HUMBOLDT STATE TEACHERS COLLEGE
AND JUNIOR COLLEGE
ARCATA, CALIFORNIA

EDITORIAL NOTE

This volume follows essentially the arrangement described in the editorial note in the Proceedings for 1921. The material relating directly to the activities of the Association itself has been collected in the front of the book, which in a measure takes the place of the Association's Yearbook where formerly was gathered official information of permanent value. Here appear the lists of affiliated associations and of members of the Representative Assembly.

This volume is the largest the Association has issued. The increased size is due to the addition of two new departments—Immigrant Education and Elementary School Principals—and to the full programs of some of the older departments at Chicago and at Boston.

The current publications of the Association include in addition to this volume (1) occasional bulletins, programs, and reports; (2) the Legislative Commission series; (3) bulletins of the Research Division; and (4) THE JOURNAL. Among the publications issued by the departments of the Association are (1) *The Journal of Rural Education*; (2) *The Bulletin of the Department of Elementary School Principals*; and (3) bulletins of the Department of Superintendence. The publications of the respective departments are sent only to members of these departments and to such others as subscribe for them. They are not included in the regular \$5 N. E. A. membership.

Responsibility for seeing this volume through the press has been largely assumed by the assistant editor, Miss Jessie M. Robbins. The printing has been done by Messrs. Judd and Detweiler, of Washington, the printers of THE JOURNAL. The volumes from 1896 to 1921 were printed by the University of Chicago Press, to which the Association owes a debt of gratitude for its excellent work. The change was made in order to have the Association's printing within immediate reach of its permanent headquarters.

National Education Association of the United States

1857—1870

THE NATIONAL TEACHERS ASSOCIATION

Organized August 26, 1857, at Philadelphia, Pennsylvania.

PURPOSE—*To elevate the character and advance the interests of the profession of teaching, and to promote the cause of popular education in the United States.*

The name of the association was changed at Cleveland, Ohio, on August 15, 1870, to the "National Educational Association."

1870—1907

NATIONAL EDUCATIONAL ASSOCIATION

Incorporated under the laws of the District of Columbia, February 24, 1886, under the name, "National Education Association," which was changed to "National Educational Association," by certificate filed November 6, 1886.

1907—

NATIONAL EDUCATION ASSOCIATION OF THE UNITED STATES

Incorporated under a special act of Congress, approved June 30, 1906, to succeed the "National Educational Association." The charter was accepted and by-laws were adopted at the Fiftieth Anniversary Convention held July 10, 1907, at Los Angeles, California.

ACT OF INCORPORATION

AN ACT TO INCORPORATE THE NATIONAL EDUCATION ASSOCIATION OF THE UNITED STATES

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled:

SECTION 1. That the following-named persons, who are now officers and directors and trustees of the National Educational Association, a corporation organized in the year eighteen hundred and eighty-six, under the Act of General Incorporation of the Revised Statutes of the District of Columbia, viz.: *Nathan C. Schaeffer, *Eliphalet Oram Lyte, *John W. Lansinger, of Pennsylvania; Isaac W. Hill, of Washington, D. C.; Arthur J. Matthews, of Arizona; John H. Hinemon, *George B. Cook, of Arkansas; Joseph O'Connor, *Josiah L. Pickard, Arthur H. Chamberlain, of California; *Aaron Gove, *Ezekiel H. Cook, Lewis C. Greenlee, of Colorado; Charles H. Keyes, of New York; *George W. Twitmyer, of Delaware; *J. Ormond Wilson, *William T. Harris, Alexander T. Stuart, of the District of

* Deceased.

Columbia; Clem Hampton, of Florida; *William M. Slaton, of Georgia; *Frances Mann, of Idaho; J. Stanley Brown, *Albert G. Lane, *Charles I. Parker, *John W. Cook, *Joshua Pike, Albert R. Taylor, *Joseph A. Mercer, of Illinois; *Nebraska Cropsey, Thomas A. Mott, of Indiana; John D. Benedict, of Indian Territory; John F. Riggs, Ashley V. Storm, of Iowa; John W. Spindler, Jasper N. Wilkinson, *A. V. Jewett, *Luther D. Whittemore, of Kansas; William Henry Bartholomew, of Kentucky; *Warren Easton, of Louisiana; *John S. Locke, of Maine; *M. Bates Stephens, of Maryland; Charles W. Eliot, *Mary H. Hunt, Henry T. Bailey, of Massachusetts; Hugh A. Graham, Charles G. White, William H. Elson, of Michigan; *William F. Phelps, *Irwin Shepard, John A. Cranston, of Minnesota; Robert B. Fulton, of Mississippi; *F. Louis Soldan, *James M. Greenwood, William J. Hawkins, of Missouri; *Oscar J. Craig, of Montana; George L. Towne, of Nebraska; *Joseph E. Stubbs, of Nevada; James E. Klock, of New Hampshire; *James M. Green, John Enright, of New Jersey; *Charles M. Light, of New Mexico; *James H. Canfield, Nicholas Murray Butler, *William H. Maxwell, Charles R. Skinner, *Albert P. Marble, James C. Byrnes, of New York; James Y. Joyner, Julius Isaac Foust, of North Carolina; *Pitt Gordon Knowlton, of North Dakota; Oscar T. Corson, Jacob A. Shawan, Wells L. Griswold, of Ohio; Edgar S. Vaught, Andrew R. Hickham, of Oklahoma; *Charles Carroll Stratton, Edwin D. Ressler, of Oregon; Thomas W. Bicknell, Walter Ballou Jacobs, of Rhode Island; David B. Johnson, Robert P. Pell, of South Carolina; Moritz Adelbert Lange, of South Dakota; *Eugene F. Turner, of Tennessee; Lloyd E. Wolfe, of Texas; David H. Christensen, of Utah; *Henry O. Wheeler, Isaac Thomas, of Vermont; Joseph L. Jarman, of Virginia; Edward T. Mathes, of Washington; T. Marcellus Marshall, Lucy Robinson, of West Virginia; *Lorenzo D. Harvey, of Wisconsin; *Thomas T. Tynan, of Wyoming; Cassia Patton, of Alaska; Frank H. Ball, of Porto Rico; Arthur F. Griffiths, of Hawaii, C. H. Maxson, of the Philippine Islands, and such other persons as now are or may hereafter be associated with them as officers or members of said Association, are hereby incorporated and declared to be a body corporate of the District of Columbia by the name of the "National Education Association of the United States," and by that name shall be known and have perpetual succession with the powers, limitations, and restrictions herein contained.

SEC. 2. That the purpose and object of the said corporation shall be to elevate the character and advance the interests of the profession of teaching and to promote the cause of education in the United States. This corporation shall include the National Council of Education and the following departments, and such others as may hereafter be created by organization or consolidation, to wit: The Departments, first, of Superintendence; second, of Normal Schools; third, of Elementary Education; fourth, of Higher Education; fifth, of Manual Training; sixth, of Art Education; seventh, of Kindergarten Education; eighth, of Music Education; ninth, of Secondary Education; tenth, of Business Education; eleventh, of Child Study; twelfth, of Physical Education; thirteenth, of Natural Science Instruction; fourteenth, of School Administration; fifteenth, the Library Department; sixteenth, of Special Education; seventeenth, of Indian Education; the powers and duties and the number and names of these departments and of the National Council of Education may be changed or abolished at the pleasure of the corporation, as provided in its by-laws.

SEC. 3. That the said corporation shall further have power to have and to use a common seal, and to alter and change the same at its pleasure; to sue or to be sued in any court of the United States, or other court of competent jurisdiction; to make by-laws not inconsistent with the provisions of this act or of the Constitution of the United States; to take or receive, whether by gift, grant, devise, bequest, or purchase, any real or personal estate, and to hold, grant, convey, hire, or lease the same for the purpose of its incorporation; and to accept and

* Deceased.

administer any trust of real or personal estate for any educational purpose within the objects of the corporation.

SEC. 4. That all real property of the corporation within the District of Columbia, which shall be used by the corporation for the educational or other purposes of the corporation as aforesaid, other than the purposes of producing income, and all personal property and funds of the corporation held, used, or invested for educational purposes aforesaid, or to produce income to be used for such purposes, shall be exempt from taxation; *provided*, however, That this exemption shall not apply to any property of the corporation which shall not be used for, or the income of which shall not be applied to, the educational purposes of the corporation; and, *provided further*, That the corporation shall annually file, with the Commissioner of Education of the United States, a report in writing, stating in detail the property, real and personal, held by the corporation, and the expenditure or other use or disposition of the same, or the income thereof, during the preceding year.

SEC. 5. That the membership of the said corporation shall consist of three classes of members—viz., active, associate, and corresponding—whose qualifications, terms of membership, rights, and obligations shall be prescribed by the by-laws of the corporation.

SEC. 6. That the officers of the said corporation shall be a President, twelve Vice-Presidents, a Secretary, a Treasurer, a Board of Directors, an Executive Committee, and a Board of Trustees.

The Board of Directors shall consist of the President, the First Vice-President, the Secretary, the Treasurer, the chairman of the Board of Trustees, and one additional member from each State, territory, or district, to be elected by the active members for the term of one year, or until their successors are chosen, and of all life directors of the National Education Association. The United States Commissioner of Education, and all former Presidents of the said Association now living, and all future Presidents of the Association hereby incorporated, at the close of their respective terms of office, shall be members of the Board of Directors for life. The Board of Directors shall have power to fill all vacancies in their own body; shall have in charge the general interests of the corporation, excepting those herein intrusted to the Board of Trustees; and shall possess such other powers as shall be conferred upon them by the by-laws of the corporation.

The Executive Committee shall consist of five members, as follows: the President of the Association, the First Vice-President, the Treasurer, the Chairman of the Board of Trustees, and a member of the Association, to be chosen annually by the Board of Directors, to serve one year. The said committee shall have authority to represent, and to act for the Board of Directors in the intervals between the meetings of that body, to the extent of carrying out the legislation adopted by the Board of Directors under general directions as may be given by said board.

The Board of Trustees shall consist of four members, elected by the Board of Directors for the term of four years, and the President of the Association, of the Board of Directors, held during the annual meeting of the Association who shall be a member *ex officio* during his term of office. At the first meeting at which they were elected, they shall elect one trustee for the term of four years. All vacancies occurring in said Board of Trustees, whether by resignation or otherwise, shall be filled by the Board of Directors for the unexpired term; and the absence of a trustee from two successive annual meetings of the board shall forfeit his membership.

SEC. 7. That the invested fund now known as the "Permanent Fund of the National Educational Association," when transferred to the corporation hereby created, shall be held by such corporation as a Permanent Fund and shall be in charge of the Board of Trustees, who shall provide for the safekeeping and investment of such fund, and of all other funds which the corporation may receive

by donation, bequest, or devise. No part of the principal of such Permanent Fund or its accretions shall be expended, except by a two-thirds vote of the active members of the Association present at any annual meeting, upon the recommendation of the Board of Trustees, after such recommendation has been approved by vote of the Board of Directors, and after printed notice of the proposed expenditure has been mailed to all active members of the Association. The income of the Permanent Fund shall be used only to meet the cost of maintaining the organization of the Association and of publishing its annual volume of *Proceedings*, unless the terms of the donation, bequest, or devise shall otherwise specify, or the Board of Directors shall otherwise order. It shall also be the duty of the Board of Trustees to issue orders on the Treasurer for the payment of all bills approved by the Board of Directors, or by the President and Secretary of the Association acting under the authority of the Board of Directors. When practicable, the Board of Trustees shall invest, as part of the Permanent Fund, all surplus funds exceeding five hundred dollars that shall remain in the hands of the Treasurer after paying the expenses of the Association for the previous year, and providing for the fixed expenses and for all appropriations made by the Board of Directors for the ensuing year.

The Board of Trustees shall elect the Secretary of the Association, who shall also be secretary of the Executive Committee, and shall fix the compensation and the term of his office for a period not to exceed four years.

SEC. 8. That the principal office of the said corporation shall be in the city of Washington, District of Columbia; *provided*, That the meetings of the corporation, its officers, committees, and departments, may be held, and that its business may be transacted, and an office or offices may be maintained, elsewhere, within the United States, as may be determined by the Board of Directors, or otherwise in accordance with the by-laws.

SEC. 9. That the charter, constitution, and by-laws of the National Educational Association shall continue in full force and effect until the charter granted by this act shall be accepted by such Association at the next annual meeting of the Association, and until new by-laws shall be adopted; and that the present officers, directors, and trustees of said Association shall continue to hold office and perform their respective duties as such until the expiration of terms for which they were severally elected or appointed, and until their successors are elected. That at such annual meeting the active members of the National Educational Association, then present, may organize and proceed to accept the charter granted by this act and adopt by-laws, to elect officers to succeed those whose terms have expired or are about to expire, and generally to organize the "National Education Association of the United States"; and that the Board of Trustees of the corporation hereby incorporated shall thereupon, if the charter granted by this act be accepted, receive, take over, and enter into possession, custody, and management of all property, real and personal, of the corporation heretofore known as the National Educational Association incorporated as aforesaid, under the Revised Statutes of the District of Columbia and all its rights, contracts, claims, and property of every kind and nature whatsoever, and the several officers, directors, and trustees of such last-named Association, or any other person having charge of any of the securities, funds, books, or property thereof, real or personal, shall on demand deliver the same to the proper officers, directors, or trustees of the corporation hereby created. *Provided*, That a verified certificate executed by the presiding officer and secretary of such annual meeting, showing the acceptance of the charter granted by this act by the National Educational Association, shall be legal evidence of the fact, when filed with the Recorder of Deeds of the District of Columbia; and, *provided further*, That in the event of the failure of the Association to accept the charter granted by this act at said annual meeting then the charter of the National Educational Association and its incorporate existence shall be and are hereby extended until the thirty-first day of July, nineteen hundred and eight, and

at any time before said date its charter may be extended in the manner and form provided by the general corporation law of the District of Columbia.

SEC. 10. That the rights of creditors of the said existing corporation, known as the National Educational Association, shall not in any manner be impaired by the passage of this act, or the transfer of the property heretofore mentioned, nor shall any liability or obligation, or the payment of any sum due or to become due, or any claim or demand, in any manner, or for any cause existing against the said existing corporation, be released or impaired; and the corporation hereby incorporated is declared to succeed to the obligations and liabilities, and to be held liable to pay and discharge all of the debts, liabilities, and contracts of the said corporation so existing, to the same effect as if such new corporation had itself incurred the obligation or liability to pay such debt or damages, and no action or proceeding before any court or tribunal shall be deemed to have abated or been discontinued by reason of this act.

SEC. 11. That Congress may from time to time alter, repeal, or modify this act of incorporation, but no contract or individual right made or acquired shall thereby be divested or impaired.

SEC. 12. That said corporation may provide, by amendment to its by-laws, that the powers of the active members exercised at the annual meeting in the election of officers and the transaction of business shall be vested in and exercised by a representative assembly composed of delegates apportioned, elected, and governed in accordance with the provisions of the by-laws adopted by said corporation.

Sections 1-11 were passed by Congress and approved by the President June 30, 1906. They were accepted and adopted as the constitution of the National Education Association of the United States by the active members of the National Education Association in annual session at Los Angeles, California, July 10, 1907.

Section 12 was passed by Congress and approved by the President of the United States May 13, 1920, as an amendment to the original act of Incorporation. It was accepted and adopted as an amendment to the Constitution of the National Education Association of the United States by the active members thereof in annual session at Salt Lake City, Utah, July 9, 1920.

BY-LAWS

(Complete as amended at the Annual Business Meeting of the Representative Assembly, Boston, Massachusetts, July 7, 1922.)

ARTICLE I—MEMBERSHIP

SECTION 1. The membership of the National Education Association of the United States shall consist of three classes, Active, Associate, and Corresponding, whose qualifications, rights, and obligations shall be as hereinafter prescribed.

SEC. 2. Active members of the Association shall be those actively engaged in the profession of teaching or other educational work at the time of their becoming members.

SEC. 3. The annual dues of an active member shall be \$2.00, which shall entitle him to attend all meetings of the Association and its several departments, to receive *The Journal* free, and, on application, to secure all publications of the Association at a price fixed by the Publication Committee, which shall be the approximate cost. By the payment of annual dues of \$5.00 an active member shall receive, in addition to *The Journal*, without application or other condition, the volume of Proceedings and all other regular publications of the Association, in-

cluding reports of committees and all special bulletins and announcements when issued.

SEC. 4. All life members and life directors shall have all the rights and privileges of active members without the payment of annual dues, and shall receive free without application or condition the publications of the Association.

SEC. 5. Associate members of the Association shall be persons who are not actively engaged in the profession of teaching, but interested in the promotion of education. The annual dues of an associate member shall be the same as the dues of an active member, and he shall have the same rights and privileges excepting the right to vote and hold office.

SEC. 6. Eminent educators not residing in America may be elected by the Board of Directors as corresponding members. The number of corresponding members shall not at any time exceed fifty. They shall pay no dues and may receive free the publications of the Association.

SEC. 7. The annual dues of all members shall be paid at the time of the annual meeting of the Association or shall be sent to the Secretary on or before November 1. An active member failing to pay his dues as herein provided shall forfeit the privileges of membership and after being in arrears one year shall be dropped from the list of members.

SEC. 8. The membership year shall be the same as the fiscal year of the Association, from June 1 to May 31, inclusive. New members may join at any time, and the membership of those joining between March 1 and June 1 shall extend to the end of the following membership year. Those joining after January 1 may, if they so elect, have their dues apply to membership for the following year.

SEC. 9. The Secretary of the Association shall furnish each member of the Association a membership card, declaring him to be a member of the National Education Association for the year for which his dues are paid, and as such entitled to all the rights and privileges granted by the Charter and By-laws of the Association.

SEC. 10. The right to vote shall be limited to active members of the Association whose dues are paid. The right to hold office in the Association or in any department shall be limited to active members whose dues are paid. The right to vote and hold office in the Council shall be limited to members of the Council whose dues are paid. Each active member shall have one vote.

ARTICLE II—ELECTION OF OFFICERS, REPRESENTATIVE ASSEMBLY, AND AFFILIATED ASSOCIATIONS

SECTION 1. The election of officers and transaction of business at the annual business meeting shall be by a Representative Assembly composed of delegates apportioned, elected, and governed as hereinafter provided.

SEC. 2. The President, Vice-President, Treasurer, and Directors of the Association shall be chosen by the Representative Assembly by ballot, at the annual business meeting, a majority of the votes cast being necessary for a choice. They shall continue in office until the close of the annual meeting subsequent to their election, and until their successors are chosen, except as herein provided. The Secretary and the Treasurer shall enter upon their duties at a date which shall be determined by the Board of Trustees and which shall not be later than the first of October and shall continue in office during the terms for which they are separately chosen and until their successors are duly elected.

SEC. 3. The State Teachers Association or Educational Association of a State, territory, or district, may become affiliated with the National Education Association and shall be designated an Affiliated State Association. Each Affiliated State Association shall be a State unit in the organization of the National Education Association and as such shall be entitled to representation in the Representative Assembly as hereinafter provided. The annual dues of an Affiliated State Associa-

tion shall be \$10.00 for each delegate to which said State shall be entitled, with a maximum of \$100.00. Said Association shall receive without application, or other condition, all regular publications of the National Education Association, including the Volume of Proceedings, reports of committees, and all special bulletins and announcements when issued.

SEC. 4. A local educational association or teachers' organization within a State, territory, or district may affiliate with the National Education Association and shall be designated an Affiliated Local Association. Each Affiliated Local Association shall be a local unit in the organization of the National Education Association and as such shall be entitled to representation in the Representative Assembly as hereinafter provided. The annual dues of an Affiliated Local Association shall be \$5.00, which shall entitle said Association to receive without application, or other condition, all regular publications of the National Education Association, including the Volume of Proceedings, reports of committees, and all special bulletins and announcements when issued.

SEC. 5. Each Affiliated Association, both State and local, shall be furnished a certificate of membership and shall be entitled to the active assistance and support of the National Education Association in promoting the interest of such affiliated association and its members in so far as such interests come within the purpose and object of the National Education Association as set forth in its Charter. The Secretary of the National Education Association shall, with the advice and approval of the Executive Committee, make such arrangements for mutual cooperation between the National Education Association and the State and Local Affiliated Associations as will promote the welfare of all and advance the interests of the teaching profession.

SEC. 6. Each Affiliated State Association shall be entitled to elect one delegate and one alternate to the Representative Assembly for each one hundred of its members, or major fraction thereof, who are active members of the National Education Association, up to five hundred such active members, and thereafter one delegate and one alternate for each five hundred of its members, or major fraction thereof, who are active members of the National Education Association. Such delegates shall be designated State Delegates.

SEC. 7. Each Affiliated Local Association shall be entitled to elect one delegate and one alternate to the Representative Assembly for each one hundred of its members, or major fraction thereof, who are active members of the National Education Association. Such delegates shall be designated Local Delegates.

SEC. 8. Only active members of the National Education Association shall be eligible to be delegates to the Representative Assembly, and to vote in the election of delegates in a State or Local Affiliated Association. An active member shall be permitted to vote for the election of delegates in but one Affiliated Local Association.

SEC. 9. The officers of the National Education Association as named in the Charter and the State Superintendent or Commissioner of Education of each State, territory, and district, shall be *ex officio* delegates to the Representative Assembly. The President of the Association shall preside at the annual meeting of the Representative Assembly, and the Secretary of the Association shall keep the records thereof. In case of a tie the President shall cast the deciding vote.

SEC. 10. Delegates shall file their credentials with the Secretary of the Association on blanks furnished by him for that purpose not later than ten days before the beginning of the annual meeting. The Secretary shall turn over such credentials to the Credential Committee, when appointed, with such information thereon as may be obtained from the records of the Association. The Representative Assembly shall be the final judge of the qualifications of delegates. The delegates shall have equal rights and each shall have one vote. Meetings of the Representative Assembly shall be open to the active members of the Association who shall be privileged to address the Assembly on subjects pertaining to the Association. The Representative Assembly shall adopt rules of procedure which

shall not conflict with the Charter and by-laws of the Association. It shall recommend an equitable plan for paying the expenses of delegates to the annual business meeting of the Association.

SEC. 11. The officers shall be permitted to hold meetings other than for business purposes and expenses therefor shall be provided.

ARTICLE III—DUTIES OF OFFICERS

SECTION 1. The President shall preside at all meetings of the Association, and shall perform the duties usually devolving upon the chief executive of such an association. In his absence, the ranking Vice-President who is present shall preside; and in the absence of all Vice-Presidents a chairman *pro tempore* shall be elected. The President shall prepare the program for the general sessions of the annual meeting of the Association, and, with the approval of the Executive Committee, shall determine the time and place of the general meeting of the Association and of the various departments not definitely fixed by these by-laws, and shall have the power to require such changes to be made in the programs of the Council and the departments as will promote the interest of the annual meeting. The President shall be a member *ex officio* of the Board of Trustees and chairman of the Board of Directors and of the Executive Committee. He shall sign all bills approved for payment by the Board of Directors, and all bills approved or authorized by the Executive Committee between the meetings of the Board of Directors. On the expiration of his term of office as President, he shall become first Vice-President for the ensuing year, and shall be chairman *ex officio* of the Committee on Publication.

SEC. 2. The Secretary shall keep a full and accurate record of the proceedings of the general meetings of the Association and all meetings of the Board of Directors and of the Executive Committee, shall conduct the business of the Association as provided in the articles of incorporation and the by-laws, and, in all matters not definitely prescribed therein, shall be under the direction of the Executive Committee, and, in the absence of direction by the Executive Committee, shall be under the direction of the President, and shall receive or collect all moneys due the Association and pay the same each month to the Treasurer, shall countersign all bills approved for payment by the Board of Directors, or by the Executive Committee in the interval between the meetings of the Board of Directors, or on the approval of the President acting under authority of the Board of Directors, or Executive Committee. The Secretary shall have his records present at all meetings of the Association, of the Board of Directors, and of the Executive Committee. He shall keep a list of members and shall revise said list annually. He shall be secretary of the Board of Directors, and a member of the Committee on Publication. He shall be the custodian of all the property of the Association not in charge of the Treasurer and the Board of Trustees. He shall give such bond for the faithful performance of his duties as may be required by the Board of Trustees. He shall submit his annual report to the Executive Committee not later than July 1 prior to the annual meeting of the Association, which report shall be transmitted to the Board of Directors at its annual meeting. At the expiration of his term of office, he shall transfer to his successor all money, books, and other property in his possession belonging to the Association. The Secretary shall not print, publish, nor distribute any official report or other document without the approval of the Publication Committee.

SEC. 3. The Treasurer shall receive from the Secretary and under the direction of the Board of Trustees shall hold in safekeeping all moneys paid to the Association; shall pay the same only upon the order of the Board of Trustees; shall notify the President of the Association and the chairman of the Board of Trustees whenever the surplus funds in his possession exceed five hundred dollars; shall keep an exact account of his receipts and expenditures, with vouchers for the latter; and said accounts, ending on the thirty-first day of May of each year, he shall render

to the Executive Committee not later than July 1, and when approved by said committee they shall be transmitted by the committee to the Board of Directors at the first regular meeting of the board held during the week of the annual meeting and to the Representative Assembly at the annual business meeting. The Treasurer shall give such bond for the faithful performance of his duties as may be required by the Board of Trustees. At the expiration of his term of office, he shall transfer to his successor all moneys, books, and other property in his possession belonging to the Association.

SEC. 4. The Board of Directors shall elect corresponding members as prescribed by Section 6 of Article I of these by-laws, shall elect members of the National Council of Education as provided in Section 3 of Article IV of these by-laws, shall have power to fill all vacancies in its own body and in the Board of Trustees; shall recommend to the Executive Committee the place for holding the annual meeting of the Association, the Council of Education, and the departments. The Board of Directors shall approve all bills incurred under authority of the Board of Directors, the Executive Committee, or the President and Secretary acting under the authority of the Board of Directors or Executive Committee, shall appropriate from the current funds of the year the amounts of money ordered by the Representative Assembly at the annual business meeting for the work of all special committees of research and investigation authorized and provided for at the annual business meetings, shall make a full report of the financial condition of the Association (including the reports of the Secretary, the Treasurer, and the Board of Trustees) to the Representative Assembly at the annual business meeting, and shall do all in its power to make the Association a useful and honorable institution.

SEC. 5. The Executive Committee shall assist the presiding officer in arranging for the time and place of the annual meeting of the Association, of the National Council of Education, and of the various departments.

The Executive Committee shall recommend to the Representative Assembly at the annual business meeting the appointment of special committees for investigation or research, the subjects for which may have been suggested by the National Council or by the active membership of the National Education Association or by any of its departments; it shall recommend the amount of money to be appropriated for such investigations. When such special committees are provided for and duly authorized by the Representative Assembly at the annual business meeting, the Executive Committee shall have general supervision of them, shall receive and consider all reports made by them, and shall print such reports, and present the same, together with the reports received from the Secretary, the Treasurer, and the Board of Trustees and the recommendations of the Executive Committee thereon, to the Representative Assembly at the annual business meeting. All such special committees shall be appointed by the President of the National Education Association.

The Executive Committee shall fill all vacancies occurring in the body of officers of the Association except vacancies in the Board of Directors, Board of Trustees, and the office of Secretary.

SEC. 6. The Board of Trustees shall require of the Secretary and Treasurer bonds of such amount as may be determined by said board for the faithful performance of their duties, shall make a full report of the finances of the Association to the Executive Committee not later than July 1 prior to the annual meeting of the Association, which report shall be transmitted by the Executive Committee to the Board of Directors at the first regular meeting of the board held during the week of the annual meeting of the Association. It shall choose annually its own chairman and secretary.

ARTICLE IV—THE NATIONAL COUNCIL OF EDUCATION

SECTION 1. The National Council of Education shall discuss educational questions of public and professional interest; propose to the Executive Committee, from

time to time, suitable subjects for investigation and research; have a report made at its annual meeting on Educational Progress during the Past Year; and in other ways use its best efforts to further the objects of the Association and to promote the cause of education in general.

SEC. 2. The National Council of Education shall consist of one hundred and twenty regular members, selected from the active membership of the National Education Association. Any active member of the Association is eligible to membership in the Council and each member shall be elected for six years and until his successor is elected.

SEC. 3. The annual election of members of the Council shall be held at the time of the annual meeting of the Association. The Board of Directors of the Association shall annually elect ten members and the Council ten members, and each body shall fill all vacancies in its quota of members. No State, territory, nor district in the United States shall have at one time more than seven regular members in the Council.

SEC. 4. The annual meeting of the Council shall be held during the week of the annual meeting of the Association.

SEC. 5. The absence of a regular member from two successive annual meetings of the Council shall be considered equivalent to his resignation of membership. Persons whose regular membership in the Council has expired shall be designated honorary members of the Council during the time of their active membership in the Association with the privilege of attending the regular sessions of the Council and participating in its discussions. A member who discontinues or forfeits his active membership in the Association forfeits his membership in the Council.

SEC. 6. The officers of the Council shall consist of a president, a vice-president, a secretary, and such standing committees as may be prescribed by its by-laws, all of whom shall be regular members of the Council. The Secretary of the Council shall, in addition to performing the duties pertaining to his office, furnish the Secretary of the Association a copy of the proceedings of the Council for publication.

SEC. 7. The National Council of Education is hereby authorized to adopt by-laws for its government not inconsistent with the act of incorporation or the by-laws of the Association; *provided*, That such by-laws be submitted to, and approved by, the Board of Directors of the Association before they shall become operative.

SEC. 8. The powers and duties of the Council may be changed or the Council abolished upon a two-thirds vote of the Representative Assembly taken at the annual meeting of the Association; *provided*, That notice of the proposed action has been given at the preceding annual business meeting of the Association.

ARTICLE V—DEPARTMENTS

SECTION 1. The following departments are now (1921) in existence, to wit: The departments, first, of Superintendence; second, of Normal Schools; third, of Elementary Education; fourth, of Higher Education; fifth, of Vocational Education and Practical Arts; sixth, of Kindergarten Education; seventh, of Music Education; eighth, of Secondary Education; ninth, of Business Education; tenth, of Child Hygiene; eleventh, of Physical Education; twelfth, of Science Instruction; thirteenth, of School Administration; fourteenth, the Library Department; fifteenth, of Rural Education; sixteenth, of Classroom Teachers; seventeenth, for the Promotion of the Wider Use of Schoolhouses; eighteenth, of Educational Publications; nineteenth, Deans of Women; twentieth, Department of Elementary School Principals; twenty-first, Department of Immigrant Education.

SEC. 2. Each department shall have the right to fix the qualifications of its members for the purpose of electing officers and transacting the other business of the department; *provided* active members of the Association, and no others,

shall be eligible to such department membership, and provided also that all active members of the Association shall be permitted to attend the professional programs and discussions of any department.

SEC. 3. Each department shall hold its annual meeting at the time and place of the annual meeting of the Association, except the Department of Superintendence, which may hold its annual meeting in February of each year, or at such other time as may be determined by said department, subject to the approval of the Board of Directors of the Association.

SEC. 4. The object of the meetings of the departments shall be the discussion of questions pertaining to their respective fields of educational work. The programs of these meetings shall be prepared by the respective presidents in conference with, and under the general direction of, the President of the Association. Each department shall be limited to two sessions, with formal programs, unless otherwise ordered by the President of the Association, except that a third session of business or informal round-table conference may be held at the discretion of the department officers.

SEC. 5. The officers of each department shall consist of a president, a vice-president, and a secretary, who shall be elected at the last formal session of the department to serve one year and until their successors are duly elected, and who shall, at the time of their election, be active members of the Association. In case there is a vacancy in the office of president of any of the departments, it shall be filled by an appointment made by the President of the Association. Any other departmental vacancy shall be filled by appointment made by the president of the department. Any department may provide for the creation of an executive committee and assign to it any duties consistent with the purposes of the department, and the Charter and By-Laws of the Association.

SEC. 6. The secretary of each department shall, in addition to performing the duties usually pertaining to his office, furnish the Secretary of the Association a copy of the proceedings of the meetings of the department for publication. *Provided*, no department shall establish an office outside of the general headquarters of the Association without the consent of the Executive Committee of the Association.

SEC. 7. All departments shall have equal rights and privileges, with the exception stated in Section 3 of this article. They shall be named in Section 1 of this article in the order of their establishment and shall be dropped from the list when discontinued. Each department may be governed by its own regulations in so far as they are not inconsistent with the act of incorporation or these by-laws.

SEC. 8. A new department may be established by a two-thirds vote of the Board of Directors taken at a regular meeting of the board, or by a two-thirds vote of the Representative Assembly at any annual business meeting; *provided*, That a written application for said department, with title and purpose of the same, shall have been made at the regular meeting of the board next preceding the one at which action is taken, or at the preceding annual business meeting, by at least twenty-five members engaged or interested in the field of labor in the interest of which the department is purposed to be established. A department already established may be discontinued by the Board of Directors upon a two-thirds vote taken at a regular meeting, or by a two-thirds vote of the Representative Assembly at any business meeting of the Association; *provided*, That announcement has been made of the proposed action at a regular meeting of the board the preceding year, or at the preceding annual business meeting. A department shall be discontinued when it fails to hold a regular meeting for two successive years.

SEC. 9. Any department, by a two-thirds vote of those voting at any regular business meeting, may levy a membership fee to supplement its allowance from the Association. Such membership fees shall be paid to the secretary of the department who shall transmit them monthly to the Secretary of the Association. Such funds shall be added to the department's allowance from the Association

and shall be used for the work of said department only, and shall be disbursed upon the recommendation of the executive officers of the department in the same manner as other funds of the Association are disbursed.

ARTICLE VI—COMMITTEES

SECTION 1. At the regular meeting of the Board of Directors on the first day of the annual meeting, the President shall appoint an Auditing Committee consisting of three active members of the Association, no one of whom shall be either a trustee or a director; to this committee shall be referred the report of the expert accountant, together with the communication of the President transmitting the same, as provided in Section 6 of this article; and the committee shall report its findings at the meeting of the Representative Assembly.

SEC. 2. On the first day of the annual meeting of the Association, at such time and places as shall be designated on the annual program by the President of the Association, the State and local delegates from each State shall select one member for each of the following committees: Credentials, Nominations, Resolutions, and Necrology. The Committee on Credentials shall receive the official list of the delegates from the Secretary and report thereon to the Representative Assembly.

SEC. 3. The Committee on Nominations shall meet on the third day of the annual meeting at 9:00 A. M., at a place designated by the President of the Association, and shall nominate persons, for the following offices in the Association to wit: one person for President, eleven persons for Vice-Presidents, one person for Treasurer, and one person from each State, territory, and district in the United States as a member of the Board of Directors. It shall report to the Representative Assembly at the annual business meeting.

SEC. 4. The Committee on Resolutions shall report at the annual business meeting of Representative Assembly, and except by unanimous consent, all resolutions shall be referred to said committee without discussion. This committee shall receive and consider all resolutions proposed by active members, or referred to it by the President; some time during the second day of the annual meeting of the Association the committee shall hold a meeting, at a place and time to be announced in the printed program, for the purpose of receiving proposed resolutions and hearing those who may wish to advocate them.

SEC. 5. The Committee on Necrology shall prepare for the published *Proceedings* a list of the active and corresponding members that have died during the year accompanied by memorial sketches whenever practicable.

SEC. 6. Within thirty days prior to the time of the annual meeting of the Association, the President shall appoint a competent person, firm, or corporation licensed to do business as expert accountants; the accountants so appointed shall examine the accounts, papers, and vouchers of the Secretary, the Treasurer, and the Board of Trustees, and compare the same, and shall also examine the securities of the Permanent Fund held by the Board of Trustees. The report of said accountants shall be filed with the President before the opening day of the annual meeting of the Association, and shall be by him submitted with such comments as he may think proper, to the Board of Directors, at their meeting held on the first day of the annual meeting of the Association.

