contain valuable timber and, according to some accounts, much coal and valuable minerals.

The province of Laguna consists of a level tract several miles wide along the eastern and southern shore of the lake, backed by a sweep of wild mountains, among which are Banahao and San Cristobal. The province is at present under military rule, the ports closed, and business at a standstill, but, in spite of all this, local affairs move on, the people buy and sell on a small scale in their towns, and there are few signs of military occupation. The insurrectos, who give trouble, are hiding in the uplands and among the peaks, and are rarely heard from in the immediate lake region. The low section of country, following the curve of the lake from the east to the south, is the garden spot of the world. Cocoanut groves extend on both sides of every road for miles and miles, and far up among the foothills to the dreary elevations where the soldier's "hike" begins. There is no tropical fruit which does not grow here. San Pablo is in a perfect bower of oranges. Biñan raises the finest chicos of the province. Lanzones and bananas are too common to mention, while papaias and mangoes fall to the ground for lack of enough inhabitants to eat them.

This division is inhabited almost exclusively by the Tagalogs, and I have found them a generous, hospitable, high-spirited people, many of whom are able to read and write Spanish and Tagalog, and who have taken up the study of English with enthusiasm. The inhabitants of Laguna, in particular, are a fine race. I have never seen anything more exquisite than the hospitality of a Tagalog gentleman of this province—the happiest possible upgiving of self to the enjoyment of his guest, but absolutely without self-assertion. I often feel like a barbarian among them.

Schoolhouses are being built everywhere, and English education is prospering. Everybody tries to speak English, even if it is only "hello!" I am constantly meeting children who are able to take part in quite a sustained conversation, and young men and women have everywhere become eager students. Many towns are clamoring for American teachers. In this town of Pagsanjan the American teachers tell me they might have more men and women than they could teach every night in the week till 11 o'clock if their own health would stand the strain. I not only feel encouraged over the state of things, I feel jubilant. I know these people are capable of fine things. I believe they are capable of the best things. And I fully believe that if I had American teachers enough to place one in every town that has sent in a petition, the result as a means of pacification would not long remain doubtful.

From M. A. Colton, division superintendent of schools, Cavite, Tayabas, and Batangas.

The division of Cavite, Tayabas, and Batangas is the Tagalo country. Batangas is the heart of it. Here in Batangas the Tagalo language is uncorrupted, comparatively speaking, and old Tagalo customs still hold. The feudal system reigns supreme. The economical, the political, and the martial battles are still fought by serfs for the "principales." The common "hombre" does not count. Caste is still recognized and somewhat well defined, although it shows some clear signs of breaking under certain influences of later years in addition to unfavorable environment of long standing, e. g., contact with Cavite, Manila, etc. In the

first class are those who do no manual labor, including their women, who "toil not, neither do they spin;" the second consists of shopkeepers, etc.; the third class is composed of the common workman and laborer and of the rabble. The gulf between these classes is not impassable; wealth may bridge it. Marriage customs and the conventions of courtship are quite fixed. Custom and long years of not very hard servitude have sapped the initiative of the common "hombre" and rendered him contented with his serfdom. His lord, or "principal," the landed proprietor, in return cares for him, e. g., gives him floor space in which to put his "petati" if he comes to town, or is "reconcentrated," and is his protector if he is prosecuted or arrested. In short, the principal thinks for him. He digs, votes, and fights loyally for his lord.

In Cavite Province all this has been changed, especially by long years of subjection to the friars, until class distinction based on old Tagalo customs does not exist to any appreciable extent. The principales were largely forced into the second class and many of the lower class have been raised into the second class by being trusted servants of the friars—left in charge of the property, with more or less authority. Thus until recent years the classes in Cavite were reduced to two—second and third. The friars themselves, by gaining possession of the land, displaced the first class. There are still remnants of the feudal system, and chiefs in every town who have their "clientèle," but social distinctions are not so well defined. Even the remaining representatives of the first class owe their existence to compromise with the friars and subservience to them, and to the need of the government of a few men in each town between whom to alternate such offices as gobernadorcillo. Now under American rule politics runs high, family feuds are frequent, as formerly, and the presidentes are largely elected by their own "clientèle" and faction. The second class, too, kissed the friar's hand. The common man was subjected economically and politically to the friar. As hinted above, dating from the beginning of the sacerdotal cataclysm of 1895, and for other various reasons, the principales are coming into their own in Cavite Province. A minor factor is the Cavite arsenal, now employing about 4,000 men, and even in Spanish times forming a nucleus of loyal natives who spoke Spanish, or, to be more accurate, who used chabacano, or the "lengua de tienda."

In the remainder of Cavite Province, notwithstanding the nearness of Manila and Cavite, Spanish is not spoken much more than in Batangas and Tayabas, owing to the former wealth of the "principales," especially in Batangas Province. Everywhere Spanish is the polite as well as, of course, the official language. Of the average town council about three-fourths or more would speak Spanish. To give an example of the use of Spanish as the polite language, if the presidente of, say, Mauban, Tayabas Province, went to call on the vice-presidente, they would talk Spanish; as the presidente walked home, if he met a friend he would talk Spanish; but when he arrived home he would of course talk to his wife and children in Tagalo. If he gave a dance that evening he and his guests would talk Spanish, at least, as many of them as could. Spanish to him is the sign of education and culture, and must be used in public, much as he presents knives and forks to his invited guests and himself appears dressed in European clothes, whereas in the bosom of his family he wears his Tagalo gauze shirt and in all probability eats with his fingers. It should be noted, however, that the "principal" gracefully throws the rice ball into his mouth from the fingers with great "delicadeza," and not as the common "hombre" does. For reasons just indicated it has been difficult to wean the better classes from Spanish, but we are slowly making our way. They do not in any way oppose English except in so far as it is in opposition to desire Spanish at the same time with English. With the establishment of the secondary schools we hope to reach this class better, and to reach those whose pride does not permit attendance at primary schools on account of age. Again, the serfdom mentioned above affects our attendance, but we have in school many more than we can accommodate.

In Cavite Province rice is the staple product; in Tayabas the chief crops are rice and cocoanuts, with a little hemp. Coffee and sugar were principal crops in Batangas previous to 1895, since which date little but rice has been grown. Important subsidiary crops are hemp and oranges. The climate is considerably cooler in the mountainous parts of all these provinces. Lucban, in Tayabas Province, is perhaps the coolest place in the division, and must be some 1,500 feet above sea level.

I have suffered from the cold there so that while sitting in the house I was obliged to wrap myself up in an army blanket to keep warm. It is a very interesting little manufacturing town, and has our banner average attendance of 550. It is situated near the mountain range running from northwest to southeast and

dividing Tayabas Province into two parts, almost without communication, the one with the other, such communication being by means of two nearly impassable trails, one from Lucban to Mauban, the other from Laguimanoc to Atimonan.

The common hombre in Batangas has fought for liberty only because he was told to do so. There is no evidence that he cares to change the conditions of his servitude, whether under American or Filipino rule. At the beginning of the reconcentration, as many as a hundred hombres would be housed by one "lord" in his own house; now they have shacks. Owing to the conditions of sparse settlement of the barrios formerly, reconcentration is seen in model form at Tanauan, Batangas Province. Each barrio has its own square in the camp of nipa shacks, and each square has its schoolhouse. There are about 2,000 children enrolled, which is, it seems to me, unparalleled in the history of the world.

From W. H. Hilts, division superintendent of schools, Camarines, Albay, and Sorsogon.

Transportation throughout my division is an exceedingly difficult problem. Owing to the death of all native ponies and nearly all the carabaos, it is almost impossible to get from place to place, and I have to depend on the military officers in most places for transportation by cavalry horses, or walk; and the condition of the roads at this season of the year makes traveling difficult in either case. * * *

As a result of recent local outbreaks by insurgents in different places, I have been advised by military authorities not to travel without a strong escort, but I went through these places, sometimes at midnight and alone, and was not molested. * * *

In the province of Albay, I found schools in as favorable a condition as could be expected at the present time. There seems to be an abundance of money, Albay being considered as one of the richest provinces in the archipelago. Its production of hemp is 40 per cent of the entire output of the archipelago. * * *

The chief hindrance to the school question is the lack of school buildings. This is not due to the lack of funds but to the fact that during the recent insurrection nearly all of the school buildings were destroyed by fire. Evidences remain of what were originally very fine school buildings, and some walls are still standing. * * * Governor Betts is intensely interested in the school question, and he has the confidence and respect of his people, and his wish is their law. * * * Some of the buildings used for schoolhouses are in a dreadful condition, poorly adapted and unsanitary, but they have already begun the erection of suitable buildings. * * * In view of the condition in the province of Albay, I have no special recommendation to make nor assistance to ask for. * * *

Of course we must expect some opposition on the part of the church, and already the padres are organizing private schools, and some of them are to have some instruction in English. In fact, some of the padres have gone so far as to offer some of my teachers a proposition with better financial inducements, if they would take charge of the English work in the padres' schools. * * *

It will be almost impossible to get to Catanduanes or to travel over it if I could get there. * * * I have had no reports from the teachers stationed there, and I can not hear from them as to conditions and needs in time for your January report. The governor has been there and says the people are very enthusiastic about schools. * * * If the provinces of Albay and Sorsogon were provided with launches for civil officers, it would simplify matters considerably. * * *

The devastation throughout the whole province, caused by the insurgents, is most deplorable. Albay, Daraga, Guinobatan, Camalig, all large and beautiful towns, were totally destroyed. Daraga was the wealthiest town in the province, and the ruins give but a small idea of its past grandeur. * * *

Sorsogon is torn up most of the time by small insurrections, but news of which seldom reaches the authorities at Manila. One such occurred while I was there, and apparently great numbers of natives were killed. So far they have not interfered with schools, and I think we will be left alone.

The problem of transportation in Sorsogon is even worse than in Albay. There are no regular boats plying between the various ports, and it is impossible to travel overland on account of the nature of the country, hence one must depend on bancas or exhaust his patience waiting for the army launch, which goes on special errands when so ordered. * * * The lack of Filipino teachers is greater than in Albay, some schools being entirely without them. In my opinion, Sorsogon needs no special help in a financial way.

From H. G. Squier, division superintendent of schools, Masbate, Romblon, Marinduque, and Mindoro.

Up to a year ago this was one of the chief stock-raising provinces in the archipelago. At that time the cattle alone numbered from 150,000 to 200,000 head, while now, owing to the rinderpest, there are barely 5,000 in the entire province. Horses, however, are here in goodly number.

This heavy loss, together with the destruction of towns and farms during the insurrection, has completely paralyzed all industries.

The climate is very cool and healthful. The soil is exceedingly fertile. A great part of both the islands of Ticao and Masbate consists of low rolling grass or prairie lands, the natural pasturage for thousands of cattle and horses. In the valleys numerous groves of cocoanut palms and abaca (hemp) are found, while on the sidehills rice, bananas, and camotes (sweet potatoes) grow in abundance. The inhabitants are very poor, but appear to be industrious. During the past eight months at least 500 new houses have been built in the different towns and pueblos. The work done is of the crudest kind. The people seem anxious to work, but appear at a loss to know which way to turn, for in the past they devoted all their efforts to stock raising and very little to agriculture. The mountains abound in the finest of timber, and several coal and gold beds are now being prospected.

On the islands of Masbate and Ticao there are a number of mountain streams with sufficient fall to enable the establishment of many most excellent water powers, but of the use of this power the inhabitants seem to be entirely ignorant, and are willing to grind out their corn and rice by the slow, laborious method peculiar to the locality. Their cocoanut groves are almost entirely uncultivated. Many young cocoanut and abaca (hemp) trees have been planted during the past six months.

In the matter of education the people are very much interested, and in every pueblo and even in many of the smaller barrios schoolhouses have been erected during the past year.

Several public improvements are under consideration—notably the opening up of a wagon road from Masbate to Uson, the building of a provincial capital building, etc. These improvements are a necessity in order that the people may be given an opportunity to earn the means by which they can purchase the necessaries of life. As to peace and contentment, each one seems to be anxious to assist the Americans in every way he can. * * *

After a very careful study of the conditions and resources of the province, I am firmly convinced that the best possible means of assisting the people, bringing out and developing the dormant resources of the islands, and thus insuring peace and prosperity to all, is by the erection and establishment of a first-class agricultural and trade school at Masbate.

In bringing this matter to the attention of the provincial board of officers, they, by resolution, set aside 30 acres of their best land as a site for said school, and agreed to set aside other tracts if desired.

By the establishment of this school much can be done in bringing about a better and more enlightened cultivation of the lands, and by a judicious management of the choice of work to be done the articles made can be made a source of considerable revenue. Such a school, furnished with good workshops, can be made the center of industrial education for the entire province. It will, without doubt, have even a more beneficial and lasting effect on the future wealth, happiness, and contentment of the people than did England's establishment of factories in their colonies of Afghanistan.

From Barker B. Sherman, division superintendent of schools, Leyte and Samar.

Our first tour proved:

First. That there are many native instructors of low intelligence and nonprogressive, many without other than local education, and many whom years of study abroad have neither trained to studious habits, nor stocked with information, nor stimulated to fertility in methods of teaching.

Second. That there are few architectural attractions, and that the havoc of war and the slow coming of peace are no more powerful deterrents from school attendance than the site, sanitation, and equipment of the average schoolhouse. That in the towns where the sites are worst, excellent and eligible ones exist. It is equally true that in the three respects named, no such lack of interest is observable in churches, tribunals, or warehouses. At San Isidro the frame for a new building stood in the salt marsh, daily overflowed by the tide. At Carigara, where

the people were sinners above all others in their treatment of the school, a swamp filled with foulness and exhaling stench was beneath and behind the principal school building, which had been appropriated for a town hall and municipal offices. From Barugo to San Isidro, as well as in Hinunangan, on the east coast, the children's quarters looked and smelled like stables. The girls' room at Naval had been usurped by 56 goats, which, as I opened the door, started up from the tables, benches, and floors. At Carigara the retiring room had no screen from the assembly hall. In many of the buildings the separation of the floor planks had served the purpose of a "casilla," and in no case was an outhouse provided. The Filipino is perfectly clean; in hygiene and sanitation he is a great transgressor. If the crowded single rooms of the cabin are ever to give place to divided houses, and a resulting reduction of impurity and immorality, the schoolhouse must cease to be an offense.

As far as my assurances have reached, the people and all incumbents of municipal office, as well as actual teachers and applicants for work in the schools, understand that the department views a "título" simply as evidencing what a person knew when it was granted, and looks upon relationship to officials as no qualification whatever. The October examination, which has been commenced already, will probably weed the native teachers, and may bring out some latent teaching material in the different towns. * * *

I am required by the definition of my powers and duties in the school law to present some report of the agricultural conditions existing in the island. The products have been for years practically the same—hemp, tobacco, rice, corn, cocoanuts, and cacao. I place first the crop which is most abundant, because nature does most for the husbandmen, although the price of his harvest depends very much, as in a hay crop, on protection from the rains after cutting. The finest and whitest hemp I have seen was on the west side of the island, the best sample being found at Baybay. Small preference, however, can be given to that section above others. It is rather a matter of diligence of each tao. The hemp captured by the government in Malitbog Bay at the south commanded the highest price in the market, and abaca is the vegetation which meets the eye everywhere in passing about the island. The tobacco plant is cultivated in the vicinity of Maasin, but the land best suited to it runs around from Dulag through Burauan and Dagami and off to Alang-Alang and Jaro. The best quality of the crop is supposed to be found in the territory near the latter town. Cocoanut trees are cultivated apparently more in the eastern and northern part. Rice is raised upon Biliran and on the main island almost everywhere. The best display of it which I saw was in a fair-sized garden at Maasin, where a woman had made the palay (rice) look in its straight, thoroughly weeded rows not unlike a large onion or parsley bed in an Eastern United States market garden. But many a hill slope and many an inland meadow were covered with pala, growing finely. The cattle disease and slaughter of cattle by insurrectos and soldiers have so raised the price of these draft animals as to interfere with the tillage of heavy land. The plow used is a one-handled, excessively long-armed and clumsy tool, with which the tao, instead of furrowing the soil regularly in parallel lines, goes over and around and across the portion desired for planting until he has made it a sort of porridge. Few things can be conceived of so wearisome to men and cattle as steering and dragging a Visayan plow. The bolo is the only hand implement of the farmer. Peace would come faster if this were displaced by the hoe, the rake, spade, and ax.

The fine grazing land lying between the western Biliran towns and the base of the mountain range in that island would raise high hopes in a dairyman's breast. A prime quality of dry, white cheese is exported from Naval to the north shore of the main island. The soil of Leyte is nowhere poor. When it is not a strong clay, it is often a dark, sandy loam, or the result of vegetable decay, and the establishment of fast steamer lines among the islands might develop a market-garden traffic. The true wealth of the eastern Visayas lies in their splendid timber lands. Forestry and tillage go hand in hand, and any proposed agricultural school should have an instructor in forestry. It would be a great pity, for instance, to see a company swoop down on that extensive and heavily wooded promontory between Himinanganan and Hinundayan and clean it to the ground, as some of our most valued watersheds in the States have been bared. The contents of its forests, I am told, are almost wholly molave, one of the first-class trees of the archipelago. I have forborne to say much of maize. It is food for men in some localities, in some chiefly for fowls. Its swift maturity and small grain make it valueless save in the dried state. I have never heard that the natives hulled it by boiling with lye and ate it thus cooked. It is broken into hominy with rude mortars or ground by the simple hand mills into coarse meal.

The people, as a whole, prefer rice. There may at some time be a use for it abroad to save better corn for human needs. But while fowls form so large a part of diet, as among this people, it were better that the maize should save the rice for the natives. * * *

From Gilbert N. Brink, division superintendent of schools, Island of Panay.

I found throughout the central portion of the province of Capiz, and in Capiz itself, a great deal of distress. In the town of Capiz the provincial government was daily feeding about 500 people. In the town of Pontevedra there was an average daily death rate of 11 from starvation. In the town of Pilar a death rate of 13. In the town of Dumalog the padre told me that he buried 400 in the month of June. One could not pass through the various towns without seeing on the streets men, women, and children, hollow-eyed, gaunt from hunger, and shivering from ill health. This, however, is but one side of the picture. The fields were heavily laden with the new crop of rice which will soon be gathered; then the stress will be over. Camotes were plentiful, fish could be had in abundance. The large sugar haciendas are destroyed, and thus a large number who have been accustomed to work on these plantations are without employment, and consequently in distress. These conditions will soon be almost wholly relieved by the harvesting of the new crop.

In the provincial board I found active and earnest supporters. Upon my reporting that a large number of the towns seemed to be unable to pay the salaries of native teachers, the provincial board voluntarily passed a resolution agreeing to allow every town which had need of its money sufficient to pay the salaries of native teachers until such time as the land taxes shall become available. Thus it remains only to be seen whether or not the towns are willing to borrow this money and increase the liability which would thus arise. For the most part I believe they will be willing to do so. * * *

Antique Province is in very good condition. The people are not in want. They are satisfied, contented, and prosperous. The provincial officers have done a great deal for this province. Finances are in good condition and interest in school matters is widespread. Major Holbrook, governor of the province, has been specially active in school matters, has had soldiers detailed to teach wherever possible, and has continually kept school interests before the people. * * *

Iloilo Province has 51 pueblos, a large majority of which are in the interior. The provincial treasurer reports a great deal of poverty in the distant towns and the municipal treasuries as being empty. From all reports which I have received up to date I judge that the interest in school matters is widespread, but that the ability on the part of the town to assist is limited. It will doubtless be necessary, before any marked advance can be made, to secure a large number of schoolhouses. This, under present conditions, can only be done by aid from the insular government. It is probable that some advancement can be made in this line next year after money from the land tax becomes available, but resources from this source will be limited the first year in Iloilo Province and also in Capiz Province, because of the great poverty of the people and shortage in crops. The provincial board has expressed itself unofficially to me as being very willing and glad to render me every assistance possible. With its aid and the cooperation of our teachers a very general progress is insured, but it will be slow and won at a large cost.

The island of Panay is at present wholly pacified. The only disturbing elements are roving bands of ladrones, who carry on a somewhat general course of pillage. The distress among the people, caused by failure of crops, loss of carabao, and ill health, will soon be very greatly alleviated by the incoming crops. The people all over the island are anxious to have schools established for their children. The presidentes are on the whole inefficient, but desirous of having American teachers sent to their towns. The provincial boards are very much in sympathy with our work, have already done good service, and have pledged their hearty support for the future. The Philippines constabulary, which is just organized in Panay, has, through its officers, expressed itself as anxious to lend us every assistance in its power. The conditions of transportation will make the work more than usually difficult, but each of the provincial governments is taking active steps to improve roads in its territory. The educational outlook for the island is in every respect hopeful. Improvement and growth in our schools will, unless some unforeseen event hinders, be slow and steady. It will be the work of years, rather than months, to really touch in any large way the population of the interior.

From George W. Beattie, division superintendent of schools, island of Negros.

I am endeavoring to make myself familiar with the situation in the different municipalities as rapidly as possible. Working to this end, I met the American ladies stationed at Silay and Talisay while accompanying Mr. Stone to his steamer landing in the former town.

A week later I went with an ox team to Sumag and Bago, and horseback the following day from Bago to Maao. It was my purpose to extend my trip to the experimental farm at La Granja, but heavy rains made the rivers impassable, so I returned to Bacolod on the third day.

Last week, by courtesy of Colonel Miner, I went on the ration boat on its trip to the northern and eastern stations of this province, visiting Manapla, Cadiz Nuevo, Danao River near Escalante, and San Carlos, being absent four days.

When I arrived most of the American teachers assigned to this island had been sent to permanent stations. * * * Some rearranging was found necessary after my arrival, several of the towns to which one teacher had been assigned being found large enough to justify the placing of two teachers therein permanently. * * * Colonel Miner advised against stationing women in any of the towns of the northern coast, because of the existence of trouble with ladrones. * * *

Arrangements have been made for a school of higher grade than the primary in Bacolod, and instruction will begin there this week. As the provincial government declined to assist in the matter, the municipality of Bacolod has supplied a room; pupils from the town will be admitted free, and a monthly fee of one peso is to be collected from each pupil from other towns in the province, for the purpose of paying rent and incidental expenses.

While in Maao I was the guest of Señor Juan Araneta, and had a long conversation with him about the agricultural conditions of the island. He is greatly interested in the American way of doing things, having been in California himself, and has experimented with many new seeds, etc. * * *

The idea of a boarding school seems to be inseparably connected with the schools of a higher grade in the minds of Filipinos. From the week of my arrival this idea has been continually presented to me in my conversations with people interested in schools.

Perhaps some form of dormitory system is going to be necessary in order to make a success of such schools. Probably some contract could be made with a Filipino, willing to undertake it, to board and lodge pupils at a certain price. Possibly it will be necessary for the government to supply the house and furniture necessary for operating such a scheme. So far no pupil has come to the grammar school here from outside of the town, though there was an average attendance of 25 Bacolod pupils in the month of November. The lack of boarding accommodations seems to be the greatest obstacle to attendance from other towns. A few are promised for January.

We can make a success of a high school only by putting forth much individual effort to secure the attendance of sons of wealthy hacienderos who now send their young people to Manila. * * *

Ten days of the past month (November) were spent in the saddle visiting schools, and I now have been in every town in Occidental Negros in which an American teacher is working, and to several that have only native instructors. Rumors of activity on the part of ladrones and insurrectos in the southern part of the province led me to hasten in that direction that I might know for myself the condition of affairs and judge of the safety of our teachers on the frontier. The town of Iso, 20 miles distant from the nearest American teacher, was burned about one week before my trip was undertaken. For protection and assistance, my deputy, Mr. Lee, accompanied me, both of us being armed, and over the southern end of the route a native municipal policeman went with us as guide, the road being so bad as to make frequent detours necessary in order to avoid the impassable portions. * * *

Binalbagan was the hardest field to which a teacher of English has been assigned in this province. * * * The presidente put on his white clothes and met us in the Casa Popular. Getting him between us, Mr. Lee and I gave him the worst "raking" he had had for many a day, Mr. Lee supplying the Spanish and Visayan necessary in such a startling manner that the old man trembled from head to foot. In reply to his plea, "lack of funds," "poor children in rice fields," etc., I told him there must be suitable sanitary arrangements, the attendance must improve, and there must be a girls' school before my return next week or I should remove the American teacher from the town. The treatment was evidently effective, for when we returned a few days later the attendance of the boys' school had doubled,

the girls' school had been repaired, the wife of the secretary was teaching a class of girls, and the water-closet demanded had been built. * * *

In Cabancalan the boys' school was large and the attendance was regular. I did not visit the girls' school. * * * Found the presidente an active, interested man. In this town a fine is imposed for nonattendance and seems to be very effective. * * *

After my return to Bacolod, I went north alone as far as Saravia, visiting Talisay and Silay, the two latter being towns previously visited. The presidente of Saravia was out of town, but I passed a pleasant evening in the house of Señor Reyes, a member of the school board, with whom the two American teachers board. The priest at Saravia came in at my request, and we discussed the question of holidays, which had caused some trouble previously. I am hopeful that substantial gain will result from the conference. The presidente of Saravia is active in securing attendance at school, sending the police after absentees. The native maestro is a superior teacher.

Travel in Negros in the rainy season is very difficult to accomplish. Riding horseback is the only practicable way of getting around, and that is often attended with trouble. The road from San Enrique to La Carlota is by far the worst one I have ever seen. For more than a mile it is built through a swamp which apparently has no bottom. We were obliged to pick our way on foot, leading our ponies that plunged to their bellies at almost every leap. To add to our discomfort the rain was coming down in torrents, and we reached La Carlota looking thoroughly disreputable. Another rain soaked us on our way from Jimamaylan to Cabancalan. Coming from Maao to Bacolod on a previous trip, we rode in a heavy rain from 8 a. m. till 4 p. m., finding it necessary to strip and swim one river that was too deep and swift to ford. An American teacher at home would think it strange to be visited by a superintendent plastered with mud and wearing a revolver, but such is life in the Philippines.

The field, however, is an intensely interesting one to me.

The situation bristles with problems, and I am glad of the opportunity to help solve some of them.

Next month will be spent in Oriental Negros, and I hope to know that field as thoroughly as I do the western province.

I have visited every town in Occidental Negros in which an American teacher is located, and have made a special study of the existing conditions in regard to this matter. There are some presidentes whom I respect highly for their evident desire to do the best thing possible for their schools, but the best of them are wholly unfamiliar with such duties and responsibilities as are about to be thrust upon them when the taxes for this year are collected. In other towns the presidentes are absolutely worthless, and will look upon the school funds as legitimate spoil for themselves and their hangers-on. I have in mind particularly one presidente of a town in which a feudal system exists. The entire property of the town belongs to one wealthy Filipino, who is a nonresident most of the year. The inhabitants are serfs. The municipal officers are merely tools of the proprietor and make no move except at his beck and nod. The cockpit is in the yard of the Casa Popular, and the presidente is more interested in betting on fights conducted there than in any official business. The strongest teacher in the island has been located in this town, and he wrote me last week that he believed his time was being wasted. * * *

The present law would not work satisfactorily in America with American school trustees. It seems like inviting scandal to put at the disposal of Filipino school officials more money than many of them have ever seen, giving them opportunity to spend improperly more than all their possessions are worth. * * *

The Filipino is in his element when playing a waiting game, but such a game is death to an American.

From H. E. Bard, division superintendent of schools, island of Cebu.

The division of Cebu comprises the province of Cebu, which is made up of the island of Cebu and the smaller islands of Bantayan, Mactan, and the Camotes. The Camotes, which lie off in the sea about halfway between the island of Cebu and Leyte, comprise the three islands Pasijan, Porson, and Poro and a number of smaller islands. These have a total area of about 150 square miles, and a total population of 11,145. They comprise four pueblos, San Francisco, Pilar, Poro, and Tudela, the first being the most important. The islands are difficult of access. They have no military station and very little trading is carried on.

Nothing has been done as yet with the schools. Two Filipino teachers, one a

lady 50 years old and one a man 30 years, came to the Normal Institute, but soon returned, being unable to make any headway in the work.

The island of Mactan lies to the east of the city of Cebu. It is about 11 miles long and about 5 miles wide. It is divided into three pueblos and has a total population of 13,075. The town of Opon, with a population of a little less than 7,000, is the principal town, and is well situated on the point to the east of the city of Cebu. This is and was the scene of the death of Magellan. The large monument erected to his memory by the Spaniards attracts many sightseers and travelers. There is very little evidence of work of any kind on this island. It supplies a large number of "muchachos" and other classes of laborers for Cebu, whose families, often wives and children, live on the island. The people have nothing to do. There are practically no beasts of burden.

Bantayan lies to the west of the north point of Cebu. This island has an area of 72 square miles and a total population of 14,545. It comprises three pueblos, Bantayan, Santa Fe, and Madridejos. Bantayan is a good pueblo, and the people are greatly interested in everything that makes for progress. Fishing is the chief occupation of the people. Many beautiful and rare shells are found, also some valuable pearls. Many of the women are engaged in weaving piña cloth. No agriculture is possible. An American teacher was stationed at Bantayan for a few months, when he resigned from the department to accept a commission in the Army. The attendance while he was there rapidly increased from 30 or 40 to over 300. The presidente with four of his councilmen came to Cebu in person, requesting that two good teachers be sent them at the beginning of the next school year. This island, like the Camotes, is at all times difficult and sometimes impossible of access.

The island of Cebu is a long stretch of land lying between the island of Negros on the west and the islands of Leyte and Bohol on the east. It is 150 miles in length and extends from south by west to north by east. It varies in width from 5 to 30 miles, the widest place being a short distance to the north of the city of Cebu. The island is traversed by from two to five ranges of mountains. Some of these mountains are only a few hundred feet in height, while others are variously estimated to be from 2,000 to 3,000 feet. There are comparatively few rocky crags or inaccessible points. In fact by far the larger per cent of the land is capable of cultivation, and only a small per cent is waste land. The mountains in many places extend quite to the coast. The coast for the most part is regular. There are no rivers of importance, but there is a large number of river beds which contain water for a short time after heavy rains.

There are some good roads along the east coast south of Cebu and north of Cebu as far as Danao. The roads are good also on the west coast north of Balamboan. The most serious difficulty is the lack of bridges. There are five or six trails across the mountains, but none of them are good. The one from Carcar to Barili is the best, and this is all but impassable when there is much rain.

The island of Cebu has an area of 1,800 square miles and a population variously estimated to be from 450,000 to 550,000. There are 47 pueblos, varying in size and population. All the capital towns and almost all the barrio towns are situated on the coast. Many of them are beautifully situated, with water front and mountain background. The beach in places is exceedingly fine. Practically all the people live either in the capital or barrio towns. Only a few live in the mountains.

Every pueblo has a large church, with convent, and most pueblos are provided with two schoolhouses, generally in bad repair, situated near the church, which is almost without exception prominently situated near the sea.

Among the larger pueblos, aside from the city of Cebu, are Argao, Sibonga, and Carcar. These have an average population of over 20,000, Argao having a population of 35,000. All pueblos are divided into barrios, varying in number from 3 to 33.

The capital city of Cebu is beautifully situated on the splendid harbor, with the island of Mactan opposite and a beautiful range of hills in the background.

The entrance to the harbor is a narrow channel between the mainland and a point of the island of Mactan, on which is situated the town of Opon.

In the city are the cathedral, the church of Santo Niño, the church of San Nicolás, the chapels of the Paulist Fathers and Jesuits, and a large college, having an attendance of about 1,000 students.

There are some splendid public buildings, such as the palace, the Ayuntamiento, and the San Nicolás school building, formerly a cuartel. The old fort "San Pedro," while not large or beautiful, is picturesque and of interest to travelers. It stands on the water front opposite the palace. There are several large plazas,

giving the city a free and open appearance. There are two large cemeteries and a number of beautiful drives.

Cebu is the oldest town in the archipelago, and stands second to Manila in importance. It suffered greatly in the late wars, barely escaping total ruin. In the Spanish bombardment the main buildings were destroyed and the business of the city was forced back two or three blocks from the sea. Only during the last few months has there been any sign of improvement on the water front. The greater part still lies in ruins.

Great general improvements are now being made all over the city. A large number of new homes are going up, also a large number of business houses. The streets are being cleaned, drainage is being improved, and the board of health orders are being carried out in a remarkable manner.

Trade has increased greatly. Shops or stores which only a few weeks ago had a few articles stuck away in the corners now have large stocks, displayed much in the manner of American stores.

Coal is mined at Danao, a town to the north of the city of Cebu, and at Boljoon, on the east coast south of Cebu; also on the west coast near the towns of Toledo, Balamban, and Tuburan. Petroleum wells are located at Toledo and Alegria. Gold dust is found in the sands of the river beds, but there are no mines of importance.

The people for the most part engage in agriculture. There are several industries, such as weaving, brick making, the extraction of cocoanut and beneseed oils, and the making of cheese. Some people in almost every part of the island are engaged in fishing.

The principal products are sugar, hemp, cocoa, rice, maize, coffee, tobacco, cotton, indigo, fruits, and vegetables. Rice and maize are grown in large quantities.

The people of this division are of the Visayan race. The Cebuana dialect is spoken. Many of the people have a large degree of intelligence. They are bright, quick, and eager to learn.

The fact that almost all live in towns along the coast, and are not scattered through the mountains, makes it possible, with proper transportation facilities, to reach the people with convenience.

The persons with whom teachers, and all who are engaged in public instruction, will have to do are the presidente and the padre. Of the two the padre is by far the most important. In this division almost all the padres are Filipinos (all outside of the city of Cebu.) They are the best of their race. In some respects they are simply children, but bright, intelligent children, who have some conception of their responsibility. They are doing the best they know how for their people. This can not be said, however, of all the presidentes. Some of them, of course, are intelligent, patriotic, and have a general public interest, but often it is not so, but rather the opposite.

To make friends with these men is the policy of every American teacher upon entering his field. If he fails to do this with the presidente and succeeds with the padre he may succeed in his school work, but even if he does succeed with the presidente and fails with the padre he is almost sure to fail in his school work. The padre can fill or deplete a school at a word. But he should not fail with either. They are always approachable, truly sociable, and if properly approached, will become most earnest pupils and reliable support.

The schools of this division are doing well. American teachers have been stationed in 17 of the 57 pueblos. In all these, except one, the attendance has been good; in many, excellent. In the normal institute for Filipino teachers held in Cebu, the first ever held in the division, 30 pueblos were represented. Many came at great personal sacrifice.

The primary schools in the city of Cebu have been in progress since July, 1901. While the work has been successful in the past it has a brighter future. There are two central schools, one in Cebu proper and one in San Nicolás. The one in San Nicolás another year will have a large building, large enough to accommodate 500 children, and capable of being enlarged so as to accommodate many more.

Better buildings are needed in the barrios of Cebu. Little can be done for the barrios of the other pueblos until another year. While some of them have fairly good school buildings it will be in most cases impossible to station American teachers in them. The capital towns have first claim, and they will more than exhaust the supply. Filipino teachers are not yet prepared to do the work, and if they were the municipalities would not have the money to pay them. Lack of money is the most serious question at present. The number of pueblos should be reduced to 45. Better facilities for transportation are imperative.

From L. T. Gibbens, acting division superintendent of schools for Bohol.

The islands of Bohol and Panglao, which comprise the province of Bohol, have an area of about 1,100 and 40 square miles, respectively, and a population of 240,000 inhabitants, of whom 30,000 are children between the ages of 6 and 14 years. The province consists of 16 pueblos or townships; the principal town is called the pueblo and the other towns barrios. The pueblo is the seat of the municipal government.

The islands of Bohol and Panglao are almost surrounded by one or more reefs, and the coast waters contain many hidden coral rocks. Deep-draft vessels can not approach near to the coast, and light-draft vessels must do so with caution. Roads are fairly good, being mostly of outcropping rock, bared by scraping the surface soil. Streams are few and are bridged with good wooden bridges. Trails vary with character of surface of surrounding country, from the excellent wide trail between Bilar and Carmen to the very difficult one between Balilijan and Antequera. There are three parallel ranges of mountains extending northeast and southwest, the outer ranges being near the coast. There is practically no level country, except a strip on the coast and a plateau between Balilijan and Catigbian, and also one from Bilar, extending and merging into a wide plain to the northeast coast. The mountains are rugged, but not extremely high.

The islands are of coral rock, which outcrops frequently. During the dry season water is scarce and grazing is very poor. Horses and carabao are scarce, except in the region between Ubay and Guindulman. Carts, carriages, and wagons are very scarce and poor.

Agriculture and fishing are the principal industries. Stock raising is carried on to a limited extent in the northeastern part. Some rice, corn, potatoes, hemp, and sugar cane are grown, but not enough for home supply. Cocoa trees abound, and copra is the chief article of export.

The inhabitants are Visayans, with a few Tagalogs, and are, in the main, densely ignorant and superstitious. Very few speak Spanish or have traveled farther than to Cebu, 50 miles away. Several dialects are spoken, each of which is claimed by the speakers to be the true Visayan. There is more dissipation and "shiftlessness" than is found among the natives of other islands farther north.

A provincial high school with industrial department will soon be constructed in Tagbilaran. Ten thousand dollars, local currency, is now available for that purpose. On account of the insurrection, which closed last December, and the impoverished condition of the pueblos, very little work in educational matters has been done beyond the near vicinity of the capital, Tagbilaran. During the month of December, 1901, 72½ per cent of the total school population of Tagbilaran and barrios were in attendance at school, where the instruction was given in English. Four night schools, three nights each week, and one teachers' class, daily, have been in session since January 7. Prior to this time three night schools were held three times each week. Day schools have been in almost continuous session for ten months. Twenty pueblos and barrios are represented in the teachers' class. All who applied for admission to night school could not be accommodated.

A private school was opened in the convent January 7, which caused a falling off in the attendance of the boys' public school for a few weeks. Now the enrollment is very near that of last December. The instruction in the private school is religious and is conducted in the Spanish language and Visayan dialect.

With the advent of civil government in this province and the subsequent organization of a competent constabulary force, so that traveling will be safe, the schools may receive close supervision, and I believe we may anticipate prompt and active cooperation from the better class of natives.

From Henry S. Townsend, division superintendent of schools, Mindanao, Jolo, and the Calamianes.

A large increase in attendance has been brought about in the Calamianes through the opening of a goodly number of new schools. This is due chiefly to the intelligent zeal for education of Maj. W. Le Roy Brown, in command of the fourth military district. A number of new schools have been established also in that part of Davao lying on the east coast of the island of Mindanao, for which Filipino initiative is largely to be credited. Some of these lie north of the province of Davao as laid down on the post-route map, but within the province as administered by the military authorities.

It is gratifying also to be able to note a very large increase in attendance at certain schools. This is especially the case in and around Croquieta, where

schools are crowded beyond their reasonable capacity and teachers are given more work than they can well and thoroughly do.

The governor of Misamis tells me that the immediate vicinity of Cagayan now has 22 students in Manila Normal School and that a much larger number would attend such a school if located in Cagayan. Without having made further investigation than conversations with the governor and the presidente of the municipality of Cagayan, I feel pretty safe in recommending this as a suitable place for the establishment of a regular and permanent normal school.

Before this can become a success, however, pretty positive assurance of better pay must be offered. Educated young men are not going to spend their time and money attending a normal school with 14 pesos a month held out as the material inducement. Of course, conditions have been exceptionally hard during the transition period through which we are passing. Nearly all municipal officers seem confident that they can handle the situation after a short time. In many cases I believe this will prove to be true, but in others I am far from confident of the outcome.

The land tax will be collected in sufficient quantities to meet all needs in such places as Cagayan, and, in fact, throughout most of Misamis Province. But in Iligan, for instance, it will amount to little. The commanding officer of that post expresses the opinion that most of the land held in the municipality will be abandoned when the tax is assessed and demanded. * * * The situation is less hopeful in Dapotan than in Misamis. Surigao will fare about as well as Dapotan, I think, though I have less knowledge of the conditions in that province. In the south the financial situation seems to me practically hopeless, as a very large majority of the people are "non-Christian," and therefore not landholders. In the Jolo Archipelago and Paragua the land tax will be a "negligible quantity." In the Cuyos the situation will be easy, but such will not be the case in the remainder of the Calamianes. On the whole, I see no way out of the difficulty except that pointed out by the advisory board, viz, the collection of the school tax and the payment of school expenses, including salaries of Filipino teachers, by the insular government. * * *

Having considered briefly the means of improving the quality of work done in our schools, I now turn to its character. That it is the work of the educator to take the people just where he finds them and help them to take the next step forward in their own line of development probably needs no proof or discussion here. Accepting this as the ruling principle of my work, I find myself impelled to change the character of the work as I find it as fast as circumstances will permit. It is the purpose of education to make children more efficient in the very things they will have to do. Education signifies power, not power over imaginary, but actual environment. A short time ago I visited the schools at Matti, Davao Province, and surprised the teacher and girls at work making piña cloth. At first they seemed ashamed of the work and tried to conceal it from me, but I was so much pleased and said so much in favor of the work that they came to have a new ideal. * * * Wherever practicable I have had the Filipino teachers teach sewing, and they have proved exceedingly efficient. * * *

The Bogobos, near Davao, are in need of help. From time out of mind they have cultivated their crops thus: First a piece of forest land is cleared and planted with upland rice. By the time the rice is ready to cut the cogon has sprung up. A crop of corn follows the rice and by the time it is ready to pick the cogon is as high as a man's head. It is practically impossible for the Bogobos, with their fork-stick plows and bamboo spades, to cope with this grass, so the next step is to clear another piece of forest land. Now comes the Commission commanding that no more forest land be cleared, and the Bogobos are facing starvation. * * *

Mr. F. W. Abbott has been directed to look up the chances for securing land for an elementary agricultural school at or near Santa Cruz, and report at an early date. When he reports I shall probably ask to send a man there with a good plow and some hoes, to show the people how they can get a good food supply. Perhaps he will take some books, too. I am sure these Bogobos will thus be filled with aspirations for better things—that is to say, better plows and hoes. Art and literature can wait. The desire for better tools may be used for an incentive to work along their own lines. Then the Bogobo teachers will be possible and useful. * * *

Mr. Abbott is to look up the case of the Mandayas, also; and I have in mind already a pitiful race near Cottabato, known as the Tirurays, who seem to be worthy of better things than they have reached. When I shall get around to them I can not say. The Maguindanaos, or Rio Grande Moros, are a very strong race, and Major Febiger, in command at Cottabato, is confident I shall find them ready for industrial education. * * * Since beginning this report I have

received a message from the chief dato of Tawi Tawi, asking for a school and promising to pay all expenses, including the salary of the teacher. Just what character this school will take I can not say, but I shall try to make it as useful as possible to the people.

VII.—AMERICAN TEACHERS.

Teachers have been appointed both by letter directly and by authority delegated to various heads of normal schools and colleges, together with State officials, upon whom I deemed it wise to confer a limited appointing power, owing to the great distance and the impracticability of personal conference with the applicants, and in whose judgment and integrity I had confidence. About half of all the teachers were thus appointed by power delegated to the following institutions and men:

List of institutions and men to whom power of appointment was delegated.

About 200 of the early appointments and practically all of the late ones have been made directly by letter, and have had for a basis more than 12,000 personal written applications, with testimonials appended—the recommendations of normal school principals, college presidents, and State officials, and the personal certification of the qualifications of applicants by leading educational men in the United States with whom I am personally acquainted, or whose character is well known to me by repute.

The character of the teachers' applications from the United States has been varied and indicative of a great interest in Philippine affairs. While men of nearly every profession and, doubtless, a large number without any profession, have applied for appointment to educational work in these islands, quite a number of capable and enthusiastic teachers holding good positions in the United States, and vouched for in the highest terms, have signified their willingness to accept work here at the same salaries and, in some instances, at smaller salaries than they are now receiving at home. The schools and colleges have also manifested a great interest in this work, and their hearty cooperation has been freely given in the securing of teachers. In making appointments care has been taken to secure professional teachers, i. e., men and women who are in sympathy with the work and are making it their vocation in life. The fixed requirements for appointment, as tabulated in circular letter to applicants, were:

1. Applicants must be either normal or college graduates.
2. They must have had several years' successful experience in school work and be now engaged in teaching.

3. Copies of testimonials and a late photograph should accompany each application.

4. They must be physically sound and able to withstand a tropical climate and willing to accept whatever location may be assigned to them by the general superintendent of education. A certificate of good health from a reliable physician will be required of all appointees.

The department of education desires to hear from only those who can fulfill the above conditions.

In cases of the more important appointees, special and thorough investigations have been made. No religious distinction has been made, nor has any race line been drawn—the sole desire being to secure competent, enthusiastic teachers of the highest character. However, it has been deemed wise to require that appointees shall be citizens of the United States.

General Orders, No. 145, Headquarters Division of the Philippines, granting discharge here to soldiers of volunteer regiments under orders to proceed to the United States for muster out, have given opportunity for the appointment as teachers of soldiers who have been detailed as teachers at the post of their company, or those who had the necessary qualifications and experience as teachers in the United States. A letter was sent to all such applicants directing them to report at the office of the general superintendent for examination when their regiments reached Camp Wallace. Owing to the inability of the soldiers to prepare for it, this examination was not made difficult, but special investigation of the character, habits, and general qualifications of each applicant was made. The demand for teachers from all over the archipelago was so great that several applicants with exceptional energy and education, but without previous experience as teachers, were appointed. Some of the very best teachers in the department came here originally as soldiers, likewise, most of the inferior class.

The total number of soldier applicants who have taken examinations is, approximately, 500, of whom 80 have passed satisfactorily and been assigned to schools in the various islands.

After the arrival of the American teachers, the standard of examination for applicants here in the islands was raised decidedly, with the view of protecting the quality of the teaching body by demanding evidence of a training equal to that of the ordinary normal school or college graduate.

The following is a sample set of examination papers now used:

General statement.

1. Name, ——— ———.
2. Manila address, ——— ———.
3. Other address in Philippine Islands, ——— ———.
4. Residence in the United States, ——— ———.
5. Age, ———.
6. Occupation, ———.
7. Educational institutions attended or from which graduated, and time spent in each, ———.
8. College or university degrees held, ———.
9. Experience as teacher:
    1. Number of months, ———.
    2. Nature of work, ———.
    3. Where, ———.
10. Can you teach music, drawing, and manual training? ———.
11. Knowledge of Spanish, ———.
12. Knowledge of native dialects, ———.
13. Military service, ———.
14. References in Manila, ———.
15. Where best acquainted with local conditions, ———.

General statement—Result of examination.

Instructions to applicants for appointment by examination.

QUALIFICATIONS.

1. Applicants must be either normal or college graduates or of an equivalent education.
2. They must have had at least two years' successful experience in school work. Copies of testimonials should accompany each application.
3. Two references who can vouch for the moral character and personal habits of the applicant must be given.
4. Applicants must pass an examination on the following subjects:

	Credits.
a. Arithmetic	100
b. Political geography	50
c. Physical geography	50
d. American history	50
e. General history	50
f. Current topics	50
g. School methods	50
h. Composition	50
i. Dictation	50
j. Grammar	100
k. Physiology and hygiene	50
l. Algebra	50
m. Civil government	50

5. A certificate of good health from a reliable physician must be filed with each application.
6. A contract to serve two years and accept whatever location may be assigned him will be required, if the applicant successfully complies with the above conditions and passes a satisfactory examination.
7. All papers, testimonials, certificates of character, health, etc., must be handed the examiner before beginning the examination.

In taking the examination, applicants must very carefully comply with the following directions:

1. Head each paper with the name of the subject.
2. Write your name in upper right hand corner of each separate sheet.
3. Write only on one side of the paper.
4. Leave a space between the answers given.
5. Read all papers over carefully before handing them in to the examiner.
6. Every paper will be graded on the arrangement of answers, the neatness and general appearance.

Examination questions in arithmetic.

I. (10 credits.) A and B can do a piece of work in ten days. B and C in twelve days, and A and C in fifteen days. In how many days can all working together do the work? If $52.80 pay for the work, what is each one's share?

II. (10 credits.) Sold 12 horses at $90 each; on 6 of them I gained 16⅔ per cent (16 and ⅔) and on the others I lost 16⅔ per cent. Did I gain or lose by the transaction, and how much? What was the gain or loss per cent?

III. (10 credits.) What is the distance around a water-wheel if an arc of 18° of its circumference is 1 foot 9 inches in length? (5 credits.) What is the area of the circle inclosed by the circumference? (5 credits.)

IV. (10 credits.) What will it cost to shingle a house 27 feet 8 inches in length, having a gable roof with rafters 16 feet long; the shingles to be laid 4½ inches to the weather and to be 5 inches wide; the shingles to cost $2 per M?

V. (10 credits.) A, B, C, and D built a fence and received a certain sum which they divided as follows: A received $60.06 and $\frac{1}{10}$ of the remainder; B received $70.07 and $\frac{1}{10}$ of the remainder; C received $80.08 and $\frac{1}{10}$ of the remainder, and D what was left, when it was found that each had received the same sum. What was the amount received by each?

VI. (10 credits.) Add $\frac{3}{4}$, .736, .002, 16⅔, $\frac{7}{10}$ of .125. Multiply the sum by 1.0671 and divide the quotient by 12½.

VII. (10 credits.) Divide $500 among 3 persons so that the second shall have $\frac{5}{7}$ as much as the first and the third $\frac{4}{5}$ as much as the second.

VIII. (10 credits.) A block of copper 4 inches square at one end, 2 inches square at the other, and 10 inches long is drawn into wire $\frac{1}{16}$ of an inch in diameter. How long is the wire?

IX. (10 credits.) (*a*.) On June 12, 1862, a man placed $2,160.75 at interest at a rate of 7 per cent. What amount of interest was due April 4, 1865? (5 credits.) (*b*.) What sum of money must be placed at interest to amount to $2,150 in one year, 5 months, 8 days, at 8 per cent? (5 credits.)

X. (10 credits.) If a grocer's weights are $\frac{1}{4}$ of an ounce below the legal standard, how much does he dishonestly make in selling 2 bags of coffee, 118 pounds each, at 16⅔ cents per pound?

Examination questions in geography.

I. (10 credits.) (*a*) Mention three sections of the United States noted for valuable forests. (*b*) Three States noted for the production of coal. (*c*) Three States that produce large quantities of silver. (*d*) Two States noted for the production of gold. (One credit for each correct answer.)

II. (10 credits.) (*a*) How does Cuba compare in size with New York? (One credit.) (*b*) Name and locate three of its principal seaports. (One credit for each.) (*c*) Name three important products exported from Cuba. (One credit for each.) (*d*) Name three bodies of water separating it from other countries. (One credit for each.)

III. (10 credits.) (*a*) Name four European countries that hold important foreign possessions. (Five credits.) (*b*) Name one possession of each of such countries. (Five credits.)

IV. (10 credits.) Locate the following cities, telling in what province and stating on what part of the island: Surigao, Daet, Bacolod, Nueva, Caceres, Calapan, Bayombong, San Pascual, Cayan, Capiz, Tagbilaran.

V. (10 credits.) (*a*) How many States and Territories in the United States? (Two credits.) (*b*) Name the Territories. (Three credits.) (*c*) Locate: Duluth, Elgin, Annapolis, Omaha, Saranac. (One credit for each.)

VI. (10 credits.) (*a*) What is a glacier? (Two credits.) (*b*) Mention four regions in which glaciers are in process of formation. (Two credits for each good reason given.)

VII. Compare the basin of the Mississippi River with that of the Amazon River as regards: (*a*) Size; (*b*) rainfall; (*c*) climate; (*d*) vegetation; (*e*) occupation of inhabitants. (Two credits for each section.) (Ten credits for the entire question.)

VIII. (10 credits.) (*a*) In what zone would Japan be located if the vertical rays of the sun extended as far north as its northern boundary? (Three credits.) (*b*) The parallel forming said northern boundary would then form a dividing line between what zones? (Two credits.) (*c*) Name the zones and their boundary lines. (Five credits.)

IX. What are isothermal lines? (Four credits.) (*b*) Why do they not coincide with parallels of latitude? Give three reasons. (Two credits for each reason.) (Ten credits for the entire question.)

X. (10 credits.) (*a*) Give in the order of their importance five of the most important commercial cities of the United States. (One credit for each city.) (*b*) Name one of the principal articles exported from each city. (One credit for each correct export.)

Examination questions in American history.

I. (10 credits.) (*a*) What was the object and result of each of the following conventions: New York in 1765; (*b*) Philadelphia in 1774; (*c*) Philadelphia in 1787; (*d*) Paris in 1898; (*e*) the Hartford convention. (Two credits for each section.)

II. (8 credits.) Name a literary production that treats of each of the following subjects, giving also the name of the author in each case: (*a*) The expulsion of the Acadians; (*b*) the Indians and their customs; (*c*) the slavery question; (*d*) Puritanism in New England; (*e*) early life in New England. (Two credits for each subdivision.)

III. Name a prominent statesman, other than the President, in public life at the time of: (*a*) The war of 1812; (*b*) the Mexican war; (*c*) the civil war; (*d*) the Spanish-American war; (*e*) the Philippine insurrection. (Two credits for each subdivision.) (Ten credits for the entire question.)

IV. (10 credits.) What was the prevailing motive in the settlement of: (*a*) Virginia; (*b*) Plymouth colony; (*c*) Pennsylvania, (*d*) Maryland; (*e*) Georgia. (Two credits for each subdivision.)

V. (10 credits.) For what is each of the following persons noted in the history of America: (*a*) Roger Williams: (*b*) Benjamin Franklin; (*c*) Henry Clay: (*d*) Stephen A. Douglas; (*e*) Cyrus W. Field. (Two credits for each subdivision.)

Examination questions in general history.

N. B.—Answer but five of the questions in general history; those consecutively from 1 to 5.

Leave at least a space of two lines between your answers.

I. (10 credits.) What was the effect of the thirty years' war on Germany with respect to—

(*a*) Population (2 credits.)

(*b*) Territory (2 credits.)

(*c*) Religious toleration (4 credits.)

(*d*) National unity (2 credits.)

II. (10 credits.) Select five of the following names and state for what each person is noted:

Fabius Maximus, Livy, Raphael, John Calvin, William Pitt (the Elder), Victor Hugo, Thucydides. (Two credits for each name.)

III. (10 credits.)

(*a*) What was the Renaissance? (3 credits.)

(*b*) Time? (3 credits.)

(*c*) Effect on civilization? (4 credits.)

IV. (10 credits.) State the causes leading to the French Revolution.

V. (10 credits.) During what centuries did the Roman Empire exist and what countries did it embrace when at the height of its power?

VI. (10 credits.) Locate ancient Phoenicia, and state briefly what the Phoenicians accomplished in commerce and civilization.

VII. (10 credits.) Give a short account of the events leading to the change of the Roman government from a republic to a monarchy.

VIII. (10 credits.) State the leading facts concerning the colonization by the Northmen of—

(*a*) England. (4 credits.)

(*b*) Gaul. (3 credits.)

(*c*) Iceland. (3 credits.)

IX. (10 credits.) Describe the character of Gustavus Adolphus and give a few of the principal events of his life.

X. (10 credits.) Tell briefly what you can of Charlemagne and his work.

Examination in current topics.

Answer only five of the following questions. Let your answers be brief and to the point, being careful not to omit the principal facts.

I. (10 credits.) Tell briefly what you can of the "Boxer" movement: (*a*) Location and date; (*b*) Cause; (*c*) What interest did America take; (*d*) Result.

II. (10 credits.) Give a brief account of our policy toward Cuba, with latest developments.

III. (10 credits.) What is the present relation of Porto Rico and the United States? Name the present and the preceding governor.

IV. (10 credits.) What is a trust and why is the term of special significance at the present time?

V. (10 credits.) What assassinations of high public officials have taken place during the past two years and what movement is back of this?

VI. (10 credits.) What is meant by the term "expansion" as applied to the affairs of our National Government?

VII. (10 credits.) Describe the treaty of peace recently concluded between the United States and Spain with reference to the following points: (*a*) Place; (*b*) date; (*c*) Name of one United States commissioner.

VIII. (10 credits.) Name the governor of the Philippine Islands and the members of the United States Philippine Civil Commission. What recent changes have been made in the membership of the Commission? How do the members acquire their official positions? What form of government is being established in the Philippine Islands?

IX. (10 credits.) State briefly the substance of two important official investigations conducted by our National Government during the past two years.

X. (10 credits.) Name five topics of current interest not above referred to and discuss fully one of them.

Examination in school methods and management.

I. (10 credits.) What is the special end to be attained in teaching (*a*) primary reading; (*b*) advanced reading?

II. (10 credits.) Explain fully, but concisely, the methods you would pursue in teaching English to a class of Filipinos just beginning the work. Why this method in preference to others?

III. (10 credits.) Mention four necessary conditions for successful study in the schoolroom. How would you proceed to secure these conditions in a Filipino school?

IV. (10 credits.) Distinguish between the so-called "sentence" and "word" methods of teaching reading as to (*a*) The first steps; (*b*) the relative merits of each.

V. (10 credits.) Show the effect of school environment upon (*a*) the discipline of the school; (*b*) the moral standing of the pupils; (*c*) the proficiency of the work; (*d*) do your answers apply to schools in the Philippine Islands? If not, give two reasons why not.

Examination questions in composition.

The applicant will write a brief biographical sketch of himself, furnishing information as to (*a*) age; (*b*) education; (*c*) teaching experience; (*d*) purpose in applying for position; (*e*) where last employed and reason for change; (*f*) how and in what capacity he came to the islands.

The rating of this paper will be based upon (*a*) the matter; (*b*) correctness and propriety of language used; (*c*) orthography; (*d*) punctuation; (*e*) paragraph divisions; (*f*) capitals; (*g*) general arrangement and appearance.

Examination in dictation.

A selection will be read through first by the examiner and dictated afterwards a little more slowly to the applicant.

Candidate will be graded upon (*a*) capitalization; (*b*) punctuation; (*c*) paragraphing; (*d*) neatness; (*e*) orthography; (*f*) general arrangement and appearance.

Selections recommended for dictation:

"A Bee Hunt," by Washington Irving, found on page 88, Normal Course Fifth Reader.

"Description of a Thunder Storm," by Washington Irving, found on page 46, Normal Course Fifth Reader.

"Children's Prattle," by H. C. Anderson, any paragraph on page 185, Normal Course Fifth Reader.

"The Stage Coach," by Washington Irving, fifth paragraph, found on page 147, Cyr's Fourth Reader.

(Whichever selection is chosen by the examiner, at least twenty lines must be dictated and in every case must end with a complete statement. Only one selection to be dictated.)

Examination in grammar.

I. (10 credits.) Define (*a*) case; (*b*) voice; (*c*) mode; (*d*) comparison; (*e*) sentence. (Two credits for each part.)

II. (10 credits.) Give a synopsis of the verb *hear*, in the indicative, active, third person singular.

III. (10 credits.) Write a sentence containing a clause used (*a*) as the object of a preposition; (*b*) as an attribute (predicate) noun. (Five credits for each part.)

IV. (10 credits.) "Flocks of little birds, *wheeling* around the light-house, *blinded* and maddened by the light, *dash* themselves to *death* against the glass." Analyze or diagram the above sentence.

V. (10 credits.) Parse the words wheeling, blinded, dash, and death.

VI. (10 credits.) Write the possessive, singular and plural, of sister-in-law, mercy, miss, Seward, mouse, ox, men.

VII. (10 credits.) (*a*) Give all the infinitives of the verbs *bring, slay, do;* (*b*) use the first infinitive of each as follows: (1) as a subject; (2) as an object; (3) independently.

VIII. (10 credits.) Give an example in a sentence of (*a*) an adjective clause; (*b*) an adjective phrase; (*c*) a clause used as the object of a preposition.

IX. (10 credits.) Write two sentences each containing a participle; the one partaking of an adjective, the other of the noun.

X. (10 credits.) Put "he" or "him" in places left blank, analyze each sentence, and parse the pronouns supplied: (*a*) I wish to see John, and I suppose you to be ———; (*b*) It was my mistake; you are not ———; (*c*) At first I had no doubt of you being ———.

Examination in physiology and hygiene.

I. (10 credits.) (*a*) Name two receptive organs of the human body; three excretory organs. (*b*) Name in order the five digestive fluids with which the food comes in contact during the process of digestion. (Five credits for each part.)

II. (10 credits.) (*a*) If a person does an increased amount of labor, why is an increased supply of food necessary? (*b*) Distinguish between sensible and insensible respiration. Explain how perspiration cools the body. (Five credits for each part.)

III. (10 credits.) (*a*) Compare the right lung with the left lung in regard to (1) size; (2) number of lobes. (*b*) Give function, locate, and name, where name is not given in the question: (1) The eustachian tube; (2) the largest tendon in the body, (3) the medulla oblongata; (4) the diaphragm; (5) the pylorus. (Five credits for each of the two main parts.)

IV. (10 credits.) Give three rules of health to be carefully followed in any tropical climate. Give reasons in each case.

V. (10 credits.) (*a*) Describe two symptoms of fatigue, one physical, the other mental, frequently seen in school children; (*b*) What should be done in each case?

Examination questions in algebra.

I. (10 credits.) Define (*a*) similar terms; (*b*) transposition; (*c*) literal equation.

II. Simplify $(x-y)-(-x-(y-x)+(x-y))$.

III. (10 credits.) Find by factoring the greatest common divisor of ax^2-ay^2, $cx^2-2cxy+cy^2$, and $ax-ay+2cx-2cy$.

IV. (10 credits.) Find the least common multiple of $a^2-10a+21$, $a^2+2a-63$, and $11a-77$.

V. (10 credits.) Find the value of x in the equation,

$$\frac{x}{c-d}-\frac{2+x}{cd}=\frac{m}{c-d}+\frac{n}{c-d}.$$

VI. (10 credits.) Find the sum of $\frac{a-b}{(a-b)^2}$, $\frac{a}{a^2-b^2}$, and $\frac{1}{ab}$.

VII. (10 credits.) The sum of three numbers is 43, the second is equal to 10 more than the product of the first multiplied by 2, and the third is equal to three times the quotient of the second by 4. Find the numbers.

VIII. (10 credits.)

$$\frac{a-b}{a^2-b^2}\times\frac{a-b}{ab}\div\frac{(a-b)^2}{a+b}=?$$

IX. (10 credits.) Given

$$x+\tfrac{1}{2}y=\tfrac{1}{3}$$
$$\tfrac{1}{4}x+\tfrac{1}{3}y=\tfrac{1}{6},\ \text{solve.}$$

X. (10 credits.) The length of a square room is 8 feet greater than its height. The side walls measure 720 square feet. Find the length of the room.

Examination questions in civil government.

I. (— credits.) (*a*) Mention three ways in which a vacancy in the office of Representative to Congress may occur? (*b*) How can such vacancy be filled?

II. (— credits.) Name in order the officials who succeed the President in case of his removal.

III. (— credits.) (*a*) Describe the form of government of the District of Columbia. (*b*) In what way does it differ from the ordinary State or Territorial form of government?

IV. Give two limitations to the power of the President. What is the purpose of each of these limitations?

V. (— credits.) Define: (*a*) Subpœna. (*b*) Warrant. (*c*) Writ of habeas corpus. (*d*) Ex post facto law. (*e*) Appeal.

It is expected that the matter of examining applicants for positions as teachers will later be in the hands of the Civil Service Board.

A majority of the appointments had been made by the early part of the year 1901, and urgent requests forwarded to the proper authorities for the immediate transportation of the teachers. It will be remembered, however, that the transports at this time were overcrowded owing to the large number of soldiers, some en route to the States, others on their way to the Philippines. The teachers continued to come by twos and threes until midsummer, when the special teachers' transport, *Thomas*, was assigned to carry all awaiting transportation. They were notified immediately and ordered to proceed to San Francisco; requests for transportation on the various railroads accompanying the letter of notification.

On Tuesday, July 23, the *Thomas* left San Francisco with 523 teachers. After a stay of four days in Honolulu they arrived in Manila August 21.

Long before the teachers arrived active preparations were being made for receiving them and furnishing quarters with the greatest possible degree of comfort. Hotel accommodations in Manila are extremely poor and the rates exceedingly high; and when it was found after careful inquiry that the most liberal terms to be obtained from the best and only suitable hotel in the city were about $5 gold a day for each teacher, the "accommodations" to consist of cots spread in the halls of the hotel, it was planned to save the teachers these exorbitant charges. In order to care for them properly a site in Ermita, one of the coolest and pleasantest residence portions of Manila, was chosen, the buildings fitted up under an appropriation of $10,000 from the insular government, and opened for the free use of the teachers while awaiting transportation to their permanent stations.

A contract for conducting a restaurant for the benefit of the teachers was signed with Ah Gong, a hotel proprietor of the city. The charge—$1.10 per day, or a fraction of the cost of the lowest bid from the only acceptable hotel—covered the bare cost of the meals, with the additional 10 cents to meet the current expenses of the dining room. Arrangements were also made with the same man to take charge of the laundry work of the teachers at a comparatively low rate, made possible by the large amount of laundry to be handled. Furthermore, a regular money order and registry post-office was established on the exposition grounds, to save the teachers the trouble and expense of going to the post-office—a trip necessary but very uncomfortable during the heat of the day. A regular employee of this department was detailed to visit the merchants of the city and get their lowest prices on everything that the teachers would need in the way of provisions and clothing. Those submitting figures did so with the understanding

that the quality of the goods was to be vouched for, and that they were to be delivered on board the ship securely packed, at no additional expense to the teachers. Accommodations were prepared in accordance with instructions from Washington for 25 married couples.

And, finally, in anticipation of the arrival of the transport *Thomas*, a vast amount of time and thought were given throughout the months of July and August, and even previously, to working out a satisfactory solution of the problem of assignment. The greatest pains were taken to secure as complete information as possible as to the conditions of the towns, the relative needs, the arrangements in particular for the women teachers, and matters of personal safety. Division superintendents already in the field, local authorities, military officers, and others in a position to know were carefully consulted. Provisional assignment lists, with the number and sex of the teachers, were sent to these different persons, whose opinion and decision were to be relied upon, with the request for criticisms and suggestions. Such questions were asked as: Are there other towns more deserving? What places should have two teachers? Can suitable quarters for women teachers be found? How is the town best reached? In determining the towns to which teachers should be provisionally assigned, preference was given to the larger garrisoned towns and those whose loyalty was beyond question. No town was considered where there was any possibility of danger. Thus the most reliable information possible was obtained and used as the basis for actual assignment later. And all this in the way of preparation before the teachers reached Manila.

The *Thomas* arrived on August 21, but the teachers were not allowed to land until the 23d, owing to the sanitary precautions. Landing was made at a point nearest the teachers' quarters, application having previously been made to the quartermaster's department for ambulances and wagons to convey the teachers, with their baggage, to the exposition grounds. In spite of the fact that the first launch did not leave the ship until 8 a. m., all the teachers, with their 2,000 pieces of baggage, were comfortably quartered by 1 p. m. Immediately an organization of division superintendents and certain teachers was effected, the former taking charge of the buildings in general and the latter looking after sections and caring for the baggage.

In accordance with cable instructions, accommodations were prepared for 25 married couples. On arrival, however, it was found that 42 were to be cared for. This increased number necessitated considerable alteration in the main building, but the additional quarters were soon available.

Some complaint was heard from time to time concerning food, service, and laundry work; but this was of minor import, and, in general, due to the teachers' individual temperaments. The food was inspected daily, and pronounced by a physician good and pure. The service was seriously interfered with by the irregularity of the teachers' attendance at meals, owing to their numerous shopping and sight-seeing excursions; conditions which made it well nigh impossible to know how many to expect at a meal. In the matter of laundry, teachers often gave their clothes to other men than the one secured for this work. They oftentimes forgot to keep a list of the pieces, or even a means of identifying the man; hence confusion at times existed, and loss resulted. But it was not serious.

There was reason for congratulation on the very small per cent of illness among the teachers during their stay in Manila; those cases, moreover, amounting to only 5 per cent, were of a harmless character, of every day occurrence among foreigners just arriving on the islands. During the night the temperature here drops perceptibly until about 2 a. m., when it is oftentimes very cool; and as a result of this sudden change, unless precaution is taken, as all the teachers were

carefully informed, cramps are experienced. Upon finding that a few of the teachers were suffering from such, a physician was immediately detailed to remain during the whole night on the grounds, and the trouble soon disappeared.

The question of payment of salary and reimbursement was taken up, and within a week every one of the teachers had received his salary and been reimbursed for all necessary expenses incurred en route. They had been told definitely that prices were abnormally high in Manila, that they must serve for three years, that transportation would be furnished them from their homes, and all necessary expenses, such as meals and quarters on trains, at hotels, and on the ship en route, would be repaid them on their arrival at Manila. And when they arrived they found these matters as represented, with a few important exceptions in favor of themselves. They then learned that only two years was the time for which they would be held to serve; that they were to be reimbursed for every reasonable expense incurred on the journey, even for the "tips" to porters on Pullman sleepers, which were furnished them, and that they had traveled all the way from home under full pay.

Considerable discrepancy in accrued salaries existed, some having been paid at the rate of $1,200 a year and others from the same institutions only $1,000 a year. Such a condition, temporary as it was, was made necessary at the time by the large number of teachers immediately needed to make a start in building up a school system, which had been denied these people for such a long time. The teachers were given plainly to understand that the condition of salaries existing on their arrival was at the most only temporary, and that just as soon as they showed merit their salaries would be raised accordingly. In addition, they were informed that they could gain extra compensation by slight additional service in teaching night school. The division superintendents have received instructions in a special circular to look into the work of each teacher carefully, and if there is any justification for the same, by the demonstration of efficiency in the teacher's work and his ability to grasp the situation, to recommend him for an increase in salary. At present a large number of the teachers have received increases, and the question is working itself out satisfactorily on the basis of efficiency.

Upon receipt of salaries the teachers proceeded to equip themselves with the necessary food, clothes, and bedding to accompany them to their stations. To meet any contingency that might arise in the way of lack of good food, they were all directed to supply themselves with a month's provisions; and to aid them in this the employee who had been detailed to secure the most favorable prices from the Manila merchants on all necessary articles was stationed at the exposition grounds with prices and subsistence lists covering all the provisions needed. In this way the teachers were given a definite idea of what they wanted and saved several hundred dollars. It was unfortunate that they could not take advantage of the military commissary privileges, in accordance with information given them in the States; but such commissary privileges were withdrawn after the *Thomas* had left San Francisco and communication had been cut off. Soon, however, a civil commissary was established, and the teachers had recourse to this, with the accompanying advantages almost equal to those which they could have enjoyed from the military. In addition, the Department made up sets of bedding to be sold to teachers at actual cost to the Government, and advanced them to the teachers to be paid for at their convenience.

It was to be regretted that the teachers arrived just at that time—in the midst of the rainy season. One coming from a country of occasional rainfall to a tropical land in the midst of its rainy season experiences discomfort, and the teachers were no exception. But this was a matter beyond the control of the Department. The majority of those arriving by the *Thomas* had been appointed the preceding

winter, as early as January and February, 1901. Frequent and urgent requests were made for their immediate transportation, so that their arrival would be attended with more favorable climatic conditions. But it is to be remembered that the transport service during the whole period was severely taxed by the thousands of discharged soldiers going home and the corresponding numbers coming to the Philippines to take their places. An endeavor was made to secure their transportation by the regular Japanese liners, at a cost of $250 apiece, or a total cost of something like $150,000, but unsuccessfully. It was impossible to arrange their transportation earlier. Soon after the teachers' arrival, however, the rainy season passed, and with the return of fair weather the discomforts were forgotten.

After the financial matters were settled and the various supplies secured, the teachers were ready for assignment, and in this most difficult work the information obtained previously from the superintendents in the field, the military officers, and others in authority, stood the general superintendent in good stead. The teachers were asked to submit preferences both as to stations and companions, with the promise that such would be carried out as far as possible. Suitable board and quarters for the women teachers were secured with difficulty, even in the larger towns. Accordingly they were first considered in making the assignments, and they were sent in twos for companionship and mutual help. Where married couples were both qualified teachers, they were assigned to towns in need of but one man and one woman teacher. Preferences were duly considered and met in all possible cases. In many provinces the power of assigning the teachers was given to the different division superintendents on account of their close contact with the people and extensive knowledge of local conditions. Transportation facilities between Manila and the various stations were very poor, and the boats ran only at irregular intervals, yet almost the entire number of teachers had left for their stations at the end of twenty days. The quartermaster department deserves particular credit for its prompt action in handling baggage and furnishing wagons and launches for transportation.

Since the arrival of the *Thomas*, teachers have continued to come in small numbers on the regular transports. The immediate need for the full quota of teachers, however, became more pressing, and the earlier recommendation that those awaiting transportation be furnished passage on regular Japanese liners was earnestly repeated. Another special transport, therefore, the *McClellan*, sailing from New York, was assigned to the transportation of all teachers and other civilians east of the Rocky Mountains. The *McClellan* sailed February 22, 1902, with 94 teachers, and arrived in Manila April 20.

Beginning with the year 1902 the policy of entertaining new arrivals at the exposition grounds until their assignment had been made was dropped. Instead, one of the members of the supervisory corps was detailed to secure suitable hotel accommodations, board the incoming transports, meet the teachers, and give them all helpful information. The arrival of the teachers on the *McClellan* offered the first good opportunity for testing this new plan, and it was found to work successfully.

The same general plan of assignment was followed in the case of later arrivals as in that of the *Thomas* teachers. Accommodations for the teachers, as well as the needs of the towns, were the deciding factors, in connection with which personal preferences were given due weight. The division superintendents were well acquainted at this time with the conditions and needs of every town in their divisions, and this, added to the fact that the area of active hostility has greatly diminished and the operations of insurrectos and ladrones have been confined to the known localities, chiefly in the more removed mountain sections, simplified the later problem of assigning the teachers.

In the teaching corps the following States and Territories are represented and the numbers from each given:

A list by States and Territories of the teachers employed in the Philippine Islands.

With a few exceptions, the teachers are now satisfied, intensely interested, and enthusiastic in their work. They have come from one of the most civilized countries, where every common luxury is known, to one of the less civilized ones, where much of what we at home no longer consider as luxuries, but rather necessities, is unknown; hence inconveniences and at times real difficulties were inevitable. That the teachers bore these with such little complaint was strong proof of their determination to overcome the ordinary discomforts, often severe, which are attendant upon a life in a country such as this. A strong proof of their satisfaction with conditions in many cases is the fact that they are sending for fathers, mothers, brothers, sisters, and betrothed ones.

The matter of personal safety has almost ceased to be a question, for the teachers are not allowed to remain in towns which are considered dangerous; and, in fact, their work is a guaranty of protection, so highly do the people, friendly or hostile to American occupation, appreciate this work of education.

A very encouraging phase of the work has been the way in which the military officers have everywhere taken a keen interest in this educational movement, and shown their appreciation by aiding the teachers materially. They have oftentimes furnished food and lodging to those en route; have furnished transportation to the interior; have frequently exercised their influence in gaining for the teach-

ers the good will of the community; and have at times gone so far as to procure materials for schoolhouses.

The civil commissary, from which teachers purchase supplies at reduced prices, has now been in operation for several months. While there is some complaint, particularly from those who live in the remote towns, it is small, and the advantages accruing to them from this privilege are material. The methods in handling supplies are being improved, and the transportation facilities bettered, so that the supply store promises to be of even greater benefit to the teachers in the future.

One of the difficulties resulting from the poor mail facilities throughout the islands is the serious delay which many of the teachers experience in receiving their salary checks. Oftentimes they are compelled to wait two and three weeks, and even longer, after the salary is due before they receive it. The hopeful side of the whole matter is, however, that improvements are being made in the mail service, and the delays in delivery consequently are diminishing.

Coupled with this difficulty was the depreciation of the Mexican currency in which teachers were paid. The appropriation for the salaries of teachers was made in this local currency, hence the disbursing clerk was compelled to make all checks payable in such money. All might have been well had the currency maintained its former ratio of $2 Mexican to $1 gold; but, on the contrary, it depreciated regularly. The postal authorities refused to accept it in payment of money orders on the States, and then the teachers were in a serious difficulty. Many of them had families at home dependent upon them, and others had incurred debts which they had to meet. The depreciation affected the entire civil organization, the Commissioners themselves losing by the amount of depreciation.

The matter was given most serious attention, and requests sent to the Civil Commission asking that some definite step be taken. In answer the following reply was received from Commissioner Ide, secretary of finance and justice, and sent out immediately in the form of a circular to the teachers:

The difficulties within referred to are fully appreciated by the Commission and by this office, but they are temporarily incident to the situation. The changed ratio for the next quarter will probably, before the quarter is through, operate to the advantage of civil employees, so that they will obtain more than their salary as fixed in gold. It will be necessary for all to be a little forbearing. It might be remarked that the Commissioners themselves are subject to precisely the same inconvenience as the writer of the within letter and suffer the same pro rata loss. It is impracticable to make payment for the month of December in other than the currency that was appropriated for that purpose and that is available. The only method for immediately relieving the difficulty would be to require all customs receipts and internal-revenue taxes to be paid in money of the United States, so that there might be money of that character available for all insular purposes; but in view of the early action of Congress on the currency, when it is expected the subject will be placed on a permanent basis, it is not considered advisable to make so radical a change as the one suggested, and one that would so seriously disturb the business of the islands.

As an attempt to restore matters to their former condition, the Commission enacted that the legal ratio of Mexican currency to gold should be $2.10 to $1 for the first quarter of 1902. The postal authorities, moreover, accepted the local currency again to the amount of $50 gold a month. This action helped matters considerably, and the teachers were able to gain a slight advantage as far as local debts were concerned; but the currency is still depreciating, the commercial value being lower than that enacted by the Commission. Hence difficulties in financial matters still exist, affecting all civilian employees alike. There has, however, been an amelioration, and a greater improvement is expected during the next quarter of the year and continuing.

In the matter of salary increases the basis has continued to be that of efficiency.

The following instructions were sent out to division superintendents in December,

MANILA, *December 2, 1901.*

To division superintendents:

Without making any sweeping changes or letting the teachers know that such changes are contemplated, I wish you would recommend for increase such teachers as come within the following classes and *whose work warrants the advance:*

1. Men teachers having families, and graduates of colleges and universities. These men should receive not less than $1,200.

2. Normal-school graduates. These should receive not less than $1,000.

Since the arrival of the teachers, increases have been made regularly. At the present time about 40 per cent of the total number of salaries have been advanced, and the proportion is growing daily. In addition to these increases for efficiency, the majority of the teachers have received the extra compensation of $120 a year for night-school work.

The transportation difficulties at the present time cause serious delay in receiving school supplies, a condition which obviously militates against the best results in the work. Teachers oftentimes are compelled to wait patiently for weeks for books and materials and make the best of inadequate tools and equipment on hand. It is not a question of having no books or other supplies, but of getting the additional ones needed.

Lately the quartermaster department of the army has refused to transport civil property, an action which affects the department of public instruction directly. Heretofore the army people have lent most valuable aid in shipping school supplies, particularly to the inland towns, but inform us now that they are unable to do so any longer, owing to the amount of business in their own department.

To meet this emergency the plan was adopted, whenever possible, of making the local presidentes responsible for the transportation of school supplies from the nearest post to their towns, and in other cases that of placing the respective deputy division superintendents and teachers in charge of supplies shipped after these had arrived at the port nearest their destination. They were authorized to hire bull carts for transporting the goods to the towns for which they were intended. Thus both by the presidentes and the teachers, and in some cases, still, by the military authorities, the transportation of the supplies receives attention.

Conditions are much better than a year ago, and the time taken by goods en route is shortening daily. With the arrival of the fleet of steamers now in course of construction in China, moreover, for the transportation of civil property decidedly better service is to be expected.

The work done by the American teacher is in part supervision, but in large part regular teaching. He looks after the school work in his town and oftentimes in the neighboring barrios; instructs the native teachers daily in English and in other studies; spends a part of his own time in teaching the children; and has charge of all property and supplies. The native teacher devotes all his time to school management and teaching the children.

For the purpose of gaining impartial opinions of the effect created by the American teachers in their respective towns a letter was sent to the chiefs of the constabulary, provincial governors, and others whose knowledge was considered valuable, asking their opinion as to the effect created by the American teachers, and any criticism, favorable or otherwise, together with suggestions concerning the work.

The replies were, without exception, almost flattering. In every case the teacher was reported as doing excellent work, not merely in the special field of teaching, but in the broader way of introducing the best American ideas; in raising the standard of home life; in preparing the natives really for self-government;

in dispelling feeling against Americans, and hence aiding in this work of pacification by showing the people the best we have to offer.

It is needless to quote the numerous letters received in answer to my inquiry; instead I submit a few representative ones, which serve well to show the prevailing opinion of the teachers' work.

The following is from Capt. Henry T. Allen, chief of the Philippines constabulary:

Referring to your letter of January 25 instant, it gives me pleasure to inform you that with scarcely a single exception I have heard only good reports of the work being done by the teachers of English in the various parts of the islands. In a word, they are proving by their acts as well as words the wisdom of the policy adopted in regard to education here. These teachers afford the people an opportunity of learning in a most expedient and practical way what good American citizens are and what may be expected from American control. Without them the ideas of these people would be formed largely from those with whom they have come in contact during unfortunate times—the soldiers.

I have had occasion to learn from various sources that the teachers are on extremely good terms with the people of their towns, who are beginning to rely upon them for counsel and advice in nearly all matters of importance. This means that the body of teachers, in addition to their value as instructors, will have a tremendous influence in maintaining order and peace in the archipelago. The influence of the 800 or 900 teachers under your supervision, dispersed throughout the islands giving instruction, both by exemplary habits and books, will produce a far-reaching effect scarcely attainable by any other method.

This reply is from Captain Baker, first assistant chief Philippines constabulary:

Complying with your request of January 25, I have the honor to inform you that in my recent inspections, which have extended all over northern Luzon, and even to the remote parts thereof, I have come in close contact with the American teachers therein.

In that way I have become much impressed with the high moral and mental caliber of these officials, with the earnestness and tact with which they are performing their duties, and with the patience and cheerfulness with which they have met the inconveniences, amounting in some cases to hardships, incident to the early days of their residence in remote places. This last condition is gradually passing away, especially since the establishment of the civil supply store.

Everywhere I found the teachers receiving or gaining the respect and confidence not only of the children but of the parents.

In many places the teacher, in addition to his regular duties, occupied that of adviser and friend to the community—a position similar to that filled by old justices of the peace in many of the country communities of the United States.

I do not remember having heard a single adverse criticism of any of the teachers, male or female.

I believe, however, that your district superintendents may have too much clerical work to do, and that this in time may prevent them going about their districts and making the constant personal inspections so necessary to the unimpaired efficiency of such a machine.

I also believe that in all cases they should give their English instruction in English direct, and not complicate it by using the Spanish language as an intermediary. This opinion is based on my own experience in superintending the teaching of English to Indians who possessed a larger Spanish than English vocabulary. In this connection, all through the Cagayan Valley, in Nueva Vizcaya, and the northern part of Nueva Ecija, I found that not only the children, but in many cases the town councilmen, knew already more English than they did Spanish.

The letter here given is from Mr. C. J. Bailey, senior inspector of the constabulary for Tarlac Province:

Your favor of January 28, in which you request my opinion, written at length, as to the effect created by the American teachers, and any criticism, favorable or otherwise, and any suggestions which I can make in connection therewith; also information as to what is needed in this province to make this work of education the more successful, is at hand.

After the pessimistic utterances to which the country has been treated in recent days from certain prominent educators, it is refreshing to acknowledge the hope-

ful and inspiring progress of the American teachers and their young native wards in this province. Summing up the results of educational progress in Tarlac, I can see in them the fact that the passions of the Filipinos do not run away with them, that the native spirit is growing broad and rich, that their children are treated better than the most optimistic "Americanistas" anticipated, and riches in money and brain are being used in higher ways than heretofore experienced by them.

To the soldier or civilian whose knowledge of the situation in this province has been gained by experience in the islands there is more real assurance as to the development of a satisfactory condition here, more hope of a reasonably speedy settlement of all antipathies, in the work of the school teachers than in any other agency. The highest tribute that can be paid to their (the teachers') tactful diplomacy is found in the general satisfaction their teachings have given the former insurgent leaders. The families of Macabulos, De Leon, Lopez, Rigor, Ramos, and others, as evidenced by expressions to me, have nothing but words of praise for Deputy Superintendent White and his assistants. The Rigor parents feel assured that the instruction is intended to be specially favorable to them; and the Ramos family are satisfied that what their children are taught will remove whatever grounds still remain for antiultimate Filipino independence. Much of this result is no doubt due to the energy of individual teachers with which the campaign of knowledge is being conducted.

When native school children daily gather in groups on the streets and plazas and sing "America" and "The Star Spangled Banner," in good English and with a vigor that would have made our pilgrim forefathers envious, they voice the beginning of the end, and promise that that end shall come speedily.

The school children as well as their parents have the fullest confidence in the intention of the department of public instruction to do well by them. I do not say that they as yet appreciate the full value of the work that has been and is being done on their behalf. I know that they are beginning to comprehend its beneficent purpose and its vitalizing results, because I have had opportunities for observing them in this precise connection at close range.

The following extracts are from a letter from Major Gardiner, governor of Tayabas Province:

If I were asked "What has contributed most toward convincing the Filipino people of the good intention toward them of the American Government," I would say: "It is the efforts which the Commission is making for their education."

When it is considered that heretofore the friars forbade in the provinces the teaching of Spanish; that their every effort was to prevent enlightenment of the people even when schools were supported by the Spanish Government; that a Filipino youth who returned from Europe or Hongkong, after completing his education, was looked upon with suspicion and followed by secret spies of the friars to see if perchance he spoke to others of liberty or free thought, and in the end was generally accused by the friars of being a filibustero or disturber, and deported or exiled; that only a favored few were permitted to learn anything but the catechism; seeing the different views which Americans take of matters of education, they are willing to agree that we are on these lines doing more for them than they could themselves do under an independent government.

The schools in this province are a success, and in some pueblos a phenomenal success almost beyond belief. The other day I visited the school in Lucban. I saw three American and four Filipino teachers holding classes in one building, with 650 boys and girls between the ages of 5 and 14. The school went through a portion of its Christmas-day exercises for my benefit. I heard a boy speak in clear English "'Twas the night before Christmas, when all through the house," etc. Another spoke "The Village Blacksmith;" another "Hang up the baby's stocking;" there were also dialogues, athletic exercises, American songs, etc., by little folks 5 and 6 years old. Children speak English on the street, they teach their parents, they interpret, and this has all been done in a year and a half. There is visible everywhere a yearning for knowledge, an eager desire to read our books so that their "eyes may be opened," as they express it. Filipino children are very precocious; they learn rapidly. I taught a little Filipino boy of 8 to repeat accurately, by saying it over to him three times, the couplet "Little drops of water," etc. These children are very orderly and easy to manage. One teacher told me he could more easily govern 300 Filipino children than 50 Americans. They seldom ever quarrel or fight; they are deferential and obedient. * * *

The American teachers who came to this province have, with few exceptions, done well and been enthusiastic in their work. In the little pueblos where the

teacher is, perhaps, the only American, his is a lonesome life until he becomes interested in his work, and if he is out here because he loves teaching, he will soon be so interested in his work that he will forget his isolation for the joy of seeing the fruits of his labor in this virgin soil. * * *

Three young Filipinos from this province are now attending American universities, having been sent by their parents. At the last quarterly session of the presidentes (mayors) of the pueblos of this province, it was voted that three others should be selected by competitive examination, each pueblo to send one competitor to the capital, where the selection is to be made, in order to get a thorough acquaintance with the English language, the ages of these boys to be between 14 and 16 years, and to be kept in the United States until their education is completed, the cost of their education to be paid by the pueblos in proportion to their population.

This letter is from Mr. A. W. Betts, governor of Albay Province:

In compliance with your request of the 27th instant for information concerning the educational work in this province, I am pleased to say that the progress made by the schools in this province is extremely gratifying; and, in fact, a visit to the schools that have been established during the past few months will convince one of the aptitude of these little people for acquiring knowledge that really seems incredible. I do not believe there is anywhere in the world more enthusiastic students than the children who are attending the public schools of this province. The greatest enthusiasm prevails in the towns where the schools are managed by American teachers, and the greatest problem with which we have to contend, in these places, is to provide sufficient room and accommodations for carrying on the school work. In nearly all towns the buildings occupied by the schools are inadequate to accommodate the attendance. I am informed by several of the American teachers that the majority of the pupils regret vacation time, and in some places insist on attending school during the days when vacation is ordered.

The American teachers in this province are doing more to bring about peace and good will between the American and Filipino than any other persons on earth. Their work appeals to the parents, whose pride is greatly increased through the knowledge of the progress the child is making in being able to converse in English. No more striking illustration of this can be had than to see the smile of approval on the parent's face when the child salutes you in English. I firmly believe that the school is the key to the solution of the entire problem in the Philippines, and great good is being and can be done through this institution.

As I have above stated, the one thing most lacking in the work is suitable buildings for the schools. As rapidly as possible we are repairing the former school buildings. However, in many towns they have not sufficient funds to accomplish this. Some idea of the desire of municipal officers to provide suitable school buildings can be had from the fact that they have constructed buildings by popular subscription (partly paying for same), and in other instances have given shows and entertainments to raise sufficient funds to pay for the completion of the building. If there was a fund available to assist in this work of providing suitable buildings, the towns furnishing a certain portion of the fund and the remainder to be supplied from the general fund, the work could be very rapidly increased.

Thanking you for the assistance you have given us by detailing American teachers to the numerous schools in this province, I have the honor to remain, * * *

The following is a translation of a letter from Mr. Mena Crisólogo, governor of the province of Ilocos Sur:

The desire of the Filipinos to secure instruction, and above all to learn the English language, is general; hence the American teachers have been welcome every where as the means of enlightenment and progress. Under the Spanish Government, notwithstanding the many laws and decrees in favor of education, all the efforts of the teachers were wasted against the indifference and even the opposition of the parish friars, who were the inspectors ex officio of the schools. But now that the times have changed, fortunately, and the present government does not curtail appropriations to better and further educational matters, all the Filipino people heartily welcome such interest and zeal on the part of the honorable Civil Commission, and the school buildings are filled with children and even grown-up people anxious for instruction.

I have not been acquainted with many American teachers, but those whom I have chanced to speak with I have found very competent and sufficiently capable not only to fill the work of teachers in primary instruction, but also to perform offices of a higher order. Of the behavior and morality of those conducting pub-

lic schools in this province I have heard many praises, because they fulfill their duty with the greatest care and treat the pupils very well, and even with true affection, and hence they are generally much loved in the towns.

The following letter is from John W. Green, senior inspector of constabulary of Misamis Province, Mindanao:

Yours of January 28 received, and in compliance with your request I have the honor to make the following report concerning the schools in this province:

I have been in this province since its occupation by the American troops in 1900, and have become familiar with the manners and customs of the people. Since the arrival of the teachers in September, 1901, a great change is noticeable.

Wherever there are American schools the people are much more friendly than formerly; the children are beginning to speak a little English, and the natives in general show a disposition to adopt American ideas, especially in matters of dress and in cleanliness. Wherever there are lady teachers the native women in particular showed a marked tendency to adopt American dress. These influences are not limited to the centers of population, but are beginning to assert themselves even in the outlying districts.

The natives show a great interest in the schools and seem to appreciate the advantage of American methods over the old Spanish way of teaching. The night schools for the grown people are everywhere well attended.

In this province you could use to advantage as many more teachers as are already here. I have received frequent inquiries from towns where no one has as yet been sent, asking how they can secure an American teacher and requesting me to use my influence in their behalf.

I think there should be a general fund for the purchase of materials for building schools in places where the insurrection has destroyed the buildings and left the people too poor to build new ones.

The children in these places particularly need the influence of an American education, and should not be deprived of its advantages by reason of the poverty of the local municipality. The people would willingly do the work if materials were supplied, but at present there is no lumber available, and what is obtained has to be sawed out by hand.

I can not praise too highly the work of American teachers in this province. It is an ever-active force for peace and progress. A well-equipped army may put down insurrection for a time, but no one knows when it will break out again. With the progress of education insurrection will be stamped out forever.

I heartily wish you continued success and progress in your great work. Whenever I can serve you, do not fail to command.

The following extract is from Mr. Thomas Leonard, supervisor (inspector of public works) of the province of Capiz:

It is strongly believed by the subscriber that the solution of the Philippine question in its many and varied phases, in a very large degree, is to be found in the establishment and maintenance of the public school system, which will fit the rising generation for the various positions which they must assume if a stable civil government under the United States or in any other form is to be maintained in these islands. These young men and women must learn something of the world outside of their island home, and become conversant with the history and the rise and fall of other nations, that they may profit by the knowledge thus gained and so avoid the fatal mistakes that have been the cause of disruption and fall from power of many once great nations. They must become conversant with the habits and customs of other nations, so that they may discard those of their own that have become antiquated and remain to-day only as obstacles to their future progress. They are too prone to cling to what they call "costumbre." * * * It is left for our public schools to raise and elevate them and put them upon the plane of thinking men and women, capable of governing themselves wisely and well.

Much has been done for the school question in this province; much more remains to be accomplished. Some public schools were started here under the auspices of the military, and with more than satisfactory results. Among the first schools to be established were those at Capiz, Calivo, and Ibajay. The school at Capiz was started by the Eighteenth Infantry, that at Calivo by the Sixth Infantry, and that at Ibajay by the Forty-fourth Infantry, at which point I was then commanding officer. Enlisted men were detailed as instructors, and this system was continued with encouragement and good results up to the time that civilian teachers were appointed in the place of soldiers. In the meantime many other stations had been opened up. With the advent of an organized system of instruc-

tion advancement has been made in a marked degree. There are now in this province 14 American teachers, of whom five are located in our capital city, two at Calivo, and one each at Panitan, Dao, Dumarao, Pontevedra, Panay, Ibajay, and Malinao. From the standpoint of one who has visited these towns during the times of the insurrection, the contrast between then and now is very great, and the influence of our American school system under the guidance of American teachers has been decidedly beneficial. It would be, of course, of immense advantage if an American teacher could be stationed in every one of the towns of our province, but this is hardly practicable at present, and therefore native teachers have to be employed in many instances. The eagerness with which these teachers try to learn our methods of tuition and the interest that they display in their school work are exceedingly gratifying. Already in Capiz there is a class of young women known as the "aspirante" class and composed of some of the very best people of our town. They are trying to fit themselves for the work of teaching, and already many of them are able to render valuable assistance in the work. This plan, I believe, should receive every encouragement, and nothing could be more helpful than the establishment of a provincial normal school, and I believe the province should be required to furnish suitable buildings and other necessities required for this purpose.

The following extract is from a letter from Mr. James Ross, governor of the Camarines:

From my acquaintance with and observation of the work and conduct of the American teachers in this province I believe they must average up pretty well with those of other sections. Most of them appear to be earnest and active young men and women, with a desire and ambition to make a success of the work they have undertaken, and I consider that the results accomplished by them during their short period of service here have been as satisfactory as could be expected when the adverse conditions under which most of them are obliged to work are taken into consideration. It would be difficult for people in the United States, or even in Manila, to appreciate the conditions under which an American school teacher in a small provincial town has to live. Cut off from all the comforts and even ordinary conveniences of life, far removed from people of his own race and language, and out of the lines of communication with the outside world, his position is not one to attract the notice of the envious. I have found, however, that as a rule the teacher thus situated meets the situation cheerfully enough and makes the best of the conditions as he finds them. I have also been pleased to observe that most American teachers in this province have apparently come here thoroughly imbued with the idea which I consider the essence of the American policy in these islands, viz, to get into as close touch as possible with the people, and by kind, courteous, and honorable conduct toward them gain their respect and confidence. The conduct of teachers along this line has been most satisfactory as a rule, and I have found that they use very good judgment and tact in dealing with the natives, thereby making themselves active agents of the Government in convincing the people of the benefits they are to derive by trusting and remaining loyal to the United States Government and in showing them the way to a higher plane of civilization. I believe you will agree with me in considering this to be a part of the teacher's work as much as his daily routine in the school room.

The following is an extract from the letter of Mr. Bonifacio Serrano, governor of Masbate:

In compliance with your request of January 27, I have the honor to submit the following in regard to the schools and the effect of the presence of the American teachers:

In making my semiannual tour of inspection at the close of last year I was pleased to find the most friendly relations existing between the teachers and the people. Wherever they are stationed there are already many children speaking considerable English, and there is manifested a great desire on the part of the people to learn the language.

The teachers have made their presence felt in many ways. The sanitary condition of the pueblos has been improved. They have distributed medicine of their own, but, owing to the great amount of sickness, it has not been sufficient. This and the manner of their life have been such as to win the confidence and respect of the people, and no doubt done much to satisfy them as to the real object of American occupation.

Below is a part of a letter from Mr. Demetrio Larena, governor of Oriental Negros:

I have the honor to acknowledge receipt of your favor of the 27th of January last, and, in accordance therewith, I state the following:

The satisfaction produced in this province by the settlement of the American teachers is of a high degree. For the short time they have been in charge of the schools the improvement observed in the children of both sexes is very remarkable, notwithstanding the natural apathy of many toward education and the work of certain elements in discrediting work of the teachers, impressing secretly on the minds of the parents fanatic ideas, and causing some of these to fear sending their children to school. The prestige that the teachers are gaining in the towns makes the attendance at school ever greater.

Nothing censurable can be said of them. On the contrary, the people tell me everywhere that they are satisfied with their teachers, and that on account of the large attendance of both boys and girls they desire more American teachers.

The problem before the American teacher is one requiring the greatest amount of thought. The teacher is needed but a short time each day, but the diplomat must be on duty continuously. As a rule, the American teachers have been most cordially welcomed, and have at once apparently become a necessity to those to whom they have been sent. Many are far removed in the interior, living on the native food, miles away from the nearest American, with only a glimpse now and then of the outside world, through the medium of a poorly equipped mail service; but with all these drawbacks there is a bright side, as is shown by the following remark made by an American woman from a New England State: "I really trembled to think of what I should have missed if I had not come to the Philippines."

The responsibilities of the teachers are great when the situation is looked upon from a broad standpoint, but it is a grand opportunity to bring out all the manhood and womanhood that there is in them. That the majority are rising to meet this opportunity augurs well for the success of the educational movement and is a high tribute to the character and ability of the American teacher, proving conclusively that they will do their share toward the pacification and upbuilding of this island archipelago of ours. The following extracts from a report of one of the division superintendents is of interest:

The American teacher in the Philippines and the problems which he must strive to solve are not fully appreciated by those who have not been an eyewitness to his work and surroundings.

His chief duties are to teach five hours a day; to instruct the teachers of the central school one hour daily; to organize, after his day school is running smoothly, an evening class for adults, and to meet them three times per week for one hour and a half each time; to investigate the barrio schools and supervise the work of barrio teachers; to be tactful and patient in dealing with everybody he meets—especially the presidente.

The surroundings to which he must adapt himself are hard, and above all, strange. There are only two ways in which he can provide food and quarters for himself. If he is the only teacher in the pueblo, and the pueblo is garrisoned, he has in many cases been invited to mess with the commanding officer. I have never heard of a teacher refusing this invitation. When there is only one the situation is serious. He can not afford to keep up an establishment by himself.

When two teachers are assigned to one pueblo they can arrange for their own mess, hiring a cook and a muchacho. * * *

For one week at least after his arrival at the place to which he is assigned the teacher is discouraged. From this time on he improves—that is, in four cases out of five. If by this I mean that he takes hold of the situation and makes the most of it. He becomes interested in his work and makes friends among the leading people, interviewing members of the city council, explaining matters to the presidente, and winning his way.

From the presidente to the smallest urchin, admiration for the American women in the provinces is unfailing and never ending. The school children adore her. Their attentions become a burden, and it requires the nicest ingenuity to avoid giving offense and yet to have sufficient time for rest and recreation. The schoolhouse for girls is filled by 7.30 in the morning. In the afternoon they accompany the "maestra" home. When the "maestra" walks out the pupils waylay her,

and before she reaches her room again there are many "compañeras." If the "maestra" wishes anything there is a scramble to see who can have the honor. One presidente asked for three ladies, and gave as a reason that the children could not distinguish between an American soldier and an American male teacher. There is a grain of truth in this, but there is a better and truer explanation, though the presidente has not perhaps thought of it. A woman in the presence of children can become more sympathetic and kindly than can a man. Especially is this true in the present stage of the development of the schools, when the situation in respect to many things is as hard and strange to the children as to the teacher. The best class-room instruction I have seen in this division has been given by the American women.

The American teacher, if true to himself, his calling, and his country, is, perhaps, the chief factor at present. The success of this great educational experiment depends upon his ability to establish sympathetic relations with Filipino pupils, parents, and teachers; to work day and night conscientiously and tactfully, and then patiently to await results. He needs to possess, besides scholarship and professional training, ready tact, plain common sense, a warm heart, and colossal patience. It should be noted that nowhere in the United States are the qualifications for elementary teachers any higher than those exacted, as a general rule, by the department of public instruction here in the appointment of the thousand teachers. They are either normal or college graduates, and the majority of them have had at least two years' successful experience; their health good, personal habits and moral character vouched for by proper authorities.

VIII.—FILIPINO TEACHERS.

The native teachers are appointed by the division superintendents and paid by the municipalities.

The permanent normal schools prepare the natives for taking up the school work, and after they have become teachers a regular course of training is laid out for them, consisting of daily instruction given by the individual American teachers and work done in the vacation normal institutes, which are established in every province.

The total number of Filipino teachers at present is approximately 3,400, distributed as shown in the table, Section V.

Since the institution of the American school system the salaries of native teachers have been generally increased by something like 33⅓ per cent, and yet in many cases they are still inadequate. The average salary for male teachers is about 20 pesos a month; for female teachers, 15 pesos. There are some teachers at present who are receiving sufficient compensation for the quality of work they are able to do; their preparation, received some time ago, was poor, hence their work is not of the first class. On the other hand, however, there are many who are doing excellent work and yet are receiving barely enough salary to meet their living expenses. These teachers should certainly receive more money on the score of efficiency. Another reason for such increase is that teaching here would be made a more desirable profession and attract the most capable among the Filipinos. When the superintendents, however, recommend increase in the native teachers' salaries, the municipalities in many cases claim they can not grant the additional amounts, and this statement is oftentimes true. As a solution to the problem, the recommendation is strongly urged by some division superintendents that the insular government pay the native teachers. In some cases this government has lent financial aid to the municipalities, and may do so more extensively, having as security a claim on the local land tax. It is this local tax which is often needed to put different municipalities on their feet financially, and it is hoped that when thus situated they will be able to grant the increased salaries to their native teachers.

There is at present no means of knowing the ability of native teachers except by actual observation of their work. Hence some system of certificates is necessary. Such existed under the Spanish rule, but were of little value because they were not true indices of the teachers' ability. The question was submitted to the various division superintendents, and the general opinion was that a system of examination should be established, not necessarily formal written ones, but of such a nature that the teacher's ability could be gauged, on the results of which appropriate certificates of first or second grade could be issued.

The matter of pensioning Filipino teachers was also submitted to division superintendents for their opinions. The majority were in favor of such pensioning, on the ground that teaching would thus be made a desirable life profession, and at the same time teachers could without hardship be removed from active work to make place for the younger, more active, and efficient ones. These matters of pensioning teachers and issuing certificates remain to be worked out.

The establishment of tributary normal schools in the provinces in conjunction with the central normal school of Manila gives the solution of the problem of securing efficient native teachers; for the graduates of these institutions go out well equipped for their work, with a substantial training in English and the common studies. This work of preparing the Filipinos to teach their fellow-beings is the fundamental element in this educational organism, and is one of the most significant signs to the Filipinos of the true object which the American Government has in coming to these islands.

IX.—FILIPINO CHILDREN.

Now that we have considered the American and the Filipino teachers, it is, perhaps, appropriate to say a word about their charges, the native children. The following questions were embodied in a letter recently sent out to the teachers, and the answers were exceedingly interesting:

What branches of school work are most interesting to the boys?

What branches are of most interest to the girls?

In what games do the boys take interest?

In what games do the girls take interest?

Do the boys and girls play together?

What do you think of the advisability of mixed schools?

Do you observe as good results from the schools in the way of desirable habits, such as punctuality, regularity, neatness, accuracy, truthfulness, industry, etc., as you do in scholarship?

In what lines, if any, does the Filipino child surpass the American child?

In what lines does he fall short of the American child?

Suggestions.

The boys were found to take by far the greatest interest in arithmetic, next preferring English, drawing, writing, and reading in the order named.

The girls show the greatest interest in English, reading, spelling, drawing, writing, and music. Their interest in English (their favorite subject) is not so marked over the other subjects as the interest of the boys in arithmetic.

Among the native games the boys take great interest in kites, pitching pennies, native football, and leapfrog, introducing the element of gambling wherever practicable.

Of the games introduced by the American teachers they take most interest in baseball, football, prisoners' base, catch, duff, and hop scotch. The boys are more active than the girls in all sorts of play.

The majority of the teachers report that the girls do not play games. Many report, however, that the girls are interested in the shell game (a kind of marbles), native hop scotch, running games, song-and-dance games, and jackstraws.

Under the guidance of the teachers many of the girls enjoy jumping the rope, hide and seek, blind-man's buff, crack the whip, dressing dolls, etc.

The boys and girls in the majority of cases do not play together, especially among the better classes.

Sixty per cent of the teachers are opposed to mixed schools, because of the public sentiment against the practice. Many say the better class of girls would leave school if mixed schools were established. They say, too, that the girls are inferior to the boys in intelligence and would feel too keenly a failure in recitation before the boys.

The minority are very strong in their support of mixed schools, claiming that they have a refining influence on the boys, make the girls less diffident, render the problem of grading much easier, and reduce the necessary number of teachers.

On the whole the results in scholarship are better than in the desirable habits mentioned. Many affirm, however, that in punctuality and neatness the results have been as gratifying as in scholarship.

A very large majority of the teachers claim the superiority of the Filipino child in the power of imitation, in memory, and in courtesy. Many teachers, on the contrary, state that he surpasses the American child in nothing.

The Filipino child falls short of the American child in general intelligence, in concentration, in reasoning, in activity, in morality, and in ambition.

Almost all of the teachers beg the enforcement of a compulsory school law. Many ask for the requirements of English in the private schools and for the payment, or partial payment, of native teachers from the insular treasury.

X.—TEXT-BOOKS AND SUPPLIES; COURSE OF STUDY.

Under the military organization the start was made in substituting English texts in place of Spanish ones. The books introduced at that time, together with their distribution, have already been given in Section II. The following is a complete list of text-books and supplies to date:

List of text-books and supplies received and ordered since January 1, 1901.

ARITHMETICS.

Wentworth's arithmetics	35,000
Heath's primary arithmetics	15,000
First Steps in Arithmetic	10,000

Grand total, $454,972.28.

The problem of selecting suitable text-books for Filipino children has been a difficult one. With the view of getting the teachers' ideas as to the relative merits of the English texts used questions were sent out asking for detailed answers. The teachers, almost without exception, found the books undesirable for the reason that they dealt with things unfamiliar to the Filipino child. The stories and pictures were those of a different environment, intended for children of another country. Such words as "strawberry," "snow," "Jack Frost," and "fairy" possess little significance for the children of the Philippines.

It was finally decided that a set of primary readers prepared expressly for the Filipinos would be the only satisfactory solution of the problem. The plan of the books includes considerable drill and practice in phonetics, with verbs which can be acted out or which lend themselves easily to gesture. The nouns are to be the names of familiar objects and the sentences are to develop from the most simple to the complex forms, with the view of teaching other words largely from the context. The work before the third reader is to be such as to enable the teacher, when this book is taken up, to explain in English all new and more difficult words and expressions. Sufficient repetition in each book and throughout the set is to be made to fix the more common forms of expression. Bright, attractive illustrations of such a sort as really to help the child understand are to be a feature.

The books should be strictly reading books, based upon the pedagogics of reading, but with the view of correlating and mutually reenforcing the work and of awakening many-sided interest. The matter in the second and third readers is to

be varied. Simple music, nature study, the elements of geography, grammar, and arithmetic, manual training, and a study of form are to be introduced.

The general plan includes two courses, one basic, the other supplementary, for which the special books midway between the American and the so-called colonial texts will be used.

An elementary language book to be taken up at the close of the third year is to be made with direct reference to these readers. A geographical reader treating of Philippine life and a hygiene for children of the tropics are to be included in the supplementary course, and a special reading chart in colors is to accompany the course.

For the aid of the inexperienced American teachers and the Filipino teachers, a special manual is to be written in which will be treated the use of the books, the blackboard, the chart, and the work at the desk.

Until such a set of books becomes available the following has been adopted as a suggestive course of study:

Outline for the First Year.

READING.

[First half.]

Make the lessons the first part of the year from blackboard exercises, taking original black board charts, consisting of pictures and words in script and print.

Be careful about difficult sounds and combinations.

Begin in a simple way the work in phonics to be taken up the second half year.

Use with the blackboard the Carnefix chart, teaching thoroughly a few common words, such as horse, dog, hat, boy, girl, man, etc.

[Second half.]

Continue the chart.

Use Ward's Primer and First Reader as a basis, and use Bass's or Baldwin's Primer and Baldwin's First Year or the Thought Reader, Book I, for supplementary work. Use the Ward Manual for Teachers.

LANGUAGE.

Use the nature work as the basis of much of the language work in this year.

Use words in the reading lesson as the basis for the forming of original sentences.

Teach the use of capital letters in beginning sentences and in writing the names of people.

Teach each child to write his own name and the town in which he lives after it.

Also teach the use of the period.

Short stories should be given by the teacher.

Question and answer and reproduction by the pupils.

Give talks on nature and the day's experience.

Encourage the children to talk freely about their busy work.

Have pupils copy words and sentences, and encourage them to make short original sentences.

The object lessons on size, shape, and color will give a good basis for language lessons, and will correlate well with the study of form as outlined below.

SPELLING.

The spelling of this year should be very simple.

See that the child pronounces the word correctly before spelling it.

Then see that he copies it correctly.

Teach the spelling only of such words as the child is familiar with.

Select them from the reading lesson and from the language work.

The child should at the end of the year be able to spell every word in his lesson passed over.

Oral spelling can be used occasionally with good results.

GEOGRAPHY.

Observations and talks on the earth and sky.

Develop ideas of right and left and the points of the compass.

Give talks on day and night, sun, moon, and stars.

Teach the names of the days and months, and the arrival of holidays, and explain simply the meaning of each, thus giving the child a little glimpse of history.

Teach by object lessons—by sand board, if you have one—mountain, valley, river, and ocean.

NUMBER WORK.

In teaching numbers the name of each should be the secondary consideration and incidental to the development of the sense of perception.

Have number games; use beads, blocks, and sticks.

Count and group in blocks of twos, threes, and fours to eight during the first quarter of the year.

Formal work in numbers should not be taught during the first half of the year.

Numbering should be incidental to the forming of clear conceptions of the object observed.

Elementary operations in addition, subtraction, multiplication, and division may also be taught up to eight; fractions up to the same number may be taught during the first half year.

By the end of the year pupils should be able to read and write numbers up to 100, and to use them in simple operations up to and including 10.

LIFE AND NATURE STUDY.

Learn the names of various common plants.

Learn what plants are used for food.

Learn what plants are used for making cloth.

Learn what trees are used for wood, what furnish fruit, and what furnish building material.

Learn what plants are poisonous.

Have, wherever possible, sample of plant discussed in the schoolroom, also samples of the products made from it.

Make these lessons the basis for conversation.

Get the children to tell you all they know about the subject discussed.

STUDY OF FORMS.

Study solids in the following order:

1. As wholes.
   (*a*) By handling.
   (*b*) By modeling in clay.
   (*c*) By comparing.
2. As to surface, determining various kinds.
3. As to phases.
   (*a*) Plane.
   (*b*) Curved.
   (*c*) Round.
4. As to edges.
   (*a*) Rough.
   (*b*) Smooth.
   (*c*) Sharp.
   (*d*) Round.
5. As to curves and angles. Teach the terms:
   (*a*) Sphere.
   (*b*) Hemisphere.
   (*c*) Cube.
   (*d*) Prism.
   (*e*) Cylinder.
   (*f*) Oblong.
   (*g*) Square.
   (*h*) Triangle.
   (*i*) Circle.
   (*j*) Semicircle.

Paper folding and cutting will be very helpful in this work. It should teach:

1. Geometrical forms.
2. Sequence of forms.
3. Linear dimensions.
4. Symmetrical forms.

Have the children cut these from object patterns and later from dictation.

Fold from the square a circle to illustrate position of lines and the formation of angles.

Cut forms previously traced or folded.

Mount these, if possible.

NOTE.—Interest is added to this work by the use of colored papers. When used, the names of the colors should be taught to the children.

DRAWING.

Drawing should include simple objects, leaves, fruits, etc.

Coloring with crayons.

Drawing of lines, including triangles and quadrilaterals.

Also teach the child the different colors, with the name of each.

SEWING.

Lines, straight and combined, to form plain figures.
Outlines of living forms, leaves, flowers, fruits, etc.
Perforated cards can be used to advantage here. They can be designed and prepared by the teacher.

PHYSICAL TRAINING.

Have movement plays, songs and games, walking, marching, and simple calisthenic exercises, training in correct breathing, sitting, standing, and walking, and the proper use of hands and feet.

HYGIENE AND PHYSIOLOGY.

Give short talks on cleanliness, care of the nails, skin, body, teeth, eyes, ears, and feet.
Teach the injurious use of narcotics and stimulants.
Teach the child to appreciate his body.
Name each of the different parts, as skull, face, trunk, and limbs.

MUSIC.

Make the music charts and the First Reader of the Normal Music Course the basis of the work. Use Lyman's Normal Course in the schoolroom.
During this year teach a few simple songs and songs descriptive of ordinary life.
Be accurate in time.
Seek distinct articulation.
Avoid straining the voice. (Soft singing will be a safeguard against this.)
Before the year closes teach the scale.
Use syllables.
Also teach the children to read the scale.
Teach them to beat simple time.
For supplementary work schools will be supplied with the Child's First Studies in Music and Leaflet Silver Song Series, which should be used for rote singing.
The schools will also be supplied with Leaflet Coda numbers, Songs of Nations, for this year and those that follow.

WRITING.

Use pencil.
Take copy from blackboard.
Copy books: None can be used in this grade.
Be sure the child understands what he is writing.

RHETORICALS.

During the last half of the year have the children learn easy selections for occasional recitations.

OUTLINE FOR THE SECOND YEAR.

READING.

[First half year.]

Continue the Ward First Reader as a basis and complete Baldwin's First Year or the Thought Reader.

[Second half year.]

The Ward Second Reader should be used as a basis.
Baldwin's Second Reader to about page 100.
Continue to use the blackboard for illustration and explanation.
Also make use of nature in your explanations.
Ask questions upon the lessons, and insist that the answers be given in complete sentences.
Impress upon the children that reading is the expression of meaning.
Cultivate in them the habit of expressing as clearly as possible the meaning of what they are reading by the way they read it.
Pay attention to the position of the child when reading; that he stand erect and hold his book in the proper position.
During this latter part of the year practice sight reading occasionally.
Silent reading can be used this year as busy work.
Study well new lessons and give much attention to new words.
Heart of Oak Book No. 1 should be used for supplementary reading.
Other books which will be distributed to teachers for supplementary reading in this year and the years that follow are Fifty Famous Stories, Health Chats with Young Readers, Big and Little People of Other Lands, Little Nature Studies, Nature Stories, and Robinson Crusoe for Youngest Readers.

LANGUAGE.

Let oral work predominate.
Give some attention to written work at the desk.
Make it very simple, avoiding the use of complex sentences.
Make the getting of the thought precede the expression of it.
Notice carefully the most common mistakes and give special work to correct these mistakes.
Teach the use of punctuation marks as illustrated in the lessons.
Teach the most common abbreviations: Mr., Mrs., Dr., the abbreviations for the months, P. I., U. S., etc.
Give frequent dictation work.
Have the children write short original sentences.
Give frequent drill in oral and written reproduction of parts of the reading lesson.
Give action lessons in which the teacher or pupil performs an action and the class describes it in a complete sentence or sentences.
By the end of this year the pupil should be able to use ordinary simple sentences with ease.

SPELLING.

Give written and oral spelling from the reading lesson.
Give frequent dictation work in which the words of the spelling lesson are to be found.
Be sure the class learns to spell every word in the reading lesson.
Study the children's vocabulary, and make this the basis of your spelling work.

HISTORY.

Continue the teaching of the holidays.
Give special emphasis to their historical significance.
Tell them in words they will understand simple stories with an historical basis.
These lessons should not be frequent—not more than once a week.

GEOGRAPHY.

Continue the work of the first year, and give more detailed instruction in local geography. (Local maps are needed for this work.)
Give special attention to the geography of the Philippine Islands, especially the province in which you teach.
Teach the continents and seas, the North Pole, the South Pole, the equator; why it is cold at the poles and warm at the equator.

ARITHMETIC.

In this grade the children should learn the simple combinations of the numbers up to 25 and be able to use them in their other work.
Teach objects of comparative magnitudes.
Teach them to read the clock dial.
Teach the number of days in a week, weeks in a month, months in a year, days in a year, and the number of days in a lunar month.
Teach the Mexican currency.
Teach United States money by cents to 25 cents; by nickels and dimes to $1; by dollars and $5 to $25.
Have the children tell the number of the lesson and the page where it begins.
Teach long measurement.
Compare it with the native measurement.
Do as much of this work as possible by means of objects.
First Steps in Arithmetic, Heath's Primary Arithmetics, and Wentworth's Arithmetics will be at the teacher's disposal for this year and the years that follow, but the work will not be primarily book work.

NATURE STUDY.

Birds and insects.
Learn the names of various birds and insects.
Learn which are used for food; which are used for other purposes, if any.
Learn something of their habits.
Have specimens of the animal under discussion in the room, if possible.
Use these lessons as material for conversation.
Urge the children to watch the subjects studied when they are out of school, reporting what they have learned the following day.

DRAWING.

Study the models:
1. Square.
2. Prism.
3. Cylinder.
4. Rectangle.
5. Equilateral.
6. Triangle.

7. Right, obtuse, and acute angles.
8. Horizontal and vertical lines.

Pay some attention to:

1. Division into equal parts.
2. Proportion.
3. Symmetry.
4. Arrangement.

Let the pupils do some drawing on paper.

Teach the colors of the rainbow, and how these colors are made.

Draw natural objects:

1. Round.
2. Uneven.
3. Irregular outlines.

SEWING.

Class drill on position.
Use of thimble.
Holding and threading of needle and use of scissors.
Simple plain sewing.
Basting.
Running.
Stitching.
Overhanding.
Patching.
Darning.
Buttonholes, etc.

PHYSICAL TRAINING.

First-year work continued.

Special attention given to correct position, correct breathing, setting-up exercises, and special fancy drills.

HYGIENE AND PHYSIOLOGY.

Continue the talks on personal cleanliness, as outlined in the first-year course.

Also the effects of narcotics and stimulants.

Continue the study of the body, taking up the parts more in detail.

MUSIC.

Continue the use of the Normal Course First Reader as a basis.

Review the scales and teach scales of 1 and 2 sharps and 1 and 2 flats.

Teach the common intervals.

Make this work as thorough as possible.

Put the new scales on the blackboard in colors and keep them there until the children have mastered them.

Continue teaching of songs, using the material referred to under the first year. By the end of this year the pupils should be able to master two-part singing.

WRITING.

Use a pen.

Write from blackboard copy and also in the regular copy books Nos. 1 and 2.

Be sure the child knows what he is writing about.

Never let the work degenerate into mere imitation.

RHETORICALS.

Have maxims and short chosen selections memorized and recited from time to time.

Caution: The tendency will be to a mere reciting of the words with no conception of their meaning.

Outline for the Third Year.

READING.

[First half year.]

Continue the Ward Second Reader as the basis throughout the year, and complete Baldwin's Second Year or the Second Reader in Stepping Stones to Literature series during the first half year.

[Second half.]

Read complete the Third Reader in Stepping Stones to Literature series with some other book of same grade for sight reading.

Throughout the year lay special stress on bringing out the thought in natural conversational tones.

Watch carefully the articulation of words and give special drill to the children on sounds that are hard for them.

Have frequent exercises in sight reading.

Occasionally have the one who has just read a selection give the substance of it in his own words.

The child should be encouraged to read at home, and to read much aloud, in order that correct pronunciation may become natural to him.

Heart of Oak Books Nos. 2 and 3 and Great Americans can be used to advantage here for supplementary reading.

LANGUAGE.

The third year should be a continuation of the work of the second, both oral and written work being carried along together.

Oral lessons on nature, with objects to illustrate, and on geography, alternating with written reproductions and stories from history or fiction, will give variety and interst to the work.

Occasional exercises should be given in descriptive writing.

Strive to secure brief and clear descriptions.

Writing from dictation a number of simple letters should be given the class during the third year.

In all written exercises great care should be taken that the sentences are well constructed and the words well chosen.

Avoid repetitions and loose constructions.

Scrutinize closely all written work; better a small amount well done than a large amount which is poor.

Teach during this year how to write the days of the week, the months of the year, the streets in which the pupils live, the names of the holidays, the use of such abbreviations as A. M., P. M., P. O., U. S., Co., etc.

Teach verb forms, and incidentally the use of common pronouns.

Secure the correct use of *are* and *is*, *was* and *were*, *has* and *have*, *these* and *those*, *do* and *did*, etc.

The teacher should not spend much time in explaining why we should use irregular verbs and pronouns as we do; he should rather teach by well-selected examples how we use them.

In this year the teachers will be greatly helped by the use of the following books: First Steps in English and Mother Tongue No. 1.

SPELLING.

Spell the words found in the various lessons of this grade.

Make carefully selected word lists of such words as are frequently misspelled by the children, and use them in the spelling lesson.

Study the division of the word into syllables, having both written and oral spelling.

Occasional spelling matches delight these children very much and serve to keep up a lively interest in this study.

GEOGRAPHY.

The work in geography should now be carried along two distinct lines at the same time, thus giving variety and interest to the work.

First:

Natural features of the earth's surface. Study the –

1. Hill.
2. Valley.
3. River.
4. River bed.
5. Seashore.
6. Sea level.
7. Tides (do not attempt to explain them).
8. Mountain peaks.
9. Chains.
10. Canyons.
11. Why rivers start in mountains or elevated sections.
12. Possibilities of water from the highlands being used to irrigate the dry sections at lower levels.
13. Explain that this will make possible two crops a year on irrigated lands.

Second:

Local geography.

Begin with the compass.

Get a clear idea of direction, then find relative location of the schoolhouse and the other principal buildings of the town.

Make a map of the town, locating these.

Having learned the geography of the town, develop its geographical relation to the neighboring towns, and later its location in the province.

Make a map of the province, showing the location of its towns, its principal roads, and rivers.

Have the children tell you how to get from one town to another.

From the study of the provinces pass to the study of the islands as a whole.

Note the geographical relation of the provinces to each other.

Learn the capital of each.

The mountain chains and other influences on the provincial boundary lines and also the principal ports of the island.

ARITHMETIC.

Teach the signs—plus, minus, multiplied by, divided by, sign of equality, if not previously learned.

Continue concrete work along lines indicated in second-year outline.

Third:

Give simple problems in denominate numbers, involving one change in linear and also in square measurement.

Teach dry and liquid measurement, the liter being the unit.

Compare with it the native table of dry measurement.

Teach the table of weights, using the gram as a unit.

NOTE.—The metric system should be the basis of all this work.

When a set of measurements is being studied put them in tabular form on the board, showing relative values.

Teach time measurement; second, minute, hour, day, week, month, year, century.

Give much work in addition, subtraction, multiplication, and division, within the limits of 60.

Have some oral work.

Teach the children to write problems in good English, and to express arithmetically and vice versa.

Give drills in the fractional parts of numbers.

In the last half of the year teach combinations and numbers to 150.

Read Arabic numbers to 5,000 and Roman numbers to 100.

Give frequent drills on the multiplication tables.