ARTICLE VII—MEETINGS

SECTION 1. A stated meeting of the Association, of the Council of Education, and of each department shall be held annually at such time and place as shall be determined by the Board of Directors or the Executive Committee acting for the board in accordance with these by-laws. An annual meeting of the Association and its subordinate bodies may be omitted for an extraordinary cause, upon the written consent of two thirds of the directors of the Association, obtained by the Executive Committee.

SEC. 2. The annual business meeting of the Representative Assembly shall begin on the second day of the annual meeting at 9:00 A. M. A regular meeting of the Board of Directors shall be held on the first day of the annual meeting at 10:30 A. M. The first regular meeting of the new Board of Directors shall be held as soon as practicable and within twenty-four hours after the close of the last session of the annual meeting, the place and time of the meeting to be announced in the printed program. The Board of Trustees shall hold its annual meeting at some convenient time and immediately following the meeting of the new Board of Directors referred to above in this section. Special meetings of the trustees may be called by the chairman, and shall be called on request of the majority of the Board of Trustees. Due notice of all meetings of the Board of Trustees shall be given to every member of the board by the secretary thereof.

ARTICLE VIII—PROCEEDINGS

SECTION 1. The proceedings of the Association, the Council, the departments, the commissions and committees, shall be published at the discretion of and under the direction of a committee appointed by the executive committee, *provided*, That in the opinion of the executive committee the funds of the Association warrant the publication. Each member of the Association shall be entitled to a copy of the *Proceedings*.

SEC. 2. No paper, lecture, nor address shall be read before the Association or any of the departments in the absence of the author, without the approval of the President of the Association or of the departments interested, nor shall any such paper, lecture, or address be published in the *Proceedings* without the approval of the Publication Committee.

ARTICLE IX—QUORUM

SECTION 1. Representatives from twenty-five States and territories shall constitute a quorum in all meetings of the Representative Assembly and of the Board of Directors.

ARTICLE X—APPROPRIATIONS

SECTION 1. Unless otherwise ordered by the Representative Assembly at the annual business meetings, not less than 10 per cent of the gross income of the Association each year shall be set aside for such educational investigations and studies as may be ordered in accordance with Section 5 of Article III.

ARTICLE XI—AMENDMENTS

SECTION 1. These by-laws may be altered or amended at the annual meeting of the Representative Assembly by unanimous *vote*, or by a two thirds vote of the Representative Assembly if the alteration or amendment shall have been proposed in writing at the annual business meeting next preceding the one at which action is taken, and due announcement of the proposed action shall have been made in the official publication of the Association.

NATIONAL EDUCATIONAL ASSOCIATION
NOW KNOWN AS THE
NATIONAL EDUCATION ASSOCIATION OF THE UNITED STATES

CERTIFICATE

of Acceptance of Charter and Adoption of By-Laws under Act of Congress approved June 30, 1906.

We, the undersigned, Nathan C. Schaeffer, the presiding officer, and Irwin Shepard, the Secretary of the meeting of the National Educational Association held at Los Angeles, California, on the 10th day of July, 1907, said meeting being the annual meeting of the Association held next after the passage of an act of Congress entitled "An Act to Incorporate the National Education Association of the United States,"

Do hereby certify, that at said meeting held pursuant to due notice, a quorum being present, the said Association adopted resolutions of which true copies are hereto attached, and accepted the charter of the National Education Association of the United States, granted by said act of Congress, and adopted by-laws as provided in said act and elected officers; and the undersigned pursuant to said resolutions

Do hereby certify that the National Education Association of the United States has duly accepted said charter granted by said act of Congress, and adopted by-laws, and is the lawful successor to the National Educational Association.

In witness whereof, we have hereunto signed our names this 20th day of August, 1907.

NATHAN C. SCHAEFFER, *Presiding Officer*
IRWIN SHEPARD, *Secretary*

VERIFICATION

RESOLUTIONS ADOPTED BY THE ACTIVE MEMBERS, JULY 10, 1907

1. *Resolved*, That the National Educational Association hereby accepts the charter granted by an act of Congress entitled "An Act to Incorporate the National Education Association of the United States," passed June 30, 1906, and that the President and Secretary of this meeting be authorized and directed to execute and file with the Recorder of Deeds of the District of Columbia a verified certificate showing the acceptance by the Association of the charter granted by said act.

2. *Resolved*, That the proposed by-laws of which notice was given at the annual meeting of the Association held on July 6, 1905, which are printed in full in the Journal of said meeting, be and the same are hereby adopted to take effect immediately.

3. *Resolved*, That the Association adopt as its corporate seal a circle containing the title "National Education Association of the United States," and the dates "1857-1907."

4. *Resolved*, That the Association do now proceed to elect officers, and to organize under the charter granted by the act of Congress.

Filed in the office of the Recorder of Deeds of the District of Columbia, September 4, 1907.

Friday Afternoon, July 7, 2:00 o'clock

This afternoon was given over to programs of the departments of the Association and of the allied organizations.

REPORT OF COMMITTEE ON RESOLUTIONS

GUY E. MAXWELL, PRESIDENT STATE TEACHERS' COLLEGE,
WINONA, MINNESOTA, CHAIRMAN

The National Education Association, of 116,000 American teachers, in its Sixtieth Annual Convention, declares its profound faith in the principles of our democracy and in the indispensable character of public education as the vital force in that democracy; we here devote ourselves anew to the patriotic duty of developing intelligence, honor, and loyalty in the lives of American boys and girls.

For the teachers of the United States to come to New England is not a journey but a pilgrimage. It was here that the American public school was born. It was here that the principle of the free school, taxed, supported, and controlled by the people, had its first clear and substantial expression. It was here that the first public high school was established. It was here that Horace Mann lived and labored. To this birthplace of the American public school it is the privilege of our Association to return. From this vantage ground of a splendid tradition, it is fitting that we should proclaim anew our faith in the American public school. Here, in the nursery of American freedom, it is fitting that we should pledge again our unswerving loyalty and devotion to the American ideal of universal public education as the basic safeguard, guarantee, and bulwark of civil and religious liberty. It is especially fitting that we bespeak here, in behalf of twenty million boys and girls who must soon bear the full responsibilities of American citizenship the continued and increased interest of the American people in the welfare and progress of their most fundamental institution.

It is especially appropriate in this place and at this time to reassert a principle that has been irrevocably established in our National life—the principle, namely, that public education is more than a matter of local or even State concern; that it is in truth a matter of the deepest National concern; and that the Nation as a nation has a stake and interest in the welfare and development of every child in the land.

It is appropriate in this place and at this time to reassert this principle because its establishment was due primarily to men from New England. It was Rufus Putnam, of Massachusetts, who secured in the Land Ordinance of 1785 that far-reaching provision which has set aside for "the support and maintenance of public schools" the sixteenth section of every township in every State that has been since carved from the National domain. It was Nathan Bane, of Massachusetts, who drafted the Ordinance of 1787, which placed religion, morality, and education as the foundation of the States formed from the Northwest Territory. It was Manasseh Cutler of Massachusetts who stood first and foremost in 1787 for the Federal land grants which made possible the State universities of our Middle West. It was a senator from Vermont, Justin S. Morrill, who fought through

three sessions of Congress for the legislation which, within a decade after its approval by President Lincoln in 1862, secured the establishment in every State of the Union of a "College of Agriculture and Mechanic Arts," under National support but with complete State control. It was a sun-crowned son of Massachusetts, Charles Sumner, who fathered in the Senate the bill introduced in the House of Representatives by James A. Garfield in 1867, establishing a Federal Department of Education. It was Charles Sumner who said that, if he could have his way, he would place the head of the Department of Education in the President's Cabinet. It was another great Senator from Massachusetts, George F. Hoar, who in session after session urged Congress with cogent force to appropriate for the support of public schools throughout the country the National funds arising from the sale of public lands. It was the venerable and honored Senator Carroll S. Page, of Vermont, whose name was first connected with the legislation which is known today as the Smith-Lever act, and also with the bill now known as the Smith-Hughes act which, passed with the complete and cordial support of the New England States, has been the Nation's first great step toward the solution of the problem of vocational education.

Notwithstanding all that has been so nobly wrought, there are unfinished tasks before us. No State today can be educationally self-sufficient. No American citizen, no matter what his color, what his occupation, or what the land of his birth, can, with safety to our social order, be merely "hands and feet to fetch and carry." Human destiny, to an extent never known before, is now in the hands of the great masses of the people. The fundamental problem that now confronts us is to raise the common man, not so much to a greater degree of skill and industrial efficiency as to those high planes of thinking, feeling, and social action which the complexity and interdependence of life demand.

In full accord with these ideals and teachings, we pledge our support to the following principles and policies and invite good citizens everywhere to join us in making them effective throughout the Nation.

We reaffirm our sincere, devoted, and unqualified support of Federal aid and Federal recognition of public education, without Federal interference in any way with State and local control, as they are embodied in the Towner-Sterling bill now pending in the 67th Congress.

The question of adequate school revenues is one of the most pressing and important problems facing the country at this time. The wealth of the Nation is sufficient for all its educational needs. We ask that Congress and the State legislatures recognize the supreme importance of public education and that they set themselves to the task of providing adequate funds for its support. We believe, in order that there may be equality of educational opportunity for all children, that the State should assume a much larger responsibility for the adequate financial support of schools and that at least one half of the school revenues should be derived from State income.

We believe that the best interests of education will be served by a full

recognition of the principles that education is a State function, and that local boards of education are in this sense officers of the State; and that they should be free to determine and administer their own financial budgets, subject to general State control but unhampered by municipal authorities.

The safety of the Republic rests in a large degree with the teachers of the Nation. We call upon teachers everywhere to teach respect for law and order and for constituted authority; to impress alike upon young and old the importance of obedience to the Constitution and to all State and National laws and to local ordinances; to teach the children that the laws are made by the majority and may be changed by the majority; but that they must be obeyed by all; and that he who disobeys the Constitution or laws is an enemy of the Republic.

We approve training in American citizenship and urge that the principles of this Government as embodied in the State and National Constitutions be made an integral part of the training of every student in every school. We also urge in the interest of true Americanism that no person, unwilling to submit to these principles, be employed in the education of youth.

We declare our unqualified approval of permanent tenure for teachers during efficiency and good behavior following a reasonable probationary period; of the establishment of permanent, safe, and adequate teachers' retirement funds; of raising educational standards and attracting the finest ability to the teaching profession by an increase in teachers' salaries; and we stand unalterably opposed to a lowering of salary schedules for competent teachers in any part of the country. To these ends we urge continued activity of the National Education Association to secure the legislation in various States which will bring about these results.

We declare that the fundamental need in public education is an adequate supply of well-trained teachers; and we urge the support of every agency and policy that will increase and improve the facilities for the preparation of teachers. We urge that salaries be based upon professional preparation, the skill attained, and the quality of service rendered, irrespective of the grade or age of the children to be taught.

We call attention to the failure to provide an adequate program of education for the children living in the rural areas of our country, and we urge that the educational opportunities provided for children in rural America be made equivalent to those offered to children in the most favored urban communities.

We look to the City of Washington for leadership in matters of school administration, supervision, teaching, business management, and for the development of a sane, well-balanced and progressive educational program in city schools. In a special sense the schools of the capital city belong to the Nation. In behalf of the Nation we ask Congress to create a board of education for the City of Washington which shall be entirely free from party control, to have direct charge of its own financial budget, and which shall have a secure financial income sufficient to make these schools worthy of the capital city of the Nation.

We declare that the exclusion of Hawaii and other territories from benefits of Federal appropriations is unjust and indefensible; and we instruct the Legislative Commission of the National Education Association to urge Congress in all acts providing for Federal aid for education to place these territories on the same basis as the States.

We are unalterably opposed to the Johnson bill now pending in Congress whereby the education of the foreign-born would be placed in charge of the Naturalization Bureau. This work belongs to the Department of Education and should be placed there.

We send fraternal greetings to all national organizations of teachers in foreign lands, expressing our desire and readiness to join them in the leadership which shall promote the cause of truth and of international understanding. To this end we commend the work of the Association's Committee on Foreign Relations in preparing for a world conference on education in 1923.

We rejoice in the reduction of world armaments already accomplished. We believe that international peace and good-will, brought about by mutual understanding and confidence, will be more speedily realized by education than by any other means. We therefore recommend that revenues released by the reduction of armaments be used in the promotion of education.

We express our sincere appreciation of the fine hospitality which has been shown the members of the Association by the committees, organizations, press, and citizens of Boston and vicinity. There has been evidence everywhere of careful foresight and of untiring effort on the part of scores of volunteer workers who have contributed to the success of the Sixtieth Annual Convention of the Association.

MINUTES OF BOSTON MEETING OF THE
REPRESENTATIVE ASSEMBLY¹

BOSTON, JULY 5, 6, AND 7

First Business Session—The First Business Session of the Boston meeting was called to order by the Secretary, Wednesday morning, July 5, 1922, at Mechanics Hall at 9 o'clock, and after making a few announcements he requested the audience to remain at ease until a larger number of delegates had arrived. A few minutes later the President, Miss Charl Ormond Williams, on being assured that a quorum was present, took charge of the meeting and announced that the first order of business would be a report of the Committee on Credentials, and called on Miss Middleton, of Arkansas, chairman of the sub-committee, to make the report.

Miss Middleton reported as follows:

We, the Sub-committee on Credentials, beg leave to report that we have examined the list of names as filed in the Secretary's office and find that there are 806 properly accredited delegates, and we recommend that they be seated in the Assembly. We further recommend that those delegates who have not yet submitted credentials be accepted and seated on presentation of the delegate's credential card furnished by the Secretary and endorsed by the committee. We further recommend that the Credentials Committee be continued in office until its successor is elected at the next regular meeting of the Association.

A motion was passed to adopt the report of the Committee.

The Chairman stated that she desired to appoint a Committee on Rules if there were no objections, and hearing no objections she appointed the following on the Committee: Mr. Owen, Illinois, Chairman; Mr. Beach, Washington; Mr. Doudna, Wisconsin; Miss McSkimmon, Massachusetts; and Miss France, Tennessee.

The Chairman of the Committee, Dr. Owen, was then recognized and moved that the Rules of Procedure of this Representative Assembly be the same as those of the Des Moines meeting until a new report of rules should be submitted by the Committee and adopted by the Assembly. The motion was seconded. On request of the President, Dr. Owen then read the rules for the information of the Assembly. The rules are as follows:

1. Seating and Organization of Delegates: The delegates from the several States, Territories, and Districts shall be seated in a body. Each State delegation shall elect a Chairman of the delegation to serve through the annual meeting.

2. Delegates and Alternates: In the absence of a delegate from any meeting of the Representative Assembly the alternate shall have the right to vote in his stead. In the absence of a delegate and his alternate no other person shall be authorized to vote in their stead. Where a State or local affiliated association is represented by more than one delegate or alternate, in the absence of any delegate from the meeting of the Representative Assembly, the delegates from that State or local affiliated association shall select the alternate to act.

3. Debates: In debate on any motion each speaker shall be limited to five minutes unless his time be extended either (1) by unanimous consent or (2) by vote of the Representative Assembly.

¹ This is a brief statement of the proceedings of the three business sessions of the Representative Assembly. The complete copy of the notes taken by the reporter is in the Secretary's office.

4. Voting: No person may cast more than one vote in the proceedings of the Representative Assembly. In the taking of a roll call it shall be done by States; the Chairman of each State delegation shall announce the ayes and noes on the question.

5. Parliamentary Procedure: Roberts' Rules of Order is adopted as the authority on parliamentary procedure.

The motion was unanimously carried.

The Chairman stated that the next order of business would be the presentation of the report of the Committee on Salaries, Tenure, and Pensions and that Miss Snow, of Washington, acting Chairman of the Committee would make the report.

Miss Snow stated that at a meeting of the Committee it was decided that the Chairman of each sub-committee should present a report. She called upon Mr. Carlson, of Minnesota, Chairman of the Sub-committee on Pensions who reported as follows:

Madam President, you have heard that the Committee on Salaries, Tenure, and Pensions met yesterday morning and unanimously adopted the following resolution which we submit to the Representative Assembly for its endorsement. We believe that no subject coming before the Association at this time is more vital to the progress and advancement of American education and the legitimate professional interest of the teachers than the establishment of satisfactory permanent teachers' retirement funds where such funds do not now exist. We urge the membership of the National Education Association in each State to take such steps as will secure the enactment of legislation providing such funds where they do not now exist. Every year of delay increases the burden of superannuation and the resultant inefficiency in our public schools, and causes privation to hundreds and anxiety to thousands of teachers.

We believe that satisfactory results can be secured with the greatest expedition and certainty if the Association continues the work which it has begun and authorizes and directs the appropriate committee to hear all persons interested in the problem and directs the committee to prepare and complete its report with conclusions and recommendations sufficiently in advance of the next annual meeting to permit it to be printed in the *Journal* at least one month before the annual meeting, and that such report be submitted to the Representative Assembly in such manner as the Representative Assembly shall decide. Dated at Boston, Mass., July 4, 1922, and submitted to the Representative Assembly July 5, 1922, for its endorsement.

Madam President, I wish as Chairman of the Pensions Division of that committee to speak to that report.

After giving a history of the pension movement and giving reasons why the Association should give special attention to this important question, Mr. Carlson moved the acceptance and adoption of the recommendations of the committee. The motion was seconded and carried.

Miss Sally Hill was then called upon to present the report of the Sub-committee on Tenure, and in the absence of the Chairman, Dr. Updegraff, reported as follows:

Madam President, and members of the Delegate Body: The Committee on Tenure has very little to report. What there is has been printed and is in your hands, but the following resolution was adopted by the committee as a whole for your endorsement to be handed to the Resolutions Committee, and this is the resolution as drawn up by the Committee on Salaries, Tenure, and Pensions:

Whereas, the tenure situation in most States is deplorable, the boards of education having absolute right to dismiss or decline to re-employ teachers for any

reason or no reason whatever; and whereas, certain boards have used this arbitrary power to the detriment of the schools;

Be it therefore *resolved*: That the Representative Assembly of the National Education Association go on record opposing this practice and urge its membership in each State to take such steps as will secure the enactment of legislation by their respective State legislatures that will guarantee permanency of tenure during efficiency and good behavior following a reasonable probationary period.

Miss Hill said that she did not think it necessary for any one to speak on the need of a tenure bill and moved the approval of the report to be presented as a part of the resolutions.

It was announced by the Chair that the convention endorsed the report and that it would be reported to the Resolutions Committee to become a part of the report on Resolutions.

Miss Snow, Chairman of the Sub-division on Salaries, then called attention to the Report on Salaries which was in the hands of delegates in printed form. After pointing out important items in the report Miss Snow stated that at a meeting of the full committee on Salaries, Tenure, and Pensions yesterday, the following recommendation was adopted to be submitted for the consideration of the Representative Assembly.

That the Committee on Salaries, Tenure, and Pensions as a standing committee of the National Education Association be discontinued, and that three committees, one on salaries, one on tenure, and one on pensions be established by the delegate assembly.

She moved the adoption of the report and recommendations. The motion was seconded.

Miss Haley, of Chicago, spoke against separating the committee into three distinct parts and criticised the work of the Committee on Salaries, Tenure, and Pensions since the time of the Salt Lake City meeting.

Miss Snow again spoke in support of her motion.

Mr. Marshall, of West Virginia, moved to table the motion. The motion was seconded and lost.

The motion made by Miss Snow was then put and carried.

Miss Williams, the President, then called on Dr. Driver, of Pennsylvania, Chairman of the Committee on County Superintendents' Problems, to present the report for his committee. He presented an able report which will appear in full in this volume of Proceedings. A motion was passed to receive the report.

The presiding officer, at this point in the program, announced the winners of the banners, one banner having been offered to the State having the greatest percentage of its teachers as members of the State Association, and one banner to the State having the greatest percentage of its teachers for membership in the National Education Association. It was announced that Utah had secured the largest percentage of teachers for membership in the National Education Association and that Wyoming had secured the largest percentage of teachers for membership in the State Association. It was explained that the enrolment of members in the National Association from the Hawaiian Islands was on a par with that of the highest States, and hence the Executive Committee had decided to award a special

banner to the Hawaiian Islands. On the request of the Chairman the delegates from Utah, Wyoming, and the Hawaiian Islands came to the platform and received their banners. There was great applause as the delegates stood beside their respective banners on the platform singing "For He's A Jolly Good Fellow." Mr. Hoopii, of Hawaii, sang "Aloha Oe" in the Hawaiian language, receiving an ovation from the audience.

The Chairman announced that the next order of business would be the report of the Rural School Committee, and called on John F. Sims, of Wisconsin, chairman of the committee, to make the report. (This report is published in this volume of Proceedings.)

At this point Miss Williams called Dr. Homer H. Seerley, of Iowa, to the chair.

On motion the report of the Rural Committee was received as read by Mr. Sims.

The Chairman then called on Henry J. Ryan, chairman of the Committee on Education of the American Legion to make the report for the Joint Committee of the American Legion and the National Education Association. (This report is published in this volume of Proceedings.) The report was enthusiastically received by the audience, and on motion was unanimously accepted and adopted by the Representative Assembly. The Chairman announced that the report was accepted saying, "Now let us go out and see that the thing that we have adopted during Education Week be given such harmonious coöperation as to bring about the most marvelous success."

He then announced that the first business session of the Assembly was adjourned.

SECOND BUSINESS SESSION

THURSDAY FORENOON, JULY 6, 1922

Second Business Session—The second business session of the Representative Assembly was held in Mechanics Building, Thursday forenoon, July 6, 1922, being called to order at 9 o'clock by William B. Owen, of Illinois, who announced that a quorum not being present the audience would be at ease until a larger number of delegates had arrived. A few minutes later Miss Williams, President of the Association, asked all delegates to be seated as quickly as possible, announcing that a quorum was present, and that the first order of business would be the report of the Commission on Research Agencies by Mr. Jesse H. Newlon, of Colorado, chairman of the committee. Mr. Newlon then gave the report of the Committee. (This report is published in this volume of Proceedings.) On motion the report was received by the Representative Assembly.

The Chairman announced as the next order of business the report of the Committee on Foreign Relations, and called on Dr. A. O. Thomas, of Maine, chairman of the committee, to present the report.

After presenting the report Dr. Thomas moved that it be accepted. The

motion was seconded and carried by unanimous vote. (The report is published in full in this volume of Proceedings.)

After announcements by the Secretary the Chairman announced as the next order of business the report of the Committee on Sources of Revenue by Dr. William B. Owen, of Illinois, chairman of the committee.

After presenting the report, which is published in full in the *Journal* and the Volume of Proceedings, Dr. Owen moved that it be accepted. His motion was seconded and carried.

The Chairman announced the next order of business to be the report of the Committee on Health Problems by Dr. Thomas D. Wood, of New York, Chairman of the Committee, in whose absence Miss Ada Van Stone Harris was called upon to present the report. After the report was read by Miss Harris a motion was made to accept the report but on the suggestion of Miss Haley the word "receive" was substituted for the word "accept." The motion was then seconded and carried to receive the report of the committee.

A motion was then made by Miss Haley, of Chicago, that it be the sense of this body that the copyright of any publication relating to that report be held in the name of the National Education Association and that no individual or association has any right to any royalties from it. The motion was seconded.

After discussion it was suggested that the matter be referred to the Executive Committee, and with the permission of Miss Haley a motion was made to refer the question to the Executive Committee for decision. This motion was carried by unanimous vote.

The next order of business as announced by the Chairman was the report of the Legislative Commission by its Chairman, George D. Strayer, of New York. The report was enthusiastically received by the Representative Assembly, and after the Chairman had finished reading it, Dr. Payson Smith, of Massachusetts, made the following motion: "I want to move that this really great report be accepted and that it be referred to the Executive Committee with the recommendation from this Assembly that the report be printed for wide-spread distribution." The motion was seconded. A delegate inquired whether the acceptance of this report meant the endorsement of the Towner-Sterling bill, and was informed by the Chairman that it did. Then this delegate announced that she was opposed to the Towner-Sterling bill. At this point Dr. Owen, of Chicago, was called to the chair. He stated that the motion was before the house and open for discussion. There being no discussion he called for all in favor of the motion to say aye. (There were many ayes.) He then called for those opposed to say no. There was one no.

The Chairman then announced that the motion was carried, and after making a number of announcements he stated that the morning session was adjourned.

THIRD BUSINESS SESSION

BOSTON, JULY 7, 1922

Third Business Session—The third business session of the Representative Assembly was held in Loew's State Theater, Boston, on July 7, 1922, Friday forenoon, beginning at 9 o'clock. The meeting was called to order by the President, Miss Charl O. Williams. She said that she would wait a few moments before taking up the business of the day. A few minutes later she called on the Secretary to read the minutes of the Des Moines meeting.

The Secretary explained that the minutes of the Des Moines meeting had been printed in the *Journal* and also in a pamphlet which had been placed in the hands of every delegate, containing the charter, by-laws, and the minutes of the Des Moines meeting. He asked whether, under the circumstances, the Association wanted to hear the reading of the minutes.

A motion was made, seconded, and carried that the minutes of the Des Moines meeting be adopted as presented in the report to the delegates.

The President stated that the next order of business would be the presentation of the Treasurer's report by Miss Cornelia S. Adair, of Virginia, Treasurer of the Association. Miss Adair called attention to the growth of the Association and the increase in income from membership dues, and also the increased income from advertising and from commercial exhibits. She believed that the idea of having a budget plan for the payment of dues had commended itself to members, and urged that affiliated associations and schools give further attention to the plan during the coming year. She recommended that an effort be made to secure a number of life memberships. She then called attention to the printed report which was in the hands of the delegates and moved that the Treasurer's report be adopted. The motion was seconded, put, and unanimously carried. The financial statement of the Treasurer is printed under the general heading Complete Report of the Auditors following the minutes of the business sessions in the Volume of Proceedings (p. 66).

The President then called on the Secretary to present his annual report. The Secretary called attention to the fact that the report was in printed form and in the hands of the delegates. He called attention to the reports of the heads of departments of the central office as well as to the part of the report which had been prepared by himself. He then moved that the report be received. The motion was seconded and carried. (This report is printed in full in this volume of Proceedings.)

Mr. Springer at this point made the suggestion that in making charts showing the growth in membership that the associate members should be counted during the years when there were both active and associate members. The Chairman expressed approval and referred the matter to the Secretary.

The President announced that the next order of business would be the report of the Board of Trustees by the Chairman, Mr. Pearse, of Wisconsin.

In presenting the report of the Board of Trustees Chairman Pearse explained the main items in the printed report, and called attention to the excellent condition of the funds of the Association. He said that although \$98,000 represented the purchase price of the headquarters' property, it could be sold at the present time for more than \$135,000. He then moved that the report be received and approved. The motion was seconded and carried.

The report as approved by the auditor is printed under the heading The Complete Report of the Auditors following the minutes of the business sessions.

The Secretary explained that he had the complete minutes at hand for all meetings of the Association for a period of five years. He stated that Miss Chase was present with the original credentials of all delegates of the Representative Assembly.

The Secretary then read the report of the Auditing Committee which was signed by M. C. Lefler, A. J. Matthews, and F. L. Schlagle, which is as follows:

Your Auditing Committee begs leave to state that it has examined the report of the Board of Trustees and the report of the Treasurer of the National Education Association, together with the report of the Secretary's office showing the cash receipts and disbursements for the year ending May 31, 1922, as prepared and audited by Marwick, Mitchell & Company, New York, N. Y., certified accountants and auditors, and found them in order, and to the best knowledge and belief of the Committee, true and correct.

It was then moved, seconded, and carried that the report be received.

After calling on the Secretary for announcements the Chairman called for a report of the Committee on Necrology and asked Mr. Green, of Missouri, Chairman of the Committee, to make the report. The following is the report which was presented by Mr. Green:

Ladies and Gentlemen of this Association: It is apparent that the Committee on Necrology in the past, because of its dealing with the dead, has been considered a dead committee. However, thirteen States met at the appointed time and place, as indicated in this program, and appointed a sub-committee and empowered the members to act to provide some sort of report to make at this time. Last evening after the evening's program was over we had a short session, hearing from this sub-committee.

The report in substance is simply this: They have divided the country, geographically speaking, into three parts, each of the three members of this sub-committee having in charge a geographical division. They are therefore to communicate with the Directors recently elected for their respective States to secure from them and through them any notices of deaths within their boundaries of members of this Association, and these in turn will be reported to Secretary Crabtree, who will very likely report them through the columns of the *Journal*.

That is all the report we have to make, and I trust that it is a movement in the right direction to have more attention given to our distinguished members who have passed to the Great Beyond.

The President then stated that if these were no objections she would consider that the report had been received and that its recommendations were to be followed. Hearing no objections she announced that that would be considered as the action of the Representative Assembly.

At this point Mr. Nusbaum, of Pennsylvania, addressed the chair and was given the privilege of presenting an invitation to a representative for holding the annual meeting of the Association four years hence in Philadelphia, at the time of the Sesqui-Centennial Anniversary of the Independence of America. He stated that this event would be celebrated by a great international exposition in Philadelphia. He read a number of statements from organizations in Philadelphia.

Miss Williams, the President, gave assurance that the invitation would have consideration in 1925 and that she hoped it might be favorable.

The Chairman next called on Mr. Hunter, of California, Vice-President, to present the report of the Executive Committee. After speaking briefly, Mr. Hunter presented the following report:

REPORT OF EXECUTIVE COMMITTEE FOR THE BOARD OF DIRECTORS TO THE REPRESENTATIVE ASSEMBLY

MEMBERS OF THE COMMITTEE

CHARL ORMOND WILLIAMS, President.....	Memphis, Tenn.
FRED M. HUNTER, Vice-President.....	Oakland, Calif.
CARROLL G. PEARSE, Chairman Board of Trustees.....	Milwaukee, Wis.
CORNELIA S. ADAIR, Treasurer.....	Richmond, Va.
T. E. FINEGAN, Member by Election.....	Harrisburg, Pa.

The Executive Committee submits for your consideration the following report and recommendations:

I. GENERAL BUDGET

The Executive Committee recommends the following general budget for the year 1922-23. This budget is based on the expenditures for the past year, a careful estimate of the receipts from all sources for the ensuing year and a thorough survey of the program and needs of the Association.

EXPENDITURES FOR 1921-22 AND ESTIMATED EXPENDITURES FOR 1922-23

	Paid out, 1921-22	Estimated expense for 1922-23
Board of Trustees.....	\$1,111.79	\$1,000
Executive Committee.....	4,186.03	4,000
General Secretary's office.....	53,853.00	76,100
Express and freight.....	1,120.33	1,500
Printing	111,310.54	150,900
Appropriations for committees.....	7,827.02	16,600
Auditing accounts.....	592.35	600
Unclassified expenses.....	461.16	500
Office fixtures and furniture.....	844.50	3,000
Annual convention.....	5,439.99	6,000
Departments	8,366.62	17,500
Other expenses.....		8,000
To meet deficit.....	10,877.69	
Total	\$205,991.02	\$285,700
Surplus and Revolving Fund.....	27,877.67	24,300
Grand Total.....	\$233,868.69	\$310,000

II. EXPENSES OF THE GENERAL OFFICES

The estimates for the expenses of the general offices of the Association as contained in the budget recommended above is \$76,100. Upon recommendation of the Executive Secretary, the following itemization of this expenditure is approved by the Executive Committee. We recommend its adoption as the budget for the executive offices for 1922-23.

Budget Estimate for the Secretary's Office

	Paid out, 1921-22	Estimated expense for 1922-23
Salary, Secretary.....	\$7,125.00	\$7,500
Postage	5,110.58	5,500
Telegraph and telephone.....	1,290.35	1,500
Express and freight.....	300.50	300
Clerical services.....	11,535.22	15,900
Rent, light, heat, power, janitor.....	6,471.89	8,000

Traveling	1,393.56	1,500
Miscellaneous expense.....	738.23	500
Field Secretary's Department.....	13,727.56	15,000
Research Department.....	4,138.76	18,000
Insurance	125.40	200
Surety bonds.....	180.00	100
Interest and discount.....	570.11	600
Total	\$53,853.00	\$76,100

III. BUDGET FOR SPECIAL COMMITTEES

Much work of the Association is done through the operation of the special committees appointed by the Association and its departments and affiliated bodies. In fact the accomplishment of the program to which the National Education Association has pledged itself is to be brought about by the success of the work thus delegated to these special bodies. The Executive Committee recommends appropriations for the work of these committees as follows:

	Appropriation 1921-22	Appropriation 1922-23
Legislative Commission.....	\$1,000	\$2,500
Rural Education.....	600	800
Health Education.....	1,000	1,000
		1,500 ¹
Salaries, Tenure, Pensions.....	1,000	2,000
(To be divided into three committees)		
Foreign Relations.....	100	500
Reorganization of Elementary Education.....	1,200	1,250 ²
Visual Education.....	100	200
Coördination of Research Agencies.....	2,500	2,500
Character and Citizenship.....	250	250
Thrift Education.....	250	1,000
Illiteracy	2,000	1,800
		700 ³
Financing of Delegates.....		100
Standardization of Schoolhouse Planning and Construction		500
Total	\$10,900	\$16,600

¹ For publication of series of Health Curriculum Bulletins.

² For reorganized committee as recommended below.

³ Not to exceed \$1800 may be spent on not more than three illiteracy conferences, and \$700 may be spent on printing the report of the committee.

IV. APPROPRIATIONS FOR DEPARTMENTS OF THE ASSOCIATION

The activity of some of the larger departments of the Association has been a prime factor in achieving the present accomplishments of the reorganized Association. Many of these departments have had entailed upon them, on account of the necessity for this activity, a considerable amount of very necessary expense. To meet the expenses of these important activities as carried on by these departments, the Executive Committee recommends the following appropriations:

Superintendence (appropriation amounting to one half the net profit from commercial exhibits held at Department meeting).....	\$5,000
Elementary Principals.....	2,500
Classroom Teachers.....	5,000 ¹

V. APPROPRIATIONS FOR WORK OF STATE DIRECTORS

The great increase in the membership of the Association occurring during the past year has been due, in no small part, to the splendid campaigns carried on under the leadership of the State directors of the Association in their respective states. The small appropriation heretofore allowed by the Association for the work of the directors has in no wise met this expense. The committee believes that a policy of meeting the expenses of these directors within a limit to be determined by the Executive Committee is one of the best investments which the Association can possibly make. We, therefore, recommend that the following appropriation be set aside to defray the necessary expenses of the respective State directors in conducting their membership campaigns and other necessary work of the office:

Summary of Special Appropriations

Special Committees.....	\$16,600
Departments of the Association.....	12,500
State Directorships.....	2,500
Total	\$31,600

VI. COMMITTEES FOR THE ENSUING YEAR

The Executive Committee recommends the continuance of the following as active committees of the Association for the year 1922-23:

Legislative Commission; Character and Citizenship; Foreign Relations; Salaries, Tenure, and Pensions (To be reorganized into three committees—action of Representative Assembly); Expenses of Delegates; Coördination of Research Agencies; Reorganization of Elementary Education (to be reorganized as shown in statement ix); Illiteracy; Health Problems; Thrift Education; Racial Well-Being; Rural Education; High School Libraries; Schoolhouse Planning and Construction; Coöperation with American Legion; Coöperation with Federation of Women's Clubs; Coöperation with American School Citizenship League; Coöperation with Conference on Limitation of Armaments; County Superintendents' Problems; Editorial Council; Visual Education; and Sources of Revenue.

VII. SECRETARIAL HELP FOR DEPARTMENTS, COMMITTEES, STATE DIRECTORS

The Executive Committee recommends that the policy outlined by the Executive Secretary to render much-needed assistance to departments and special committees carrying a heavy burden of work as a part of the program of the Association be the recognized policy of the Association and that the Secretary be authorized to render such assistance as he and the Executive Committee deem necessary and to make such special assignments of heads of executive departments

¹Appropriation to pay expenses for regional conferences held by this department and expenses of executive officer assigned from executive office to this work.

or special secretaries of the Headquarters' staff for this purpose as the work may, in his judgment, demand.

VIII. RECOMMENDATIONS FOR COÖPERATION WITH THE AMERICAN LEGION

The Executive Committee recommends that the Americanism and Education program of the American Legion in coöperation with the Association be approved.

IX. REORGANIZATION OF COMMITTEE ON ELEMENTARY EDUCATION

The Executive Committee recommends as follows:

1. That the completed reports of the Commission on the Reorganization of Elementary Education be accepted and published immediately.
2. That the present committee be discontinued.
3. That instead of one commission, four separate committees with clearly defined fields of work be constituted, the president to indicate the scope of the work of each at the time of appointment.
4. That these separate committees be as follows: (a) A committee to co-ordinate and supervise reports in fields of special education already completed and ready to be issued; (b) A committee on course of study in English in the elementary schools; (c) A committee on course of study in arithmetic in the elementary schools; and (d) A committee on the social studies in the elementary schools including geography, history, and civics.
5. That the budget of \$1250 recommended above for this reorganization committee be itemized as follows: (a) \$500; (b) \$250; (c) \$250; (d) \$250.

X. CHANGING DATE OF ANNUAL MEETING

The Committee was instructed to report on the question of changing the date of the annual meeting. It has not however been able to reach a decision on the question and therefore requests an extension of time.

Mr. Hunter then moved the adoption of the report of the Executive Committee. The motion was seconded and the Chairman stated that it was open for general discussion. In the discussion which followed, and which was participated in by Miss Buchanan, Mr. McKenny, Mr. Hunter, and others, there seemed to be the feeling that further attention should be given to the matter of financing delegates to the convention, but no definite action was taken and the report was adopted by a unanimous vote.

The President next called on Miss Cornelia S. Adair, Chairman of the Committee on the Financing of Delegates for the Representative Assembly, to present the report of the Committee. She discussed briefly the printed report which was in the hands of the delegates and then moved its adoption. (The report is printed in the volume of Proceedings.)

Miss Buchanan moved that it was the sense of this body that \$25,000 be appropriated for the purpose of paying the expenses of delegates on a percentage of mileage basis, to be used as far as it will go. The motion was seconded. A point of order was raised to the effect that there was already a motion before the house. The Chairman therefore ruled Miss Buchanan's motion out of order but announced that she would recognize Miss Buchanan at a later time. Miss Buchanan changed her motion to the form of an amendment, and the question was discussed from that standpoint. A motion was then made to table the amendment. It was seconded and carried.

The question of receiving the report of the Committee was then voted upon and the report adopted.

Mr. T. Marcellus Marshall, of West Virginia, was recognized by the Chairman, and stepping to the platform made the following impressive statement:

If you have in your hands the "Charter, By-laws, Officers, Committees," etc., that was given to you, and will turn to page 3 you will have before you the basis I wish to speak upon.

The second Act of Incorporation of this body was by a special act of Congress passing a bill, that a committee from this body prepared, and in that bill and act there were named the officers, the life directors, the annual directors, etc., of this body. I was to present this at the close of the committee's report on Obituary, but in the rush of business it was passed over.

In looking at that you will see that a large number of those names are preceded by a star, showing that they are dead. Except for Thomas W. Bicknell, who I believe now resides in Rhode Island, I don't remember that there remains a single one of the old guard with whom I used to meet year after year in this Association.

My attention was called to this about two days ago when I went over this report. I think out of the list thirty-six are starred, whereas fifty-nine are probably not alive, though the Secretary, Mr. Crabtree, tells me that a number have died since this report was written.

My purpose in appearing here is this: You have a very great organization in which you rejoice, and of which you are proud, and in which you believe you have great force for making educational progress, and these pioneers are responsible for having brought you to this great estate of influence and wealth. Why, when I first belonged to this body we didn't have money enough to print a copy of our annual report without having to raise a special fund for it. You don't know the struggles through which we came to bring you to your estate today; and I think it would be well, Madam President, if we should all stand for a minute in honor of our pioneers who have brought us to where we are today.

Miss Williams, the president, spoke as follows:

"This National Association of more than 114,000 members will always remember with affection and reverence the vision and courage of those pioneers who started the educational progress of this country. It is most fitting to stand for one minute in their memory. Will you not stand?"

The entire assembly stood as directed. It was an impressive scene.

The Chairman then made the following announcement:

In accordance with Article 5, Section 4 of the By-laws, the Chair will order a meeting of the Classroom section this afternoon at 2 o'clock at the Boston Trades School, and all classroom teachers whether delegates or not are entitled to attend that meeting and are urged to do so. The Chair will read Section 4: "The object of the meetings of the departments shall be the discussion of questions pertaining to their respective fields of educational work. The programs of these meetings shall be prepared by the respective presidents in conference with and under the general direction of the President of the Association. Each department shall be limited to two sessions, with formal programs, unless otherwise ordered by the President of the Association, except that a third session of business or informal round-table conference may be held at the discretion of the department officers."

A meeting was held by that section of the classroom teachers and they adjourned without the election of officers. At the request of many members of that

department, the Chair is ordering this meeting for 2 o'clock at the Boston Trades School at which the incoming President will preside and all classroom teachers are urged to be present.

Miss Buchanan, of Washington, spoke as follows:

"Madam President, would it not be possible to have that meeting at another time? The National League of Teachers Association has its meeting at that time, and there are so many classroom teachers who are affiliated with the National League of Teachers that it would certainly make a great interference. Could we not have that at some other time—at the close of this meeting, for instance?"

Miss Haley, of Chicago, in rising to a point of order, spoke as follows:

I wish to state that such an order is out of order at this time, for the reason that the classroom teachers department at its session yesterday had before it a motion properly moved and seconded that when they adjourned it was to an adjourned session, the time and place being made, and that motion was voted down. A second motion was made to adjourn and another time and place named, and that motion was voted down. A third motion was made to adjourn without any qualification for fixing the time or the place, which means a *sine die* adjournment for this session of the N. E. A., and that motion was carried.

Now I submit, Madam President, that under the By-laws, when a body on its own vote closes a session that this section of the By-laws prevails,—that officers elected at the last formal session of the Association shall serve one year and until their successors are elected. I submit that the President, Vice-President, and Secretary of the Association elected according to those by-laws at the last formal session, in 1921, at Des Moines, hold over until their successors are elected and qualified; and I am doing this simply for the record, Madam President. I want the record to show that I have made this point of order, that a meeting called by the President at this time will not have the authority under this constitution and by-laws to conduct the meeting, to conduct the election and to place properly qualified officers in command. I submit that no meeting in that department that will cause this kind of confusion should be held at this time without legally electing officers. It has legally elected officers now and I submit, Madam President, to you further that the wording of the constitution under which you are making this call is as follows: 'Each department shall be limited to two sessions, with formal programs, unless otherwise ordered by the President of the Association.' Now, I submit that that does not give the President of this Association the power to call a meeting. It gives the President power to order a meeting; and if the President of this Association is acting under the authority conferred by this by-law in issuing a call, I submit, Madam President, you are exceeding your authority and that a call for this meeting cannot be made at this time in this way. If the President of this Association wishes to exercise her prerogative and order a meeting she may, and then the call must issue to the members of this Association, and I submit the members of this Association are not necessarily members of this body. This is a delegate body and they are all the members of the N. E. A. Many classroom teachers who attended that meeting yesterday went away from that meeting knowing that two motions to adjourn to a certain time and place were voted down. I submit that you are taking from those members rights which they have, and if officers are elected they will be elected illegally.

I want to submit further that I don't believe the President of this Association would go over the heads of the Department of Superintendence if they had adjourned in the way that body adjourned yesterday after voting down twice a motion to hold an adjourned session.

A point of order was raised to the effect that Miss Haley had spoken five minutes. The point of order was sustained, and the Chairman said that Miss Haley's protest would be recorded in the minutes of this meeting, and that the Chair, in accordance with the wording of Section 4 of Article 5 would order a meeting of that department immediately at the close of this session, and that all classroom teachers, whether delegates or not, were invited to remain for the meeting.

The President then announced the next order of business to be the consideration of amendments proposed at last year's meeting. The Secretary was asked to read the amendments. He called attention to the fact that these amendments were printed in the pamphlets in the hands of the delegates, and called attention to the pages on which they would be found. He mentioned the nature of each amendment and stated that any delegate could call up any amendment that he desired to have considered. Mr. Shaw, of Pennsylvania, moved that consideration of the first amendment be postponed for one year. The motion was seconded and carried.

Mr. Stanton, of Ohio, moved the adoption of the amendment found at the bottom of page 66 of the pamphlet containing the amendments.

The Secretary was called upon to read the amendment.

The Chairman then recognized Mr. Stanton, maker of the motion, who argued in favor of the amendment. Mr. Engleman, of Illinois, Mr. Newlon, of Colorado, and Mr. Moore, of Illinois, spoke against it.

Mr. Rosier, of West Virginia, spoke in favor of the principle of the amendment but thought it did not go far enough. He moved that the whole matter be laid on the table. The motion was seconded and carried.

The following amendment was at this time proposed by Mr. Springer, of Michigan, for consideration at the next annual meeting:

Madam Chairman, it is proposed to amend Section 3 of Article 6 to read: "It shall also nominate one person for trustee and one person for member of the Executive Committee, and shall report said nominations to the new Board of Directors at the first meeting held after said nominations are made."

Mr. Stapleton, of Minnesota, proposed the following amendment: "To amend Article 2, Section 8 by adding the words, 'For determining the apportionment of delegates, an active member may be counted in two affiliated associations, and no more; and that one of these shall be the State Association.'"

Miss Blake, of New York, made the following suggestion which the Chairman said would serve as notice for an amendment:

I would like at this moment, while we are discussing the nominations, to make a suggestion. I would like to suggest to the consideration of this body a change. At present the President automatically becomes the first Vice-President. In other words, the President is put into the Executive Committee without an apprenticeship and serves the apprenticeship after the office is taken. I would like to suggest that in any reconsideration of the By-laws the arrangement be reversed, and that the first Vice-President we elect should automatically become President after having served as Vice-President and become acquainted with the duties of the organization. It is really a suggestion. If the delegates choose to do so they can amend when they have unanimous consent.

The Secretary read the following proposed amendments which had been handed to him:

Article 2, Section 7 to be amended to read as follows: "Each affiliated local Association shall be entitled to elect one delegate and one alternate to the Representative Assembly for each one hundred of its members, or major fraction thereof, who are active members of the National Education Association *up to five hundred such active members and thereafter one delegate and one alternate for each five hundred of its members, or major fraction thereof*, who are active members of the National Education Association. Such delegates shall be designated Local Delegates."

Another proposed amendment is to establish a department of Visual Instruction. This request contains the required number of signatures, and will come up for consideration another year.

At this point Dr. Chandler, of the College of William and Mary, of Virginia, presented the following suggestion for the consideration of the Association:

"I am very much interested in vocational education, and as I am desirous that all the societies interested in vocational education be brought together I offer this motion: That the Executive Committee be requested to confer with the National Society for Vocational Education and the Vocational Education Association, and other vocational associations, and if practicable to invite them to become a department of this Association. The Executive Committee is hereby given full power to act. I ask for the adoption of that motion." His motion was seconded and unanimously carried.

Miss Haley called attention to certain amendments which had been proposed and had not been presented by the Secretary. The Chairman, however, ruled that these amendments had been presented properly by the Secretary, but she indicated a willingness for them to be further considered, if desirable.

The Secretary read the amendment to which Miss Haley referred in the three forms in which it had been presented. A motion was then made by Mr. Hunter that the amendment be indefinitely postponed. It was seconded and carried. Separate action was taken on each of the three forms that have been read. A motion was then made to postpone indefinitely proposed amendment 8 which reads as follows:

Article XI. These By-laws may be altered or amended at the annual meeting of the Representative Assembly by unanimous consent, or by a two thirds vote of the Representative Assembly if the alteration or amendment shall have been proposed in writing at the annual business meeting next preceding the one at which action is taken, and due announcement of the proposed action shall have been made in the official publication of the Association.

The motion was seconded and carried, and the Chairman announced that the amendment had been indefinitely postponed.

Miss Haley took the floor in order to enter a protest against the way in which amendments were handled. The Chairman stated that her protest would be entered in the minutes. Miss Haley's statement was as follows:

Now, Madam President, I shall simply ask that my protest be recorded, and this is my protest: On the question of the interpretation of this section of the

By-laws, the President of this Association made a ruling—Mr. Hunter, last year, at the close of the session in a discussion on that ruling admitted that his ruling was wrong, but he ruled that way because he thought that was the way Illinois wanted it. Now, Illinois wants no wrong rulings, and we have an amendment to this by-law that makes it impossible for this body to vote for any amendment to amend its by-laws except by unanimous consent, and the President of this Association at the close of the session made that admission. That is not the way it was ruled on the floor, and I submitted then, Madam President, and I submit now that this Assembly should not be left in this situation. It was confusion then and there is confusion now, and I submit, Madam President, that opportunity should have been given here today for a ruling as to what this amendment means—whether it means that if you want to bring an amendment to the by-laws before this house that you must get unanimous consent to bring the amendment if no notice has been given, or whether you must have a unanimous vote to adopt the by-law; and I submit, Madam President, that with confusion and no ruling on that question and uncertainty about it, this body is not in a position to do business intelligently. That is my protest, and I—

Miss Haley stated further that she wished to give notice that she would re-submit the amendment that was submitted last year on the point of amending the by-laws. The Chairman stated that the amendment would be re-submitted at the next meeting.

Mr. Stapleton gave notice that he would re-submit amendments 6 and 7 as found in the pamphlet to be voted upon next year.

Mr. Pearse, of Wisconsin, then called attention to amendment 4 submitted by Miss Haley last year and moved that it be adopted.

The proposed amendment was as follows: "To amend Article XI, Section 1 by striking out the word "consent" and inserting, in lieu thereof, the word "vote." The motion to adopt the amendment was seconded and carried.

Miss Blake, of New York, made the following suggestion:

Madam President, I was deputed by the Editorial Council to bring a certain matter before this body. I think you all heard what Dr. Bagley said the other day about the wonderful work done by Mr. Morgan, the editor. I have been deputed to voice the feeling of the Editorial Council and of Mr. Morgan as to the wonderful work done by Dr. Bagley, and to offer as a suggestion to the incoming President that we will be happy—for the Council, I believe, goes out of existence each year—if the incoming President would consider Dr. Bagley again as Chairman of the Council. We are moved to ask that by the extremely helpful work Dr. Bagley has done and by the modesty with which it has been done. His work has been of a character that words cannot be too strong to speak of.

I offer this suggestion, Madam President, at the request of the Editorial Council. I don't like to hamper the incoming President, but I would like to report that it was the sense of the Editorial Council that we would be very happy if Dr. Bagley would be continued as Chairman of that Council.

A motion was made and seconded to adopt this suggestion as the action of the Representative Assembly. The Chair asked all to stand who were in favor of the motion, and then announced that the suggestion was adopted unanimously and that the incoming President would govern himself accordingly.

Dr. Bagley then moved that the following message of greeting, confidence, and good-will be sent to the Belgian teachers through Mr. Cove:

The National Education Association of the United States to the Teachers of Belgium, Greeting: Through the courtesy of Mr. W. G. Cove, President of the National Union of Teachers of England and Wales, it is the great privilege of the National Education Association of the United States to send to the teachers of Belgium a message of fraternal affection and regard. While nothing that we could say would be commensurate with the supreme honor in which a democratic world will always hold the Belgian people, we wish to tell you that the American teachers are proud that it is their responsibility to pass on to the children of our Republic that great lesson of heroic sacrifice for a great ideal with which the name of Belgium is forever linked. To the Belgian schools and the Belgian teachers, we are confident, a large share of the credit must be given for the development of the superb spirit and morale which made that lesson possible. It is our hope and prayer that peace and prosperity may always rest upon you and your people as a partial reward for the matchless service that you have rendered to humanity.

We ask Mr. Cove to convey to you our cordial greetings and our heartiest good wishes.

This motion was seconded and carried unanimously.

The President then called on Professor Balys Zygelis, of Lithuania, who expressed the good wishes of his country to the National Education Association. He gave assurance that his country would join in making the World conference on education a success in 1923.

Mr. Carlson, of Minneapolis, called attention to the excellent reports of the convention by the *Minneapolis Journal*. Other delegates called attention to the excellent reports in the New York papers, the *Globe*, the *Evening Mail*, the *Evening Post*, and others called attention to the complete reports of other papers. Mention was also made of the full and accurate reports of the Boston papers.

The Chairman then put the question to the audience, asking all in favor of giving an expression of appreciation and thanks to these papers to say "aye." The action taken was unanimous.

Mr. Jose M. Galvez, of the University of Chile, was then called upon and expressed to the Association the best wishes of the educators and public officials of Chile. He presented suggestions concerning the World conference on education. The Chairman expressed appreciation and stated that the Committee on Foreign Relations would have power to act upon the suggestions.

The Chairman then called upon Mr. Maxwell, of Minnesota, Chairman of the Committee on Resolutions, who presented the report. (It is printed on page 43.)

Mr. Maxwell then moved the adoption of the report. The motion was seconded, and those in favor were asked to stand. Almost all of the delegates stood. The President then called on those who were opposed to the adoption of the resolutions to stand. The President stated that there were only three or four standing in opposition to the motion and that it had been almost unanimously carried.

The Chairman requested all seated with delegates who did not hold credentials to take seats in other parts of the hall. She stated that only delegates could vote and that it might become necessary in voting to poll delegations.

The Chairman next recognized Miss Snow, of Washington, who presented the following resolution:

Be it resolved, that the National Education Association establish a committee which shall make a thorough and scientific study of rating systems, with their possibilities or their inadequacy, and shall report to this Association at its next assembly the result of such study with any recommendations such committees may see fit to make. The findings and recommendations of such committee shall be in the hands of the Association at least one month prior to the date of the annual meeting.

It was then moved, seconded, and carried that this resolution be adopted.

The President announced that the next order of business would be the election of officers, and called upon the Nominating Committee to report, but at that moment Dr. Finegan asked for the floor and made the following statement and motion:

Before this convention adjourns I think we should express our appreciation of the eminent service which has been rendered it for several years through the Field Secretary, who will soon retire. I, therefore, move that this Association extend a rising vote of thanks to Mr. Magill in appreciation of the service he has rendered the Association and public education in America.

The motion was seconded and, the entire audience voting on the affirmative, it was declared carried by the Chairman.

Mr. Pearse, of Wisconsin, gained recognition to make the following statement and motion. His motion was seconded and carried by unanimous vote.

It seems to me this is a good time to make a beginning on something the Association may from time to time be called upon to do. There has been a report freely circulated that in the city of Elgin a number of teachers were dismissed from service, the reason assigned being that they were affiliated with an organization other than their own local teachers' organization, and as a matter of fact the organization to which objection was made is the National Education Association.

I wish to move that the Field Secretary and our Director of Research be authorized to inquire into the facts in this particular case and report to the Executive Committee, and that if the Executive Committee think wise the report be printed in the *Journal*.

The Chairman again called for the report of the Nominating Committee to be presented by the Chairman, Dr. Chandler, of Virginia. He presented the report of the committee. (The list of officers is printed in the *Journal* and in the Volume of Proceedings.)

After presenting the report Dr. Chandler moved that the Secretary be authorized to cast the ballot of the Association for these officers. The motion was seconded and unanimously carried. The Secretary said, "I hereby cast the ballot for each of the persons named in the report." The Chairman announced that each of those nominated by the committee have been duly elected.

The Chairman, Miss Williams, spoke as follows:

We have about three minutes more that we may remain in this hall and so, since the incoming President is already on the stage, we shall not have to appoint a committee to bring him here.

I want to express my personal appreciation to every single member of the National Education Association for the whole-hearted support and coöperation you have given me in the past twelve months. It has in every sense of the word been a successful year. It has been a rare privilege to serve you. I can only pledge my support to the incoming President, and try to measure up to the splendid support which was given to me, as promised by the then outgoing president, Mr. Hunter, of California, on the platform at Des Moines last year. If I can be as good a first Vice-President as Mr. Hunter has been I shall be very happy at the close of the next convention.

Now, I cannot use this gavel as a gift to the incoming President, because nothing would induce me to part with it, but I will use it as a symbol of authority in passing over to this member of the Association, who has been longer identified with the Association than I have been, the office I have held for the past year. He needs no introduction to this body of educators.

It gives me very great pleasure to present to this house of delegates and the active members gathered here this morning the incoming President of our Association, Dr. Owen. I wish him the same spirit of service and coöperation which you have shown to me.

Dr. Owen, coming to the platform, was given an ovation and spoke as follows:

Madam President, and Members of the Representative Assembly and of the National Education Association:

I should like first to recognize the very gracious introduction of the retiring President and to say to her that I shall utilize her services to the limit.

I should like to say just one word or two. It certainly would be ungracious for me if I did not say a personal word about the satisfaction that I feel in having been elected President of the National Education Association. The fact is that by a peculiar set of circumstances I have been called the President of the National Education Association for the last two or three days so many times that I almost feel as if I were closing my year of service instead of beginning it.

But, seriously, I would rather be President of the National Education Association than to hold any other position in public education in America. I believe in this Association and its power to do good. I think it is our business to recognize the good that we can do, and I want to say to you officially that I will do all I can, with this thought in view, to build up the organization as such.

I hope we will not go out from this Association underestimating the significance of what has happened here. It is easy to come together and review certain things and then overlook the fact that the power of this Association continues and abides through the year; and I hope that every one of us goes away from this meeting with this thought—that if there is any weakness here we will make up our minds that we will try to remedy it instead of making capital out of it against the Association.

We haven't begun to find out what this Association could do if it made up its mind to do it, but I hope we recognize that unless this Association leads in the National recognition of the American public schools there is no other existing agency to do it. I think the hope of the American public schools, not the only hope but the most fundamental hope, is a National organization of the teachers of America. They aren't above law, they are the servants of the law; but they cannot act very effectively individually. It is a challenge to us to see whether we collectively have the intelligence and the patriotism and the self-sacrifice to learn how to act effectively.

And so I want to ask just one thing—that you will forget the idea of a National Education Association being something different from the State and local associations, and you will think of the National Association, all of you, as being every one of you acting together. That means that every State Association ought to feel that that association is a tremendous factor in building up this great National Association.

Now, I want to say one other word and I will stop. I am in favor of the Townner-Sterling bill in its fundamental policies, in all that it embodies of the program of the National Education Association. I am for anybody that is for it. I want to assure you that if I can do anything this year to help put as good a man in to lead that fight as we have just lost I shall consider myself a very happy man. I am in favor of all the policies of the National Education Association as we have embodied them in our program, and I want to close with the hearty request, the urgent demand, and an invitation to all of you to help me make my year a success, because without you I cannot make it a success.

I don't believe in the National Education Association coming to consciousness for a week in some section of this country; I think we ought to be self-conscious all the time, and that is one of the things that we can accomplish. We should be alive, militant, and aggressive through all our elected officers and agencies.

And so I thank you for the opportunity you have given me to serve you. I do not assess my ability as equal to that of my predecessors, but I am not going to yield to anyone and not even to them in devotion to and in belief in the possibilities of this great Association.

Miss Hall, of Massachusetts, asked whether the Association stood for salaries regardless of sex, and was answered by the Chairman that the platform of the National Education Association stands squarely for equal pay for equal service without regard to sex.

Dr. Owen was then recognized and made the following statement:

"I would like the authority of the Association that the Executive Committee of the Association may have the approval of the Association in making such response to the offer made by Mr. Hays last night as the Executive Committee will find desirable. I mean by that simply that you put it into the hands of the Committee."

A motion was made, seconded, and carried to put the matter in the hands of the Executive Committee for action in accordance with Dr. Owen's suggestion.

The President then announced that the Sixtieth Annual Session of the National Education Association had come to a close and declared the meeting adjourned.

CHARL ORMOND WILLIAMS,
President.

J. W. CRABTREE,
Secretary.

COMPLETE REPORT OF THE AUDITORS

FISCAL YEAR JUNE 1, 1921, TO MAY 31, 1922

REPORT COVERS BOOKS OF THE SECRETARY, TREASURER, AND
BOARD OF TRUSTEES

June 26, 1922

Miss Charl Ormond Williams, President
National Education Association of the United States
Washington, D. C.

DEAR MADAM:

In accordance with instructions received, we have made an examination of the cash receipts and disbursements of the National Education Association of the United States for the year ended May 31, 1922, and now submit our report thereon.

SECRETARY'S OFFICE

J. W. CRABTREE, *Secretary*

INCOME AND EXPENSES

The following is a summarized statement of the income and expenses for the period under review:

INCOME

Memberships from Secretary's Office.....	\$91,443.00
Memberships from Annual Meeting.....	3,755.00
Memberships from Superintendent's Department.....	2,830.00
Memberships from Department of Elementary School Principals.....	1,035.28
Subscriptions to <i>N. E. A. Journal</i> (Part of Membership Dues).....	72,793.12
Volumes of Proceedings.....	1,696.50
Special Reports.....	361.07
Commercial Exhibits.....	11,303.67
Advertising	41,489.12
Net Income Transferred from Permanent Fund.....	7,629.20
Miscellaneous Income.....	82.71
Total income.....	<u>\$234,418.67</u>

EXPENSES

Board of Trustees—Expenses.....	\$1,111.79
Executive Committee—Expenses	4,186.03
General Secretary's Office:	
Salary of Secretary.....	\$7,125.00
Clerical Services	11,535.22
Postage	5,110.58
Rent, Light, Heat and Janitor.....	6,471.89
Stationery and Office Supplies.....	1,148.24
Telephone and Telegraph.....	1,290.35
Traveling Expense	1,393.56
Interest	570.11
Insurance	125.40
Express and Freight.....	300.50
Surety Bonds (Premiums).....	180.00
Repairs and Depreciation—Office Furniture and Fixtures.....	1,444.50
Miscellaneous	738.23
	<u>37,433.58</u>
Field Secretary's Expenses.....	13,727.56
Research Department	4,138.76
Express and Freight (Distribution of Volumes)	1,120.33
Printing	111,310.54
Special Appropriations	7,827.02
Department of Elementary School Principals	649.98
Auditing Accounts of Association.....	592.35
Annual Convention	5,439.99
Department of Superintendence.....	8,366.62
Unclassified Expenses	461.16
Total expenses	<u>196,365.71</u>
Surplus for the year.....	<u>\$38,052.96</u>

The net financial results show a substantial improvement over last year in net income of \$37,221.72. This is due to large increases from all sources of revenue, including \$13,816.28 from memberships, \$50,302.12 from subscriptions to the *N. E. A. Journal* and \$36,308.29 from advertisements, with only small increases in expenses except in the case of printing. While a different method of allocating the expenses of the General Secretary's Office produces expense figures which if compared in detail would show variations of some size, they cannot be fairly compared except in total.

The balance in the Surplus Account on June 1, 1921, was \$2,815.73, which added to the net income for the current year results in a balance as of May 31, 1922, of \$40,868.69.

RECEIPTS AND DISBURSEMENTS

The following is a summary of the cash receipts and disbursements of the Treasurer's Account for the year:

Cash Balance, June 1, 1921:

Revolving Fund:

On Deposit with Continental Trust Co., Special Account (Including \$81.00 Trust Fund for Special Donations).....	\$226.36
On Hand	23.09
Transfer from Continental Trust Co. (Regular Account) to reimburse Fund	4,831.55
	5,081.00
Less Overdraft at Continental Trust Co. (Regular Account)...	1,737.53
	3,343.47

RECEIPTS

Income as per Income and Expense Statement.....	\$234,418.67
Less Accounts Uncollected.....	11,615.69
	222,802.98
Loans from Continental Trust Co.....	6,000.00
	228,802.98
	232,146.45

DISBURSEMENTS

Expenses as per Income and Expense Statement....	196,365.71
1921 Bills Paid during Current Year.....	10,848.50
	207,214.21
Less:	
Bills Unpaid—May 31, 1922.....	\$20,807.83
Depreciation Reserved	596.95
	21,404.78
	185,809.43
Payment of Loans from Continental Trust Co.....	6,000.00
Furniture and Fixtures.....	6,962.15
Trust Fund for Special Donations Repaid.....	81.00
	198,852.58
Cash Balance, May 31, 1922.....	\$33,293.87
Cash Balance, May 31, 1922, brought forward.....	\$33,293.87

Accounted for as follows:

Revolving Fund:

Transfer from Continental Trust Co., Regular Account, to reimburse Fund	\$10,567.69
On Hand	28.93
	10,596.62
Overdraft at Continental Trust Co., Special Account.....	596.62
	10,000.00
Continental Trust Co., Regular Account.....	23,293.87
Total	<u>\$33,293.87</u>

A thorough examination was made of the cash received, and so far as the system in use permitted, we have satisfied ourselves that all the funds received have been properly accounted for. No interest is being received on bank balances, which matter we have brought to the attention of your General Secretary.

Vouchers in support of all cash disbursements were examined and found in order.

The balances of the two accounts with the Continental Trust Co. were certified to by the bank, and the cash on hand was verified by count.

ASSETS AND LIABILITIES

The following is a statement of the assets and liabilities as at May 31, 1922, as shown by the books:

BALANCE SHEET

ASSETS

Cash:

Secretary's Fund—In Bank, On Hand and to be Reimbursed from the Regular Account.....	\$10,000.00
Regular Account.....	23,293.87
Permanent Fund	20.51
	33,314.38
Accounts Receivable	11,615.69
Securities, at Book Value (Schedule "1").....	130,936.00

Real Estate:

Cost	\$98,000.00
Less Mortgages Payable.....	31,500.00
	66,500.00

Furniture and Fixtures:

Expenditures to May 31, 1921.....	11,939.04
Expenditures during Year ended May 31, 1922.....	6,962.15
	18,901.19
Old Volumes of Proceedings.....	500.00

\$261,767.26

LIABILITIES

Accounts Payable.....	20,807.83
Reserve for Depreciation on Furniture and Fixtures.....	2,634.23
Trust Fund—Permanent Investment.....	197,456.51
Surplus	40,868.69
	<u>\$261,767.26</u>

We recommend that the accounts receivable be examined and that all old accounts, ascertained to be uncollectible, be charged off.

The real estate is carried at cost and the amounts owing on mortgage have been certified to us by the holder.

The additions to the Furniture and Fixtures Account during the year were examined and found in order.

The old volumes of proceedings are carried at an arbitrary value of \$500. We are informed that there are in the possession of the Association some 23,000 volumes which cost between \$.85 and \$1.10 per volume to publish. As these publications appear to be in demand, the value is considerably higher than that shown on the books.

We made a sufficient check to satisfy ourselves that all the liabilities are shown on the books, and in addition obtained a certificate to that effect signed by the Assistant Treasurer.

We again recommend that a sufficient balance be carried in the Special Account so that the proper use of the "Regular" and "Revolving Fund" may be strictly adhered to, and that all income and expenses be allocated between the years to which they apply. As instructed, no detail audit was made of the funds received by the Departments of Superintendence and Elementary School Principals. These records are not kept at the Washington Office and the Association books record the receipts as reported to them by these departments.

TREASURER'S REPORT

CORNELIA S. ADAIR, *Treasurer*

FROM JUNE 1, 1921, TO MAY 31, 1922

Deficit brought forward from Treasurer's Report for year ended May 31, 1921.....	\$1,737.53

CERTIFICATE OF AUDITORS

To the President of the National Education Association:

We have audited the accounts of the National Education Association, and of the Treasurer, and of the Secretary, for the year ended May 31, 1922, and certify that the foregoing statement of Income and Expenses is correct, and is in accordance with the books of the Association. The Secretary's Working Fund of \$10,000.00 has also been verified by us.

MARWICK, MITCHELL & Co.

40 Exchange Place, New York,
June 26, 1922.

BOARD OF TRUSTEES

CARROLL G. PEARSE, *Chairman*

PERMANENT FUND

We have audited the receipts and disbursements of the Permanent Fund and have inspected the securities in the custody of the Trust Officer of the Continental Trust Co., Washington, D. C. Details of the securities are given in Schedule "1," showing par value and cost, the market value not having been ascertained.

The cash on hand in the Permanent Fund at June 1, 1921, was \$420.51. The 4¼ per cent Los Angeles School Dist. Bond became due during the year and was paid (\$1,000.00), and \$100.00 was received for one life membership, making a total of \$1,520.51. Of this amount \$1,500.00 was expended in reducing the mortgage on the real estate owned, leaving a cash balance at May 31, 1922, of \$20.51.

The permanent investment at June 1, 1921, was \$197,425.80, to which was added \$100.00 for the life membership fee and from which was deducted \$69.29 for the loss sustained in retiring the Los Angeles School Bond, thus leaving a balance in the fund at May 31, 1922, of \$197,456.51.

The cash balance has been certified to by the depository.

The income from investments and the disbursements for the period may be summarized as follows:

RECEIPTS AND DISBURSEMENTS—PERMANENT FUND

Receipts:

Interest from Securities Owned (Schedule "1").....	\$5,580.00
Interest from Securities Retired and Paid during Year.....	22.50
Rentals Received from Real Estate Owned.....	5,875.00
	<u>11,477.50</u>

Disbursements:

Interest on Mortgages.....	\$2,310.00
Repairs to Building.....	1,078.27
Trustees' Commissions	460.03

3,848.30

7,629.20

Surplus Transferred to Treasurer's Account..... \$11,477.50

The receipts were properly accounted for, and vouchers were produced in support of the disbursements.

Commissions paid on rental receipts, etc., which are not specifically covered in the contract with the Trustee, should be approved by the Trustees of the Association. We recommend that a new contract be drawn up with the Trustees, covering all remuneration for its services.

The foregoing is a correct statement of the funds and accounts of the National Education Association of the United States, for the year ended May 31, 1922, as same appear on the books of this company.

CONTINENTAL TRUST COMPANY,
ERSKINE GORDON,
Trust Officer.

To the President of the National Education Association:

We have examined the books and reports of the Board of Trustees of the National Education Association, and certify that, in our opinion, the foregoing statement correctly shows the condition of the permanent funds and the securities in custody of the Continental Trust Company, Washington, D. C.

MARWICK, MITCHELL & COMPANY,
Certified Public Accountants.

New York, N. Y., June 22, 1922.

MEETING OF EXECUTIVE COMMITTEE, BOSTON, JULY 1, 1922

The meeting was called to order by the Chairman, Miss Williams, President, with the following answering to roll call: Miss Adair, Mr. Hunter, Mr. Pearse, and Miss Williams (in the chair). Miss Jones and Mr. Siders, of the Board of Trustees, were present. Dr. Finegan, of the Executive Committee, was absent having been detained by the death of a brother.

The minutes of the last meeting were presented, and on motion adopted.

The members of the committee expressed approval of the Secretary's report. A motion was passed authorizing the Chairman to appoint a subcommittee to prepare a budget and to list the recommendations in the Secretary's report to be placed before the Board of Directors and the Representative Assembly. The Chairman appointed on this committee Mr. Hunter, Miss Adair, and Mr. Crabtree.

A motion was passed directing the Secretary to inform members of the headquarters staff that they are not to participate in the political and partisan movements of the Association. This action was taken on the recommendation of the Secretary to safeguard the future of the Association and to put the Association behind a policy which is already being observed at the Central Office.