Give frequent simple lessons in mental arithmetic.

NATURE STUDIES.

Plants and animals:

1. Show how birds and insects assist the plants in fertilization.
2. Show how one is dependent upon the other.
3. Explain the natural laws here illustrated.
4. Learn what birds and insects are harmful to the people, and why.
5. Learn what plants are harmful, and why.
6. Discover, if possible, and teach how these pests may be eradicated.

HISTORY.

Give the life story of some of the world's great men.

Explain simply the most obvious effect each life has had upon the world.

Both story and explanation should be brought so clearly and simply before the child that he can readily understand them.

Such men as Washington, Lincoln, McKinley, Gladstone, and Rizal can be made living realities to the child if skillfully presented, and will serve as the basis for lessons on patriotism.

Tell simple stories of the lives, struggles, and inventions of famous inventors.

These stories should be both entertaining and instructive.

They can be so correlated with the other work that no extra time will be required.

During the year the children should from memory reproduce in writing the stories of some of these men.

Montgomery's History of the United States for Beginners and Eggleston's histories can be used for the regular work, and such books as Great Americans can be used for supplementary work.

DRAWING.

Teach the division of lines into 2 and 4 parts, and illustrate the resulting division of areas and continents.

Give lessons on curved lines.

Teach pupils to recognize natural forms and forms in manufactured articles.

Have them reproduce these on paper and work them into designs.

Have the pupils make designs for borders, for carpets, for tile floors, for windows, etc.

In the latter part of the third year let the children do some shading and learn the simplest principles of perspective drawing.

In all this work teach the pupil first to locate the principal points of a picture, then to sketch in the lines very lightly, and after the sketch is made to finish it with firm, smooth lines.

SEWING.

Make samples involving selections from the following exercises:

1. Hemming.
2. Oversewing.
3. Darning.
4. Hemmed-on patch.
5. Stitched-on patch.
6. Darned-on patch.
7. Oversewed patch.
8. Patches of various sizes and shapes.
9. Buttonholes, made with cotton and twist.
10. Band.
11. Tucking.
12. Whipping.
13. Ruffling.
14. Marking initial on embroidered edge.
15. Cutting and making any useful article involving any of the above work.

PHYSICAL TRAINING.

Give special attention to the carriage of the body.

When walking cultivate prompt, quiet foot movements.

Keep the head well poised.

Continue the breathing exercises.

At the close of the third year the child should have good self-control, good bodily carriage, and graceful movement.

HYGIENE AND PHYSIOLOGY.

In addition to the work of the second grade, have the children learn the number of bones in the forearm; why two? In the upper arm. In the lower leg; why two? In the upper leg.

Find the shoulder blades and ribs.

Count them.

How do they act when breathing?

Find the spine.

Why is it possible to bend the spine?

Name the senses.

Interest will be awakened if you test the eyesight of each pupil in the class, or his hearing, both for kind, location, and distance of sound.

Test the sense of smell, of taste, and of touch.

Give talks on the value of clean surroundings, clean clothing, clean houses, clean yards, clean streets and plazas; the necessity of removing all refuse to a distance; the danger from breathing impure air; the part each child can do to better the conditions in his town, that is, by being careful that he does not increase in any way the unhealthful conditions.

MUSIC.

The Normal Music Reader No. 2 should be used as the basis for this year's work.

Continue the teaching of the scales and time; how they are indicated.

Teach the different notes; how indicated.

Give frequent exercises in beating time.

Drill in all kinds of measurements and the different rates of time.

Be sure the pupil understands tone length.

Practice sight reading by taking single measurement and having the children tell you what the different notes are, what the time is, and what beats should be given to the measurement.

Later, take some simple song and ask the pupils to sing it at sight.

See that the children are thinking and understanding.

The children should be able to learn fifteen or twenty songs this year.

Use the material previously referred to.

WRITING.

Use copy books 3 and 4.
Give work in copying prose and poetry.
Have the children write formal personal letters.
Pay much attention to capitalization and combination in this work.
During this year the child should learn simple forms of correspondence and be able to use them correctly and readily.

RHETORICALS.

Have selections of prose and poetry recited.
Also have occasional readings.
In all later work drill the child until he can read his selections well.

Outline for the Fourth Year.

READING.

Use the Ward Third Reader as the basis for this year's work, with supplementary reading from Fifty Famous Stories Retold, Baldwin's Third and Fourth Reader, and the Fourth Reader in Stepping Stones to Literature series.
Continue throughout this year, as in the third, to lay stress on good oral reading.
Note enunciation of words and inflection, position and control of the body.
Continue the exercises in sight reading.
Have each child prepare, outside of school hours, one selection made by the teacher each month to be read before the class.
Assist the child in making selections of books for home reading.
Grimm's Fairy Tales and Heart of Oak Book No. 3, together with books already referred to in previous years, will serve as excellent reading books.

LANGUAGE.

Correlate the language work with the geography, reading, and nature work.
Write a letter or story once in two weeks.
Have subjects taken from pictures and from stories told or read by the teacher; from a story told by some child.
Tell how some article is made or some piece of work is done.
Describe—

1. A day in school.
2. A trip to town or into the country.
3. Something they consider beautiful.
4. Something homely.
5. The character of the person they most admire.

Let the teacher read some of the compositions and letters to the class, calling attention to errors.
Have some of the stories read by pupils, and let the class make criticisms.
Continue dictation exercises.
Pay especial attention to form of sentences.
Construct examples of each, and write sentences expressing past, present, and future time.
Some attention should be paid to possessives.
Insist upon clear and complete sentences.
Neatness should be carefully inculcated, no papers being accepted unless it is the best work the pupil can do.
Once a month have each pupil prepare a story to tell to the class.
Text-books should be in the hand of the pupil, and technical work closely correlated with it.
Lyte's Elementary English and Mother Tongue No. 2 can be used to advantage here.

SPELLING.

Continue both written and oral spelling, using for the lessons those words found in the lessons for the grade.
Continue giving the child lists of words often misspelled.
Give such words in dictation exercises so that the meaning of the word may become fixed in the child's mind with the spelling.
Note what part of the word is the root; what is the suffix or prefix.

GEOGRAPHY.

Rapidly review at the beginning of each lesson:

1. The globe.
2. Its forms.
3. Hemispheres.
4. Continents.
5. Oceans.

Spend at least one month teaching:

1. The names of the capitals of the great countries.
2. Twenty-five of the great commercial cities.
3. The mountain systems.
4. Deserts.
5. Locate a few characteristic plants and animals.
6. Also teach the chief exports and imports.

Have pupils make sand or papier-maché map of each grand division.

Compare with other countries throughout the course in regard to size, shape, position, and direction of mountain systems.

Why certain nations have progressed more rapidly than others.

The basis of the year's work will be the United States.

Teach its position, boundaries, mountain systems, tributaries, varieties of climate, with other causes; important vegetable and animal life.

Teach the States, the more important capitals, and the large cities.

Why they are located as they are.

Chief exports and imports.

Compare with other countries throughout.

Have much map drawing from memory—quick work.

Teach spelling of difficult words.

Correlate with language and reading work.

Name the important cities of the Philippine Islands, and why important.

Important animals; why not fur bearing.

Principal products of the soil and of the manufactories.

Supplementary material that may be used to great advantage in this year's work are The World and Its People, Guyot's Geographical Readers, Carpenter's Geographical Readers.

HISTORY.

Text-book in hands of pupils, the Beginner's American History or its equivalent, alternating this with a suitable child's history of the Philippines.

One half of this year may be devoted to American history and the other half to Philippine history.

Continue telling stories of heroes.

Biography, human action and achievements are now within the child's grasp, but the events of the nation's life are still beyond him.

Stories of real men—what they did—will delight the pupil, while a mere recital of events will weary him.

Let life be the framework upon which you hang your facts.

ARITHMETIC.

The pupil should now begin the regular use of the text. Wentworth's Elementary Arithmetic or its equivalent should be completed this year.

Give much drill on the analysis of problems.

Insist upon clear statements and good English.

Units of measure and simple fractions continued.

A thorough drill on the four fundamental operations, including long division.

Insist upon accuracy.

Give daily mental drill along the lines of the previous years.

NATURE STUDY.

1. Study the life history of the animals already made familiar to the child by former lessons, and pay special attention to their coverings, homes, foods, habits, etc.
2. Make simple studies of familiar plants.
3. Throughout this year have frequent descriptions and drawings made by the children.

DRAWING.

The children should now be supplied with drawing books.
They should be taught to appreciate good pictures.
The work of the life of an artist with a story of the picture will give pleasure to the children and stimulate a taste for the highest forms of art.
Have much drawing outside of the books.
Let common objects be used as models.
Teach the child to see correctly; to look at the object as though it were flat.
It will be found to produce good results if some of the best drawings are put on the wall.
Some color work, also brush work, with ink, can be introduced here to advantage.
For ink work, if the pupils have no brushes, a solid pencil or stick will do.
Continue the work in perspective drawing.
Do not attempt to explain the reasons underlying the mechanical laws of perspective.
Be content if your pupils of this year learn a few of the simplest laws and how to apply them.

SEWING.

Teach:
1. Hemstitching.
2. Herringbone (stitching and cutting, giving special attention to the latter).

Have at least two garments cut and made.

PHYSICAL TRAINING.

Continue the work of the third year.
Give frequent practice in the setting-up exercises.
It will add interest to this work to form a company of the larger boys for military drill once a week.
The girls will enjoy receiving instructions in fancy drills, executing figures, etc.

HYGIENE AND PHYSIOLOGY.

The pupils should now be supplied with some good text-book in hygiene and physiology.

1. The cells.
   - (*a*) Of what made.
   - (*b*) Importance.
   - (*c*) How cared for.
2. The digestion of food.
   - (*a*) In the mouth.
   - (*b*) In the stomach.
3. The blood.
   - (*a*) From what made.
     - (*aa*) Where formed in the body.
   - (*b*) The circulation through:
     - (*aa*) The heart.
     - (*bb*) The capillaries.
     - (*cc*) The veins.
   - (*c*) How blood flows.
     - (*aa*) Why the heart beats faster after violent exercise.
   - (*d*) How alcohol affects the—
     - (*aa*) Heart.
     - (*bb*) Arteries.
     - (*cc*) Blood.
4. Breathing, heating, and clothing:
   - (*a*) Breathing.
     - (*aa*) The process described.
   - (*b*) How air gets into—
     - (*aa*) The blood.
     - (*bb*) The capillaries.
   - (*c*) The warmth of the body.
     - (*aa*) How secured.
   - (*d*) Clothing.
     - (*aa*) How it affects the warmth of the body.
     - (*bb*) What kind of clothing is best adapted to this climate.
5. Skin and kidneys:
   - (*a*) Skin.
     - (*aa*) Use of the skin.
     - (*bb*) Care of the skin.
     - (*cc*) Including hair, nails, the necessity of cleanliness.

5. Skin and kidneys—Continued.
   (*b*) Kidneys.
      (*aa*) Function.
         (*aaa*) Colaborers with the skin.
6. The nervous system:
   (*a*) Nerves.
      (*aa*) Where found.
      (*bb*) Functions.
   (*b*) Spinal cord.
      (*aa*) Where found.
      (*bb*) Functions.
   (*c*) Brain.
      (*aa*) Where found.
      (*bb*) Functions.
7. Bones, joints, and muscles:
   (*a*) Bones.
      (*aa*) Review briefly the work passed over in the third year.
   (*b*) Joints.
      (*aa*) Different kinds.
         (*aaa*) Give sample of each.
      (*bb*) Use of each kind.
   (*c*) Muscles.
      (*aa*) Where found.
      (*bb*) How formed.
      (*cc*) How attached to the bones.
      (*dd*) How they act.
      (*ee*) Their function.
      (*ff*) How used and abused.

MUSIC.

Review the work of the third year on scales, keynotes, notes, and time.
The Normal Music Reader No. 3 should be the basis for the work in this year
Continue the work in sight reading.
Teach part singing.
Drill on 2 and 3 part songs.
Give special attention to the development of expression in singing.

WRITING.

Use copy books 5 and 6.
Continue the work of the previous grade.
Every paper written by the pupil should be a writing lesson.
He should not have one style of writing for his copy book and another for his ordinary work.

RHETORICALS.

Let at least nine selections be memorized by pupils during the year, these being selected mostly by the teacher.
Also some short gems.
It is suggested that these be written on the blackboard and changed every few days.
Have selections read as in the previous years.

XI.—SCHOOL FINANCES.

The expenses incurred in the interests of education here are met by the insular government, the provinces, and the municipalities.

The salaries of the American supervisors and teachers, the reimbursements for traveling expenses, the office rent of division superintendents, the cost of textbooks and supplies, and the cost of transporting these to the various towns, all these are paid for by the insular treasury.

The teachers and books for the provincial high schools are furnished by the insular government; the sites, buildings, and equipment by the provinces.

The salaries of native teachers, together with the cost of local school buildings and their equipment, are paid by the municipalities.

Below is a statement of salaries paid supervising officers and teachers and of

other school expenses for the period from July 1, 1901, when civil government was established, to February 1, 1902:

SCHEDULE A.—*Itemized statement of actual expenditures from office of general superintendent of public instruction from July 1, 1901, to February 1, 1902.*

SALARIES AND WAGES.		
General superintendent and employees of office	$13,726.80	
Division superintendents	17,738.25	
Teachers of English	419,024.26	
Laborers	399.75	
		$450,889.06
SCHOOL FURNITURE, BOOKS, AND SUPPLIES, INCLUDING TRANSPORTATION.		
School furniture	$22,047.46	
School books	47,627.52	
School supplies	22,688.83	
		92,363.81
TRANSPORTATION.		
Traveling expenses, general and division superintendents	$2,568.31	
Traveling expenses, teachers	41,284.69	
		43,853.00
Support of provincial schools		1,857.35
MISCELLANEOUS, CONTINGENT EXPENSES.		
Office supplies	$2,556.33	
Incidental expenses	370.87	
Teachers' temporary quarters	4,614.22	
Normal school	7,399.46	
Rents of storehouses	950.00	
Agricultural school	737.76	
Teachers' permanent quarters	717.02	
Trade school	5,965.52	
Nautical school, including salaries, rent of building, transportation, and per diem allowance to superintendent	2,989.08	
Superior advisory board	70.10	
		26,370.36
Total		615,333.58

SCHEDULE B.—*Itemized statement of funds invoiced to other bonded officials of the civil government, for which accounting is made directly to the auditor.*

Traveling expenses	$50,000.00
School books and supplies	102,835.34
Support of schools	8,416.50
Agricultural school	1,000.00
	162,251.84

SCHEDULE C.

Average monthly pay roll American supervisors and teachers now in the field, approximately	$100,000.00
Average yearly pay roll American supervisors and teachers, approximately	1,200,000.00
Estimated total amount paid Filipino teachers per month	37,756.00
Estimated total amount paid Filipino teachers per year	453,072.00
Estimated total value of school property	498,760.00
Estimated total amount expended for rentals and repairs per year	71,316.00

XII.—NIGHT SCHOOLS.

In September, 1900, night schools for teaching English to adults were opened by the Department in the city of Manila. They were so successful that with the establishment of regular day schools throughout the archipelago steps were taken to open night schools as well. The general superintendent urged that the teachers should receive $15 a month extra compensation for conducting evening schools an hour and a half each night three times a week, and such has continued the regular amount.

The growth of these schools, of which the object is to teach the English language to adults and those who are otherwise engaged during the day, has been rapid, and now in practically every town where there is an American teacher there is at least one night school. The total enrollment in these schools can not be given absolutely, for the number is continually increasing. At present, however, it reaches about 25,000.

Those attending represent every occupation, from the poorest field laborers to the presidentes and the provincial governors, all with a practical object in view of studying the English language. The interest shown in these schools by the older persons, less to be expected than in the case of the children, and hence the more remarkable, is deep. An incident occurred in the town of Olongapo, Zambales, recently, which serves well to indicate the presidente's idea of the importance of the night school.

There was a wedding in town one night, and when school opened there were in attendance only six men in one room and four in the other. The presidente, one of the pupils, is an old man, but he gets angry like a boy and stamps his foot and pouts. He noticed the small attendance in the rooms, then blew his whistle for the police and ordered them to bring all the men who were enrolled on the night-school sheet to either the schoolhouse or the jail. And then there was a full attendance, all in wedding array.

English is primarily the subject taught in the night schools, particularly in the provinces; yet the common branches are also taken up, both as a direct help in teaching English and as an additional training. In this work the pupils are constantly drilled in conversation, and in reading, writing, and spelling the language.

The night schools of Manila—and those of other large towns will soon follow the example—have carried the work beyond this elementary stage, and teach higher arithmetic, geography and history, bookkeeping, stenography, typewriting, and telegraphy. It is now planned to conduct special evening schools to take up these more advanced branches and prepare the Filipinos for the civil-service examinations. Thus they will be able to carry on their daily work as before and fit themselves during the evening for substantial positions. Some have already done so by learning bookkeeping, typewriting, and stenography, and many others are waiting to seize the opportunity.

XIII.—VACATION NORMAL SCHOOLS.

In the capital of each of the provinces a normal school is held during the long vacation, attendance at which is required of all the native teachers in the province.

The following regulations were sent to the division superintendents concerning these schools:

1. The normal institute in each district shall be conducted during the long vacation for that district.
2. Owing to the different times for vacation, difficulties of transportation, local interests and conditions, the normal institute work shall be conducted in the different districts under the supervision of the division superintendents thereof, and not in a general vacation term at Manila.

3. The normal institute shall continue four weeks, but six weeks is recommended.

4. Native teachers in one district may, on the permission or request of their own superintendent, attend the normal institute in another district, provided that the superintendent from whom these native teachers come shall, at the request of the superintendent conducting the normal institute, contribute to the teaching force a number of American teachers proportional to the number of his native teachers in attendance.

5. American teachers shall, at the request of their division superintendent, teach during the normal institute in alternate years.

Thus the institute is under the direction of the division superintendents, aided by American teachers, and its curriculum comprises a study of school methods and management, history, geography, arithmetic, and a continuation of the work in English. It extends over a period of from four to six weeks, and during the session native teachers are often given the opportunity to visit well-conducted schools, from which they get helpful suggestions and new ideas. At the end of the term certificates of attendance are issued to the native teachers, with a statement of the grade of work done.

Division superintendents were governed by the following instructions in regard to the work to be carried on in these vacation normal schools:

In these first institutes nothing should be attempted in methodology as such. The work pursued should be practically what the native teacher will take up in his own school, and the method should come out in the treatment of the subject in the institute.

ENGLISH.

In the English work emphasis should be placed upon securing a good working vocabulary and the correct use of words in sentences.

Constant drill should be the method. But little or no technical grammar at first. Much oral work, and the reading of books or board work, not too difficult, that they may get the swing and catch the sense of the word in the context.

The best plan of attack for the oral work is to take up the principal parts of speech, with their most general inflections.

1. A hundred, more or less, of the most common verbs—eat, drink, sleep, come, run, see, hear, buy, bring, go, take, open, shut, stand, sit, etc. Give the principal parts and use correctly in sentences, oral and written.

2. A hundred, probably many more, of the most common nouns—boy, girl, man, woman, ear, eye, hand, house, table, door, floor, chair, tree, book, pencil, coat, hat, etc. Give the singulars and plurals and use correctly in sentences, oral and written.

3. Treat the adjective in the same way as the verb and noun.

4. The personal pronoun, person, number, and case inflections. Teach this more by the use of sentences than by the "nominative, I; possessive, my or mine; objective, me" plan.

5. Follow this work with the remaining parts of speech, all of which have been touched upon incidentally in the preceding work.

Insist upon complete sentences and good English. All of the oral work should be "acted out" in the class. There should be walking, talking, standing, running, touching, taking, bringing, closing, shutting, singing, asking, telling, etc., in the English class.

Avoid becoming bookish and too formal. Never allow the class to translate. A Spanish word thrown in at a critical time may help, but translation is always bad. The student must think in the new language, a thing which he will probably never do if he is allowed to translate at first.

The thing to be insisted upon is constant drill and action.

GEOGRAPHY.

1. A study of the chief land forms.
   (*a*) Names and definitions—illustrations.
   (*b*) Relative size, form, and position of the continents and most important islands.
2. A study of the chief water forms.
   (*a*) Name and definitions—illustrations.
   (*b*) Relative size, form, and position of the oceans and a few of the most important lakes, gulfs, straits, and rivers in the world.
3. A study of relief and contour.

A brief study of the causes of relief and contour forms and the forms themselves—denudation, eruptions, earthquakes, frost, drifts, irrigation, rainfall, coral reefs, volcanoes, tidal waves,

ocean currents, mountains, hills, valleys, plains, plateau, desert, river basin, river system, delta, estuary, etc.

NOTE.—In this work and what follows all land masses offer splendid opportunity, but the Philippine Islands should be used as much as the material at the teacher's disposal will admit of.

4. Climatic conditions, due to latitude, and relief and contour forms.
5. Plant and animal life.
   (*a*) Mutual relations.
   (*b*) Favorable and unfavorable conditions.
   (*c*) Uses.
6. Industrial life.
   Occupations, location and building of cities, railroads, and canals, harbor improvements, etc., and finally on to government, or political and commercial geography.

NOTE.—1 and 2 must be seen as forces behind 3; 1, 2, and 3 plus latitude must be seen as forces behind 4; 1, 2, 3, and 4 must be seen as forces behind 5, and 1, 2, 3, 4, and 5 must be seen as forces behind 6.

HISTORY.

1. First plan of attack:

(*a*) Present in brief outline the general unrest and spirit of adventure in Europe at the opening of the sixteenth century.

(*b*) Present in general outline the conditions in Spain at this time.

(*c*) Trace the fortunes of the Spanish in foreign explorations, conquests, and colonizations the world over, with special emphasis upon the United States and the Philippine Islands.

(*d*) Material at the teacher's disposal will determine whether the Spanish will be followed in America and finally United States history taken up, or if they will be followed in the Philippine Islands and the history of the Philippine Islands taken up. The chronology is such that it makes little difference which is taken up first, but it would be confusing at present to pursue both lines at the same time.

NOTE.—Every division superintendent and deputy superintendent should have some good book on the Philippine Islands, preferably Foreman's, which could be used in the institute and by the teachers in their regular work.

2. Second plan of attack:

Study the history of the locality—the history of the town government, of the church, the school, the laying out of the town, cemeteries, construction public buildings and public roads. Contemporaneous history of the locality.

ARITHMETIC.

The native teachers are very slow and very inefficient in their arithmetic work. There should be daily drill in rapidity and accuracy. Do not enter too much into the why and wherefore, but endeavor to secure a reasonable amount of speed and accuracy in the four fundamental operations and fractions.

These vacation normal schools are helpful in furnishing the additional training which is necessary in the case of so many native teachers, and in bringing the various teachers of the province together for interchange of suggestions and ideas, and discussion of school matters.

XIV.—PERMANENT NORMAL SCHOOLS.

In conjunction with the Manila Normal School five tributary normals have recently been established: in Vigan, province of Ilocos Sur; Nueva Cáceres, province of Camarines Sur; Iloilo, Panay; Cebú, Cebú, and Zamboanga, Mindanao. These schools are to open in June and are planned to furnish preliminary training to Filipinos intending to become teachers. They will spend the first three years of their normal-school course in these provincial normals and will come to the Manila Normal School to receive final training.

The curriculum includes practically the same studies as the normal school in Manila, the report of which is given later on, and covers, with the work done in Manila, a four-year course.

The following suggestions on the administration of the tributary normal schools have been sent to the division superintendents in whose provinces these schools are established:

I. In order that the administrative machinery may be most simple, responsibility for work done more definitely fixed, business matters more unified, the entire normal-school work of the islands better correlated and so more efficient, the work of the tributary normals shall be under the principal of the central normal school of Manila.

II. All teachers in the tributary normal schools shall sustain the same relation to the principal that the teachers in the central normal at Manila do.

III. All teachers in normal schools shall be appointed by the general superintendent of public instruction on the recommendation of the principal of the normal school, whose recommendation, however, is subject to the disapproval of the general superintendent.

IV. Each tributary normal shall have a vice-principal who shall be responsible for the administration of the school in the absence of the principal, but who shall formulate and execute no new policies without the knowledge and consent of the principal.

V. The principals and vice-principals of the normal schools shall constitute a normal school board which is subject to call by the principal or general superintendent of public instruction.

VI. The relation that exists between the normal-school administration and the public-school administration in the district in which the normal school is situated is a relation of cooperation, mutual educational reenforcement, and professional courtesy—a relation similar to that existing between the central normal at Manila and the superintendent of the Manila public schools, or that existing between the administration of a State institution and the superintendents of the county and city in which the institution is situated.

In company with the central normal school at Manila these institutions are of first importance. Their work in preparing Filipinos to teach their fellow-beings is a thoroughly fundamental one, and these schools are essential factors in the solution of the present problem.

XV.—SPECIAL SCHOOLS: NORMAL, NAUTICAL, AND TRADE SCHOOLS OF THE PHILIPPINE ISLANDS.

I. NORMAL SCHOOL.

From April 10 to May 10, 1901, a preliminary term of the Manila Normal School was conducted under the direction of Superintendent Barrows, of the Manila public schools, acting principal of the normal school, who called to his assistance 47 well-trained American teachers.

A building within the walled city, known as the Escuela Municipal, by thorough renovation and alteration was changed into a good schoolhouse, containing a large assembly hall, with a seating capacity of 500, an office, library, storeroom, and 10 large recitation rooms.

After the purpose of the school and the courses offered were carefully announced, and very favorable rates for transportation from the insular steamship companies secured, applicants came from all over the archipelago for admission to the school. By April 10, the opening day, 450, over 100 more than were expected, had enrolled, and others continued to come. Thus it was found necessary to relieve the crowded conditions by opening a second school in close conjunction with the first. The total enrollment reached 600. It was an interesting fact that about 10 per cent of those from the provinces were able to speak English.

Thirty-three classes were formed in English, geography, and arithmetic, these three branches forming a basis of primary instruction. Each pupil was given a copy of Baldwin's Primer, the material of which was mastered by him at the end of the course. In addition, Montgomery's Beginners' History of the United States was used in the English classes; and more advanced pupils did profitable work in studying short selections from American poets, including Bryant and Longfellow.

Classes were formed for the study of physical and political geography and map and globe study. In this work Frye's Elementary Geography and Myer's General History were used, but the work was carried on mainly by lectures.

In arithmetic, classes were formed for the study of both fundamental operations and methods of teaching. Wentworth's Elementary Arithmetic was used to good advantage.

In addition to this regular class work, classes in kindergarten and art work, manual training, nature study, and physiology, attendance at which was required, were held regularly.

And finally, essays by various pupils attending, and lectures by Americans who had their subject well in hand, were delivered from time to time.

A careful record was kept of the work done by each pupil, and the results were gratifying. Great interest was shown by almost everyone and enthusiasm to an unexpected degree was aroused. The average daily attendance was 98 per cent, even including cases where severe illness was known to be the cause of absence. Many of the pupils made real sacrifices to attend.

For a more detailed account of this preliminary term, see the report of Major-General MacArthur for the period October 1, 1900, to July 4, 1901, Appendix G G.

The following is an account of the courses pursued and the work done in the present normal school of the Philippine Islands, under the direction of Mr. E. B. Bryan:

Since there were so many applicants for positions in the schools of Manila at the close of the term, May 10, and as there was no way of definitely determining their qualifications, the city department placed one of its teachers in the escuela municipal to organize a class for the purpose of examining applicants and training those who were not qualified for positions.

The numbers increased, many coming to study and prepare for teaching at some future time. In about two weeks there was an average daily attendance of about 125.

Four teachers were furnished by the city department, and the classes met from 2.30 to 5 every afternoon, five days a week.

Work was carried on in the three branches, English, arithmetic, and geography, the last two branches being necessarily English lessons also, as many students had never studied the English language before entering.

One class was composed entirely of teachers with "títulos," many of them having had years of teaching under Spanish rule. This class had for text-books the books used in the public schools of the city, and they were taught not only the text but how to teach the work.

From time to time, as teachers were needed in the city schools, they were selected from the best of this class, other applicants coming in to take the vacant places in the class. Some twenty teachers were thus appointed.

The second class was composed of young men and women who had been studying English in the various night schools of the city, and all instruction was given in English and was of a higher grade.

The other classes were organized and classified with reference to the amount of English the pupils could understand.

During the entire term it was understood that the pupils would be handed over to the general department upon the arrival of the normal-school principals.

Because of this understanding, it was the aim not to attempt to organize a normal school, but merely to carry the pupils on in their work that they might form the advanced classes of the normal school when organized.

The normal school has been occupying the escuela municipal, in which have also been conducted the school for American children in the forenoon and a large evening school. The school has thus been limited in time, its sessions being from 2 to 5.25 p. m. Five courses have been given full time and two courses part time. The five courses which have been given every day are, (1) English expression in its broadest sense (reading, writing, and talking); (2) geography; (3) American history; (4) arithmetic; (5) science. Music has been taught two days and art three days each week, the subjects alternating on the programme.

A new site with suitable buildings already constructed, accommodating 700

students, has been chosen for the school. This will make it possible to have forenoon and afternoon sessions, to multiply the courses, to provide more adequate helps, and to do much more effective work in every way.

ARITHMETIC.

The work in arithmetic in the lower classes at present consists mainly in the simple problems in the four fundamental steps of arithmetic. The main object is to give the pupils a full vocabulary in arithmetic and also to cause their minds to reason out the different problems.

Realizing that their previous training has been the memorizing of rules in arithmetic and that the work has been such that the pupil need only to look at the top of the page to see if he is studying addition, subtraction, etc., in order to know whether to add or subtract, it is necessary now to give much time and attention to developing their reasoning powers.

Also the pupils are required to read the problems with careful articulation, and to explain in good English sentences the work performed. This work is necessarily very slow with the lower classes.

In the upper classes the same line of work as in the lower is done for a part of each period, and to this is added more advanced work in the mechanical part of arithmetic. Then, too, a part of each period is given to rapid mental work, a branch entirely new to their minds, yet one which they are grasping with great interest and activity.

Neatness in written work is one point that needs great attention. The pupils are in general very careless in the forming of figures, dollar signs, etc., and in the general appearance of the work. When one considers the lack of organization and discipline in the Spanish schools this is not to be wondered at, yet the pupils are rapidly grasping the new ideas given them, and great improvement can be seen even from day to day.

GEOGRAPHY.

In geography, to force thought work, simple lessons in physiography were first taught, and a study of the great land slopes, their effects upon drainage, and the land features caused by water action was taken up after using the sand box for experiment and illustration.

Rain, evaporation, clouds, etc., form natural lines with some laboratory work.

The movement of land masses, together with water action, causes changes in the continental outlines. Islands, their formation and uses, follow, with special work on the Philippines. Movement and composition of the atmosphere—winds, their effects upon land and water. Effects of the sun upon the atmosphere are related topics which lead to the study of the great solar and planetary movements. The results of these natural features as shown in the animal and vegetable life are constantly kept in mind and have been the real objective fact through all of this work.

Reading on local features, commerce, government, and manners and customs of peoples supplements the course, and chalk modeling and sand work are done daily.

The many physiographical features of the islands have offered splendid oppo tunity for putting the study of geography upon an observation basis.

HISTORY.

The principal work is being put upon United States history at present, but general history which correlates with the geography work is not neglected in the supplementary reading.

The plan of teaching from the biographical standpoint has been adopted, hoping that the natural interest in great character and the simplicity of wording which this makes possible, with the reading matter which it brings within the pupil's range, may give a use of English which will enable him later in the course to take the work after a more matured method.

Emphasis is being put upon related geographical features. Our object is the study of the United States history from the social and political side, explaining and teaching the modes of government, the growth of institutions, the manners and customs of the country now so closely related, with the hope of effecting some improvement in the home life and citizenship.

After the holidays lectures were given on Philippine history. The work comprised a study of institutions here in the islands from which the students could get an idea of the life of their own country and its development.

READING.

The following plan is followed in this work:

Aim—

1. To teach a correct enunciation; and
2. The immediate use of correct English sentences.

Method—

1. (*a*) Daily ten-minute drill upon positions of vocal cords in the articulation of difficult sounds in words in the lesson assigned; (*b*) Spelling by sound.
2. (*a*) Spelling by letter and giving meaning of word in Spanish; (*b*) Reading paragraph and acting out what has been read; (*c*) Reading paragraph, closing book, and answering questions in English upon same, always using a complete English sentence.

At the start the pupils are taught to begin all answers with the subject, followed by the verb and complement unless "Is there" or "Are there" are in the questions, when they begin the answer with "There is" or "are."

Each day the pupil brings to class sentences illustrating the use of the verbs in most common use in the different tenses of the indicative mood.

In six weeks pupils have averaged three pages a day in the Thought Reader, committing and singing the songs, acting out the text, spelling and translating the words, and answering questions upon the same in good English.

SCIENCE.

The work in science comprises botany, zoology, physics, and chemistry under the general heading "Nature study," and is carried out along the following lines:

1. *Botany.*—We are studying the ecology and distribution of land, water, and air plants. We get out material by going with the class to the neighboring brooks and meadows. When we return we examine our specimens under the hand lens and the microscope. We now draw our specimens and tell both orally and verbally what we have observed. Every pupil has a book in which he keeps all his drawings and descriptions. This is followed by a short lecture about the specimen under observation.

2. *Zoology.*—In our trips we find various kinds of ova, microscopic as well as larger animals, which we take back to our schoolroom for examination. Many of these we draw, others we describe verbally, and all of them we describe orally. It is our purpose to keep always in mind the fact that we are also teaching the teachers the English language.

3. *Chemistry.*—We are teaching whatever problems in chemistry come up in our biology and zoology lessons. For example, we have studied decomposition and oxidation. Here again we ask the teachers to use different means of expression; as, for example, a five-minute talk about decomposition.

4. *Physics.*—We are studying such topics as heat and electricity. An exceedingly hot day brought up the former, while the sight of a Government automobile brought up the latter. Wherever it is practicable we have laboratory work, and at all times very much conversation.

This elementary work we hope to be the beginning of more advanced work, when the proper time arrives.

ART.

In this the purpose is not to develop art critics, but to develop an appreciation for the beautiful and skill in the execution of the simpler art forms. The schoolhouse has many excellent art models at its disposal, and the interest and natural skill of the students encourage us to expect excellent results in this department.

MUSIC.

Music is a fine art, and the aim is much the same as given in the paragraph on art. At present the purpose is to teach the students to read music, to drill them in singing, and develop an appreciation for good music.

The classification of the school is based almost entirely upon the students' ability to speak and write the English language. The number of students in the school at its opening was 200, and it was thought best to have not more than 30 students in a class, and wherever possible a smaller number. Seven classes were formed, with from 25 to 30 students in a class, and all classes pursue the same line of work. It is found that the classification upon English as a basis is in most cases very satisfactory. In some cases, however, the student's general attainment is so far in excess of his ability to use the English language correctly that he is promoted to a higher class, even with a minimum of English. Such students have invariably been faithful and industrious, and have in reasonable time brought up their English. In some cases the student's general attainment is so far below his ability to use the English language that it becomes necessary to place him in a lower class. But as a rule the student's ability in English is proportionate to his aptness as a student and the length of time already spent in the study of the language, and as these are the two most prominent factors in determining his general attainment it is found that in a large majority of cases his ability to use good English is a good index to his general attainment and so is an admirable basis for classification.

Inasmuch as all of the students in all of the classes are pursuing exactly the

same lines of work, only at different rates of progress, the conditions for a satisfactory scheme of promotion are ideal. Each teacher was requested to make note of any student who seemed to be making more rapid progress than the other members of his class, and to recommend such student for promotion. Upon the approval of the faculty of this recommendation, the student is promoted at once. Of course the scheme will lose some of its flexibility and become less satisfactory as the courses become more numerous and the advanced courses presuppose more elementary ones—a condition that will doubtless be present after the first year.

The following is a statistical statement of the school under the present organization, beginning September 16, 1901, up to January 1, 1902:

Total enrollment, males	292
Total enrollment, females	18
Total enrollment, both (latest figures)	310–350
Average enrollment	220
Average daily attendance	202
Per cent daily attendance	92
Number of days taught	75
Average age of students	19
Youngest	16
Oldest	28
Number of American teachers, male	4
Number of American teachers, female	7
Number of American teachers, total	11

Provinces represented and number from each:

Albay	1
Batangas	7
Benguet	2
Bulacan	12
Cagayan	1
Capiz	7
Cavite	4
Cebu	2
Ilocos Norte	23
Ilocos Sur	12
Iloilo	11
Laguna	12
Leyte	9
Manila and environs	60
Marinduque	11
Nueva Ecija	11
Nueva Vizcaya	3
Pampanga	8
Pangasinan	23
Rizal	7
Tarlac	3
Tayabas	18
Union	56
Zambales	7

In conclusion it remains to be said that the organizing idea in all the work of the normal school is expression in the broadest sense—spoken language, written language, modeling, drawing, singing, work in sand, and the production of appliances for use and illustration in the class room.

II. NAUTICAL SCHOOL.

There exists at present in Manila a flourishing nautical school, which opened December 15, 1899, with an enrollment of 22 pupils. Lieut. Commander V. S. Cottman, U. S. N., was appointed first superintendent and assisted by 3 instructors. Lieut. George F. Cooper relieved him on December 25, 1899.

The course of instruction at first covered three years. Some of the students had been in the Spanish nautical school, and in the examination held to determine their classification 3 of them were qualified to enter upon the work of the second year; the other 19 were assigned to the work of the first year.

During the vacation covering the months of April and May 5 of the pupils were taken into the service of the Compañia Marítima, and thus acquired valuable experience in their future profession.

At the beginning of the new term in June the number of pupils had increased to such an extent as to require the services of 7 instructors instead of the 3 previously employed.

At first instruction was given in Spanish, but owing to the inferior quality of the texts and the inefficiency of the teachers it soon became desirable to substitute the English language for the Spanish.

Beginning with July 1, 1901, the nautical school has been under the supervision of Lieutenant Commander Knapp, U. S. N. The school opened on that date with an enrollment of 83 students, divided into three classes, as follows: First class, 6; second class, 22; third class, 55.

The following statistics are interesting:

Total enrollment	83
Average daily attendance	83
Per cent daily attendance	92.7
Number days school taught	120
Average age of students	years 18
Youngest	do 15
Oldest	do 24
Number of teachers	7
Provinces represented	19

Number from each province as follows:

Albay	1
Batangas	8
Bulacan	2
Capiz	1
Caroline Islands	1
Pangasinan	1
Tayabas	2
Cavite	4
Cebu	2
Camarines Sur	2
Guam	1
Laguna	1
Rizal	2
Zambales	1
Mindanao	2
Manila	45
Marinduque	1
Panay	3
Pampanga	2
Samar	1

At the end of the first term, on October 31, 1901, it was deemed advisable to make the course four years instead of three, and accordingly the students who entered the school in July were divided into the third and fourth classes.

The instruction during the first year includes arithmetic, English, geography, and drawing; that for the second year, English, algebra, geometry, geography, and drawing; that for the third year, English history, geometry, plane trigonometry, mechanics, geography, and drawing. During the fourth and final year the pupils are instructed in spherical trigonometry, nautical astronomy, navigation, seamanship, hydrographical drawing, history, and English. All classes are instructed in practical seamanship three times a week.

For the course in practical seamanship a mast has been erected in the school grounds and fitted with a foresail and a topsail. The pupils are frequently drilled at this to make them familiar with the nomenclature and the handling of ropes and sails. It is impossible, however, to get sea experience from this, and it is greatly to be desired that the school be provided with a school ship at as early a date as is practicable.

The first object is the Americanization of the students in language, habits of thought, manner of performing work, and general moral principles. The next object is the technical education in seamanship, navigation, and kindred subjects. In view of the fact that the students had little, if any, satisfactory primary training before their admission to this school, it is deemed that very encouraging progress has been made.

The respect for authority and the physical development of the pupils are not unprovided for. Each school morning at 8 o'clock they are required to form in front of the school building and remain uncovered while the United States colors are hoisted. After this they are given twenty minutes "setting-up exercise." This drill, together with the exercise obtained by handling the sails and spars, has greatly improved the appearance and bearing of the students. As a further means of discipline the students are formed between recitation periods by the officer of the day and are then marched to their several recitation rooms by their class leaders.

The school hours are from 8 until 1. This time is divided into six periods of forty minutes each, with five-minute intervals between each period. The two larger classes are divided into two sections each, so that each instructor has during each period an average of 12 students. At the beginning of the school year the number of instructors was 5, 2 American and 3 Filipino. There are now 5 instructors, 4 of whom are American and 1 Filipino, and in addition thereto the superintendent has taken direct charge of the instruction in navigation.

The methods of instruction, system of marks and records, and the discipline of the school are based on those of the United States Naval Academy at Annapolis. A card system for the keeping of marks and records has been introduced during the present year. Monthly and semiannual examinations have been held. Monthly reports of the efficiency and conduct of each pupil have been sent to the parent or guardian, and have also been posted in the school building, that both students and instructors could see the results of the school work.

All the instruction in the school at present is given in English, with the exception of that in the class room of the remaining Filipino teacher. It is the intention to use English only during the next school year. The change of the school language from Spanish to English has been an important step, as it is deemed that American methods, particularly in seamanship and navigation, are more direct, and in addition thereto the students are absorbing the wished-for American method of thought and action.

Steps have already been taken toward procuring new buildings and introducing

the dormitory system. It is planned to conduct the school on the same lines as our Annapolis Naval Academy and allow each province to appoint annually a certain number of cadets.

III. TRADE SCHOOL.

Owing to delays in getting tools and appliances, the Manila Trade School did not open as soon as it was hoped it would. Even now there is but a scant outfit in the wood-working department. Notwithstanding the delays and lack of accommodations, however, more pupils are on the rolls to-day than can conveniently be taken care of. With the beginning of the new school year and a full complement of tools there is little doubt but that the trade-school work will be taken up in earnest by the Filipinos.

At present the following branches are taught: Woodwork, including carpentry, cabinetmaking, and wood carving; drawing, both free-hand and mechanical; plumbing, and telegraphy. Other trades will be added as soon as possible. The work is carried on similarly to that of our trade schools in the States.

From the first the classes in telegraphy have been filled and many have been turned away. With the woodwork it was different, pupils applying very slowly. Now, however, the classes are filled beyond the number which the present supply of tools will accommodate. Of the 148 pupils who have registered, 90 elected telegraphy and the balance woodwork. Over 80 per cent have attended regularly in telegraphy, the percentage of those in woodworking being a little lower. This may be due to the fact that the youngest pupils take woodwork. There is quite a difference in the ages, the oldest being 50 and the youngest 9 years old. The average is about 20.

The best pupils are those younger than the average; that is, those from 16 to 18 do the best work. As might be expected, the older ones are more regular in their attendance, but much slower in learning, while the younger ones are not inclined to take the work seriously.

Ninety of the 148 pupils were born in Manila. Half of the provinces in Luzon are represented in this respect, Ilocos Sur and Bulacan leading with 6 representatives each. Panay furnishes 5 and Negros, Zamboanga, and Mindoro 1 each. Two are foreign born, coming from Hongkong. Likewise all but 2 live in Manila. These 2 come from Cavite. Naturally the nearest barrios furnish the greatest number of students, 88 coming from Ermita and 17 from Malate. In all, 14 barrios are represented, Manila with 14 coming third. Among those most distant are Binondo with 3, Tondo with 4, and Santa Cruz with 4.

There are very few who claim other than Filipino parents. Among the fathers are 4 Spanish, 2 mestizos, 2 Japanese, 2 Portuguese, 2 Visayans, and 1 American.

Among the mothers are 2 Visayans, 2 Portuguese, 1 mestiza, 1 Spanish, and 1 Hawaiian. In this respect it seems remarkable that no Chinese blood is claimed.

The occupations of the fathers range from fisherman and laborer to navigator and merchant. There are 28 laborers, 25 clerks, and 9 teachers. Among the others are painters, farmers, contractors, soldiers, and masons, besides government employees. Twenty-three have never studied English. The longest period for anyone spent in this study is three years, making an average of eight months.

As many different occupations are represented by the pupils as by their parents. Fifty-six are students, 16 clerks, 6 teachers, and only 5 laborers. Besides these there are machinists, actors, masons, tailors, carpenters, cigar makers, and many others. Apparently they perform a slightly higher class of work than their fathers.

The highest salary earned is $86 Mexican per month, and the lowest $10; $35 Mexican per month is the average of those earning money.

The mestizos do better work than the natives; as a rule the work is as good, if not better, than that of American boys, although it is not done as quickly.

The following are statistics relating to this school:

Number in woodworking course	58
Number in telegraphy course	90
Total	148
Oldest matriculated student ..... years	50
Youngest matriculated student ..... do	9
Average age ..... do	20
Place of birth:

Average of those receiving salary	35

Length of time student of English:

Longest ..... years	3
Never studied	23
Average ..... months	8

Both day and evening classes have been conducted at the trade school successfully.

XVI.—SPECIAL WORK.

MUSIC.

Together with the work in English, arithmetic, and geography in the schools, music and drawing have been taught, particularly in city schools, and to a certain extent also in the provinces. The first fifteen or twenty minutes every morning are given to singing songs, a part of the work in which the children take great enjoyment. It is true that they love music, but they must add constant practice to this natural fondness in order to gain ability.

The following is an account of the work done in the Manila and surrounding schools:

In Manila each of the 40 schools has been visited once each month, the different classes drilled in singing, and the work laid out for the following month. For each school there is a teachers' meeting in which the Filipino teachers go over the work with the music teacher, as also with the English teacher when possible. In most of the schools the music is taught by the Filipino teachers, the English teacher watching the work during the month, as from their imperfect knowledge of English the native teachers do not always understand just what the instructions mean. In some cases the English teachers can not do the work, from lack of musical ability.

The pupils love the work and it makes no difference to them whether they sing do, re, mi, or words, English or otherwise, if there is melody in the music. It did not seem advisable at first to teach them to sing the patriotic songs of America, but they want to sing them and almost will sing them whether their instructor wills or not. There is some trouble with these, as they have in most cases learned the songs by ear from the soldiers, and have learned them wrongly. The "Star-Spangled Banner" is usually sung in a most laughable manner. Other tunes suffer also; but the children so enjoy singing and are so enthusiastic in it that it is a pleasure to teach them.

Their voices are harsh, and especially when they are excited, as they usually are, they have a tendency to shout. The aim is to give them a more musical quality, and to cultivate a love for a pure, sweet tone.

They are very quick in reading music, more so than American children, perhaps. Just now they are handicapped in English songs by their imperfect knowledge of English and that of their teachers. The work can not be graded as well as in America, but wherever possible the pupils of one age are kept together.

In many of the schools they are now studying the scales in the different keys, and the older classes are singing two and three part work with good results. They like the harmony, and seem to fall more easily into part singing than American children.

It is not known for certain as yet whether their ear for music is true and acute, since all is so new to them this year, and they have had no previous instruction.

They are not at all timid about singing—sometimes the teacher wishes they were a little more so, as they do not seem to care whether they sing rightly or wrongly, but plunge ahead without much thought as to what they are doing.

It is doubtful if their sense of rhythm is very marked. This lack is noticeable not only in the singing of the children but in the playing of the native bands and orchestras. Their time is not so good as that of the American negro, who has always a wonderful sense of rhythm. They are great mimics, and it is amusing to see how they try to imitate the teacher. The teachers in Manila as well as in the provinces say that music is a great aid, and that if it comes first there are few tardy marks.

With all the hindrances and difficulties, such as having no charts, books, or other material to work with, good progress has been made this year.

At Iloilo work in music has likewise been conducted successfully, and with its introduction into the curricula of the tributary normal schools the work will continue to increase in scope.

DRAWING.

Prior to the introduction of the present system of drawing in Manila a majority of the schools had no drawing on their regular programmes. In many schools there was no attempt made to teach this branch, and in most of the schools where it was taught the results were not satisfactory.

Two native teachers were assigned by a former city superintendent of schools as special instructors in this work. They possessed marked ability in drawing, but had no training in teaching and were weak in English. The models used, moreover, native hats and baskets, were too difficult for beginners, and the same ones presented week after week made the work tedious and mechanical. Yet some of the pupils acquired considerable ability.

According to the present plan the native teachers are to attend a class conducted by the supervisor of drawing once every fortnight. In this class is outlined in detail the work of the following fortnight and each teacher provided with a mimeographed programme.

This plan has been introduced into the school system and seems well adapted to the needs here. The teachers, both American and Filipino, have shown interest and energy in the work.

All native teachers who teach drawing have attended these normal classes and with the printed outline for each day in detail they have done encouraging work. A considerable number of the Filipino teachers who do not teach drawing have attended these normal classes in order that they might be prepared to do so. The help of the American teacher has been needed, both in understanding and executing the plan, and the work of the Filipino teachers has been most successful where most actively supervised by the former.

A regular programme of drawing work in the various schools has been arranged and these plans are being followed in a satisfactory manner.

Similarly at Iloilo an outline of the work in drawing has been made and is being followed successfully. The tributary normal schools will also include drawing in their curricula. Hence the work is regularly expanding.

SEWING AND WEAVING.

In many of the regular schools throughout the archipelago the girls are taught sewing by the women teachers and they take great interest in the work. At first they seemed to think that such work was hardly a branch to be taught by American teachers, but as soon as they saw that the teachers not only sanctioned but encouraged it their interest increased to such an extent that some of the teachers

could with difficulty find time after school and Saturdays for themselves, the girls were so anxious to learn to sew, make dresses and the like.

Sewing and weaving as a regular branch are taught among the Moros and the work appeals to the people strongly. It is a question if anything in the way of book learning should be attempted among these people, and the success of this industrial work among them seems to show clearly along what lines the education of the Moro children should lie.

XVII.—INDUSTRIAL EDUCATION.

Industrial education is the great want among the Filipinos. The aim of this work of instruction must be a utilitarian one, to meet the needs of the masses; the children are to be fitted for bread-winning occupations. And looking at the possibilities of development of these islands ample returns for the labor expended are awaiting them.

With this purpose in view steps have already been taken and appropriations secured for establishing industrial and agricultural schools at various points in the islands where the conditions are peculiarly favorable, especially at Baguio, Benguet; Bangued, Abra; and in Negros. Trade schools are likewise in process of establishment. Besides the school at Manila, now in operation, plans have been drawn up for a similar institution at Iloilo; and steps have been taken for establishing another at Cuyos, Cuyos Island. But this is only the embryonic stage; it is hoped to have an industrial and agricultural school at no distant date in each of the provinces.

The line of work in the trade schools will be similar to that of the one in Manila. In the schools of agriculture something will be done in the way of seed experimentation, and much stress will be laid upon the introduction of the present improved method of culture.

In Negros it is proposed to establish a general agricultural school and experimental station. A site in the vicinity of La Granja, where a similar school was in operation in Spanish times, has been favorably considered after a careful investigation of the conditions, and is thought to be an ideal one for the purpose. It is in the midst of productive plantations, where sugar, cacao, cocoanuts, rice, corn, garden produce, and trees of market value grow, with high and low land, and the accompanying diversity of climatic conditions.

The following is a report from Mr. Brill, superintendent of agricultural schools, on the agricultural conditions of the island of Negros, with reference to the establishment of an experimental station and school of agriculture there:

Land.—On the east coast of the island of Negros the land rises very gradually from the coast to the foot of the mountain range. Most of the soil of this section is a brown loam, very fertile and easily worked. It contains so much humus that it may be worked while quite wet without baking. In a few places the clay subsoil comes nearer the surface, making the land too wet and heavy for cane growing.

On the west coast the mountains extend almost to the sea and terminate very abruptly, thus giving little room for sugar plantations.

At that part of the island between Bacolod and Valle Hermosa the land for half the distance across the island is taken up for sugar plantations; but around La Castellana the buildings on many of them are burned and no work is being done on the plantations. Beyond La Castellana the land is higher, more rolling, and, with the exception of one or two stretches of forest, is covered with tall, coarse grass. Most of it has been cultivated, but some is so stony and irregular that cultivation under present conditions would not pay. However, it is admirably suited for grazing, provided better grasses were introduced. The sides of the mountains are heavily wooded, extending down nearly to the sea on the west coast.

Some of the planters say that there are large tracts of fine sugar land, belonging to the government, on the southeast and northeast coasts. The reason why

they had not been taken up was that heretofore these sections had been infested with ladrones. Very little seemed to be known of the interior of the island, either by foreigners or natives. There is no path across the island except at the point where the telegraph line crosses the mountains, and even this is a very poor one. There are practically no roads on the island except some short stretches connecting a few coast towns, and most of these have no bridges over the streams.

Sugar.—Negros is considered the best sugar country of the entire archipelago. The sugar crop is of more value than all the other agricultural products of the island combined. The yield of sugar is from 30 to 100 piculs of 137 pounds per hectare of land. The lesser amount is from some of the older plantations along the coast, which have been cultivated for thirty years or less. On these plantations the yield was said to be double this at first. This sugar, however, is of a higher quality than that from the new plantations. On the older plantations near the coast the cane has to be reset each year, while on the higher and newer plantations it is only reset once in three or four years.

The rainfall is sufficient to grow a good crop without irrigation except in very dry years, provided the cane is set at the proper time. In a dry season the irrigation pays well, and yet only one plantation was heard of where it was practiced. On many it would be very easy to do, as many streams come down from the mountains. No fertilizer is used for sugar growing, except that on the older plantations the manure is drawn from buffalo pens and spread on the fields nearest the buildings. Even on the plantations on which the cane has to be reset each year the ground, as a rule, is allowed to lie idle a year between crops, and, as the cultivation is so clean, few weeds come up to cover the ground. Some leguminous crop, as clover, sown in the cane at the last cultivation, would give much pasture for the buffalo and cattle and greatly increase the fertility of the soil, with no expense but the cost of the seed.

Sugar should exhaust the plant food in the soil the least of any crop if properly managed and the stalks and leaves or their ashes returned to it. The plant can get all the elements contained in the sugar from the air and water. This is one reason why sugar growing has been so fostered in Germany and France, and later in the United States.

Tools.—For plowing the land and cultivating the cane, as well as maize and rice, a very crude plow of Chinese style is the only tool used, except an equally crude harrow made of sections of bamboo pinned together with the branches left projecting 5 or 6 inches. The point and mold band of the plow are of very rough castings, and all the rest is of wood and made at home. The two iron castings cost about $2.25 Mexican. On two plantations foreign plows were being used and gave excellent satisfaction, except that each point cost $2 Mexican, or nearly as much as the two castings for the Chinese plow. In the United States they would cost from 50 to 65 cents Mexican, at retail. Certainly many American tools could be used with profit, even if more expensive, as they would do so much more effective work. Most of the plantations away from the coast use water wheels to furnish power for crushing the cane, while along the coast steam engines are used. On most plantations the crushed cane is used for boiling the juice, but under the engine boilers wood is used almost entirely, and as the forests are cleared farther and farther from the coast, this wood becomes quite a large item of expense. On some plantations the wood is supplemented by the stems of the coarse grass, which is cut and stacked under sheds during the dry season.

Even on the best-equipped plantations little attention is paid to saving in labor. Even on Mr. A. Locsan's plantation, which is said to be the best fitted and arranged of any on the island, the laborers have to carry the cane 10 feet and step up 3 feet to get it from the truck on the tramway onto the moving table that carries it to the crushing rollers, and yet there is no apparent reason why the tramway should not come nearer and high enough so that the cane might be thrown from the trucks directly onto the table, thus saving half the labor.

The laborers, aside from the foreman, get 12½ cents Mexican per day and two meals of rice and maize, except during the time of making the sugar, when they get double pay and three meals a day. On some plantations a good share of this is paid in tuba or bino and betelnut. Some of the plantation owners feel that they will have trouble with their laborers under American law. One said that if the laborers knew he could not kick or beat them when they did not do as he told them he could do nothing with them. An American officer said that recently a Spaniard on the west coast was greatly surprised and exceedingly angry for being fined because he severely beat one of his laborers.

It has been so easy to grow a profitable crop of sugar on this fertile new land that little careful study has been given the subject by most planters. One planter, when asked if he thought an experiment station and school of agriculture would

be of much value to the people, replied: "Yes, if you will show us how to grow other crops besides sugar; but there is no use in attempting to teach us to grow sugar or to make it, as any boy on the plantation 12 years old knows all about growing and making it." The sugar made sells for a low price; but whether on plantations of this size it would be profitable to use more expensive machinery and make a better grade of sugar would have to be determined. On Luzon they make a different grade of sugar. One trouble with most of the planters in Negros is that when they get a good crop they spend the money in having a big time in Manila or Hongkong, and then have to borrow money at from 12½ to 25 per cent to care for their next crop.

Colonel Miner said he investigated the titles to the land a little to see if American capital could not be secured at a lower rate, but found most of them too defective for this. The early settlement of land titles is very important, and difficult as well. Some of the American officers as well as planters say that certain planters are enlarging their plantations very rapidly.

Maize and rice.—These are grown on all plantations and often together. They are grown more for use as food for the laborers than to sell in the market. The cultivation of the rice on the dry land is very good. It is difficult to get even an approximate estimate of yield from the planters. Considerable forest land is burned each year for planting maize and upland rice. The burning kills all the weeds and brush so thoroughly, and the ashes make so good a fertilizer, that for two years scarcely any cultivation is necessary, and all the crop costs is the trouble of planting and harvesting. After two years a little hand cultivation is given for a couple of years more and then the land is often allowed to grow grass and brush.

Abaca or Manila hemp.—Next to sugar this is the most important export from the island. The plant closely resembles the banana and grows best when shaded by it or some tree. It grows wild, but when planted the young suckers are generally set on freshly cleared hillsides. Smooth land is not necessary, as most of the cultivation consists simply in keeping the weeds and other small growths down by hand. The plants will yield fiber in from two to three years after they are set. About 140 plants will yield a picul of fiber and require laborers about seven days to draw it. If of the best quality and unstained it will be worth about $20 to $23 Mexican. Much fiber is wasted in drawing, but whether it could be saved at a profit is one of the questions yet to be settled. Many machines have been tried for drawing it, but so far without success. Why more is not planted is not easily understood, except that the planter has to wait two years for any return. The cost of starting a plantation is small and the crop is safe from the attack of the locusts.

Mr. Arenta, who is said to have the largest plantation of abaca on the island, is planting cocoanuts and areca nuts among the plants, as shade, to take the place of bananas, as the former are much more profitable. He says different plants of the abaca vary greatly as to the amount and quality of the fiber they produce.

Tobacco.—Tobacco is for the most part grown in small patches on the hillsides by the plantation laborers on shares. In this way the women and children assist in its cultivation and harvesting. The leaves are generally slung on rattan and hung in the tops of the laborer's house to cure. In this way it is grown and cured at little expense.

Cocoanuts.—Cocoanuts are much grown along the coast on both sides of the island. Very little copra is made, as most owners cut the flower stems for tuba. This is sometimes distilled, but generally sold the same day or next after gathering. Most of the nuts produced are used locally for oil. On the coast the young trees will bear profitable crops of nuts in from five to seven years after planting, while on the upland from seven to nine years are required. On the upland they are more subject to the attacks of locusts and other insects.

Other products.—Quite a large quantity of areca nut is exported. The plant grows well almost everywhere and is quite profitable. The nuts bring about $1 Mexican per 1,000 on the island after they are cleared of the husks.

Coffee and cocoa are grown for local use, but little attention is paid to their cultivation. Small quantities of each are brought to the local market for trade.

Mangoes and bread fruit grow without cultivation where the seeds have been thrown out.

Excellent pineapples are grown on a few plantations and a few are exported.

Bananas grow almost everywhere.

Scarcely any cotton is grown, except the wild tree cotton, which is of no use for spinning.

A wild lemon, as well as the pomelo, grows in the mountains, and probably a cultivated one of good quality would grow equally as well. Some other fruits are grown or grow wild in small quantities.

On each plantation cloth is spun and woven by the women on hand looms. Several fibers are used alone and mixed, as abaca, pineapple, etc. This is about the only manufacturing on the island.

Cattle.—Most of the labor on the plantations is done with the buffalo. The ordinary ox is used for the saddle or to draw the native carriage, even in the villages. He is much quicker in his movements, but not as heavy and stout as the buffalo.

Rinderpest.—On the east coast the rinderpest is very prevalent and many cattle and buffalo are dying daily. On many of the plantations the work in the cane fields is practically at a standstill for lack of animals to do it. The disease is rapidly spreading to the interior of the island. The army surgeons have supplied some material for inoculation, but were short of syringes. Apparently very little attention was given the burning or burying of the bodies, and in some cases they were skinned before being buried. Often they were buried so shallow that the dogs dug them out. At Iloilo so many had died that there were not enough left to handle the freight, and it was a very common sight to see men drawing loaded carts. If these cattle had been properly inoculated before they were actually sick, probably nearly all would have been rendered immune to the disease. It would need close foreign supervision all the time to make inoculation effective.

Locusts.—Locusts are very numerous in certain sections this year. How many broods there are a year or how long the eggs require for hatching could not be learned. Their great numbers are largely due to cutting or burning the forests and then allowing the ground to grow up with grass and weeds; these waste places are where they hatch in such large numbers. In several of the places all the people were out driving the young ones into pits before they were able to fly. In this way they caught bushels of them. One planter had some dry diseased ones, with which he was going to inoculate some of those on his plantation. They will not eat abaca, tobacco, cotton, nor the castor-oil plant.

TRADES.

In the latter part of 1901 an investigation, under the direction of Mr. R. P. Gleason, supervisor of industrial education, was made into the trades of Manila with a view toward gaining an idea of the tools used, the quality of work done, and the wages paid, in order to judge of the degree of advancement made in various lines of industry here.

The following trades were studied:

Mechanical drawing, carpentry, cabinetwork, wood carving, saw and planing mills, masonry, plastering, wall decorations, house and sign painting, plumbing, tinsmithing, pattern making, foundry and machine-shop work, harness and carriage making, carriage painting, printing, the manufacture of musical instruments, bamboo and rattan work, clay modeling, die sinking, tailoring and rope making—a list of 25 industries.