There was a discussion of the disposal of the balance in the treasury. It was thought that the balance would disappear during the summer, but a motion was passed asking the Board of Trustees to consider the advisability of adding possibly ten thousand dollars to the permanent fund should that sum be available in November or December.

The treasurer's report was read and accepted.

The meeting of the Board of Trustees had been called for two o'clock, but since it conflicted with that of the Executive Committee, the Chairman could make no report at this time. It was explained, however, that a meeting would immediately follow the meeting of the Executive Committee and a report would be made at the next meeting of the Executive Committee.

Mr. Magill presented the following resignation:

To the Executive Committee,

National Education Association:

I beg to submit my resignation as Field Secretary of the National Education Association, to take effect September 1, 1922.

In accordance with the terms of my contract, it may be terminated by mutual agreement between the Executive Committee and myself. When I was asked to accept the position of General Secretary of the International Council of Religious Education, I refused to consider the offer until the members of the Executive Committee gave me permission to take such action as I might decide I should take under the circumstances.

After serious consideration, I came to the conclusion that I could not conscientiously decline to undertake the leadership of the new merged organization, representing practically the united forces of the Protestant Christian Churches of North America, in support of an enlarged, coöperative program of religious education.

In taking this step I very deeply regret to sever my connections with the headquarters staff of the National Education Association. I have been most happy in my work and have enjoyed the very generous and sympathetic coöperation of the officers and members of the Association. I shall continue a member of the Association and shall always have a deep interest in the promotion of its great educational program.

I sever my official relations with the kindest feeling for all with whom I have been associated, and with sincere wishes for the continued success and prosperity of the Association and of the great profession which it represents.

Respectfully submitted,

HUGH S. MAGILL.

Mr. Hunter in making a motion to accept the resignation spoke as follows: With a great deal of regret and whole-hearted appreciation of what Hugh S. Magill has done for the National Education Association, I move the acceptance of the resignation, provided the information for the Representative Assembly shall be a carefully worded statement setting forth the exact reasons for the severance of the relations in a very few words, and also making clear the future relationship.

In seconding the motion Mr. Pearse stated that it was with regret and genuine good wishes for the future that the Association was willing to let Mr. Magill go to the new position. Similar sentiments were expressed by other members of the Executive Committee and Board of Trustees. The motion was carried.

Mr. Hunter stated that he would invite the Association to hold its annual meeting in Oakland, in behalf of the educators and civic organizations of that city.

A motion was passed giving Miss Jones full authority to serve as Chairman of the Elementary Education Commission until a permanent chairman is appointed, by the President.

The committee adjourned to meet again in a short time on the call of the Chairman.

CHARL ORMOND WILLIAMS,
President.

J. W. CRABTREE,
Secretary.

MEETING OF EXECUTIVE COMMITTEE, BOSTON, JULY 3, 1922

On call of the Chairman, a meeting of the Executive Committee was held Wednesday afternoon, July 5 at 3:30 o'clock, in Room 633, Copley Plaza Hotel.

The meeting was called to order by the Vice President, Mr. Hunter, with the following answering to roll call: Miss Adair, Mr. Finegan, Mr. Pearse, and Mr. Hunter (in the chair). Miss Williams was absent during the first half of the meeting because of a speaking engagement. Members of the Board of Trustees were present on the standing invitation of the President.

Miss Blake presented a report of the National Council on Education and the Secretary was instructed to print the report.

Miss Gardner, President of the Department of Classroom Teachers, presented the Constitution and By-laws of the Department for the approval of the Executive Committee. The Secretary was instructed to go over the report carefully and to report to Miss Gardner whether it was in harmony with the Charter and By-laws of the Association. The Secretary later gave it as his judgment that the Constitution and By-laws of the Department of Classroom Teachers was satisfactory and legal.

Mr. Carlson, Chairman of the Committee on Pensions for Teachers, was present and requested an appropriation of \$5000 to be used in an investigation of the pension systems of the country and in working out a plan for the States and for the Federal Government. He expressed a desire to hold at least three meetings during the year.

Chairman Pearse presented the report of the Board of Trustees, which was adopted as read.

Mr. Hunter, Chairman of the Subcommittee to prepare the report of the Executive Committee, presented the report which had been prepared, and on motion the report was adopted without change. [This report was later accepted by the Board of Directors and by the Representative Assembly. It is printed in the Minutes of the Business Session.]

On motion an adjournment was taken until 10 o'clock and at 10 o'clock in the evening all members of the committee met in Room 633 of the Copley Plaza Hotel with Mr. Hunter again in the chair.

A motion was passed approving of the American Legion program on Americanism and Education. Mr. Hunter presented a set of resolutions which had been passed by the American Institute of Homeopathy and the Secretary was instructed to acknowledge receipt of the same.

A motion was passed instructing the Secretary to credit the Department of Superintendence with half of the net proceeds of the Commercial Exhibits at the midwinter meeting. The other half of the proceeds is to apply on the expenses of the meeting.

The Secretary was instructed to charge to committee allowances for work which is done in the Research Department under the direction of committees.

CHARL ORMOND WILLIAMS,
President.

J. W. CRABTREE,
Secretary.

MEETING OF EXECUTIVE COMMITTEE, BOSTON, JULY 7, 1922

A meeting of the Executive Committee was held Friday afternoon, July 7, 1922, 4:30 o'clock, in the Swiss Room, Copley Plaza Hotel as announced in the official program with President Owen in the chair and the following answering to roll call: Miss Adair, Mr. Hunter, Mr. Siders, and Mr. Owen. The following members of the Board of Trustees were present: Mr. Pearse, Miss Doherty, and Miss Jones.

The Secretary was instructed to ask for preliminary propositions from cities which have extended invitations for the next annual meeting of the Association.

A motion was passed instructing President Owen to visit the cities having extended invitations and to report at the next meeting of the Executive Committee.

A motion was passed authorizing the Secretary to provide Secretary Shankland, of the Department of Superintendence, with clerical and secretarial help and in compliance with the request of the Department of Superintendence to assign him such work of the general association as he can do in addition to the work of the Department of Superintendence. The Secretary explained that the Executive Committee of the Department of Superintendence and its secretary had expressed a desire for Mr. Shankland to work under his direction just as heads of departments at the Central Office are now doing.

The Secretary recommended that a meeting of the Executive Committee be held as early as possible in the school year to readjust salaries of the office force and pass on other matters of importance in connection with the work of the Central Office.

A motion was passed authorizing the chairman to call a meeting soon after the middle of September or at such other time as he might think proper.

W. B. OWEN,
President.

J. W. CRABTREE,
Secretary.

MEETING OF THE BOARD OF DIRECTORS, BOSTON, JULY 3, 1922

A meeting of the Board of Directors was held Monday forenoon, July 3, at 10:30 o'clock as announced in the program of the Boston meeting with Vice-President Hunter in the chair. The President, Miss Williams, was presiding at a general session.

The following directors answered to roll call: Lester D. Henderson, Alaska; Annie Griffey, Arkansas; Mary F. Mooney, California; H. B. Smith, Colorado; F. A. Hathaway, Florida; K. T. Alfried, Georgia; T. B. Shank, Idaho; Mrs. Sarah Thomas, Illinois; H. Lester Smith, Indiana; L. H. Minkel, Iowa; M. E. Pearson, Kansas; H. A. Allan, Maine; Mary McSkimmon, Massachusetts; William Burdick, Maryland; J. C. Brown, Minnesota; E. E. Bass, Mississippi; Thomas Agnew, New Jersey; Ambrose Cort, New York; Robert H. Wright, North Carolina; E. E. Oberholtzer, Oklahoma; George H. Webber, South Carolina; Mamie S. Bastian, Texas; L. John Nuttall, Utah; Caroline S. Woodruff, Vermont; Nannie W. Thompson, Virginia; Florence J. Parker, West Virginia; J. F. Sims, Wisconsin; Harry English, District of Columbia; Carroll G. Pearse, Wisconsin; George D. Strayer, New York; Marshall T. Marcellus, West Virginia; Charles R. Skinner, New York.

The resignations of absent members were accepted and the following seated in their places: A. J. Matthews, Arizona; W. S. Lafargue, Louisiana; W. L. Coffey, Michigan; E. M. Carter, Missouri; A. J. Stoddard, Nebraska; Mrs. M. Florence Knapp, New Hampshire; A. C. Burt, North Dakota; E. H. Whitney, Oregon; Louis Nusbaum, Pennsylvania; S. L. Smith, Tennessee; Elsie Maxam, Washington.

On motion the minutes of the last meeting were approved as presented by the Secretary.

The report of the Treasurer by the Treasurer, Miss Adair, was adopted by a unanimous vote of the directors.

The report of the Board of Trustees was presented by Chairman Pearse and adopted by a unanimous vote.

The Secretary submitted his annual report which on motion was received. On the suggestion of Mr. Owen the Secretary was instructed to rearrange the items in the budget pertaining to the surplus and revolving fund.

The Chairman stated that it would be necessary to hold another meeting to consider the report of the Executive Committee for the Representative Assembly.

Mr. Pearse cautioned against large appropriations, just at the time that the deficit is changed to a surplus.

The Chairman announced the appointment of the Auditing Committee as follows: M. F. Lefler, Nebraska; A. J. Mathews, Arizona; and F. L. Schlagle, Missouri.

On motion, W. G. Cove, President of the National Union of Teachers of England, was elected Corresponding Member of the Association.

A motion was passed to appoint a committee to report names to the new Board of Directors to fill vacancies in the Educational Council. Director Sims and Wright were appointed on the Committee.

Approval was expressed of the business transacted during the year by the Executive Committee and by the Staff at the central office.

On motion the meeting adjourned to 2:00 o'clock Thursday afternoon, July 6.

FRED M. HUNTER,
Acting Chairman.

J. W. CRABTREE,
Secretary.

MEETING BOARD OF DIRECTORS, BOSTON, JULY 6, 1922

An adjourned meeting of the Board of Directors was held Thursday afternoon, July 6, 1922, at 2:30 o'clock in the Swiss room at the Copley Plaza Hotel, with Vice-President Hunter in the chair. It was announced that Miss Williams, President, was filling a speaking engagement in one of the departments.

The following directors were present: Lester D. Henderson, Alaska; A. J. Matthews, Arizona; Annie Griffey, Arkansas; Mary F. Mooney, California; H. B. Smith, Colorado; F. A. Hathaway, Florida; K. T. Alfriend, Georgia; H. M. Wells, Hawaii; T. B. Shank, Idaho; Mrs. Sarah Thomas, Illinois; H. Lester Smith, Indiana; L. H. Minkel, Iowa; M. E. Pearson, Kansas; W. S. Lafargue, Louisiana; H. A. Allan, Maine; William Burdick, Maryland; Mary McSkimmon, Massachusetts; W. L. Coffey, Michigan; J. C. Brown, Minnesota; E. E. Bass, Mississippi; E. M. Carter, Missouri; A. J. Stoddard, Nebraska; Mrs. M. Florence Knapp, New Hampshire; Thomas Agnew, New Jersey; Ambrose Cort, New York; Robert H. Wright, North Carolina; A. C. Burt, North Dakota; E. E. Oberholtzer, Oklahoma; E. H. Whitney, Oregon; Louis Nusbaum, Pennsylvania; George H. Webber, South Carolina; S. L. Smith, Tennessee; Mamie S. Bastian, Texas; L. John Nuttall, Jr., Utah; Caroline S. Woodruff, Vermont; Nannie W. Thompson, Virginia; Florence J. Parker, West Virginia; Elsie Maxam, Washington; J. F. Sims, Wisconsin; Harry English, District of Columbia; Carroll G. Pearse, Wisconsin; George D. Strayer, New York; Marcellus T. Marshall, West Virginia; Charles R. Skinner, New York.

The Secretary presented the report which the Executive Committee had prepared for the Representative Assembly. The report was considered item by item. There was prolonged discussion on items IV and V. Item IV which appropriates large sums to departments was approved after the matter had been fully explained by members of the Executive Committee. Item V was adopted with the understanding that it would be the policy to increase the appropriation each year until the State Director could have better financial support in conducting membership campaigns. A motion was passed doing away with the limit of \$20 for the expenses of each director and authorizing the Executive Committee to fix the amount for each State director keeping within the limits of the appropriation of \$2500. Nearly all of the directors participated in the discussion.

The Secretary asked whether the State association through its secretary might not be authorized to handle membership drives, but this suggestion was not acted upon, members looking upon this as a prerogative of the State Director who could secure the help of the officers of the State associations. It was the belief that the Secretary of the State Association would render effective assistance in each State.

After each item had been adopted the report as a whole was adopted and the Executive Committee authorized to submit it to the Representative Assembly. [This report was adopted without change and is printed as part of the minutes of the Business Session.]

The Secretary explained that the Executive Committee had worked out a plan for having the membership year coincide with the calendar year so as to remove the confusion which had resulted from the use of double figures to represent the membership year, but when it was found that the secretaries of State Associations preferred not to make the change the plan was dropped and would not be presented to the Board of Directors and Representative Assembly for action. The membership year should be the same in the local, State, and National associations if the budget system is to be generally adopted.

FRED M. HUNTER,
Acting Chairman.

J. W. CRABTREE,
Secretary.

MEETING NEW BOARD OF DIRECTORS, BOSTON, JULY 7, 1922

A meeting of the new Board of Directors was held in the Swiss room of the Copley Plaza Hotel as announced in the official program Friday afternoon, July 7, 1922, at 2:00 o'clock. The Secretary called the meeting to order explaining that the new president, Mr. Owen, was presiding over a meeting of the classroom teachers which had been ordered by Miss Williams at the business session in the morning. He advised that a temporary chairman be elected. A motion was passed electing Director Strayer as Chairman.

The following members were present: A. J. Matthews, Arizona; Annie Griffey, Arkansas; Lester D. Henderson, Alaska; Mary F. Mooney, California; H. B. Smith, Colorado; Levi T. Garrison, Connecticut; David A. Ward, Delaware; F. A. Hathaway, Florida; K. T. Alfriend, Georgia; T. B. Shank, Idaho; Mrs. Sarah Thomas, Illinois; H. Lester Smith, Indiana; L. H. Minkel, Iowa; M. E. Pearson, Kansas; R. E. Williams, Kentucky; W. S. Lafargue, Louisiana; H. A. Allan, Maine; William Burdick, Maryland; Mary McSkimmon, Massachusetts; W. D. Coffey, Michigan; J. C. Brown, Minnesota; E. E. Bass, Mississippi; A. J. Stoddard, Nebraska; Chauncey W. Smith, Nevada; Mrs. M. F. Knapp, New Hampshire; Thomas Agnew, New Jersey; Ambrose Cort, New York; Robert H. Wright, North Carolina; A. C. Berg, North Dakota; F. E. Reynolds, Ohio; E. E. Oberholtzer, Oklahoma; E. H. Whitney, Oregon; J. H. Kelley, Pennsylvania; George H. Webber, South Carolina;

Lida Williams, South Dakota; S. L. Smith, Tennessee; Catherine Gorbett, Texas; L. John Nuttall, Jr., Utah; M. D. Chittenden, Vermont; Nannie W. Thompson, Virginia; Elsie Maxam, Washington; Mrs. Florence J. Parker, West Virginia; J. F. Sims, Wisconsin; Mrs. J. C. Liston, Wyoming; Harry English, District of Columbia; H. M. Wells, Hawaii; C. G. Pearse, Wisconsin; George D. Strayer, Wisconsin; and T. Marcellus Marshall, West Virginia.

The Chairman stated that it would be in order to consider invitations for the next meeting of the Association. Invitations were extended as follows: for Oakland by Mr. Hunter, for San Francisco by Miss Dacre, for Seattle by Mr. Adams, for Indianapolis by Mr. Smith. The Secretary stated that he had received cordial invitations from Chicago, Detroit, and Jacksonville. It was explained by Mr. Hunter and Miss Dacre that their invitations were for holding the next meeting at Oakland-San Francisco, the cities working together in making arrangements. They stated that a plan would be worked out satisfactory to the Association.

A standing vote resulted as follows: Detroit 3, Indianapolis 6, Jacksonville 1, Oakland-San Francisco 20, and Seattle 11. It was explained that the Executive Committee had full authority in locating the next meeting and that this vote of preference on the part of the State directors would not control the action of the committee but that it would indicate in a general way the wishes of the Board of Directors.

An invitation was extended by Mr. Wells to hold some future meeting of the Association in Honolulu.

The following report presented by Mr. Sims was adopted:

Your committee appointed to nominate candidates for vacancies in the National Council of Education beg leave to report as follows:

J. M. Gwinn, Superintendent of Schools, New Orleans, Louisiana.

E. E. Oberholtzer, Superintendent of Schools, Tulsa, Oklahoma.

George D. Strayer, Columbia University, New York City, New York.

W. A. Brandenburg, President, State Manual Training Normal College, Pittsburg, Kansas.

Carroll G. Pearse, President, State Normal School, Milwaukee, Wisconsin.

J. W. Butcher, State Normal School, Emporia, Kansas.

E. G. Doudna, Superintendent of Schools, Wisconsin Rapids, Wisconsin.

John Callahan, State Superintendent of Public Schools, Madison, Wisconsin.

May Wade, Elementary Teacher, Berkeley, California.

S. B. Underwood, Superintendent of Schools, Raleigh, North Carolina.

C. B. Glenn, Superintendent of Schools, Birmingham, Alabama.

(Term expiring in 1924.)

Mary McSkimmon, Principal, Pierce School, Brookline, Mass. (Term expires in 1923.)

Respectfully submitted,

J. F. SIMS, *Chairman.*
ROBERT H. WRIGHT.

A motion was passed to drop the Patrons Department. The work of the Department has not been satisfactory during the past two or three years, and it was the belief that the work for which the Department was created was being cared for by the National Congress of Mothers and Parent-Teachers Association, one of the active coöperating associations.

A motion was passed expressing the approval of the Board of Directors for the purchase of additional property for the headquarters of the Association at Washington, if after investigation the Board of Trustees considers it wise to make the purchase.

Chairman Strayer having to leave to attend another conference Mr. Sims was called to the chair, who announced the next order of business to be the election of a member of the Board of Trustees, Mr. Pearse's term having expired.

Mr. Pearse on being nominated to succeed himself gave reasons why he should not accept a réélection and suggested that the honor be passed around. He proposed the name of Dr. Payson Smith. It was stated that Mr. Pearse's reasons for declining were not satisfactory and that Dr. Smith and all the others wanted him to remain on the Board of Trustees. On a rising vote Mr. Pearse was declared the unanimous choice for trustee and the Secretary was instructed to cast the ballot of the Board of Directors for him. He cast the ballot and the Chairman announced that Mr. Pearse was duly elected and would succeed himself on the Board of Trustees.

At this point President Owen appeared and on Mr. Sims' request took the chair. He expressed regret that he was late. He stated that the next order of business was the election of a member of the Executive Committee. Mr. Hunter was nominated. A motion was passed instructing the Secretary to cast the ballot of the Board of Directors for Mr. Hunter, and the ballot being cast, the Chairman announced that Mr. Hunter had been duly elected as member elect of the Executive Committee. Members restrained Mr. Hunter from withdrawing in view of the possibility of the next meeting of the Association being held at Oakland-San Francisco.

The resignations of the following State directors were accepted and the one recommended by each elected as State director for the ensuing year.

Jessie C. Liston, Wyoming, recommending A. A. Slade.

Elsie Maxam, Washington, recommending Jennie M. French.

Lida Williams, South Dakota, recommending Harold W. Focht.

Mrs. M. Florence Knapp, New Hampshire, recommending Clifton A. Towle.

David A. Ward, Delaware, recommending H. V. Holloway.

A. J. Matthews, Arizona, recommending H. E. Hendriz.

W. L. Coffey, Michigan, recommending Thomas E. Johnson.

H. M. Wells, Hawaii, recommending Vaughan MacCaughy.

It was the sense of the meeting that each State Director should work to secure as many life memberships as possible in his State.

Board of Directors adjourned to meet on the call of the President.

WILLIAM B. OWEN, *President*.

J. W. CRABTREE, *Secretary*.

MINUTES OF THE BOARD OF TRUSTEES

BOSTON, MASS., JULY 1, 1922

A meeting of the Board of Trustees of the National Education Association was held in room 633 of the Copley-Plaza Hotel, Boston, Mass., Saturday afternoon at 4:50 o'clock, July 1, 1922, with the following answering to roll call: Miss Williams, and the Chairman, Mr. Pearse, Miss Doherty, Miss Jones, Mr. Siders.

The minutes of the meeting of March 2, 1922, were read and approved.

The report of the auditors, Marwick, Mitchell & Co., on the financial affairs of the N. E. A. was read and filed.

It was moved by Trustee Jones and seconded by Trustee Doherty that the Chairman and Secretary of the Board of Trustees secure competent legal opinion of the exact status of the Board of Trustees of the National Education Association with regard to their powers and duties. The motion was carried.

The Board adjourned subject to the call of the Chairman.

WALTER R. SIDERS, *Secretary*.

C. G. PEARSE, *Chairman*.

MINUTES OF THE BOARD OF TRUSTEES

BOSTON, MASS., JULY 6, 1922

The Board of Trustees met in Room 633, Copley-Plaza Hotel, Boston, Mass., Thursday afternoon, at 1:00 o'clock. Present: Trustees Pearse, Doherty, Jones, and Siders.

The Secretary was requested to notify the General Secretary to have the Auditor's Report printed with the reports of the Treasurer and the Board of Trustees.

Moved by Trustee Doherty and seconded by Trustee Jones that the Chairman of this Board notify the Continental Trust Company, of Washington, D. C., that this Board wishes a new contract covering all remuneration that this Board is to pay them, and also to cover the amount of interest we are to receive on deposits. Motion carried.

Moved by Trustee Jones and seconded by Trustee Doherty that the Trustees appoint some competent person to investigate and report back to the Trustees as soon as practicable on accounts receivable. The motion was carried.

Moved by Trustee Siders and seconded by Trustee Jones that the revolving fund in the hands of the General Secretary be increased by adding \$5000, making the sum total of said fund \$15,000. The motion was carried.

Moved by Trustee Doherty and seconded by Trustee Jones that we fix the rent of the N. E. A. Headquarters at 1201 16th St. N. W., Washington, D. C., at \$10,000 per annum to be paid to the Continental Trust Co. of aforesaid city as rentals with the understanding that the said

N. E. A. may sublet such portions of the building as are not needed for its own work. The motion was carried.

The Secretary of this Board was instructed to notify the Chairman of the Executive Committee of the motion immediately preceding.

Moved by Trustee Jones and seconded by Trustee Doherty that this Board seek the advice of the Board of Directors about the purchase of additional property at Washington, D. C., as per recommendation of the General Secretary in his report published for the Boston meeting. Motion was carried.

The Board adjourned to meet July 7, 1922, at 8 A. M. in this hotel.

WALTER R. SIDERS, *Secretary*.

C. G. PEARSE, *Chairman*.

JULY 7, 1922

Board met as per preceding adjournment and adjourned to meet again awaiting the action of the Board of Directors on the question referred to them.

WALTER R. SIDERS, *Secretary*.

C. G. PEARSE, *Chairman*.

MINUTES OF THE BOARD OF TRUSTEES

BOSTON, MASS., JULY 7, 1922

A meeting of the Board of Trustees was held in the Swiss Room, Copley-Plaza Hotel, Boston, Massachusetts, Friday afternoon, July 7, 1922, at 4:00 o'clock. The following were present: President Owen, Chairman Pearse, and Trustees Doherty, Jones, and Siders.

Chairman Pearse called the meeting to order, and after explaining that the first order of business would be the election of officers nominated Trustee Siders for the Chairmanship. The nomination was seconded by Trustee Owen. Mr. Siders and the other trustees objected vigorously to the proposed withdrawal of Chairman Pearse, but he was firm in his determination and Mr. Siders was elected Chairman of the Board of Trustees for the ensuing year.

Nominations for Secretary were then in order and Miss Doherty nominated Miss Jones, who declined. Miss Doherty was then nominated and elected despite vigorous protestation on her part. The newly elected officers then took charge of the meeting.

Trustee Pearse reported that the Board of Directors would approve of purchasing additional Washington property if after investigation the Board of Trustees considered it wise to make the purchase.

It was moved by Chairman Pearse and seconded by Miss Jones that Trustees Siders and Owen be authorized to investigate the property, have it appraised by experts, and report to the Board of Trustees at its September or October meeting, but if haste should be necessary, to report in writing or to ask for an earlier meeting of the trustees. Motion carried.

The Secretary was instructed to see that the officers of the Headquarters staff are bonded for the amounts decided upon by the Board of Trustees at the Des Moines meeting.

It was decided that a statement for *The Journal* should be prepared, setting forth the duties of the Executive Committee and Board of Trustees and to submit the same for approval before publication to the Chairman of the Board of Trustees and to the Chairman of the Executive Committee.

Miss Jones moved that a committee consisting of Trustees Doherty and Pearse be appointed to secure additional legal opinion as to the powers and duties of the Board of Directors, the Executive Committee, and Board of Trustees before completing the statement for publication. Motion passed.

On motion the Board of Trustees adjourned to meet on the call of the Chairman.

AGNES E. DOHERTY, *Secretary*.

WALTER R. SIDERS, *Chairman*.

THE SECRETARY'S ANNUAL REPORT, BOSTON MEETING,
1922

To the Executive Committee, Board of Directors, and Representative Assembly:

It again becomes my pleasure to make a report on the growth, activities, and ideals of the National Education Association and to present policies and plans for its continued growth and improvement. I am including, as a part of the report, carefully prepared statements of the heads of departments.

The report attempts to give the causes for the phenomenal growth in membership during the past few years. It discusses such matters as the all-inclusive Association, the relation of the Association to its departments, to its committees, to its affiliated associations, and to coöperating National associations. It contains special reports from members of the Headquarters Staff showing the work actually done during the year and suggesting improvement in plans and policies for the future. Tables, charts, and diagrams present facts in concrete form. It attempts to outline the policies of the Association on the method of electing members of the Headquarters Staff and on the rules of tenure to be observed. It shows that teachers are growing more and more professionally-minded. It points out the need of a big forward-looking program carrying out the principles embodied in the platform of the Association.

Among the recommendations in the report are the following: The continuation of the present plan of coöperation with the American Legion and other organizations; the purchase of additional property east of the headquarters building; the enlargement of the permanent fund; provision to do the secretarial work of departments of the Association by the Headquarters Staff; the wider use of the budget system for local, State, and National associations; the continuance of the \$2 membership fee; arrangements for a more extensive use of the Research Department by the committees and affiliated associations; and an adequate budget allowance for next year.

GROWTH AND EFFICIENCY

The State associations of all States, except Rhode Island, are now affiliated with the National Association. The number of local affiliated associations has been increased from 578, at the time of the Des Moines meeting, to 1001. On July 1, 1921, there were 850 one-hundred-per-cent schools. There are now over 1530. A year ago there were 75,000 members. This number has been increased to more than 110,000.

The following shows the active membership of the Association on December 31 of each year mentioned: 2321 in 1900; 5261 in 1905; 6909 in 1910; 7441 in 1915; 7873 in 1916; 8557 in 1917; 10,104 in 1918; 24,025 in 1919; 52,350 in 1920; and 87,414 in 1921. The records show the enrolment on June 15, 1922, to be 110,000, which number will be greatly increased by the end of the calendar year.

This phenomenal growth is due to a number of causes. Changing the National Headquarters to the Nation's Capital added to the prestige of the Association and contributed to its growth. The appointment of the Emergency Legislative Commission in 1918 and the Commission's forward-looking program of service made strong appeal to the rank and file of teachers throughout the country. The part which the Association had

Figure 1. GROWTH IN ACTIVE MEMBERSHIP, 1910-1922

in securing increased salaries for teachers and in promoting the interests of the profession established it more certainly in the affections of teachers everywhere.

The field work, the office correspondence, *THE JOURNAL*, and the general publicity, which supply teachers and the public with reliable information concerning the schools, have impressed the teachers of the Nation with the Association's great mission and with the high type of its service to the profession. The reorganization, on the representative basis in 1920, provided a method of selecting delegates from all sections of the country and from all ranks of the profession to transact the Association's business. It provided an adequate scheme of organization for growth and expansion. The membership is practically three times what it was when the new plan of organization was adopted.

Teachers are professionally-minded—The need of a high type of teamwork has been felt more strongly year by year in every vocation and profession. There has been an exceptionally marked awakening among teach-

ers as to the need of effective organization, not only in this country but in other countries as well. In America the growth in numbers and in the extent and quality of service is as striking in State and local associations as in the National Association itself.

There has thus grown up during recent years a new sense of obligation to the profession and hence to the Association which promotes the interests of the profession. There has been developed a greater pride than ever before in the best professional standards and ideals. As teachers have become more and more professionally minded, they have naturally had a greater desire to become members of their professional association and to lend their support to its growth and success. While the new professional spirit is in part due to the work and influence of the Association, it also has been a leading factor in the unprecedented growth in membership.

The all-inclusive National Association—Formerly teachers did not appreciate the advantages of team-work in a large way. They sought to do big things working separately. More recently came the idea of working together in classes in various lines of work—or in local organizations, each having worthy ends in view and making honest efforts for needed improvement. We are now in a period when classes and groups as well as individuals realize the wisdom and value of coöperation through the all-inclusive organizations. The ties in each of the associations—the local, the State, and the special or departmental—have become stronger as the bond which holds them in the all-inclusive group has become more effective.

It might have been possible earlier to destroy the all-inclusive character of the Association, but since the need of team-work is so well understood and the desire for it so firmly established, it would require much more than personal grievances or differences on small issues to break the unity of effort which now operates through the National Education Association and which gives size and permanency to the enrolment.

The Association is entrenched in the confidence of the public. It has the goodwill and support of professional and other organizations. It uses its good offices to establish a more cordial coöperative feeling between teachers and community. It helps the public to appreciate the work of the schools. This is the greatest service which it can render to the profession and is no doubt the real underlying cause of recent growth and development.

The appeal that wins—In soliciting memberships, the Headquarters Staff has kept in mind the high standards and ideals of the Association. It has not made appeal to the selfish interests of teachers by promising personal benefits of various kinds, but instead has appealed to the professional pride of teachers, promising only such personal rewards as come from the elevation of the profession as a whole and from the general educational uplift which combined effort alone can give. This type of appeal has met with a response which indicates that the teachers of the United States are willing to give their support to the cause of the profession from the broader point of view.

While each member receives in the sixty-eight page JOURNAL, which reaches his desk each month, more in value than the amount which he pays in membership dues, this advantage of membership is not strongly urged, because it means more to the Association and more to the individual member to have the incentive for becoming a member professional rather than personal.

COMPARATIVE GROWTH OF TWO NATIONAL ASSOCIATIONS

A member of the Headquarters' Staff is making a careful study of the national teachers' associations of other countries with the idea of profiting from their experiences. The plan is to give the results of the study in the Secretary's Report for 1923 for the information and use of members and delegates at the time of the World Conference on Education. Permit me, however, to present at this time some of the information which has been collected concerning one of the associations. I wish to show the comparative growth of the National Union of Teachers of Great Britain and our own Association, and to point out a few similarities and differences in the policies and methods of these two leading organizations.

Figure 2. COMPARATIVE GROWTH OF THE NATIONAL UNION OF TEACHERS AND THE NATIONAL EDUCATION ASSOCIATION

The National Union of Teachers of Great Britain is recognized as the largest all-inclusive association in the world and as one of the most democratic in organization and management. The accompanying chart shows the comparative growth of this and our own National Association since 1910. It is of interest to know that the purposes and platforms of these

associations are strikingly similar, that the National Education Association was organized in 1857 and the Union in 1870, and that each has had an enviable record of achievement in its own country.

Ideals and differences—Although alike in certain high standards and ideals, the two organizations are unlike in the way in which some of their ideals are carried out. The Union calls special attention to what it does for the individual member, while the National Education Association takes pride in what it accomplishes for the profession as a whole. The difference in the conditions under which teachers work in the two countries accounts, in part, for the difference in methods of work.

There is little demand in this country for legal help for teachers. The Union paid approximately \$50,000 in 1920 for legal assistance to members. The Union supports members who suffer in defense of their professional rights. The sustentation grants in 1919 amounted to over \$250,000. The Union has given much attention to questions of unfair dismissal of teachers, while our Association has laid more stress on strengthening the ties between the public and its schools.

Leadership in legislation—Both associations assume leadership in important educational movements and give time and attention to national legislation for education. The National Union promoted the passage of the Fisher Bill which became a law in 1918. Having a membership of over 100,000 when the Bill was before Parliament, the Union exerted a powerful influence for its passage. This law does for England what, in a general way, the Towner-Sterling Bill, if enacted into law, would do for the United States. The recent growth of the National Education Association now gives it power similar to that of the Union at an earlier date, and gives tremendous force to its legislative program. Civic organizations in England fought for the passage of the Fisher Bill as civic, fraternal, and patriotic organizations are now working for the passage of the Towner-Sterling Bill.

COÖPERATION WITH AFFILIATED AND OTHER AGENCIES

Affiliated agencies—The following plan has been started and will be continued with greater success with the aid of the new Research Department: (1) to present to each affiliated State and local association and to each coöperating agency at the beginning of the school year, a list of problems for investigation and study and to ascertain the items and problems to which each will give special attention; (2) to keep all associations which are studying the same problems in touch with each other; (3) to gather and summarize results or have this done by some other agency and to give out the summary to all coöperating associations and to the members of the Association; (4) to submit questions pertaining to the work of committees for the consideration of these agencies; (5) to submit in a similar manner emergency problems on the request of affiliated associations; and (6) to call on all these organizations for help on important matters of legislation and to extend help to them as needed in the solution of their local problems.

Other agencies—The National Education Association has the coöperation of leading National civic, patriotic, fraternal, and religious organizations in carrying out the fundamental planks of its platform. The relationship of coöperation is definite, and though not so binding as affiliation it is perhaps equally effective. In affiliating, the organization pledges

Figure 3. NATIONAL ORGANIZATIONS COÖPERATING WITH THE NATIONAL EDUCATION ASSOCIATION

itself in advance to give support, because in affiliating it becomes an integral part of the Association itself. The connection through coöperation secures support only as the cause is worthy of support. It means that the Association must use care in deciding on the planks which it puts into its platform. It means that the coöperating organization will give stronger help because of giving it from the standpoint of conviction and genuine interest. The present plan is highly satisfactory to coöperating organizations and should be continued indefinitely.

Coöperation with the American Legion—A joint program of work was outlined a year ago by the Committee on Education of the American Legion and the Board of Directors of the National Education Association and was adopted by the Representative Assembly at the Des Moines Meeting. It

placed the American Legion squarely behind a few essential educational policies and pledged the fullest coöperation of both organizations in the promotion of the interests of the public schools.

American Education Week, December 4 to 10, which was observed throughout the Nation, was an important part of the program. Civic, fraternal, and religious organizations participated in calling the attention of the public to the needs of the schools and urging that these needs be met. The Association can hardly fail to see the importance of the movement which has been started. It is significant that practically all great National and local organizations and agencies have centered their interest in the public schools and that they are now coöperating with the National Education Association to acquaint the public with both the work and needs of the schools. Never before in the history of the Nation has such importance been attached to the public schools by leading social agencies.

A low estimate of the results of the efforts of the American Legion and the Association to secure the observance of American Education Week throughout the Nation were in brief: The coöperation of 200,000 merchants, 20,000 moving-picture theaters, 9000 Legion Posts, 1500 Chambers of Commerce, 14,500 newspapers, 2000 women's clubs, and 50,000 local fraternal, civic, commercial, and religious organizations; this vast undertaking reached directly and indirectly more than 25,000,000 people. In a few States, exercises were held in practically every school district. In many States, over half of the cities, villages, and community centers carried out definite plans and programs.