These questions were kept in mind during the investigation: "Do the Filipinos control these industries?" "If not, who does?" "Do they do the best or the higher class of work?" "Who does the best work if the Filipino does not?" "What wages do they earn?" "Do they make good artisans?" "Can they ever become the masters industrially?" "Are they faithful and industrious and to be depended upon?" "Do they work well with those of other countries?" etc. The kind of tools used and methods employed were carefully observed. A list of places visited was kept, with a record of the work done at each.

Drawing.—Work in mechanical drawing by Filipinos is found in several different places in the city, and of several different kinds.

Map drawing, both copying and working from field notes of surveys, was found in the office of the city engineer, the mining bureau, and the weather bureau. Besides map work in the weather bureau, there is much work done in platting results to represent graphically the data gathered by the bureau. Observations are made to a large extent by Filipinos, and their work in drafting is well done. In such work they excel in detail, make excellent copies, and do beautiful lettering.

One fault found with them was that, in completing a drawing, if some error

had been made in it, they would often try to cover it up by stretching a line here or an angle there.

No originality of consequence could be observed, but they have been taught only to copy, so no more can be expected of them, and what the Filipino has been taught to do in this work is well done.

To remedy their faults, it would seem that free-hand drawing should be taught in connection with drafting. Sketches could be made of natural forms, and work in design could be given, calling for use of these forms, both natural and conventional. Mechanical drawings from measurement of machine parts could follow work in orthographic projection of simple geometric forms. By drawing to scale from these forms and then working to scale in the shops from these drawings they would learn to build up definite mental images and so develop useful imaginations. This would help to give them that creative ability and originality the absence of which is so often noted.

At a silversmith shop were found working drawings done by Filipinos that were complete and very similar in form to designs for such work by American and European metal workers. Scenes of Filipino life and tropical foliage were worked out by the engraver in the metal from a working drawing.

Carpentry.—The tools are primitive, but the results obtained surprisingly good. Few American tools are used. An American saw of ordinary size was found in use at one place adapted for oriental usage by drilling a hole through the tail and inserting a large wire spike, so as to use 2-man power.

As a rule the Chinese do the carpentry work, though there are many Filipinos also who work at this trade. There are many Chinese contractors, most of whom, however, have an American partner. A few American carpenters are at work here at prices ranging from $2 to $3 gold per day.

The testimony of those Americans who have employed native labor seems identical—that the Filipino is unreliable when left without a supervisor, but that he has much manual dexterity.

One contractor who has had much experience in Central and South America and on the Panama Canal places the Filipino last in the scale as compared with the people of those countries. One great trouble is lack of responsibility. There are a few graduates of the old Spanish industrial schools who know enough of plans and working drawings to direct workmen from them.

One piece of house construction that is done by the Filipino is the raising and fixing in position of the posts that reach from the ground to the roof, as used in local construction.

If a Chinese contractor has the job, he makes the posts and then lets the contract to a Filipino to raise and put them in place at so much a post. The Filipino does not like the American scaffolding, and will only trust himself on bamboo tied with rattan, and they have been known to go so far as to replace at their own expense bamboo in preference to the scaffolding furnished them by Americans. Skilled workers get from 1 to 3 pesos per day; unskilled labor from 50 to 80 cents Mexican.

Cabinet work, wood carving, and musical instruments.—In cabinet work are found the Japanese, the Chinese, the Filipino, and the Spaniard, but with the Filipino in the minority. However, he is doing a high grade of work, as is shown by samples of carving, turning, polishing, and decorating. They are using the American tools, while the Chinese and Japanese use their own peculiar make.

The Filipino excels in wood carving, and there are many beautiful examples of his skill to be found in Manila, notably that at the church of San Ignacio, where we find much originality in the interior decorations. There are also many handsome pieces of carved furniture to be found in the native stores and private homes.

At the carpenter's shops a Filipino workman was seen designing and carving a back of an old chair, a part of which had been broken and lost. This particular piece of work called for an artistic and original design that should harmonize with the rest of the chair. The superintendent of the shops said that for work of that nature he should always choose a Filipino in preference to one of any other nationality.

In connection with the wood-turning work, a most primitive lathe was seen in one of the little Chino shops. A Chino was turning a fly wheel, some 4 feet in diameter, by means of a crank. In the groove on the face of the wheel ran a hemp cord a fourth of an inch in diameter, which was connected directly with the piece to be turned. Modern gouges and chisels were in use and good results were being accomplished, even though the work did stand still now and then as the rope slipped on the piece of wood.

On Calle Curvalle one can see the Filipinos doing most excellent work in making violins, guitars, mandolins, and other instruments. By their work in this alone they show conclusively that they have mechanical ability of no mean order.

Saw and planing mills.—The greater part of the lumber that is used for building purposes in Manila is ripped from the log by the Chino hand-power saw. These men average about $2 Mexican per day for wages. There are, however, a number of steam-power mills, some with old-style machinery, others with more modern machinery, notably the one near the railroad station—Perez & Co. Here about sixty Filipinos are employed at prices ranging from 80 cents to $1.50 Mexican a day. At this mill they prefer the Filipino to the Chino, for they say that the Chino is neither to be trusted nor depended upon, but that the Filipino is very reliable. Some of the latter have worked there for fifteen years or more.

The Chinese and Japanese do not seem to work well as a general thing with the Filipino, although in one Chinese mill a Filipino bookkeeper and foreman was found.

Masonry.—Nearly all work done in bricklaying is done by the Chinese. The Filipino mason receives about the same wages as the carpenter. Stone dressers get from 3 to 4 pesos per day.

Plastering and wall decoration.—Little plaster is used in interior work where it is seen. Cloth is used as a covering for the wall as a usual thing. This is cut and sewed the right size before putting in place.

In decorating the walls the Filipino is at home. He submits no design, but partly by the use of templates and much free-hand work the results are surprisingly good.

In their stencil work there are few patterns, with occasional variations.

Journeymen painters receive 1 peso a day, decorators 50 cents to $2 Mexican.

House and sign painting.—Some curious instances were heard of regarding the Filipino as a painter. It is said that when the San Sebastian church was built the contract for the painting was let out to natives by the day. They erected some 25 feet of bamboo scaffolding and painted to the top of it, then erected 25 feet more scaffolding and painted to the top of that, and so on until the church was completed. The results were of course poor, as the part first painted was spattered from one end to the other. Painters receive from 60 cents to $1.25 Mexican.

The Filipino is deliberate in his work, as we all know. One contractor said that an American painter on interior work will do as much in the same time and also much better work than 10 Filipinos. In one American sign painter's shop about 7 native boys were at work. They do good work but, "can not be depended upon unless closely supervised."

In other shops the testimony was about the same.

Plumbing and tinsmithing.—Plumbing is a new industry to the Filipinos. A good sanitary condition is an unknown thing, or rather was unknown until the American occupation. This is a trade that even the Chinese have not taken up to any great extent, for it is as unknown in China as it was in Manila.

There are three American plumbing establishments besides that at the quartermaster's shops.

The cost of plumbing is much higher here than in the States, due to the great scarcity of skilled labor and the high price of material.

Here is some testimony from those employing Filipinos:

"The native will never be able to do more than the cruder class of work."

Another says: "Patient, careful training will make the native at least an ordinary, if not an efficient, workman." Still another says that "They are not reliable, faithful, or honest in their work. They will stay until they get a few pesos, then fail to appear until their money is spent." They seem to need constant watching and supervision or they will destroy both their tools and their work. In some ways this is not strange, for the average American who employs such help does not like to spend his time instructing his men.

There are a number of Chinese tinsmithing shops here where a general tinsmithing business is being done. There are a few native tinsmiths who are doing fairly good work at wages ranging from 80 cents to $2 Mexican per day, the majority receiving 1 peso.

Blacksmithing, pattern making, foundry and machine-shop work.—The largest blacksmithing establishment was found at the quartermaster's shops. Here a score or more Filipinos were seen forging and welding the various articles necessary for such a shop. In many cases the work was of quite an intricate nature, but it was well done. A Filipino is in direct charge of this shop, and, according to the master mechanic, is capable and competent. The workmen are

very slow and deliberate; the blows struck by their hammers are of little force, with the result that all operations required more time than was necessary. One incident occurred at this place which gave an opportunity to learn how the different peoples were considered by those in authority. The Filipinos were marched out of one gate and those of the other nations from another. The Filipinos only were stopped in order to undergo an examination to see that no tools or materials were being taken away.

There is very little pattern making in Manila, but at the shipbuilding plant at Cavite considerable molding and casting were being done by natives. The results were good. The superintendent there said that "as long as they were watched and directed the work would be well but slowly done, but without constant supervision the results were far from satisfactory." He has an assistant who has been working for the firm for many years, and he described him as faithful, competent, and industrious.

In the machine shops many Filipinos are employed and doing good work if supervised. At the shops of the Earnshaw Brothers about 800 are listed as being employed there, but 500 is the largest number ever available, and usually about 400 are at work. Of this number 10 receive 3 pesos a day, but the average is 2 pesos. These wages are just twice what they were three years ago.

On Saturday the men receive their weekly pay, and on Monday scarcely half enough appear to do the work. By Tuesday or Wednesday most have returned. One of the foremen there says that "they are good for absence." At other places many natives were seen at work making both simple and complicated pieces of machinery. They do not seem to be successful in working here with those of other nationalities.

Carriage, harness, and painting industries.—The Americans, Spaniards, and Filipinos control these industries, with Filipinos in the lead. These are industries in which Chinese take no part.

In many of these shops most skillful work was seen. The tools and appliances used are old and crude and the methods slow. Many of the conveniences deemed necessary in American shops are lacking here, and all work is done by hand.

The Filipino is doing much work in leather, and there are a number of harness shops. They seem to do good work in painting, following the methods usually prevailing in the States. Salaries here range from 20 to 40 pesos per month, according to the skill required. Foremen command 2 pesos per day. Natives who employ labor complain that wages have doubled since American occupation.

Printing.—Filipinos are employed entirely to do the mechanical work in the printing offices of the city. The Filipino typesetter in the American offices simply follows copy. He knows nothing of the matter he sets up, but simply follows the typewritten copy word for word and letter for letter, and, considering the fact that he does not understand what he is setting up, he makes very good time. The "stick" that he uses holds but one line of type, consequently much time is lost in "dumping" each line. Notwithstanding these handicaps, the native typesetter averages about 400 or 500 ems an hour.

Most of the type cases in use are the old Spanish style, and the presses range from the old Spanish hand press to the latest high-speed Miehle. Between them the printing press products of nearly all countries are represented.

Filipinos are employed exclusively in the press room as press feeders, but require an experienced foreman, for they can not make repairs if anything goes wrong with the machinery.

All the Manila offices make their own printing rollers, Filipinos doing the work.

Since American occupation the wages of native compositors, press feeders, and bookbinders have been nearly doubled. The Spanish and Filipino offices pay the old wages, ranging from $4 to $8 a week. First-class compositors receive the latter amount, while binders and feeders receive less. The American offices pay from $4 to $8 gold a week, and require about nine hours' work each day.

Bamboo and rattan work.—In regard to bamboo and rattan work, relating to chairs, baskets, etc., it was found that practically all of the shops visited had none but Chinese workmen; in fact, not one native was found, although undoubtedly such are engaged in this work somewhere. Many of the articles were imported from China.

At Bilibid prison information was given that this class of work was performed by the natives, and the samples on sale seemed to be of better grade than those seen in the stores of the city.

The natives are trained from childhood to work with these materials, and it is undoubtedly the one thing in which they excel. One sees the necessity of all

this upon examination of their houses, fully constructed throughout without a nail being used.

Clay modeling.—There are a number of Filipinos who are working in clay in connection with painting. Bas-relief forms are modeled on plaques. These are painted, and on the background are depicted native scenes.

Wax is also found in place of clay in many instances. Wood is the material that the natives prefer, however, and, as mentioned above, he does much carving that would do credit to one of any country.

Die sinking.—There is some work in die sinking and cutting, but it is quite limited, and as a general thing the facilities are poor.

Tailoring.—The estimated number of tailor shops in Manila is about 400, a large proportion of which are controlled by Filipinos. Wages range from 50 to 60 cents per day for men and women.

Rope making.—Near Tondo Market one can see the native rope maker at his work during pleasant weather. The hemp is twisted into strands and then into ropes of varying sizes by hand power on a very simple, and to them, apparently, a very satisfactory machine. To a novice the ropes looked well made, and the men, while they did not appear to be overworked, were industrious and attended strictly to business.

In summing up, the consensus of opinion of those who gathered the foregoing information was that few natives were in control of the leading industries, and that while they were doing at the present time much of the rougher class of work, with careful and patient instruction they were capable of better things; that there was much latent mechanical ability, and in time they could rise and take their places as leaders, not immediately, not in the near future, not in one generation, but they have the qualities in them to do the work. They are slow, take life leisurely, putter over their work, and lack responsibility. That, however, is not strange, considering the climate. They no doubt do lack the energy to do the work, but also lack the knowledge. Their thoughts and their natural ability have not been trained to do things. With knowledge to do, ambition may be aroused, and the results, it is hoped, may be such that in time the Filipino may become, not the "helper" that he is to-day, but the leader in all industrial enterprises that will help to put this archipelago on a higher plane.

In October, 1901, circulars were sent out to all division superintendents and their deputies, asking for information regarding the status of the industries of the different provinces at that time. This was done with a view of assisting the department in laying out courses of work in the trade schools that would fit into the industries of the various parts of the archipelago.

Owing to the difficulties in getting about, and the great amount of work necessary in establishing the many English schools, it has been impossible for all to make reports, but enough have been received to give a good general idea of the conditions as they exist at the present time.

The ravages of war have prostrated many industries that flourished in times past. Rinderpest, that dread cattle disease, has done its share to ruin many to whom cattle raising was of the greatest importance. On the island of Masbate alone the number of cattle has been reduced in the past year from between 100,000 and 150,000 to about 5,000 head. The same conditions exist also in other parts of the archipelago.

In the interior of all the islands there is little industrial civilization, except that brought in by the foreigner. Crude, makeshift tools of all kinds and descriptions are found, and methods in vogue centuries ago are still the only ones known to them now. In fact, away from the seaport towns the Philippines are practically still in a state of nature.

There is a great amount of excellent rich land, which under proper cultivation would grow almost any tropical product, but as one man expressed it regarding the tobacco crop, "They trust to the Almighty to not only raise it, but cure it as well." And this remark applies to all crops. There are exceptions to all rules,

but generally speaking the Filipino lives only for to-day, and it is not surprising. In a land where little clothing is required and where food grows without cultivation there is not much incentive for the average person to work. With a bolo and the bamboo which grows on every side the Filipino can not only build himself a house, but he can furnish it as well, scant though that furnishing be; make his head gear, pipes for carrying water, baskets, spoons, fishing traps, bancas or canoes, and many other things which his simple needs demand. Bamboo leaves are also used sometimes as an article of food. This, with the many fruits that grow with no cultivation and the fish that abound in the water, satisfies the great majority of the people.

The consensus of opinion seems to be that with proper guidance and with modern tools and methods the Filipinos could develop into a race of artisans and agriculturists. This would do much to put the islands on a higher plane than they are at present. Many do beautiful work, and while as a rule it is a copy of that done for generations past, it is new to us and the workmanship is excellent. The beautiful fabrics of jusi, piña, and sinamay are entirely made by the Filipino women and are a source of great revenue in certain localities. Those of Iloilo, on the island of Panay, are most noted for their fineness and beauty, as are the woven mats, or petates, of Romblon. The finely woven hats of the province of Bulacan and Pangasinan all testify to the manual dexterity of the Filipino, as the weaving of mats, bags, and baskets, the spinning of the thread, and the making of the beautiful cloths testify to the manual skill of the Moro women of the south, and the work in steel in making bolos and carving of the handles of the same by the Moro men.

In Manila one can see most exquisite work in wood carving and in the making of musical instruments. They excel in light work where great patience is required, but for the heavier grades of work they are of little account. The Chinese are the ones who practically control the labor situation. They are to be found in every manual occupation. They are faithful, work daily, Sundays, holidays, and all times, if need be. Nothing seems to daunt them. They are ingenious and grasp and apply any idea or suggestion with the greatest alacrity. They control many of the mechanical industries; the Filipino but few, except in the interior.

One of the industries of the greatest importance in Manila is the manufacture of cigars and tobacco. In that city alone there are fully 50,000 Filipinos employed, their output being something like 5,000,000 cigars in a day. A few Chinese and some of other nationalities are employed, but their work is of an inferior class to that of the Filipino.

Wages have almost and in many cases have more than doubled since American occupation. In Manila the following wages are paid at the present time: Skilled wood workers, $1 to $3, Mexican, per day; unskilled, 50 cents to 80 cents, Mexican; sawyers of lumber, $2, Mexican; stone dressers, $3 to $4, Mexican; house painters, 60 cents to $1.25, Mexican; tinsmiths, 80 cents to $2, Mexican, majority $1, Mexican; carriage makers, $20 to $40, Mexican, per month, according to skill required. In printing, the Spanish and Filipino offices pay wages ranging from $4 to $8, Mexican, per week, while the American offices pay the same amounts in gold, or double that of the Filipino and Spanish offices. Tailoring, 50 cents to 60 cents, Mexican, per day. Cigar makers are usually paid by the piece; those working in this way can make about $15, Mexican, per week. A great many, however, earn about $5, Mexican, per week. Outside of Manila the wages are considerably lower, especially away from the seaport towns. Common laborers receive as low as 10 cents, gold, per day; skilled workers, 50 cents, gold.

Whether or no the Filipino will ever become the master of the industrial situation depends very much upon what he himself is willing to do to overcome his

inborn inertia. One of the most baneful effects of the Spanish occupation is the idea that hand work is degrading. The desire to occupy some position where it will not be necessary to soil either his hands or his clothes seems to be the great ambition of a large majority of the Filipino race. The prejudice against manual labor must first of all be overcome before it can make any great advancement.

At present, after three hundred years of training in the Spanish school of life, the testimony seems to be that the average Filipino is neither industrious, faithful, or to be depended upon.

Industrial schools will do much to change all this, it is hoped, and with examples of what an energetic race of men and women are accomplishing already, with the introduction of new tools, new appliances, and modern machinery, new ideas will be developed, the land will be cultivated, and this body of people will come forth to play their part in the great struggle for life.

XVIII.—SCHOOL BUILDINGS.

One of the great handicaps in the work at present is the lack of suitable school buildings in many of the towns. During the late insurrections and wars many substantial buildings were partly or wholly destroyed, and in the majority of cases have not been rebuilt, but, instead, replaced by those of a temporary character.

In answer to a special circular letter sent out to the teachers, a detailed report on the school buildings was made, from which it was possible to gain accurate information on the condition of each schoolhouse. The estimated number of school buildings is 1,500, many built of stone, but the larger number of wood and nipa. For a time some schools were conducted in convents, but this practice in general was discontinued on the recommendation of the civil governor, in order to avoid any harsh feeling between church and civil authorities. There are, however, some schools still held in the convents on the express invitation of the local priests.

Oftentimes the buildings are used for other purposes—as the presidencia or other office, as a dwelling, or even a store. The practice obtained under Spanish rule of using the schoolhouse as the home of the teacher and his family, a custom that has been set aside now with the idea of raising the dignity of the school building.

The schoolhouses are in various stages of equipment; some have received the modern American desks which recently arrived, others are fitted with rather crude, but serviceable, Filipino desks, and still others have nothing but a few bamboo benches for furniture. The floor space varies from 160 to 3,000 square feet, and the amount of blackboard surface from none to 600 square feet. The buildings contain from 1 to 8 rooms. and in general the conditions of light and sanitation are good, but the state of repair generally only fair, frequently poor, and in many cases bad.

This matter of suitable schoolhouses is now claiming serious attention. The general superintendent has made urgent recommendation that a construction fund be provided by the insular government, with the idea of helping the great number of deserving municipalities to a certain extent rather than aid the few entirely. The Bureau of Architecture is now ready to draw up plans from specifications forwarded by the municipalities through the division superintendent and approved by the general superintendent.

Activity on the part of the towns in providing suitable schoolhouses is on the increase, and when these municipalities are on a firmer financial basis more is to be expected. Furthermore, with the withdrawal of the soldiers from various towns which have come under civil régime, where their services are no longer needed, the number of satisfactory buildings for school purposes increases.

XIX.—HOLIDAYS, VACATIONS, AND SCHOOL SESSIONS.

The school year in Spanish times was from six to twelve months, according to the locality. School sessions varied from three to eight hours, and vacations came at all times of the year.

After a consideration of the local conditions peculiar to each province, uniformity in the periods of vacation was found impracticable, and the matter, with certain general regulations, was left to the individual division superintendents to decide. These regulations were:

1. The school day shall be divided into a morning and an afternoon session, and shall not be less than five nor more than five and one-half hours, one of which shall be spent in daily instruction of the Filipino teachers.
2. There shall be allowed fourteen weeks' vacation each year, two of which shall be the usual Christmas vacation.
3. Of the remaining twelve vacation weeks all may be given consecutively, but eight must be.
4. There shall be no more than three vacations during the year, one of these being the Christmas vacation.

In addition to these regular vacations, the following holidays have been established by act of the United States Philippine Commission:

	In 1902.
New Year's Day	January 1.
Washington's Birthday	February 22.
Holy Thursday	March 27.
Good Friday	March 28.
Independence Day	July 4.
Occupation Day	August 13.
Thanksgiving Day	November 27.
Christmas Day	December 25.
Rizal Day	December 30.

In addition to these, the following church fiestas, or such of them as are considered advisable, may be observed as holidays by the schools of these islands:

	In 1902.
Epiphany, or Three Kings' Day	January 6.
Purification of the Blessed Virgin	February 2.
Ascension Day	May 11.
Corpus Christi Day	June 1.
Assumption Day	August 15.
All Saints' Day	November 1.
Conception of the Blessed Virgin Mary	December 8.

Suggestions as to the list of church days were invited from the division superintendents and such changes recommended as might accord better with the customs of their provinces.

XX.—LEGISLATION—NECESSARY ADDITIONAL ENACTMENTS.

Since the passing of the school bill additional enactments have provided for the increase of the number of school divisions to 18 (act 180), the appointment of deputy division superintendents (act 232), and the appointment of teachers for secondary instruction (act 373).

Further legislation is now necessary to provide for the supervision of private schools, to frame a compulsory school law, and to grant additional power to division superintendents over the expenditure of the portion of the municipal revenues which is for school purposes.

Since the coming of the Americans private schools have sprung up like mushrooms. Within ten months, since June, 1901, 29 new ones have been opened in

Manila alone. There are three classes—parochial schools, branches of the Liceo de Manila, designated as feeders to that institution, and primary and secondary schools established by private parties on their own accounts. All of these are patterned after the old order of things, and are teaching either Spanish or the vernacular. The popular demand for English has compelled many of them to make a show of teaching a little of it, but it is generally being attempted without English teachers worthy of the name. The curriculum of these schools, especially those of a primary grade, should conform to the course in the public schools, but with full latitude in matters of religious instruction; and the inspection of them should be made to the extent of seeing that they are schools in fact and not in name only.

The general superintendent has, therefore, recommended that section 25 of act 74 be amended by adding thereto the following:

But these shall be under the control of the general superintendent of public instruction and the division superintendents.

A study of the supervision of private schools in various parts of the United States shows that such is considered necessary, even amid the most favorable educational conditions.

The object of the supervision should be to raise the standard of these schools and get them in line and harmony with the general educational movement. If this is done, these schools are to be welcomed and encouraged; if not so regulated, they are a very positive menace to educational advancement.

The supervision of private schools will insure a general standard of excellence in all of the schools of the islands, and incidentally will make it possible to have a compulsory school law of real worth.

A compulsory school law is a necessary thing for any country where the purpose is to secure general education. Twenty-nine States and two Territories in the United States have passed such laws, defining the ages to which the laws shall apply, the annual term of school attendance, and the penalty imposed upon parents and guardians for violations.

To attempt general education here without such a law would presuppose a greater interest in education than exists in the most cultured nations.

The general superintendent has recommended that the Commission empower the presidentes of the pueblos to compel attendance by proclamation on the advice of the division superintendents (who would not give such advice unless there were sufficient school accommodations). This law should require attendance at some authorized school of all children between 6 and 12 years of age. It should by no means limit the attendance to the public school. It should make special provision for servants within this age, compelling their attendance but a portion of the regular time. Only where the municipal authorities are in sympathy with such a law can it be successfully enforced. The division superintendents have recommended it, stating that many presidentes were willing to pass such a regulation were they so empowered.

In a few cases compulsory-attendance regulations have already been enacted by municipalities eager to push educational interests. This action is as yet hardly constitutional, yet has effected its purpose.

In the matter of expending the money set aside by law for school purposes division superintendents have met with difficulties. As the law at present reads, all initiative in expenditure lies with the municipal council; and the division superintendent, together with the local board, although they take a deeper interest in educational matters and understand better the school needs, have only the power of recommendation. Division superintendents feel that they ought to have a more direct control of the funds which belong to their department, and it is

deemed necessary to give them some power of initiative. It might be well to make the deputy division superintendents members of their respective provincial boards.

XXI.—PRESENT PLANS FOR FUTURE DEVELOPMENT.

It is of vital necessity now, after these people have been given the means of a rudimentary education, that something higher should be held out to them. The movement would be only too certain to end in failure if, after the desire for education had been awakened in them, there was nothing which we could furnish to satisfy it.

Grammar and high schools are therefore being established now, and a school of fine arts, music, and painting, a technical school, and a university are definitely planned.

The grammar and high schools, provincial institutions in nature, are opening in each province. The insular government furnishes the teachers and books, the provincial government the buildings and equipment. The curricula are to include advanced work in English, higher mathematics, Spanish, and Latin.

The school of fine arts, music, and painting, to be opened at Manila, is intended to encourage work in this line, in which the Filipinos have shown unexpected ability.

The technical school, with courses in mining, civil, and electrical engineering, is planned to prepare the young men for practical work in developing their country. At present there are but 120 miles of railroad in the whole archipelago, few good bridges, and numberless poor roads, many of which are mere trails, almost impassable. There are, furthermore, mineral resources, and opportunities for industrial growth by utilizing the innumerable mountain streams for power directly or converting their energy. A well-equipped technical school here, after the pattern of our Massachusetts Institute of Technology, will fill a great need in enabling the people to solve these problems.

A university finally completes the system, with an academic department, graduate school, and schools of medicine and law.

There are additional supplementary agencies planned in the way of reform schools and institutions for the deaf, dumb, and blind, and also a circulating library for the benefit of the teachers.

Thus from the primary institution to the university there is a logical system in which something higher is constantly offered until the highest is reached. The process of development is a steady one along the two lines of perfecting and completing the system of academic training by opening normal schools and higher institutions, and of increasing the scope and efficiency of the work by the establishment of special schools and supplementary educational agencies.

XXII.—EDUCATION OF FILIPINOS IN THE UNITED STATES.

In this system we must beware of the possibility of overdoing the matter of higher education and unfitting the Filipino for practical work. We should heed the lesson taught us in our reconstruction period when we started in to educate the negro. The education for the masses here must be an agricultural and industrial one, after the pattern of our Tuskegee Institute at home.

It is desirable to send certain Filipinos to the United States for the purpose of becoming acquainted with our methods, and of being able to apply them with advantage to their work here. The general superintendent has, therefore, asked each division superintendent to recommend a few especially promising Filipinos, whose names are to be submitted to the Commission for action. In the estimation

of the general superintendent it is preferable to send a small number, for perhaps two years' study, than a large number for a short time; and such will be the principle observed.

XXIII.—RELATION OF EDUCATIONAL WORK TO THAT OF OTHER DEPARTMENTS.

The department of education is in the unclassified civil service, and is regularly becoming a factor in matters not strictly educational. It is associating itself with the post-office department, in that many of the teachers have become postmasters for their respective towns; with the bureau of non-Christian tribes, for the teachers are making investigations for this bureau in their various localities; with the board of health, for many teachers are acting as members of local boards; and with the general government by taking part in the work of getting the census of the archipelago.

XXIV.—EDUCATIONAL POLICY.

The policy followed throughout is steady, slow going, careful, fundamental work, the fruits of which the future alone will bear; our hopes are centered in the new generation; no attempt has been made at display; nothing for which there was no need has been introduced into the system. As the educational wants of the Filipinos grow and their ability to assimilate the new substances likewise increases, they are supplied. The character of the work is entirely practical and utilitarian.

XXV.—EDUCATIONAL OUTLOOK.

The capacity of the Filipinos for education gives to our efforts the promise of permanent results. The change from fee to free schools has been an important one and a prime factor in arousing the interest of the people in education. And in this interest lies in great part the success of the movement. There is a desire for American teachers and schools everywhere; even political enemies have been friendly to the educational movement. The eagerness is shown not only by the children, from whom it might be expected, but also by the old people; and although part of this results from the novelty of the work, the greater part has a deeper foundation.

We must not, however, assume too much. Native dialects will continue to be spoken; but English will become the official language, the medium for the transmission of modern currents of thought—in short, modern civilization. Japan serves as a good illustration of this. And herein lies the justification of the present educational movement: A preparation both for the pursuit of practical life-sustaining occupation, and for the best of past and present civilization in literature, culture, and art.

CHAPTER XXX.

FOREIGN UNIVERSITIES AND OTHER FOREIGN INSTITUTIONS OF HIGHER EDUCATION.

I. Universities arranged according to date of founding.
II. Other seats of learning arranged according to date of founding.
III. Universities, etc., arranged according to number of students.
IV. The same arranged alphabetically.
V. Universities arranged according to countries.
VI. Polytechnica arranged alphabetically.
VII. Agricultural, forestry, and mining schools arranged alphabetically.
VIII. Veterinary schools arranged alphabetically.

INTRODUCTION.

The authors of "Minerva, Jahrbuch der Universtäten der Welt" (K. Trübner and F. Mentz), which is the chief source of information offered in the following lists, say that they have submitted their work at various stages of completion to different professors of the countries mentioned, so that they are assured that their decision as to which of the learned institutions of the world should be regarded as universities is upheld by the most trustworthy authority. They describe their Jahrbuch as a collection of names of teaching bodies, of universities, or similar institutions of the world.

Since this Report of the Bureau of Education contains direct information concerning the higher institutions of learning in the United States, they have been omitted from the following lists, which are devoted exclusively to foreign institutions:

I. *Foreign universities arranged according to age.*

Date of foundation.	Locality.
	Tenth century.
988	Cairo, Egypt.
	Twelfth century.
1119	Bologna, Italy.
1181	Montpellier, France.
1200	Paris, France.
1200	Oxford, England.
	Thirteenth century.
1209	Valencia, Spain.
1222	Padua, Italy.
1224	Naples, Italy.
1233	Toulouse, France.
1243	Salamanca, Spain.
1257	Cambridge, England.
1266	Perugia, Italy.
1288	Coimbra, Portugal.
	Fourteenth century.
1303	Rome, Italy.
1339	Grenoble, France.
1343	Pisa, Italy.
1346	Valladolid, Spain.
1348	Prague, Bohemia, Austria.
1349	Florence, Italy.
	Fourteenth century—Continued.
1361	Pavia, Italy.
1364	Cracow, Galicia, Austria.
1365	Vienna, Austria.
1367	Fünfkirchen, Hungary.
1386	Heidelberg, Baden, Germany.
1391	Ferrara, Italy.
	Fifteenth century.
1402	Würzburg, Bavaria, Germany.
1409	Leipzig, Saxony, Germany.
1409	Aix, France.
1411	St. Andrews, Scotland.
1412	Turin, Italy.
1419	Rostock, Mecklenburg, Germany.
1422	Parma, Italy.
1422	Besançon, France.
1426	Louvain, Belgium.
1431	Poitiers, France.
1437	Caen, France.
1441	Bordeaux, France.
1444	Catania, Sicily, Italy.
1450	Barcelona, Spain.
1451	Glasgow, Scotland.
1456	Greifswald, Prussia, Germany.
1457	Freiburg, Baden, Germany.
1460	Basel, Switzerland.
1463	Nantes, France.

I. *Foreign universities arranged according to age*—Continued.

Date of foundation.	Locality.
	Fifteenth century—Continued.
1465	Budapest, Hungary.
1472	Munich, Bavaria, Germany.
1474	Saragossa, Spain.
1477	Upsala, Sweden.
1477	Tübingen, Würtemberg, Germany.
1478	Copenhagen, Denmark.
1494	Aberdeen, Scotland.
	Sixteenth century.
1501	Valencia, Spain.
1502	Halle-Wittenberg, Prussia, Germany.
1502	Seville, Spain.
1504	Santiago, Spain.
1506	Breslau, Prussia, Germany (1702).
1508	Madrid, Spain.
1527	Marburg, Prussia, Germany.
1531	Granada, Spain.
1531	Sarospatak, Hungary.
1537	Lausanne, Switzerland.
1540	Macerata, Italy.
1544	Königsberg, Prussia, Germany.
1548	Messina, Sicily, Italy.
1549	Debreczen, Hungary, Theological College.
1556	Sassari, Italy.
1558	Jena, Thuringia, Germany.
1559	Geneva, Switzerland.
1566	Olmütz, Moravia, Austria.
1567	Strasburg, Alsace, Germany.
1568	Braunsberg, Prussia, Germany.
1572	Nancy, France.
1575	Leyden, Holland.
1580	Oviedo, Spain.
1582	Rome, Italy (Pontif.).
1583	Edinburgh, Scotland.
1586	Gratz, Styria, Austria.
1588	Kiev, Russia.
1591	Dublin, Ireland.
1596	Cagliari, Italy.
	Seventeenth century.
1605	Manila, Philippine Islands.
1607	Giessen, Hessia, Germany.
1614	Groningen, Holland.
1622	Salzburg, Austria.
1632	Amsterdam, Holland.
1632	Dorpat, Russia.
1636	Utrecht, Holland.
1640	Helsingfors, Finland, Russia.
1657	Kaschau, Hungary.
1665	Kiel, Prussia, Germany.
1666	Lund, Sweden.
1671	Urbino, Italy.
1673	Innsbruck, Tyrol, Austria.
1676	Eperies, Hungary.
1683	Modena, Italy.
	Eighteenth century.
1710	Barbados (Codrington College), West Indies.
1721	Habana, Cuba.
1722	Dijon, France.
1727	Camerino, Italy.
1737	Regensburg, Germany, Theological Lyceum.
1737	Göttingen, Prussia, Germany.
1740	Erlau, Hungary.
1743	Erlangen, Bavaria, Germany.
1743	Santiago, Chile.
1748	Cadiz, Spain.
1755	Moscow, Russia.
1771	Münster, Prussia, Germany.
1777	Siena, Italy.
1779	Palermo, Sicily, Italy.
1784	Lemberg, Galicia, Austria.
1785	Pressburg, Hungary.
1788	Grosswardein, Hungary.
1798	Kasan, Russia, Theological College.
	Nineteenth century.
1800	Edinburgh, Scotland, Medical College.
1804	Kasan, Russia.
1804	Kharkov, Russia.
1805	Yaroslavl, Russia.
1808	Clermont, France.
1808	Lille, France.
1808	Lyon, France.
1808	Rennes, France.
1809	Berlin, Prussia, Germany.
1811	Christiania, Norway.
1812	Genoa, Italy.
1816	Ghent, Belgium.
1816	Warsaw, Poland, Russia.
1817	Liege (Lüttich), Belgium.
1818	Bonn, Prussia, Germany.
1819	St. Petersburg, Russia.
1820	Nezin, Russia, Philological School.
1821	Montreal, Canada.
1826	London (University College), England.
1827	Toronto, Canada.
1827	Sheffield (Medical College), England.
1828	Lampeter (St. David's College), Wales.
1832	Durham, England.
1832	Zurich, Switzerland.
1832	Kiev, Russia.
1834	Freising, Germany, Theological Lyceum.
1834	Brussels, Belgium.
1834	Berne, Switzerland.
1836	London (University), England.
1837	Athens, Greece.
1838	Messina, Italy.
1840	Kingston, Canada.
1843	Eichstätt, Germany, Theological Lyceum.
1845	Cork, Ireland.
1845	Belfast, Ireland.
1845	Galway, Ireland.
1849	Algiers, Algeria.
1850	Sydney, Australia.
1851	Manchester (Victoria University), England.
1851	Newcastle, England.
1853	Melbourne, Victoria, Australia.
1857	Calcutta, India.
1857	Madras, India.
1857	Bombay, India.
1860	Jassy, Roumania.
1862	Kecskemet, Hungary.
1864	Bucharest, Roumania.
1865	Odessa, Russia.
1866	Neuchâtel, Switzerland.
1868	Tokyo, Japan.
1870	New Zealand, New Zealand.
1872	Aberystwith, Wales.
1872	Adelaide, Australia.
1872	Klausenburg, Hungary.
1873	Cape City, South Africa.
1874	Agram, Croatia, Hungary.
1875	Angers, France.
1875	Lille (Faculté Libre), France.
1875	Lyon (Faculté Libre), France.
1875	Czernowitz, Bukowina, Austria.
1875	Birmingham, England.
1876	Bristol, England.
1876	Montevideo, Uruguay.
1876	Montreal, Canada, Université Laval de Quebec.
1877	Leeds, England.
1877	Liverpool, England.
1878	Stockholm, Sweden.
1879	Sheffield (Firth College), England.

NOTE.—The number of students in higher seats of learning not mentioned has not been ascertained.

IV. *Foreign universities, etc., arranged alphabetically, with faculties and number of students.*

1. *Aberdeen, Scotland:* University of Aberdeen. 905 students. Philosophical, theological, law, and medical faculties; library.
2. *Aberystwith, Wales:* University College of Wales, with college at Bangor, 524 students.
3. *Adelaide, Australia:* University of Adelaide, 316 students. Observatory.
4. *Agram, Croatia, Hungary:* Königl. Universität Agram, 829 students. Theological, law, and philosophical faculties; library.
5. *Aix-en-Provence, France:* Université d'Aix, 772 students. Law and philosophical faculties: library.
6. *Algiers, Algeria, Africa:* Académie d'Alger, 786 students. Law, medical, scientific, and philosophical faculties; library, observatory.
7. *Allahabad, India:* University of Allahabad. Examining board, 3,310 candidates.
8. *Amiens, France:* École Prep. de Medicine. Medical school.
9. *Amsterdam, Netherlands:* Universiteit te Amsterdam. 975 students. Law, medical, scientific, philosophical, and theological faculties; library and several institutes.
10. *Amsterdam, Netherlands:* Free University, 122 students. Theological, law, and philosophical faculties.
11. *St. Andrew's, Scotland:* University of St. Andrew's, 264 students. St. Salvador, St. Leonard's, and St. Mary's College.
12. *Angers, France:* Université Catholique de L'Ouest. Law, scientific, theological, and philosophical faculties: library.
13. *Angers, France:* École Prep. de Medicine. Medical school.
14. *Athens, Greece:* National University, 3,000 students. Theological, law, medical, and philosophical faculties; public library.
15. *Bangor, Wales:* University College of North Wales.

16. *Barcelona, Spain:* Universidad de Barcelona, 1,887 students. Philosophical, law, scientific, medical, and pharmaceutical faculties; library.
17. *Basel, Switzerland:* Universität Basel, 695 students. Theological, law, medical, and philosophical faculties; public library.
18. *Belfast, Ireland:* Queen's College, 337 students.
19. *Belgrade, Servia:* Serpska Kraljevska Velika Skola, 412 students. Philosophical, law, and technological faculties; library.
20. *Berlin, Prussia, Germany:* Königl. Friedr.-Wilhelms-Universität, 12,063 students. Theological, law, medical, and philosophical faculties; seminary for oriental languages, and 11 other seminaries, library, and 36 university institutes and museums.
21. *Berne, Switzerland:* Universität Bern, 1,230 students. Catholic and Protestant theology, law, medical, and philosophical faculties; city libraries.
22. *Besançon, France:* Université de Besançon, 256 students. Scientific, philosophical, and medical faculties; library.
23 *Birmingham, England:* Mason College, 967 students. Arts and science, medical and dental faculties; library.
24 *Bologna, Italy:* Regia Università di Bologna, 1,469 students. Philosophical, scientific, law, medical, and pharmaceutical faculties; veterinary and engineers' schools; library.
25. *Bombay, India:* University of Bombay. Examining board, 3,474 candidates; five preparatory colleges.
26. *Bonn, Prussia, Germany:* Rheinische Friedr.-Wilhelms-Universität, 2,420 students. Protestant and Catholic theological, law, medical, and philosophical faculties; library and many institutes.
27. *Bordeaux, France:* Facultés de Bordeaux, 2,080 students. Law, medical, scientific, and philosophical faculties; library.
28. *Braunsberg, Prussia, Germany:* Königl. Lyceum Hosianum, 68 students. Theological and philosophical faculties; library.
29. *Breslau, Prussia, Germany:* Königl. Universität Breslau, 1,748 students. Catholic and Protestant theological, law, medical, and philosophical faculties; library.
30. *Bristol, England:* University College, 542 students (197 women). College faculty and medical school; library.
31. *Brussels, Belgium:* Université libre de Bruxelles, 1,060 students. Philosophical, law, scientific, medical, and pharmaceutical faculties; also polytechnical school; library.
32. *Bucharest, Roumania:* Universitatea din Bucuresti, 4,314 students. Scientific, philosophical, law, medical, and theological faculties; library.
33. *Budapest, Hungary:* Királyi Magyar Tudomány-Egyetum, 5,661 students. Theological, law, medical, and philosophical faculties; library.
34. *Buenos Ayres, Argentina:* Universidad Nacional, 2,665 students. Law, medical, and general faculties.
35. *Cadiz, Spain:* Facultad de Medicina (belonging to Seville). Medical faculty; library.
36. *Caen, France:* Université de Caen, 659 students. Law, scientific, and philosophical faculties; library.
37. *Cagliari, Sardinia, Italy:* Regia Università di Cagliari, 243 students. Law, medical, and scientific faculties; library.
38. *Cairo, Egypt:* Azhar University, about 9,060 students and hearers.
39. *Calcutta, India:* University of Calcutta, 7,210 candidates, of whom 3,475 passed. Examining board; library.
40. *Cambridge, England:* University of Cambridge, 2,985 students. Schools of theology, law, oriental, classical, and modern philology, music, moral science, history and archæology, astronomy, physics, chemistry, mineralogy, biology, geology, and medicine; library.
41. *Camerino, Italy:* Libera Università degli Studi di Camerino, 287 students. Law, medical, and pharmaceutical faculties, and veterinary school; communal library.
42. *Cape Town, South Africa:* University of the Cape of Good Hope.
43. *Cardiff, Wales:* University of South Wales, 577 students. Philosophical and scientific faculties and department of engineering; library.
44. *Catania, Sicily, Italy:* Regia Università degli Studi di Catania, 981 students. Law, medical, scientific, and philosophical faculties; library.
45. *Christiania, Norway:* Kongelige Frederiks Universitet, 1,400 students. Theological, law, medical, philosophical, and scientific faculties; library.
46. *Clermont-Ferrand, France:* Université de Clermont, 267 students. Scientific and philosophical faculties; library.

47. *Coimbra, Portugal:* Universidade de Coimbra, 1,684 students. Theological, law, and scientific faculties; library.
Copenhagen. (See Kjøbenhavn.)
48. *Cordoba, Argentine:* Universidad Nacional. Law, scientific, and medical faculties; observatory.
49. *Cork, Ireland:* Queen's College, 212 students.
Cracow. (See Krakau.)
50. *Czernowitz, Bukowina, Austria:* K. k. Franz-Josephs-Universität, 483 students. Theological, law, and philosophical faculties; library.
51. *Debreczen, Hungary:* Evangelical Reformed Universität, 319 students. Law, theological, and philosophical faculties.
52. *Dijon, France:* Facultés de Dijon, 649 students. Law, scientific, and philosophical faculties; library.
53. *Dillingen, Bavaria, Germany:* Theological Lyceum, 131 students.
54. *Dorpat (Jurjew), Russia:* Kaiserliche Universität, 1,790 students. Law, theological, medical, and philosophical faculties.
55. *Dublin, Ireland:* University of Dublin, 1,047 students.
56. *Dublin, Ireland:* Royal University of Ireland, about 600 candidates. Examining board.
57. *Dundee, Scotland:* University College, 253 students.
58. *Durham, England:* Durham University, 220 students. To this university belong the Codrington College, on the island of Barbados, and the Fourah Bay College, in Sierra Leone; also the College of Science, at Newcastle-on-Tyne, which has an enrollment of 1,500 students.
59. *Edinburgh, Scotland:* University of Edinburgh, 2,800 students. Philosophical, theological, law, and medical faculties; library.
60. *Edinburgh, Scotland:* School of Medicine, 1,200 students.
61. *Eichstätt, Bavaria, Germany:* Bishöfliches Lyceum, 111 students. Theological and philosophical faculties.
62. *Eperies, Hungary:* Evangelische Rechtsakademie, 256 students. Law school.
63. *Erlangen, Bavaria, Germany:* K. Bayerische Friedr.-Alexander-Universität, 994 students. Theological, law, medical, and philosophical faculties; library.
64. *Erlau, Hungary:* Erzbischöfliche Rechtsakademie, 95 students. Law school.
65. *Ferrara, Italy:* Libera Università di Ferrara, 109 students. Law, scientific, and medical faculties; library.
66. *Florence, Italy:* R. Instituto di Studi Superiori Practici e di Perfezionamento, 602 students. Philosophical, scientific, medical, and pharmaceutical faculties; library.
67. *Florence, Italy:* R. Instituto di Magistero Femminile, 152 students. Woman's university.
68. *Freiburg, Baden, Germany:* Badische Albert-Ludwigs-Universität, 1,847 students. Law, theological, medical, and philosophical faculties; library.
69. *Freiburg, Switzerland:* Katholische Universität, 345 students. Theological, law, and philosophical faculties; library.
70. *Freising, Bavaria, Germany:* Königl. Bayerisches Lyceum, 165 students. Theological and philosophical faculties.
71. *Fünfkirchen, Hungary:* Bischöfliche Rechtsakademie. Law school, 145 students.
72. *Galway, Ireland:* Queen's College, 110 students.
73. *Geneva, Switzerland:* Université de Genève, 819 students. Theological, law, medical, philosophical, and scientific faculties; five libraries.
74. *Genoa, Italy:* R. Università degli Studi di Genoa, 1,351 students. Law, medical, scientific, and philosophical faculties, and schools of engineering and pharmaceutics; library.
75. *Ghent, Belgium:* Université de Gand, 753 students. Philosophical, law, scientific, and medical faculties; library.
76. *Giessen, Hessia, Germany:* Hessische Ludwigs Universität, 950 students. Theological, law, medical, and philosophical faculties; library.
77. *Glasgow, Scotland:* University of Glasgow, 2,030 students.
78. *Gothenburg, Sweden:* Göteborgs Högskola, 1,795 hearers.
79. *Göttingen, Prussia, Germany:* Georg-Augusts-Universität, 1,500 students. Theological, law, medical, and philosophical faculties; library.
80. *Granada, Spain:* Universidad de Granada. Philosophical, law, scientific, medical, and pharmaceutical faculties; library.
81. *Grätz, Styria, Austria:* K. k. Karl-Franzens Universität, 1,650 students. Theological, law, medical, and philosophical faculties; library.

82. *Greifswald, Prussia, Germany:* Universität, 820 students. Theological, law, medical, and philosophical faculties; library.
83. *Grenoble, France:* Université de Grenoble, 573 students. Law, scientific, and philosophical faculties; library.
84. *Groningen, Netherlands:* Rijks Universiteit te Groningen, 427 students. Theological, law, medical, scientific, and philosophical faculties; library.
85. *Grosswardein, Hungary:* Jógakademia, 222 students. Law school.
86. *Halle, Prussia, Germany:* Friedr.-Universität Halle-Wittenberg, 1,863 students. Theological, law, medical, and philosophical faculties; library.
87. *Habana, Cuba:* Universidad de la Habana, 671 alumnos and 555 under private tutors. Philosophical, scientific, medical, and law faculties; library.
88. *Heidelberg, Baden, Germany:* Ruprecht-Karls-Universität, 1,464 students. Theological, law, medical, philosophical, and scientific faculties; library.
89. *Helsingfors, Finland, Russia:* Kejersliga Alexanders Universitet i Finland, 2,495 students. Theological, law, medical, and philosophical faculties; public library.
90. *Innsbruck, Tyrol, Austria:* K. k. Leopold-Franzens Universität, 1,032 students. Theological, law, medical, and philosophical faculties; library.
91. *Jaroslawl (or Yaroslavl), Russia:* Demidovskij juridiceskij Licej, 368 students. Law school.
92. *Jassy, Roumania:* Universitatea din Jasi, 420 students. Law, philosophical, scientific, and medical faculties; library.
93. *Jena, Thuringia, Germany:* Sächsische Gesammt-Universität, 809 students. Theological, law, medical, and philosophical faculties; library.
94. *Jerusalem, Palestine:* École Pratique d'Étude Bibliques. Theological school, 25 students.

Jurjew. (See Dorpat.)

95. *Kasan, Russia:* Imperatorskij Kazanskij Universitet, 859 students. Philosophical, scientific, law, and medical faculties; library.
96. *Kasan, Russia:* Theological academy, 280 students.
97. *Kaschau, Hungary:* Rechts-Akademie, 201 students. Law school.
98. *Kecskemet, Hungary:* Rechts-Akademie, 120 students. Law school.
99. *Kharkov, Russia:* Imperatorskij Charkowskij Universitet, 1,384 students. Philosophical, scientific, law, and medical faculties; library.
100. *Kiel, Prussia, Germany:* K. Christian-Albrechts-Universität, 1,071 students. Theological, law, medical, and philosophical faculties; library.
101. *Kiev, Russia:* Imperatorskij Universitet, 2,316 students. Medical, law, and philosophical faculties; institutes and library.
102. *Kiev, Russia:* Theological academy, 189 students.
103. *Kingston, Ontario, Canada:* University of Queen's College, 672 students. Theological, arts, law, and medical faculties; museum.
104. *Kjöbenhavn (Copenhagen) Denmark:* Kjöbenhavns Universitet, about 2,000 students. Theological, law, medical, philosophical, and scientific faculties and polytechnic institute; library.
105. *Klausenberg, Siebenbürgen, Hungary:* K. k. Klausenberger Universität, 1,403 students. Law, medical, philosophical, and scientific faculties; library.
106. *Königsberg, Prussia, Germany:* K. Albertus Universität, 923 students. Theological, law, medical, and philosophical faculties; royal and university library.
107. *Krakau, Galicia, Austria:* Jagellonische Universität, 1,405 students. Theological, law, medical, and philosophical faculties; library.
108. *Kyoto, Japan:* Imperial University, 363 students. Law, medical, and scientific faculties.
109. *Lahore, India:* The Punjab University, 2,664 candidates, of whom 1,398 passed. Oriental languages, arts, law, medicine, science, and engineering departments.
110. *Lampeter, Wales:* St. David's College, 120 students.
111. *Lausanne, Switzerland:* Université de Lausanne, 711 students. Theological, law, medical, philosophical, and scientific faculties.
112. *Leeds* (see Manchester), *England:* Yorkshire College, 1,137 students.
113. *Leyden, Netherlands:* Rijks-Universiteit, 1,014 students. Medical, scientific, philosophical, theological, and law faculties; library.
114. *Leipzig, Saxony, Germany:* Universität, 3,739 students. Theological, law, medical, and philosophical faculties; library.
115. *Lemberg, Galicia, Austria:* K. k. Franzen's Universität in Lemberg, 2,060 students. Theological, law, and philosophical faculties; library.

Liége. (See Lüttich.)

116. *Lille, France:* Facultés de Lille, 1,110 students. Law, medical, scientific, and philosophical faculties; library.
117. *Lille, France:* Facultés Libres, 550 students. Theological, law, medical, scientific, and philosophical faculties; library.
118. *Lima, Peru:* Universidad Mayor de San Marcos. Theological, law, medical, and philosophical faculties.
119. *Limoges, France:* École de Médecine et de Pharmacie, 108 students. Medical and pharmaceutical courses.
120. *Lisbon, Portugal:* Ecola Medico Cirurgica. Medical college.
121. *Liverpool* (see Manchester), *England:* University College, about 560 students.
122. *London, England:* University of London, about 5,000 candidates. Examining board; library.
    To the university belong:
    (1) University College, with philosophical, law, scientific, and medical faculties; library; about 1,020 students.
    (2) King's College, with theological, philosophical, and medical faculties; library; 1,300 students.
    (3) School of Modern Oriental Languages.
    (4) Eight other colleges with 511 students.
    (5) Ten medical schools connected with hospitals; about 4,000 students.
123. *Louvain, Belgium:* Université Catholique de Louvain, 1,890 students. Theological, law, medical, philosophical, and scientific faculties; library.
124. *Louvain, Belgium:* Philosophical School of St. Thomas Aquinas.
125. *Lund, Sweden:* Kongl. Universitet i Lund, 675 students. Theological, law, medical, and philosophical faculties; library.
126. *Lüttich* (or *Liége*), *Belgium:* Université de Liége, 1,601 students. Philosophical, law, scientific, and medical faculties; library.
127. *Lyon, France:* Facultés Libres, about 600 students. Theological, law, scientific, and philosophical faculties.
128. *Lyon, France:* Université de Lyon, 2,458 students. Law, medical, scientific, and philosophical faculties; two libraries.
129. *Macerata, Italy:* Regia Università di Macerata, 155 students. Law faculty.
130. *Madras, India:* University of Madras, about 7,420 candidates. Examining board.
131. *Madrid, Spain:* Universidad Central de España, 5,118 students. Philosophical, law, scientific, medical, and pharmaceutical faculties; libraries.
132. *Manchester, Liverpool, and Leeds, England:* Victoria University, about 3,000 students. This institution consists of:
    (1) Owens College, Manchester, 1,065 students.
    (2) University College, Liverpool, about 1,000 students.
    (3) Yorkshire College, Leeds, 1,039 students.
133. *Manila, Philippine Islands:* Real y Pontificia Universidad de Santo Tomás de Manila, 1,144 students. Theological, law, medical, and pharmaceutical faculties; library.
134. *Marburg, Hessia, Germany:* Universität Marburg, 1,286 students. Theological, law, medical, philosophical, and scientific faculties; library.
135. *Marseilles, France:* Belongs to Facultés d'Aix, 174 students. Scientific, medical, and law faculties; library.
136. *Melbourne, Victoria, Australia:* University of Melbourne, 647 students.
137. *Messina, Italy:* Regia Università degli Studi di Messina, 626 students. Law, medical, scientific, philosophical, and pharmaceutical faculties; library.
138. *Mexico, Mexico:* Instituto Médico Nacional. Medical faculty.
139. *Milan, Italy:* Academia Scientifico-litteraria, 97 students. Scientific school.
140. *Modena, Italy:* Regia Università degli Studi di Modena, 711 students. Law, medical, scientific, and pharmaceutical faculties; library.
141. *Montauban, France:* Belongs to Facultés de Toulouse, 85 students. Law, medical, scientific, and philosophical faculties; library.
142. *Montevideo, Uruguay:* University, 132 students. Medical, law, and mathematical faculties; library.
143. *Montpellier, France:* Facultés de Montpellier, 1,602 students. Law, medical, scientific, and philosophical faculties; library.
144. *Montreal, Canada:* McGill College and University, 1,111 students.
145. *Montreal, Canada:* Succursale de L'Université Laval de Quebeck, 650 students. Theological, medical, and law faculties.
146. *Moscow, Russia:* Imperatorskij Moskowskij Universitet, 4,483 students. Philosophical, scientific, law, and medical faculties; library.

147. *Moscow, Russia:* Duchovnaja Akademija, 212 students. Theological faculty; library.
148. *Munich, Bavaria, Germany:* K. Bayerische Ludwig-Maximilians-Universität, 4,414 students. Theological, law, medical, and philosophical faculties; library.
149. *Münster, Prussia, Germany:* K. Preussische Theologische und Philosophische Akademie, 811 students. Theological and philosophical faculties; library.
150. *Nancy, France:* Université Nancy, 1,034 students. Law, medical, scientific, and philosophical faculties, and pharmaceutical school; library.
151. *Nantes, France:* École de Médecine de Nantes, 243 students.
152. *Nantes, France:* École Libre de Droit, 100 students.
153. *Naples, Italy:* Regia Università degli Studi di Napoli, 5.165 students. Philosophical, law, mathematical, scientific, and medical faculties, and pharmaceutical school; library.
154. *Neuchâtel, Switzerland:* Académie de Neuchâtel, 227 students. Philosophical, scientific, theological, and law faculties; library.
155. *Newcastle, England:* The colleges belong to Durham University.
(1) College of Medicine, 220 students.
(2) Durham College of Science, 1,650 students.
156. *New Zealand:* University, consisting of four colleges, 1,244 students.
157. *Nezin, Russia:* Historical and Philological Institute, 81 students.
158. *Nottingham, England:* University College, 1,902 students. Philology, law, and scientific faculties, and school of engineering; free public libraries.
159. *Odessa, Russia:* Noworossijskij Universitet, 675 students. Philosophical, scientific, and law faculties; library.
160. *Olmütz, Moravia, Austria:* Theologische Facultät, 185 students.
161. *Ouro-Preto, Brazil:* Facultade de Direito. Law academy.
162. *Oviedo, Spain:* Universidad Literaria, 234 students. Law faculty; library.
163. *Oxford, England:* University, 3.499 students. Theological, law, medical, scientific, and philosophical faculties; Bodleian library.
164. *Padua, Italy:* Regia Università degli Studi di Padua, 1,536 students. Law, medical, scientific, and philosophical faculties, and schools of engineering and pharmacy; library.
165. *Palermo, Sicily, Italy:* Regia Università degli Studi di Palermo, 1,400 students. Law, medical, scientific, and philosophical faculties, and schools of engineering and pharmacy; library.
166. *Paris France:* (1) Université de Paris, 12,171 students. Protestant theological, law, medical, scientific, and philosophical faculties, and schools of engineering and pharmacy; libraries.
167. *Paris France:* (2) Facultés libres. Law and philosophical faculties; library.
168. *Paris France:* (3) Collége de France.
169. *Paris, France:* (4) École Libre de Sciences Politiques, 600 students.
170. *Paris, France:* (5) École pratique des hautes études en Sorbonne, 233 students. Philosophical and theological faculties; library.
171. *Paris, France:* (6) École nationale des beaux-arts, 2,000 students.
172. *Paris, France:* (7) École nationale de chartes, 69 students.
173. *Paris, France:* (8) Ecole du Louvre.
174. *Paris, France:* (9) École des langues orientales vivantes and other special schools, 415 students.
175. *Paris, France:* (10) École Normale Superieure, 110 students.
176. *Parma, Italy:* Regia Università degli Studi di Parma, 579 students. Law, medical, and scientific faculties, and veterinary and pharmaceutical schools.
177. *Pavia, Italy:* Regia Universtà degli Studi Pavia, 1,029 students. Law, medical, scientific, and philosophical faculties; pharmaceutical school and library.
178. *Perugia, Italy:* Università Libera degli Studi di Perugia, 298 students. Law and medical faculties, and pharmaceutical and veterinary schools; library.
179. *St. Petersburg, Russia:* Imperatorskij Universitet, 3,613 students. Philosophical, scientific, law, and oriental languages faculties; library.
180. *St. Petersburg, Russia:* Imperatorskij Wozensio-Medicineskaja Akademja, 750 students. Medical faculty; library.
181. *St. Petersburg, Russia:* Theological Academy, 242 students; also a law school, 330 students, independent of the university.
182. *St. Petersburg, Russia:* Military medical school, 750 students.
183. *St. Petersburg, Russia:* Law Academy, 330 students, and several other special schools.
184. *St. Petersburg, Russia:* Hist. Philological Institute, 101 students.

185. *St. Petersburg, Russia:* Higher Courses for Women, 1,000 students.
186. *Pisa, Italy:* Regia Università degli Studi di Pisa, 1,100 students. Law, philosophical, medical, and scientific faculties, and engineering, pharmaceutical, veterinary, and agricultural schools; library.
187. *Poitiers, France:* Université de Poitiers, 736 students. Law, scientific, and philosophical faculties; library.
188. *Prague, Bohemia, Austria:* K. k. Deutsche Carl-Ferdinands Universität, 1,185 students. Theological, law, medical, and philosophical faculties; library.
189. *Prague, Bohemia, Austria:* C. k. česk Universitet Karlo-Ferdinandovij, 3,224 students. Theological, law, medical, and philosophical faculties; library.
190. *Pressburg, Hungary:* Jógakademia, 242 students. Law and philosophical faculties; library.
191. *Quebec, Canada:* Université Laval, 331 students. Theological, law, medical, and arts faculties; library and museum.
192. *Recife, Brazil:* Faculdade de direito, 237 students. Law faculty.
193. *Regensburg, Bavaria, Germany:* Lyceum, 172 students. Theological and philosophical faculties.
194. *Rheims, France:* École Prép. de Médecine, 92 students. Medical school.
195. *Rennes, France:* Facultés de Rennes, 1,057 students. Law, scientific, and philosophical faculties; library.
196. *Rome, Italy:* Regia Università degli Studi di Roma, 2,348 students. Philosophical, scientific, law, and medical faculties; engineering and pharmaceutical schools; library.
197. *Rome, Italy:* A number of colleges supported by the church, with 975 students; also a woman's university with 165 students.
198. *Rome, Italy:* Pontificia Universitas Gregoriana in Collegio Romano, 1,115 students. Theological, law, and philosophical faculties.
199. *Rostock, Mecklenburg, Germany:* Grossherzogliche Universität, 549 students. Theological, law, medical, and philosophical faculties; library.
200. *Rouen, France:* École Prép. de Médecine. Medical school, 157 students.
201. *Salamanca, Spain:* Universidad de Salamanca, 1,200 students. Philosophical and law faculties; library.
202. *Salzburg, Austria:* Theologische Fakultät, 60 students.
203. *Santiago, Chile:* University with 4 faculties and 1,000 students.
204. *Santiago, Spain:* Universidad de Santiago. Law, medical, and pharmaceutical faculties; library.
205. *Saragossa, Spain:* Universidad de Zaragoza, 966 students. Philosophical, law, medical, and scientific faculties; provincial library.
206. *Sarospatak, Hungary:* Theologische und Rechtsschule, 148 students.
207. *Sassari, Italy:* Regia Università degli Studi di Sassari, 160 students. Law, medical, and scientific faculties; library.
208. *Seville, Spain:* Universidad de Sevilla. Philosophical, law, and scientific faculties; library.
209. *Sheffield, England:* University College (belongs to Oxford University), 450 students; also a medical school.
210. *Siena, Italy:* Regia Università degli Studi di Siena, 215 students. Law and medical faculties and pharmaceutical school; library.
211. *Sophia, Bulgaria:* Wische utschilische w Sophia, 483 students.
212. *Stockholm, Sweden:* Stockholms Högs Kola, 337 students.
213. *Stockholm, Sweden:* Medical Institute, 330 students.
214. *Strasburg, Alsace, Germany:* Kaiser Wilhelms Universität, 1,194 students. Theological, law, medical, philosophical, and scientific faculties; provincial library.
215. *Sydney, New South Wales, Australia:* University of Sydney, 583 students.
216. *Tokyo, Japan:* Teikoku, Daigaku, 2,908 students. Law, medical, philosophical, and scientific faculties and school of engineering; library.
217. *Tomsk, Siberia:* Imperatorskij Tomkij Universitet, 557 students. Theological and medical faculties; library.
218. *Toronto, Canada:* University of Toronto, 1,322 students. Philosophical, law, and medical faculties; library.
219. *Toronto, Canada:* Victoria University, 250 students. Arts and theology; library.
220. *Toronto, Canada:* Three medical schools.
221. *Toulouse, France:* Université de Toulouse, 2,040 students. Law, philosophical, scientific, and medical faculties; library.
222. *Toulouse, France:* Institut Catholique, 100 students. Theological and philosophical faculties; library.