Mr. Alvin M. Owsley, of the Americanism Commission of the Legion, in speaking of the first American Education Week said: "The policy of holding American Education Week annually has been adopted, and this acceptance marks a step forward in the educational world for America. We shall work unceasingly until within our borders every tongue shall speak the English language, until every intellect shall know something of our institutions and history, and until every heart shall grow to love and respect our flag."

RELATION OF DEPARTMENTS TO THE ASSOCIATION

The relation of the departments to the Association has not been fully determined. The amendments to the By-Laws, which were adopted at the Des Moines meeting, giving broader powers and responsibilities to the departments are considered adequate, but the departments have not yet worked out satisfactory plans and regulations under the new code.

The Department of Superintendence has gone farthest in its plans. It adopted a constitution and by-laws and provided for an executive committee and other officers including a full-time secretary. It decided upon a fee of \$5 to be paid by its members in addition to the regular N. E. A. membership dues. One meeting has been held under the new plan.

Members of staff as department secretaries—It is believed that few, if any, of the departments will be able permanently to support a full-time secretary and also do enough research work to satisfy its members. The

Department of Superintendence is perhaps the only one which could hope to do so at the present time. A feasible plan would be for a member of the Headquarters Staff to serve as secretary or assistant secretary of each department. Inasmuch as the work of no one department will require all the time of a secretary, the same person might easily serve as the secretary of two or more departments and also do much other work for the Association.

The Board of Trustees has made Mrs. Helen T. Hixson Assistant Treasurer, assigning to her the routine work of the Treasurer. She is a regular member of the Headquarters Staff and does a large amount of other work for the Association at the Central Office. Mr. Magill is Secretary of the Legislative Commission. Mr. Norton is doing much of the work of important committees in the preparation of reports for the Boston meeting.

A department might similarly have its regular officers—president, vice-president, executive committee and secretary—and have in addition a member of the Headquarters' Staff assigned to it to serve as assistant secretary. The assistant secretary would do the work which should be done at the Central Office. One member of the Headquarters' Staff might be made the secretary or assistant secretary of the department even though acting in the same capacity for other departments.

When a department has a full-time secretary, it must also have stenographers, typists, and other help. The expense for this office help could not be less than the salary of the secretary. There are more than twenty departments. The combined salaries of secretaries of the departments, if all should have paid secretaries, would be not less than \$60,000 a year and the total expense of the office force including the salaries of secretaries would be not less than \$120,000 a year.

By having all this work brought together and done by the general office force, thus avoiding the wide duplication of work caused by departments working separately, there would be a saving of at least \$50,000 a year. This saving could be used to advantage for important investigational and research work and for special attractions for meetings. An outstanding advantage of having this work in the Central Office, besides the saving in funds, would be the contact of the departments with the work of the Association as a whole.

I, therefore, recommend that the Executive Committee and Representative Assembly authorize the Secretary to provide the necessary secretarial help at the Central Office for each department desiring such help, and to do so at the expense of the general Association. I make the recommendation in the interest of economy and efficiency in the departments. I make it because the department needs its own fees for special research work and because I believe the expense of this phase of work belongs properly to the general Association.

BASEMENT

Figure 4. BASEMENT PLAN OF THE HEADQUARTERS BUILDING

HEADQUARTERS BUILDING

The headquarters building was purchased in 1919 and occupied by the Association in 1920. The purchase price was \$98,000. It would sell now for \$150,000. At first, space was leased to the Swedish Legation and the National Congress of Mothers and Parent-Teacher Associations. In 1921, the Swedish Legation purchased a building of its own and gave up its lease on space in our building. Owing to growth in membership, it was necessary to use this additional space for the work of new departments and divisions. It is generally understood that the National Congress of Mothers and Parent-Teacher Associations will be permitted to retain its headquarters in this building as long as possible because of the relation of its policies and purposes to those of our own Association.

Additional space needed—By examining the charts which show the uses made of the various rooms, and by taking into account the rapid growth in membership, it will be seen that not only the rooms now occupied by the National Congress of Mothers but additional space will soon be necessary to meet the growing needs of the Central Office. Now is the time to provide for this space. There will be a large apartment house built north of our building and an immense hotel just across Sixteenth street. All property on Sixteenth street has increased greatly in price during the past year. Although property lying just back of this building can yet be purchased for a reasonable sum, this is the last chance to secure adjacent ground.

Although the buildings on this adjacent property are old, they would serve for a few years for the storage of volumes, for mailing and shipping, for multigraphing and printing, and for other similar purposes, leaving the

THE LIBRARY

MARSHALL STATE TEACHERS' COLLEGE

AND JUNIOR COLLEGE

FIRST FLOOR

Figure 5. FIRST-FLOOR PLAN OF THE HEADQUARTERS BUILDING

present building for the main offices of the Association. Within five or ten years there will be the need of constructing a fine building on this site or an enlargement of the present building, which is rated as one of the best office buildings in Washington. It would be both economical and wise to make this purchase, and I recommend that steps be taken at the earliest moment to contract for it.

HEADQUARTERS ORGANIZATION

Plan of organization—There are now five well-organized departments in the headquarters organization: Records and Accounts, established in 1917; Field Work, established in 1918; Business, established in 1919; Publications, established in 1920; and Research, established in 1922. There are two assistant secretaries with the same rank as heads of departments: One has charge of the business interests of the Association under the direction of the Secretary and the other assists in the general correspondence and has special charge of important phases of the work with affiliated associations.

In the larger departments, the one next to the head or director has the rank of assistant. In the department of Records and Accounts, the position is Assistant Recorder, in the Department of Publications, the position is Assistant Editor, and in the Secretary's Office, the position is Assistant to the Secretary. As other departments develop and the number of employees increases, the rank of assistant will be given to others. The larger departments are divided into divisions, the head of the division holding a place of responsibility. With the growth in membership, the number of these divisions will increase. Division heads rank next to head assistants.

The present plan of organization is economical and effective. It groups the work in five departments with the necessary subdivisions and enables a comparatively small force to do an enormous amount of work. It requires only a few men and women on high salaries, thus making it possible on the limited income of the Association to provide adequate clerical help.

Appointment and tenure—There are now in the central office a secretary, five heads of departments, two assistant secretaries, three chief assistants, three heads of divisions, ten expert stenographers, and twenty-five or more typists and clerks. At times during the year, additional help is needed. The number of typists and clerks will be increased to forty or more for next year in order to care for the additional work due to increasing membership.

The Secretary is elected by the Board of Trustees for a term of not to exceed four years as provided in the Charter and By-laws. The Field Secretary is elected by the Executive Committee for a period of four years also. All other members of the staff are elected for one year and then re-elected without specifying the time for which elected. They are subject to the ordinary tenure regulations.

Just as boards of education elect principals and teachers on the recommendation of superintendents, so the Executive Committee elects members of the Headquarters' Staff on the recommendation of the Secretary. Were the Executive Committee to elect on its own initiative, responsibility for weaknesses in the office force would not be definitely fixed. The present plan places the responsibility for results on the Secretary, where it properly belongs. The tenure ideals of the Association are essentially the same as those of the best public-school systems. Although formal rules have not been adopted, the practice of electing employees on the recommendation of

SECOND FLOOR

Figure 6. SECOND-FLOOR PLAN OF THE HEADQUARTERS BUILDING

the Secretary and of observing proper tenure regulations has become an established policy of the Association.

The staff and election of officers—The Association has in a short time grown to remarkable proportions. Its income has increased until it now receives a large amount annually. Herein lies the danger of the immediate future. The offices, the resources, the power of the Association cannot escape notice and might easily become the objects of designing persons. They may be exploited even by thoughtless friends of the Association.

As positions of honor become more and more in demand, the help of the Headquarters Staff will be sought more insistently in the contests for office, unless it is clearly understood that under no circumstances will members of the staff participate in the selection of officers of the Association. The fact that candidates have not in the past embarrassed the Secretary by calling for the help of the office, does not mean that designing men and women may not do so in the future. It is well known that members of the staff are in a position to give special help to candidates. Ethically, the staff cannot give such help.

Members of the staff as now constituted are decidedly opposed to interesting themselves in the election of officers. The sentiment of the members of the Association is strongly against such participation. No action on the question has been taken by the Executive Committee or the Representative Assembly; owing to the well-known policy of the Central Office action has not been considered necessary.

The ideals and standards of teachers are high. Teachers are not inclined to use questionable campaign methods or to use their professional association to promote personal ends. Our Association may, for this reason, escape from some of the usual experiences of other organizations.

THIRD FLOOR

Figure 7. THIRD-FLOOR PLAN OF THE HEADQUARTERS BUILDING

FOURTH FLOOR

Figure 8. FOURTH-FLOOR PLAN OF THE HEADQUARTERS BUILDING

To prevent the Association from being injured by designing people, and to keep it on a sound basis under sane leadership is the paramount duty of officers and members. Therefore, in order to establish permanently a wise administrative policy for the Central Office, and to further safeguard the future of the Association, would it not be well for the Representative Assembly to take formal action on this point? Formal action by the Assembly would put the Association as well as the Secretary's office behind the policy. The observance of such a policy very properly goes hand in hand with the observance of wise tenure regulations.

The new Research Department—The U. S. Bureau of Education, the Government's agency for supplying statistical information on education, has not been able to publish current information to meet emergency demands. Its staff includes the Commissioner and specialists of recognized ability, but although much good work has been done, funds have not been provided for extensive investigations by these experts. Even more discouraging is the fact that the printing fund is so meagre that comparatively few of the important reports can be published. Many of them lose their current value in the long delay in their publication.

This neglect of education on the part of the Government is most regrettable. It results from having the Bureau hidden away in the Department of the Interior. The Secretary of this Department having no special connection with education and having many other bureaus and divisions in which he is interested can hardly give more than passing attention to the needs of the Bureau of Education.

Because of this situation, it became necessary for the National Education Association to establish a Research Department of its own to furnish edu-

cational agencies with necessary information which could be secured from no other source.

This department was established in March. It has been in operation only a third of a year, yet by reading the report of the head of the department which is a part of this report, it will be seen that it is rendering a most valuable service to the educational interests of the country. It has already issued information of distinctive current value. The funds for this service come largely from the membership fees of teachers whose salaries are so low that they can hardly make ends meet. All feel, however, that no wiser use of membership dues can be made than in doing this emergency research work.

ORGANIZATION OF COMMITTEE WORK

Special attention is called to the new plan of having committee work function through the Research Department. The plan came as a result of a resolution introduced by Dr. William B. Owen and adopted by the Representative Assembly at the Des Moines meeting. Definite recommendations will be made by committee chairmen to encourage all committees, whose reports require investigational and research work, to adopt this plan. The investigational work will thus be done by the Research Department under the advice and direction of the committee.

This plan will probably result in smaller committees and in holding meetings of committees only at the time of the general meetings of the Association. Other committee work can be done through correspondence. This arrangement will be effective and economical and might well apply to nearly all committees.

Committees have often felt it necessary to hold meetings at the expense of the Association. But the expenses of the members of any large committee for one meeting amounts to more than \$1000. The total would soon reach high into the thousands. Owing to the conditions of the current funds, the Executive Committee has formed the practice of not allowing committee appropriations to be used for paying traveling expenses. A few committees have been permitted for good reasons to pay traveling expenses out of committee allowances. If one committee, however, is given that privilege, other committees can claim the right to use their appropriations in the same way. Because of the large number of committees and the large membership in each, the practice of bearing traveling expenses would in a short time bankrupt the Association.

It is proper for certain committees to have their traveling expenses paid by the Association because of the nature of their work, but neither the Secretary nor the committee should have the responsibility of deciding the question. I am, therefore, recommending that in asking for appropriations, committees state definitely the purpose for which funds are desired and that these purposes be named in the statements to be acted upon by the Representative Assembly when the appropriations are made.

NEED OF INCREASING THE PERMANENT FUND

The successful development of the Association depends not only upon the character of its professional ideals and educational standards, but also upon the efficiency of its business management and the certainty of its financial resources.

The Association has had for many years two main sources of income, one from membership dues and the other from the interest on the Permanent Fund. When there were only 7000 to 8000 active members, the in-

Figure 9. RECEIPTS OF THE ASSOCIATION BY MONTHS

come from the Permanent Fund of \$200,000 constituted an important part of the total income of the Association. Now that there is an active membership of over 100,000, the interest from the Permanent Fund covers a much smaller fraction of the operating expenses. It would require a permanent fund of more than \$2,000,000 to serve the larger Association as well as the Permanent Fund of \$200,000 served the smaller Association.

This fund formerly provided income to tide over the years when annual meetings were not held and when the receipts from membership dues had dropped very low. It made it possible to put the annual membership dues on a \$2 basis. It gave business standing and enabled the Executive Committee to borrow money at the time when the epidemic of influenza had cut off practically all receipts from membership dues for a period of six months. It made a permanent home possible and carried the Association

Figure 10. Map Showing Membership of State and National Associations (For data, see Table 1, page 111)

over many bad places, but owing to the recent growth in membership it can no longer meet these emergency needs.

Contributions and life memberships—Steps were taken at the Des Moines meeting to increase the Permanent Fund through a plan of life memberships. It was arranged for active members to take out life memberships on the payment of \$100. Owing to the business depression during the present year, the Secretary's office did not promote the plan. It is intended to give time and attention to this item during the coming school year. It is believed that a large number of teachers will annually take advantage of this opportunity to help the Association.

Among other means which might be used for increasing the Permanent Fund are the following: (1) To retain all interest from invested funds in the Permanent Fund instead of using it to pay current expenses; and (2) to extend to men and women of means who are interested in education the opportunity of making donations. Looking far ahead, the suggestion comes to encourage our own members and the friends of the cause of education to arrange in their wills for gifts to the Association.

If these suggestions were adopted, the interest on the permanent fund would add \$8000 to \$12,000 a year. Life memberships might add from \$5000 to \$15,000 annually. The amount from donations would likely not be large at first, because donations cannot be accepted from agencies desiring to control the policies of the public schools. The time must never come when the Association will accept donations with strings to them. Its members must never be dominated by organized moneyed interests. It is believed, however, that men and women may be found who will make donations, trusting to the Association to use the income for the promotion of the best in education.

Would it not be wise to authorize the Executive Committee and the Board of Trustees to make an effort to add as large an amount as possible each year to the Permanent Fund?

AMOUNT OF THE MEMBERSHIP FEE

Permit me again to remonstrate against increasing the membership dues and to give reasons for so doing.

The membership fee of \$2 appeals to teachers as being reasonable. There is now the opportunity of paying \$5 annually and receiving the volume of proceedings and all publications of the Association, yet few superintendents and college presidents and practically no teachers pay the higher fee. A fee of \$4 for enrolment and membership was tried out for years without apparent success. Teachers on low salaries manage to spare \$2 a year for membership dues, and yet those on higher salaries are slow to pay more than that amount. It must be remembered that this \$2 is in addition to local, district, and State membership dues. It must be remembered also that departments are now adding a departmental fee of from \$1 to \$5.

If the fee is too large the membership will be small. If the fee is small and yet large enough to be respectable, the enrolment will be high. The \$2 fee has proved to be a popular sum. It has been successful. It is increasing the membership of the Association. It purchases office supplies, pays for *THE JOURNAL*, covers the expenses of committees, provides for research work and pays for other valuable services. It is the goose that lays the golden egg.

The \$2 fee will not cover the expenses of delegates to annual meetings. A \$5 fee would likely provide less funds for this purpose than the \$2 fee because the enrolment would be much lower. It will be better in the long run for the local and State associations to increase fees for this purpose than for the National Association to do so. Teachers will pay larger fees to the local than to the National Association. It is only natural that they should do this.

The \$2 fee, which maintained the Association during the period of business depression, rendering remarkable service in maintaining and even in increasing salaries for teachers, should accomplish even more for the Association as cost of paper and printing reach a lower level. In my judgment, the \$2 fee is ample.

When I say that the \$2 fee is ample I am taking for granted that *The Journal* will become more nearly self-supporting as it grows in the confidence of advertisers, the income from commercial exhibits will largely pay the expenses of programs; the place where the meeting is held will continue to bear the expenses for entertainment, to provide assembly rooms and rooms for the officials, and to supply clerks for registering and stenographers and typists for publicity work; the State, city, and county school systems will be encouraged to send representatives to meetings and to bear certain expenses of associational work for which direct benefits are derived; men and women will as in the past consider it an honor to give their services in addressing conventions and contributing articles for *The Journal* and other publications; and that communities will increasingly take pride in helping defray the expenses of delegates to the annual meetings.

THE BUDGET SYSTEM RECOMMENDED FOR AFFILIATED ASSOCIATIONS

The budget plan was recommended for schools and associations in the report of the Treasurer, Miss Adair, at the Des Moines meeting and adopted by the Representative Assembly. A few school systems and local associations have put it into effect and a much larger number have decided to begin its use next September. It will require time to secure its adoption in all schools and will only become effective as teachers appreciate the importance of membership in local, State, and National associations.

The recommendation has come from local associations to arrange to pay dues under the budget plan through the principal's or superintendent's office, because there are a number of associations in many school systems.

It is planned to continue to urge all schools and associations to adopt the budget system. It pays to urge its adoption, because when once in general

use throughout the schools of the country it will not only add to the permanency of membership in the Association but it will lead to more systematic and careful work in all professional organizations.

BUDGET ESTIMATE OF THE ASSOCIATION FOR 1922-23

It was estimated a year ago that the total income for 1921-22 would be about \$200,000, but it was \$233,868.69. The membership increased beyond what was expected and the income from advertising was more than double the amount of the estimate. The estimate for 1922-23 is based on an expectation that there will be a 25 per cent increase in membership and more than 50 per cent increase in the amount received from advertising.

After having viewed the situation from different angles and after having given consideration to the probable income from other sources than from membership dues, it has been decided to estimate the total income for 1922-23 at \$310,000, which is perhaps as accurate an estimate as can be made at this time. Tables 2 and 3 show the income and expenditures for 1921-22 and the estimated income and expenditures for 1922-23.

TABLE 2—INCOME FOR 1921-22 AND ESTIMATED INCOME FOR 1922-23

	Receipts for 1921-22	Estimated receipts for 1922-23
From annual meeting.....	\$3,755.00	\$4,000.00
From meeting, Department of Superintendence	2,830.00	13,000.00
From membership dues.....	164,336.12	200,000.00
From sale of volumes.....	1,696.50	2,000.00
From sale of special reports.....	361.07	400.00

Stationery and office supplies.....	1,145.84	1,500.00
Traveling.....	1,393.56	1,500.00
Miscellaneous expense.....	738.23	500.00
Field Secretary's Department.....	13,727.56	15,000.00
Research Department.....	4,138.76	18,000.00
Insurance.....	125.40	200.00
Surety bonds.....	180.00	100.00
Interest and discount.....	570.11	600.00
Total.....	\$53,853.00	\$76,100.00

Arrangements have been made for an expert accountant to make a careful investigation of the system of records and accounts and to recommend modifications which have been made necessary by the recent growth of the Association. One of these changes will doubtless be to have the books

show accurately the cost of operating each department at the central office. A beginning has been made, but action will need to be taken by Executive Committee on the advice of a recognized expert in order to adapt the system fully to these new points.

It will be observed in the budget estimate that \$15,000 is given as the estimate for the Field Secretary's department for 1922-23, \$13,727.56 having been used for this service last year, and that \$18,000 is the amount estimated for the Research Department, \$4,136.76 having been used in this work since March 1. It is advised that the amounts in these estimates be appropriated to these departments and the Executive Committee authorized to add to appropriations if necessary.

The Association has had the practice for a number of years of appropriating definite amounts for the use of committees. The estimate fixes the total amount for committees at \$8000. This amount would be low except that a large part of the investigational work of committees will be done in the Research Department.

Salaries of the office force—The estimate for salaries for 1922-23 covers a fair increase in pay for members of the headquarters staff and provides for a few additional clerks. Although the Executive Committee increased the pay of many members of the staff last year, the salaries of all are still too low. Some of the men and women have had the refusal of better-paying positions in other organizations and in business. They have been willing, because of their interest in the work of the Association, to remain in the Headquarters' Staff. I trust I have the fullest approval of all active members as well as of the Executive Committee in promising that increases in pay will be granted from time to time until salaries are on a more satisfactory basis.

THE WORK OF THE STAFF

Permit me to commend the work of the members of the Headquarters' Staff. These men and women are particularly suited to their respective lines of work. They are able and successful. Hugh S. Magill's work as Field Secretary has been the greatest factor in giving standing to the Association. It is well known that there is only one Hugh S. Magill in the country. The auditors give Mrs. Helen T. Hixson the name of being exceptionally accurate and efficient in handling the funds and in keeping the records and books of the Association. They give her first place in this important line of work. Ray S. Erlandson in handling the commercial exhibits and advertising and in managing the business of the Association has a Nation-wide reputation, which few men of his age have achieved.

Joy E. Morgan, Managing Editor, besides being resourceful and having great ability, has had the advantage of two years' training under Dr. W. C. Bagley, who is recognized as the leading editorial writer in education in the United States. Mr. Morgan's work has already given him a place of outstanding prominence. John K. Norton became Director of Research only four months ago, yet his work has already interested the research experts of the country as well as the educators who make use of the valuable in-

formation which he prepares for them. Miss Agnes S. Winn began her services as Assistant Secretary in February and is rapidly establishing herself in the confidence of teachers of all ranks in the profession.

The heads of departments have repeatedly called attention to the efficient work of their chief assistants and other help. Those working under the immediate direction of the Secretary are deserving of special mention also. Miss Harriett M. Chase, who has filled one of the most responsible positions of the Central Office in a faithful and efficient manner, is most deserving of high commendation, as is also true of those assisting her in the office work. Without this faithful support, the departments could never render the maximum of service however able and worthy their managers might be personally. The workers in associations as in business who cheerfully cooperate in carrying out policies and plans and who go through the daily grind and the drudgery with loyalty and devotion are always deserving of the larger credit for the success of the enterprise. I join the heads of departments in the expression of appreciation for the loyal and efficient work of the first assistants and other help.

THE LARGER PROGRAM

There is need of a larger educational program than has ever been made. The Association's platform points the way. This larger program should be prepared by the best talent in the Association and affiliated units with the coöperation of all agencies. It should include the adaptation of the course of study for the public schools to the current political, industrial, commercial, economic, social, and moral needs. It should include the use of measurements, intelligence tests, and other devices as their values are determined and properly demonstrated. It should utilize the film in education as commerce and society utilize radio. It should provide for a study of school buildings from the standpoint of use and long-time economy. It should make adequate provision for the development of a thoroughly trained, democratically organized teaching force. It should provide for a wise legislative policy in each State and in the Nation. It should define as definitely as possible the interest and the responsibility of locality, State, and Nation for maintaining educational enterprises of various kinds and should suggest measures and means for meeting that responsibility. It should be well balanced, sane, comprehensive, and genuinely representative of the best educational thought of the time. The world conference on education to be held next year could well afford to give special attention to the principles and policies which would determine the character and outline of this larger educational program.

REPORT OF FIELD DEPARTMENT

HUGH S. MAGILL, FIELD SECRETARY

We are pleased to submit a brief summary of the work of our department for the past year, with a few suggestions and recommendations for your consideration.

Our efforts have been devoted primarily to the promotion of the legislative program of the Association now pending in Congress, and to the development of a greater interest in the teaching profession and in public education, not only among teachers, but particularly among the great civic and patriotic organizations of the country.

In our report submitted one year ago we discussed the situation existing at that time with respect to the Towner-Sterling Bill. We explained that this measure in revised form had been introduced in the House and Senate at the opening of the special session of the 67th Congress in April, 1921, and had been duly referred to the Committee on Education of the House, and to the Committee on Education and Labor of the Senate. We called attention to the effort being made at that time by persons in positions of influence and authority to displace our Educational Bill with what was known as the Public Welfare Bill, creating a Department of Public Welfare, in which education was to be included along with other interests. By the united and determined opposition of the friends of education, the inclusion of Education in the proposed Department of Public Welfare was prevented, and no further action has since been taken on this bill.

The friends of the Towner-Sterling bill have tried diligently to have it reported favorably by the Committee on Education of the House. In their efforts they have had the consistent support of Congressman Towner, and a majority of the Committee are favorable to the bill, but action has been prevented by the movement for the reorganization of the Executive Departments. It will be recalled that one of the announced policies of the present administration was the reorganization of the Executive Departments of the Government. A bill was passed creating a committee consisting of three Senators and three Representatives, to consider this important subject and report thereon. Later the bill was amended to provide for a personal representative of the President on this joint committee. This Reorganization Committee was organized about a year ago by the election of Honorable Walter F. Brown, the President's personal representative, as Chairman. It was agreed that Mr. Brown would bring to the committee a suggested plan for the reorganization of the Executive Departments representing the wishes of the administrative branch of the Government, and that the committee would then take the subject under consideration and make recommendation thereon to Congress.

More than a year has passed since the creation of this Reorganization Committee, and up to the present time the Chairman has not submitted a formal report, although it is understood that he has made an informal recommendation to the President. When the friends of the Towner-

Sterling bill have urged action on their measure, they have been told that they should await the report of the Committee on Reorganization of the Executive Departments; that since the Reorganization Committee will submit a plan for the reorganization of all the Executive Departments, the Towner-Sterling bill, creating a Department of Education, should not be advanced until this reorganization report shall have been made. For months we have been repeatedly assured that the President would submit to the Reorganization Committee in a short time his recommendations on the reorganization of the Executive Departments and the creation of such new department or departments as he might think advisable. Reports indicate that action by the President has been delayed by a lack of agreement among the heads of departments regarding the allocation of certain existing bureaus. This explains why action has not been taken on the Towner-Sterling bill. We have been told that the President desires that no action be taken until he shall have perfected his reorganization plans and submitted his recommendations for the reorganization of the Executive Departments.

On May 5th, by special appointment, a committee consisting of Dr. George D. Strayer, Dr. Thomas E. Finegan, Mrs. Frederick P. Bagley, of Boston, and the Field Secretary called on the President to ascertain if possible his attitude. This committee was received most cordially by the President, who assured the members of his interest in the program of the National Education Association. The President declared that it was his intention to make a recommendation within a few weeks on the reorganization of the Executive Departments, in which education would be given distinctive recognition. Information was given the committee from a reliable source that the President planned to recommend the creation of a Department of Education and Welfare, in which Education would hold the first place, and that the extension of the principle of Federal aid for the promotion of certain phases of education would be conceded.

Just what attitude the National Education Association and other allied organizations supporting the Towner-Sterling bill should take toward the proposed recommendation for a Department of Education and Welfare cannot be determined until the plan has been submitted and its exact provisions known. In the meantime we should continue to work unitedly for the Towner-Sterling bill. We might consistently welcome any action that would bring us nearer the realization of the objectives for which we have worked, but we should not accept any compromise that would prevent the ultimate realization of our purposes, or make their attainment more difficult.

The annoying and disappointing delays that have been encountered during the past year in advancing the Towner-Sterling bill have been more than counterbalanced by the very effective support which the bill has gained. This is particularly marked among lay organizations. A score of National organizations, representing more than ten million voters, are giving the measure their loyal and unwavering support and will resist any unfavorable compromise. The bill has been fortunate in its foes. While it is not

claimed that all of its opponents are enemies of public education, there is an abundance of accumulated evidence that the avowed enemies of public education are its most violent opponents. This fact has rallied to its support millions of friends of public education who might not otherwise have become so deeply interested in the subject.

The alignment of forces for and against this measure is becoming more definitely drawn. The friends of public education in America are more numerous and more powerful than are its enemies. When these forces, united and determined, shall bring their influence to bear directly upon Congress, there can be but one outcome. Public education will receive the just recognition which it has so long been denied, and another great forward step will be taken in the promotion of America's most cherished institutions, the free public school.

The Field Secretary has devoted only a minor portion of his time, however, to the promotion of the Association's legislative program. His principal, if not his most important work, has been in the field. He has traveled during the last year more than forty-one thousand miles, spoken nearly two hundred times, and addressed approximately one hundred thousand people. Many of these addresses were delivered to State teachers' associations and other educational gatherings, but more of them were to civic organizations and public meetings. We are convinced that it is of the first importance that the people generally should be awakened to the vital relation of public education to the welfare of the community, the State, and the Nation. With this in mind, we have embraced every possible opportunity of bringing to the public the message expressed in the platform and program of the National Education Association, and it may be said that the people have received this message gladly.

We believe there is nothing more important for the welfare of the teaching profession and the promotion of education than to keep constantly before the public the simple facts that the public schools belong to the people; that they were founded and are supported by the people to do the people's work; that if they function effectively, the people will reap the benefits in the proper training of all the children and the development of a stronger, more intelligent citizenry; that if they fail to function properly, because of a lack of public interest and public support, the people themselves will suffer an irreparable loss which will fall most disastrously upon the children of the community, the State, and the Nation, who, because of such neglect, will be denied the educational privileges which should be guaranteed to every child beneath our flag.

In carrying forward our work in the field we have come in touch with educational conditions in every part of the country and with the forces which promote or retard educational progress. We have tried always to consider the work of the Association in its broadest aspects; to keep in mind its fundamental purpose as set forth in its charter granted by Congress, "To elevate the character and advance the interests of the profession of teaching, and to promote the cause of education in the United States." We

are convinced that if the National Education Association is to measure up to its possibilities and realize the worthy purposes for which it was founded, it is absolutely essential that there shall be unity of organization and effort; that the Association shall coöperate effectively with other organizations which are devoted to the promotion of education; and that it shall seek membership and support within the profession, and recognition and co-operation without the profession, on no other basis than that of devoted, effective service—"Service to the teachers, service to the profession, service to the Nation."

Every department of the Association should be granted the fullest possible freedom in working out its own particular problems. The amendments to the By-Laws adopted at the Des Moines meeting make this possible. But it should be kept constantly in mind that only through united effort can recognition for the profession be obtained and effective service rendered. To carry the recognition of departmental groups and classes within the profession to the extent of weakening the unified strength of the Association will prove disastrous to the working out of the Association's great educational program, and ultimately inure to the detriment of every department and every member.

The Association is organized on the same general plan as our National Government. Its members give expression to their purposes through their chosen representatives, selected by them in their respective affiliated State and local associations. The interests of the different groups and classes within the profession are given special recognition and consideration in the several departments of the Association. But the strength and influence of the Association, like the strength of our Nation, depend upon unity of purpose and action, and upon holding the welfare of all, the interests of the profession as a whole, above the interests of any class or individual. In the language of our platform, let us work for "The unification and federation of the educational forces of the country in one great professional organization devoted to the advancement of the teaching profession, and through education, the promotion of the highest welfare of the Nation."

REPORT OF BUSINESS DEPARTMENT

RAY S. ERLANDSON, ASSISTANT SECRETARY AND BUSINESS MANAGER

I take pleasure in submitting the third annual report of the Assistant Secretary, embodying the activities of the Business Department during the past year.

The department is divided into the following divisions:

1. The Journal
2. Educational and Commercial Exhibits
3. Conventions
4. Office management: (a) purchasing, (b) shipping and mailing, (c) departmental budgets, (d) employment, (e) building supervision.

General growth of department—During the past year the Business Department has grown extensively in the service it renders and the income it produces. When organized in 1919 the activities of the Business Manager consisted chiefly in the purchasing of paper, materials and office equipment, and in assisting in the management of the convention. With the rapid growth of the Association these two activities have not only been enlarged but new duties have been added. In 1921 the Commercial Exhibit which formerly was managed by an outside organization was taken over. *The Journal of the National Education Association* was established, also necessitating the opening of an advertising division, and in September, 1921, a division of typing was created.

Whereas at the time of its establishment none of the income of the Association was attributable to the work of the Business Department, yet during the present year the total income from commercial exhibits and advertising—the two principal sources of revenue outside of the membership dues—amounted to \$63,000. That this is an important factor in the service the Association is able to render can be seen by noting that the net profits of the Commercial Exhibits would pay the entire cost of maintaining the Research Department, and that the advertising receipts now pay approximately eighty per cent of the printing cost of the sixty-eight page monthly magazine published by the Association.

The purchasing and shipping divisions have also grown proportionately with the development of the Association. The need for typing and clerical assistance was so great at the beginning of the present year that a new division of typists was created with Miss Mabel Wheelock in charge. At one time twenty-five girls were employed in this division to assist in membership drives and to supply the other departments with stenographic and clerical services as needed.

TABLE 1.—*The relation of advertising pages to reading pages, and the relation between advertising receipts and printing costs of The Journal*

Month	Number of pages	Number of copies printed	Printing cost	Number of pages of advertising	Advertising receipts as billed
1921—					
September	20	95,000	\$2,278.60	4	\$1,099.55
October	20	95,000	2,327.26	4½	1,210.75
November	36	95,000	3,557.85	4	1,034.50
December	36	95,000	3,591.70	7	1,636.50
1922—					
January	68	100,000	6,929.86	22	5,733.39
February	68	95,000	6,696.18	25	6,534.05
March	68	95,000	6,655.75	23	6,043.25
April	68	105,000	7,301.53	20	5,029.62
May	68	125,000	8,357.61	22	5,426.45
June	68	125,000	8,397.70	25	6,550.80

I. THE JOURNAL

Advertising—Table 1 shows the monthly receipts from advertising for the year as well as the number of pages of paid advertising, number of pages in each issue of the magazine, printing costs and number of copies printed.

The total receipts from advertising for the year were \$40,298.86.

It will be seen that there has been a steady growth in the income from advertising during the year. In June the receipts reached the highest mark. The February and March advertising were above normal because of the desire of commercial exhibitors to call attention to their booths at the Convention of the Department of Superintendence.

With the increase in the circulation of *THE JOURNAL* it is recommended that as soon as business conditions permit, the advertising rates be increased proportionately.

Developing new advertisers—In the work of encouraging and developing new advertising accounts to use the pages of *THE JOURNAL* we have had the pleasure of discovering many commercial and industrial firms who never before had advertised in educational mediums. The Business Manager has made many personal calls upon such organizations and sold them on the value of educational advertising, not in *THE JOURNAL* alone, but in all similar State and National publications. It has also been possible to outline and assist in organizing advertising campaigns of new business firms who were beginning to market their products and who were looking for suggestions and advice in opening their publicity campaigns. Many of the advertisers appearing in *THE JOURNAL* and other publications had never advertised in educational mediums until conferences with this department. It has been a source of satisfaction thus indirectly to coöperate with them thereby generally stimulating advertising in the educational press of the country. This plan can be still further developed as I shall suggest later.

Plan of coöperation for educational journals—With the establishment of a National official educational magazine has come a desire from educational advertisers and publishers alike, for the development of uniform standards in operation and arrangement among the educational publications, State and National. The National Education Association has been requested to give consideration to the complicated problems involved in an activity of this type. There is no question but that the adoption of a uniform page size would materially increase the amount of advertising now possible. Advertisers confronted with the necessity of making eight to ten different electros for a single advertisement to fit the many-sized magazines now in existence spend much of their appropriation each month in this way, which otherwise would go into the purchase of more advertising space. It is believed that all of the educational magazines would profit by the adoption of standard page and type-page sizes, a uniform number of columns per page and uniform column widths. The same is true with the kind of paper used. If this were of a standard weight and finish it would be much simpler for advertisers and publishers alike.

In view of the fact that most of the educational magazines are not large enough to maintain advertising representatives of their own in the larger cities, the question of coöperation in advertising has also been considered. I am now making a comprehensive study of this question and later will be in a better position to make definite suggestions and recommendations.