223. *Tours, France:* École Prép. de Médecine, 85 students. Medical school.
224. *Tübingen, Würtemberg, Germany:* K. Eberhard Karls Universität, 1,521 students. Theological, law, medical, philosophical, and scientific faculties; library.
225. *Turin, Italy:* Regia Università degli Studi di Torino, 2,700 students. Law, medical, philosophical, and scientific faculties and pharmaceutical school; library.
226. *Upsala, Sweden:* Kongl. Universitet i Upsala, 1,384 students. Theological, law, medical, and philosophical faculties; library.
227. *Urbino, Italy:* Libera Università degli Studi di Urbino, 148 students. Law and mathematical faculties and pharmaceutical and surgical schools; library.
228. *Utrecht, Netherlands:* Rijks Universität te Utrecht, 1,003 students. Philosophical, medical, theological, law, and scientific faculties; library.
229. *Valencia, Spain:* Universidad de Valencia, 1,726 students. Law, scientific, and medical faculties; library.
230. *Valladolid, Spain:* Universidad de Valladolid. Law and medical faculties; library.
231. *Vienna, Austria:* K. k. Universität, 6,009 students. Law, theological, medical, and philosophical faculties; library and numerous university institutes.
232. *Vienna, Austria:* Protestantische Theologische Fakultät, 29 students.
233. *Vienna, Austria:* Lehranstalt für Orientalische Sprachen, 147 students.
234. *Vienna, Austria:* Consular Academy, 33 students.
235. *Warsaw, Poland, Russia:* Imperatorskij Warschawskij Universitet, 1,122 students. Philosophical, scientific, law, and medical faculties; library.
236. *Würzburg, Bavaria, Germany:* K. Julius-Maximilians Universität, 1,210 students. Theological, law, medical, and philosophical faculties; library.
237. *Zurich, Switzerland:* Schweizerische Hochshule, 901 students. Theological, law, medical, and philosophical faculties; cantonal and city libraries.

V. *Foreign universities, arranged according to countries.*

Argentina: Cordoba, Buenos Ayres.
Australia: Adelaide, Melbourne, Sydney.
Austria: Czernowitz, Grätz, Innsbruck, Cracow, Lemberg, Olmütz, Prague (German), Prague (Bohemian), Salzburg, Vienna.
Belgium: Brussels, Ghent, Liège, Louvain.
Bolivia: (Universities not mentioned in "Minerva.")
Brazil: Recife, Ouro-Preto.
Bulgaria: Sophia.
Canada: Kingston, Montreal, Quebec, Toronto.
Cape Colony: Cape City.
Chile: Santiago.
China: (College of Foreign Knowledge.)
Colombia: (Universities not mentioned in "Minerva.")
Corea: (None.)
Costa Rica: (None.)
Cuba: Habana.
Denmark: Copenhagen.
Ecuador: Quito.
Egypt: Cairo.
England: (See also Ireland, Scotland, and Wales, below.) Birmingham, Bristol, Cambridge, Durham, Leeds, Liverpool, London, Manchester, Newcastle, Nottingham, Oxford, Sheffield.
France: Aix, Algiers, Angers, Besançon, Bordeaux, Caen, Clermont, Dijon, Grenoble, Lille, Limoges, Lyons, Marseilles, Montauban, Montpellier, Nancy, Nantes, Paris, Poitiers, Rennes, Toulouse, and four separate medical schools.
Germany: Berlin, Bonn, Braunsberg, Breslau, Dillingen, Eichstätt, Erlangen, Freiburg, Freising, Giessen, Göttingen, Greifswald, Halle, Heidelberg, Jena, Kiel, Königsberg, Leipzig, Marburg, Munich, Münster, Regensburg, Rostock, Strasburg, Tübingen, Würzburg.
Greece: Athens.
Guatemala: (None.)
Haiti: (None.)
Hawaii: (None.)
Honduras: (None.)

Hungary: Agram, Budapest, Debreczen, Eperies, Erlau, Fünfkirchen, Grosswardein, Kaschau, Kecskemet, Klausenburg, Pressburg, Sarospatak.
India: Allahabad, Bombay, Calcutta, Lahore, Madras.
Ireland: Belfast, Cork, Dublin, Galway.
Italy: Bologna, Cagliari, Camerino, Catania, Ferrara, Florence, Genoa, Macerata, Messina, Modena, Naples, Padua, Palermo, Parma, Pavia, Perugia, Pisa, Rome, Sassari, Siena, Turin, Urbino, and several colleges.
Japan: Kyoto, Tokyo.
Mexico: (Schools of law, medicine, engineering, etc.)
Montenegro: (Theological seminary, not mentioned in "Minerva.")
Morocco: (None.)
Netherlands: Amsterdam, Groningen, Leyden, Utrecht.
New Zealand: One university.
Nicaragua: (None.)
Norway: Christiania.
Orange Free State: (None.)
Paraguay: (National college, not mentioned in "Minerva.")
Persia: (Several colleges, not mentioned in "Minerva.")
Peru: Lima.
Palestine: Jerusalem.
Philippine Islands: Manila.
Portugal: Coimbra.
Roumania: Bucharest, Jassy.
Russia: Kharkov, Dorpat, Helsingfors, Yaroslavl, Kasan, Kiev, Moscow, Nezin, Odessa, St. Petersburg, Warsaw.
Salvador: (One university, not mentioned in "Minerva.")
Santo Domingo: (None.)
Scotland: Aberdeen, St. Andrews, Dundee, Edinburgh, Glasgow.
Servia: Belgrade.
Siam: (None.)
Siberia: Tomsk.
South African Republic: (None.)
Spain: Barcelona, Cadiz, Granada, Madrid, Oviedo, Salamanca, Santiago, Saragossa, Seville, Valencia, Valladolid.
Sweden: Gothenburg, Lund, Stockholm, Upsala.
Switzerland: Basel, Berne, Freiburg, Geneva, Lausanne, Neuchâtel, Zurich.
Turkey: (Several colleges not mentioned in "Minerva.")
Uruguay: Montevideo.
Venezuela: (Universities not mentioned in "Minerva.")
Wales: Aberystwith, Bangor, Cardiff, Lampeter.

VI. *Technological schools.*

1. *Aachen* (Aix-la-Chapelle), *Prussia, Germany*, founded 1870; 611 students.
2. *Berlin, Prussia, Germany*, founded 1779; 4,441 students.
3. *Brunswick, Germany*, founded 1745; 483 students.
4. *Brünn, Austria*, founded 1850; 416 students.
5. *Budapest, Hungary*, founded 1856; 1,835 students.
6. *Copenhagen, Denmark*, founded 1829; 500 students.
7. *Coopers Hill, England*, founded 1885; 131 students.
8. *Darmstadt, Hessia, Germany*, founded 1868; 1,683 students.
9. *Delft, Netherlands*, founded 1864; 783 students.
10. *Dresden, Saxony, Germany*, founded 1828; 1,241 students.
11. *Glasgow, Scotland*, founded 1886; 605 students.
12. *Grätz, Styria, Austria*, founded 1811; 395 students.
13. *Hanover, Prussia, Germany*, founded 1879; 1,483 students.
14. *Helsingfors, Finland, Russia*, founded 1847; 372 students.
15. *Karlsruhe, Baden, Germany*, founded 1825; 1,494 students.
16. *Kharkov, Russia*, founded 1884; 1,000 students.
17. *Lemberg, Galicia, Austria*, founded 1844; 698 students.
18. *Lisbon, Portugal*, founded 1837; 560 students.
19. *London, England*, 2 institutions, founded 1884; 238 and 185 students.
20. *Lyon, France*, founded 1857; 98 students.
21. *Madrid, Spain*, founded 1835; 80 students.
22. *Marseilles, France* [1891]; 30 students.
23. *Milan, Italy*, founded 1863; 467 students.
24. *Moscow, Russia*, founded 1832; 1,002+350 students.

25. *Munich, Bavaria, Germany*, founded 1827: 2,488 students.
26. *Nancy, France*, founded 1890; 102 students,
27. *Naples, Italy*, founded 1863; 210 students.
28. *Paris, France*, founded 1794; five schools, with 1,350 students.
29. *Oporto, Portugal*, founded 1877; 237 students.
30. *Prague, Bohemia, Austria*, founded 1806 and 1868; 2 schools, with 1,768 students.
31. *Riga, Russia*, founded 1832; 1,770 students.
32. *St. Petersburg, Russia*, founded 1828; 4 schools, with 2,616 students.
33. *São Paulo, Brazil*, founded 1894; 175 students.
34. *Sheffield, England*, founded 1885; 750 students.
35. *Stockholm, Sweden*, founded 1798; 428 students.
36. *Stuttgart, Würtemberg, Germany*, founded 1829; 1,056 students.
37. *Turin, Italy*, founded 1858; 482 students.
38. *Vienna, Austria*, founded 1815; 2,027 students.
39. *Zurich, Switzerland*, founded 1851; 1,456 students.

NOTE.—Several noted technological schools in Italy and in other countries are connected with universities, hence are not mentioned separately in this list.

VII. *Higher agricultural, forestry, and mining schools.*

[Figures in brackets signify date of founding.]

1. *Altenburg, Hungary* [1819], Agricultural Academy; 136 students.
2. *Aschaffenburg, Bavaria, Germany* [1844], Forestry Academy; 66 students.
3. *Beauvais, France* [1854], Agricultural Institute; 104 students.
4. *Berlin, Prussia, Germany* [1806], Agricultural Academy; 628 students.
5. *Berlin, Prussia, Germany* [1860], Mining Academy; 212 students.
6. *Bordeaux, France* [1891], School of Chemistry, Industry, and Agriculture.
7. *Campinas São Paulo, Brazil* [1887], Agricultural Institution.
8. *Clausthal, Prussia, Germany* [1775], Mining Academy; 212 students.
9. *Coopers Hill, England* [1885], Forestry Academy and Engineering College; 131 students.
10. *Copenhagen, Denmark* [1858], Veterinary and Agricultural Academy; 300 students.
11. *Debreczen, Hungary* [1865]; Agricultural Academy; 97 students.
12. *Douai, France* [1888], Agricultural College; 30 students.
13. *Eberswalde, Prussia, Germany* [1820], Forestry Academy; 64 students.
14. *Eisenach, Saxe-Weimar, Germany* [1859], Forestry Academy; 42 students.
15. *Evois, Finland, Russia* [1859], Forestry Academy; 22 students.
16. *Freiberg, Saxony, Germany* [1765], Mining Academy; 372 students.
17. *Gembloux, Belgium* [1860], Agricultural Academy.
18. *Grignon, France* [1828], Agricultural Academy; 120 students.
19. *Hohenheim, Würtemberg, Germany* [1818], Agricultural Academy; 107 students.
20. *Jekaterinoslaw, Russia* [1899], Mining Academy; 128 students.
21. *Kaschau, Hungary* [?], Agricultural Academy; 124 students.
22. *Keszthely, Hungary* [1865], Agricultural Academy; 123 students.
23. *Kolozsmonostor, Hungary* [1869], Agricultural Academy; 80 students.
24. *Leoben, Styria, Austria* [1894], Mining Academy; 250 students.
25. *London, England* [?], Mining and Agricultural College; 90 students.
26. *Lille, France* [1885], Industrial and Agricultural School.
27. *Madrid, Spain* [?], Schools of Agriculture and Veterinary Science; 223 students.
28. *Milan, Italy* [?], Agricultural Academy; 180 students.
29. *Mons, Belgium* [?], Mining Academy; 325 students.
30. *Montpellier, France* [1872], Agricultural School; 200 students.
31. *Moscow, Russia* [?], Agricultural and Forestry Academy; 225 students.
32. *Münden, Prussia, Germany* [1868], Forestry Academy; 45 students.
33. *Nancy, France* [1824], Forestry Academy; 28 students.
34. *Nowaja-Alexandria, Poland, Russia* [1892], Agricultural and Forestry Academy; 218 students.
35. *Ouro-Preto, Brazil* [1892], Mining Academy.
36. *Paris, France* [?], Mining Academy; 146 students.
37. *Paris, France* [?], Agricultural College; 260 students.
38. *Poppelsdorf, Prussia, Germany* [1846], Agricultural Academy; 325 students.
39. *Portici, Italy*, founded 1872, Agricultural College, 105 students.

40. *Pribram, Bohemia, Austria* [1849]. Mining Academy; 95 students.
41. *Rennes, France* [1890], Agricultural College; 118 students.
42. *Schemnitz, Hungary* [?], Forestry and Mining Academy; 263 students.
43. *St. Etienne, France* [1816], Mining Academy; 120 students.
44. *Stockholm, Sweden* [1823], Forestry School; also Agricultural Academy [1811].
45. *St. Petersburg, Russia* [1773], Mining Institute; 550 students.
46. *St. Petersburg, Russia* [1880], Forestry Institute; 516 students.
47. *Tharandt, Saxony, Germany* [1811], Forestry Academy; 72 students.
48. *Toronto, Canada* [1888], Agricultural College.
49. *Vienna, Austria* [1872], Agricultural Academy; 360 students.

NOTE.—Other similar higher institutions of learning are connected with universities, hence they are not mentioned in this list of separate institutions.

VIII. *Veterinary schools.*

1. *Alford, France* [1766]; 294 students.
2. *Berlin, Germany* [1790]; 486 students.
3. *Bucharest, Roumania* [1861]; 95 students.
4. *Budapest, Hungary* [1786]; 384 students.
5. *Cordoba, Spain* [1802]; —— students.
6. *Copenhagen, Denmark* [1858]; see above in VI.
7. *Dorpat, Russia* [?]; 288 students.
8. *Dresden, Germany* [1774]; 160 students.
9. *Hanover, Germany* [?]; 273 students.
10. *Kasan, Russia* [?]; 452 students.
11. *Kharkov, Russia* [1804]; 150 students.
12. *Leon, Spain* [?]; 99 students.
13. *London, England* [1791]; 230 students.
14. *Lyon, France* [1761]; 180 students.
15. *Madrid, Spain* [1792]; 344 students.
16. *Milan, Italy* [1791]; 165 students.
17. *Munich, Germany* [1790]; 300 students.
18. *Naples, Italy* [?]; 200 students.
19. *Santiago, Spain* [1820]; —— students.
20. *Saragossa, Spain* [?]; 276 students.
21. *Stockholm, Sweden* [1821]; 57 students.
22. *Stuttgart, Germany* [1821]; 126 students.
23. *Toulouse, France* [1825]; 164 students.
24. *Turin, Italy* [?]; 91 students.
25. *Utrecht, Netherlands* [?]; 83 students.
26. *Vienna, Austria* [1764]; 305 students.
27. *Warsaw, Russia* [?]; —— students.

CHAPTER XXXI.

REPORT ON EDUCATION IN ALASKA.

DEPARTMENT OF THE INTERIOR,
BUREAU OF EDUCATION,
Washington, D. C., June 16, 1902.

SIR: I have the honor to submit the sixteenth annual report of the Alaska division for the fiscal year ending June 30, 1901.

During the year there have been maintained in Alaska 28 public schools under the immediate supervision of this Bureau, with 37 teachers and an enrollment of 1,963 pupils.

During the autumn of 1900 pneumonia prevailed extensively through Arctic Alaska, causing many deaths among the native population. In order as far as possible to prevent the starvation of the stricken people, under authority from the Secretary of the Interior, the revenue cutter *Bear* gave out provisions among the settlements along the shores of Bering Sea, which were distributed by the missionaries, teachers, and officers in that region. At Port Clarence many of the children whose parents had died were gathered into an orphanage established by the teacher. In the spring of 1901 smallpox made its appearance among natives of southeastern Alaska, and spread with great rapidity. As a precautionary measure several of the public schools in that section were closed during the prevalence of the disease.

The appropriation for education in Alaska, which had been continued annually since 1886, was not renewed by the last session of Congress. An amendment to section 203, Title III, of the "Act making further provisions for a civil government for Alaska" (approved March 3, 1901) provides that "50 per centum of all license moneys provided for by said act of Congress, approved March 3, 1899, and any amendments made thereto, that may hereafter be paid for business carried on outside incorporated towns in the district of Alaska, and covered into the Treasury of the United States, shall be set aside to be expended, so far as may be deemed necessary by the Secretary of the Interior, within his discretion and under his direction, for school purposes outside incorporated towns in said district of Alaska."

SAXMAN.—Mrs. J. W. Young, teacher; enrollment, 66; population, Thlingket. Mrs. Young reports:

Our school year opened under very favorable conditions, and for a part of the year the school was well attended and there was a marked degree of interest. Very good progress was made in all branches taught, especially in arithmetic and language, as my assistant, Miss Eva Sill, was a tireless worker and competent in all branches. Having an assistant, we had more time to devote to each pupil. Had it not been for sickness, we expected an enrollment of 100 or more, and a good attendance, as the "potlatches" and feasts were few. Early in the winter the people contracted a contagious malady, resembling smallpox. It soon spread so that nearly the whole population was infected with it. Several deaths occurred. Hence the attendance was very irregular, although the children usually came to

school as long as they could sit up, and returned as soon as possible, being, by reason of the ravages of the disease, frightful looking objects.

On the 12th of February the local school committee ordered the school closed. The people who were not sick became panic-stricken and left the town. I could not open the school again until May, when a few of the people returned. We were disappointed that we could not keep the school open, as the children were very much interested and learning fast.

We made a practice of visiting the homes of the pupils often, especially if any were sick or absent. The natives are naturally very fond of music, both instrumental and vocal. We had the use of an organ in school; it belongs to the community, being paid for by subscription.

GRAVINA.—Mrs. Alice B. Hamblet Davis, teacher; enrollment, 69; population, Thlingket. Mrs. Davis reports:

The attendance until June was very good, but during that month the people began to move from the village to their fishing haunts and to canneries where they secured employment. Then in the village, the fathers being gone, the girls and boys had to help in the box factory. The pupils and patrons are greatly interested in the school work, although the home habits of irregularity add greatly to the teacher's duties.

In dress and personal habits the children are reasonably neat, but most of the native homes lack cleanliness. My greatest difficulty is to make the children speak English outside of the schoolroom. Since the teacher is the only one in this vicinity who speaks English, it is not surprising that the children hesitate to use it regularly. I have tried English afternoons, picnics, stories, object lessons, and various other methods, still they use very little English in their everyday conversation. Our people are to be commended for having erected a very comfortable school building, which was completed last May. It is furnished with serviceable desks, and the teacher can accomplish much more than was possible under former conditions. My pupils are very fond of drills and calisthenics. They take to song with a naturalness and ease seldom found among white children. Their voices are musical and well modulated. As a rule, they are energetic and cheery, displaying none of the sullenness common among some native tribes. Their progress this year has been very noticeable.

JACKSON.—Miss Nellie Green, teacher; enrollment, 88; population, Hydah. Miss Green writes:

The new desks and blackboards which the Department kindly sent us added greatly to the appearance of the schoolroom this year. At the beginning of the year a native committee was appointed to secure the school attendance of delinquent members, which worked admirably. Most of the children, though often late, attended regularly.

A number of former pupils are successfully supporting themselves by making use of the instruction they received while at school. There are two native storekeepers in the village, former pupils, who go to Seattle in their own schooners whenever it is necessary to order goods. Other pupils are boat builders and carpenters. One of the carpenters has just completed a two-story house with bay windows and porches. Another is assisting in building a warehouse at Hunters Bay. Others are successful assistant engineers and others are good pilots and interpreters.

FORT WRANGELL No. 1.—Miss Minnie Robertson, teacher; enrollment, 68; population, Thlingket. Miss Robertson writes:

I find the native children quite bright and willing to learn, but owing to their irregular attendance they do not make as much progress as the whites. Those who stay in town the year round are quite regular, but most of the native population are on the move the greater part of the time. They have their seasons for hunting, fishing, and trapping, which keeps them out of school the greater part of the year. This accounts for the high enrollment and the low average daily attendance. The natives are very fond of music, and assisted in several entertainments during the winter; we have an organ in the schoolroom, and they derive a great deal of enjoyment from it. They are also very fond of kindergarten work, and as they learn mostly by object lessons, I find that the introduction of kindergarten work into the school has proved of great benefit to them. The older ones as well as the younger take a great interest in it.

One young man who attended school during the winter months has been working at the sawmill this spring, and his sister, a young lady of 15, who has

attended quite regularly during the whole year, left just a few days before school was out to work in a boarding house. These are the only two who have come directly under my notice.

FORT WRANGELL No. 2.—Victor L. Holt, teacher; enrollment, 80; population, white. Mr. Holt reports:

In the absence of the assistant teacher at the commencement of the school, I had charge of both the natives and the whites. I found it necessary for a while to continue the sessions of the school until 5 o'clock in the afternoon, and from 7 until 9 in the evening, in order that all of the classes might be heard. When the teacher for the natives came the press on this department was relieved for a time. A number of students came in from neighboring places, and more would have come if we could have accommodated them.

There are now seven grades in our school, and there are to be at least eight next year. Through the efforts of the friends of education here we have secured a library of 259 volumes, for the use of the school. The books have been carefully selected, and have proven of inestimable value to the school. A librarian has been employed, and funds have been raised by the students to keep the library open all summer.

It is to be hoped that Fort Wrangell will have a new school building in the near future.

KAKE.—Mrs. Anna R. Moon, teacher; enrollment, 88; population, Thlingket. Mrs. Moon writes:

The usual letter from the Bureau of Education, asking for an annual report of my school, did not reach me until recently. Our mail is very irregular. Sometimes we find that our letters have been carried up to Dawson, or out to western Alaska, before they finally reach us at this little out of the way village. Our nearest post-office is Fort Wrangell, which is 100 miles distant. The journey in an open boat between Kake and Fort Wrangell is a hazardous one during the winter months. Sometimes as long as two or three weeks are consumed in making the trip. Our messengers are usually natives, who frequently stop to hunt to and from Fort Wrangell.

The white population of this island consists of my husband and myself, our two children, and the merchant. There are about 300 natives that regard Kake Village as their headquarters. They are of a nomadic disposition, which naturally interferes considerably with the regularity of their attendance at school. Many of the old customs, which have disappeared among the natives living near the larger towns of Alaska, are still observed in this region. The feast for the dead, for instance, frequently takes them to remote settlements. With all these drawbacks, we nevertheless see an improvement. This is especially marked in the appearance of their houses. In this village every house but one now contains a heating and cooking stove, stools, chairs, beds, and dishes. The horn spoons and wooden bowls are now relics of the past. Men, women, and children now dress in "store clothes," as do the common people in other parts of the country: they do not wear the blanket suits that they formerly used to make in imitation of the white man's clothing.

No hoochinoo has been brewed in the village in almost two years. Some of our natives, however, are very much tempted when visiting towns which the steamers touch and where liquor is plentiful.

We have lumber ready for use in erecting a church. The natives have subscribed very liberally toward paying for it, and they will give their labor gratis in erecting the church. Many of them are good mechanics. Most of them realize the benefits to be derived from taking advantage of the privileges offered them by the school.

SITKA, No. 1.—Miss Cassia Patton, teacher; enrollment, 48; population, white. Miss Patton reports:

The year was a very pleasant and profitable one until the Christmas recess, after which unusual sickness made great inroads on our work.

Our second annual fair in October was a very successful affair, and I am convinced that the one-room school with a programme already full can do something along industrial lines in this way. The children displayed paddles, paper knives, kites, houses, pincushions, aprons, pillowcases, bags, darning, patching, lace, bread, cake, cookies, cottage cheese, syllabub, butter, jelly, and canned fruit; also three models of full-rigged vessels on which the boys had spent many hours during the summer vacation. Our display chart contained language, arithmetic,

month was almost broken up by the smallpox, which we hope will amount to nothing more than a scare.

Yet, with all the difficulties of hard rains, deep snows (and they were the deepest that have been known in this part of Alaska for many years), carelessness, and indifference on the part of some of the parents in not keeping the children in school, we feel that this year has not been an entire failure; it has certainly been an exceedingly busy one in our school. Our greatest progress was made in spelling, geography, and arithmetic. We have a good local committee, who have been very kind and helpful and have encouraged us greatly.

The Government was kind enough to have part of our school ground cleared of logs and stumps, which adds much to the attractiveness of our surroundings and gives us a little room for a playground, which we were very glad to have.

We received a donation of 52 books from the Congregational Public Library of Douglas, which addition to our library was very thankfully received.

HAINES.—Miss May Mackintosh, teacher; enrollment, 46; population, white and Thlingket. Miss Mackintosh reports:

This year I have had a better average attendance than last year. I try to visit the homes of the children every other day, and oftentimes each day after school. I make music an important study, and as in this they all take an interest, some will come for that when they would not for other things.

WOOD ISLAND.—Charles E. Bunnell, teacher; enrollment, 63; population, Russian creole and Aleut. Mr. Bunnell reports:

The attendance has been the largest in the history of the school, and our schoolroom has been taxed to the utmost capacity.

Through the entire session I have taught a night school four evenings each week. While this was designed principally as a study hour for the older mission children, it was open to all the natives who did not attend during the day. During the winter months there was an enrollment of 28 besides the older mission children. The eagerness with which they studied their primers and readers and worked over their arithmetic was very encouraging and added greatly to the interest of the school.

We have been seriously handicapped this year for floor room and breathing space. A large school means hard work, but a large school in cramped quarters adds much to the work of the teacher and the restlessness of the children.

AFOGNAK.—Mrs. Charles W. Pajoman, teacher; enrollment, about 43; population, Russian creole and Aleut. Mrs. Pajoman writes:

From the Aleut village the attendance has been very irregular from various causes. The children make excuse that they have no shoes to wear; that they must fish in the lake; that they must help in the potato planting. About the middle of May they leave the village with their parents for the bays, where they spend the whole summer fishing and drying salmon, so the school year is necessarily short.

At 2 a. m. October 9, 1900, the whole village was awakened by quite a shock of earthquake. The shock continued every day for a week, then every once in a while all winter. Even now during the summer there are slight shocks.

UNGA.—Frank A. Golder, teacher; enrollment, 39; population, white, Russian creole and Aleut. Mr. Golder reports:

School opened the first Monday in September, and before the week had passed nearly all the pupils were sick with the measles. From that time until the 1st of October the school was closed, but after that the attendance was regular and the pupils worked hard and faithfully, and they are justly proud of what they have accomplished and of the prizes which, through the generosity of Mr. F. C. Driffield, were awarded to the most faithful at the end of the year.

The course of study pursued during the year by the advanced class, whose average age is 12 years, will give an idea of the quality and quantity of the work done, and it is therefore stated here.

It reviewed fractions and completed Milne's Elements of Arithmetic, and did satisfactory work in Cook and Cropsey's Advanced Arithmetic. In mental arithmetic the class completed Bailey's Mental Arithmetic, and are doing good work in Brook's New Normal Mental Arithmetic. Every problem is analyzed and fully explained.

Much time has also been spent on composition and letter writing, and on the whole the work is satisfactory, considering the fact that the English language is

not the language of the mother and the home, and with most of the pupils it is only idiomatic; some use the Russian and Aleut construction. The Aleut language has only one word for both "he" and "she," and many of the children are unable to grasp the distinction between the pronouns and to use them properly. This is only one of the many difficulties the pupils contend with.

History is another difficult subject to the class, since much of the subject-matter is unfamiliar and almost beyond their imagination. The text-books are far from satisfactory for these pupils. Daniel Boone, Andrew Jackson, Lincoln, and Washington are very much admired on account of some feat of strength or daring.

Geography is studied with pleasure and much profit by the class.

According to their ability the other classes have worked equally as hard and have accomplished equally as much. The primary classes alternate study with kindergarten work.

The teacher feels under great obligation to the parents and many others who assisted him in so many ways. Through their generosity the school had a Christmas tree, and presents for all the children of the island.

UNALASKA.—Miss Frances Mann and A. W. Newhall, teachers; enrollment, 95; population, Russian creole and Aleut. Miss Mann writes:

The daily attendance at school has been very good for Alaska. The natives are realizing more the value of the public school and are more willing to send their children.

There has been much sickness in the village during the fall and winter and an epidemic of measles caused the death of about one-third of the population.

At Christmas time the exercises by the children were held in the schoolhouse. All the people in the village were invited and the room was well filled. Every one was remembered with a gift at the close of the exercises from a well-filled Christmas tree. This pleasant occasion increased the interest of the parents in the school and lessened their ignorance and prejudice toward our work.

Our new school building is of good size, the rooms are large and conveniently arranged, and a new flag floats proudly above the building.

CARMEL.—Mrs. Emma Luber Rock, teacher; enrollment, 52; population, Eskimo. Here there is a home for native children under the Moravian missionaries as well as a public school.

Mrs. Rock writes under date of January 30, 1902:

From the beginning we have found that day scholars make very slow progress, and we attribute this mainly to irregular attendance. When they do come regularly for a few months and have learned a few of the rudiments, both they and their parents think they have all the education necessary. On the other hand, such children as have been taken into the home learn the ordinary English branches readily. They make steady progress until they reach what we might call an intermediate grade. From that point it is uphill work and only the brighter ones persevere.

EATON REINDEER STATION.—Frederick E. Willard, teacher; enrollment, 10; population, Laplander and Eskimo. This school was kept in fulfillment of an agreement with the Lapp employees of the Bureau of Education that their children should have educational facilities.

Mr. Willard reports:

School began October 23 and closed April 26, during which time school was in regular session, with the exception of holiday vacations. The number of pupils enrolled during the first term was 10, 7 of whom were Eskimos, 2 Lapps, and 1 American. Gradually, as the parents moved away and the hunting seasons opened, the attendance decreased. The ages of the pupils ranged from 6 to 21 years, most of whom had attended school before, some at the station and others at the mission school at Unalaklik.

A large part of the time was taken up with conversation, in teaching the proper use of the English language. Lessons were given in reading, writing, arithmetic, spelling, geography, and drawing. The children take great interest in their school work, and it has been not an infrequent occurrence to have a boy or girl come to school without his or her breakfast. The pupil furthest advanced reads nicely in the third reader and has studied arithmetic as far as common fractions.

The natives, though of a sluggish nature, are bright and very fond of music. Indeed, the children teach their parents songs that they have learned in school.

Their use of English savors of the vernacular, they having acquired a good deal of it from passing prospectors. For example, upon asking a boy if he liked to come to school, I received the reply, "You bet!" This has to a certain extent been overcome and purer English taught in its place.

NOME.—Miss Cora B. Young and Miss Florence Mauzy teachers; enrollment, 63; population, white. In April, 1901, Nome became an incorporated town, and from that date the school has not been under the Bureau of Education, but under a local board of education.

In regard to the school year previous to that date Miss Mauzy writes:

When we came to Nome in August, 1900, we began school in the library of the Congregational Church, which we were expected to vacate on demand at any time. We commenced with three pupils, but after days of street canvassing and calling from house to house we built up a school of some numbers. At times, because of lack of funds for fuel, we felt that we should be compelled to suspend work: but this problem was solved for us, when in November the church needed the room we occupied and the school was closed until another building could be secured.

A vigorous effort was then made to raise by subscription enough money to buy fuel, pay a janitor, and rent a building. The response in actual money was not very satisfactory, but a building was donated and coal furnished free of charge.

We have enrolled over sixty pupils and almost every State in the Union has been represented. We have had but two Eskimos and they remained in school but two days. While it has been real pioneer work we have taken great interest in building up as good a school as possible, and on the whole have found it a pleasant task.

GAMBELL, St. Lawrence Island.—P. H. J. Lerrigo, M. D., teacher; enrollment, 72; population, Eskimo.

Dr. Lerrigo makes the following report:

We have been interrupted by many things in the course of the year. After Mr. Doty commenced school on September 4, the *Bear* arrived and the landing of coal and supplies, together with the departure of Mr. Doty, prevented us from resuming until the latter part of the month. It was then continued without interruption, except for a day or two, when we were occupied with the reindeer work, until the Christmas holidays.

Having resumed on January 2, we were again interrupted toward the latter part of the month by the threatened epidemic of smallpox, and immediately following that by the rescue of Mr. Egan, a shipwrecked seaman, and the search for his companion. Returning from the search I found it necessary to operate upon Mr. Egan's foot. The next event was my own sickness from varioloid, which laid me up until nearly the end of February.

School was closed upon the 1st of April, both because there were many things about the premises which we were compelled to leave undone when the winter closed in, and because the ice breaking away very early (about a month sooner than usual) took most of the children away from school.

The attendance has been about the same as last year, but it was only by great exertion that I could induce the children to come at all. The school has lost its novelty; there is no royal road to learning, and the mental application required is repellant to them.

I have used every inducement, making the work as light as possible, endeavoring to render the sessions attractive, introducing new methods and offering rewards for regularity; but the inducements are not sufficient recompense for the waste of gray matter upon their part, and time after time I have been reduced to the necessity of going out and capturing my pupils before commencing school, and that with but indifferent success.

The progress of those scholars who have approximated regularity in their attendance has been quite gratifying. Some of the older ones have advanced as far as fractions in arithmetic. Most of the pupils who were in the classes last year have been advanced one grade, and great improvement has been made by all in reading, writing, and the use of the English language.

Perhaps in the latter branch of study the most marked progress has been made. Having picked up a large part of their English from the whaling vessels, it was formerly a heterogeneous compound of pigeon English, intermingled with Kanaka words (as *pau*, *wahinny*, etc.), French (as *savez*), and other foreign words. It has been my endeavor to correct these bad habits of speech and to substitute

grammatical and idiomatic English. While there is still much to be desired, the improvement is remarkable.

The premises.—During the past year the schoolroom has been enlarged by the addition of 20 feet to the front of the building. The frame was constructed by carpenters supplied by Captain Tuttle, Revenue-Cutter Service, from the revenue cutter *Bear*, and the addition completed by us with the assistance of the natives. We have applied three coats of paint to the new part and have given one coat to the old.

The old part of the house still needs another coat of paint, but the white lead gave out and we were compelled to leave it as it is.

We have also doubled the size of the coal shed by building a lean-to upon the north side for the protection of the lumber.

TELLER REINDEER STATION.—T. L. Brevig, teacher; enrollment, 30; race, Eskimo.

School was kept from the beginning of September to the end of May, and as the pupils were all in the building the attendance was regular and progress was marked. School was taught 180 days, with an average daily attendance of 16. Besides the regular studies the girls have been taught sewing and housekeeping, and the boys had their regular hours of work every day, and all have done their best to do their duties.

During the epidemic last summer 45 natives were fed for some time, and food was prepared for 32 and the sick looked after for six weeks before any Government aid was sent in. In the near vicinity about 30 died. I buried 20 in all, who died in the buildings or in tents pitched around the buildings for sick natives. Many orphans were left. The mission took in 12 orphans, 2 widows, each with a child, and 3 young men, who have been cared for. Ten orphans and the 3 young men are yet with us, the 3 latter being employed as apprentices.

CAPE PRINCE OF WALES.—Charles T. Kittredge, teacher; enrollment, 107; population, Eskimo. Mr. Kittredge reports:

The school opened September 25, 1900, and closed May 31, 1901. The chart and first and second reader classes were quite regular in attendance all the time. A few big boys in a higher class did well also, but it is almost impossible for the young men to make much advancement, as they have to go seal hunting every day the weather will permit.

Whooping cough, brought from Siberia last summer, kept many of the school children coughing until nearly Christmas, which added to the unpleasantness of a crowded schoolroom.

In arithmetic the pupils liked addition best and never tired of rivalry in adding columns of figures. Other favorite work was writing and drawing, where their ability is equal to that of white children.

POINT BARROW.—S. R. Spriggs, teacher; enrollment, 111; population, Eskimo. Mr. Spriggs sends the following report of this school, the northernmost on the continent:

School began on September 4 and continued for nine months, broken only by a week's vacation at Christmas, and one other day when a severe winter blizzard absolutely prevented attendance. In all, one hundred and eighty-one days were taught. The attendance has been something remarkable. In the deep winter months of December, January, and February the attendance was at times from 60 to 70, and some of the pupils had to be seated on boxes and some upon the floor (a native's natural chair). For the month of February the average attendance reached 58 and for the entire year 41.

The children and their parents have taken an interest in school not manifested heretofore, and many of the children I know have made special endeavors, in some cases, denials, that they might attend school. The favorable whaling season of the previous year made it possible for many more than usual to remain in the village the entire year, and thus their children could attend school; and during the early part of the whaling season this spring school was possible, because the children were anxious to attend. The village has not had a greater population in several years than it had the past winter. Several families came from Herschell Island, some from Point Hope, several families were here from the Wainwright Inlet district, many more from that region were here for several months; besides there were some inland natives who seldom come here.

The interest taken in school will be numerically represented by stating that the total enrollment for the year was 111. The disparity between the total enrollment and the average attendance is because so many natives have necessarily to go

inland fishing and hunting at times, and then their children accompany them. Thus all the children of school age are never here at one time.

One man told us that if we did not find that his children did as we directed them and study diligently, we should use physical force; but this is unnecessary among these Eskimos.

The children average bright, are quick to learn, and are all anxious to acquire English; some have succeeded very well, now being in the second reader; history and geography, however, will necessarily always be more or less advanced studies to them.

To me, who have taught them, the progress of the school has been very satisfactory. In the early part of the year we had a severe epidemic of whooping cough, which, with complications, took away several of our school children.

The local school committees as at present constituted are as follows:

Sitka: John G. Brady and Edward de Groff, appointed January 15, 1891; Rev. Anthony Dashkevich, appointed May 14, 1900.

Douglas: School No. 1, P. H. Fox, appointed January 15, 1891; C. A. Hopp, appointed September 26, 1899. School No. 2, R. J. Willis and William Mackie, appointed July 25, 1899.

Wrangell: Thomas Willson, appointed March 29, 1892; Rev. H. P. Corser, E. P. Lynch, T. G. Wilson, appointed February 20, 1900; William H. Lewis (native Alaskan), appointed May 14, 1900.

Kadiak: Frederic Sargent, appointed July 22, 1893; William J. Fisher and P. D. Blodgett, appointed March 21, 1900.

Unga: C. M. Dederick, appointed September 22, 1894; George Levitt and F. C. Driffield, appointed January 23, 1901.

Saxman: James W. Young, W. L. Bunard, Rev. Edward Marsden (native Alaskan), appointed April 9, 1900.

Gravina: Mark Hamilton, Roderick Murchison, Benjamin Dundas, Alfred B. Atkinson, appointed April 9, 1900, all of whom are native Alaskans.

The following list contains the names of former members of local school committees in Alaska:

Sitka: Hon. James Sheakley, N. K. Peckinpaugh, Dr. C. D. Rodgers. Juneau: Karl Koehler, Rev. Eugene S. Willard. Douglas: G. E. Shotter, S. R. Moon, Robert Duncan, jr., Albert Anderson, A. J. Campbell. Wrangell: W. G. Thomas, William Millmore, Allan Mackay, Rufus Sylvester, Finis Cagle. Jackson: James W. Young, W. D. McLeod, G. Loomis Gould. Metlakahtla: William Duncan, Dr. W. Bluett, D. J. Leask. Unga: N. Guttridge, John Caton, Edw. Cashel. Unalaska: N. S. Resoff, N. B. Anthony, L. R. Woodward. Skagway: Thomas Whitten, E. L. Niskern, Walter Church, F. R. Burnham. Juneau: John G. Heid, B. M. Behrends, J. B. Denny, Rev. John B. René. Nome: Walter Church, D. J. Elliott. John Brynteson, Dr. S. J. Call, D. W. McKay, S. A. Keller, E. S. Ingraham, J. V. Logan.

The members of these committees have been of good service to the Bureau of Education, both as correspondents and by acting as auditors, countersigning the bills sent in for various local expenses of these schools, inspecting repairs, and giving advice as to measures for the greater efficiency of the schools.

For the southeastern section of Alaska a local superintendent was appointed as early as 1890 and has been in service ever since. The present local superintendent is William A. Kelly, of the Sitka Industrial School. His duties are to visit the schools, report on their condition, and examine candidates for the position of teacher.

MISSIONARIES AND TEACHERS AT MISSION STATIONS IN ALASKA.

Baptists.

Wood Island: Rev. and Mrs. Curtis P. Coe, Mr. and Mrs. F. H. Forby, Mrs. M. G. Campbell, Dr. C. F. Miller.

Congregational.

Cape Prince of Wales: Mr. and Mrs. W. T. Lopp; native assistants, Sokweena and Elobwok.

Nome: Rev. William C. Fowler; 61 communicants.

Valdez: Rev. D. W. Cram; 8 communicants.

Douglas: Rev. William Davis; 28 communicants.

Episcopalian.

Sitka: Bishop Peter Trimble Rowe, D. D.; J. N. Dudley.

Juneau: H. J. Gurr, J. M. Davis.

Skagway: Rev. James G. Cameron, Charles Riga; Mrs. Bow, at hospital.

Ketchikan: Miss Agnes Edmond.

Circle City: Miss E. M. Deane.

Fort Yukon: Rev. L. H. J. Wooden.

Rampart City: Mr. E. J. Knapp.

Anvik: Rev. and Mrs. John W. Chapman, A. R. Hoare, Miss B. M. Sabine, Miss A. C. Farthing, Miss M. Leighton.

Point Hope: Mr. John B. Driggs.

Tanana: Rev. and Mrs. Jules L. Provost, A. A. Selden.

Nome: Rev. C. H. H. Bloor, A. B. Wright. Six native assistants.

Friends.

Kotzebue: Rev. and Mrs. Robert Samms, Miss Martha E. Hadley.
Douglas: Rev. and Mrs. Charles Replogle, Miss Jennie Lawrence.
Taku Harbor: J. L. Campbell.
Kaak: Rev. and Mrs. Silas R. Moon. Several native assistants.

Methodist Episcopal.

Unalaska: Dr. and Mrs. A. W. Newhall, M. D.; Miss Ella A. Darling, Miss Elizabeth Schwab, Miss Harriet Barnett.

Moravian.

Bethel: Rev. and Mrs. J. H. Romig, M. D.; Rev. and Mrs. Joseph Weinlick.
Ugavig: Rev. and Mrs. Benjamin Helmick.
Carmel: Rev. and Mrs. J. H. Schoechert, Rev. and Mrs. Samuel Rock, Miss Mary Huber, Miss Phillippine C. King, trained nurse. Twenty-one native assistants.

Norwegian Evangelical Lutheran.

Teller Reindeer Station: Rev. and Mrs. T. L. Brevig, Mr. Hovick.

Presbyterian.

Eagle City: Rev. and Mrs. James Wollaston Kirk.
Haines: A. R. Mackintosh; 96 native communicants.
Saxman: Rev. and Mrs. Edward Marsden (natives); 43 native communicants.
Skagway: Rev. and Mrs. S. Hall Young, D. D., general missionary, Rev. and Mrs. N. B. Harrison; 33 white communicants.
Rampart: Rev. M. Egbert Koonce, Ph. D.
Sitka: Rev. and Mrs. W. S. Bannerman, Mrs. Matilda K. Paul (native), interpreter; 16 white and 355 native communicants.
Hoonah: Rev. and Mrs. William W. Carle, Mr. Willis Hammond (native), interpreter; 117 communicants.
Wrangell: Rev. H. P. Corser; 90 communicants.
Jackson: Rev. and Mrs. D. R. Montgomery, Mr. Samuel Davis (native), interpreter; 96 communicants.
Juneau: Rev. and Mrs. L. F. Jones, Rev. and Mrs. J. H. Condit, Mr. and Mrs. Frederick L. Moore (native), interpreter and assistant at Douglas Island (station), Juneau; 30 white and 178 native communicants.
Point Barrow: Rev. and Mrs. H. R. Marsh, M. D., Mr. Koonooya (native), interpreter.
Klawack: Rev. and Mrs. David Waggoner.
Sitka hospital: B. K. Wilbur, M. D., physician and surgeon; Miss Esther Gibson, head nurse; Miss Anna Hinds (native), assistant nurse.
Sitka training school: Mr. William A. Kelly, superintendent; Mr. Dean W. Richards, assistant superintendent; Miss Susan Davis, Miss Sadie Martindale, Miss Anna M. Sheets, Miss Lucile Owen, Miss Frances H. Willard (native), matrons; Mr. John E. Gamble, Mr. Howard George (native), teachers.
Teller: E. J. Meacham, M. D., in charge.

Roman Catholic.

[From report of 1900.]

Juneau: Rev. John B. René, S. J.
Dawson, Northwest Territory: Rev. William Judge, S. J., chaplain of the hospital and of the Sisters of St. Ann; Brother Bernard Cunningham, lay brother.

Koserefski (Holy Cross Mission): Rev. R. J. Crimont, S. J. (superior); Rev. John Lucas, S. J.; Rev. A. Robaut, S. J.; Rev. F. Monroe, S. J.; Rev. J. B. Post, S. J.; Brothers V. O'Hare, S. J.; B. Marchisio, S. J.; J. Twohig, S. J.; P. Brancoli, S. J.

Nulato: Rev. J. Jetté, S. J. (superior); Rev. A. Ragaru, S. J.; Rev. J. Perron, S. J.; Brothers C. Giordano, S. J., and J. Negro, S. J.

Dawson Hospital: Sisters of St. Ann; Mary Zephirine (superior), Mary of the Cross, Mary Pauline, Mary Joseph, Mary John Damascene, Mary Prudentia.

Koserefski (Holy Cross Mission, girls' school): Sisters Mary Stephen (superior), Mary Prudence, Mary Seraphine, Mary Winifred, Mary Benedict, Mary Antonia, Mary of the Passion, Mary Magdalen.

Russian Orthodox Church.

Sitka: Rev. Antonius Dashkevich; in missionary school, J. Popoff and S. Cherepnin.

Juneau: Rev. Alexander Jaroshevich.

Killisnoo: Rev. John Soboleff.

Nuchek: Hieromonk Methodius.

Kadiak: Rev. Tikhon Shalamoff.

Afognak: Rev. Basil Martysh.

Kenai: Rev. John Bortnovsky.

Belkovsky: Rev. Euphimius Alexin.

Unalaska: Rev. Dean Alexander Kedrovsky, Rev. Basil Kashevaroff.

Unga: Rev. Nicholas Rysseff.

St. George Island: Rev. Peter Kashevaroff.

St. Paul Island: Rev. John Orloff.

St. Michael: Rev. Peter Orloff.

Ikohmut: Rev. Hieromonk Amphilochius.

Pavlovsk: Rev. Constantin Pavloff.

Nushagak: Rev. Nicholas Kashevaroff.

Schools are located at Sitka, Unalaska, Atton Island, Belkovsky, St. Paul Island, St. George Island, Quichpach, St. Michael, Kuskoquim, Nushagak, according to the report in Russian Orthodox American Messenger, but names of teachers are not given.

Swedish Evangelical Mission Covenant.

Yakutat: Rev. Albin Johnson, Mrs. Albin Johnson, Rev. August Berggren, Miss Hilda Anderson.

Unalaklik: Rev. Julius F. Qvist, Rev. Axel E. Karlson, Mrs. A. E. Karlson, Miss Selina Peterson, Stephen Ivanoff (a native worker), Mrs. Ivanoff, Mrs. Ojeark Rock.

Golofnin Bay: Rev. J. Hendrickson, Rev. O. P. Anderson, Mrs. O. P. Anderson, Miss Amanda Johnson, Dr. C. O. Lind, and Mrs. C. O. Lind.

BAPTIST MISSIONS IN ALASKA.

Skagway.—The North Star Baptist Church was dedicated here August 27, 1899. The church numbers 22 members, and has a fine building, the first church building to be erected at this southern terminus of the Yukon and White Pass Railroad.

Wood Island.—(By the Rev. Curtis P. Coe, superintendent.) The great need at present is a boys' dormitory. Until this can be supplied I have transformed my own cottage into a place for the boys. I have also established a reading room for the children and their parents, and for the sailors who may be in port.

This is the only Baptist mission to the natives in the territory. The church has 10 members, and during the year has contributed $116 for missionary purposes.

To show the work which is being done in the orphanage, I quote from a letter of Mr. Robert Stifer, a former Government teacher here:

"The work here is worthy of the attention it is receiving. It is doing a vast amount of good. It has never been my lot to meet a people so hard to work with as the creoles of this section. The mission children are, in most cases, the very worst that could be found to deal with when they come into the mission; in a short time they are better than the best of the outsiders."

CONGREGATIONAL MISSION.

[From the report of Rev. F. P. Woodbury, D. D., corresponding secretary of the American Missionary Association.]

Cape Prince of Wales.—Mr. W. T. Lopp has continued faithfully his work at Cape Prince of Wales and is now closing twelve years of service under the American Missionary Association. The reindeer herd in his charge has grown to be the largest in Alaska, numbering nearly 1,000 head, two-thirds of which belong to the natives. During the winter the herd is kept from 30 to 40 miles away. Last year Mr. Lopp reported the sale of 15 male deer for $460. He was thus enabled to put up a nice, comfortable frame house for the herders, which has four bedrooms, a kitchen and dining room, and a storeroom. An undivided share of three-fourths of this house has been sold to three of the native helpers. The probability is that the reindeer will be increasingly useful every year now.

The quarters for this mission comprise several buildings, which are comfortably fitted up for the various uses to which they are put. Mr. Lopp has reported that it would be advantageous to open up a small hospital with provisions for eight or ten patients. He reports that the Government school has been well attended and has been in charge of an experienced teacher. The religious services have also been very well attended. The natives offered during the year in Sunday collections about $65, and, by their request, $50 of this was sent to be used in the work of the association in Porto Rico. About 100 of the natives are now, in the mature judgment of the missionary, Christian believers. The missionary reports that he has had less drunkenness to contend with last year than almost any other year since he has been in the work. The reformation of an influential native, Ok-ba-ok, has had a very marked influence in the whole community in favor of temperance. Ok-ba-ok is the wealthiest native in the settlement and has steadily refused, during the year, to drink any intoxicants, giving as his reason, "I am a Christian." He is called by the whites, "The Chief." He has now a good frame house in addition to his large under-ground house.

The last year has been a fairly prosperous and healthy one for the Eskimos throughout this region. The walrus catch was unusually large. With the progress of the natives in civilization there has been a commercial advance. An enterprising San Francisco firm of very high character has put into the hands of the leading native, Ok-ba-ok, a stock of goods, and the demand for them is steady and increasing. Besides the houses which belong to the mission, there are now six frame houses in the settlement, which were built by the natives. Most of the families are now using stoves. Mr. Lopp reports that there is no reason why the progress made hitherto can not be continued, so that most of these natives will have better houses and more of the conveniences of civilization.

After so many years of continuous service, Mr. Lopp has found it advisable to return with his family to the States, his children now being of such an age that they should have American environment and school privileges. The association has therefore appointed a new missionary for its service at Cape Prince of Wales. It has been able to secure the services of Mr. Hugh J. Lee, of Connecticut. Mr. Lee has already had a good deal of experience with arctic life. He spent two years with the Peary expedition, and Mrs. Lee, his wife, was with him during a large part of one year. During this time Mr. Lee familiarized himself with the habits and, to quite a considerable extent, with the language of the Eskimos, and is exceptionally well equipped to take hold of the work which Mr. Lopp has to relinquish.

This Alaska mission has attracted wide attention among the constituents of the American Missionary Association and receives a steady and ample support. Its establishment and progress have vindicated fully the effort to plant it, which began in the midst of uncertainties and involved the sacrifice of the life of Mr. Thornton, but which has now eventuated in great gain to the Eskimos of that region and is reaching in its influence over into Siberia.

In addition to the mission at Cape Prince of Wales to the Eskimos, the Congregational Home Missionary Society reports work at three other places for the whites:

Douglas, where there is a church of 28 members.

Nome, where the church has 61 members and is self-supporting.

Valdez, where the church reports 8 members.

MISSIONS OF THE PROTESTANT EPISCOPAL CHURCH IN ALASKA.

[From the report of the Right Rev. Dr. Rowe, bishop.]

Sitka.—The church building is of stone and wood and cost a little over $4,000, the gift of a devoted church woman in New York. There are twenty or more communicants connected with the station.

Juneau.—Juneau is rapidly becoming a place of homes, and among its population of 4,000 the church has her place of influence and importance. The property is valuable, the church building neat and commodious, and the rectory adjoining it complete and in excellent condition.

Skagway.—In a late letter from Mr. Cameron, he says: "Our new church (the gift of a New York church woman) is a great comfort. It is yet unplastered, but otherwise is complete." Again, "Through Mrs. Burnham's kind help we have succeeded in getting a dwelling house under way. It will be a frame building 1½ stories high, with 6 rooms, and will cost when furnished $1,000.

The hospital is doing its noble work. Beginning with one single log building, improvements have been made from time to time, until now there stands a hospital that is a credit to the church.

Douglas Island has no church building. The services are held in a rented hall and are well attended. The women are most faithful and loyal to the church. For four years they have continued as a guild, and by their united efforts have purchased an organ and paid for the rent of the hall. They are trying now to raise money for the erection of a chapel.

Rampart City has become another hospital center, St. Andrew's. Mr. E. J. Knapp, a layman, who supports himself, is busily engaged in nursing the sick. The hospital building was erected by the citizens of Rampart, at a cost of $3,000, on the lots belonging to the mission.

There are eight schools at present in the mission, namely: a boarding school and day school at Anvik, and day schools at Circle City, Fort Yukon, Rampart, Tanana, Point Hope, and Ketchikan.

MORAVIAN MISSIONS IN ALASKA.

[From the annual reports of the missionaries.]

The missionary force consists of 5 brethren and 7 sisters. There are 11 native assistants who hold services and 10 other native helpers, a total of 21 helpers.

Bethel.—The work at the mission has been that of the regular church services, the care of the sick, and the management of the work at the four out-stations. From the mission also have the various missionary trips and efforts been carried to completion.

A stricken and sorrowing people, with homes emptied or nearly emptied by the ravages of the epidemic of 1900, called for a union of those left. Much work was open for the missionary to do, that the home and happiness (if such can be termed the lot of these Eskimos) should be preserved or established for the widowed or the orphan in their dire situation, and each member of the force has carried his or her share of the burden of the year.

Ugavig.—Among these people much earnest work and self-denial has been done by Brother and Sister Helmich. More noticeable are the good effects of such a work to those who visit than to those who are striving to elevate their people to a standard ever above, and in advance of the step they seem so slowly to take. Our visits at Ugavig have been pleasant ones, for to visit a kindred people and not to have the worry of the trials of their lives to burden one, but simply to enjoy the benefits of others' earnest work is a true pleasure and encouragement.

Carmel.—Easter service at Carmel on the Nushagak. "About 4 a. m. both bells were rung, which soon brought the natives together, the men filling the boys' room of the schoolhouse and the women coming into our kitchen. All were served with a cup of hot tea. The next bell called us together in our schoolroom and chapel, where the morning service was opened in the usual way. Part of the Scripture was read in English and part in the native language. Then we went to

the cemetery, where there was from three to four feet of snow, but as there was a good crust on the snow there was no difficulty in walking upon it or moving around. Although there was a sharp, cold wind blowing and the morning cloudy, yet every one seemed pleased to remember the resurrection of Christ while standing among the graves of the departed ones. Later a mother related how her son could not sleep for fear he would miss hearing the bell for the services.

FRIENDS' MISSION.

[From reports of the missionaries.]

Kotzebue.—The educational, medical, and gospel work at this mission of the Friends has been remarkably blessed, and all interested feel that God's power has been manifest in many ways. Marriage has been solemnized among the natives, many have confessed their sins and sought pardon, and a little organization has been made of the confessing ones. Some of the young people have proved themselves real missionaries in carrying the gospel stories to others and in holding services in places where the missionaries could not go.

Kaak.—A new church has been built here and the natives have subscribed very liberally in paying for it. They also assisted in the work of building and in subscribing toward the cost of an organ for the new church. We have had 73 accessions to the church, who are trying to live consistent Christian lives.

Douglas.—In the past year our natives have scattered greatly. The work in the mines having become more dangerous than they liked, they have sought and found work at the various canneries about Douglas. This has caused us to change somewhat our former methods and secure assistants both of natives and whites to occupy the fishing stations with them. We have a minister and his family, with one field matron and one day-school teacher, stationed at Douglas. Here we have an enrollment in the day school of something near 65 pupils all told, and a membership in the Friends Church of about 200 natives and 50 whites. We also have an out station in Taku Harbor, with J. L. Campbell as worker. There is a day school now being held in Taku Harbor, but it is not yet permanent, as we have not yet completely furnished it, but Mr. Campbell is doing what he can, without salary. The natives, having been unfairly deprived of their homes in Douglas, are seeking a new location, and will possibly locate at this place permanently. We are longing for the time to come when the native can be protected in his home without the necessity of a long, tedious lawsuit with some moneyed corporation.

MISSION OF THE METHODIST EPISCOPAL CHURCH.

[From the report of Mrs. S. L. Beiler, secretary of Alaskan bureau.]

Unalaska.—At the Jesse Lee Home the year has been uneventful in any great degree. Much has been done in the way of teaching English and trying to inculcate American ideas of government and that the Czar and the Russian flag do not rule the Aleutian Islands, but that they are under the Stars and Stripes, which are kept floating as an object lesson. Much has been done in industrial training in cooking, sewing, gardening—everything toward home making for both girls and boys.

One of the boys writes thus of the work: "I am going to tell you about Jesse Lee Home. I milk the cow and feed her, give some hay, and feed the calf every morning and every afternoon, and I feed the hens. I hunt all the time, only Sunday I don't hunt, because holy day, and we must rest for Jesus and sing to him. I like to learn how to read and write and how to talk English, and I am going to the school next winter."

There are so many reasons why we need a hospital that as soon as sufficient money is in the treasury we will "rise to build." The Marine Hospital will take only marine cases, not natives nor travelers, nor even the sick at the North American Commercial Company's homes. If we had our hospital and some one to take care of it we could take in every one of these.

The garden is doing well. We have a hotbed, and in that way we start small vegetables. Our cows graze seven months in the year. The silo is a success. The chickens are a luxury; the milk and fresh eggs for the sick have been a blessing few can have in the Aleutian Islands. Our whole plant is an object lesson to all around.

Our growth is not rapid. We have unusual obstacles to overcome, but we are firmly planted, and are a great light to those who sit in darkness.

MISSION OF THE NORWEGIAN EVANGELICAL LUTHERAN CHURCH IN AMERICA.

[From report of the missionary.]

On June 30, 1900, Rev. T. L. Brevig, a Norwegian[1] Lutheran clergyman, with his family and an assistant, returned to Teller Reindeer Station as superintendent of the Government and native reindeer herds in the vicinity and as the first Norwegian Lutheran missionary in Alaska. An epidemic of grippe and measles then raging among the natives carried away over 50 per cent of the population that year, leaving many orphans, so that it became necessary to establish a home for them.

From the first from 10 to 18 orphans have been cared for at the station, and this has become a most important feature of the work.

PRESBYTERIAN MISSIONS IN ALASKA.

[From report of Rev. George F. McAfee, superintendent school work, Presbyterian Board of Missions.]

Alaska is no less inviting a field for missionary effort than in past years. In fact, the past year has been one of great blessing, though there have been many things to perplex the missionaries. Intemperance, impurity of life, and old heathen customs have held firmly in their grasp the great mass of the people, but there have been conversions from among the most noted natives, and from the Sitka school alone have come over 40 who have named the name of Christ.

The woman's board has the last year paid the salaries of the 16 missionaries and interpreters of the board who have served the churches and missions at Haines, Fort Wrangell, Hoonah, Jackson, Juneau, Klawak, Saxman, Sitka, and Douglass Island, at a total cost of $10,491.80. The total cost of all Presbyterian missions in Alaska is $32,609.22.

Point Barrow.—Dr. and Mrs. Marsh, with their friend, Koonooya, the elder, and his wife, returned to their field in July last, after a year's rest. This mission is to the Eskimo, and is very hopeful. Dr. Marsh rendered valuable service to the woman's board while in the States by his many addresses to churches and women's societies. Missionaries, 2; salaries, $1,200; other expenses, $977.59; total, $2,177.59.

St. Lawrence Island.—Dr. P. H. J. Lerrigo, who occupied that field last year, returned home in September last, and was succeeded by Dr. D. E. O. Campbell. Dr. Lerrigo in his report says: "Mr. Gambell fought devil worship; Mr. Doty fought the whisky traffic, and both with marked success. I had the privilege of continuing their work, so well begun, and of preaching to the people, without serious opposition, salvation by grace through faith in a crucified and risen Lord."

Sitka Training School.—This is a coeducational institution, and is open to all the tribes in Alaska, not excepting the Eskimos and the Russian Creoles. In the school the pupils are taught the Bible regularly and systematically. A common English education is given, and the industrial work is emphasized. The girls are taught to do all kinds of housework as well as the proper care of their persons, clothing, etc. The boys are taught carpentry, boatbuilding, shoemaking, and other industries which fit them for earning an honest support. The graduates of the Sitka school are settling in many parts of Alaska. They are doing business on their own account, carrying on trades, working in mines, fisheries, and lumber mills, and everywhere are recognized, trusted, and respected as industrious, honest, and consistent Christians, as well as patriotic citizens. The race is being redeemed. Since the work was established, in 1878, there have been over 1,000 converts baptized, many of them being pupils of the school. Some noted miracles of grace are reported. The old chief, Kat le an, who for twenty-five years steadily and stoutly resisted the truth and fought the work of the missionaries and teachers most resolutely, has, during the present year, submitted himself to Christ. He is clothed and in his right mind—a most marvelous conversion. Like the man of Gadara, out of whom Jesus cast the legion of devils, he is going about among the native villages telling his people "what great things the Lord hath done for him." Pupils—boarding, 150; day, 5; total, 155; teachers, 15; salaries, $6,949.91; current expenses, $7,995.89; repairs, etc., $997.03; total, $15,939.83. Tuition received, $605.75.

Sitka hospital.—Physician and two nurses. Over 1,500 patients have been treated in the hospital and at the ranches, and a large number of successful opera-

[1] Mr. and Mrs. Brevig first came to Teller as teachers in 1894.

tions performed. Smallpox was epidemic, and physicians, nurses, and teachers acted heroically in caring for the sufferers.

Several of the Sitka pupils have been trained as nurses and have rendered valuable service here in the hospital and in the homes to which they have gone. While a comparatively small part of the time is devoted to religious work, yet the Bible study is emphasized; services are held regularly in the ward every evening and the Sabbath-school lesson is taught every Sunday. That much real good is accomplished in quickening the spiritual life of all who come under the influence exerted in hospital life is abundantly shown by the character of those who have gone forth and are teaching or caring for the sick as opportunity offers.

Many of the pupils have earned and are still earning good wages simply by their knowledge of the English language by acting as guides, interpreters, and packers for the large number of white men who have come into the territory within recent years. Especially was this true during the memorable season of 1897–98, when the miners found the assistance of our boys of incalculable value. The miners found the boys invariably honest and trustworthy.

As far as can be traced, the boys educated in the Sitka school are now employed as follows:

Eleven in the boot and shoe trade, 3 in boat building, 22 in carpentry, 3 in coopering, 2 in clerking, 4 in cannery, 2 in engineering, 3 in mining, 2 as missionaries, 2 as teachers, 4 as merchants, 1 as painter and paper hanger, 4 in sawmills, and 1 as silversmith.

The following number of girls are employed in work: Two in cooking, 4 in dressmaking, 2 as missionaries, 4 as teachers, and 2 as nurses.

In addition to the foregoing, the following from the pen of a native teacher marks as one blessed result the breaking down of tribal enmities and the unifying of race sentiment:

"Here at Sitka are 133 of the cleanest, happiest boys and girls to be found in all this great land of ours. Eskimos from the north, Aleuts from the west, Haidas from the south, Tinneh from the interior, Tsimsheans and Thlingkets from the coast are living together in most friendly fashion in our mission school; and yet the grandparents, and even the fathers and mothers, of these children were bitter enemies.

"My grandmother taught me to hate the Sitka people because members of our Stickine tribe had been massacred by them long ago. An insult was never forgotten. The mother taught her children to hate and revenge, and when the children grew up they, in their turn, taught their children the same wicked lessons. That is the reason why it seems almost a miracle that representatives of all these one-time enemies should live so lovingly together. What has accomplished this change? It is the power of the Prince of Peace."

SCHOOL WORK OF THE RUSSIAN ORTHODOX CHURCH IN ALASKA.

[From report of school work in Russian Orthodox American Messenger.]

In the districts of Sitka and Unalaska 802 children of both sexes have attended school. Out of this number, 9½ per cent were the wards of the charity institutions of the Russian Church. The general impression of our church school activities in this country is that the foundation for the education of the masses has been established, they being taught religion, reading, and arithmetic.

The satisfactory state of the work in the Sitka district only increases our wish that it should be enlarged and strengthened as far as possible, so as to be implanted in the very spirit of the inhabitants who are constantly unsettled by offers, flattery, and invitations of various kinds.

MISSIONS OF THE SWEDISH EVANGELICAL MISSION COVENANT IN ALASKA.

[From the report of D. Nyvall, secretary.]

Yakutat, a place not different from an abode for wild animals when our missionaries first landed there some fourteen years ago, is now rapidly growing into a city. Fishing is the actual business of the place, with much mining in prospect. Steamboats come and go every month, winter and summer, and consequently post and other conveniences of modern life help to make the sojourn at Yakutat nothing at all like what it was some five years ago.

Still, the evils of the liquor traffic coming in the wake of these conveniences more than offset the blessings, so that our missionaries are tempted to ask to be left alone as of old, with the natives and the gospel. They strongly protest against

the lawlessness of some captains in selling strong drinks to the natives. They describe most vividly the evil influences of alcohol upon the natives, who seem to lack every power of resistance to temptation from the whites, many of whom are morally slaughtering all the natives they are able to reach.

The missionaries are teaching 60 children in the Sunday school and are caring for 5 girls in the mission home, and report a successful year in spite of discouragements.

Unalaklik.—A great revival visited Unalaklik last winter. Almost the whole population became seekers of truth and a new life, and the missionaries saw the fruit of their patient sowing. The influence of the mission can be seen in a radius of 50 miles around the station in the cleanliness and other good habits of the natives.

Golofnin Bay.—Last summer almost every family at Golofnin Bay was visited by the angel of death, and the missionary was for a long time the only man in the village able to bury the dead. A great many children were left orphans and worse than homeless. Our missionaries picked them up on the beach in a state impossible to describe and could only take them to the mission home. In this way the great need of an orphanage made itself felt, and friends among the gold discoverers subscribed $6,000 for this purpose. With this a home was erected and dedicated to its mission of mercy on Thanksgiving Day, 1900. The home is large enough to receive 50 children, which means at least $6,000 more expense for this mission. It is a great blessing, although a blessing that calls for new sacrifices from those who support our missions. But our whole experience as a missionary society is to walk in faith and do what often seems impossible.

The above include the reports submitted to me by the various missionary organizations in Alaska.

Very respectfully, yours,

SHELDON JACKSON,

United States General Agent of Education in Alaska.

The COMMISSIONER OF EDUCATION.

CHAPTER XXXII.

ELEVENTH ANNUAL REPORT ON THE INTRODUCTION OF DOMESTIC REINDEER INTO ALASKA.

DEPARTMENT OF THE INTERIOR,
BUREAU OF EDUCATION, ALASKA DIVISION,
Washington, D. C., December 30, 1901.

SIR: I have the honor to submit to you the Eleventh Annual Report on the Introduction of Domestic Reindeer into Alaska.

The year has been one of progress. Among the more noteworthy events were the securing of a number of reindeer from the region back of Ola, Siberia, to cross with the existing herds, the larger employment of reindeer for transportation, and the more favorable treatment of the reindeer enterprise by the newspaper press.

From the commencement of purchasing reindeer, in 1891, when 16 were bought as an experiment, up to the present time 1,320 reindeer have been procured in Siberia and delivered in Alaska. From these, 4,462 fawns have been born. In 1898 265 reindeer were killed by the Government, mainly for food for the icebound whalers at Point Barrow, and 1,353 have been killed for food for the herders and their families or died from disease or accident during the past ten years, leaving 4,164 in the herds at the present time.

Eaton reindeer station.—Personnel: Francis H. Gambell, M. D., superintendent; Frederick Willard and J. T. Lindseth, assistants. The Lapp herders were Ole Bahr, Nils Klemetsen, and Per Mathisen Spein. The Eskimo herders were Okitkon, Tatpan, and Nellagoroak.

The station buildings are in good condition. The school was taught by Mr. Frederick Willard, who reports that school began October 23, 1900, and closed April 26, 1901. Of the 10 pupils, 7 were Eskimo, 2 were Lapps, and 1 American. Their ages ranged from 6 to 21 years. The most advanced pupil reads well in the Third Reader and has studied arithmetic as far as fractions. Some of the children manifest their desire for education by not infrequently coming to school without waiting for breakfast.

The latter part of September men were sent to Nucleet to bring in the herds of the station for the winter. Encountering a severe storm on their return from the herd, the boat was capsized at the mouth of Egavik River and the personal effects, clothing, and Government stores were lost.

There being large forests of birch at this station, and not at the other reindeer stations, 100 sets of harness trees and a large amount of sled timber were cut out during the winter at the Eaton station, which last summer was distributed by the revenue cutter *Bear* to the several stations.

Two Eskimo herders, Okitkon and Tatpan, at Golofnin, not doing very well, it was thought best to remove them and their herds to the neighborhood of Eaton Station in order to place them under the supervision of Dr. Gambell.

All the fuel for summer and winter used at the station, with its dozen dwelling houses, was drawn by "green" deer. In this way between 30 and 35 young deer were broken to harness and made ready for the trail the following year.

During the winter an epidemic attacked the dogs, so that hundreds died along

the shores of Bering Sea. Over 200 dogs were hauled away from the small village of Unalaklik after the snow disappeared. The same epidemic affected to a small extent the Lapp dogs used in herding the deer.

With furnishing relief for two detachments of United States infantry snowbound to the eastward of the station, the furnishing of reindeer transportation for building of the military telegraph line between Unalaklik and Kaltag, the separation from the Government herd of the reindeer loaned to the Roman Catholics and of those loaned to the Moravians, together with a tour of inspection of Kotzebue Sound and the reindeer herds on Seward Peninsula by the superintendent, the year was a very busy one.

Moravian Mission reindeer herd, Bethel, Kuskokwim River.—J. H. Romig, M. D., local superintendent; Lapp herders, Nils P. Bals and his son, Persen N. Bals.

The Moravian herd left Eaton Station in charge of Mr. J. T. Lindseth about the 26th of February, arriving at St. Michael March 1, where the herd was turned over to Henry Noreen, representing the Moravian Mission. The herd made the trip in good condition, crossing the Yukon River in the neighborhood of Andreafski and arriving at Bethel on the 27th of March. Abundance of moss pasturage was found during the whole distance of over 300 miles. The herd was attended on the entire trip by Nils Klemetsen, an experienced Laplander, who, upon the completion of the trip, returned to the headquarters station at Eaton. The herd made from 20 to 30 miles a day.

On March 29 the herd, numbering 88 males and 88 females, was driven through and beyond the mission to the pasturage grounds that had been chosen in the region of Mount Hamilton. The coming of this herd had been long anticipated by the missionaries. With the fast disappearance of the game food and fur-bearing animals the native population was beginning to face starvation, and it is hoped that the increase of this herd will create a new industry and a new means of support to those needy Eskimos.

After the long trip from Eaton reindeer station to Bethel, in March, it is of interest to note that the 88 does composing the herd each gave birth to a fawn during April, May, or June, and all the fawns lived but two.

Protestant Episcopal Mission reindeer herd.—Rev. J. L. Prevost in charge. This herd is still on the seacoast, 49 head being in the herd of the Swedish Mission at Golofnin Bay and 60 in the Government herd at Eaton Station.

Roman Catholic Mission herd.—Rev. J. M. Treca, S. J., superintendent; Lapp herder, Isak A. Bango. After several years of conference and correspondence with the Roman Catholics, during the past winter arrangements were finally consummated by which they would take charge of the deer which the Government had promised to loan them. When it came time, however, to drive the herd to the Catholic Mission at Nulato a blizzard was raging which delayed the trip. After the blizzard came a thaw, then another blizzard, making an ice cap several inches in thickness on the snow.

Hearing of the unusual depth of snow upon the portage between Eaton and the Yukon River, on the 11th of November Dr. Gambell made a reconnoissance with reference to the feasibility of driving the herd set apart for the Roman Catholics over that route. There were from 30 to 40 inches of snow on the level, upon which it had rained and frozen, causing a crust several inches thick of frozen snow, which made it impossible for the deer to secure food.

In loose snow not over 4 feet deep the reindeer will paw down to the ground and pasture on the moss, but when a rain or thaw occurs, followed by a freeze creating a coating of heavy ice or thick layer of frozen snow, it becomes impossible for the deer to break through the crust and dig down to the moss. On account of this condition of the snow, after a conference with Father Treca, the Roman

Catholic priest in charge, it was decided to leave the herd for another season in the neighborhood of the reindeer station. The herd, which had been separated from the Government deer and marked with the brand chosen for the Catholic herd, was then, at the request of Rev. J. M. Treca, S. J., missionary at Nulato, placed in charge of Isak Bango, an experienced Lapp, and sent to a pasturage by themselves not very far distant from the headquarters station. It is very much to be hoped that the herd this present winter (1901–2) will reach its destination in safety.

Swedish Evangelical Union Mission herd, Golofnin Bay, Alaska,—Rev. J. Hendrickson in charge. Eskimo herders, Constantine and Toktok. They report the total number of reindeer belonging to the mission at 221; the number belonging to the herders, Constantine 17, and Toktok 17. There are also in the herd at this station 49 deer belonging to the Episcopal Mission. From the 68 does 65 fawns were born, all of which lived but two.

Presbyterian Mission reindeer herd, Gambell, St. Lawrence Island.—Personnel: Superintendent, P. J. H. Lerrigo, M. D.; assistant, Ole Krogh; herder, Nils Sara; Eskimo apprentices, Ahtakyak, Betwinkhuk, and Sepilla. The attendance at school for the year was 60. Some of the older pupils have advanced as far as fractions in arithmetic; the majority of those in attendance the previous year advanced one grade and steady improvement has been made by all in reading and writing, and especially in the use of the English language. Having picked up a large part of their English from the whalers, it was formerly a heterogeneous compound of pigeon English intermingled with Hawaiian words, such as "pau," "wahinny," etc., and of French "savez," and other foreign words. The teacher made a specialty of grounding them in grammatical and idiomatic English. The school was taught by the superintendent.

During last season the schoolroom was enlarged by the addition of 20 feet to the front of the building and the coal shed doubled in size by building a lean-to on the north side. The station buildings being on the ridge midway across the peninsula and a mile from the beach, where supplies are landed from ships, it was thought advisable to erect a small warehouse near the north beach for the temporary storage of the annual supplies, which was done. The health of the community was good with the exception of five cases of smallpox, of which number one case proved fatal. The superintendent had an attack of varioloid. The community had all been vaccinated, but the vaccine matter was seven months old and did not take well.

July 27, 1900, 29 reindeer were brought from Siberia by the cutter *Bear* and located about 15 miles east of the station. On September 9 the *Bear* landed 41 more deer from Port Clarence, together with Nils P. Sara, herder, and his family. A herder's house 20 miles east of the station was finished October 12. On the 26th of April, 1901, the first fawns were born. The fawning season continued through May and June, 33 being born in all. Four were born dead and 3 died subsequently. The total number of deer that died during the year was 9.

Synrock reindeer herd.—Mrs. Charlie Antisarlook (a native woman) in charge. The herd numbers 360, of which Mary, widow of Charlie, owns 272; her sister-in-law, widow of Achickchick, owns 45; Sagoonuk (son of Achickchick, aged 16 years), owns 10; Kotak (Charlie's brother, aged 21), owns 12; Angalcok (Charlie's brother, aged 16), owns 9; Aseebuk, aged 18, owns 6, and Kokenyok owns 6. There is one sled deer in the herd belonging to the Government. From 198 does in the herd 148 fawns were born.

White men passing through the country from one mining region to the other have killed some of the deer from this herd. The unlawful interference with the herds has been so great during the past season that the family expect to remove

their herd to the neighborhood of Unalaklik, on the eastern shore of Norton Sound.

Norwegian Evangelical Lutheran Mission herd, Teller Reindeer Station, Alaska.—Local superintendent, Rev. T. L. Brevig; Lapp herders, Johan I. Tornensis and Per L. Anti; Eskimo herders, Sekeoglook, Tautook, Dunnak, and Ablikak; apprentices, Coxrook, Kozetuk, Serawlook, Erlingnuk, Ahmukdoolik, Nunahzarlook, and Bahsuk.

The Rev. T. L. Brevig, upon his return from the States, June 30, 1900, found that the station had not flourished during his absence of two years. An epidemic of influenza had broken out among the small Eskimo villages in the neighborhood of the station, from which ultimately half of the population died. When the epidemic was at its height the Eskimos in the neighborhood, in their fear, fled to the station and pitched their tents around the mission, where 20 of them died and were buried by Mr. Brevig. For six weeks, before any Government aid was sent in, of which mention is made later in the report, 45 natives were fed and their sick cared for at the station, and later on 12 orphans, 2 widows (each with a child), and 3 young men were taken into the station and cared for during the winter by the Norwegian Lutheran Mission and from "supplies for destitute natives" left by the revenue cutter *Bear*. There are at the close of this report 43 persons in the care of the mission. Information received December, 1901, from Labrador by the way of London, gives an account of the ravages of influenza among the Eskimos on the northeastern coast of America at the same time that it was raging around the coasts of Bering Sea, both in Asia and America.

During the fall the herd was kept on the north side of Grantly Harbor until New Year's, after which it was driven and kept on the Agiapuk Creek until June. During the summer it was driven and kept 7 miles to the northwest of the station.

The destruction of pasturage by burning the moss in the neighborhood of the mining camps around Teller Reindeer Station necessitates the removal of the herds from that neighborhood. If present arrangements are carried out the herds will be driven from Port Clarence to the country east of Norton Sound.

The school at this station has been taught during the year by the superintendent, having under his care 17 orphans whose parents died in the epidemic of last year. The attendance was regular and the children made good progress in their studies. The station being on the direct route between Nome and the mines at York, Shismarieff Inlet, and Good Hope Bay, there were many calls from passing miners. In addition to all his other duties, Mr. Brevig was in charge of the distribution of the relief supplies furnished by the Government and left by the revenue cutter *Bear* for the natives in the neighborhood of Port Clarence. During the year the log schoolhouse, which had not been used for several years (school being taught at headquarters), was removed to the new mining town of Teller for the use of the public school started at that place this fall.

Congregational Mission herd, Cape Prince of Wales, Bering Straits.—Mr. W. T. Lopp in charge. There are several Eskimo young men who are part owners in the mission herd, but no report has been received of their names or the names of the apprentices. During the year the Eskimo herders secured from the miners contracts for freighting with the reindeer amounting to $600. In the spring 276 fawns were born to the herds, 48 of which died from desertion or freezing or were stillborn; 75 deer were killed for clothing and meat, and 33 died from disease and accident, leaving a present total of 993 head.

The school was taught by Mr. C. B. Kittredge, with a total enrollment of 107 and an average of 42 pupils.

Friends Mission reindeer herd, Cape Blossom, Kotzebue Sound, Arctic Ocean.—Robert Samms in charge; Lapp herder, Alfred Nilima. During the year 100 head

of reindeer have been loaned this mission, and during the present winter will be driven to their destination, a distance of 300 miles.

Presbyterian Mission reindeer herd, Point Barrow, Arctic Ocean.—Rev. S. R. Spriggs, superintendent; Eskimo herder, Ojello; apprentices, Tokpuk, Panneoneo, Taukawana, Otpelle, Panyoona, and Ungawisbuk. Total number of deer, 227, of which Government owns 100, mission 85, and Ojello 42. The herd is located 25 miles from the station. The school was taught during the season by the superintendent.

Point Hope reindeer herd.—No report has been received from this station.

As it has not been found expedient and practicable to secure the supervision of a white man over the Eskimo herd in the neighborhood of Point Hope, instructions have been given to move that small herd northward to Point Barrow, where it will be placed under the general oversight of Dr. Marsh, the local superintendent at that station.

WINTER TOUR OF INSPECTION.

On the 27th of February Dr. Gambell left Eaton Reindeer Station for a tour of inspection. Journeying northward to the head of Norton Bay, he ascended the Koyuk River 25 miles, then passing over the divide between Bering Sea and the Arctic, he traveled down the right fork of the Buckland River to its mouth; then crossing Elephant Point, he passed over Eschscholtz Bay (an arm of the Arctic Ocean) on the ice to the peninsula, 40 miles distant from the mission station of the Friends. Along much of the route he found great destitution of food and clothing among the Eskimos, and a very earnest desire on their part that domestic reindeer should be brought to their part of the country.

Leaving the Friends Mission on the 12th of March and crossing an arm of the Arctic Ocean on the ice 60 miles to Cape Espenberg, he followed down the sub-Arctic coast southward to Cape Prince of Wales. The herd in connection with that station was found suffering for the want of a sufficient supply of moss on account of the hard crusted condition of the snow.

After inspecting the herd at Cape Prince of Wales he journeyed to Port Clarence, visiting the Synrock herd, which was in the mountains 25 miles distant. Passing eastward along the Bering seacoast of the Seward Peninsula, the herd connected with the Swedish Evangelical Mission at Golofnin Bay was inspected, reaching Eaton Station on the 19th of April, having made a sledge trip of 1,000 miles.

Now that the herds have been sufficiently long in the country for one intelligently to form a system of dealing with them, it is important that this annual inspection should be kept up, as it affords an opportunity for ascertaining not only the condition of the several herds, but also for comparing one with another; it enables the local superintendent to ask and answer questions concerning methods; it enables the Eskimo herders to secure more and more information with regard to their calling, and excites an emulation among them to have their herds in the best possible condition.

TABLE OF HERDS LOANED BY THE GOVERNMENT.

A number of reindeer have been loaned by the Government to missionary societies and natives, the Government reserving the right after a term of three to five years of calling upon the mission station or individual for the same number of deer as composed the original herd loaned.

Herds at mission stations in Alaska.

	Number loaned.	In herd, 1901.	When loaned.	When due.
Congregational Mission, Cape Prince of Wales	118	993	Aug., 1894	
Swedish Evangelical Mission, Golofnin Bay	50	201	Jan. 16, 1896	
Protestant Episcopal Mission, Golofnin Bay	50	109	do	
Presbyterian, Point Barrow	100	185	Sept., 1898	Sept., 1903
Presbyterian, St. Lawrence Island	70	87	July 30, 1900	July, 1905
Norwegian Evangelical Lutheran, Teller	100	160	Sept. 1, 1900	Sept., 1905
Roman Catholic, Nulato	100	136	Mar., 1901	Mar., 1906
Moravian, Bethel	88	128	Feb. 26, 1901	Feb., 1906
Moravian, Carmel	88	128	do	do

EFFICIENCY OF NATIVE HERDERS.

The question has been asked of late. "How do the Eskimos take to the management of the reindeer?" The enterprise has been in progress for ten years, and during this time 30 to 35 herders have served an apprenticeship of two to five years. Twenty of them now have reindeer of their own. To those interested in the movement it is a question of moment whether the Eskimos show adaptation and inclination to the work. Mr. William T. Lopp, who is the agent of the American Missionary Association, and has had a herd since August, 1894, has from that date to this used exclusively Eskimo herders in the care and management of his herd, now numbering nearly 1,000 head. Mr. Lopp's apprentices had received two years' training under the direction of the Siberian herders, who, during 1892 and 1893, cared for the Government herd at Teller Reindeer Station.

Mr. Lopp has been so well satisfied with the efficiency of his Eskimo young men that he has steadily refused to receive a Lapp teacher in connection with his herd. The Rev. T. L. Brevig, who has been connected with the Teller Reindeer Station since 1895, and who has warm friends among the Laplanders brought by the Government from Norway for the instruction of native Eskimo men in the management of reindeer, says:

The native deer men have been faithful with the herd, and their efficiency has been demonstrated not only by their skill in driving between camp and the station and in hauling wood, but also by longer trips with freighting trains. And in this connection I would especially mention Kozebuk, a young man or boy about 17 years old, the youngest of the 3 mission apprentices. In May he, with Johan Tornensis, took a train of 18 loaded sleds to Tuttle Creek, on the Arctic slope, about 65 miles from the station: Kozebuk driving a string of 5 deer with loaded sleds, the 4 last being tied to the preceding sled. From there he alone took 2 harnessed deer with sleds and 10 loose deer to Mr. Lopp's herd, 45 miles distant, returning to camp and in a week taking 10 more deer to Mr. Lopp's herd. Returning to camp on June 1, he started for the station with 4 deer and 8 empty sleds during the worst possible condition of travel, the snow melting and rivers open-

[1] Transportation charges on these deer, being paid from the appropriation for 1902, will appear in the next report.

ing, arriving at the station June 4 without accident and the deer in good condition, having traveled 245 miles with a string of deer and all alone, showing that natives can learn to handle deer. This is his first year's apprenticeship.

Francis H. Gambell, M. D., for the past two years superintendent of all the reindeer stations in Alaska, writes with reference to them as follows:

I find that they take an interest not only in lassoing and breaking the deer, but that they are anxious as to the outcome of their herds.

They are very quick at making harness and sleds, and take a great deal of pride in doing their work well.

While I do not consider them as efficient as the Laplanders, nevertheless I think that the deer would go on and increase were outside influences removed and they (Eskimos) were left wholly in charge of the respective herds.

Lieut. E. P. Bertholf, Revenue-Cutter Service, who was one of the Point Barrow Relief Expedition of 1898, testifies:

In January, 1898, I was en route with provisions from St. Michael to Kotzebue Sound. At the head of Norton Sound I found a scarcity of dog teams, whereupon I applied to the Laplander in charge of the Government herd of reindeer, near Cape Denbeigh. Dr. Kittleson was at the time superintendent of this herd, which was on its way from Teller Station to Eaton Station. But Kittleson had gone on toward Cape Prince of Wales with Lieutenant Jarvis, leaving Mikkel in charge of the herd. Mikkel was willing to loan me five sled deer, and send one of his Lapland herders along if I could get Okitkoon, a native Eskimo herder, who belonged to the Golofnin Bay Station, to accompany me, saying he would trust Okitkoon with the deer anywhere. This is a practical demonstration of the Laplander's idea of an Eskimo herder. * * *

On the morning of February 15, 1898, Mr. W. T. Lopp, a missionary at Cape Prince of Wales, while en route to Point Barrow with the deer herd intended to relieve the starving whalers at that point, left Cape Espenberg to cross over Kotzebue Sound on the ice to Cape Kruzenstern. This was some 50 miles over very rough ice. He had with him over 400 deer and several eskimo herders, all belonging to his mission at Cape Prince of Wales. No Laplanders were among the party. By nightfall they had crossed over to within 15 miles of the other shore, when they decided to rest for the night. Thinking the deer would be too tired to stray, all hands turned in. The next morning at 5 o'clock when they awoke nothing was to be seen of the deer herd except the sled deer, which had been tethered the night before and consequently were still in view.

Realizing the fact that during the night the deer, becoming hungry, had started back to where their instinct told them there was moss, Mr. Lopp immediately dispatched two herders to trail up the deer and bring them back, while the rest of the herders kept on with the deer train to the village of Anyok at Cape Kruzenstern. At 5 in the morning of the 16th, they started on the back trail to hunt the deer. They found the herd some few miles from the shore at Cape Espenberg. They turned this herd, started them back toward Kruzenstern, drove them all that day, all the succeeding night, and reached shore at Kruzenstern at 3 o'clock in the morning of the 17th, having thus been on their feet driving the deer from 5 a. m. of the 16th until 3 a. m. of the 17th, without a single thing to eat.

This incident would seem to me to indicate that these Eskimo herders showed intelligence and faithfulness. When they had tracked the deer to within a few miles of the shore at Espenberg they could have driven them to shore, found feeding ground, and sought shelter and rest for themselves before returning to Mr. Lopp; but they were filled with a sense of responsibility, knowing that Mr. Lopp was in a hurry and was making all haste to get the herd to Point Barrow. Consequently, when they had tracked the herd they did not stop for a minute, but started right back with them to drive the deer to the other side, where Mr. Lopp was waiting. * * *

When Mr. Lopp and myself left Anyok (near Cape Kruzenstern) with the deer herd, on the 21st of February, it had been decided to send back to their homes four of the native herders then with the herd, and these were consequently left behind at that place, provision having been made for their return travel.

Having accompanied Mr. Lopp and the deer herd along the coast as far as the place where he was to strike across the lagoons for the Kivalena River, I parted company with him on February 27 and proceeded to this place, in accordance with previous orders from Lieutenant Jarvis. Here I received word, on March 21, that some of our deer were at Anyok in charge of two of the herders. I sent

word to them to drive the deer up here, and on August 21 the herd reached this place in charge of Ituk and Keok. It appears that somewhere between Anyok and the Kivalena River these deer, 34 in number, had strayed from the main herd unnoticed, and a native who had acted as guide had discovered them on his return to Anyok. As the four herders had not yet started on their return trip to their homes, they went after the deer and drove them back to the village, after which they all started for their homes at Cape Prince of Wales, except Ituk and Keok, who then drove the small herd here. Three deer had been killed for food on the way, so that when they reached here there were 31 in the herd, 26 of them being females. I gave the herders my tent and camp gear, employed three young natives to help them, and sent them with the deer several miles back into the hills, where the moss was good and they would not be troubled by the dogs from the villages. There the camp was established and the deer cared for.

Here was a case where four Eskimo herders were on their way home, after some particularly hard work driving the deer herd. They discovered these strayed deer, sent word to me, and then awaited my instructions; and when I sent word to them to drive those deer to me at Point Hope there was no hesitation on their part. They decided among themselves which two of them should return and which two should go home, and without one word of complaint these two simply performed what seemed to them their natural duty.

TRIP OF LIEUT. E. P. BERTHOLF, REVENUE-CUTTER SERVICE, TO SIBERIA.

Information from various sources having reached the Bureau of Education that in the neighborhood of the Okhotsk Sea a breed of reindeer flourished that is larger in stature than those we have been importing from northern Siberia, it was decided to endeavor to obtain a supply of deer from those herds which would still further improve our present stock and result in giving to Alaska a breed of reindeer superior to that of any other country.

First Lieut. E. P. Bertholf, United States Revenue-Cutter Service, one of the officers of the revenue cutter *Bear*, was one of the three members of the expedition sent by the Government during the winter of 1897–98 to drive a herd of reindeer from Point Barrow for the relief of over 300 shipwrecked whalers believed to be starving at that place. The success of that expedition called the attention of the Commissioner of Education to him as a suitable person to send to Okhotsk Sea to procure, if possible, a number of the Tunguse deer of that section, and a request was made through official channels for his service, which was granted.

Accordingly this officer, having been detailed by the Secretary of the Treasury for duty under the Secretary of the Interior, was dispatched to the neighborhood of the sea of Okhotsk and directed to make a full investigation of the subject and if possible to procure a number of these larger reindeer for Alaska.

Furnished with the necessary credentials from the State Department to the Russian authorities, Lieutenant Bertholf left Washington on January 11, 1901, and proceeded to St Petersburg in order to obtain official sanction of his undertaking. On February 24, with ample commendations from the imperial ministry of the interior to the governors-general of Irkutsk and eastern Siberia, he left St. Petersburg and proceeded to Moscow. From this city his route lay across European and Asiatic Russia via the Trans-Siberian Railway to Irkutsk, on Lake Baikal. At this place he left the railway and purchased fur clothing, arms, and provisions for himself and interpreter, traveled by sledge down Lena River to Yakutsk, and thence across the country to Okhotsk. From this point he proceeded along the coast, and on April 29 reached Ola, a small village on the west shore of the Okhotsk Sea, about midway between the towns of Okhotsk and Gishega, and inhabited by half-breed Russian Tunguse, the latter belonging to one of the more civilized tribes of Siberian natives.

Here he found himself in the heart of the country in which flourishes the superior breed of reindeer known locally as "Tunguse" deer, and, armed as he was with the sanction of the Russian authorities, he was able to purchase a herd of 428 of these animals, using money in the transaction, for the Tunguse natives of

that section have been in contact with the Russians so long that they both understand and appreciate that article.

A corral was built and a supply of moss gathered, and when the ice of the Okhotsk Sea broke up in the spring and the Russian mail steamer arrived, Lieutenant Bertholf took passage to Vladivostok, where he arrived July 17, 1901. Here he chartered a small Russian steamer, went back to Ola, took on board the herd he had purchased, and proceeded to Alaska, arriving at the Teller Reindeer Station, Port Clarence, August 29, 1901.

Unfortunately, the weather was very boisterous and the steamer experienced such rough seas on the trip from Ola to Alaska that many of the reindeer succumbed, and 254 in all were landed at the Port Clarence station.

In traversing Siberia to reach the shores of the Okhotsk Sea, Lieutenant Bertholf traveled 3,000 miles by sledge, driving at different times horses, reindeer, and dogs, and in his report on his expedition and the observations of this officer on the various uses to which the reindeer are put in Siberia he shows the important part these animals are playing in the development of that country.

Between Yakutsk and Okhotsk, a distance of 754 miles, is a post-road, over which the mails are sent twice a month during the long winter, and on the greater part of this route reindeer are used. The animals are changed at stations that average about 50 miles apart, and in good weather the reindeer usually cover the distance between the stations in from six to seven hours.

There are two ports on the Okhotsk Sea from which the "brick tea" (tea pressed into brick-shaped blocks weighing 2 pounds each and used by the Russian peasantry) is transported to the Lena country, Okhotsk, and Ayan. The tea from Okhotsk is sent to Aldan, 510 miles, where it is stored until summer and then shipped by steamer down the Aldan River to the Lena. From Ayan the tea is transported to Nelkan, 300 miles, and from there shipped the following summer down the May River to the Lena. All this transportation in winter is done with the reindeer, and Lieutenant Bertholf passed many deer caravans between Yakutsk and Okhotsk, one day alone counting over 200 sleds loaded with "brick tea" bound from Okhotsk to Aldan.

Ola, Siberia, is the point whence is transported overland all the stores for the penal colonies and other villages on the lower Kolima River. There are Government and private warehouses at Ola, in which the goods are stored when brought by the steamers in summer. In the winter these goods are carried by deer sleds some 400 miles to a place called Cemechan, at the head of navigation of the Kolima, and the following summer floated down that river on flatboats. This route was opened five years ago by a Cossack named Kalinken, who has controlled it ever since, having the contract to transport not only all the Government stores, but also the goods of the private merchants. The contract price is 4 rubles ($2) a pood (36 pounds) from Ola to Kolima, whereas before this route was established all the goods for the lower Kolima were sent from Yakutsk mainly with horses, and cost 12 rubles ($6) a pood. Kalinken owns only about 500 reindeer himself, and consequently depends for his transportation almost entirely upon the natives of this region, whose deer he employs. During the winter over 1,000 sleds leave Ola at different times, bound for Cemechan, in caravans of about 100 each. With a caravan of 100 sleds belonging to one outfit there would be about 10 men, each managing a train of 10 sleds, he driving the head team, while the other teams are tied by their halter lines to the sled in front. As each sled has two deer, and each train has extra deer for emergencies, it will be seen that some 2,500 reindeer are used on this route alone.

Each sled carries 15 poods (540 pounds), which makes a total of at least 15,000 poods (540,000) pounds, and as the difference between the cost of the deer caravans from Ola and the old horse caravans from Yakutsk, both bound to the

same place, is 8 rubles a pood, over 120,000 rubles, or $60,000, is saved to the Government each year by the establishment of this deer caravan route from Ola to the Kolima River. For this service the Russian Government has presented to Kalinken a medal.

These instances are but a few of the many cases wherein the Russians are using the reindeer for transportation, and the important part these animals are playing in the development of Siberia is full of suggestion regarding the possibilities of the reindeer in the development of that part of our country bordering on the frozen seas, namely, Alaska.

HERDS BECOMING A SOURCE OF PROFIT.

In the growth of the reindeer enterprise a few of the herds, notably that at Cape Prince of Wales, have reached such numbers that the owners are able to kill off, to a limited extent, a portion of the extra males for food for the families of the herders, and also for sale to the butchers in the neighboring mining camps, where the deer last winter brought from $60 to $100 each, the proceeds of the sale supplying the families of the herders with clothing and household appliances. In addition to supplying the market with venison, a few male deer trained to harness were sold to miners at $150 each, to be used in freighting and traveling. This also furnished employment to Lapps, who were employed as drivers. The herders at Cape Prince of Wales received last winter $600 in gold for freighting with their reindeer to the mining camps. Smaller sums were earned in a similar way at one or two other stations. It is only a question of a few years of considerate care of the herds when the missionary societies will have herds sufficiently large to enable them to dispose of the extra males for a sum equal to the annual expenses of the station.

REINDEER TRANSPORTATION.

Mention has already been made in this report of the employment of the reindeer at Eaton Station for the relief of the troops snow-bound near Kaltag, and afterwards for the transportation of telegraph poles, telegraph supplies, and provisions for the men engaged in building the telegraph line between Norton Sound and the Yukon River. Also of the employment of reindeer teams from the Teller Reindeer Station for a military expedition to Kotzebue Sound to relieve the reported destitution of the natives in that section. In addition to this official work the reindeer belonging to private parties at Teller, Synrock, Cape Prince of Wales, and Golofnin stations did considerable transporting of men and supplies to various outlying mining camps. As the number of available reindeer for transportation purposes increases in the country they will commence more and more to take the place of dogs used in the past for transportation. As the reindeer is the only draft animal in Arctic regions that is able to secure its own food while on a journey, the question of cheapness and speed will finally win the day in favor of the reindeer. In that day Alaska, with similar conditions of climate and pasturage to those existing in Lapland and Siberia, will, as commonly as those countries have done for centuries past, use the reindeer for draft purposes. (See p. 1491.)

REINDEER RELIEVE UNITED STATES SOLDIERS.

As the report of 1900 was closing, letters were received from Dr. Gambell, superintendent of the reindeer stations, with the information that two detachments of United States infantry had been rescued by reindeer teams sent from the station. It appears that at the opening of last winter the War Department had three construction parties, aggregating about 110 officers and enlisted men, engaged in the work of building a Government telegraph line between Unalaklik

and Kaltag, on the Yukon River. As the winter storms came on one after another, all work had to be suspended, rations began to fail, and mule transportation gave out. Even where the soldiers shoveled a trail through the deep snow the mules marked their course with blood from their legs, cut with the icy crust on the snow. In this emergency General Randall, in command of the military department of Alaska, requested Dr. Gambell to take all the deer teams that could be spared and go to the relief of the Government party. Accordingly, on the 4th of December, Dr. Gambell started with 3 deer, leaving Mr. Lindseth to follow the next day with 32 deer and the necessary drivers and sleds. The troops were found in camp 18 miles west of Kaltag, and with their camp equipage were brought through deep snow to a new camp established near Old Woman's Mountain, a distance of 50 miles. The troops being left in a place of safety, the deer teams were sent, at the request of the commanding general, to St. Michael for the transportation of provisions for the men, and telegraphic supplies. They were also employed during a portion of the winter in drawing telegraph poles from the woods.

There are persons in the United States who consider the sum of $25,000 appropriated annually by Congress during the last few years for the introduction of domestic reindeer into Alaska as money uselessly expended, They have given little thought to the fact that in this appropriation the country is providing for emergencies that are liable to happen at any time, and which are sure to come sooner or later, when numbers of our fellow-citizens who are now penetrating the frozen lands of Arctic Alaska in search of gold will be saved to their families and country by this enterprise. When in 1897 the chambers of commerce of San Francisco, Portland, Seattle, and Tacoma wired the President that large numbers of American miners in the Yukon Valley were in danger of starvation, Congress without hesitation voted $200,000 to the Government for the relief of the miners. Happily in that case the relief was not needed, but a little later in the same season word was received that 400 whalers had been caught in the ice in the neighborhood of Point Barrow with only three months' provisions in their ships, and that the ships would necessarily be detained for twelve months, if not sooner crushed in the ice, before they could escape, and that starvation faced the whalers. The country did not hesitate to indorse the action of the President and his Cabinet in instituting a relief expedition, which ultimately cost nearly $100,000, for the rescue of those men. The revenue cutter *Bear* was at once dispatched northward, but on account of the arctic ice could not get within many miles of the starving men. Two lieutenants and a surgeon were put ashore near Nunivak Island to make a winter sledge journey of nearly 2,000 miles. They could take no provisions for the starving sailors. They had difficulty in taking sufficient provisions for the three men. There was no known method by which flour, groceries, and clothing could be taken to the whalers. Had not the Government five years previously commenced the introduction of domestic reindeer into Alaska many of those 400 men would have certainly perished before relief could have reached them. But the rescue party, gathering up the reindeer at two stations, successfully made the trip through an unknown country in midwinter, during the long arctic night, reached the sailors, slaughtered reindeer, issued rations as needed, nursed the men stricken with scurvy back again to life, and restored them twelve months later to their friends and country.

In years to come other men will receive similar rescue through the instrumentality of the reindeer herds, fostered by this small annual appropriation.

BRANDS.

In the multiplication of herds given to missionary societies and Eskimos it has become necessary to establish a system of branding by which the property of each

individual may be distinguished from all others by the marking of the ears of the reindeer, these markings representing 19 ownerships.

REINDEER PRESERVES.

On the 30th of March, 1901, the President issued the following Executive order:

EXECUTIVE MANSION, *March 30, 1901.*

It is hereby ordered that the hereinafter-described tracts of land in the district of Alaska be, and they are hereby, reserved and set aside for reindeer stations, subject to any existing legal rights to any land in the limits of the reservation hereby established, to wit:

1. The entire peninsula of which Cape Denbigh forms the southwestern extremity, situated in latitude 64° 30′ north, longitude 161° 30′ west from Greenwich, approximately 15 miles in length and 5 miles in width.

2. A tract of land bounded as follows: Beginning at a point about 6 miles above the mouth of the Unalaklik River, and extending along the north bank of the Unalaklik River in a generally northeasterly direction 10 miles; thence in a generally northwesterly direction 10 miles; thence in a generally southwesterly direction 10 miles, and thence in a generally southeasterly direction to the point of beginning.

WILLIAM MCKINLEY.

COOPERATION OF TREASURY, STATE, AND WAR DEPARTMENTS.

The cooperation of the honorable the Secretary of the Treasury and of Capt. Charles F. Shoemaker, Chief of the Revenue-Cutter Service, has been freely extended as in past years, granting transportation on the revenue cutters *Bear*, *Rush*, and *Thetis* to the general agent and his clerk; also to Government teachers and their supplies to various stations in Alaska that are inaccessible by ordinary commercial vessels. The kindness of Capt. Francis Tuttle and the officers of the *Bear*, Capt. William F. Kilgore and officers of the *Rush*, and Lieut. William H. Cushing and the officers of the *Thetis* was appreciated.

Thanks are due to the honorable the Secretary of War, Brig. Gen. M. L. Ludington, Quartermaster-General, and Capt. D. S. Stanley, U. S. A., in command of the army transport *Warren*, for transportation from Seattle to Nome, and for many kindnesses on the route.

Thanks are also due to the honorable the Secretary of State and Hon. Charlemagne Tower, ambassador to the court of Russia, for credentials procured from the Russian Government, and letters of commendation of Lieut. E. P. Bertholf, Revenue-Cutter Service, to the governors of Irkutsk and Eastern Siberia.

ITINERARY.

Leaving Washington on the 1st of May and spending Sabbath, the 5th, at Salt Lake City, Seattle was reached the 8th, where I was expected to go on board the revenue cutter *Bear*, which was scheduled to sail on the 10th. Mr. A. R. Cheever, who had been detailed as my clerk, was awaiting my arrival at Seattle. Upon inquiry I found that in the repairs which had some months before been ordered on the *Bear* a portion of the boiler works had been removed from the ship, and before the new works were substituted the machinists' strike, which existed in all the leading cities of the Pacific coast, occurred, and work upon the *Bear* as well as other vessels ceased. Captain Shoemaker, Chief of the Revenue-Cutter Service, learning that the cutter *Bear* could not be fitted for sea in time for an early cruise, proposed that we should change to the cutter *Thetis*. Upon further investigation it was found that the *Thetis* also was unprepared for sea. On account of the machinists' strike I was unable to proceed farther on my journey for one month. On the 27th of May, concluding that the cutters might be detained all summer for repairs, I telegraphed the War Department for transfer on the United States army transport *Warren*, which was expecting to sail

for Nome. This request was promptly granted, and on the 8th of June we went on board the transport, which sailed at noon of that day. It was the intention of Captain Stanley to proceed directly to Nome without calling at Unalaska, but when 30 miles southeast of the Pribilof Islands the transport met ice, and the sailing captain recommended to Captain Stanley that the steamer should return to Unalaska for information as to the condition of northern Bering Sea.

Arriving there on the 18th we learned that, with two exceptions, no steamer had been able to reach Nome during the season; that four attempts had been made to reach Pribilof Islands by local steamer in vain, and that a steamer was then at sea making the fifth attempt. The ice was reported several miles below the southern limit reached in many years; we were also informed that the winter ice had not yet left Norton Sound. This delay at Unalaska gave me an opportunity to inspect the public school and look after school matters at that place. After lying at anchor in Unalaska Bay for a few days the captain decided to make another attempt, and on the 22d day of June we again started for Nome. Passing through small fields of floating ice and skirting ice floes many miles in extent, we reached Nome on the morning of June 28th. The surf was so bad, however, that we were unable to land until the 29th. The news at Nome with regard to the harbor at St. Michael was very discouraging; several vessels had made the attempt, but found that Norton Sound was still full of winter ice and that no vessel had been able, on account of the ice, to get within 12 miles of the shore. On the 3d of July Captain Stanley determined to go as far as he could toward St. Michael, thinking he might, perhaps, be able to communicate with the commanding officer over the ice. Upon arriving within sight of the place on the forenoon of the 4th of July we found that the ice had left the harbor the day before. At St. Michael I met Dr. F. H. Gambell, superintendent of the reindeer station, and his assistant, Mr. J. T. Lindseth; also the Rev. and Mrs. A. E. Karlson, who were waiting an opportunity to reach their mission station at Unalaklik. Being anxious to reach the Eaton Reindeer Station as soon as possible, diligent search was made for a boat, steam launch, or some conveyance to Unalaklik, 60 miles up the coast. While the search was being made the schooner *Laurel*, loaded with Government supplies for the Eaton Reindeer Station and the Swedish mission at Unalaklik, came into the harbor, and at 1 o'clock on the morning of July 6, we all went aboard the little vessel and started for Unalaklik. The wind subsiding, we were all day making the trip, and did not arrive there until half past 5 in the afternoon. As the sea was calm the natives with their boats were at once secured and started unloading the freight, the work being continued until midnight. On the 8th the unloading of the ship was resumed and completed on the 9th. The same afternoon the army launch *Nordica* steamed into the mouth of the Unalaklik River, bringing supplies for the men in charge of the military telegraph station at that point. The officer in charge of the launch, having instructions to receive myself and party on board, took us to St. Michael. At 8.15 on the morning of the 10th we left Unalaklik, and at 5.30 p. m. that afternoon were safely on board the transport *Warren* in St. Michael harbor. July 13 the army transport *Warren*, with the army transport *Seward* in tow (the latter being disabled), left for Nome, where we arrived on the following day about noon. Dropping anchor off Fort Davis, the vessel was soon visited by Dr. S. J. Call, the quarantine officer, who upon his return to shore very kindly took my clerk and myself on board his launch.

On July 16, finding that the steamer *Sadie* was about to leave for Teller City, we went on board, and that night were accorded the courtesy of a special landing at the Teller Reindeer Station, instead of being taken 6 miles beyond to the Teller mining camp. A week was pleasantly spent in the family of Rev. T. L. Brevig, a Norwegian missionary and Government superintendent of the reindeer station, in inspecting the work and reviewing the affairs of the station. On the 24th we

took the steamship *Jeannie* to return to Nome and await the arrival of a revenue cutter to enable us to visit and inspect the Gambell Station on St. Lawrence Island. On July 31 the cutter *Bear* arrived and dropped anchor in the harbor. Soon after Captain Tuttle sent a boat ashore for the ship's mail and with an invitation to myself and party to come on board. At 7 p. m., August 1, anchor was raised and we sailed away for St. Lawrence Island, reaching that place during the afternoon of August 3. Some supplies were landed for the station, the station was inspected, and conferences held with the natives. Dr. Lerrigo, who had been in charge of the station during the previous year, receiving information by the whalers of the dangerous illness of his mother, had left the place in June, leaving the station in charge of Mr. William A. Egan, since Dr. E. O. Campbell, who had been appointed to succeed Dr. Lerrigo, had not arrived.

Leaving Gambell on August 4, we reached Teller Reindeer Station August 6. Dr. H. Richmond Marsh, wife and child, and Mr. Peter Koonyooa and wife (Eskimo) were waiting an opportunity to reach their distant Arctic field at Point Barrow. Captain Tuttle kindly offering to take them to their station, on August 8 they came on board with various supplies, and at 11 a. m. we sailed for Cape Prince of Wales, where Dr. Gambell, Mr. Cheever, and myself were left to visit Mr. Lopp and confer with him concerning the interests of the reindeer herd in his charge.

On August 14, the cutter *Thetis* having arrived and unloaded some supplies for the station, through the courtesy of Lieut. W. H. Cushing, commanding, myself and party were received on board for transportation to the Teller Reindeer Station, where we arrived on the 15th. Two days later (the 17th) we took the steamship *Newsboy* for Nome, arriving there the next morning. The surf being bad, it was after midday before we were able to reach the shore. Receiving a telegram from the Commissioner of Education notifying me that Lieutenant Bertholf had succeeded in securing a number of reindeer in the neighborhood of Ola, Okhotsk Sea, Siberia, and directing me to return to Teller Reindeer Station and await the arrival and landing of the deer, on August 25 we took the steamer *Jeannie* for Teller, where we arrived the following day. On August 28 the Russian steamship *Progress*, with Lieutenant Bertholf and the reindeer on board, arrived and dropped anchor in front of the reindeer station. A steam tug and lighter were at once secured at Teller City, and the work of landing the reindeer commenced. In the meantime Dr. and Mrs. Campbell arrived at Teller Station and were anxiously waiting an opportunity to be sent to their own station at Gambell. The arrival of the Russian ship, which, upon its return to Vladivostock, would pass St. Lawrence Island, gave them an opportunity. Accordingly they sailed on the 31st of August for St. Lawrence Island.

On September 5, taking the steamship *Oregon*, we reached Nome on the 6th. The cutter *Bear* having returned from its Arctic cruise to Point Barrow, on September 12 we went on board and Captain Tuttle very kindly took me to inspect the reindeer station at Synrock and confer with Mary Antisarlook, who, with her relatives, owns the herd. Finding that the herd had been interfered with by lawless whites and much of the pasturage in the immediate vicinity of the herd burned by fires started by the whites, I advised her to remove, during the coming winter, to the east side of Norton Sound, where she would be among her relatives and better protected from annoyance by white men.

Having now concluded the summer's work in Bering Sea, on September 16 we went aboard the steamship *Roanoke* for Dutch Harbor, where we arrived on the 18th. Not needing Mr. Cheever's services further at this time, I directed him to continue to Seattle and from there return to Washington. The same day, securing a stateroom on the mail steamship *Newport*, I left Unalaska for Sitka on the morning of the 19th at 5 o'clock. On the morning of the 20th, at 5.30, we dropped

anchor at Belkofsky to leave the mail. During our short stop Father Alexander, the Russo-Greek priest, came on board especially to express his thanks to the Bureau of Education for allowing Mr. Golder, teacher at Unga, to teach English to his pupils during the summer vacation. At 3 p. m. that afternoon we dropped anchor in the harbor of Sand Point to deliver the mail. A short call was made on shore. At 5.30 Unga was reached, and I again went on shore to confer with the teacher of the public school. At 2.15 p. m on the 21st a call was made at the salmon canneries at Chignik, and at noon on the 22d we reached Karluk, probably the largest salmon-fishery station in the world. That same afternoon a pleasant call was made at the salmon cannery at Uyak. At 6 a. m. on the 23d we entered the snug little harbor of Kadiak. This place was the original capital of the Russo-American possessions, the seat of government being removed from Kadiak to Sitka for political purposes and to restrain the advance westward of the Hudson Bay Fur Company. At Kadiak is a Government school. There is also a Government school on Wood Island, a few miles distant. The larger portion of the day was spent in visiting these schools. At Wood Island the ship took on board a large grindstone that was left there by the Russians at the time of the transfer, and had been given by Mr. Ezekiel, manager of the North American Commercial Company's station at Wood Island, to the Alaskan Society of Natural History and Ethnology, whose museum is at Sitka.

Leaving Wood Island in the afternoon of the 23d, at 6 a. m. on the 24th we dropped anchor in the little harbor of Seldovia on Cooks Inlet. After an hour's stay we steamed away for Homer, where an Eastern company is at work developing the coal mines of that vicinity. Leaving Homer about noon we steamed southward out of Cooks Inlet, rounded the southern end of Kenai Peninsula, and called at Fox Island on the 25th, where a number of blue foxes were taken on board to be transported to stock an island in southeastern Alaska. At 2 a. m. in the morning of the 26th the new city of Valdez, at the head of Prince William Sound, was reached. In the neighborhood is a military camp, from which has been built a military trail, extending in a general northeast direction from Prince William Sound to Eagle City, on the Upper Yukon River, known as the "All-American Mail Route to the Interior of Alaska." The present Valdez is a very small village built on the moraine of the Valdez Glacier, but although a small place it has great expectations. It is the natural gateway to all central Alaska, and in anticipation of its coming greatness enterprising men have located seven different city sites in the neighborhood. The day was very pleasantly spent at this village awaiting the arrival of the inland mail carrier, who had telegraphed ahead that he was coming. Leaving Valdez at 7.30 in the evening, on the next day, the 27th, we called at Orca. Nuchek was reached at 9.40 p. m., and Kyak at 9 a. m. on the 28th, and Yakutat at noon on the 29th. Yakutat is a large village of Thlingket natives. At this place the Swedish Evangelical Missionary Society have a promising station in charge of Rev. Albin Johnson.

Leaving Yakutat that afternoon, the mouth of Lituya Bay was reached at 5.30 a. m. on the 30th. The surf was so bad that it was not until evening that a landing could be effected.

Leaving Lituya that night, Sitka was reached October 1 at 2 p. m. The next eleven days passed quickly in visiting the schools and arranging school matters at Sitka. Capt. William F. Kilgore, commanding the cutter *Rush*, having offered to take me to the out-of-the-way villages of southeastern Alaska, on the 11th of October Governor Brady and myself went on board, and at 12.35 p. m. we were under way. The weather being heavy and stormy, we anchored that night in Deadmens Reach at 5.24 o'clock.

Getting under way at 7.30 a. m. October 12, we soon after passed the Coast and Geodetic Survey steamers *Patterson* and *Gedney* on their way to Sitka. The

storm of the previous day continuing, we ran into Rodman Bay for shelter, and anchored at 9.40 a. m. After lunch we went ashore and visited the plant of a mining company at work on this bay. At 6 o'clock on the 13th we again got under way for Hoonah, stopping at 2.35 p. m. to take ice on board from a floating berg. At 3.50 p. m. Hoonah was reached, and we went on shore to visit the teacher, schoolhouse, and church. Nearly all of the villagers were still absent on their fall hunt. Getting under way at 7.10 a. m. on the 14th, at 2 p. m. we arrived at Angoon, where Governor Brady and myself went ashore to inspect the place with reference to the establishment of a school for the native children. At 5 p. m. the herring works at Killisnoo were reached. Starting at 6 o'clock on the 15th we steamed southward toward Wrangell. The day was stormy, and toward night, the fog setting in, at 7 p. m. the ship anchored at the north entrance of Wrangell Narrows. Getting under way at 7 o'clock the following morning, in half an hour we were anchored off the salmon cannery at Petersburg, where we went ashore and spent the forenoon. Getting under way at 11 o'clock, at 4.50 p. m. we reached Wrangell, where, during the afternoon, two visits were made ashore. On the 18th we reached Ketchikan. Here visits were made ashore both at Ketchikan and the neighboring places of Saxman and Gravina. Schools were inspected and conferences had with teachers and others. On the 19th we reached Karta Bay, Prince of Wales Island, where we anchored for the night. The next morning, hoisting the anchor, we steamed eastward some 15 miles to Copper Queen on Kasaan Bay. After a call on shore, a storm arising, we returned to Karta Bay for anchorage. Taking a fresh start on the morning of the 21st, we steamed to Skowls's village, known as Kasaan. This village is noted for the number and excellence of the totem poles that are still standing. A conference was held with Skowls, the chief, and others of the old men that were at home in the village, with reference to the removal of the population to Copper Queen, in order that they might have a school for their children and larger privileges for themselves, the Kasaan Bay Mining Company that control the copper mines and fisheries in the neighborhood of Kasaan having stipulated that if the Hydahs of that vicinity would remove to Copper Queen the company would give them permanent employment winter and summer, build them a schoolhouse and church, prevent as far as possible the location of any liquor saloons in the vicinity, and assist them in laying out a new village. Some of the prominent men being absent at Ketchikan, on the afternoon of the 22d we steamed away from Skowls's village to Ketchikan, and on the 23d another conference was held in the cabin of the cutter, and on the 24th I took the steamer *City of Topeka* at Ketchikan for Seattle, where I arrived on the 27th. Leaving Seattle via the Northern Pacific Railway October 29, I reached Washington November 5, thus closing a trip of 15,400 miles.

SHELDON JACKSON,
General Agent of Education in Alaska.

The COMMISSIONER OF EDUCATION.

CHAPTER XXXIII.

CONSULAR REPORTS.[1]

CONTENTS.—The City Commercial University at Cologne—Foreign students at Geneva—Reform in education in China—Business training for Americans in France—Distribution of Nobel prizes—Manual training for boys in Germany—French writing system for the blind—Forestry in Saxony—American students in German universities—Educational matters in Mexico—Education of mining engineers and metallurgists in Germany.

THE CITY COMMERCIAL UNIVERSITY AT COLOGNE.

On April 20, 1901, a new commercial university was opened in this city, under the patronage of the royal ministry of trade, industry, education, etc., the foundation being a legacy of Privy Councilor Dr. von Mevissen.

The objects of the institution are:

1. To provide grown-up young people who are destined for a mercantile career with a thorough general and mercantile education.

2. To provide future commercial school teachers with the necessary theoretical and practical knowledge of their branches.

3. To offer young departmental, consular, and chamber of commerce officials the opportunity of improving their knowledge in commercial branches.

4. To give practical traders, clerks, and other business men the chance of perfecting their knowledge of any particular branch of commerce.

The following may be admitted as students:

1. Graduates of secondary schools of a course of nine years and of those commercial schools whose senior class ranks with the senior class of the first-named schools.

2. Traders who have passed the examination for one year's military service and have served their apprenticeship.

3. Foreigners whose previous education is considered sufficient by the examining board.

4. Teachers educated in a normal school, and who have passed the second examination, will be taken into the seminary department of this commercial institution.

The entrance fee is 20 marks ($5). The half-yearly school fees are: For matriculated Germans, 125 marks ($30); for matriculated foreigners, 250 marks ($60). These fees admit to all lectures.

Each matriculated student is obliged to pay 3 marks (75 cents) per half year to the sick fund.

Besides matriculated students, hearers or occasional students are admitted, the fees for whom are: Germans, per current one-hour lecture per half year, 10 marks ($2.50); foreigners, per current one-hour lecture per half year, 20 marks

[1]This chapter contains information regarding educational affairs in foreign countries as reported by United States consuls. These reports have been in part transmitted direct to the Bureau of Education by the State Department for publication and in part reprinted from the publications of the State Department.

The technical educational terms used by the consuls in their reports have been in most cases retained, and must be understood to have generally the signification which attaches to them in the countries to which they refer.

($5), up to the maximum sum payable by matriculated students. For apprentices and student commercial school-teachers the last-mentioned fees are reduced to 5 marks.

The cards of admission to the public lectures cost 3 marks per half year.

PLAN OF THE TWO-YEAR COURSE OF THE COMMERCIAL UNIVERSITY AT COLOGNE.

1. Political economy.—Introduction to political economy, means of communication, the technicalities and organization of the world's commerce (including money, bank, and exchange methods), commercial and colonial policy, history of commerce, finance (including a general survey of the financial position of the most important foreign nations), industrial and agricultural policy, social policy, and statistics.

2. Law and jurisprudence.—The fundamental principles of civil law; mercantile, bill, and marine law; criminal law at home and abroad (including bankruptcy); State, administrative, and common law; industrial law (patents, trademarks, etc.) at home and abroad: trade law.

3. Pure and applied science.—Physics (especially electricity), chemistry, mechanics, chemical technology, and industrial sanitation.

4. Geography and knowledge of goods.—General geography, political geography, knowledge of goods, colonial economy.

5. Commercial branches and languages.—Bookkeeping, commercial arithmetic, correspondence and office work, English, French, Italian, Spanish, and Russian.

6. General knowledge.—German and foreign history, history of art, literature, and philosophy.

The above subjects are divided over four half years as follows:

First half year.—Introduction to political economy, means of communication, fundamental principles of civil law, political geography (first part), and physics.

Second half year.—Organization of the world's commerce; commercial history, industrial and agricultural; commercial, bill, and marine law; political geography (second part), and chemistry.

Third half year.—Commercial and colonial policy; social politics; criminal law at home and abroad; knowledge of goods, first part (vegetable matter); chemical technology, and industrial sanitation.

Fourth half year.—Finance; statistics; State, administrative, and common law; industrial law; knowledge of goods, second part (animal matter and minerals); mechanics, and colonial policy.

In the third and fourth half years in the political economy and commercial jurisprudence sections seminary exercises will be held, as well as in the physical and chemical laboratories. Regular visits to factories in the Rhine provinces are proposed, and Saturdays are left free for this purpose.

Public lectures will be given on subjects of general interest, which will be duly announced.

CHAS. E. BARNES, *Consul.*

COLOGNE, GERMANY, *May 22, 1901.*

FACILITIES OFFERED TO FOREIGN STUDENTS AT VARIOUS INSTITUTIONS IN GENEVA.

Out of a total budget of 8,000,000 francs the Canton of Geneva spends 2,350,000 for public instruction; with its population of 125,000 inhabitants, the expense for public schools is about 20 francs ($4) per head. It is stated that no other European state is so liberal as concerns the education of its people.