It may be said, however, that this is a complicated question. There is no doubt but that a pooling arrangement could be worked out with the various official State journals whereby the gross circulation of all would be sold at a fixed advertising rate. The overlapping circulation problem would not need to be considered. One of the difficulties in such an arrangement that would require careful study is whether or not advertising rates under this plan would be too high. For example, the necessary publication costs of a single magazine with 200,000 circulation might permit much lower advertising rates than a pooled circulation of 200,000 of ten different magazines published in ten different places, each with its separate overhead costs. This question is one that requires careful and scientific investigation into operating costs. Another problem that would arise is the establishment of a single date of publication. Some magazines at present are printed on the 1st, some the 5th, some the 15th, etc. If a unified effort of soliciting advertising is to be made it would be fairer to all publications that they be printed at approximately the same time. Then too, it may be easier to sell circulation on the Pacific Coast and to such wealthy States, as New York and Pennsylvania, whereas a representative might have difficulty in selling space in those journals published in the southwest and a portion of the northwest. The utmost confidence in the management of a coöperative advertising representation is necessary. Many State educational journals have more or less of a National or at least a sectional distribution. Whether or not they would be willing to enter such a scheme would need to be determined. As soon as magazines overlap State boundaries they classify themselves with National mediums and enter into competition with other National magazines. In this field the problems of coöperation become more complicated because of the element of competition. This is particularly true of the magazines appealing to the school administrators and executives.

The Alumni magazines of the various colleges and universities of the country have organized a central advertising representative method and have pooled their circulation selling a gross circulation at a fixed price and then proportionately distributing the advertising obtained and dividing the net receipts in proportion to their circulation. Thus far the plan has not been successful.

On the other hand the Associated Business Papers, the Associated Farm Papers, and Associated Periodical Papers have organized, not to sell advertising but rather to stimulate and encourage National advertising in their respective fields. This encouragement is made through publicity campaigns, through the establishment of uniform standards, through the application of better business management by the individual members, and the

enforcement of a code of business practice or ethics which leads to confidence and support by advertisers and advertising agencies. As a beginning such a plan of an Associated Educational Press, a bureau proportionately supported by members to sell the value of advertising in educational mediums might be valuable. The purpose and function of such an organization would include such things as: (1) Encourage advertisers to use educational journals as mediums for advertising, by conducting a comprehensive publicity campaign; (2) Establish uniform styles of type page sizes; uniform dates of publication, a uniform quality of paper, etc.; (3) Work out principle or standard of practice to be followed by all member publications; (4) Maintain a joint collection service for hard accounts; (5) Act as a clearing house on such questions as the financial status of advertisers, their ability of paying bills, and on general information as may be desired; (6) Work for fair competition, the maintenance of stable advertising rates that are profitable, guaranteed circulation; (7) To establish a code of ethics for the organization, including such points as declining to publish advertising tending to mislead, refusing to publish "puffs," free reading notices, or paid write-ups, keep reading columns independent of advertising considerations; (8) To avoid unfair competition; (9) Co-operative purchasing of paper, supplies, etc.; and (10) To supply all advertisers with full information regarding character and extent of circulation statements. Such an organization doubtless could do much to build a larger advertising clientele in the various educational publications of the country. The establishment and successful operation of such a bureau promoting and seeking the good-will of all advertisers and especially educational advertisers toward these mediums might well be the forerunner of a plan of actual solicitation among various non-competitive groups in the educational field. Indeed it may readily be seen how later departments of the Associated Educational Press might be organized by the publishers not competing with each other to solicit advertising. Such groups might roughly be classified as follows:

Group 1. Official journals of State education associations and other State publications, one from each State.

Group 2. National publications appealing to all interests.

Group 3. National publications appealing to school administration.

Group 4. National publications appealing to teachers.

Group 5. Specialty publications as in psychological research, English, physical education, and the like. This classification is merely suggestive and neither comprehensive nor scientifically worked out.

Financial statement of THE JOURNAL—It is doubtless of interest to the members of the N. E. A. to know how THE JOURNAL would fare if treated as a separate business project of the Association, crediting \$1.00 of each membership to the subscription price of THE JOURNAL. No separate budget having been kept, the expense figures are estimated.

Figure 1—COST OF PRINTING THE JOURNAL. THE SHADED PORTION SHOWS THE PART OF PRINTING COST PAID BY ADVERTISING RECEIPTS

INCOME

Subscription 1921-22	\$72,793.12
Advertising 1921-22	40,298.86
Total	<u>\$113,091.98</u>

EXPENSE

Printing	\$56,005.04
Mailing and Drayage.....	13,304.00
Editorial and Records.....	22,000.00
Wrappers, Paste, Etc.....	800.00
Stationery, Postage	10,500.00
Advertising	3,000.00
Total	<u>\$105,609.04</u>
Net Profit for Year.....	\$7,482.94

EDUCATIONAL AND COMMERCIAL EXHIBITS

The Boston exhibit is the eleventh commercial exhibit held by the Association and the fourth managed directly by the Business Department of the Association. Figure 2 shows the gross receipts and net profits of these exhibits.

*Department of Superintendence Conventions**Annual Conventions*

Figure 2—NET PROFITS FROM COMMERCIAL EXHIBITS SINCE 1917

It is of interest to note that the Chicago exhibit in connection with the meeting of the Department of Superintendence, February 27 to March 3, 1921, was the largest exhibition of its kind ever held in the United States. Ninety-five thousand square feet of floor space on three floors of the old Siegel Cooper (Leiter) building were used. This space was secured free rental through the courtesy of Mr. Joseph Leiter, the owner, who was glad to donate the \$8000 rental charge to the cause of public education. The profits from the exhibits more than pay the convention expenses. In view of this fact, it is recommended that the profits after paying all convention expenses for the meeting of the Department of Superintendence be divided half and half between the Association and the Department.

The educational feature—Since the N. E. A. has directly assumed charge of conducting the exhibits we have endeavored to emphasize the educational part. This was first effectively done at Des Moines when the entire balcony floor of the exhibit hall was turned over to a complete display of the work of the Iowa Consolidated Schools. Keen interest was shown in the many fine demonstrations of Iowa's activities in this type of rural work.

At the Chicago convention of the Department of Superintendence the educational part of the exhibits consisted of a demonstration of the Chicago method of teaching Visual Education under the direction of William Dudley Hayes, record and report systems in use by Chicago schools, and the exhibit of school architecture and buildings under direct supervision of Superintendent Condon of Cincinnati. Dr. Condon's splendid display occupied 10,000 square feet of floor space, with exhibits from the leading cities and rural districts of Alabama, Arizona, California, Colorado, Illinois, Iowa, Maryland, Massachusetts, Michigan, Minnesota, Mississippi, Montana, Nebraska, New Jersey, Ohio, New York, Pennsylvania, Washington, Wisconsin, and the District of Columbia.

The educational feature of the exhibits will be further emphasized at Boston. All of the New England States are coöperating in a comprehensive display of the best work done. Two buildings will be used, the academic exhibit being housed in the Boston Normal School and the industrial exhibit

in the Boston Trade School. The Committee on Rural Education which makes its final report will also have an exhibit as well as the territory of Hawaii, which is sending six accredited delegates.

It is recommended that the Association give more study to the problem of organizing and planning these educational exhibitions on a scientific basis in order that it may better serve in a definite way the needs of the delegates and members.

CONVENTIONS

With the growth of the Association the preliminary work of organizing the local arrangements for the annual conventions has become more complicated. The Boston convention is expected to be the largest in the history of the Association since 1910 and the preliminary arrangements have necessitated more than a dozen trips in working out the details with the local committees. Perhaps in no city, however, has such enthusiastic co-operation been received. The civic pride of New England has resulted in securing the business and educational leaders of community to serve on committees, and they have worked out a convention organization that will serve as a model for years to come. The convention budget of this local committee exceeds \$20,000. The hospitality and entertainment planned is unexcelled. The service to be rendered the visitors is organized to the finest detail. The halls provided for the many meetings have been selected with care.

It is the duty of the Business Department to concern itself with the preliminary work of arranging for and setting up the organization of these conventions. This consists in meeting the local leaders, conferring on necessary committee organizations, matters of housing, entertainment, meeting halls, exhibits, State headquarters, registration headquarters, local help, hotels, printing contracts, etc. In general the work necessary to the efficient operation of the convention constitutes an important function of this department.

There has been a growing tendency among cities inviting the Association and its departments to hold these conventions, to issue a cordial and earnest invitation without making definite promise beforehand to supply the necessary and customary accommodations. As a result, the Association is in danger of putting itself on record by vote of wishing to hold its meeting in a city which might rightly refuse to supply proper entertainment.

It is suggested that before a city can be considered to have issued an invitation to meet and before this invitation is placed before the delegates, it agree in writing to certain minimum requirements either financial or otherwise as may be determined by the Secretary of the Association.

OFFICE MANAGEMENT

Purchasing—A reference to the report of the Treasurer and the managing editor will reveal the importance attached to the work of purchasing supplies and equipment for the Association as well as the contracting of the printing of the many publications which it now issues.

The purchasing division operates similarly to that of any well-managed business office, all requests for purchasing being filled out in writing on regular requisition blanks, signed by the head of the department and sent to the business office where purchase orders are issued and purchases made. All bills are inspected and O. K.'d by the Business Manager before being passed to the Treasurer for payment.

Shipping and mailing—It is a gigantic task alone to mail out each month 110,000 numbers of *THE JOURNAL*, but it is most efficiently handled with a minimum of cost under the present arrangement. More room is required however, and unless the Association has its mailing done by the printer of *THE JOURNAL* additional space will be needed.

During the past year the Association has grown to occupy practically the entire building. Much new equipment, such as multigraphs, addressographs, graphotypes, typewriters, furniture, etc., has been purchased.

Departmental budgets—The various departments are now taking definite shape with fairly stabilized personnel and operating requirements. Up until the present time the practice has been to charge all clerical services, postage, supplies, etc., to a single account in the general Secretary's office. This was necessary because the Association formerly did not maintain a departmental method of operation and all work was carried on by this office direct. Now that most of the departments are clearly outlined with definite policies and definite fields of activities it is suggested that they be placed on a budget basis and a definite accounting be made. The Field Department, the Business Department, including *THE JOURNAL*, and the Research Department would first lend themselves to such a plan, and I suggest that a budget be planned for these departments. Later all departments can be organized on this basis. Much flexibility should be allowed, of course, because of the possibility of unexpected conditions arising. The budget should not be necessarily appropriated to the departments but should serve as a guide in determining the cost of the services rendered and in arriving at a more scientific basis of knowing what amount of money is needed to perform this service. It is believed also that if each department head had a definite plan of expense allowance, many small leaks in expenditures could be eliminated.

Employment—A new division of typists and clerks was created this year, with Miss Mabel Wheelock in charge. All of the departments needed extra help at various times during the year and instead of hiring temporary help for each department as the need arose, releasing the employees when through, it was thought best to maintain a small force as permanently as possible, consolidated in a single unit from which the various departments could draw upon as needed. This gives a flexible as well as a trained personnel under competent supervision, materially reducing costs and affording a much more competent service than the old system of spasmodic employment.

It is difficult to measure the increasing service rendered by the Association. Results in promotional work are always more or less intangible. Assuming that the staff, however, is constantly rendering the maximum of

service, one of the most definite indices of a growing service is the increasing personnel. Figure 3 is interesting and valuable therefore in showing a comparison of the maximum number of employees each month this year as compared with last.

Figure 3—NUMBER OF EMPLOYEES AT HEADQUARTERS, 1921-22. SHADED PORTION SHOWS THE NUMBER OF EMPLOYEES, 1920-21

Building supervision—Visitors to Washington and the Association headquarters are proud of the beautiful building in which we are housed. Since its purchase three years ago, the property has increased in value from \$98,000 to \$150,000. Many needed repairs which should have been undertaken sooner but were not made because of lack of funds, should now be made. More room is needed. The department of records and accounts as well as the mailing division, and the multigraphing and addressographing divisions are badly crowded. There is no room to store volumes and other publications. The Research Department will soon require more room. There are two alternatives. One is to build additional floors, the other to purchase an additional building. The latter is recommended for several reasons. To build higher might mar the beauty of the building. The mechanical equipment with its irksome noises should be isolated from the office. The volumes and printed material of all kinds should be housed on the basement or ground floor, because of its weight and also because of constant danger of fire. The mailing and shipping division should be so arranged that incoming as well as outgoing shipments can be handled easily and with a minimum of expense. For these reasons I wish to recommend the purchase of the property lying on 1541-43 M Street, consisting of a three-story brick building and 2460 square feet of land, at a price not to exceed \$40,000. That property values adjacent to the N. E. A. head-

quarters are constantly increasing is evident. At the present time a large eight-story hotel is under construction just across the street while on the vacant lot just to the north of the N. E. A. building an eight-story apartment house is now under construction.

Figure 4. BUILDING ADJOINING HEADQUARTERS RECOMMENDED FOR PURCHASE

Conclusion—The very efficient and thorough manner in which the detail work of the Business Department is cared for by the assistant, Miss Margaret Holden, contributes much to the successful operation of its many activities. It is naturally impossible for the head of the department to give more than general direction and supervision to the various divisions. The selection of competent division heads and the delegation of authority and responsibility to them is therefore essential. When the maximum of service is rendered with the efficiency, thoroughness, and minimum of expense that exists at Association headquarters it is fitting that those in charge receive due commendation. It is a pleasure therefore for me to express the deep

appreciation felt for the competent manner in which the work in the various divisions of this department has been dispatched—Mr. Reily in the general work of shipping and multigraphing, Mrs. Harriet Thatcher in the mailing room, and Miss Mabel Wheelock, who has had charge of the general typing and clerical work, have been most faithful and persistent in their efforts to serve the best interests of the Association. Indeed their inspiration has maintained a splendid *esprit de corps* throughout the entire staff, and has done much to maintain an atmosphere of coöperation and mutual helpfulness that is unique among the business institutions of the city.

Under the continued leadership of the man who has been the guide and counsellor and leader of all of the activities of the Association—the general secretary—we look forward to a year of increased efficiency, greater usefulness, and larger service to the great cause of public education.

Summary of recommendations—1. That the Executive Committee be authorized to purchase the property consisting of 2460 square feet of land and the three-story brick building, Nos. 1541-43 M Street N. W., at a price not to exceed \$40,000.

2. That the Association adopt the budget plan for the various departments at headquarters as soon as feasible.

3. That the profits accruing from the commercial exhibits of the Department of Superintendence after the payment of all expenses be divided equally between the Department of Superintendence and the Association.

4. That the advertising rates be raised as soon as business conditions justify.

5. That the Business Department be authorized to coöperate with the State and National educational magazines in developing a larger advertising service.

6. Cities desiring to entertain the Association or its departments agree in writing to the minimum requirements before the invitation is placed officially before the Association.

REPORT OF EDITORIAL DEPARTMENT

JOY ELMER MORGAN, EDITOR

The following report covers the work of the Editorial Department for the period between July 1, 1921, and June 30, 1922, under the headings (1) The Journal, (2) Proceedings, (3) Other Publications, (4) Publicity, (5) Need for an Association Library, (6) The Work of the Department.

I. THE JOURNAL

Its rapid growth—The *Journal of the National Education Association* has grown during the year in size, in circulation, in the quality and variety of its content, and in the approval which it has had from educational work-

ers throughout the country. It is worth noting that it has reached its present stage of development at least a year sooner than could reasonably have been expected. This excellent progress has been made possible by the whole-hearted coöperation of everyone connected with *The Journal*, including the Business Manager, Mr. Ray S. Erlandson, the Editor-in-Chief, Dr. William C. Bagley, and the Editorial Council; by the earnest work of other departments of the Headquarters Staff, and by the enthusiastic support of hundreds of leaders in education throughout the country, who have given help and encouragement in important ways. The growth of *The Journal* in size—which is a fair index of its growth in other respects—is indicated by the following table, covering the school year 1921-22. The number of pages given includes the cover.

Month	Total number of pages	Number of text pages	Number of advertising pages
September	20	16	4
October	20	15 1/2	4 1/2
November	36	32	4
December	36	29	7
January	68	46	22
February	68	43	25
March	68	45	23
April	68	48	20
May	68	46	22
June	68	43	25

The standard of sixty-eight pages in each number of *The Journal* should now be regarded as a minimum, with a possible maximum of not over 100 pages for the coming year. With a minimum of sixty-four pages it is possible to make plans and commitments sometime in advance. In the early days of *The Journal* it was not possible to ask for many articles on specific themes inasmuch as the limited space available gave no assurance that the articles could be printed when they had been prepared. Even in its larger form *The Journal* is able to print only a small portion of the material which is submitted for use in its pages. It will become more and more necessary for plans to be made many months ahead if *The Journal* is to maintain uniformly high standards.

Editorial policy—*The Journal* has endeavored to register the striking progress which has been made in education and to support vigorously the policies and programs of the Association. There have been two meetings of the Editorial Council under the chairmanship of Dr. Bagley. A meeting was held at Des Moines July 3, 1921, and another in Chicago on March 1, 1922. Expressions of opinion obtained at these meetings, supplemented by correspondence with individual members of the Council, have served as a guide in the selection and interpretation of material and will become still more valuable as *The Journal* grows larger.

It is not easy to set up standards defining the content of *The Journal*,

or having established such standards, to obtain for each issue material that entirely agrees with our conception of what *The Journal* should include. The following types of material are described in the approximate order of their claim for inclusion.

1. Official accounts of the Association's work and editorials designed to further its program.

2. Material relating to the organization and work of teachers' associations generally, more especially of State and local affiliated associations.

3. Accounts of educational legislation, administration, policies, plans, and scientific advance, thus making the best experience quickly available.

4. Material which because of the peculiar position of *The Journal* it can better publish than any other periodical. It should give special consideration to new movements in education and to matters of National and international concern which should be brought quickly to the attention of members.

The Journal and the Association—*The Journal* will come more and more to represent the Association in the minds of the rank and file of the membership. *The Journal's* most difficult problem is so to present the work of the Association that the individual member will appreciate the deeper meaning of the membership privilege. *The Journal* must come to reflect more and more largely the growing activities of professional organizations—National, State, and local—in such a way that their programs shall appeal to the great body of educational workers throughout the Nation as immensely worthwhile. Loyalty to the cause of education is a secure and abiding foundation upon which to build a great organization. Such a foundation is not to be compared with appreciation of mere benefits received. It is upon this rock of loyalty to the educational needs of democracy that the Association and its *Journal* may best be built.

The judgment of the editorial force has been unfavorable to numbers devoted to special phases of education. While numbers thus specialized appeal strongly to a certain group, they appeal less strongly to the members of the Association as a whole. For the same reason the Editorial Council has felt that it would be unwise to give space to Departments as such in each issue of *The Journal*. For example, it is considered better to have good articles on rural education scattered throughout *The Journal* than it would be to give a specific page each month to rural education. In the first case, the article is directed to the Association's entire membership, whereas in the second case it might appear to be of interest only to those members who are also members of the Department of Rural Education.

What has been said with reference to departments does not apply to certain features which have come to be regarded as a regular part of each number. Included among these features are Enrolment and Affiliation, The Guide to New Books, and School Building Progress. It may be noted that these special features in reality take the place of a large number of notes which might otherwise be published under the heading, *In the Field*.

The page of pictures is popular—Pictures enable leaders to know each other and supply a personal appeal without placing *The Journal* in a position of indulging freely in personal praise and comments. The portraits used in *The Journal* have been standardized in two sizes—(1) a small size eight picas wide by nine and one-half picas long, (2) a large size fourteen picas wide by twenty picas long. This practice makes it possible to use the same plate in several consecutive groups.

In connection with the picture page there has been built up in the Editorial Department a considerable collection of photographs and information about leading educators. This collection, which has been in charge of Mrs. Bertha M. Robbins, should continue to grow until it includes photographs of all well-known educational leaders in this country and even in the world. It is used in connection with general publicity as well as with *The Journal*.

Enrolment and affiliation—This section gives deserved recognition to associations and individuals who have rendered distinctive service in the promotion of professional organization and constitutes a record of the Association's growth. Lists of enrolments and affiliations have been furnished by Miss Harriet M. Chase.

Guide to books—This section was first undertaken experimentally in *The Journal* for October, 1921. It proved unexpectedly popular and with modifications indicated by experience has come to be a distinctive feature. The book section of the June number indicates the plan which represents the judgment of the Editorial Council and which promises to become more or less permanent. First, is a short list of books with notes selected from *The Booklist* of the American Library Association, which is compiled by experts on the basis of reports from the leading libraries of the United States. This list includes new books of general interest. Second, is the comprehensive list which aims to mention without notes all important new books on education published in the United States. Third, is a brief list of books, including descriptive notes, on a subject of special interest to teachers. These are three services which can be rendered by *The Journal* better than in any other way. It will be noted that where selection of books is made, the work is done by specialists who have the qualification and the opportunity to make careful estimates.

School-building progress—The importance of school building was brought to the attention of the Association in the campaign to relieve unemployment which was undertaken by the Secretary of Commerce in October, 1921. A study of the situation revealed an enormous amount of school building in progress with a strong demand for additional building to compensate for the period during the war and after when virtually no construction was undertaken. As a means of systematically reporting school-building progress, facts have been gathered, compiled, and published in *The Journal* each month. While the school-building page may be regarded as the equivalent of seventy or eighty news items, its comprehensiveness gives it an additional value to persons interested in school building and related activities.

Relation to other educational journals—The Managing Editor has examined regularly all educational journals of importance published in the United States and has given much thought to their relation to each other and to *The Journal of the National Education Association*. It becomes increasingly apparent that the field of educational journalism is still comparatively undeveloped. There is enough educational thought in America to fill all journals which now exist, to improve them still further, and even to establish others. There is enough potential educational advertising to support much larger enterprises in educational journalism that have yet been undertaken. It is believed that *The Journal of the National Education Association* will greatly stimulate professional thinking and research. In fact, a considerable proportion of its articles are written specifically for it on the basis of subjects or outlines furnished from headquarters to persons of approved fitness to write on special subjects. It is also apparent that the advertising campaigns undertaken by the advertising manager of *The Journal* stimulate an interest in educational advertising and help other educational journals tap resources that have hitherto been undeveloped.

The Journal of the National Education Association will do its greatest work in full coöperation with wide-awake, local educational newspapers, with State education journals fully alive to the needs of the teachers of their respective States, with National journals giving vigorous expression to independent educational leadership, and with special journals devoted to the development of special phases of education and to the improvement of special classes of educational workers. *The Journal of the National Education Association* seeks to encourage in every way possible the development of every worthy educational journal.

II. PROCEEDINGS

The points in which the 1921 Volume of Proceedings differs from its predecessors are set forth in an editorial note at the beginning of the Volume. An effort was made to group the material according to a more or less logical arrangement and to publish the Volume in the fall rather than in the spring. In spite of delays which are unavoidable, because of the large number of authors involved, the volume was ready for distribution in November. Much of its excellence is due to the good work and co-operation of the University of Chicago Press, which has published the Proceedings regularly beginning in 1896. Although the growth of the Association and certain other considerations, have indicated that the 1922 volume should be published in Washington, the change has not been made because of any lack of appreciation of the distinctive service rendered by the University of Chicago Press over a period of a quarter of a century.

The Proceedings for 1922 are being published by Messrs. Judd and Detweiler, the publishers of the Association's *Journal*. The material from the Department of Superintendence and other meetings held at the same time are already in type and it is hoped that it will be possible to have the completed volume ready for distribution by October 1. Much of the work on

the 1921 Proceedings and most of the work on the Proceedings for 1922 has been done by the Assistant Editor, Miss Jessie M. Robbins.

III. OTHER PUBLICATIONS

Publications other than *The Journal* and the Proceedings have increased with the growth of the Association and of its departments, several of which have used the resources of the Editorial Department. The following list of publications issued during the year is here included for reference purposes. It does not include minor reports and bulletins issued during the meetings, press releases, and similar matter.

Title	When published	Number of pages in each	Number of copies	Total number of pages
Addresses and Proceedings, 1921.....	Nov., 1921	897	7,500	6,727,500
	1921-22:			
The Journal of the National Education Association	Sept.	20	95,000	1,900,000
	Oct.	20	95,000	1,900,000
	Nov.	36	95,000	3,420,000
	Dec.	36	95,000	3,420,000
	Jan.	68	100,000	6,800,000
	Feb.	68	95,000	6,460,000
	Mar.	68	95,000	6,460,000
	Apr.	68	105,000	7,140,000
	May	68	125,000	8,500,000
	June	68	125,000	8,500,000
Program of Des Moines Meeting.....	July, 1921	64	8,000	512,000
Program of Chicago Meeting.....	Feb., 1922	48	11,000	528,000
American Education Week, Bulletin 16	Oct., 1921	4	10,000	40,000
Give a Job, Bulletin 17.....	Oct., 1921	4	2,000	8,000
Department of Elementary School Principals' Proceedings, 1921, Bulletin 18.....	Jan., 1922	46	1,000	46,000
Salary Schedules, 1920-21, Bulletin 19.	Jan., 1922	32	10,000	320,000
Serve Democracy's Greatest Need....	May, 1922	1	30,000	30,000
Ideals of Public Education for the Department of Superintendence.....	May, 1922	32	3,000	96,000
Financing Public Education.....	May, 1922	48	3,000	144,000

Yearbook of the Department of Elementary School Principals.....	May, 1922	144	2,000	288,000
Research Bulletin	June, 1922	64	10,000	640,000
				63,911,500

IV. PUBLICITY

The publicity work done by the Editorial Department or under its direction includes (1) publicity work extending throughout the year; and (2) special publicity in connection with the Association's annual meetings and in connection with American Education Week. Press releases have been sent from headquarters at the rate of about one each week to the educational press, to general magazines, or to newspapers. Editorials and other material from *The Journal* have frequently been used in this way and have been widely reprinted and used as the basis of editorial comment. The importance of maintaining adequate salary standards and the legislative program of the Association have been especially emphasized. The amount of publicity obtained is probably twice that received in any previous year. The amount of publicity which the Association has had in the educational press is several times the amount heretofore received. This increased appreciation of material sent out by the Association indicates a growing appreciation of the importance of education on the part of editors of magazines and newspapers generally.

Publicity for meetings—The method of conducting the publicity campaigns for the two major meetings of the Association is described in the report of the Editorial Department for 1921. Before the meeting in Des Moines considerable time was given to conferences with local newspaper representatives. Their attention was directed to the importance of educational news, to the aims and character of the Association, to the arrangement of the meetings including the relation of the departments to the general sessions, and to discussions of certain features of the meetings which would be of special interest to newspaper workers. This preliminary work included talks by Mr. J. W. Searson and myself to the entire staffs of two leading Des Moines papers. It is worth noting that one of these has since employed a regular school editor. Much of the effectiveness of the publicity at Des Moines was due to the work of Mr. Searson, who gave his entire time during the meeting.

The Chicago meeting—Before this meeting there was a general feeling among the officers of the Association that Chicago newspapers had given far too little space to the Association's meetings. Special effort was therefore made to secure more favorable treatment. Much preliminary work was done from Washington by the Editor and in Chicago by Mr. George A. King, who is regularly employed by the Teachers' Council of the Chicago High Schools. Mr. King gave his entire time during the meeting to the writing of news for Chicago newspapers and press associations, acting as the special representative of City Superintendent Mortenson, who assumed personal responsibility for seeing that the meetings were given adequate publicity in Chicago. The publicity organization also included Mr. Charles H. Lake, assistant superintendent of the Cleveland schools, and Mr. Clyde R. Miller, of the Division of Publication of the Cleveland

schools, both of whom served as the spécial representatives of Superintendent R. G. Jones, president of the Department of Superintendence.

The Boston meeting—Much advance publicity work covering the Boston meeting has already been done and present indications point to a publicity organization which will be unusually effective.

American Education Week—The Editorial Department coöperated with the Publicity Department of the American Legion in the publicity for American Education Week. An enormous amount of publicity appeared in the newspapers, based on material sent out from this office as well as that sent out by the Legion and other organizations. As the purposes of the Week come to be better understood practically every educational organization in the Nation may be relied upon to plan a special publicity campaign in coöperation with the Legion and the Association.

V. NEED FOR AN ASSOCIATION LIBRARY

The Editorial Department has used freely the library of the U. S. Bureau of Education, the Library of Congress, the Public Library, and other libraries in the city, but it is now apparent that it will be necessary for the Association to establish a special library of its own. The purposes of this library should be so defined that it will never become unduly expensive or unwieldy. It should be in charge of a librarian familiar with the resources of other libraries and trained to organize material in the most approved and effective manner. It may well contain a small reference collection covering education in general. It will make large use of filing cases, organizing and preserving much material in pamphlet and typewritten form. In professional organization, educational legislation, and on other subjects covered by the Association's program it should be the most comprehensive library in existence. The library will be used chiefly by the Research and Editorial Departments and might well be managed under the direction of a committee including the Secretary and the heads of these two departments. The cost of maintaining such a library for next year would probably include about a thousand dollars for furniture and equipment, a thousand dollars for books, and about two thousand dollars for service.

VI. THE WORK OF THE DEPARTMENT

The Journal has come to be the most important single undertaking of the Department, and as such has chief claim to the time and attention of the Editor. With this thought in mind, effort has been made so to plan the work of the Department and of the publicity for the Association's meetings as to leave the Editor free to devote the larger portion of his time to matters connected with *The Journal*. At the time of the Association's meetings when it is possible to have conferences with many educational leaders it is desirable that a large amount of time be given to making plans for future issues of *The Journal*. It now seems desirable to develop a publicity organization, which, while under the general direction of the

Editorial Department, can operate without full attention from the Editor during the time that meetings are in progress. The plan which worked so well at Chicago may well be developed and extended. During this meeting a local newspaper man employed by the High School Teachers' Council acted as a member of the publicity staff and wrote much of the news matter used by the Chicago newspapers. The city in which the meeting is held has so much interest in obtaining adequate publicity that it may well be expected to furnish such a member for the publicity organization.

The staff of the Editorial Department now includes regularly four persons and calls upon the Stenographic Division for additional help as needed. In addition to the Editor the department includes an assistant editor, Miss Jessie M. Robbins; an editorial clerk, Mrs. Bertha M. Robbins; and a secretary, Miss Lillian B. Wheelock. The work of the various members of the editorial staff has been highly satisfactory. There has been growth in service and appreciation of the larger purposes of the work. The members of the Editorial Department value most highly the coöperation of all members of the Association's staff and the sympathetic and constructive leadership of its Secretary.

REPORT OF DEPARTMENT OF RECORDS AND ACCOUNTS

HELEN T. HIXSON, ASSISTANT TREASURER

It again becomes my privilege and pleasure to submit to you and to the Executive Committee a report of the Department of Records and Accounts for the year 1921-22. While the stress of work in our department contingent with the closing of the fiscal year has handicapped me somewhat in giving as detailed a report as I should like, I shall endeavor to make a fairly comprehensive survey of the year's work, at the same time showing the growth of our department—which growth, I believe, is a good criterion of the rapid growth of the Association during the last twelve months.

SYSTEMS OF RECORDS AND ACCOUNTS

The simplified system of handling the funds of the Association and the record of its membership which was installed in 1919, still seems to operate advantageously in handling the membership records even with the large increase in membership. As yet we are unable to see where it could be improved to facilitate the work in this branch of the department, but we are rapidly outgrowing the handling of the funds of the Association through our bookkeeping accounts, owing to the addition of new departments and necessarily new accounts. Early in the new year it would be advisable for us to have expert advice as to how these accounts had best be handled, so as to cover our growing demands and also enable us to show the exact cost of operation of each department.

Last year upon recommendation and approval by the Executive Committee our Revolving Fund was increased to \$10,000 to cover the operating

expenses of the General Secretary's office, and subordinate departments. During the greater part of the year we found that this was entirely adequate for our needs, and we were always able to close the month's expenses with a small balance on hand in our "Special Account" to carry us through until our reimbursing check came to us from our "Regular Account," but during the past two months (April and May) when our work has been unusually heavy, and our expenses have likewise increased for clerical service and supplies, we have realized that for the coming year we will need a Revolving Fund of at least \$15,000. Otherwise it will be necessary for us to put through a bi-monthly expense bill to cover the expenses of the Secretary's office, and this is not practical since the bulk of our expenses is incurred at the end of the month when the salary checks are made up. We could perhaps meet our expenses easily on the \$10,000 Revolving Fund if the salary checks were all drawn bi-monthly, and then expense bills made up immediately after the 15th and at the close of the month. I think we should submit this to the Executive Committee for their consideration at the summer meeting.

During the recent audit of the funds of the Association by Messrs. Marwick, Mitchell & Co., of New York, favorable comment was made concerning the handling of funds. While several suggestions were made whereby the work might be simplified or accounts readjusted, upon discussing the matter in detail the suggestions were withdrawn. It may be that the auditors will have something favorable to recommend in their official report which may be helpful in the work. They again expressed the view that all membership receipts should be consecutively numbered and accounted for, but under our new system and with the large growth of the Association, we feel that this would be absolutely prohibitive, and when it came to auditing the records under consecutive numbering it would mean the work of several people for a considerable length of time, at heavy expense. Under our present system of handling the cash memberships, which is covered by a triplicate check, there is very little likelihood that bogus memberships might be issued.

MEMBERSHIP

According to our records for the year ending May 31, 1921, we had approximately an enrolment of 70,000 members, including institutions, or an increase of 25,000 over the preceding year. Our total membership on June 1, 1922, was 108,474, an increase of approximately 40,000 during the past year. While our growth in membership during the coming years may be somewhat more gradual than during the past two years, we anticipate that through our affiliation with the State and local associations, which we hope may soon become operative through the "budget" plan, that our membership will have an ever steady and increasing growth. With this almost doubled membership during the year has come increased work in the handling of the records of membership, but we have endeavored to dis-

patch the work as rapidly and efficiently as possible with a minimum of service. During the first seven months of the year we handled the work of the department without additional help, thus keeping the cost of handling the increasing membership down as low as possible, but since the first of January we have found it necessary to add six new people to our staff, as the major proportion of our memberships now reach the office during the last three months of the fiscal year. It is imperative that these memberships be promptly entered and the proper credits given as quickly as possible, in order that we may clear up the membership records before the close of the year, when the transfer of record cards and addressing plates is made to start the new year.

In order that our members may be somewhat more conversant with his or her membership record, every one of which has a separate place in our "Membership Record" file, perhaps it might be of interest to follow "just one" of the 108,474 memberships that come to the office of the General Secretary through the process of recording. After the letter from a member has been opened in the Secretary's office and the remittance attached to the transmittal blank or letter, it goes to the Cash Entry Clerk who enters same on the daily cash sheets, and at the same time these entries are consecutively numbered, which enables us very readily to trace any payment through our cash records. These sheets, covering a day's entries, then go to the cashier, or assistant treasurer, who detaches the remittances and prepares same for deposit in the regular banking account of the Association at the Continental Trust Co., Washington. After the banking has been prepared, the cash sheets with remittance blanks are then passed to the head of the Record Department, and in turn each name is checked with our Membership Record file to ascertain whether or not the member is already enrolled as a member of the Association, and if he is, his record card is "pulled" so that the cash entry can be recorded, and the change of address noted when indicated. The membership blanks then go to the addressograph operators, who prepare the plates for all new members and correct old ones where needed, and then the cards are run for the various files, the envelope for the return membership card, and the wrapper for the Journals.