Public instruction in the Canton of Geneva is divided into four branches: Primary instruction, which is gratuitous and compulsory from the age of 6 to that of 15 years; secondary and professional education, university education, and private-school education.

PRIMARY INSTRUCTION.

Primary instruction begins in the infant schools, is continued in the primary schools, and completed in the supplementary schools.

The supplementary schools are attended by children of from 13 to 15 years of age who have left the sixth primary form. The programme of these schools is at once practical and professional.

In the primary and supplementary schools books, paper, and pens are furnished free of charge.

Many of the schools are fitted up with warm-water baths.

Religious instruction is optional. It is given by clergymen of the different religious denominations in the city.

From the sixth form in the primary schools pupils pass into the professional school and the secondary rural school, while in the fifth form pupils are prepared for the seventh class in the college or in the young ladies' high school, on condition that they come furnished with a certificate from the primary school.

SECONDARY INSTRUCTION.

College of Geneva, at St. Antoine.

[Founded by Calvin in 1559, restored in 1883.]

The lower division comprises three years of study.

Subjects: French, Latin, German, geography, and history, constitutional history, arithmetic, elements of the physical and natural sciences, drawing, penmanship, singing and gymnastics.

Conditions of admission: Age, 12 years; a certificate from the primary State schools, or an entrance examination.

The lower college prepares for all the classes of the upper college or for the commercial school.

Fee: Twenty francs (about $4) per half year.

The upper college or gymnasium comprises four years of study, subdivided into four sections, dealing respectively with classical and modern languages, pedagogics, and technical education. The lectures are open to all comers. Outsiders have no examination to pass either on entering or leaving the college. They attend the same classes as the regular pupils.

Subjects: The regular subjects in all these classes are French language and literature, German language and literature, geography and cosmography, history, mathematics, physical and natural sciences, elements of psychology, notions concerning common law and political economy, drawing, gymnastics. The special branches are: (*a*) In the classical section, Latin language and literature, Greek language and literature; (*b*) in the modern section, Latin, English, and bookkeeping; (*c*) in the pedagogical section, normal lectures and bookkeeping; (*d*) in the technical section, technical drawing, descriptive geometry, special mathematics, bookkeeping, hygiene.

In 1899 a special class was formed for young foreigners.

Subjects: (1) Elocution, pronunciation, articulation, intonation, reading, recitation, and conversation. (2) Vocabulary: The words are taught by means of "object lessons" and conversation on ordinary life, commerce, industry, science, agriculture, etc. (3) Grammar: Orthography, flexions, syntax. (4) Composition: Essays, tales, descriptions, dialogues, etc. Twelve hours of lessons a week, in the morning only.

Fee, 25 francs (about $5) per half year during the first two years and 30 francs during the last two years. Outsiders not belonging to the college pay 4 francs (about 80 cents) for each course of lectures of one hour a week and lasting the half year.

Girls' high school.

[Quai de la Poste and Rue d'Italie.]

The lower division comprises a course of study extending over three years.

Subjects: French language and literature, German, general history, geography, arithmetic, the elements of the physical and natural sciences, drawing, penmanship, singing, gymnastics, needlework. Conditions of admission: A certificate from the primary State schools or an entrance examination.

Fee, 20 francs (about $4) per half year.

The upper division comprises four years of study, subdivided into three sections—literature, pedagogy, and commercial education.

Girls not belonging to the school may attend the lectures without being obliged to pass an entrance examination; they receive the same instruction as the regular pupils.

Subjects: The branches common to the literary and the pedagogical sections are French language and literature, German, general history of Switzerland, geography, cosmography, bookkeeping, geometry, physics, chemistry, natural history, drawing, penmanship, music, needlework, hygiene, housekeeping, gymnastics.

Special branches of the pedagogical section: Arithmetic, algebra, psychology, history of pedagogy, and practical pedagogy. The pupils are, moreover, obliged to receive normal instruction and to give, as practice, lessons in other Genevese schools.

Optional branches of the division: Greek and Latin literatures, modern foreign literatures, English, general history, history of philosophy, history of the fine arts, civil and commercial law.

Certificate: The literary and pedagogical sections give certificates to pupils who have passed successful examinations. The certificate of the pedagogical sections opens to its holder the career of teacher in the primary school.

Admission: Last examination of the lower division; certificate of the secondary rural schools; entrance examination.

Fee, 30 francs (about $6) per half year. The optional branches are gratuitous.

Commercial section: Two years of study.

Fee, 30 francs (about $6) per half year. Outsiders pay 4 francs (about 80 cents) for each course of lectures of one hour a week, and extending over half a year.

As at the college, the girls' high school has opened French classes for young foreigners.

Subjects: Study of vocabulary by simple methods; conversations on practical subjects, such as the human body, clothing, houses, weather, country, animals, plants, industry, commerce, travel, art (with use of Hölzel's graphics). Reading: Oral exercises on the above subjects. Grammar: Irregular verbs, practical exercises, principal rules of syntax, dictation. Elocution: Pronunciation and intonation. Literature: Principal authors of the nineteenth century; study of portions of their works. Lessons: Twelve hours a week.

Optional subjects: Lessons in natural history, geography, and history, and a practical study of French.

A certificate is given to regular attendants who have passed the examinations.

Conditions of admission: None fixed.

Fee, 75 francs (about $15) per half year. The fee may be reduced to 50 francs (about $10) for persons who are preparing for a school-teacher's career.

Professional schools.

[Boys.]

THE PROFESSIONAL SCHOOL.

[La Prairie.]

The professional school comprises two years of study, and prepares for all manual professions by the study of the sciences, drawing, and hand work.

Conditions of admission: Thirteen years of age for the first year and 14 years of age for the second year.

Fee, 10 francs (about $2) per half year.

[Girls.]

PROFESSIONAL AND HOUSEKEEPING SCHOOL.

[Rue d'Italie.]

Two or three years of study.

Subjects: French, German, bookkeeping, and practical exercises, commercial geography, housekeeping, elements of science and hygiene, drawing and geometry, millinery, embroidery, cutting, making and mending of clothes, cooking, laundering and ironing, gymnastics (half hour each day).

Conditions of admission: Examination of the sixth form of the primary schools; entrance examination.

Fee: Free school fee.

UNIVERSITY EDUCATION.

The ancient academy was founded by John Calvin in 1559, and became a university in 1872.

As the purpose of this report is more to point out the primary courses, this division will not be elaborated beyond stating that the university is fully equipped as such and ranks with the first in Europe.

For information, application may be made to the rector of the university, Bastions, Geneva.

It may be mentioned that outsiders may attend the lectures without passing the entrance examinations, and no diploma is required. They simply pay the same fee as ordinary students.

There has also been established a modern French seminary for the benefit of foreigners who desire to qualify themselves for teaching the French language and literature in their own countries. The seminary is open to students who have not matriculated in any of the faculties.

Subjects: Modern French literature, civilization and institutions of French-speaking countries from the sixteenth century. Pronunciation, elocution, rhetoric and composition, methods of teaching French.

The regular students of the seminary who have attended two courses of lectures of six months each and presented the required exercises may, at the end of the summer course, compete for the certificate of capacity of modern French teacher.

The seminary is open also to outsiders who desire to attend the lectures.

For programme and rules, apply to M. le Secrétaire-Caissier de l'Université, Rue de Candolle.

SPECIAL SCHOOLS.

Under this head, omitting the various schools of arts and crafts, which embrace agricultural classes, clock and watch making schools, etc., may be mentioned a

special vacation course at the commercial high school (under State control) for young foreigners desirous of completing their knowledge of French.

Condition of admission: The pupil must be 15 years of age. (Inscription list open from 15th to 31st of July.)

Subjects: French (twelve hours per week), translation, dictation, composition, correspondence, elocution, conversation, commercial arithmetic (optional, two hours per week), bookkeeping (optional, four hours per week).

Fee: Fifty francs (about $10).

Pupils take their places in the French classes according to the knowledge they already possess of the language, and—if their parents so desire—may take only a limited number of lessons.

In the afternoon the pupils visit the museums, manufactories, etc., and go for excursions into the surrounding country. During their stay at Geneva the pupils are under the supervision of the director of the school committee. At the request of parents a certificate is furnished at the end of the term.

For information as to boarding houses, apply to the director of the school (Rue Général Dufour), who will supply all necessary references and indicate the prices of board and lodging in Geneva.

A preparatory class is organized for foreign pupils with a view to their qualification for the regular classes in the school. Inscription list for this class is open all the year around. Apply to the director of the school for the special programme

CONSERVATOIRE.

This academy, which was founded in 1835 by Mr. Bartholoni, is far-famed, and in 1899 numbered 1,200 pupils. The purpose of the teaching given is to form professional musicians, as well as to cultivate a taste for music in all classes of the population. A diploma is awarded at the end of the course of studies.

Subjects: Solfeggio, vocalization, and the art of singing; lyric elocution, declamation, reading at sight (vocal and instrumental), playing the piano, organ and harmonium, stringed instruments, wind instruments, and the harp; harmony, composition, accompaniment, quartet, instrumentation, history of music.

Each class is divided into three degrees of two divisions each, and each division is subdivided into two or three sections.

For information, apply to Monsieur le Directeur du Conservatoire, Place Neuve, Geneva.

ACADEMY OF MUSIC.

[4, Boulevard Hélvétique.]

This is a private establishment of recent date. The instruction is about the same as that given at the Conservatoire, and also very efficient.

For information, apply to Professor Richter, director.

Respectfully submitted.

HORACE LEE WASHINGTON, *Consul.*

GENEVA, SWITZERLAND, *August 31, 1901.*

REFORM IN EDUCATION IN CHINA.

LEGATION OF THE UNITED STATES OF AMERICA,
Pekin, China, September 13, 1901.

I have the honor to inclose for your perusal the translations of two imperial edicts of recent date, decreeing certain important reforms in the prevailing system of civil and military examinations.

These edicts, if properly carried out, can not but effect great changes in the

intellectual, political, and industrial life of the Chinese, and result in the removal of much prejudice and the promotion of more cordial relations between China and the West.

The interest of the Chinese Government in educational matters is confined almost wholly to the securing of the most intelligent and efficient men for the service of the State.

The present system of examinations devised for this purpose dates from 600 A. D. Its chief defect has been the exclusive attention to classical and historical studies which it has developed.

The determining factor in the selection of candidates has been their ability to write the stilted "eight-legged" essay, so called from its treatment of its theme under eight divisions. A careful balance and parallelism have to be maintained between sentences and paragraphs, which make free expression impossible, and the result is a highly artificial composition. This has been condemned many times by various Chinese statesmen, notably by the Viceroy Chang-Chih-tung, and is now definitely abandoned.

The attention to mere phrase making has made plagiarism very easy, and the introduction of photo-engraving has led to the production of miniature editions of the classics and other noted works prepared especially to be smuggled into the examination halls and used there in the preparation of the thesis.

The study of the physical sciences and of political economy demanded by the new scheme will correct the present one-sided culture and prepare the way for the proper development of the wonderful resources of this great Empire.

The classics spoken of in the first edict are variously enumerated. According to the most commonly received canon they are five:

(1) The Books of History, containing more or less reliable traditions of the early history of the Chinese from 2300 B. C. to 619 B. C.

(2) The Book of Odes, a collection of ancient poetry.

(3) The Book of Changes, a book of divination.

(4) The Book of Rites, a Chinese Leviticus.

(5) The Spring and Autumn Annals, a bare chronicle of the most important events in the history of Lu, the native state of Confucius, from 722 B. C. to 481 B. C.

The "four books" referred to in the first edict are books of four great philosophers: (1) The Analects of Confucius; (2) The Works of Mencius; (3) The Great Learning, by Tseng-tzu, and (4) The Doctrine of the Mean, by Tzu-tzu, grandson of Confucius.

The various examinations to be passed by the student begin with those of his own district or county, which admit him to the prefectural, and these in turn to the provincial. Once in three years, usually at the provincial capital, examinations are held for the degree of "siu-tsai," commonly called bachelor of arts, and for the degree of "chu-jen," or master of arts, and at Pekin, once in the same period, an examination of the masters, which leads to the doctor's degree. These pass through two examinations in the imperial palace, which result in the selection of a number for the Han-lin Academy, where further tests are held for the selection of those who are to be retained there for literary work, the remainder being sent to the provinces to take office.

Each district has its fixed quota of students admissible to the provincial examinations, and each province a definite number, determined by population or otherwise, who may appear at the metropolitan examinations. The number who may pass at any examination is also a definite one.

Literary qualifications have never been greatly insisted upon at the military examinations, but the students are required to compete in archery, horsemanship,

sword practice, lifting weights, and other athletic exercises, once very useful accomplishments in the soldier, but now found to be obsolete.

Military and naval academies have already been established in several places, and a few regiments of troops have been organized after Western methods, but now for the first time, save for the ill-starred attempt in 1898, the old system is entirely discarded.

The demands of the allied powers for the suppression of examinations in districts where foreign lives and property were injured in the disturbances of last year have given the Chinese Government the opportunity to introduce these very necessary and praiseworthy reforms. If they are really in earnest, and will continue along these lines, great good may be hoped for, but it will be a happy surprise to us all if they do so continue.

I have the honor to be, sir, your obedient servant,

E. H. Conger.

EDUCATIONAL REFORMS.

[Translated from the Sin Wan Pao of Shanghai, of September 2, 1901.]

The following edict was received by the grand council on August 29, and was telegraphed to this paper yesterday from Sian:

The examinations form that important system by which men of talent are selected (for official employment). Our dynasty has continued the ancient regulations of the Mings, who preceded us, and who used the "eight-legged" essay (as a test by which) to choose students (for office). Famous statesmen and eminent scholars came from among those selected in large numbers. During that period the students all stored their minds with the classics and histories, and mere elegance of composition was purposely relegated to a subordinate place. But (these regulations) having been in operation for more than two hundred years, many abuses have grown up, which have become more serious day by day. Students have regarded the system merely as a means of securing literary honors. Plagiarism has been practiced to excess, and there has been no clear exposition of the classics or the histories. It thus becomes urgently necessary to get out of the old ruts and make a search for real learning.

Moreover, during recent years all nations have been brought into commercial relations with each other, and the wisdom and skill of the foreigner have increased from day to day, so that it becomes more than ever important that there should be intellectual intercourse between China and the West in order to the development of useful talents. The various examinations conducted by the Government can not but be changed, therefore, to suit the times, if they are to be depended upon for the accomplishment of the work needed.

Beginning with next year, thenceforth, at the triennial examinations for the master's and the doctor's degrees, let the candidates be required at the first session to prepare five essays on Chinese government and Chinese history. At the second session let them be examined in the political economy and industrial sciences of foreign nations, the discussion of five themes being required. At the third session let them prepare one essay expounding a theme from the Four Books and one in exposition of a text from the Five Classics.

The examiners, in passing upon the papers, must compare the results of all three sessions and thus determine upon the rejection or acceptance of candidates, and they must not give more importance to the themes of one session than of another.

Candidates for the bachelor's degree and the bachelors at triennial test examinations, and at the examinations preliminary to those for the master's degree, will be allowed according to custom one extra session before the regular examinations begin, but instead of being examined in the ancient classics, will be especially tested in Chinese government and Chinese history and in the political economy and industrial sciences of other countries. At the regular examinations they will be required to prepare an essay on the exposition of a theme from the Four Books and another on a theme from the Five Classics.

At the examinations for the selection of official examiners and at those of the Han-lin bachelors, which are held to determine who are to be retained in the college and who are to be released from study and sent on official employment, one essay and one paper will be required; and at the palace examinations of the doctors one essay shall be prepared, and at the examinations for admission to Han-lin

College one paper; all the essays being upon Chinese government and history, and the papers upon themes connected with foreign political economy and the industrial sciences.

In any exposition of themes from the Four Books or the Five Classics in the above-mentioned examinations it will not be permitted to use the "eight-legged" arrangement, but the essays and papers must be practical and logical. There must be none of the verbosity and useless padding nor of the plagiarism that have obtained heretofore.

Henceforth, after the issue of this edict, all must strive to rid themselves of these faults. Let them use the Four Books and the Five Classics for a foundation and apply their minds to the study of political economy. Let them take special care to avoid empty phraseology and to attain to a thorough understanding of the subjects studied and their practical applications, so that they may prepare themselves to become useful instruments in fulfillment of the desire of the court to find men worthy to be intrusted with office.

As to the details of the regulations to be adopted for the conduct of the various regular examinations, together with all matter not yet determined relating to any further examinations, the board of ceremonies will consult with the board of national administration and make satisfactory arrangements, after which they will report in a memorial to us. Respect this.

On the same day the following edict was received:

In the custom of holding military examinations we have followed the regulations of the Ming dynasty which preceded us. But as the custom has obtained for a long time there have grown up a great many evils. The exercises with the stiff bow, with the sword, and with heavy weights, together with the archery exercises, both on horseback and afoot, have none of them really any relation to a soldier's duties, and under present-day conditions are utterly useless. We ought therefore to devise a plan introducing reforms, and earnestly seek after what is practical.

Hereafter the examinations for the degree of military bachelor of arts and the test examinations of the military bachelors, together with those for the military master of arts and doctor's degrees, are all forever discontinued. The present military masters and doctors are all required to enter the army and thoroughly learn their profession. As to the youthful, athletic bachelors and those who have heretofore been preparing themselves as candidates for the military bachelor's degree, they may all be enrolled simply by enlistment (i. e., without examination). Hereafter each province will establish a military school, and a set of regulations will be adopted later prescribing the examinations to be held for the selection of officers, that thus we may be able to secure the military talents which are needed.

Let this edict be published abroad for the general information. Respect this.

Minister Conger transmits from Pekin, October 1, 1901, translations of two more imperial edicts, providing for the establishing of schools throughout the Empire, and ordering the viceroys and governors to select and send students abroad for the purpose of being educated in special branches of industrial science. The edicts follow:

[Translation from the Pekin Gazette of September 29, 1901.]

On the 5th day of the eighth moon the following imperial edict was received:

The development of men's talents is certainly at the present time of urgent importance. Some time since it was proposed by the provincial authorities of Kiangnan, Hupeh, and Szechuen to select and send students abroad to travel and study—an excellent suggestion.

Let the viceroys and governors of the various provinces all act in accordance with it and exert themselves to select students of mental gifts, upright character, literary talents, and a general knowledge of affairs, who shall go abroad to thoroughly educate themselves, particularly in the specialized branches of industrial science. Let them acquire a thorough mastery of some profession, and genuinely exert themselves in the pursuit of knowledge.

When their education shall have been completed and they shall have obtained their diplomas and returned to China, let the viceroys and governors and literary chancellors of the provinces concerned at once divide them into classes, according to the courses of study which they may have pursued, and examine them. If their knowledge shall really correspond with the statements made in their diplomas, the authorities mentioned shall issue a document certifying the same, and send it with the student to the board of foreign affairs, who, after further

examination, shall select the most worthy and memorialize us, requesting honors to be conferred on them. As to the expenses attendant upon such travel and study, let each province arrange some satisfactory method of paying the same, and it will be permitted to enter the item under the head of government expenditure.

Should any person go abroad to study at his own expense, let the viceroy and governor of his province at once report the fact to the Chinese minister in the country to be visited, that he may look after such students as occasion may require. If he shall complete his course of study and obtain a first-class diploma, on his return to China he shall be permitted to enter the examinations on the same terms as the students which have been sent abroad by the Government. Afterwards they will await an imperial decree bestowing upon them, according to their attainments, the degrees of doctor and master of arts, that they may be prepared for official employment and to encourage the pursuit of learning.

Let this edict be published abroad for general information. Respect this.

[Translation from the Universal Gazette, Shanghai, September 17, 1901.]

On the 4th day of the eighth moon a telegram was received saying that on the 1st day of the same moon (September 13, 1901) the following imperial edict was issued:

Human talent lies at the foundation of all affairs, and in the cultivation of talent the most important thing is the improvement of educational methods. From of old it has been the glory of the academy that it has laid emphasis upon the practice of virtue and the cultivation of the arts. Therefore, in such times both theory and practice were attended to, and men of talent and virtue were numerous. But nowadays scholars are either empty pretenders or of no use or are fickle and wanting in sincerity. At present it is desired to remove these evils; but without reverence for teaching and exhortation to study there is no way of prospering the undertaking.

Aside from the Imperial University at Pekin, which must be put in thorough order, it is commanded the viceroys and governors of the various provinces, each to convert the schools at the provincial capital into a college, and let each prefecture, subprefecture, and independent department establish an intermediate school, and each department and district a lower grade school with numerous primary schools. In the curriculum let the four books and five classics, with the three bonds and five virtues, form in a general way the foundation, and history, Chinese and foreign government, and industrial science be employed to supplement this course. Let earnest effort be made to inform the mind, to secure upright conduct, to improve both literary talents and character, and produce men acquainted with the times, diligent in the pursuit of real usefulness. This will approximate the laying of a foundation [for] the completion of virtue and the improvement of talent, which will assist in fulfilling the purpose of the Throne to secure men equipped for the duties of government. Let each of the viceroys, governors, and literary chancellors earnestly consult together and proceed as directed. As to the teachers needed, the rules to be established for the schools, and the methods to be employed to reward those students who shall complete the course of instruction, and all the details of such regulations, let the board of national administration issue instructions to all the provincial authorities to prepare the same, and when they shall have been submitted, let the said board, together with the board of rites, again examine them and prepare a memorial.

Let this edict be published abroad for general information. Respect this.

Minister Conger sends from Pekin, February 6, 1902, copies of two imperial edicts recently issued, which, he says, indicate the loosening of the bonds of old custom and the present trend toward a new order. The removal of the prohibition of intermarriage between Manchus and Chinese is of political significance, as indicating a desire to emphasize less strongly the distinction between rulers and ruled. The other edict is in line with the policy declared in a number of recent edicts to encourage the study of Western methods.

The edicts follow:

[Translation from the Pekin Gazette of February 1, 1902.]

The following imperial edict was issued to-day:

Our dynasty, distinguished for its benevolence, has richly bestowed its benefits in overflowing measure throughout the whole Empire. No partiality has been shown to Manchu or Chinese, whether high official or people; but according to an old custom there has been no intermarriage between them. This was originally

because, when the dynasty was first established, the customs and speech of the two peoples were considerably unlike, and therefore the prohibition was made. Now, however, customs and beliefs are alike, and, more than two hundred years having passed, we ought to defer to the general feeling and remove the prohibition; and therefore we command that Manchu and Chinese, whether officials or people, be allowed to intermarry. Let there be no bigoted adherence to old custom. But, as for the Chinese women, for the most part, they have followed for a long time the custom of foot binding, which is an injury to the good order of creation. Hereafter, let the officials and gentry all exert themselves to gently persuade and lead the people, and cause them all to understand, in the hope that this old custom may be gradually abolished. But on no account will it be permitted officials, clerks, or the slippery yamên runners to take advantage of this to go about harassing the people with their prohibitions. But at the times for selecting girls for palace attendants, the Manchus must still be chosen; there must not be any selection of Chinese, lest we fall into the corrupt practices of the former Ming Dynasty. We therefore make this restriction out of deference to the feelings of the [Chinese] people. Let this edict be published abroad for general information. Respect this.

[Translation from the Pekin Gazette of February 1, 1902.]

The following edict was issued on the 23d of the twelfth moon (February 1, 1902):

Our international relations are of the utmost importance. At the present time, when we are seeking to restore prosperity to the people and the Government, we ought more than ever to gather together those of superior merit. If those who go abroad will devote themselves earnestly to the investigation of foreign methods of government and the sciences of those countries, we may hope to so increase our talents as in some measure to meet the needs of the Government. At present, there are many students from the various provinces, zealous in acquainting themselves with current affairs, who have gone abroad to study in foreign schools and learn a profession. This practice has never obtained among the imperial clansmen and the eight banners, and it is urgently necessary that they become more liberally educated. Let the imperial-clan court and the lieutenant-generals of the eight banners select young men from each banner between the ages of 15 and 25, of good character, intelligent minds, and sound bodies, and prepare a list to be sent to the grand council, who may report to us and await our appointment of an official to reexamine and make a selection of a certain number, who shall be furnished with means and sent abroad to travel and study, availing themselves of the opportunity to familiarize themselves (with foreign methods) and enlarge their experience, that they may assist the court in its purpose to cultivate talent for the service of the Government. Respect this.

BUSINESS TRAINING FOR AMERICANS IN FRANCE.

In view of the fact that we are finding new markets abroad for our products, I would call the attention of our manufacturers and exporters to one method the European exporter employs to extend and retain trade—a method which, so far as western France is concerned, has been almost entirely ignored by us. The young men of the United States should be given a practical business training abroad. It is just as essential that the American should have a knowledge of foreign business methods as for him to have a knowledge of the foreign language. These two trade weapons should go together when markets are to be conquered. Although our enterprise and progress are acknowledged, and we have attained a place in the foremost ranks in the commercial world, we can not expect to force our crisp and rapid business methods upon the conservative Frenchman. We may gradually convince him of the superiority of our system, but we must in the beginning make certain concessions. Our young men should come to France and obtain employment in some of the large business establishments for six months, one year, or two years, as the exigencies may require. True, wages are low here, but doubtless a number of young men could obtain employment which would at least pay their board, and the experience thus obtained would be beyond value. Large manufacturing and export houses could send young men abroad. In this

city of 200,000 inhabitants I know of but one from the United States who is engaged in business, and he is with a retail firm. Young men from England, Wales, Belgium, and Switzerland are here temporarily, with the leading import houses, getting a practical knowledge of the language and of French business methods. Especially is this true of the coal and the wholesale commission trades, where deals are made for phosphates, lumber, and grain in cargo lots. In such positions these young men are often able to give valuable pointers to the exporter from their own country. They usually attend to the correspondence from their respective countries, study French, and obtain an insight into the metric system and French peculiarities in business. I am convinced that the sale of American coal in France during the past year would have been doubled had it not been for lack of information on the part of American producers concerning French trade, and their consequent inability to meet the requirements promptly on this side.

JOSEPH I. BRITTAIN, *Consul.*

NANTES, FRANCE, *October 24, 1901.*

DISTRIBUTION OF NOBEL PRIZES.

Under date of December 11, 1901, Minister Thomas, of Stockholm, Sweden, writes:

The prizes offered by Alfred Bernhard Nobel, the Swedish engineer and inventor, to those persons who contribute most materially to benefit mankind in the domains of physics, chemistry, medicine, literature, and in the works of peace, were awarded this year as follows:

In physics, to Wilhelm Conrad Röntgen, professor at the University at Munich, the discoverer of the Röntgen rays.

In chemistry, to Jacobus Henricus Van't Hoff, professor at the University of Berlin.

In medicine, to Emil von Behring, professor at Halle, the discoverer of the diphtheria serums.

In literature, to Sully-Prudhomme, member of the French Academy.

In works of peace, the prize was divided in two and awarded in equal parts to Henri Dunant, of Switzerland, the leading spirit in bringing about the Geneva convention and in instituting the societies of the Red Cross, and to Frédéric Passy, national economist, of France. Each of the five prizes is for the sum of 150,782.23 crowns, or more than $40,000. Five prizes of like, or perhaps greater amount, will be awarded every year on December 10.

Alfred Nobel directed that substantially the whole of his vast fortune be used for the benefit of mankind. Though the discoverer of dynamite, he instituted one of his grand prizes for works of peace. His beneficence was as broad as humanity. He was more than patriot; he was the friend of the human race. In his last will he directed that no consideration whatever be paid to nationality, but that the worthiest be awarded the prize, whether he were Scandinavian or not.

GERMAN EFFORTS FOR THE MANUAL TRAINING OF BOYS.

Mr. von Schenckendorff, of Görlitz, Prussia, published recently an article with reference to German efforts for the manual training of boys. He says that manual training of boys is becoming of great importance in all civilized countries. Manual training is most cultivated in France, the countries of the North, and in the United States, but England, Switzerland, and a number of other countries are making good headway.

In Germany the idea of the manual training of boys found a ready response, as it was recognized that the one-sided system of German schools in training the intellect and the memory required a supplemental, practical education. This had been already advocated by such pioneer pedagogues as Comenius, Pestalozzi, Froebel, and others, but has only recently become a systematic branch of the education of boys. Progressive methods for teaching working in wood, pasteboard, and metals, also in modeling, have been adopted for the boys of school age, and trained teachers conduct this part of their instruction according to established principles of pedagogy, similar to the "Froebel" work in kindergartens. This instruction is not only for the purpose of imparting manual skill, but, above all, to stimulate and develop original creative work. The German society for the manual training of boys has about 2,000 members and is the champion of these efforts spoken of. One thousand manual training schools are in operation at present.

A normal school for teachers of manual training exists at Leipzig under the direction of Dr. Pabst. A practice school is connected with it. The students receive instruction during the summer months. Until recently manual training was confined to separate schools but lately it has become a part of the public schools proper. This latter method is now recognized as the best. In Worms and Königsberg experiments have been conducted in the public schools on a large scale for a number of years past, with the approval of the Government and aided financially by the municipality. They have given excellent results, which will soon be published.

RICHARD GUENTHER,
Consul-General.

FRANKFORT, GERMANY, *December 28, 1901.*

FRENCH WRITING SYSTEM FOR THE BLIND.

In 1829 the Braille machine made reading possible to the blind. This machine is composed of a metal frame with a movable copper reglet, which slides across the frame. This reglet is pierced at regular intervals by little holes in squares of 6. There are 24 squares on the reglet and each square is susceptible of forming a letter.

In order to write, a thick sheet of paper is placed on the frame between the reglet and a sheet of zinc, on which are depressions corresponding to the little holes in the reglet. The writer uses the left hand as a guide and, with a pointed instrument that he passes into the holes of the reglet, forms depressions in the paper that appear in relief on the opposite side. These dots form the letters. When one line is finished—that is, when he reaches the end of the frame—he moves the paper and begins another line, and so on, indefinitely.

Since the characters must be read on the opposite side from the one on which they are formed, the writing must be from right to left. The blind must learn two alphabets—one for the formation of letters from the wrong side and one for reading them from the right. As the sheet of paper is fastened to the frame, it must be removed to correct a mistake.

A new invention permits the blind writer to write as he reads—from left to right. He can thus correct as he writes, without displacing the paper. He has but one alphabet to learn, which he can acquire in six lessons.

Mr. Dussaud, the inventor, uses the pointed instrument and reglet for writing, but instead of passing through the holes into depressions in the paper below, this instrument simply presses on small mobile keys, which are hollow, and in their

turn press on raised metal points, which take the place of the hollows in the zinc plate of the Braille machine. The characters formed are thus in relief on the side of the writer, who can verify his writing without displacing the paper.

In addition to the above advantages, the blind can calculate arithmetically, which was not possible under the Braille system. There is no metal plate and the paper is much thinner. The machine can be folded and carried in the pocket, and it is considered a great boon to the blind.

W. P. ATWELL, *Consul.*

ROUBAIX, FRANCE, *March 18, 1902.*

FORESTRY IN SAXONY.

The Kingdom of Saxony is divided into twelve principal forest districts, which are subdivided into one hundred minor districts. The following table[1] speaks for itself:

Principal districts.	Income.	Expenses.	Value of forests.	Dividends.
				Per cent.
Dresden	$112,312.70	$57,758.95	$3,234,253.00	1.69
Moritzburg	89,929.85	48,044.42	3,491,388.00	1.2
Schandau	353,335.36	127,773.11	10,066,185.00	2.24
Grillenburg	200,421.70	74,296.10	5,057,721.00	2.45
Tharandt	13,727.52	7,133.81	396,184.00	1.29
Bärenfels	334,701.10	95,362.12	7,274,692.00	3.3
Marienberg	426,286.03	121,016.12	11,283,580.00	2.79
Schwarzenberg	535,287.01	135,471.65	10,257,204.00	3.9
Eibenstock	384,646.04	112,691.90	8,779,320.00	3.13
Auerbach	361,884.86	141,871.72	7,364,981.00	2.99
Zschopau	206,383.03	85,725.15	5,541,759.00	2.18
Grimma	218,061.22	88,219.80	6,791,132.00	1.94
Total	3,246,976.42	1,005,364.85	79,538,399.00	[2]2.71

[1]The table is compiled from the latest statistics (1898) published in the Tharandter Forstliches Jahrbuch. It must be borne in mind that these are only for the forests owned and managed by Saxony, the forests of corporations and individuals not being included.
[2]Average.

The net profit was $2,241,611.57.

Saxony possesses one of the best-regulated systems of forestry in the world. The school of forestry at Tharandt, in the vicinity of Dresden, has sent and is still sending out some of the best-prepared foresters in Germany. Under their supervision the forests of Saxony serve not only the purpose of giving the State a substantial annual revenue, but they add a thousandfold to the scenery of the country, thus attracting many tourists into these parts every summer. The most important feature of the forests, however, is the fact that they keep forever alive the fountains of water which spring from the highlands of the Erzgebirge and Saxon Switzerland. The forests furnish the material and the water the motive power to hundreds of pulp, paper, and saw mills, which in turn give employment to thousands of men, women, and children.

For the benefit of students of forestry in America, I give the scheduled list of subjects taught in the Academy of Forestry at Tharandt: Chemistry, physics, mineralogy, zoology, mechanics, geology, mathematics, botany, surveying, history of forestry, forestry in all its different phases, and game and fish laws. In connection with these lectures, excursions are frequently made into the forests to study the different woods, rock formation, and soil. Actual practice is in every case united with theoretical work.

There is some talk at present of removing the academy from Tharandt to Leipzig, in order to absorb it in the university. It is claimed that the students would

thus have an opportunity of hearing a broader course of lectures, while materially lessening the cost of maintaining the institution. It remains to be seen, however, whether this plan will be carried out.

ERNEST L. HARRIS,
Consular Agent.

EIBENSTOCK, GERMANY, *March 14, 1902.*

AMERICAN STUDENTS IN GERMAN UNIVERSITIES.

The matriculation lists of the various German universities contain the names of many American students. Within the past few years women have been admitted, and a number of American lady students are now hearing lectures in some of the more frequented universities. Many American students come abroad without having any definite idea of the inside workings of a German university, what subjects it would be best for them to study, and what will be required of them in general. It seems to me that this subject, on the whole, is of sufficient importance to warrant a somewhat closer examination, and I trust that this report may be of service to those of our young men and women who have completed American college courses and are contemplating further study in a German university.

In connection with the following table I beg to state that the statistics given are for the year 1897, while the list of American students is for the winter semester 1901–1902, which I have obtained by direct inquiry:

University.	Professors and instructors.	Students.	American students.
Berlin	334	8,313	156
Bonn	142	1,939	9
Breslau	134	1,493	1
Göttingen	115	1,099	21
Greifswald	86	964	----
Halle	138	1,477	14
Kiel	91	731	----
Königsberg	105	721	----
Marburg	74	1,006	6
Münster	42	463	2
Munich	173	3,872	14
Erlangen	61	1,180	3
Würzburg	74	1,482	7
Leipzig	200	3,047	59
Tübingen	83	1,190	3
Freiburg	109	1,453	18
Heidelberg	121	1,309	21
Giessen	63	653	4
Rostock	45	523	1
Jena	91	812	3
Strassburg	121	971	11
Total 21	2,402	34,698	353

All these universities except one have four faculties, namely, theology, law, medicine, and philosophy. The latter embraces the following departments: Pedagogy, philology, history, art, political economy, and all the sciences, such as mathematics, astronomy, physics, chemistry, geology, mineralogy, pharmacy, botany, zoology, etc. The universities of Bonn, Breslau, and Tübingen have each a Catholic faculty as well as Protestant. The university at Münster in Westphalia is only termed an academy, having but two faculties—theology and philosophy.

The following courses of lectures will give a general idea of the character of

the instruction in German universities. During the winter semester, 1901–1902, the lectures in the Protestant theological faculty at Leipzig were—

Introduction to the Old Testament.
Interpretation of the Prophets.
Interpretation of Old Testament.
Palestine, people and customs.
Introduction to New Testament.
History of Christ.
New Testament theology.
The Gospel Mark.
The Gospel John.
Epistles to the Romans.
Epistles to the Ephesians.
The Primitive Church.
The church in the Middle Ages.
History of church art.
The church in the nineteenth century.
Christian ethics.
Theological ethics.
History of church ethics.
Christianity in the German colonies.
Interpretation of the Lord's prayer.
Practical theology.
Mohammed and Islamism.
Comparative religion.

The lectures in the Catholic theological faculty for the summer semester, 1902, in the university of Bonn will be—

The Old Testament.
Epistles to the Corinthians.
Church history.
The Four Gospels.
The Apostles.

Lectures in the law faculty for the summer semester, 1902, in the university of Heidelberg will be as follows:

History of Roman law.
Roman civil law.
History of German law.
German civil law.
Law of things.
Canon law.
Sociology.
Commercial law.
German criminal law.
Constitutional law.
International law.
Divorce laws.
English constitutional law.
Marine law.

Lectures in the medical faculty for the summer semester, 1902, in the University of Munich will be:

Physiology.
Pathology and therapeutics.
Births.
Eye, clinic.
Physical diagnosis.
Surgery, clinic.
Medicine in general.
Bacteriology.
Diseases of the insane.
Topographical surgery and anatomy.
Diseases of children.
Ear, clinic.
Diseases of the throat.
Diseases of the mouth.
Diseases of the skin.
Sexual diseases.
Microscopy.
Medical chemistry.
Surgery in time of war.
The nerves.
Anatomy of the brain.
Diseases of the stomach.
Internal medicine.

Lectures on history and philology delivered in the philosophical faculty of the University of Halle during the winter semester, 1901–2, were:

HISTORY.

Ancient History.
History of Rome.
Alexander the Great.
The German people since 1871.
History of the Crusades.
History of Prussia.
The Renaissance.
Prussia since the Great Elector.
Frederick the Great.
The French Revolution.
Revolutions of 1848.
The Reformation.

PHILOLOGY.

Sanscrit.	Arabic.
Songs of the Rigveda.	History of Greek art.
Songs of the Sacuntala.	Greek poetry.
Songs of the Atharvaveda.	The Age of Homer.
Old inscriptions in India.	Latin prose and poetry.
Language of the Phoenicians.	High German grammar.
Language of the Assyrians.	History of German literature.
English philology.	French philosophy.
Dante's life and works.	Boccacio's Decameron.

Many Germans, during the four years of their student life, make it an object to attend several universities. Such universities as Berlin, Leipzig, and Munich are given the preference in winter, for the reason that the students are thus permitted to attend operas, concerts, theaters, etc., not to mention visits to the splendid art galleries and other attractions. In summer Heidelberg, Bonn, Freiburg, and Tübingen are given decided preference on account of beautiful environments and opportunities for leading a more out-of-door life. In theory all German universities are on an equality in the eyes of the law. If, for example, a student should spend six semesters in the University of Munich, there is nothing which will prevent him from going up for a degree in the University of Berlin at the beginning or end of the seventh semester. I would advise American students, however, to spend at least two semesters in the university in which they expect to take a degree. A personal acquaintance with the professors who will carry on the examination will be found to be of great advantage. The student will have had time to familiarize himself with the lectures of his examiners, and what is more important, perhaps, will have given them an opportunity to form an opinion, not only of the character of his work, but of the student himself.

Nearly all German universities now have faculties which teach the natural sciences. Especially is this the case in the universities of Berlin and Heidelberg, where the laboratories are fitted out with all the latest improvements. Of the 21 universities mentioned above, that of Berlin stands easily at the head. There is no better place in Europe for the study of medicine than the hospitals of Berlin, taken in connection with the university lectures on medical subjects. Yet, in spite of the fact that Berlin strives with all the means in her power to attract the best brains and skill from the minor universities into her fold, she has never been successful in diminishing the luster which hangs about such universities as Heidelberg and Leipzig, which to-day still dispute with her for the mastery along certain lines of work. Berlin is great in medicine and philosophy, but Heidelberg is also great, not only in these two branches of learning, but in law and chemistry, while Leipzig stands at the head in history and economics.

There are many names linked with these universities whose fame in their special lines of work has gone far beyond Germany. Virchow, Bergmann, and Koch in Berlin, together with Czerny and Kussmaul in Heidelberg, are known to the medical profession all over the world. Since Billroth's death, Czerny is considered one of the best surgeons in Europe. In Leipzig Lamprecht reads lectures on history which have given birth to a new school of thought. Brentano in political economy (Munich), Sohm in jurisprudence (Leipzig), and Mommsen (Berlin) may be mentioned as being foremost in the rank of those who exert a powerful influence upon the world of scholarship. In Heidelberg, Kuno Fischer, although nearly 80 years of age, still gives lectures on philosophy and literature with an eloquence and charm which leave a lasting impression on the minds of all his hearers.

American students are permitted to matriculate in German universities on the

production of a passport. If, however, it is the intention of the student to take a degree, he must either present a college diploma or pass an examination before being admitted as a candidate. There has been some agitation recently to make stricter entrance conditions to foreigners, but this need give no American uneasiness, for the reason that the movement is directed against students from Russia and the Balkan States.

The expense of living in a German university is not high. From $600 to $800 a year ought to be enough to satisfy the most fastidious tastes of any American, provided he has come abroad for the purpose of study. Many American students are getting through on a much smaller sum. The matriculation fee in most universities amounts to $4.75. The private lectures cost about $4.75 a lecture of four hours each week during one semester. No student should register for more than four lectures in one semester. A small fee must be contributed each semester to a sick fund, which entitles the student in time of sickness to medical attendance, medicine, and admission to the university hospital free of charge. Most German students rent a room and take their meals in some restaurant, or wherever they choose. It is a custom among them, for the most part, not to patronize the many boarding houses which exist in every university town. It would be well, perhaps, for American students to follow the German plan, by taking a room costing from $7 to $9 a month, including coffee. Dinner and supper ought not cost more than $25 a month in any of the university towns.

A thesis, or "Arbeit," which must show original research, and an oral examination which lasts two hours are still indispensable factors in obtaining a doctor's degree. The old custom of defending the thesis has been practically abolished in many universities. In most branches of learning which fall under the philosophical faculty, including the natural sciences, one major subject (Hauptfach) and two minor subjects (Nebenfächer) must be selected by the student as a preliminary requisite for a degree. He may select whatever subjects he sees fit so long as they fall under the same faculty and have some cognate relation. His thesis must be chosen from the major subject, and may, in the philosophical faculty, be written in any one of the ancient or modern languages which has an established literature.

The degree conferred by the law faculties is J. U. D. (Juris utriusque doctor)—that is, doctor of both laws, canon and civil. In this faculty the candidate must prepare two written interpretations, one consisting of a paragraph from the pandects of Roman law and the other on some practical subject chosen from either international, constitutional, or German civil law. During the verbal examination the candidate must be able to translate and interpret at sight a paragraph from Justinian's Code (Corpus juris civilis). The actual conferring of the degree is accompanied with ceremony. On the following day the dean, clad in the robes of his order or faculty, receives the candidate in private audience and requests him, before the degree is finally conferred, to repeat a somewhat lengthy Latin oath. I have some misgivings, however, about the practical value of this degree to an American student who proposes to practice law in the United States. The subjects taught under this head, with the exception of constitutional and international law, must be considered luxuries, which no doubt add much to the student's erudition, but can never be of material value. The civil law has, of course, a far-fetched analogy with the common law, and in a very few American universities is taught in connection with the latter. Unless, however, an American student intends to teach law it seems to me that there are other subjects in a German university which he might study with more advantage and profit.

The seminaries in German universities are, in the opinion of many competent to judge, fully as important as the lectures. These seminaries give opportunities for practical training, and stimulate the student to original research. Each pro-

fessor usually holds one weekly, and a thorough, critical study is made of the sources upon which the lectures are founded. The seminary is to the student of history what practical hospital work is to the student of medicine, and all these seminaries are, as a rule, attended only by those students who are ambitious to learn.

The lectures in most universities begin about the 15th of October and close on the 15th of March. This period of time composes the winter term, or what is more properly called semester. The summer semester begins on the 15th of April and closes about the end of July. This is universal in all the universities. I have known American professors to come over in June after the close of their college work, matriculate in a university for the remaining lectures of the summer semester, and win a doctor's degree at the end of four or five years, always with the provision, of course, that they returned regularly every year for at least six weeks' attendance on lectures. This plan has its good points, and is worthy of consideration by those who are thus situated.

The technological universities in Germany are as follows:

University.	American students.
Charlottenburg	21
Aix-la-Chapelle	1
Darmstadt	6
Dresden	7
Hanover	1
Karlsruhe	11
Brunswick	4
Munich	4
Stuttgart	3
Total	58

Of the total 411 American students at present attending the various German universities, 353 are matriculated in the 21 classical, and only 58 in the 9 technological universities. Each one of these latter universities is fitted out with a trained corps of professors and instructors, who teach all the cognate subjects which come under the following heads:

Architecture, shipbuilding, general sciences, commercial law, food stuffs, engineering, chemistry, electricity, metallurgy, sugar, mechanics, smelting, political economy, pharmacy, textiles.

Students are admitted on the following conditions:

(1) Proof of sufficient academical education.

(2) Certificate of moral character.

(3) The applicant must have passed his eighteenth year.

(4) Consent of parents or guardian for students under age.

The semesters and vacations are on the same plan as in other German universities. Expenses are about the same.

The influence of these technological universities on the industries of Germany is boundless. The iron, steel, and machine industries all over the empire; the textile industries in Saxony and the Rhine province; the chemical factories of Höchst, Offenbach, and Ludwigshafen; the beet-sugar factories about Magdeburg and Stettin, together with many other important branches of production, each and all owe something to these excellent institutions.

Our system of education in the United States, together with a wide-awake, intelligent press, disseminates learning and information to the masses in a manner absolutely unknown in Germany. Many American universities now have post-graduate courses which are fully equal to those of Berlin or Heidelberg. The German system, however, is favorable to specialists who are permitted to devote

their whole time and energy solely to their chosen work. Considered on the whole, the day is not far distant when American State universities and other well-endowed institutions will be able to march abreast with the best universities in the German Empire. The day is past when the 21 classical universities of Germany should serve as models or exert influence on education in America. They must give way to the Empire's 9 technological universities, which have adapted themselves to the actual needs of industrial life. I recommend them to American students coming abroad. Let us ingraft their methods of thoroughness, as far as practicable, on our own institutions. The technological university and technical education own the future.

ERNEST L. HARRIS,
Consular Agent.

EIBENSTOCK, GERMANY, *March 24, 1902.*

EDUCATIONAL MATTERS IN MEXICO.

[Extracts from the message of President Diaz to the Mexican Congress referring to educational matters in the federal district and territories of Mexico, which extracts were received in translation from the State Department and are here inserted.]

It is satisfactory to me to be able to inform you that during the school term which closed in December last 2,197 pupils completed their compulsory primary education in the federal district and territories, and that 1 ordinary and 2 extraordinary examination sessions were held, during which 283 applicants for admission were tested.

The general popularity that has been attained by the system of instruction is revealed by the fact that official inspection has been solicited by 127 private schools, which is the largest number recorded up to the present.

In order to perfect the knowledge of pedagogy on the part of the teachers, weekly conferences on the subject have been opened under the charge of technical inspectors, and in order to exercise a better vigilance over the fulfillment of the law in the private schools which have accepted official inspection, a special visiting inspector has been appointed who will explain the true meaning of the legal provisions.

With the intention of obtaining more satisfactory results in public education, not only have the different powers and duties of the persons dedicated to that branch been better defined, but a physician has been appointed who will certify to the diseases that really prevent teachers from attending to their duties.

In order to fill the positions in the secondary, professional, and special schools by the appointment of persons approved by competent examiners, a set of regulations was issued in October last for the guidance of the professional career, reestablishing the system of competitive examinations which had partially fallen into disuse. Several of these examinations have already been held and others will shortly be held.

After a careful study by special committees which, under the direction of the department, have been engaged in revising the curricula of studies, the new laws relating to the superior primary and preparatory schools, as well as the schools of jurisprudence, medicine, and engineering, were enacted and came into force in January last, and in order to regulate the status of the pupils who are to continue their courses under these new laws extraordinary partial examinations were held which realized all our hopes.

In order to continue the work of revision that was undertaken in the matter of public education, the department of that branch appointed special committees to form the programmes of study for the national conservatory of music, as well as a board, to study these programmes under the presidency of the subsecretary of

public instruction, in order to prepare a new scheme, as will also be done with the other educational institutions that are not yet reorganized.

In order to harmonize in the most methodical manner possible the teaching of the same subject when distributed between schools of different grades, committees have been formed to study the programmes of those subjects throughout all the schools of successively widening scope, and programmes on drawing have been issued which are to be utilized from the elementary, through the superior primary, up to the preparatory school.

The intellectual and moral improvement of the superior schools could not be effected if at the same time their apparatus, instruments, and furniture were not renewed, as part of them have not been altered for over thirty years. Orders have, therefore, been placed in Europe and the United States for a supply of scientific materials, and the laboratories of the national preparatory school will be properly equipped.

Besides this, instruments have just been received from Germany for experimental psychology, and they will be divided between the normal school of professors and preparatory school, for the purpose of giving instruction in that science, and deciding, as far as possible, the intellectual and physical capacity for study of each pupil.

Besides this, the necessary instruments have been received for the orchestra of the national conservatory; a model organ has also been purchased and erected in the same institution, and the other indispensable instruments will be procured.

For the purpose of concentrating the materials for the study of our history, the documents contained in the archives of the old inquisition of Mexico and many manuscripts from the archives of the College of San Gregorio, have been purchased and deposited in the library of the national museum. Learned bibliophiles have been charged with making inventories of these archives, with the intention of publishing those documents which, on account of their historical importance, ought to be given to the public, and a paleographist will be appointed to make copies of the documents of most importance for the history of Mexico that are still to be found unedited in the archives of the Indies.

The prosecution of the material work of reconstructing or repairing the buildings devoted to public education, primary, superior, and special, has not been neglected, and in a short time the new building for the normal school of professors will be completed. Work has been commenced on the repairs and adaptation of several departments of the national preparatory school, in order to fit it for the improved plans of instruction, and in the same way, the necessary repairs have been commenced on the national school of fine arts, where a hall will shortly be opened for the purpose of a permanent exhibition. The work already commenced on the national school of agriculture, the school of arts and trades for women, and the department of the national library intended for night service has been continued.

Scientific congresses.—The Executive has received a formal invitation to have Mexico represented in the coming International Congress of Americanists which is to meet in New York during the month of October, as well as in the Fourteenth Medical Congress which is to be held in Madrid in April of next year. Both of these invitations have been accepted, and the delegates will in due time be appointed so as still further to strengthen the intellectual bonds which Mexico has with other countries.

Encouragement to art.—And, finally, the Government has endeavored by every means in its power to assist in the diffusion of learning and the development of artistic ideals, and therefore contribute by an exhibit of its schools to the success of the exposition of hand work which was organized in the Colegio de la Paz by the Mexican delegation to the Pan-American Congress. It also furnished space in

the national school of fine arts for an art exhibition which was organized by the pupils of that school in favor of the sufferers from the recent earthquakes in the State of Guerrero, and cooperated in the presentation of interesting portions of a musical work that was recently composed by a Mexican author.

EDUCATION OF MINING ENGINEERS AND SURVEYORS AND METALLURGISTS IN GERMANY.

UNITED STATES CONSULATE,
Chemnitz, Germany, April 2, 1902.

The same thoroughness and care which Germany is taking in the education of her young people in all branches of industry like textiles, and in engineering, etc., she is also taking in the education of men who are to occupy the higher positions in the mining industry.

This industry, one might say, has a great many peculiarities, inasmuch as one must work shut out from the light of day, and certain precautions must be taken in timbering, observation of atmospheric conditions, etc., which may, if not carefully attended to, not only result in a loss of life, but also cause great damage to property and to business in general. The law of June 17, 1901, which goes into effect July 1, 1902, makes it imperative for a man aspiring to a position in the higher state departments of mining and metallurgy in the Kingdom of Saxony, to pass two examinations before he is given such a position. A diploma from the "Bergakademie" (Mining Academy) at Freiberg, in Saxony, is deemed sufficient to consider the candidate for such a position as having passed the first examination. Between the first and second examination a period of three years must elapse before the candidate is allowed to try the second examination.

During this period he must continue to study. He must also write a scientific paper concerning a subject in his branch and hand it to the examination committee at least six months before the examination. The board of examination is called the "berg- und hüttenmännische Prüfungskommission" (the "mining and metallurgical examining committee") and is located at Dresden.

The second examination is both oral and written. However, before being admitted to this examination the candidate must hand in—

(1) A short sketch of his life; (2) proof that he has passed the first examination; (3) a certificate showing the scientific and practical work he has done, and (4) must also show that he has passed in the thesis he is supposed to have written during the period between the first and second examination.

The written examination consists in preparing two scientific theses, the subjects of which are given by the examining committee, about mining or metallurgy. For the first thesis a period of four months is allowed and for the second two weeks. The candidate must name all the books he has used as references and also take oath that he wrote the thesis himself. To make use of a draftsman for drawings is not allowed. If the committee decide that the theses are satisfactory, the candidate is allowed to take oral examination.

The oral examination comprises questions concerning mining and metallurgical works, economical and statistical importance of the same, how the works should be run, and the Saxon State laws governing mines.

This examination does not take place until a month after the handing in of the last written thesis. The duration of the examination is left to the committee, and not more than four candidates can be examined at once.

After the oral examination the candidate is told whether he has passed the whole examination, that is, both written and oral, and receives a certificate to that effect and the title of "Bergassessor" or "Hüttenassessor" ("mining assessor"

or "metallurgical assessor"). Anyone not passing the examination is allowed to take it a second time, but only after the expiration of one year.

To receive a position as assistant at the mining bureau or the mining inspection bureau, or as mine assistant or director's assistant, vice-smelting master, or metallurgical chemist of the fiscal mining district, a diploma from the Mining Academy is sufficient.

The object of the Mining Academy at Freiberg is to give young men who have chosen mining as their calling a thorough scientific education in mining. Before we go further, a brief history of this school might be in order. The silver mines of Freiberg, which have been worked now for seven hundred years, have not merely enriched Saxony, but have also contributed a great deal to science. In Freiberg, one might say, the first real foundation was given to mining, enabling it to make the great progress which it shows to-day. To this progress the Bergakademie, or Mining School, at Freiberg, which was opened one hundred and thirty-six years ago, has contributed in a large degree. In the year 1702 a desire was shown to educate young men in branches which were not taught at the high schools, namely, analysis and surveying, and later metallurgical chemistry and mineralogy. This led to the founding of the Bergakademie on November 13, 1765. Lectures were first given at Easter, 1766. It was supported by money from the State, donations, and part of the silver taken from the mines. To-day the school possesses a very fine collection of minerals and models, also a library of 54,000 volumes. In the eighteenth century there were students from every country in Europe at the academy, and to-day there are more foreign pupils than German. The number of pupils in 1900 was 117 Germans and 128 foreigners; total, 245. An applicant for admission must be 18 years of age and show a certificate proving that he has had a certain prescribed preliminary education.

German applicants must show a "Reifezeugniss" (diploma) from a Humanistisches- or a Real-gymnasium (the former is a school where, among other things, the Latin and Greek languages and literatures are studied, while in the latter more stress is laid upon modern languages), the Royal Trade Academy at Chemnitz, or some school on the same level as the schools just named. A foreign applicant must show a diploma from a school recognized by the State or country from which he comes. In addition, knowledge of the German language is necessary.

No examination is necessary for admittance, but the applicant must be 18 years of age.

Diplomas for positions as mining engineers, mining surveyors, metallurgists, and iron metallurgists are given at this academy. The course comprises four years. The plan of studies is different for the different positions of mining engineer, mining surveyor, metallurgist, and iron metallurgist.

Course for mining engineers.

First year: Advanced mathematics, first part; descriptive geometry, algebra, spherical trigonometry, physics, inorganic chemistry, mineralogy, crystallography, drawing, and drafting.

Second year: Advanced mathematics, second part; mechanics, general science of mining, geology; petrifaction, doctrine of; exercises in determining rocks, crystallography, physics, blowpipe analysis, machine drawing.

Third year: Mine surveying and geodesy, first part; practical geodesy, special mining engineering, exercises in mining engineering, science of ore dressing, making briquettes, engineering, science of deposits, metallurgy, art of building; machine drawing, second part; political economy, finances.

Fourth year: Mine surveying and geodesy, second part; practical mine surveying, general principles of law, mining law, sketches of mining and smelting buildings, exercises in science of ore dressing, mining and metallurgical bookkeeping, mining and metallurgical statistics, electro-technics, sketch of science of iron smelting, science of salts, general mechanical-metallurgical technology, special mechanical-metallurgical technology, art of assaying, examination of damps in mines.

Course for mining surveyors.

First year: Higher mathematics, first part; descriptive geometry, algebra, spherical trigonometry, physics, mineralogy, general science of mining, drawing, and drafting.

Second year: Mine surveying and geodesy, first part; practical geodesy, higher mathematics, second part; special mining engineering, geology, mechanics.

Third year: Mine surveying and geodesy, second part; practical geodesy, science of deposits, general jurisprudence, mining laws, political economy, finances.

Course for metallurgical engineers.

First year: Advanced mathematics, first part; descriptive geometry, algebra, physics, inorganic chemistry, mineralogy, practical crystallography, general mining engineering, drawing, and drafting.

Second year: Advanced mathematics, second part; mechanics, art of assaying, geology, practical crystallography, practical physics, blowpipe analysis, qualitative chemical analysis, machine drawing.

Third year: Metallurgy, machines, general jurisprudence, mining and metallurgical bookkeeping, mining and metallurgical statistics, quantitative chemical analysis, mine surveying and geodesy, first part; art of building, machine drawing with sketches, first part; doctrine of salts, political economy, finances.

Fourth year: General mechanical-metallurgical technology, special mechanical-metallurgical technology, analysis, mass analysis, technical chemical analysis of gases, chemical technology, iron metallurgy, furnaces, electro-technics, electro-metallurgy, sketches of mining and smelting buildings, exercises in pyrometry and calorimetry.

Course for iron metallurgists.

First year: Advanced mathematics, first part; descriptive geometry, algebra, physics, inorganic chemistry, mineralogy, general mining engineering, drawing and drafting.

Second year: Advanced mathematics, second part; mechanics, art of assaying, geology, practical physics, blowpipe analysis, qualitative chemical analysis; machine drawing, first part.

Third year: Science of iron metallurgy, metallurgy, machines, quantitative chemical analysis, mine surveying and geodesy, first part; art of building, machine drawing, second part; art of firing, political economy, finances.

Fourth year: General mechanical-metallurgical technology, special mechanical-metallurgical technology, analysis of iron, mass analysis, technical chemical analysis of gases, iron works, sketches of mining and smelting buildings. general jurisprudence, mining and metallurgical bookkeeping, mining and metallurgical statistics, exercises in pyrometry and calorimetry.

After finishing the foregoing courses of study the student is examined in the following manner:

There are two periods of examination, called the preliminary examination and final examination. What is called the preliminary examination is mostly oral, and takes place after the second year of study, generally in the month of October, and

the final at the end of the course. This final examination is oral on those subjects which relate to theoretical matter.

Examination for mining engineers.

Preliminary examination (after second year): Mathematics, descriptive geometry, mechanics, physics, mineralogy, geology and doctrine of petrifaction.

For the final examination the applicant must present a certificate showing that he has worked practically in a mine—worked at least 40 shifts, and written a report concerning the same; also hand in graphical work in descriptive geometry, mechanics, and drawing and drafting.

Subjects of final examination: Mining engineering, art of assaying, science of deposits, mine surveying and geodesy, machines, mining law and general jurisprudence.

The handing in of a long, written thesis, with diagrams, on some subject connected with the science of mining, is necessary.

The problems and drawings worked out during the period of study, inclusive of those concerning building, are considered as special subjects for examination.

The student must also show that he has heard lectures on the following subjects: Inorganic chemistry, metallurgy, metallurgical analysis, blowpipe analysis, building, electro-technics, iron metallurgy, general mechanical-metallurgical technology, special mechanical-metallurgical technology, science of salts, political economy and finances, mining and metallurgical bookkeeping, mining and metallurgical statistics.

The object of the practical course mentioned is to give the student the necessary preliminary instruction for the study of mining. This course begins the first week after Easter and ends with the close of the term. It is recommended that all students take this course. It is generally taken at some mine in the neighborhood of Freiberg, but the student can, if he wishes, visit other mines in the Kingdom of Saxony.

The practical course must be taken in the following order: (1) Work in the mine at hewing, hoisting, timbering, walling—seven to ten weeks are to be spent in this work; (2) work outside mine in the smelting works and blacksmith shops, three weeks; (3) visits to different mines in company of a professor or mine official; (4) student must give a complete report of his observations during this course.

Examination for mining surveyors.

Preliminary examination: Mathematics, descriptive geometry, mechanics, physics, mineralogy, geology.

The candidate must furnish evidence that he has taken the miners' preliminary course, which has been already described. He must also exhibit diagrams in descriptive geometry, mechanics, and drawing and drafting.

Subjects, final examination: Mine surveying, geodesy, use of instruments, science of mining, doctrine of deposits, mining law and general jurisprudence.

The examination thesis must be a lengthy geodetic mine-surveying problem, giving all measurements, operations, and calculations.

The problems which have been worked out, with drawings, during the course of study, are considered as special subjects of examination. In mining surveying, especially, the student must prove his ability by showing problems which he has specially worked out.

Examination for metallurgists.

Preliminary examination: Mathematics, mechanics, inorganic chemistry, mineralogy, physics, exercises in blowpipe analysis, ore dressing.

Final examination: Analytical chemistry (inclusive of mass and gas analysis), metallurgy, analysis, metallurgical technology, chemical technology.

The subject of thesis for examination must be on the subject of metallurgy.

The examination in analytical chemistry includes a qualitative and quantitative analysis, which must be worked out in the laboratory.

The practical part of the examination in analytical chemistry is considered when deciding on the outcome of the examination; also, the problems and drawings worked out during the course of study, inclusive of those concerning building.

Evidence must be furnished that the following lectures have been heard: General science of mining, descriptive geometry, geology, iron metallurgy, machinery, general jurisprudence, building, electro-technics, political economy, science of salts, mining and metallurgical bookkeeping, mining and metallurgical statistics.

Examination for iron metallurgists.

Preliminary examination: Mathematics, mechanics, inorganic chemistry, mineralogy, physics, blowpipe analysis, ore dressing.

Final examination: Analytical chemistry (inclusive of mass and gas analysis), iron metallurgy, analysis of iron, metallurgical technology, machinery.

An extended thesis on the subject of metallurgy.

Examination in analytical chemistry includes a qualitative and quantitative research.

As in the other branches, the work during the course is also considered in deciding on the outcome of examination.

Evidence must be furnished that the following lectures have been heard: General science of mining, descriptive geometry, geology, general jurisprudence, building, electro-technics, political economy and finances, mining and metallurgical bookkeeping, mining and metallurgical statistics.

Besides the mining academy there is also a mining school in Freiberg, but the two have nothing in common. The object of the mining school is to educate young men to become good master miners, subinspectors, and foremen. An examination for admittance to this school is necessary, but is very rudimentary, and comprises merely a knowledge of arithmetic, writing, and spelling; it presupposes, however, that the applicant is at least 18 years of age and not over 22, and that he has worked practically in some mine for at least a year. Certificates of good behavior, diligence, etc., must also be shown. The number of scholars admitted to this school depends on the needs of mining. The number must not exceed 60.

The course comprises four years and is divided into 4 classes.

The fourth class, or first year, comprises: German grammar, orthography, and style; taking down dictation; arithmetic; free-hand drawing and round-hand writing; ordinary writing; German and Latin letters of the alphabet; numbers.

Third class, or second year: Mineralogy; crystallography; physical and chemical properties of minerals; classes of salts and stones; geometry, inclusive of plane trigonometry and the beginning of stereometry, or geometry of solids; descriptive geometry, first part; German language; German exercises on given themes.

Second class, or third year: Physics—elements of practical mathematics, knowledge of sound, magnetism, heat, electricity, and light; mining—general doctrine of deposits, seeking of deposits, extraction, method of working, underground working, timbering; talks on general police rules for mining; descriptive geometry, second part; mineralogy, second part; classes of minerals.

First class, or fourth year: Surveying and drafting; mining, second part—holding water, atmospheric conditions, hoisting, etc.; bookkeeping—introduction, inventory, etc.; machinery drawing and building; geology; first help in case of accidents; general knowledge of machinery.

After finishing the four years' course the pupils are given a diploma in which is stated what they have accomplished and also their behavior during the course. This is then handed in to the "Bergamt" (mining office) and after examination legalized. A copy is kept at the mining office and can be seen at will by owners of mines. During 1901 there were 50 scholars at this school.

The foregoing will give a good idea of the education given to mining students in Germany. In closing, we might add that there are two classes of schools for the education of mining students. The higher schools are called mining academies and are intended to educate the higher class of mine officials. The oldest school is at Freiberg, opened in 1765. There is also an academy at Berlin, opened in 1861.

Lectures are also given at the polytechnical universities in Aachen, on mining and metallurgy.

The lower classes of schools are called mining schools. The object of these schools is merely to educate the lower class of officials at the mines, and not to prepare students for the mining academies, or higher schools. Mining schools are found only where there are mines, as generally, besides class study, the students are working in the mines for pay.

The cost of tuition at the mining academies depends on the cost of the different lectures, and differs according to the number of lectures given weekly and attended by the student. Foreigners must pay 200 marks extra at the mining academy in Freiberg. Tuition at the mining schools is free.

The following table gives the number of students who took the final examination at Freiberg from 1872 to 1900:

Year.	Mining engineers.	Mining surveyors.	Metallurgists.	Iron metallurgists.
1872–1885	105	46	70	6
1886	9	3	14	1
1887	9	6	14	1
1888	14	7	8	1
1889	20	----	11	1
1890	8	8	7	4
1891	16	2	4	1
1892	11	5	4	2
1893	9	4	10	----
1894	18	5	7	3
1895	17	2	6	2
1896	12	4	4	5
1897	9	10	6	4
1898	22	6	8	5
1899	24	5	4	5
1900	18	12	3	7
Total	321	125	180	48
Number of diplomas granted	285	118	161	41

Very respectfully

J. F. MONAGHAN,
United States Consul.

CHAPTER XXXIV.

CITY SCHOOL SYSTEMS.

This chapter contains the usual statistics of city school systems in cities of over 8,000 inhabitants and in cities and villages of population between 4,000 and 8,000. It includes also statistics of evening schools in cities of over 8,000 inhabitants and of kindergartens in cities of over 4,000 inhabitants.

The whole enrollment for the United States in cities of over 8,000 inhabitants was 4,090,819, an increase of 141,258, or 3.58 per cent. This increase is distributed as follows: North Atlantic Division, 67,393; South Atlantic Division, 27,016; South Central Division, 8,843; North Central Division, 22,934; Western Division, 15,072. The greatest rate of increase appears in the South Atlantic Division, where it is nearly 10 per cent, the highest shown by this division since 1891–92. The increase in the North Central Division of 22,934, less than 2 per cent, is the lowest of the five divisions. The enrollment in private schools was 897,099, a falling off of 32,238, or 3.47 per cent. Each of the divisions except the Western shares in this decrease, though the only decided loss appears in the North Atlantic Division, where the private-school enrollment dropped from 450,864 to 419,349. This falling off in the private-school enrollment of 31,515, which is more than 7 per cent, coming at the same time with an average increase in public-school enrollment, might suggest the thought that private schools in the North Atlantic Division are rapidly losing ground. Reference to the detail table shows, however, that a very large part of this loss occurred in the city of New York, which reports in private schools an enrollment less by 24,487 than the number reported for 1899–1900. In the returns from this city for 1899–1900 and for 1900–1901 the private-school enrollment is in both cases estimated, and this fact may in a measure account for the great difference between the figures for these two consecutive years. And in general, when making comparisons between the statistics of private schools and of public schools as set forth in these tables, it should be remembered that the figures given for private schools are largely estimated, and therefore not entirely accurate.

The total number of supervising officers reported is 4,733. This total shows no gain over the figures of 1899–1900, but an actual loss of 1, while the number of teachers shows a normal increase, thus raising the number of teachers to each supervising officer from 17.6 to 18.5. In each division the number of teachers to a supervisor is greater than that of the previous year. It will be noted also that the number of women supervisors is 59 below the total of last year against a gain of 58 in the number of men. The whole number of teachers was 87,561, a gain of 4,068, or 4.87 per cent, over the number reported in 1899–1900. The rate of increase

in the number of teachers being greater than the rate of increase in attendance, the average number of pupils to each teacher is thus reduced from 35.3 to 34.9.

Table 6 shows that the number of pupils to a teacher is less in each division than in 1899–1900, and that for the United States there has been since 1897–98 a gradual increase in the relative number of teachers.

The average number of sittings to a building is the greatest yet recorded. For several years there has been a gradual increase in seating capacity of the average city school building, though this should hardly be taken as a measure of the tendency toward larger and more commodious structures, which, judging from the printed reports of school boards and superintendents, is stronger and more general than the increase in the average size during this period would indicate. The summaries for the year 1900–1901 show that the number of buildings reported was 9,374, a gain of 184. The number of seats or sittings for study increased by 133,779, an average of 727 sittings to each new building added. Further evidence of the tendency toward larger and better buildings appears in the rapid increase since 1896–97 in the per capita value of school property, though, of course, the entire increase can not be assigned to this cause.

In 1900–1901 the value of school property per capita of pupils in average attendance was $111.67, which is higher than that for any previous year, and $2.14 higher than the per capita value in 1899–1900. The rates of increase in the expenditure for supervision and teaching and in the total expenditure are greater than those of any other items in the list. The whole amount expended for supervision and teaching was $63,433,167, an increase of $4,249,601, or 7.18 per cent, over the previous year. It will be noted that almost the whole of this increase occurred in the North Atlantic and North Central divisions, and hence the average annual salaries in these divisions take an upward turn, the gains being sufficient to offset actual decreases in the average salaries in the other divisions and raise the average salary for the United States from $670.81 in 1899–1900 to $687.29 in 1900–1901. The table of average annual salaries of teachers in cities of over 8,000 inhabitants is printed in another chapter of this report. The total expenditure amounted to $107,663,785, an increase of $8,206,551, or 8.25 per cent.

Table 11 gives the summarized statistics of evening schools in cities of over 8,000 inhabitants. There were 921 evening schools, employing 5,115 teachers, and having a total enrollment of 203,000 pupils. Comparison with the table published in the Report of this office for the year 1896–97 show sthat since that period the number of evening schools has been augmented by 108, 974 more teachers are employed, and the whole enrollment increased by 19,832. The rate of increase in enrollment in the evening schools is lower than that in the public day schools during the same period.

The summarized statistics of public and private kindergartens are given in Table 13. The whole number of public kindergartens in cities of over 4,000 inhabitants is 2,111 against 1,815 for 1899–1900. The number of teachers employed is 3,611, a gain of 285, or 8.57 per cent. The whole enrollment is 149,710, an increase of 18,053, or 13.71 per cent. Table 14 gives in detail statistics of public kindergartens maintained in connection with city systems of public schools.

TABLE 1.—*Summary of statistics of cities containing over 8,000 inhabitants, showing increase from previous year.*

	1899–1900.	1900–1901.	Increase.	Per cent of increase.
Number of city school systems	568	582	14

TABLE 4.—*Comparative statistics of cities containing over 8,000 inhabitants, summarized by States, etc.*

Cities of—	Ratio of private school enrollment to enrollment in all schools, public and private.	Ratio of average attendance to enrollment (public schools).	Average number of days' attendance of each pupil enrolled.	Average length of the school term.	Average number of pupils in attendance to each teacher.	Average number of teachers to each supervising officer.	Average number of seats to each 100 pupils in attendance.	Average number of seats to a building.	Value of school property per capita of pupils in average attendance.	Cost of teaching and supervision per capita of pupils in average attendance.	Total cost of schools per capita of pupils in average attendance.	Average cost per day of tuition for one pupil.	Average daily expenditure per pupil for all purposes.

TABLE 5.—*Summarized statistics of schools in cities of over 8,000 inhabitants from 1890–91 to 1900–1901, inclusive.*

Cities of—	Number of city school systems.	Enrollment in public day schools.	Aggregate number of days' attendance of all pupils.	Average daily attendance.	Number of supervising officers.	Number of teachers.			Number of school buildings.	Number of seats or sittings for study.	Value of public property used for school purposes.	Expenditure for supervision and teaching.	Expenditure for all purposes.	Enrollment in private and parochial schools (largely estimated).

TABLE 6.—*Comparative statistics of city school systems from 1891–92 to 1900–1901, inclusive.*

Cities of—	Ratio of private school enrollment to enrollment in all schools, public and private.	Ratio of average attendance to enrollment (public schools).	Average number of days' attendance of each pupil enrolled.	Average length of school term.	Average number of pupils in attendance to each teacher.	Average number of teachers to each supervising officer.	Average number of seats to each 100 pupils in attendance.	Average number of seats to a building.	Value of school property per capita of pupils in average attendance.	Cost of teaching and supervision per capita of pupils in average attendance.	Total cost of schools per capita of pupils in average attendance.	Average cost per day of tuition for one pupil.	Average daily expenditure per pupil for all purposes.

CHAPTER XXXV.

UNIVERSITIES, COLLEGES, AND TECHNOLOGICAL SCHOOLS.

The total number of institutions included in the tables in this chapter is 647, of which number 132 are institutions for women only. Of the 473 universities and colleges for men and for both sexes, 137 admit men only to the undergraduate departments, while 336 are open to both men and women.

A number of changes have taken place during the year, as follows: Ridgeville College, Ridgeville, Ind., St. Louis Seminary, Jennings, Mo., and Columbia Athenæum, Columbia, Tenn., have been closed; Central University, Richmond, Ky., was consolidated in June, 1901, with Centre College, Danville, Ky., as Central University of Kentucky at Danville, Ky.; Salt Lake College, Salt Lake City, Utah, has been changed to Gordon Academy, and Glendale College, Glendale, Ohio, to Home School for Young Ladies.

NEW COURSES OF STUDY.

University of California.—Established a department of irrigation.

Throop Polytechnic Institute, Pasadena, Cal.—Inaugurated a commercial course.

Taylor University, Upland, Ind.—Added commercial and art departments.

College of Emporia (Kansas).—Added a department of music.

Washburn College, Topeka, Kans.—Added a course in Spanish.

Kentucky Wesleyan College, Winchester, Ky.—Added a course in pedagogy.

Centenary College, Jackson, La.—Added a commercial department.

Tulane University, New Orleans, La.—Established departments of philosophy and pedagogy, of economics and sociology, and of civil engineering.

Syracuse (N. Y.) University.—The Lyman Cornelius Smith College of Applied Science has been added during the year.

Clarkson School of Technology, Potsdam, N. Y.—Established a course in domestic engineering for women.

University of North Carolina.—Established a department of mining.

Marietta (Ohio) College.—A military department has been added.

Pacific University, Forest Grove, Oreg.—Added an elective course in Spanish.

Grove City (Pa.) College.—A preparatory course in mechanical and civil engineering will be added.

Lehigh University, South Bethlehem, Pa.—Established a four-year course in physics.

College of Charleston (S. C.).—Added courses in biology and geology and the B. S. degree will be conferred hereafter.

King College, Bristol, Tenn.—Added normal and business departments.

CHANGES IN COURSES OF STUDY.

Blackburn University, Carlinville, Ill.—Course changed from fully required to one-third elective.

Illinois College, Jacksonville, Ill.—Courses of study changed to group system, and entrance requirements readjusted to meet the preparation furnished by the high schools of the State.

Monmouth (Ill.) College.—Adopted a modified elective system.

Coe College, Cedar Rapids, Iowa.—Adopted the group system of studies.

Morningside College, Sioux City, Iowa.—Adopted the group system of studies.

Bethany College, Lindsborg, Kans.—Junior and senior years have been made elective.

Tulane University, New Orleans, La.—Adopted elective system of studies applying especially to the two higher classes.

Olivet (Mich.) College.—Terms of admission changed to meet courses of high and academic schools of the State.

University of Cincinnati (Ohio).—The elective system of studies has been adopted.

Western Reserve University, Cleveland, Ohio.—The elective system of studies has been enlarged.

DIVISION OF COLLEGE YEAR.

The following named institutions have changed from the term to the semester plan: Coe College, Cedar Rapids, Iowa; Olivet College, Olivet, Mich., and Buchtel College, Akron, Ohio.

STUDENTS.

The total number of undergraduate and resident graduate students in universities and colleges for men and for both sexes, colleges for women, Division A, and in schools of technology for the year 1900–1901, is reported as 103,351, an increase of 4,428 students over the number for the preceding year. The number of such students for each year from 1889–90 to 1900–1901, is as follows:

Number of undergraduate and resident graduate students in universities, colleges, and schools of technology, from 1889–90 to 1900–1901.

Year.	Universities and colleges for men and for both sexes.		Colleges for women, Division A.	Schools of technology.		Total number.	
	Men.	Women.	Women.	Men.	Women.	Men.	Women.
1889-90	38,056	8,075	1,979	6,870	707	44,926	10,761
1890-91	40,089	9,439	2,265	6,131	481	46,220	12,185
1891-92	45,032	10,390	2,636	6,131	481	51,163	13,507
1892-93	46,689	11,489	3,198	8,616	843	55,305	15,530
1893-94	50,297	13,144	3,578	9,517	1,376	59,814	18,098
1894-95	52,586	14,298	3,667	9,467	1,106	62,053	19,071
1895-96	56,556	16,746	3,910	8,587	1,065	65,143	21,721
1896-97	55,755	16,536	3,913	8,907	1,094	64,662	21,543
1897-98	58,407	17,765	4,416	8,611	1,289	67,018	23,470
1898-99	58,467	18,948	4,593	9,038	1,339	67,505	24,880
1899-1900	61,812	20,452	4,872	10,347	1,440	72,159	26,764
1900-1901	65,069	21,468	5,260	10,403	1,151	75,472	27,879
Increase (per cent)	71.0	165.9	165.8	51.4	62.8	68.0	159.1

The number of students pursuing various courses of study, so far as reported, is as follows:

Classical courses	46,613
Other general culture courses	17,230
General science courses	9,081
Agriculture	3,843
Mechanical engineering	5,623
Civil engineering	3,532
Electrical engineering	2,696
Chemical engineering	536
Mining engineering	1,509
Textile engineering	234
Architecture	391

DEGREES.

There seems to be a tendency among the institutions for higher education toward adopting the single degree of Bachelor of Arts as representing a general liberal culture. This degree can no longer be accepted as representing only a classical education, as it is the only degree now conferred by 137 institutions on the completion of what are known as liberal in contradistinction to technical courses of study. The dropping of the Ph. B., B. L., and B. S. degrees has been going on for some time, and during the past year eleven institutions have reported the dropping of some or all of such degrees. The institutions so reporting are: Southern University, Greensboro, Ala.; Hendrix College, Conway, Ark.; Carthage (Ill.) College; Colby College, Waterville, Me.; Smith College, Northampton, Mass.; Olivet (Mich.) College; Westminster College, Fulton, Mo.; Oberlin (Ohio) College; Presbyterian College of South Carolina, Clinton, S. C.; University of South Dakota, Vermilion, S. Dak.; Texas Christian University, Hermoson, Tex., and Beloit (Wis. College. The institutions conferring any or all of the degrees of Bachelor of Arts, Bachelor of Science, Bachelor of Philosophy, and Bachelor of Letters are given in Table 28 of this chapter.

The total number of degrees and the number of each kind conferred on men and on women is as follows:

Degrees conferred in 1900–1901.

Degree.	On men.	On women.	Degree.	On men.	On women.
A. B	5,355	2,588	M. E. L	0	334

B. C. S	4	1			
B. Acc's	32	3	Total	11,463	5,050

The degree of Bachelor of Science, which was conferred on 3,023 persons, is granted by a considerable number of institutions on the completion of technical courses of study for which in other institutions a technical degree is granted. Thus it is found that some institutions grant the degree of Bachelor of Science on the completion of a course of study in civil engineering, which in other institutions leads to the degree of Bachelor of Civil Engineering, and in still others to the degree of Civil Engineer.

The degree of Doctor of Philosophy was conferred on examination by 42 institutions on 312 men and 31 women, and as an honorary degree it was conferred on 35 persons by 14 different institutions. In no case was this degree conferred as

an honorary degree by an institution conferring the degree on examination. The institutions granting the Ph. D. degree are as follows:

Institutions conferring Ph. D. degree in 1900–1901.

PROPERTY.

The total value of property possessed by the institutions for higher education, including schools of technology, amounts to $391,230,784, a gain of $30,636,189 over the amount for the preceding year. The endowment funds amount to $177,127,965, and the remainder represents value of the material equipment of the institutions. Of the 473 universities and colleges for men and for both sexes, 164 have no endowment funds; 136 additional have less than $100,000; 122 others have

between $100,000 and $500,000; 21 have between $500,000 and $1,000,000; and 30 have over $1,000,000 (see Table 5). New buildings were reported as having been erected during the year by 99 institutions at a cost of $4,973,468, not including the cost of 11 buildings not reported. The institutions reporting new buildings with the purpose and cost of each, so far as given, are as follows:

Institution.	Purpose.	Cost.
Tuscaloosa (Ala.) Female College	Gymnasium	$2,000
University of Arizona	Manual training	7,500
Philander Smith College, Little Rock, Ark	Dormitory	12,000
Mills College, Cal	Assembly hall	16,000
Colorado School of Mines	Assaying	8,000
	Laboratory	8,000
Yale University	Dormitory	
	Medicine	
	Administration	
	Dining hall	
Connecticut Agricultural College	Agriculture	9,450
State College for Colored Students, Dover, Del	General	6,000
Florida Agricultural College	Dormitory	8,500
Florida State College	do	10,000
	do	10,000
	Chapel	8,000
	Gymnasium	3,000
University of Georgia	Dormitory	35,000
	Dining hall	
Georgia School of Technology	Dormitory	30,000
	Engineering	15,000
Morris Brown College, Altanta, Ga	General	18,000
Bowdon (Ga.) College	do	30,000
Andrew Female College, Cuthbert, Ga	do	16,000
North Georgia Agricultural College	Dormitory	5,000
Wesleyan Female College, Macon, Ga	Science	30,000
University of Idaho	Dormitory	25,000
	Science	25,000
Carthage (Ill.) College	Dormitory	8,500
Armour Institute of Technology, Chicago, Ill	Engineering	50,000
Northwestern University, Evanston, Ill	Dormitory	30,000
Northwestern College, Naperville, Ill	Gymnasium	12,000
Indiana University	Observatory	6,000
	Chemistry, mathematics, and law	24,000
De Pauw University, Greencastle, Ind	Physics and chemistry	75,000
Taylor University, Upland, Ind	Cottages (two)	800
	Home	1,700
Coe College, Cedar Rapids, Iowa	Athletics	1,200
	Preparatory department	6,000
Parsons College, Fairfield, Iowa	Dormitory	17,000
Upper Iowa University, Fayette, Iowa	Library	25,000
Lenox College, Hopkinton, Iowa	General	
Simpson College, Indianola, Iowa	Administration	5,368
Morningside College, Sioux City, Iowa	General	100,000
Tabor (Iowa) College	Music	30,000
College of Emporia (Kans.)	Library	30,000
St. Mary's (Kans.) College	Natatorium	2,000
Tulane University, New Orleans, La	Dormitory	23,625
	Refectory	11,255
	Library	38,000
Bowdoin College, Brunswick, Me	Library	250,000
Bates College, Lewiston, Me	Library	60,000
University of Maine	General	35,000
	Observatory	
	Biology	
United States Naval Academy	Armory	1,000,000
	Boat house	
	Power house	
Notre Dame of Maryland	Laundry and bakery	45,000
Kee Mar College, Hagerstown, Md	Gymnasium	1,000
	Physics and chemistry	500
Harvard University	Engineering	250,000
	Club house	130,000
	Architecture	150,000
	Infirmary	100,000
	Museum	100,000
	Semitic museum	70,000
Smith College, Northampton, Mass	Students' dwelling	37,300
	Observatory	3,920
Alma (Mich.) College	Ladies' hall	60,000
St. John's University, Collegeville, Minn	Library and museum	30,000
	Gymnasium	10,000
University of Minnesota	Engineering	20,000
	Chemistry	20,000

Institution.	Purpose.	Cost.
Mississippi Agricultural and Mechanical College	Textile engineering	$31,000
	Dormitory	11,500
University of Mississippi	Power and heating	34,000
Clarksburg (Mo.) College	General	6,000
Westminster College, Fulton, Mo	Science	20,000
Drury College, Springfield, Mo	Science	50,000
Montana College of Agriculture and Mechanic Arts	Boiler house	1,200
University of Omaha, Bellevue, Nebr	Dormitory	10,000
Dartmouth College, Hanover, N. H	Club house	100,000
Stevens Institute of Technology, Hoboken, N. J	Engineering	65,000
	Boiler house	15,000
Princeton (N. J.) University	Y. M. C. A	
Alfred (N. Y.) University	Ceramics	15,000
Hobart College, Geneva, N. Y	Administration	35,000
	Dormitory	32,000
Syracuse (N. Y.) University	Engineering	100,000
St. Mary's College, Belmont, N. C	General	48,000
University of North Carolina	Recitation	36,000
	Heating plant	28,000
	Waterworks	17,500
Elizabeth College, Charlotte, N. C	Music, etc	10,000
Davidson (N. C.) College	Chemistry	10,000

North Carolina College of Agriculture and Mechanic Arts	Engineering	1,000
Buchtel College, Akron, Ohio	General	50,000
	Academy	25,000
	Heating plant	10,000
Western Reserve University, Cleveland, Ohio	Chapel	
	Dormitory	
	Microscopy	
Ohio State University	Residence	4,506
Wilberforce (Ohio) University	Dormitory	26,000
Philomath (Oreg.) College	Gymnasium	1,500
Blairsville (Pa.) College	President's house	2,000
Dickinson College, Carlisle, Pa	Academy	60,000
Wilson College, Chambersburg, Pa	Music	35,000
Lafayette College, Easton, Pa	Chemistry and metallurgy	30,000
Juniata College, Huntingdon, Pa	Gymnasium	8,000
Bucknell University, Lewisburg, Pa	Physics	25,000
Allegheny College, Meadville, Pa	Observatory	10,000
	Chapel	40,000
	Library	39,000
Washington and Jefferson College (Pa.)	Dormitory	80,000
Brown University, Providence, R. I	President's house	18,350
	Chemistry	16,164
College of Charleston (S. C.)	Dormitory	5,000
Clemson Agricultural College	Chemistry	15,000
	Dormitory	22,000
	Textile engineering	8,500
South Carolina College	Boarding	11,000
Wofford College, Spartanburg, S. C	Academy	12,000
University of Tennessee	Dairying	4,130
Texas Christian University	Dormitory	9,000
Wiley University, Marshall, Tex	General	30,000
San Antonio (Tex.) Female College	Chapel and dormitory	7,000
Baylor University, Waco, Tex	Science	75,000
University of Vermont	Gymnasium	30,000
Martha Washington College, Abingdon, Va	General	10,000
Virginia Agricultural and Mechanical College	Dormitory	100,000
	Science	
	Heating and power	
	President's house	
	Infirmary	
	Machinery, barn, etc	
University of Virginia	Hospital	30,000
Hollins (Va.) Institute	Heating and lighting	12,500
Vashon College, Burton, Wash	Water and lighting	3,500
Lawrence University, Appleton, Wis	Gymnasium	15,000
Concordia College, Milwaukee, Wis	Recitation	43,000
Ripon (Wis.) College	Science	33,000
Milwaukee (Wis.) and Downer College	Dormitory	30,000

INCOME.

The total income, excluding benefactions, is reported as $33,259,612. This includes an appropriation of $3,000,000 by the General Government for new build-

ings at the United States Naval Academy. The proportion of income derived from various sources by the several institutions is as follows:

	Tuition fees.	Endowment.	State or municipal aid.	Federal aid.	Other sources.
	Per cent.	*Per cent.*	*Per cent.*	*Per cent.*	*Per cent.*
All institutions	40.0	24.4	16.5	a8.2	10.9
Universities and colleges for men and for both sexes	38.5	28.3	17.8	4.4	11.0
Colleges for women, Division A	67.7	17.0	0	0	15.3
Colleges for women, Division B	81.4	2.0	3.5	0	13.1
Schools of technology	14.6	16.2	22.4	a39.8	7.0

a Excluding extraordinary appropriation for buildings at the United States Naval Academy.

BENEFACTIONS.

The total amount of benefactions reported by the several institutions for higher education as having been received during the year is $18,040,413, of which amount $14,016,998 was received by the following-named 33 institutions, reporting gifts amounting to $100,000 or over:

University of California	$100,000
Colorado College	125,358
Yale University	953,054
Catholic University of America	134,972
University of Chicago	2,575,492
Northwestern University (Illinois)	121,273
De Pauw University	180,000
Fairmount College (Kansas)	116,000
Tulane University (Louisiana)	355,200
Bowdoin College (Maine)	170,293
Amherst College (Massachusetts)	170,000
Harvard University	956,167
Mount Holyoke College (Massachusetts)	188,000
Wellesley College (Massachusetts)	225,000
Hamline University (Minnesota)	100,000
Washington University (Missouri)	3,450,000
Doane College (Nebraska)	101,980
Dartmouth College (New Hampshire)	125,000
Cornell University (New York)	941,750
Columbia University (New York)	362,227
New York University	182,336
Western Reserve University (Ohio)	200,000
Ohio Wesleyan University	138,000
Kenyon College (Ohio)	152,500
Denison University (Ohio)	107,000
Oberlin College (Ohio)	154,700
Haverford College (Pennsylvania)	120,000
Allegheny College (Pennsylvania)	105,000
University of Pennsylvania	477,836
Brown University (Rhode Island)	567,360
Converse College (South Carolina)	107,000
Vanderbilt University (Tennessee)	140,000
Baylor University (Texas)	113,500

Of the total amount of benefactions received during the year 36.3 per cent was received by the institutions in the North Atlantic Division, 3.9 per cent by the institutions in the South Atlantic Division, 5.1 per cent by the institutions in the South Central Division, 52 per cent by the institutions in the North Central Divi-

·sion, and 2.7 per cent by the institutions in the Western Division. The gifts to the several classes of institutions were as follows:

Universities and colleges for men	$3,769,202
Colleges for women	935,211
Coeducational universities and colleges	13,336,000

CHAPTER XXXVI.

STATISTICS OF PROFESSIONAL AND ALLIED SCHOOLS.

There were 150 theological schools in 1901, with 7,567 students in attendance, a decrease of 442 since the previous year. For three successive years a decrease in the number of theological students has occurred, while the number in the other professions increased, and in some of them rapidly. By referring to the table showing the number of theological students for a series of years in each of the leading denominations (Table 4), it will be seen that without a single exception there was a decrease in the number from 1899 to 1901. In fact the number of theological students is smaller than it was several years ago, in 1892, while dental and law students in the same time have increased over 100 per cent. The value of grounds and buildings of theological schools is over $15,000,000 and the endowment funds over $21,000,000 and the number of bound volumes in libraries is over 1,500,000.

Law schools now number an even hundred, with 13,642 students, an increase during the year of 1,126. The number of students in law is now nearly twice as great as the number in theology, just the reverse of the condition in 1885. Of the whole number of 13,642 law students, over 10,000 are in the North Atlantic and North Central States. In these States, too, the law course usually occupies three years, while in several schools of other divisions there is only a one-year's course. The full comprehensive course of the Northern schools probably results from the rigid written examinations which are required in some of those States before admission to the bar—examinations which are said to be passed with difficulty by students who have received only an office training.

In the 154 medical schools there were 26,757 students, of whom 1,812 were homeopathic and 746 eclectic. This represents an increase during the year of 1,544 students. It is notable that the number of homeopathic students, which during the long period from 1877 to 1892 remained practically stationary, during the next three years was nearly doubled, and during the last six years has again become stationary. The length of the annual session in medical schools is being increased. More than one-third of them (54 out of 154) now have sessions of eight or nine months, 18 having sessions of nine months. The grounds and buildings of medical schools are reported at $14,500,000 and the endowment funds at $2,000,000, some schools failing to report this item. While a new school is occasionally started, there appears a greater tendency toward consolidation of those already founded, while occasionally one is discontinued, so that the whole number is now one less than in 1895. Although theological schools continue to be the principal recipients of benefactions, medical schools are coming into greater prominence as institutions worthy of the gifts of the wealthy.

The number of dental students, which, similar to that in law, has shown remarkable growth in the last few years, is now 8,308, an increase of 380 over the previous

year, and 741 more than all the students in theology, although only eight years ago, in 1893, there were twice as many in theology as in dentistry; but since 1893 the number of students in theology has decreased by 269, while dental students have increased by 5,456.

The 58 schools of pharmacy report 4,429 students, an increase during the year of 387.

The number of schools for training nurses is 448, with 11,599 nurses receiving instruction. Of this number 3,710 completed the course. The length of the training course is being rapidly changed from two to three years. Of the 403 schools not connected with hospitals for the insane, nearly one-half have courses of three years. In 1895 only 5 schools required three years.

TABLE 1.—*General summary of statistics of professional and allied schools for 1900–1901.*

Class of schools.	Schools.	Instructors.	Students.	Increase (+) or decrease (−).	Graduated in 1901.	Per cent graduated.	Students having A. B. or B. S. degree.

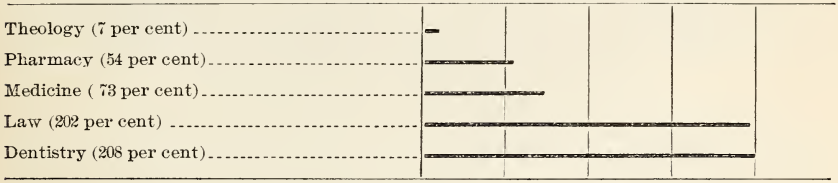
a 181 of these were women. b 170 of these were women.

Four years in dentistry.—The National Association of Dental Faculties, at its meeting in Milwaukee, Wis., in August, 1901, adopted the following resolution:

Attendance upon four full courses of not less than seven months each in separate academic years shall be required before examination for graduation for all students matriculating after the session of 1902–1903.

Evening schools.—It was also resolved, by the same association—

That full credit shall not be given by members of this association for courses of instruction which do not commence in the morning and continue through the day.



Georgetown University no longer an evening school.—The medical department of Georgetown University, Washington, D. C., was conducted as a day school in 1900–1901. The announcement for the year said:

The demands of modern medical education are such that the faculty has found it necessary to extend the hours of instruction so that more time may be given to practical work in laboratories and hospitals. The instruction will, therefore, begin in the morning and continue throughout the day. Students are required to devote their entire time to the study of medicine.

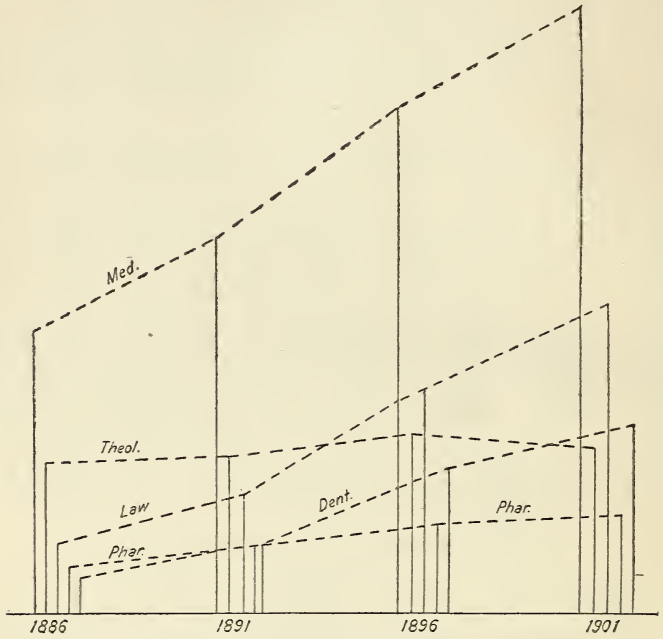
Graduates			157	218	471	1,498	3,456	3,710

Growth in number of students since 1890.

Discontinuance of the Northwestern University Woman's Medical School.[1]—The secretary of the board of trustees, Mr. Frank P. Crandon, on January 6 [1902] presented the following statement:

"1. It has been decided to discontinue said department at the end of the present scholastic year.



"2. This decision is based upon purely financial considerations. The maintenance of the Woman's Medical School has resulted in such an annual deficit for several years that the University trustees do not feel justified in continuing its operations."

It is worthy of note in favor of medical education of women that "at a recent meeting of the trustees of the University of Chicago it was voted to permit the enrollment of women in Rush Medical College.

Discontinuance of the veterinary school of Harvard University.—The Harvard authorities announced the discontinuance of the veterinary school after June, 1901, and the students were transferred to other schools.

[1] Jour. A. M. A., Jan. 11, 1902.

University of Pennsylvania, new laboratories.[1]—A contract has been entered into by the trustees of the University of Pennsylvania for the erection at a cost, including equipment, of $600,000, on the south side of Hamilton Walk, of new medical laboratories. The building will have a length of 340 feet and an extreme depth of 245 feet. Halfway between the eastern and western ends, at the rear, a hexagonal structure will be erected containing two amphitheaters, each with a seating capacity of 400 persons. The building will be two stories in height and fireproof.

Comparative number of students at different periods.

Evening law schools.—An evening law school has been established under the auspices of the Evening Institute of the Boston Young Men's Christian Association. A course of four years is required. The McDonald Educational Institute of the Young Men's Christian Association of Cincinnati also has a night law school.

The course occupies three years. Seven hours for lectures and recitations and court practice will be given to the junior year class, and nine hours to the senior and middle year classes, each week during the school year. Upon completion of the course and compliance with the other conditions for graduation, the degree of LL. B. is given.

Written examinations in law in North Carolina.[2]—The supreme court of North Carolina has prescribed written examinations for applicants for license to practice law. That this action necessitates thorough training is evidenced by the fact that at the February term, 1899, only 20 out of 52 applicants were successful, and of these successful applicants 17 were prepared at the University law school. At the February term, 1900, of the supreme court, of the 47 applicants 33 were licensed.

Mr. J. P. Morgan's gift to Harvard Medical School.[1]—It is with a very peculiar sense of gratification that we make note of Mr. Morgan's munificent donation of upward of $1,000,000 for the furtherance of medical education as represented by the Harvard Medical School. The money is to be expended for the erection of three of the new medical buildings contemplated for several years, the only stipulation being that the buildings are to be memorial halls, in memory of Junius Spencer Morgan, a native of Massachusetts, formerly a merchant of Boston, and at the time of his death a merchant in London. This gift is the more significant from the fact that neither Mr. Morgan nor his father, so far as we are aware, had any special interest in medicine or in medical education. It goes to show how widespread

[1] Boston M. and S. Jour., July 4, 1901.

the feeling is coming to be among the laity that medicine both needs and deserves the recognition for which it has long been waiting. It is apparently difficult to uproot the idea, based, we regret to say, to some extent on fact, that medical schools are, in the first place, founded for mercenary ends, and, in the second place, are easily supported. These conceptions are every day being disproved. In the better medical schools, of which unfortunately there are none too many, the mercenary element is wholly overshadowed by the higher demands which medicine as a branch of liberal education is making, and certainly it takes but little experience to know that the expense of properly conducting a medical department is exceedingly large. In announcing Mr. Morgan's gift President Eliot said: "There is no department of the university to which a great gift of this sort could be made with greater hope of an abounding return. The progress of medicine and surgery during the last twenty years is simply amazing. The triumphs of the physician and surgeon over disease and death are unparalleled in the whole history of the world; but we have as much more to look forward to, and I know of no department of scientific research from which greater hope can be entertained than the department of applied biology. Moreover, this great gift comes as a reward to one of the most laborious, enthusiastic, and hopeful of all the faculties of the university—the faculty of medicine."

Mr. John D. Rockefeller's gift to Harvard University.[1]—Just seven months ago we had the pleasant editorial task of recording and commenting upon Mr. J. P. Morgan's gift to Harvard University for its new medical school buildings, and this week we find a similar agreeable duty imposed upon us by the announcement that Mr. Rockefeller proposes to offer Harvard University $1,000,000 to aid in carrying to completion the same project. Mr. Morgan's gift of something more than $1,000,000 was for the erection of three of the five new buildings as previously planned for upon the new territory of 26 acres which had previously been secured by friends of the medical school for this and kindred purposes. As we understand it, Mr. Rockefeller's gift may be used for buildings or for endowment, and is to be accompanied by the stipulation that something in the neighborhood of $500,000 additional should be raised for these purposes by other contributors.

Fund for the study of chronic diseases.[1]—The late Miss Ellen O. Proctor has given by will to the president and fellows of Harvard College and their successors the sum of $50,000, the same to constitute a fund to be known as the Proctor Fund for the Study of Chronic Diseases; the income of said fund to be devoted to the care in a hospital or hospitals of persons afflicted with chronic diseases, and to investigations into the nature and treatment of the same.

ENDOWMENT OF MEDICAL TEACHING.

The provost of the University of Pennsylvania, in his report for 1901, says:

The preservation of health and the prolongation of life have become more and more the profession of the votaries of medicine. It is no exaggeration to say that to-day as much thought on the part of the physician is given to the means of preventing disease as to the manner of its treatment. The great activity that characterizes medical science has for its ultimate aim the suppression and eventual disappearance of many of the diseases that now cause disability, produce suffering, and bring about the largest number of premature deaths.

That this purpose is not chimerical and that it has not been fruitless is abundantly shown by the steady march and progress within the past ten to twenty years of preventive medicine. That many diseases formerly regarded as unavoidable are now conceived to be due to carelessness or indifference, or have been to a great extent entirely abolished, is almost too common an experience to awaken interest in the manner of achievement of these results or their importance from an economic standpoint. And yet these wholesome and invaluable results have been accomplished by the medical profession, which in one sense is directly benefited by the prevalence of disease.

I wish, then, to draw attention not only to the sacrifice of private advantage to a higher sense of duty which these results demonstrate, but also to the fact that every step made in advancing health and diminishing disease reacts upon the industrial and economic as well as upon the moral value of the individual. The most enlightened men are possessed by a sort of fatalism in respect to disease. While other occurrences of life are accepted as operations of law, the matter of

[1] Boston M. and S. Jour., Feb. 6, 1902.

health is dealt with as though it were largely outside of such control. It is a well-known fact that the generously inclined promote far more readily the advancement of the mechanical and economic arts and sciences than the advancement of that most important science—the science of medicine. It can be truly said that no better investment for the purpose of extending the useful knowledge of the world can be made than in the endowment and support of the best medical teaching that carries with it also a wider medical research.

THE "CASE" METHOD OF INSTRUCTION IN MEDICINE.[1]

The "case" method advocated by Mr. Cannon, of Harvard University, in March, 1900, has received the indorsation of many teachers in England and the United States. This method is supposed to supplant the dreary, old-fashioned didactic lecture, and is an imitation of the plan adopted in the law department of Harvard. The plan is to secure printed histories of actual cases which perhaps the student may have seen in the hospital. Each student is previously supplied with a printed copy of the history for careful perusal some time prior to the discussion. The class and teacher meet and discuss the diagnosis, pathology, symptoms, and treatment. Text-books and other literature are consulted, and the case is thoroughly thrashed out. The student is learning the judgment of clinical data, the estimation and relative value of the various symptoms, distinguishing between the important and the unimportant, the common features and the more unique. He not only receives but acquires knowledge.

Advantages of the case system.[2]—The first claim made for the method was that by its use the objectionable features of the didactic lectures are avoided. The student does not spend his time duplicating his reading matter by lecture notes to be set aside for later study; he is learning his facts gradually from day to day by actually applying them to his work. Instead of depending on his uncertain records of lectures, he is training himself by practical experience to use his books just as later he may have to use them in reference to his patients.

The power of arousing interest and enthusiasm among the students was a second claim made for the method. This claim has been abundantly confirmed. The printed record of an actual case gives a center of interest. As one student said, "I used to sit down and read twenty pages of 'Practice' and be sleepy, but there is an excitement in hunting down the diagnosis of a case and in getting ready to stand by my idea of the treatment of it that keeps me lively." The exercises at which these cases have been discussed have had the largest regular attendance of all clinic exercises of this last half of the senior year. The students argue and discuss the case together in their rooms; they come to the conference and dispute and question not only one another, but also their instructor; they are kept alert and keen-minded throughout the exercise. Impressions made under such conditions, when the attention is naturally sharp and eager, are deep and lasting. It is the particular patient, the concrete instance, that gives body and form to text-book abstractions, holds the attention, and stimulates the reasoning power. Neither the lecture nor the recitation stirs enthusiasm: the case system, however, is on record as having accomplished this result most successfully.

The most important virtue of the case system, however, is its great value in drilling the mind of the student to meet intelligently the difficulties of practice. Let the students have a number of cases with similar symptoms, but with peculiarities and complications, and can any student fail to puzzle over them and study them? And, having studied them, will not the conference at which his diagnosis and treatment are either confirmed or questioned mean more to him and produce a more lasting impression than any lecture? The clinics train the medical student in observation; nothing at present requires him to look carefully on all sides of many cases, to think clearly and accurately, or to have reasons for his conclusions. Are not these powers among the most indispensable qualities of a physician? If so, the method of bringing these qualities into constant use and discipline, and at the same time demanding the most thorough and precise knowledge, is certainly that best adapted for the study of medicine.

In text-books symptom after symptom is written down without indication of importance or weight. In considering a particular case and discriminating between the various diseases it might represent the students first begin to see what may be called the perspective of symptoms; they are learning to distinguish

[1] From address of Dr. J. R. Jones, of Winnipeg, Manitoba, before the Canadian Medical Association August 21, 1901.
[2] B. W. Cannon, A. M., Harvard University.

between the big and the little, the important and the unimportant, the common features and the unique.

Among the new unforeseen merits characterizing the case method is the discovery that the particular instance may be stated so vividly that it will leave on the mind a picture quite as definite and lasting as the sight of a real patient. This virtue suggests the especial use of the method in teaching the management of acute urgent conditions, such as alarming hemorrhages, the agonizing distress of angina pectoris, and the cutting, stabbing pains of biliary colic, conditions which students never see in the hospitals and which they may be called upon at any time to treat.

Another of the unexpected features of the case method is that of showing to the students themselves, and also to their instructors, what they do not know and wherein their knowledge is inaccurate. The students are going through their last year in the school ignorant of their ignorance and complacent in their false knowledge, until meeting the actual conditions of real cases shows them their deficiencies.

The case method in the University of Pennsylvania.[1]—In a crude form it has long been in use; the practice of demanding bedside diagnosis, etc., at clinics is an old one, and has been employed by many teachers. The introduction of the fully elaborated method at the University of Pennsylvania occurred some two years ago, and the details, as followed out in that institution, are given by Dr. Frazier in the University Medical Bulletin for September.

Each student is given a manifold copy of the complete clinical data of a case in the hospital records, including family history, physical examination, antecedents, blood, urine, sputum, etc., examinations, as well as the full history of the disease. He is instructed to prepare a report from the facts, including diagnosis, prognosis, and treatment; in some cases only one or two of these may be required; in others, special attention is called to the diagnosis, prognosis, or treatment. No conclusions are accepted or given credit for unless based on logical reasoning from the facts given. These papers are distributed each Saturday and a report required on the following Saturday. A week later the instructor analyzes the reports before the class, points out their errors and omissions, states what further examination might be conducted to elucidate the case, and gives the subsequent history, results of treatment, etc., as they occurred. As a rule, typical cases are not selected, but those that give the student some exercise of judgment in his diagnosis, and they are so chosen as to work into a systematic scheme embracing instances of affections of each important class. Dr. Frazier finds the method of value in developing the power of discrimination, educating the judgment, encouraging research into authorities, and widening the reading of the student. He also finds that it especially arouses enthusiasm and interest, a point the importance of which is not to be underrated.

It is evident that a plan that presents, as this does, cases as they occur in actual practice must be more interesting than purely impersonal facts or dry enumeration of symptoms.

FRAUDULENT DEGREES IN DENTISTRY.

[From report of the foreign relations committee of the National Association of Dental Faculties for the year 1900-1901.]

In our last report we made public the fact that a number of the fraudulent institutions were suppressed and their conductors imprisoned. We hoped that this would practically close up all of them, but special circumstances have intervened to protect certain ones, and the work is not yet completed.

It is not generally known in this country that thousands of fraudulent diplomas have been sold abroad. Were it possible for foreigners to distinguish between the reputable and the disreputable schools, this would not so much matter, but it is possible to incorporate degree-granting institutions which have practically no State supervision or responsibility whatever, and which with legal sanction are, under the great seal of the State, certified as lawfully organized colleges. By that certification the most unblushing impostures are placed apparently upon the same plane with reputable institutions, and foreigners are deprived of all means by which they can positively determine which is worthy of recognition and which is not. As a consequence, some foreign governments have used this condition, either honestly or as a desirable pretext, to discriminate against all Americans, and have refused them permits to practice, and positively prohibited, under

[1] Jour. A. M. A., Sept. 21, 1901.

heavy penalties, the employment by anyone of the American degree or title. This interdiction is spreading very fast, and unless something is done to forestall it, soon the possession of an American diploma, whether legitimately or illegitimately obtained, will be a positive detriment to a practitioner. In fact, that is the case to-day in some parts of Germany. The influence of such enactments upon American educational affairs and upon the members of this association may perhaps be imagined. Already prohibition is practically accomplished in southern Germany, is impending in northern Germany, has been commenced in France, in Italy, and other countries, and there is sharply threatened a combination of all Europe against the American dental degree and the American dental school. * * *

Practically no fraudulent degrees are sold in America; the countries of Europe are the sea into which the foul tide empties, and the sweetening of the waters can not be effected there. It is in this country that the remedy must be applied, and until a healthy public and professional sentiment can be evoked here nothing can be done. The condition has existed for years, and it is constantly growing worse. A pest hole can not be cleansed until it is uncovered. A festering wound must be laid open that access may be obtained to its foulest depths. The community must be convinced whence an infection proceeds before it will abolish the source. Few dentists are aware of what exists in this country. Any man knows that when the honest intelligence of our profession is fully awakened to any enormity, it will move heaven and earth if necessary to put an end to it. * * *

The name of Consul Worman has been mentioned. Your committee believes that his efforts to rehabilitate the American degree in Europe have been, and promise to be, of the greatest benefit to dentistry, and his work should be sustained by everyone. Your committee has not been able to give him all the assistance it desired, because it was this year without the credit upon the treasurer of the association that has been accorded it in the past, but it hopes that the good work may not be hindered by this obstacle in the future. Our national, our professional, our individual reputations are at stake. The good name of every member of this association is in the balance, and our vindication from a foul blot upon our professional escutcheon must not be a matter of indifference. To assume that this is in the interests of antagonistic foreign governments, that it is doing their dirty work, is to attempt to cover up and apologize for and justify the villainy that is being done in our names, to assume complicity with the men who are trading on our good deeds, and who, under cover of the high reputation of American dentistry won by us, are endeavoring to foist upon foreign communities a counterfeit that must of necessity throw doubt upon the original.

Ban on American dental colleges removed.[1]—United States Consul Worman, of Munich, has succeeded in securing from the Bavarian Government a decree removing the wholesale restriction placed upon the practice of dentistry under foreign diplomas. This restriction was aimed principally at American diplomas. Mr. Worman immediately set to work to protect the American dental colleges entitled to support, and, acting upon his representations, the Bavarian Government has modified the original decree so as to allow the recognition in Bavaria of degrees obtained from "reputable" American dental colleges.

DEGREES IN PHARMACY.

There is great variance among the schools of pharmacy in the bestowment of degrees and in the manner of abbreviating them. Nine schools give only one degree, that of Graduate in Pharmacy, which they usually abbreviate Ph. G. Sixteen other schools give the same degree upon completion of one course, and another degree upon completion of another course. Two schools give only the degree of Doctor in Pharmacy—the National College of Pharmacy, Washington, D. C. (which it abbreviates Phar. D.), and the Maryland College of Pharmacy (Pharm. D.).

The following schools give the degree of Graduate in Pharmacy:

1. Chicago College of Pharmacy.
2. Northern Indiana School of Pharmacy, Valparaiso.
3. Iowa College of Pharmacy, Des Moines.
4. State University of Iowa, Department of Pharmacy.
5. Detroit College of Pharmacy.

[1] The Washington Post, November 7, 1901.

6. Albany College of Pharmacy.
7. University of North Carolina, School of Pharmacy.
8. University of Texas, School of Pharmacy.
9. Milwaukee Medical College, School of Pharmacy.

In the catalogues of the following institutions the requirements for graduation are mentioned, but it was not ascertained what degree is given. It is probably that of Graduate in Pharmacy:

School of Pharmacy of the Medical College of Alabama.
Atlanta College of Pharmacy.
Tulane University, Pharmaceutical Department.
New Jersey College of Pharmacy.
Leonard School of Pharmacy, Shaw University.
Sewanee Medical College, School of Pharmacy.

The degrees granted by the other institutions are as indicated below:

Kansas City College of Pharmacy (*gives Ph. G. and Ph. B.*).—Upon the completion of the regular two years' course and three years of experience in a pharmacy the degree of Graduate in Pharmacy is received, but if the candidate has not obtained the required shop experience he is given the degree of Bachelor of Pharmacy. (Cat. 1902, p. 19.)

University College of Medicine, Department of Pharmacy, Richmond, Va. (*Ph. G., Ph. B.*).—Gives the degree of Graduate in Pharmacy upon completion of a two years' course and three and one-half years of shop experience. If the student has not the latter qualification he receives the degree of Bachelor of Pharmacy. (Cat. 1902, p. 93.)

National College of Pharmacy, Washington, D. C. (*Phar. D.*).—Gives Doctor of Pharmacy after three years of instruction and four years of shop experience. (Cat. 1902, p. 27.)

Maryland College of Pharmacy (*Pharm. D.*).—Gives Doctor of Pharmacy after two years of instruction, shop experience not being required. (Cat. 1901, p. 25.)

Louisville College of Pharmacy.—Gives Doctor of Pharmacy upon completion of two courses of instruction and four years in a pharmacy. The degree of Master of Pharmacy is bestowed upon graduates of this college of not less than five years' standing upon presentation of some work showing original research of exceptional merit. (Cat. 1902, pp. 5, 7.)

Brooklyn College of Pharmacy (*Ph. G., Phar. D.*).—Gives Graduate in Pharmacy when the student has completed the regular course of two years and four years of pharmaceutical experience, and after one year's postgraduate attendance the student may receive the degree of Doctor of Pharmacy. A student completing the regular two years' course, but not having the required experience, receives a certificate which may be exchanged for the regular diploma upon receiving the required experience in a pharmacy. (Cat. 1902, p. 9.)

College of Pharmacy of the City of New York.—Same as Brooklyn College of Pharmacy. (Cat. 1902.)

Medico-Chirurgical College of Philadelphia, Department of Pharmacy.—Same as Brooklyn College of Pharmacy. (Cat. 1901.)

California College of Pharmacy, University of California (*Ph. G., Phar. D.*).—The degree of Graduate in Pharmacy is received after two years of attendance and four years of practical training. (Cat. 1902, p. 370.)

College of Physicians and Surgeons, Department of Pharmacy, San Francisco.—Gives Graduate in Pharmacy upon completion of the two years' course and four years of experience, and "a graduate of this college of not less than five years' standing who shall by original research have executed work of exceptional merit and present same to the examination committee of this college in the form of a thesis, together with such product or products as may have been obtained, shall, if deemed worthy by said committee, receive the degree of Doctor in Pharmacy." (Cat. 1902, p. 9.)

Purdue University, School of Pharmacy, Lafayette, Ind. (*Ph. G., B. S.*).—Gives Graduate in Pharmacy upon completion of two years of instruction (no shop experience required), and upon completion of a four years' course Bachelor of Science in Pharmacy. (Cat. 1901, p. 12.)

University of Maine, Department of Pharmacy (*Ph. C., B. S., M. S.*).—A course of two years leads to the degree of Pharmaceutical Chemist. The full course of four years includes instruction in modern languages, civics, and the

sciences, and leads to the degree of Bachelor of Science in Pharmacy. Further work of one year in residence or two years in absence secures the degree of Master of Science. (Cat. 1901, p. 115.)

Massachusetts College of Pharmacy (*Ph. G., Ph. C.*).—The degree of Graduate in Pharmacy is given after two courses of instruction and four years of shop experience. Students who complete two courses and submit a satisfactory thesis, but who have not the required practical training, receive the degree of Pharmaceutical Chemist. (Cat. 1902, pp. 21, 24.)

Scio College, Ohio (*Ph. G., Ph. C.*).—The course for the degree of Graduate in Pharmacy covers a period of forty weeks, and the course for Pharmaceutical Chemist two years.

Northwestern University (*Ph. G.. Ph. C.*).—Upon completion of two sessions of six months each the student receives the degree Graduate in Pharmacy. Additional work during the fall and winter terms of the second year and full work during the spring terms of both years secures the degree of Pharmaceutical Chemist. (Cat. 1902.)

Cleveland School of Pharmacy (*Ph. C.*).—Completion of either the two years' course or the three years' course secures the degree of Pharmaceutical Chemist. (Cat. 1902, p. 7.)

Walden University, Pharmaceutical Department, Nashville, Tenn. (*Ph. C.*).—The degree of Pharmaceutical Chemist is given upon completion of the regular course of three sessions of not less than twenty-four weeks each. (Cat. 1901, p. 37.)

Oklahoma University, School of Pharmacy (*Ph. C.*).—Upon completion of the regular course and two years of experience in pharmacy the student receives the degree of Pharmaceutical Chemist. (Cat. 1902, p. 58.)

University of Kansas, School of Pharmacy (*Ph. C., B. S.*).—The degree of Pharmaceutical Chemist is given to any student who completes the course of two years or the course of three years. Those who finish the four years' course receive the degree of Bachelor of Science in Pharmacy. (Cat. 1902, p. 12.)

Buffalo College of Pharmacy (*Ph. G., Phar. M., Phar. D.*).—Gives the degree of Graduate in Pharmacy upon completion of the two years' course, no shop experience being required. For the degree of Master in Pharmacy the candidate must have had two years' professional training after receiving the degree of Graduate in Pharmacy or its equivalent, and he must present an acceptable original thesis. For the degree Doctor in Pharmacy the candidate must have received the degree Master in Pharmacy or its equivalent, and he must subsequently attend one session of the Buffalo College of Pharmacy and present an acceptable original thesis. (Announcement for 1903.)

St. Louis College of Pharmacy (*Phar. G., Phar. B., Phar. C.*).—Gives Graduate in Pharmacy upon completion of the regular course of two years and four years of drug experience, or when the latter requirement is not met the degree of Bachelor of Pharmacy is given. Upon completion of the course for Bachelor of Pharmacy and subsequently taking the third year's professional course in chemistry the degree of Pharmaceutical Chemist is obtained. (Cat. 1902, p. 27.)

University of Tennessee, Department of Pharmacy (*Phar. C., B. Sc.*).—Gives Pharmaceutical Chemist upon completion of the two years' course, and upon completion of the four years' course the degree of Bachelor of Science in pharmaceutical chemistry. (Univ. Cat. 1903, p. 47.)

Ohio State University, College of Pharmacy (*Phar. C., B. Sc.*).—Gives the degree of Pharmaceutical Chemist upon completion of the two years' course, and on completion of the four years' course the degree of Bachelor of Science in pharmacy. (Cat. 1902, p. 16.)

Vanderbilt University, Department of Pharmacy (*Phar. C., Phar. M.*).—Gives Pharmaceutical Chemist upon completion of a two years' course, practical experience in pharmacy not being required. Upon graduation in pharmacy and subsequent attendance for one year the degree of Master of Pharmacy is given. (Cat. 1902, p. 26.)

Pittsburg College of Pharmacy (*Phar. G., Phar. D., Phar. C., Phar. M.*).—The degree of Graduate in Pharmacy is given after two years of instruction and four years in a drug store. The degree of Doctor of Pharmacy is given to graduates in pharmacy who have attended a third year's course of instruction. The degree of Pharmaceutical Chemist is given students who have attended three courses of instruction but have not received the practical experience required for graduation in pharmacy. Master in Pharmacy is given to those who after graduation have continued for five years in the practice of their profession and who submit a satisfactory thesis. (Cat. 1902, p. 23.)

University of Wisconsin, School of Pharmacy (*Phar. G., B. Sc., Phar. M., M. Sc.*).—The degree of Graduate in Pharmacy (Phar. G.) is conferred upon completion of either the course for two years or the course for three years (no practical experience required); Bachelor of Science, upon completion of the four years' course. Master of Pharmacy is conferred upon graduates of the shorter courses only after a year of residence at the university. They must pursue advanced work in some science or sciences allied to pharmacy and present a satisfactory thesis embodying the results of an original investigation. The degree of Master of Science can be obtained by graduates of the four years' course upon fulfillment of similar requirements. (Cat. 1901, p. 196.)

Highland Park College of Pharmacy, Des Moines, Iowa (*Phar. G., Phar. C., Phar. M., Phar. D., B. Sc.*).—The course leading to the degree of Graduate in Pharmacy includes four quarters of twelve weeks each, two in the junior course and two in the senior. The course for Pharmaceutical Chemist includes two quarters of twelve weeks each and is designed for those who have completed the Phar. G. course. The student who has completed the Phar. C. course may secure the degree of Master of Pharmacy upon completion of the regular scientific course at Highland Park College. The student who has received the degree of Pharmaceutical Chemist may secure the degree of Doctor of Pharmacy upon completion of a course to be prescribed by the faculty and the preparation of a satisfactory thesis. A special course in chemistry, covering three years, leads to the degree of Bachelor of Science. (Cat. 1901, p. 27.)

University of Michigan, School of Pharmacy (*Phar. C., B. Sc.* (*Phar.*), *M. Sc.* (*Phar.*)).—Upon completion of a two years' course (four semesters of four and one-half months each) the degree of Pharmaceutical Chemist is given. Work in a drug store is not required. There is also an academic and professional course leading to the bachelor's degree, B. Sc. (Phar.). Students holding the degree of Bachelor of Science in pharmacy after a year of graduate study may undergo an examination for the degree of Master of Science in pharmacy. (Cat. 1902, p. 20.)

University of Minnesota, College of Pharmacy (*Phar. C., Phar. M., Phar. D.*).—The degree of Pharmaceutical Chemist is given upon completion of a two years' course. Drug store experience is not required. A graduate course of one year leads to the degree of Master of Pharmacy, and of two years to the degree of Doctor of Pharmacy. (Cat. 1900.)

Philadelphia College of Pharmacy (*Phar. D., Phar. C., Phar. M.*).—The degree of Doctor in Pharmacy is given upon completion of a course of three years by students having four years of experience in a pharmacy. If the student has not the experience required, he is given the degree of Pharmaceutical Chemist. The degree of Master in Pharmacy is given to graduates who have been engaged for five years in pharmaceutical work and who present a satisfactory thesis. (Cat. 1901, p. 28.)

Cincinnati College of Pharmacy (*Phar. B., Phar. C., Phar. M., Phar. D.*).—The degree of Bachelor of Pharmacy is given to students who attend a full course of lectures and laboratory instruction, including two and one-half full days per week in the laboratories. The degree of Pharmaceutical Chemist is given upon completion of a course of instruction covering a period of four days per week. Students who meet the above requirements and possess the legal qualifications to practice pharmacy, upon further attendance on a course in chemistry, therapeutics, and bacteriology, receive the degree of Master of Pharmacy. Any graduate of the Cincinnati College of Pharmacy who has been in the drug business five years after graduation, who meets the above requirements, presents a satisfactory thesis, and attends a special course in theoretical and applied chemistry, may receive the degree of Doctor of Pharmacy. (Journal, June, 1901.)

e An evening school.

f George W. Watts, of Durham, N. C., gave $5,000 to the endowment fund, and completed, in addition, payments on a chapel which cost $21,000—his gift to the seminary.

g Rev. Dr. Wm. Bliss Ashley, of Milwaukee, recently deceased, left $7,200 of this amount.