While this is going on the individual membership cards are made up from the cash sheets, so that they will be ready for mailing as soon as the record is complete. These plates, cards, and envelopes are again checked against the remittance blanks and cash sheets, and the plates and cards are then ready for filing in our "paid" file. This indicates that each membership must be handled ten times before the transaction is complete and the record of a member's payment duly recorded on the rolls of the Association. We often have memberships to adjust, many of which need an individual letter suiting the particular case, but out of the 108,000 members I think I am safe in saying that we do not have over 500 throughout the year, and these we are usually able to adjust consistent with their record in a manner satisfactory to the member as well as ourselves. Our

records are at all times open for inspection to our visiting members, and we take special pride in showing any who may call at headquarters his or her particular membership record and our system of filing. It is certainly very complete in every detail, and as yet we are unable to see how it might be improved even to meet the growing demands of the Association. In addition to our membership record file, we have a complete alphabetical and geographical file, which is of great assistance in locating a member quickly, or in making comparisons by towns, cities, or States.

Our records show that we have had a slower but steady growth in our \$5.00 memberships, especially with respect to institutions and libraries, who desire all of the publications of the Association on the shelves of their libraries for use in reference work. We have noted, however, from the many inquiries that we receive regarding membership, that *THE JOURNAL* now seems to be filling a long-felt need, and that it is looked upon as a source of pleasure and benefit to the individual member.

EXPENSE COVERING COLLECTION OF DUES

We still have before us the problem of the enormous expense of collecting the membership dues, which we hope in the near future to eliminate, or reduce to a minimum, through the "budget" plan, coöperating with the State and local associations. Under our present plan of collecting dues from each individual member, one can readily estimate the large expense involved in clerical services, and postage, in addition to the expense covering the statement of dues and necessary enclosures. This last year we sent out four notices to all unpaid members, or an equivalent of approximately 110,000 notices, and we still have 20,000 unpaid members on our rolls, the majority of whom will perhaps not pay until they have received the fifth call of dues in the early fall. You can therefore readily see what it will mean to the Association in revenue if we can have these dues collected and transmitted to us in bulk by the State or local associations. A large number of cities has already established this method of collecting dues, and in most of them it seems to be working out well. While we now and then have differences to adjust regarding the year which the membership is supposed to cover, in time this difficulty will no doubt be entirely eliminated. Thus far the only serious drawback that we have found in our department is that our rush of work comes at the end of the year, whereas formerly it was more evenly distributed throughout the year. This is probably because the dues are withheld awaiting a 100 per cent enrolment, and they reach Headquarters during the last three months of the year. A relief for this congestion, can and will no doubt be worked out as the plan is more fully developed.

AFFILIATED MEMBERSHIP

We have now been able to establish and maintain a membership record of all of our affiliated associations, and it is working out advantageously. On these record cards we keep an up-to-date record of the officers of the

affiliated associations, together with their payments of dues as received. The plate for the publications is made up when possible in the name of the secretary.

MEMBERSHIP YEAR

It was recommended last year that the Association year be changed to coincide with the calendar year, as it was thought that this would obviate the confusion arising over the exact period which a membership covers, and simplify the work in the Record Department. This we understand is not deemed advisable by the State secretaries if they are to work out the collection of dues on the "Budget" plan, as they believe that the Association year must conform to the school year. This recommendation will no doubt accordingly be rescinded.

NEEDS OF THE RECORD DEPARTMENT FOR THE COMING YEAR

During the last year we have added considerable equipment to our department in the way of steel cabinets for our addressing plates and files for the membership record, and we have also purchased another addressograph and graphotype machine so that we feel that our immediate wants are perhaps provided for. We shall need additional equipment, especially filing cabinets, before the end of the year, and it might be well for us to obtain the approval of the Executive Committee to purchase such equipment as the growth of the Association demands. What we now need most of all is more room—floor space—as we have been working to a disadvantage under congested conditions for the last three months, and we shall need to work this out at the earliest possible moment, so that we will not be handicapped for room when our work begins in the fall.

CONCLUSION

In conclusion, permit me to say that while the year has been without doubt the most strenuous in the history of our department, it has been one of added interest and zest as well as responsibility, and I feel sure that each member of the department has felt satisfied and happy in their particular work. We all appreciate the hearty coöperation given us by all members of the office staff, and the occasional visits and words of encouragement from our President, Miss Williams, have been most helpful and inspiring. In closing I wish to add a word of appreciation of my assistants and co-workers who have been most loyal and painstaking in their work, which has in a great measure facilitated the work of this department. I appreciate and feel most grateful for their splendid support, and I believe their work is as fully appreciated by you and the other officers of the Association.

REPORT OF ASSISTANT SECRETARY

AGNES S. WINN, ASSISTANT SECRETARY

I take pleasure in submitting a brief report of my work since taking up my duties as Assistant Secretary, February 15, 1922.

The work has been so varied that it is difficult to summarize its activities. They may however be classified under the following heads:

1. Annual convention
2. Standing committees
3. Affiliated associations
4. Publicity and field work
5. The president and headquarters
6. General correspondence

The annual convention—A large share of the work and plans for the Boston meeting, including correspondence regarding the general program and with the heads of Departments and Allied Organizations, forty in all, was carried on. Answering letters requesting information concerning the meeting; the preparation of a bulletin giving this information, to be sent out in letters; looking after identification certificates; and working with the editorial department in assembling the general and departmental programs and the preparation of notes and announcements consumed practically the months of April, May, and June.

Special committees—The responsibility of carrying on the correspondence with committees, notifying those that are to report at Boston and those whose reports are to be printed, has been assumed. If the work of special committees of the Association is to function it is necessary for the chairman to keep in touch with the Central Office and to keep the Secretary informed as to the results of the work. I would therefore recommend that next year a member of the headquarters' staff be assigned to each committee to assist in whatever way may be necessary to make the work effective.

Affiliated associations—Extensive correspondence has been carried on with leaders of local organizations for the purpose of strengthening the ties with the National Association of those already affiliated and of explaining the Association's program of service to those not yet a part of the National organization. As a result many affiliations and renewals of membership as well as new memberships have been received. In replying to letters no opportunity has been lost in getting the program of the Association before the teachers of the country. It is hoped that more time may be given to this phase of the work in the future.

Publicity and field work—Articles on special phases of the work of the Association have been written for the press as well as articles for organization publications. Letters have been sent to State directors, presidents and secretaries of State teachers' associations, State superintendents of public instruction for the purpose of collecting information concerning their plans for the Boston meeting and its publicity. Calls for field work have been received, but it has not been possible to respond, owing to the amount of

work at headquarters. The Secretary hopes that the work will so shape itself another year that some calls of this nature may be accepted.

The president and headquarters—The policy at headquarters has been to keep the President informed daily of all activities. It has been a privilege to carry out this policy during the present year at a time when a big program was evolved.

General correspondence—The correspondence of a general character included requests for information concerning publications of the Association, its policies, its work, and history; inquiries about the salary question, pensions for teachers, lists of books, and legislative measures.

It will be seen that the range of activities of this department is very wide. It has served to relieve the Secretary of many of the details of the organization and its various departments. These first few months at headquarters have strengthened my previous ideals for a great National Association,—an Association having the unique privilege of binding the teachers of the Nation in one great professional organization with a common purpose, with a common understanding, and with common ideals. It will be the purpose of this office to keep in touch with classroom teachers and administrators to assist in bringing about this professional unity.

The unprecedented growth of the Association since its reorganization is largely due to its program of service, to the faithful and untiring work of its officers, as well as to the awakening of a professional consciousness among teachers. With this growth in numbers the Association must equip itself for a greater future service and for a more vital influence in the lives of its members than it has ever done before. It is hoped that it will be my privilege to make clear to the teachers through correspondence and personal contact the benefits that will accrue to them and to the teaching profession from membership in a great National organization and to encourage and assist local leaders in their local problems.

To carry out this program of service the structure must be made so strong, so upright, and so enduring that the passing of the years will but strengthen its foundations. Were every member of this organization to bring to it his varied experience, and to try to interpret the aims and the aspirations of the American teacher it would help the Association realize these ideals.

REPORT OF RESEARCH DEPARTMENT

JOHN K. NORTON, DIRECTOR

I take pleasure in submitting a report covering the work of the Research Department since its establishment, March 1, 1922.

I. ORGANIZATION OF RESEARCH DEPARTMENT

First attention has been given to organizing the Research Department upon an effective basis. The organization of such a Department is a task that requires considerable thought and time. Its future effectiveness will depend upon the foundation which is laid. The following has been accomplished. Coöperative relationships have been established with a number of the research agencies of the country; contacts have been made with many of the excellent sources of information that exist in Washington. A beginning has been made in collecting a small working reference library. A simple but effective cataloging and filing system has been installed. Progress has been made in training two assistants to handle the detailed clerical, tabulating, and filing work of the department.

After much correspondence and many conferences with members of the Association representing every field of educational endeavor, the policies of the department have been outlined, and a tentative program of work has been laid out for the coming year. We shall begin the year with a feeling of confidence that comes from having well-defined objectives.

It is with satisfaction, therefore, that we report the Research Department ready to take an active part in the Association's program of service.

II. WORK ACCOMPLISHED SINCE MARCH 1, 1922

Concurrently with this preliminary work of organization it has been possible to complete several definite pieces of work. A brief statement of the work accomplished is given below under three heads.

Work accomplished under the direction of committees of the Association—Approximately half of the time of the Department staff has been devoted to collecting data for use by a number of the Committees of the Association. In coöperation with the Committee on Sources of Revenue data have been gathered concerning the methods used by the States in distributing State school funds. Beginnings have also been made on a study which has the determination of better sources for school revenue as its objective. The data being gathered upon these subjects are to be used by this Committee in the preparation of leaflets on school finance.

The Department has worked in close coöperation with the Commission on Coördination of Research Agencies. Many valuable suggestions have been received from the Commission as to the proper functions of the Department. A tentative plan has been drafted whereby the Department, acting with the advice of this Commission, will attempt to bring about a better coördination of the educational research agencies in the country. With this end in view a survey of the most important educational problems

has been completed. A communication inquiring about these problems was addressed to a representative number of affiliated associations and individual members of the Association. The replies received to this communication were tabulated, and on the basis of this tabulation the most important problems of the coming school year were listed. The problems as tabulated fall under two heads: (a) School finance: methods of distributing funds, new sources of revenue, comparative budget statistics; and (b) teacher problems: salaries, training, pension, tenure.

During the coming school year an attempt will be made to bring about a better coördinated attack of these problems by the educational research agencies of the country. At the same time much duplication of effort may be prevented on the part of research workers, and the volume of questionnaires sent out on these topics reduced.

Much time has been devoted to gathering data for use by the Legislative Commission in furthering its work for the Towner-Sterling Bill. This Commission has just completed the preparation of a comprehensive, detailed statement supporting this important measure. The task of collecting and organizing much of the data upon which this statement is based was delegated to the Research Department. Much of the data so collected will be of value during the coming school year as a basis for a number of publicity leaflets to be issued as an aid to those responsible for "selling" schools to the general public.

The Salary Division of the Committee on Salaries, Tenure, and Pensions in March outlined a program of work for the Research Department, involving the collection of information on salaries, supplementing that already in the possession of the Committee. This work was completed under the direction of this committee, and the tabulations of the data received were completed and turned over to the Committee to be used as the basis of its report.

Definite pieces of work have also been done in coöperation with the Committee on Foreign Relations and the Rural School Committee of the National Council of Education. Minor pieces of work have also been completed for several other committees.

Preparation of Research Bulletin Number One—A sixty-four page bulletin, *Facts On the Cost of Public Education*, Research Department, Bulletin One, has been prepared and printed for general circulation. This bulletin brings together information of value to those dealing with the educational problems that are now of first importance. Data found in this bulletin on salaries make possible a comprehensive view of the salary situation for a representative number of both urban and rural communities in every State of the Union. The contents include: (1) The Increasing Cost of Education; (2) Salary Tables; (3) Salaries and the Cost of Living; (4) Recent Tendencies in Salary Schedules; (5) Data Concerning Teacher Status; (6) Tenure; (7) Pensions, and (8) Reference Material. Most of the data of this bulletin are not accessible elsewhere. New methods are also suggested for the effective use of the facts presented.

Data that will serve as a basis for several smaller bulletins, are already collected and will be made available for use by the members of the Association during the coming school year. These pamphlets will contain reliable statistical information accompanied by sufficient discussion to make clear the source and meaning of the tables.

General information service—No general announcement has as yet been made that the Department is ready to supply the members of the Association with information that will aid them in dealing with special local situations. Nevertheless, numerous requests for special service have reached the Department. It has been possible to answer satisfactorily a majority of them in spite of the fact that we have been in the organizational stage. In all, forty-seven special written requests have been answered. To gather the data used in meeting these demands has often involved several hours' work. It has been the policy to reply to these requests promptly, giving at once the information desired if available. When it is not available it is later furnished in as complete form as possible. A careful record has been made of all requests for such service, so that it may be accurately known just what information is in most demand by members of the Association and so that future needs of the members of the Association may be anticipated.

III. LOOKING TO THE FUTURE

On the basis of the past four months' experience certain tentative statements concerning the policies and functions of the Department may be ventured. It appears that one of the first duties of the Research Department is to aid in bringing about a better coördination of the educational research agencies of the country so as to avoid unnecessary duplication of effort in collecting educational information. A second function has to do with the devising of machinery whereby current educational information may be promptly supplied to members of the Association when it is needed by them in meeting practical problems in the field.

During the coming school year two types of information will be in greatest demand. First, that relating to the problems of public-school finance; second, that pertaining to the welfare and development of the teaching profession. One of the first duties is to provide information of value to those interested in the development of a better qualified and better compensated profession. Frequent bulletins will be issued containing valuable information for those striving to obtain better salary schedules and improved teaching conditions.

The work in coöperation with the committees of the Association will soon become a major function of the Department. It is believed desirable that the Department give special attention and help to the work of these committees insofar as their work involves the collection of research data. Following are some of the advantages that will grow out of this development:

1. The gathering of exact data as a basis for committee reports will be the first responsibility of a trained and experienced research worker, the

Director of the Research Department, rather than the incidental duty of an already overworked school official or teacher.

2. Data may be gathered covering a period of several months in a comprehensive rather than in a hurried manner at the end of the school year as is so often necessary under present conditions.

3. Accurate statistical information will be available to committee chairmen in the preparation of their reports.

4. Duplication of effort may be prevented and a coordination of the efforts of the various committees of the Association may be brought about.

5. Committee chairmen and members may be relieved of much of the personal expense and clerical work involved in the preparation of reports. The Research Department is so organized that it is in a position to collect economically such data as the Committees desire. Information so gathered can be tabulated in proper form and submitted to the Committee chairmen in duplicate for the use of their committees.

6. Committee chairmen will be left free to devote their time to the interpretation of the data gathered for them and to the organization of their reports.

7. At the same time the expense of financing the various committees may be reduced since less traveling will be necessary. This seems desirable since last year nearly \$3000 of the Association's money and this year over \$7000 of the Association's money was used in financing the work of the various committees.

A general information service to members of the Association will doubtless soon be one of the Department's most important functions. The demands that have come to the Department during the past four months previous to any announcement of an ability to meet them and the experience of other research agencies justify this conclusion. These demands, often of vital importance to large numbers of Association members, cannot be neglected. To meet them adequately often requires an expenditure of considerable time on the part of a trained research worker. A careful selection of material for general bulletins in anticipation of coming needs will reduce the work of providing this service, but there will always be many demands that will require special work if they are to be properly handled. Furthermore, they must be met promptly. A delay of a few days or weeks means that the time will have been passed when the information desired is of most value. It is important, therefore, that we anticipate the demands that will be made upon the Department and take the steps that are necessary in preparing to satisfy them adequately.

IV. RECOMMENDATIONS

Having in mind the work that has been accomplished during the past four months and looking forward to the coming year, the following definite recommendations are submitted for approval. They are made after much careful thought and with the general financial situation of the Association in mind.

1. A trained research assistant should be added to the Research Department, as soon as the finances will permit. This is necessary in order that the two main divisions of work of the Department may be adequately carried on. The work of the Department roughly divides itself into: (a) The preparation of bulletins of general and statistical information in anticipation of the needs of the members of the Association; and (b) The meeting of special demands made by individual members of the Association, committees, or affiliated organizations.

If the first duty is properly discharged, the second must often be put aside and neglected with the result that the members of the Association are disappointed in not receiving information of vital concern to the welfare of the profession. If the second is properly discharged, the first must be neglected with the result that vital information that might be extensively circulated is not made available, and the work of gathering information for committees' use is neglected.

2. An appropriation for a reasonable amount should be made with the needs of the library of the Research Department in mind. This money should be used in the purchase of books and documents that cannot be obtained free. A small but up-to-date and adequate research library must be maintained if the Department is to be of maximum service.

3. Recommendations should be made to the Executive Committee that they encourage committees of the Association to function through the Department insofar as their work involves the collection and tabulation of educational data and information.

4. An appropriation should be set aside with the needs of the Research Department in mind sufficient to cover the budget given below:

BUDGET ESTIMATE FOR RESEARCH DEPARTMENT, 1922-23

Salaries	\$14,400
Printing	2,000
Postage and Office Supplies.....	500
Traveling Expenses.....	500
Office Equipment.....	350
Library	200
Total	<u>\$17,950</u>

This budget will make it possible for the Research Department to make a substantial contribution to the Association's program of service to the teachers of the Nation.

STATE AND LOCAL ASSOCIATIONS AFFILIATED WITH THE NATIONAL EDUCATION ASSOCIATION

Alabama

Alabama Education Association, J. Alex Moore, President, Jasper; H. G. Dowling, Secretary, Cullman.

BESSEMER—*City Teachers' Association*, J. O. Sturdivant, Secretary.

BIRMINGHAM—*Birmingham Teachers' Association*, J. C. Powell, Secretary.

FLORENCE—*State Normal School Association*, C. B. Collier, Secretary.

MARION—*Judson College Faculty*, Mabel Bower, Secretary.

MONTGOMERY—*The Woman's College of Alabama*, J. M. Dannelley, Secretary.

TROY—*State Normal School*, Mrs. Arthur Owens, Secretary.

Arizona

Arizona State Teachers' Association, A. O. Neal, President, Tucson; A. L. Jones, Secretary, Phoenix.

FLAGSTAFF—*Northern Arizona Normal School Faculty*, L. B. McMullen, President.

PHOENIX—*Phoenix Teachers' Association*, Katherine Tulloch.

TEMPE—*Tempe Normal School Faculty*, A. J. Mathews, President.

TUCSON—*Public Schools*, George Peak.

Arkansas

Arkansas Educational Association, D. T. Henderson, President, Lake Village; Irene Jones, Secretary, Leslie.

FAYETTEVILLE—*Faculty of University of Arkansas*, W. H. Crorent, Secretary.

FORT SMITH—*Fort Smith Teachers' Club*, Ruby Washington, President.

LITTLE ROCK—*Centennial Teachers' Circle*, Emmie De Neler, Secretary.

—*Garland School Improvement Association*, Mrs. Edna Rollins, Secretary.

—*Mitchell School Improvement Association*, Mrs. J. D. Lord, Secretary.

—*Peabody Faculty*, Delle Patterson, Secretary.

—*Principal's Round Table*, Emmie De Neler, Secretary.

—*Women Teachers' Association*, Mamie Gingles, Secretary.

California

California Council of Education, E. Morris Cox, President, Oakland; A. H. Chamberlain, Secretary, San Francisco.

BERKELEY—*Alameda County, California Education Association*, Elizabeth Venard, Secretary.

—*Berkeley Teachers' Association*, Frank R. Shallenberger, Secretary.

—*University of California*, Robert G. Sproul, Secretary.

CHICO—*Chico Teachers' Club*, Mary J. Mahoney, Secretary.

CORONA—*Corona Teachers' Association*, Margaret Horst, Secretary.

EUREKA—*Eureka Teachers' Association*, Miss T. Tomlinson, Secretary.

GLENDALE—*Glendale City Teachers' Club*, Margaret Ball, Secretary.

LONG BEACH—*Long Beach Teachers' Club*, Ralph E. Oliver, Secretary.

LOS ANGELES—*Faculty of Occidental College*, Robert G. Cleland, Secretary.

—*High School Teachers' Association*, Emma Graves Conway, Secretary.

—*Faculty of The College of Liberal Arts, University of Southern California*, Hugh S. Willett, Secretary.

—*Los Angeles City Teachers' Club*, Marie L. Brandt, Secretary.

OAKLAND—*Oakland Principals' Club*, Dora Loges, Secretary.

—*The Oakland Teachers' Association*, H. D. Brasefield, Secretary.

—*School Women's Club of Oakland*, Irene Borwell, Secretary.

PASADENA—*California Institute of Technology*, A. B. Sherer.

POMONA—*Pomona City Teachers' Club*, Linnie D. Savage, President.

RED BLUFF—*Tehama County Teachers' Association*, J. D. Sweeney, Secretary.

REDONDO BEACH—*Teachers' Club of Redondo Union High School District*, Anna M. K. Hansen, Treasurer.

SACRAMENTO—*Sacramento School Women's Club*, Grace L. Maxwell, Secretary.

SAN BERNARDINO—*San Bernardino City Teachers' Club*, Emma Knight, Secretary.

SAN DIEGO—*San Diego Principals' Club*, W. S. Wright, Secretary.

—*San Diego Teachers' Association*, Eugenia Welker, Secretary.

SAN FRANCISCO—*San Francisco Grade Teachers' Association*, Dorothy Farrell, Secretary.

—*San Francisco Principals' Association*, Mrs. R. B. Stolz, Secretary.

SAN JOSE—*Faculty of San Jose State Normal School*, Mary C. Sweet, Treasurer.

—*Santa Clara County School Masters' Club*, Walter L. Bachrodt, Secretary.

—*Santa Clara County Teachers' Association*, Lucile Snyder, Secretary.

SANTA ANA—*Santa Ana City Teachers' League*, Mary L. Harris, Secretary.

- SANTA BARBARA—*Santa Barbara City Teachers' Club*, W. J. Kircher, Secretary.
 SANTA MONICA—*Santa Monica Teachers' Association*, J. G. McNeely, Secretary.
 STOCKTON—*Stockton Elementary Teachers' Association*, Marie Meier, Secretary.
 VALLEJO—*Solano Teachers' Club*, Olive Wilson, Secretary.

Colorado

- Colorado Education Association*, R. J. Walters, President, Rocky Ford; H. B. Smith, Secretary, Denver.
 ALAMOSA—*San Luis Valley Teachers' Association*, Geo. J. Saunders, Secretary.
 BOULDER—*Boulder County Teachers' Association*, Anna J. Ewing-Bittner, County Superintendent.
 —*Boulder Teachers' Club*, Blanch Ricketts, Secretary.
 BRIGHTON—*Brighton Associated Teachers*, H. M. Brown, Secretary.
 CANON CITY—*Canon City Teachers' Club*, Millicent Steacy, Secretary.
 COLORADO SPRINGS—*Colorado Springs Federation of Teachers*, Dagmar M. Holm, Secretary.
 —*Teachers' Association of The School for the Deaf and Blind*, Grace M. Beattie, President.
 DENVER—*Aurora Teachers' Association*, Mrs. Marie Young, Secretary.
 —*Denver Grade Teachers' Association*, Mabelrose Wildman, Secretary.
 —*The Denver Senior High School Teachers' Association*, Emma B. Ecker, Secretary.
 —*Denver Principals' and Directors' Association*, Genevieve Simpson, Secretary.
 —*Denver Teachers' Club*, Charlotte R. Christian, Secretary.
 —*High School Masters' Guild of Denver*, Wm. C. Twieg, Secretary.
 FORT COLLINS—*Faculty of The Colorado Agricultural College*, L. M. Taylor, Secretary.
 —*Fort Collins Teachers' Club*, Pearl Moore, Secretary.
 GREELEY—*Colorado State Teachers' College Faculty*, W. H. Hargrove, Secretary.
 —*Greeley Teachers' Club*, Mary I. Comin, Secretary.
 GUNNISON—*Faculty of the Colorado State Normal School*, Eva Carpenter, Secretary.
 LA JUNTA—*La Junta Teachers' Club*, Mrs. W. H. Burrows, Secretary.
 LONGMONT—*Longmont Teachers' Club*, D. W. Spangler, President.
 MANZANOLA—*Otero County Teachers' Association*, Clifford A. Bushey, Secretary.
 MONTROSE—*Montrose Educational Association*, R. R. Brown, Secretary.
 PUEBLO—*The Pueblo Branch of the N. E. A.*, Maud Boreing, Secretary.

- Pueblo County Teachers' Association*, Lillie O. Baker.
 —*Pueblo Grade Teachers' Association*, District 20, Ruby Lammereaux, Secretary.
 ROCKY FORD—*Rocky Ford Teachers' Association*, Edith Selberg, Secretary.
 STERLING—*Federated Teachers' Club of Logan County*, Amy Dickinson, Secretary.
 TRINIDAD—*Trinidad Teachers' Association*, Mary Rose O'Brien, Secretary.
 WIGGINS—*Morgan County Teachers' Association*, Lewis R. Owens, Secretary.

Connecticut

- Connecticut State Teachers' Association*, Edward J. Graham, President, Norwich; Samuel P. Willard, Secretary, Colchester.
 DANBURY—*Danbury High School Teachers' Association*, Harold I. Long, Secretary.
 DEEP RIVER—*Deep River Teachers' Association*, Elma M. Tyler, Secretary.
 EAST HARTFORD—*East Hartford Teachers' Association*, P. S. Barnes, Superintendent.
 GLASTONBURY—*Glastonbury Teachers' Association*, Florence E. Meacham, Secretary.
 MERIDEN—*Meriden Teachers' Association*, Gertrude M. O'Connor, Secretary.
 RIDGEFIELD—*Ridgefield Parent Teachers' Association*, Mable Roth, Secretary.
 —*Ridgefield Teachers' Association*, Grace C. White, Secretary.
 SHELTON—*Shelton Teachers' League*, Dorothea A. Vebrett, Secretary.
 STAMFORD—*Stamford Teachers' Association*, Harry T. Hart, Treasurer.
 STRATFORD—*Stratford Teachers' Association*, Mary C. Nolan, Secretary.
 THOMPSONVILLE—*Enfield Teachers' Association*, Viola R. Allen, Secretary.
 WESTPORT—*Westport Teachers' League*, Theresa L. Custer, Secretary.

Delaware

- Delaware State Teachers' Association*, Warren K. Yerger, President, Wilmington; Agnes Snyder, Secretary, Newark.
 BRIDGEVILLE—*Sussex County Teachers' Association*, Anne Cahall, Secretary.
 MIDDLETOWN—*New Castle County Teachers' Association*, O. E. McKnight, Secretary.
 MILFORD—*Kent County Educational Association*, Robert E. Shilling, Secretary.

District of Columbia

- Education Association of the District of Columbia*, Dr. W. C. Ruediger, President; Adelaide Davis, Secretary.
 WASHINGTON—*Faculty of Georgetown University*, Thomas I. Gasson, Secretary.
 —*High School Teachers' Association*, Mrs. May D. Merrill, Secretary.

Florida

- Florida Educational Association*, C. R. M. Sheppard, President, De Land; R. L. Turner, Secretary, Inverness.
- BARBERVILLE—*West End Volusia County Teachers' Association*, Gertrude A. Scott, Secretary.
- DAYTONA—*East Volusia County Teachers' Association*, Jenny Morrill, Secretary.
- DELAND—*Deland Teachers' Association*, B. F. Ezell, Superintendent.
- MIAMI—*Royal Palm Education Association*, Chas. M. Fisher, Secretary.
- PALMETTO—*Manatee County Educational Association*, A. H. Flowers, Secretary.
- PINE CASTLE—*Orange County Educational Association*, C. L. Darrance, Secretary.

Georgia

- Georgia Educational Association*, H. D. Knowles, President, Quitman; Walter P. Jones, Secretary, Macon.
- ATLANTA—*Faculty of Georgia School of Technology*, F. P. Branch, Secretary.
- COLLEGE PARK—*Cox College*, George A. Hawkins, Secretary.
- FITZGERALD—*Fitzgerald Teachers' Council*, Julia Prentiss, Secretary.

Hawaii

- Hawaii Education Association*, H. W. Wells, President, Wailuku; P. H. Cooley, Secretary, Lahaina.
- HILO—*Hilo Teachers' Union*, Cecil Overend, Secretary.
- HONOLULU—*Oahu Teachers' Association*, Ethyl L. Burgun, Secretary.
- WAILUKU—*Maui Teachers' Association*, R. C. Bowman, Secretary.

Idaho

- Idaho State Teachers' Association*, Charles R. Frazier, President, Pocatello; Alice Beach, Secretary, Montpelier.
- BURLEY—*South-Central District Association*, Mae Lowe, Secretary.
- CALDWELL—*College of Idaho Faculty*, Paul Murphy, Secretary.
- Southwestern Teachers' Association*, Margaret Knowlton, Secretary.
- COEUR D'ALENE—*Coeur D'Alene Teachers' Association*, John H. McPhee, Secretary.
- IDAHO FALLS—*North Eastern Idaho Teachers' Association*, Coralie Lake, Secretary.
- LEWISTON—*Faculty of the Lewiston State Normal School*, Katherine M. Vincent, Secretary.
- NEZPERCE—*N. Central Idaho Teachers' Association*, Madge Miller, Secretary.
- POCATELLO—*Pocatello Education Association*, Ada R. Shuey, Secretary.

—*Southeastern Teachers' Association*, Clara M. Rector, Secretary.

WALLACE—*North Idaho Teachers' Association*, C. D. Brock, President.

Illinois

- Illinois State Teachers' Association*, J. O. Engleman, President, Joliet; Robert C. Moore, Secretary, Carlinville.
- ALTON—*Alton Public Schools*, W. C. Reavis, Superintendent.
- AURORA—*Aurora Teachers' Association*, Veronica G. O'Neil, Secretary.
- CANTON—*Canton Teachers' Association*, Jessie G. Mercer, Secretary.
- CARTHAGE—*Carthage College Senate*, H. D. Hoover, President.
- CHICAGO—*Chicago Teachers' League*, Helen M. Rathbun, Secretary.
- Head Assistants' Association*, Mrs. Mary Farnsworth, Secretary.
- CRYSTAL LAKE—*Illinois State Teachers Association*, N. E. Section, H. A. Dean, Treasurer.
- DECATUR—*Decatur Teachers' Association*, Sadie Fitzpatrick, Secretary.
- EAST ST. LOUIS—*East St. Louis Teachers' Association*, Elsie Tietze, Secretary.
- Grade Teachers' Fellowship Society*, Josephine Lessley, Secretary.
- ELGIN—*Elgin Teachers' Organization*, Ethelyn J. Mitchell, Secretary.
- EVANSTON—*Evanston, Illinois, Teachers' Club*, Elizabeth Champion, Secretary.
- FAIRBURY—*Livingston County Teachers' Association*, E. W. Powers.
- GALENA—*Galena Teachers' Association*, Fred Seubert, Secretary.
- GALESBURG—*Faculty of Galesburg High School*.
- Galesburg Teachers' Association*, Mrs. Rose M. Hoben Welch, Secretary.
- GENESEO—*Geneseo Elementary Teachers' Association*, Mabel C. Young, Secretary.
- GLENCOE—*Lake Shore Division, Illinois State Teachers' Association*, Arthur B. Rowell, Secretary.
- GRANVILLE—*Upper Illinois Valley Division of the Illinois State Teachers' Association*, Mrs. Anna M. Holliday, Secretary.
- JOLIET—*Joliet Teachers' Federation*, Kathryn Kelly, Secretary.
- Joliet Township High School Teachers' Association*, Gertrude Lawler, Secretary.
- LEBANON—*The McKendree Teachers' Club*, Marie Shurtleff, Secretary.
- LINCOLN—*Logan County Teachers' Association*, Ruby Fahay, Secretary.
- MACOMB—*Faculty of the Western Illinois State Normal School*, R. R. Simpkins, Secretary.
- McDonough County Teachers' Association*, Margaret Crain, Secretary.

MONMOUTH—*Faculty of Monmouth College*, M. M. Maynard, Secretary.
 MONTICELLO—*Piatt County Teachers' Association*, Charles McIntosh, Secretary.
 NORMAL—*Faculty of the Illinois State Normal University*, Edith I. Atkin, Secretary.
 OAK PARK—*Chicago Public School Kindergarten Association*, Belle Booth, Secretary.
 —*Oak Park and River Forest Township High School*, Arthur G. Bobbitt, Secretary.
 PEKIN—*Pekin Teachers' Club*, Lucille Perriell, Secretary.
 PEORIA—*School Masters' Club of Illinois*, Anthony Middleton, Secretary.
 PRINCETON—*Bureau County Superintendents' and Principals' Association*, Geo. O. Smith, Secretary.
 RIVER FOREST—*Proviso Township High School*, J. L. Thalman, President.
 ROCKFORD—*Rockford Teachers' Club*, Mrs. Jessie P. Lentz, Secretary.
 ROCK ISLAND—*Twin City Teachers' Club*, Amelia Fraenkenschuh, Secretary.
 SALEM—*Marion County Teachers' Association*, Mary E. Burns, Secretary.
 SPRINGFIELD—*Springfield Teachers' Association*, Ernestine Fetzer, Secretary.
 WAUKEGAN—*Waukegan Division of the N. E. A.*, Mabel Ellis, Secretary.
 WAVERLY—*Sangamon County Teachers' Association*, Lillie C. Campbell, Secretary.

Indiana

Indiana State Teachers' Association, Dr. H. L. Smith, President, Bloomington; Charles O. Williams, Secretary, Richmond.
 BLOOMINGGON—*Bloomington, Indiana, Teachers' Association*, E. E. Ramsey, Superintendent.
 —*Indiana University*, John W. Cravens, Secretary.
 CONNERSVILLE—*Fayette County Teachers' Association*, A. C. Payne, Superintendent.
 CRAWFORDSVILLE—*Crawfordsville Schools*, Evelyn McFeeley, Secretary.
 EAST CHICAGO—*Council of East Chicago Public School Teachers*, May Swearingen, Secretary.
 ELKHART—*Elkhart City Schools*, J. F. Wiley, Superintendent.
 ELWOOD—*Public School Teachers of Elwood*, E. B. Hargrave, Secretary.
 EVANSVILLE—*Federation of Public School Teachers*, Lois Myerhoff, Secretary.
 FT. WAYNE—*Ft. Wayne Teachers' Association*, Elizabeth G. Murphy, President.
 —*Principals' Club*, Celia C. Foley, Secretary.
 GOSHEN—*Elkhart County Teachers' Association*, Fannie Sweitzer, Secretary.
 HAMMOND—*Hammond City Teachers' Association*, Mary A. Dwyer, Secretary.
 HUNTINGTON—*Huntington City Teachers*, J. M. Scudder, Superintendent.

INDIANAPOLIS—*Teachers Association of Normal School*, Flora E. Drake, Secretary.
 JEFFERSONVILLE—*Federation of Jeffersonville Teachers*, Maude Craig, Secretary.
 LA FAYETTE—*Public School Teachers of La Fayette*, Ella Thompson, Secretary.
 LOGANSPORT—*Logansport Teachers' Federation*, Lida Fawcett, Secretary.
 MARION—*Federation of Public School Teachers*, Bertha M. Anderson, Secretary.
 —*Marion City Schools*, A. E. Highley, Secretary.
 MICHIGAN CITY—*Michigan City Teachers' Club*, Henrietta Leusch, Secretary.
 MUNCIE—*Muncie Federation of Teachers*, Marie E. Williams, Secretary.
 NEW ALBANY—*Federation of New Albany Teachers*, Jessie Lee Jones, Secretary.
 NOBLESVILLE—*Noblesville High School*, A. E. Harbin, Secretary.
 PERU—*Peru City Teachers' Association*, Hester C. Wood, Secretary.
 SOUTH BEND—*South Bend City Teachers' Association*, Alice H. Ebeling, Secretary.
 TERRE HAUTE—*Faculty Club of the Indiana State Normal School*, Mrs. Bertha Burford, Secretary.
 —*Terre Haute Teachers' Federation*, Jessie Andrew, Secretary.
 UPLAND—*Faculty of Taylor University*, Jacob Bos, Secretary.
 WABASH—*Wabash City Teachers' Club*, Gladys Moody, Secretary.
 WASHINGTON—*Washington City Teachers' Association*, R. N. Tirey, Superintendent.

Iowa

Iowa State Teachers' Association, L. H. Minkel, President, Ft. Dodge; Chas. F. Pye, Secretary, Des Moines.
 AMES—*Ames Public School Teachers' Association*, Mrs. Ora Anderson, Secretary.
 BOONE—*Boone Teachers' Association*, M. Gwynne Ward, Secretary.
 BURLINGTON—*Burlington Teachers' Association*, Nella J. Brydolf, Secretary.
 CEDAR FALLS—*Faculty of the Iowa State Teachers College*, I. H. Hart, Secretary.
 CEDAR RAPIDS—*Cedar Rapids Grade Teachers' Association*, Mary E. Paul, Secretary.
 CENTERVILLE—*Teachers' Federation of Centerville*, Mrs. Emma Barton, Secretary.
 CHARLES CITY—*County Superintendents of Iowa*, Mary D. Korinke, Secretary.
 CLINTON—*Clinton Teachers' Federation*, W. B. McMahon, Secretary.
 COUNCIL BLUFFS—*Council Bluffs Teachers' Club*, Minnie Hanson, Treasurer.
 DAVENPORT—*Scott County Teachers' Association*, Harriet J. Koch, Secretary.
 DES MOINES—*Bureau of Education, Des Moines Chamber of Commerce*, Clay D. Slinker, Secretary.

—*The Des Moines Teachers' Federation*, H. D. Eichelberg, Treasurer.
 DUBUQUE—*Columbia College Faculty*, Reverend Edward A. Fitzgerald, Registrar.
 —*Dubuque Teachers' Association*, H. M. Stolteben, Secretary.
 FAYETTE—*Faculty of the Upper Iowa University*, E. A. Billings, Secretary.
 FORT DODGE—*Fort Dodge Teachers' Federation*, Mrs. Myrtle Harmon, Secretary.
 GRINNELL—*Grinnell Teachers' Association*, Mabel Kinsman, Secretary.
 INDEPENDENCE—*Buchanan County Teachers' Association*, Yetta J. Vargason, Secretary.
 KEOKUK—*Elementary Teachers' Club*, Edith Jack, Secretary.
 MILFORD—*Dickinson County N. E. A. Unit*, Gladys Jarard, Secretary.
 MISSOURI VALLEY—*Missouri Valley Teachers' Association*, Helen Giehm, Secretary.
 MUSCATINE—*Muscatine City Teachers' Federation*, Anna M. Barr, Secretary.
 NEWTON—*Newton Teachers' Association*, Marguerite Schmitz, Secretary.
 OSKALOOSA—*Oskaloosa Teachers' Association*, Margaret Lichtenheld, Secretary.
 OTTUMWA—*Ottumwa Teachers' Club*, Ada C. Lindquist, Secretary.
 SIOUX CITY—*Sioux City High School Teachers' Association*, Troy Welker, Secretary.
 —*Sioux City Teachers' Club*, Mary A. Lord, Secretary.
 WATERLOO—*Waterloo Teachers' Association*, Catherine Lumry, Secretary.

Kansas

Kansas State Teachers' Association, J. W. Miley, President, Girard; F. L. Pinet, Secretary, Topeka.
 ATCHISON—*Atchison Educational Association*, Jane Holm, Secretary.
 CHANUTE—*Chanute Teachers' Association*, N. Pearl Killion, Secretary.
 COLUMBUS—*Cherokee County Teachers' Association*, Elizabeth Hawkins, Secretary.
 EMPORIA—*Faculty Club of Emporia High School*, Minta Queen, Secretary.
 ERIE—*Neosho County Teachers' Association*, Ralph B. Garvin, Secretary.
 FORT SCOTT—*Fort Scott Teachers' Association*, Mary D. Stevens, Secretary.
 HAYS—*Fort Hays, Kansas, Normal School*, Floyd B. Lee, Secretary.
 HIAWATHA—*Brown County Teachers' Association*, Margaret E. Funkhouser, Secretary.
 —*Hiawatha Teachers' Association*, Daisy Moore, Secretary.
 HUTCHINSON—*Hutchinson City Teachers' Association*, Isabel Kent, Secretary.
 IOLA—*Allen County, Kansas, Teachers' Association*, Lovonia M. Donica, County Superintendent.
 —*Iola Teachers' Club*, Laura Andruss, Secretary.

KANSAS CITY—*Du Bois Teachers' Club*, May McClelland, Secretary.
 —*Kansas City, Kansas, Grade Teachers' Club*, Eva H. Wolf, Secretary.
 —*Kansas City, Kansas, High School*, Alta L. Haynes, Secretary.
 —*Principals and Supervisors*, Elizabeth S. Miller, Secretary.

 —*Educational Council of Lawrence Teachers*, Mamie Clare Walker, Secretary.
 LEAVENWORTH—*Leavenworth Grade Teachers' Club*, Blanche Zapps, Secretary.
 LIBERAL—*Liberal City Teachers' Association*, Bertha L. Winters, Secretary.
 MANHATTAN—*Manhattan City Teachers' Association*, Gertrude May, Secretary.
 OLATHE—*Olathe City Teachers' Association*, Doris Iles, Secretary.
 PARSONS—*Parsons Teachers' Association*, Florence De Lay, Secretary.
 ROSEDALE—*Rosedale Teachers' Association*, Maude Clavin, Secretary.
 SALINA—*Salina City Teachers' Association*, Eva P. Smith, Secretary.
 SMITH CENTER—*Smith County Teachers' Association*, William M. McMullen, President.
 WELLINGTON—*Wellington City Teachers' Association*, Marie Friend, Secretary.
 WINFIELD—*Winfield Teachers' Association*, Cora Vaughn, Secretary.

Kentucky

Kentucky Education Association, W. J. Craig, President, Bowling Green; R. E. Williams, Secretary, Louisville.
 ASHLAND—*The Ashland Educational Association*, Edith A. Chapman, Treasurer.
 BEEA—*Faculty of Berea College, Berea, Kentucky*, M. E. Vaughn, Secretary.
 BOWLING GREEN—*Graded and High School Faculty*, Ried Potter, Secretary.
 HENDERSON—*Henderson City Teachers' Association*, Mrs. Claire Hancock, Secretary.
 LOUISVILLE—*Faculty League of The Girls High School*, Lorena Dumeyer, Secretary.
 —*Guild of Louisville Teachers*, Ethel A. Murphy, Secretary.
 —*Louisville Educational Association*, Anne Grunder, President.
 MAYFIELD—*First District Teachers' Association*, B. H. Hester, Secretary.
 MOREHEAD—*Rowan County Teachers' Association*, J. Harlin Powers, Superintendent.
 OWENSBORO—*Owensboro Teachers' Association*, J. W. Snyder, Secretary.
 PADUCAH—*Paducah, Kentucky, Public School Teachers' Association*, Adah L. Brazelton, Secretary.
 RICHMOND—*Faculty of the Eastern Kentucky State Normal School*, F. C. Gentry, Secretary.

Louisiana

Louisiana Public School Teachers' Association, W. S. Lafargue, President, Thibodaux; L. J. Alleman, Secretary, Natchitoches.

NATCHITOCHEs—*Louisiana State Normal Teachers' Association*, A. G. Alexander, Secretary.

NEW ORLEANS—*Danneel School Faculty*, Mariah D. White, Principal.

—*Faculty of Newcomb College*, Pierce Butler, Dean.

—*Mothers' Club*, Ellen L. Murphy, Secretary.

Maine

Maine Teachers' Association, G. Herbert Foss, President, Fort Fairfield; Adelbert W. Gordon, Secretary, Augusta.

ANSON—*Western Somerset County Teachers' Association*, Mrs. Annie Savage Smith, Secretary.

BATH—*Sagadahoc County Teachers' Association*, Ellen R. Turner, Secretary.

BELFAST—*Belfast Teachers' Club*, Mrs. Annie L. Black, Secretary.

—*Waldo County Teachers' Association*, Grace A. Lord, Secretary.

CALAIS—*Calais Teachers' Club*, E. Doreen Gregory, Secretary.

DANFORTH—*Eastern Penobscot Teachers' Association*, Christina Reid, Secretary.

EAST BROWNFIELD—*Saco Valley Teachers' Association*, Mrs. R. W. Giles, Secretary.

FARMINGTON—*Franklin County Teachers' Association*, Agnes Mantor, Secretary.

HALLOWELL—*Kennebec County Teachers' Association*, Ada E. Edgecomb, Secretary.

HOULTON—*Aroostook County Teachers' Association*, Mrs. Belle Briggs, Secretary.

KENNEBUNKPORT—*York County Teachers' Association*, Cora B. Littlefield, Secretary.

LEWISTON—*Auburn Teachers' Association*, Frances Estes, Secretary.

MACHIAS—*Washington County Teachers' Association*, Mary McDonald, Secretary.

MAPLETON—*Mapleton-Washburn Teachers' Association*, Marcella Hines, Secretary.

MECHANIC FALLS—*Androscoggin County Teachers' Association*, Nancy B. Farris, Secretary.

PITTSFIELD—*Eastern Somerset County Teachers' Association*, Annie M. Fuller, Secretary.

PORTLAND—*Portland Teachers' Association*, Will O. Hersey, Secretary.

PRESQUE ISLE—*Presque Isle-Westfield Teachers' Club*, Rowena C. McGowan, Secretary.

ROCKLAND—*Knox County Teachers' Association*, Harriett Trask, Secretary.

RUMFORD—*Oxford County Teachers' Association*, Edith Hanson, Secretary.

SACO—*Saco Teachers' Association*, Elvira J. Lord, Secretary.

SANGERVILLE—*Piscataquis County Teachers' Association*, Abbie M. Fowler, Secretary.

GENERAL SESSIONS

BOSTON ADDRESSES

THE NEW EDUCATION

W. G. COVE, PRESIDENT OF THE NATIONAL UNION OF TEACHERS OF
ENGLAND AND WALES, RHONDDA, WALES

In spite of grave difficulties immediately confronting the teaching profession in Britain, the kind invitation extended to me by your President to be present at this conference was readily accepted by me, and enthusiastically agreed to by the Executive of the National Union of Teachers. It was felt, and I believe rightly felt, that the organized bodies of teachers in the various lands have too long been strangers, and that nothing but good would accrue to the profession, education, and international understanding, from a coming together of those who are engaged in the work of education throughout the civilized world. It is my belief, extravagant though it may seem in the present state of national suspicions and antagonisms, that the educators of childhood and youth can, if they have the vision and the desire, be the strongest force for peace and goodwill amongst the democracies. If in our collective and individual capacities we rise to a concept of our world-wide humanist mission, we cannot but be a force greater than any that kings or statesmen can mobilize.

There can be no doubt that the school is an international factor of potent force, and it is within the power of its teachers to use it for the destruction or the healing of the nations. It is a sacred trust, a dynamic concept, and if we are to be faithful to it, we must realize ourselves as world citizens whose task it is to integrate its moral and spiritual forces. We must banish from the schools a nationalism that does not find its highest expression in service to humanity. We must eradicate national jealousies, prejudices, and hatreds and let the spirit of common childhood, common parenthood permeate and brood over the schools.

To us is given the privilege of seeing a common humanity sanctified and made pure in the child we educate. To us is given the honour of placing at the disposal of growing life the best of the inheritance of the past and the duty of nurturing the promise of things that are to be. The teachers of Britain welcome, therefore, in the spirit of common purpose and high endeavor, your kindly invitation to their President.

I would, Madam President, that I could bring with me a message of hope and recorded progress from my native land. I would, too, that I could confidently state that the war had changed the heart of musty and cynical old Europe. But truth to observation and conviction compels me

to state that Europe is still riven with economic antagonisms and national suspicions. The war has not cleared the path to a realization of a brotherhood of the nations. Our Prime Minister stated that an old man greeted him on his return from Genoa calling it Gehenna. "And," said Mr. Lloyd George, "it was not far from it after all, for I felt there was but a slight partition intervening between us and that evil place. At times I could smell the very fumes arising therefrom." And I want to say that I do not believe lasting peace will come to us on the plane of material concessions, political adjustments, and economic hegemony. Many of the chancellories of Europe are still drunk with materialism, and the democracies crushed by pessimism. The integration that is sought is material and economic, and therefore unstable and transitory. The abiding integration must be sought on a higher plane; the plane of intellectual, moral, and spiritual well-being. It is here that the school can play its great part. It must transform the materialist habit of mind of statesmen and of peoples. It must preserve, in the cross currents of materialism the kingdom of the ideal. I know that European cynical old age will laugh and mock, but as educators we have faith in childhood and youth, and we draw our inspiration from the future. Through the emotional appeal of the child we must bring about the triumph of reason. As educators we know our dependence upon world culture, and we must not let the dominance of finance capital prevent the children entering into their rightful heritage.

As we look round at the effect of modern industrialism we note that one of its baleful effects has been the mechanising of life. "Mechanism dominates life and not life mechanism." We have seen human personality dwarfed, stunted, and twisted into ugly shapes by the dominance of a mechanised industry and a mechanised society. Life has become, for millions of men and women, purposeless, stale, and flat. We have thought in terms of material values and not in terms of human values. It is the purpose of the school to restore to us the correct content of value. It is our task to make society see the truest economy in happy childhood, growing life, and creative play and work. I do not bemoan the fact that modern civilization is based upon machine production. I have no regrets about the application of science to the provision of man's material needs. What I do object to is the mechanising of human life and the material appraisalment of human personality. And there is no inevitable need that this should be so, for the school, rightly conceived by society and given its proper place and function in society, is capable of performing the task of preserving and conserving the intellectual, moral, and spiritual legacies of the ages.

The school in modern society is the social unit for the exercise and development of all that we term humanism. And there is abundant evidence that the schools of Europe and America are realising their high mission and calling in the preservation of the human in this machine age. No longer do we regard the children as passive recipients of facts. No longer do we emphasize mere knowledge. We recognize variant individualities

and unfolding personalities. We treat with reverence and wonder unfolding life. The escape for the child from a mechanised society is found in the spontaneous activities of the school. Not only is this true of our infants and junior schools, but it is increasingly becoming true of our senior departments. Further, if we are to preserve our adolescents from the banal mechanising of a machine age, we shall have to provide them with creative and recreative purpose in our schools. The logic of the machine is to negate skill for thousands of youths, and it is abundantly clear that the school must provide the educative purpose that industry can no longer provide. I would point out too that moral derelicts are made in the leisure time of youths, in the reaction from the monotony of machinefacture. It is here that the school can provide the stimulus to creative activities, and thus give meaning and purpose to youth.

There can be no doubt that the war ushered in a new era, and it did so by accelerating and intensifying the social tendencies that had already an incipient existence in industry and society since the industrial revolution. We have, the world over, industry integrated and organized upon a vaster scale than ever before; we have combinations of industrial and financial groups unprecedented in their industrial, financial, social, and political power. The world, as never before, is economically one. Yet in spite of the economic unity of the nations, there is no corresponding intellectual, moral, or spiritual appreciation of its implications for human conduct. Intellectually the vast mass of mankind, the democracies of the world, have not perceived the delicate and complex relationships of the modern society, much less have they any appreciation of its moral and spiritual significance. The vastness and complexity of modern society with its subtle economic reactions, have left them dumb and passive. The material progress of men seems to have outrun the intellectual, moral, and spiritual capacity of democracy. It is the school that must give democracy the power of adjustment to the new conditions. It is the school that must save personality from intellectual, moral, and spiritual passivity. There is nothing more tragic, nothing more dangerous to civilization than the mental stupor and moral inertness of masses of men. The passivity that gives its brains to the sensational press, the intoxication of gambling, and which allows its mental and moral fibre to be weakened by picture shows is a bar to all true progress. The school must save democracy and civilization for progress, by nurturing the constructive impulses of the common man. The greatest safeguard against future wars will be found in the intellectual perception by democracy of the unity of civilization, and the active participation of the common man in the social and political questions of the day. The school must give the knowledge upon which sound citizenship is founded, and the moral fibre which active citizenship demands.

I know that we have in the West political systems which we are pleased to term democracies, whether monarchical or republican. But has the part played by the people in them been an active one? Have not decisions of life and death been taken without reference to them, yes, and even

without reference being demanded by them? The dumbness of democracy has been tragic, and its passiveness will be fatal. If we are to have democracy in content as well as in form then this blind and ignorant passivity must give place to virile and enlightened activity. The economic transformation that has come through the forces of industrialism must be paralleled by a moral and intellectual transformation, and in this transformation the schools must play a major part. Industrial society gives no ennobling purpose to our tens of thousands of adolescents, and it cannot until it asks the schools to undertake the task.

And the schools, especially the infants' schools, have already perceived the dangers of urbanized industry with its division of labor and its sectionalization of life and human personality. Human personality has been out of focus, and it is the task of the school to bring the whole personality of the child within the focus of educational purpose. Our work we already perceive it not to pack the human mind but to develop human personality. The passivity that makes of democracy an empty form will be banished in the self activities of the school. We put our faith no longer in receptivity but in purposeful activity. The world-wide over, we cry for the concrete realization of personality in active construction. And this later movement in our schools, this vision of the unity and activeness of individual life, is of fundamental import to democracy and the new world movement. No autocracy can be imposed upon a race that has been trained to work out its own salvation in its schools. Today men need not only the *ability* to understand the problems of industrial, social, and political life, they need the *impulse* to understand, the *desire* to know. The efficiency of democracy depends in the first place upon an enlightened interest in its problems. Its tendency has been to repose an ignorant trust in those whose interests are opposed to democracy and to delegate its powers to those who are unworthy of its trust. No true democracy can persist by inertia. It is the work of the schools, by the quickening variety of their curricula and the stimulating methods of their instruction, to give to the masses the activity that is a basis of democratic government. And the significance to the new world which we have envisaged is that the new activities of the school are being purposely related to the vital and common occupations of men. The degradation of the workman has produced the nondescript citizen. The elimination of pride in craftsmanship has its complement in the absence of civic dignity. Your mechanised worker is your amorphous citizen. The common man must shake off his lethargy, must become proud of his workmanship, active in his citizenship, before we can have government of the people, by the people, and for the people. The activities of the school are of vital import in the creation of this activity, pride, and dignity, that are necessary for real democracy.

The great war revealed also the weakness of precepts in the clash of economic interests, and national and racial prejudices. Men cannot be redeemed merely by maxims, neither can universal goodwill be achieved by preaching. Your moral edifice must be slowly and patiently built in the concrete. Your social consciousness must perpetually find its aware-

ness in the actualities of social service. The school provides the social organization for the exercise of a concrete morality and the realization of vitalizing social service. One of the distinctive marks of modern society is the cleavage between private and public morality. The ethics of private conduct are not the ethics of our business and social relationships or of our foreign diplomacies. This dualism, this cynicism of a commercialized morality, has been fraught, as the revelations of pre-war diplomacy revealed with nothing but evil consequence to men. Even now, there are cynical statesmen in Europe whose blighting ethic is that "might is right." The school in and through its social relationships actively practiced in the concrete, by the reaction of theory upon practice and practice upon theory, by the unified development of human personality, will be the strongest force for ridding the world of this pestilential ethic. The perception of unity of the human personality is the first condition for the achievement of the unity of the human race. The modern school has a vision of that unity. It sees in human personality, in the sum of its potentialities and achievements something more than a piece of mechanism, something more than a mere "hand." It sees a living personality, in which body and soul are one, in which there is no divorcement of the inward convictions and outward actions, and in which full growth depends upon the balanced development of all its elements. In the relationships of the school, private and public morality are one. "The school," as one has said, "is the idealized model of the world and the world must become the realized model of the school." This may seem visionary, but I am convinced that neither leagues nor conferences of nations can secure a permanent orientation of world policy towards peace until we have ceased to sectionalize human personality into man physical and man spiritual; into man private and man public. In the constructive occupations of the schools, in their individual contributions to social tasks within and without the social unit of the schools, we have the training ground for social purpose in the spheres of industry, citizenship, and politics. The school is the microcosm that must realize itself in the macrocosm of the world. In the unification of physical and mental, in the unity of example and precept, in the supreme conception of man as the creature and creator of his environment we shall provide the world with the practical working faith that will give the world what it so badly needs, the dynamic concept of unity.

There can be no doubt that the war has left the schools and universities of the world with a great choice. They have to decide whether or not they will be the instruments of a narrow nationalism, a ruthless and material imperialism, and a cynical chauvinism. The war has not rid the world of its damning philosophies and its vaulting ambitions. We will have statesmen who dominate the politics of Europe saying that "We can only get what we can force," and who are applying in enlarged armies the cynical aphorism that the best preparation for peace is to prepare for war. We have to decide as educators whether we are prepared to teach this philosophy in our schools. There can be no doubt that the schools of the world have been effective organs for the cultivation of national

consciousness. They must now become organs of international consciousness, if the efforts towards peace are to be successful. We have to weave in our schools and universities the garment of a common humanity. In spite of the acknowledged international indebtedness in science and humanities; in spite of recognized commercial and economic dependence, we have not yet evolved a world consciousness of this essential dependence and unity. One of the noble tasks of our educational institutions will be to evolve this world consciousness. We cannot do it by teaching an exclusive patriotism in our schools and colleges. We can, and must, aid the forces of peace and goodwill by evolving a world history and a universal geography. Acquaintanceship begets understanding and understanding appreciation, and the generous mind of youth will respond to our appeal to a common humanity. We must girdle the world with the imagination of generous youth. We must not only scrap our armaments but also our historical textbooks. May I suggest in this respect that as teachers we can render much aid to the new world movement for solidarity by ourselves working for the unification of our national systems of education from the infants' school to the university, by the solidarity and unification of our profession, nationally and internationally. We have our national councils and executives, why not an international council? Such a council by its efforts to garner and distribute the world fruits of educational endeavor would be a more powerful factor than any "Supreme Council" of statesmen in the cause of world humanism. Democracy needs to see the world in perspective. It is now the willing subject of unbalanced prejudices and sectional interests. The schools and universities of the nations must take upon themselves the task of giving to democracy this sense of world perspective. They must "evolve an objective standard" for the aspirations and the testing of national conduct, and side by side with this as complementary and essential, the schools and universities must become the cultural means for its attainment in the conduct of nations. The reaction of the war has left democracy listless and without clear objectives. The passions of the past have left men dry; it is clear that in Europe, at least, men are merely creatures of blind economic forces. There is an absence of urge—a lack of direction. It is our task in the schools to restore vitality and give direction to the democracies of the world.

Thus our task as educators in the new world of democracy is a supreme and sacred one. In an age that has become mechanically complex, that is dominated by a material conception of what is economic, we have to reassert the vital and the unity and dominance of personality. We must convince a cynical world that the laughter of childhood is truly economic and the free play of the constructive impulse of youth and man is an exercise in the truest form of economy. We must make the world ring with the laughter of childhood and the joy of youth.

THE FAR-REACHING RESULTS OF THE WASHINGTON CONFERENCE

FREDERICK J. LIBBY, EXECUTIVE SECRETARY OF THE NATIONAL COUNCIL FOR THE REDUCTION OF ARMAMENTS, WASHINGTON, D. C.

Better international understanding was the greatest result of the Washington Conference according to Secretary Hughes. "It has removed the jeopardy of war beyond our generation," said Secretary Hoover. The Naval Limitation Treaty has made impracticable if not impossible a successful aggressive war on the part of any of the three great naval powers upon either of the others, according to our naval experts. China is better off—"The first time in the history of our relations with the western powers or Japan," its spokesmen say, "that a conference has brought us good and not evil." A step has been taken in the Four-Power Pact toward insuring the peace of the Pacific. In addition to all this, a great hope has begun to crystallize into a momentous resolve to abolish war as an accepted institution for the settlement of international disputes.

The growth of the hope—Sir Harry Lauder voiced the hope in New York City early in the winter by saying: "Great things are comin'. Great things will be done. Great things must be done. And there's a way in sight at this Washington Conference. There we can put an end to war, not for this generation only but for everlastin' time."

General John F. O'Ryan, a little later in the winter, expresses the next stage in the hardening of the hope: "The American people can end war in our time if they get on the job."

A little later still, William G. McAdoo, coming at it from a different angle, said in Kansas City: "The women will put an end to war. You will be told that it is impossible. That is what they said about tunneling under the Hudson. They produced the signed statements of engineers going to show that conditions under the Hudson are such as to make a tunnel there forever impossible. But there were men of faith and courage in New York City and there the tunnels are!"

In October the word "peace" was practically taboo among us as the result of efficient war propaganda. This spring every great National convention that has met, with one or two exceptions, has adopted resolutions looking to the outlawry of war.

Doubts arise and are dispelled—But someone will say, "Every war brings good resolutions which evaporate in due time. We are not ready for the millenium yet. You can't change human nature."

This last fallacy is frequently repeated: "You can't change human nature." But every church rests upon the faith that God can do this very thing—does do it in conversion. Curiously enough, the usual argument for universal military training is apt to be an argument that human nature in your country will change if you don't take extraordinary precautions—change of itself and become unwarlike and peaceful, while remaining, of course, unchanged everywhere else.

For the purposes of our discussion, however, human nature does not need to change in order to permit peace to reign. Consider a little history. During the century of peace between the United States and Canada, there have been five distinct and serious causes of war. We have quarreled over boundaries. Economic disputes such as fisheries have divided us. The press has flared up on both sides of the border. Feeling has run high; yet without war. Human nature had not changed. We merely set up machinery for settling our differences in orderly fashion, and war became unnecessary and undesired.

The limits of our task—We need neither to change human nature nor to attain the millenium in order to abolish war as an accepted institution for settling international disputes. We are not going to engender universal love and good-will in ten years. We are not going to abolish economic rivalries nor national misunderstandings. Fortunately for the human race and for our civilization, the abolition of war as a method of settling international disputes is a wholly distinct problem. Private disputes and murders are not linked in inseparable sequence. No more are the disputes of nations linked with war. It is war that we are attacking. It must be outlawed like the saloon, like slavery. It is in this limited sense that by united effort we can and must abolish it in our time.

How we can abolish war—The Anti-Saloon League differed from the temperance societies that had preceded it not only in the restriction of its task to a concrete, if relatively superficial, undertaking but also in two other important respects: First, it was organized on a nation-wide scale for action; secondly, it had a practical program. If we would escape the futility of previous efforts to banish war from the earth, we shall do well to apply this object lesson to our own problem.

I shall not have time here to enter into detail regarding the organization which I represent and with which the National Education Association has been connected from its inception. Your Field Secretary was one of the founders and is on our Executive Board with such leaders in organized progressive movements as Miss Katharine Ludington, League of Women Voters; Charles A. Lyman, Secretary of the National Board of Farm Organizations; John A. Ryan, Director of the National Catholic Welfare Council, and Mrs. A. C. Watkins, Secretary of the National Congress of Mothers' and Parent-Teachers' Associations.

Its Vice-Chairmen are equally well known. I have only to name Mr. Will Irwin, Mrs. Maud Wood Park, Mr. William Allen White, Miss Jane Addams, and Mrs. Thomas G. Winter.

The Council started with seventeen organizations affiliated in it and now comprises thirty, with nearly as many more coöperating. The combined membership of all these groups is between fifteen and twenty millions. Most of the organized women, all of the organized farmers, the educators, some of the labor groups, all faiths are here. Groups that have never worked together on any other issue are united on this. It is a world movement.

So much for the organization. Having proved its effectiveness as a

clearing-house to prevent duplication of effort at a time when so many groups are working toward a common end, and having aided in preventing the nullification of the Conference whether by failure of the treaties in the U. S. Senate or by cynical disregard of them in our army and navy appropriations, it is now organizing State and local councils, formed like the National Council of organizations, in order that everywhere overlapping may be prevented and coöperation may be complete. After the experience of 1914 no one will again expect that the world will drift into permanent peace.

A practical program—Given a limited task and a live and efficient organization, you will fail still unless you have a practical program. What is the program by which we may expect through our joint efforts to abolish the institution of war? It is a three-fold program. No part may be neglected.

First, there must be *world organization*. We are not particular as to names. "League of Nations" or "Association of Nations"—names are nothing. But effectiveness is everything. The main issue of world organization for peace is above partisanship but the details of that organization, in so far as America participates in it, fall well within the scope of party discussion. We cannot abolish the war method of settling disputes without setting up a better method. The institution of war must clearly be replaced by the institution of ordered government. But the scope and manner of that government are not yet determined for us nor finally for any nation. The League of Nations is in the experimental stage. The Four-Power Pact is an experiment. It is fair to expect that two years from now the political parties will be competing as to which can offer you the most attractive and promising plan of world organization for peace.

With world organization, reduction of armaments to police status is inseparably intertwined. This is the second part of our program. Not only are all nations wasting incalculable treasure upon armaments which they can ill afford, not only are these outlays disproportionate and yet inadequate if security is to be insured by this means, but military strength is a world menace and is so considered, regardless of the good intentions of the group that may at any particular moment wield the power.

The final condemnation of armaments comes from the necessities of the world organization itself. A great army anywhere would threaten its stability. Hence all armies must be reduced to police status for the security of all. Fortunately for progress in this direction, the time is not far distant in the economic race that lies before us when release from the costliness of armaments will be competitively sought, and the nation with the lowest "overhead" will be deemed blessed.

Education for peace—World organization, reduction of armaments, and thirdly, education for peace. We must by every means known to us *wage* peace among our own generation, and if our work is to last, we must educate the children to hold what we get or they will be misled by the glamor of war, by the throbbing drums, and the tales of heroism, and throw it all away in another world cataclysm worse even than the last.

Tell children the truth about war. General O'Ryan, speaking in Carnegie Hall last winter, called it flatly "organized murder." His division, the twenty-seventh New York, lost more than nine thousand men in casualties. He knows war as it is. It was General O'Ryan who used the fine phrase, "Let us wage peace." If you who teach history, wage peace instead of war, you will not preach a narrow nationalism, stimulate international hatred, and glorify and exaggerate the wars in our textbooks. You will, in the spirit of the Washington Conference, promote better international understanding, point out great traits in other nations as well as in our own, and go behind the wars to the causes and the ways in which they could have been prevented, thus removing their sting. Think what sectional bitterness could have been avoided if this had been the practice in teaching the Civil War! You teachers of history have it in your power to poison with hate the sensitive souls entrusted to your care or plant seeds of good-will that will bear fruit unto everlasting life. You can wage war or peace.

It is easy to show that geography cannot be well taught except by a teacher who sees the world in the modern light as one family with every nation contributing its product for the sustenance of all. Similarly, the teaching of languages, broadly conceived, ushers pupils into new realms of thought, into a bigger world than they could possibly know on the plane of their mother tongue alone. The genius of every nation is revealed in its literature and in the idioms and word arrangement that distinguishes its language from every other. Good language teaching calls attention to idiosyncracies which translations cannot convey. The exchange of teachers and students with foreign countries is greatly to be encouraged for this and other advantages that the custom offers. Correspondence between your pupils and the pupils of other lands through Junior Red Cross Chapters, for example, is likewise deserving of your encouragement.

On July 29 of this year ten nations are going to observe the anniversary of the declaration of war as "No More War" day. Parades and demonstrations will be the leading features in Germany, England, and France. Here we are planning to write to the President on that day and tell him that we are ready for another step toward world peace. The recognition of the World Court would be such a step, and the time for such recognition is opportune. Sweden is said to have two questions growing out of the war which concern her and ourselves alone. The press says that she wants to bring these questions before the World Court. The only obstacle is the fact that we have yet to recognize this court. An American devised the Court. An American sits on it. Shall we not ask the President to permit justice to be sought there? There is every reason to believe that he waits only to know your will in the matter.

Statesmen must often wait for public opinion to become articulate. It is no secret that the President in May thought the time not ripe for a world conference and frankly said so to a committee that called on him. But this committee went to work. State committees were organized. Senator Borah thundered in the Senate. Raymond Robins appealed to the teachers

of Kansas to write to the President and to get others to do likewise. A few weeks later the time had become ripe and the invitations were issued.

Step by step—In conclusion, I want to emphasize the importance of time in the achievement of our task. Even our limited task cannot be accomplished in one year. We must be patient. We must be willing to proceed step by step, year by year. We must avoid the danger of haste with consequent reaction. Always going forward, consolidating our gains as we go, we can outlaw and abolish war as an accepted institution for the settlement of international differences in our time—and “for everlastin’ time”—“if we get on the job.”

EDUCATIONAL MESSAGE FOR 1922

A. E. WINSHIP, EDITOR OF THE JOURNAL OF EDUCATION,
BOSTON, MASSACHUSETTS

Every one appreciates that the world is seething with restless human beings, as much in one nation as in another, with one race as with another. We need to realize that it is as much the mission of gravitation to fly airplanes as to hurl rocks down the mountain side. This is the world's most hopeful hour, if we will treat our opportunities as responsibilities, if we will use the restlessness for air flights instead of allowing it to hurl us to the depths below.

So long as it is good form for a member of the Cabinet to voice his disrespect for the personnel of the Legislative Department and his greater disrespect for the laws enacted, is it any wonder that Mr. Gompers, who has for forty years presided over the largest organization of Americans, should express the disrespect his members have for the Judicial Department and its rulings? If men at the top speak in disgust is it any wonder that men at the bottom shout in disgust?

The one sentence in all literature written for this hour is in the 72d Psalm, “He shall have *dominion* also from sea to sea and from the river unto the ends of the earth.” To dominate is the vision of the Psalm. It is a warning against domineering, which was then terrorizing civilization. Domineering is the growling of aristocracy whenever democracy fails to obey orders. Aristocracy rejoices in exclusiveness, in the fewness of its members, in the limitation of its borders. It believes that the business of democracy is to serve, of aristocracy to be served.

For the first time the public school is the only hope of the world.

“The Rising Tide of Color” may be a tidal wave that no sea wall can withstand, or it may have the mission that the tide always has of keeping the harbor cleansed by washing it out twice a day. Aristocracy needs the cleansing influence of “The Rising Tide of Color” much more than “The Rising Tide of Color” needs to be harnessed so that it will cease to be any tide at all.

Benevolent aristocracy is the greatest of perils because it wears the robes of saints. To pray for democracy in order to prey upon it to achieve

some aristocratic influence is what our fathers used to call a weather breeder. Look out for a storm.

The public school has the possibilities of dealing squarely with every child but the public school is in jeopardy, because there are those who claim to be 100 per cent for the public school when they are 100 per cent against it whenever it will not lend itself to their propaganda.

The public school is the only real effort ever made to give the bottom an opportunity to come to the top without giving a guarantee of loyalty to some leadership, to some faction, to some domineering influence.

The educational message of 1922 is for the public school and for all agencies seeking its promotion, especially the National Education Association, to protect itself from all insidious and ambitious attempts to domineer it in anything, anywhere, by anybody.

PROFESSIONAL TRAINING FOR TEACHERS OF CITY SCHOOLS

OLIVE M. JONES, PRINCIPAL OF PUBLIC SCHOOL NO. 120, NEW YORK CITY

Since I got to Boston I have torn my speech to pieces because of what a bright young teacher said to me on the street last night. I had told her my subject for today and when I said that I wasn't sure that I was going to say the right thing she advised: "I'll tell you: tell the training-school principals to take the girls to the N. E. A. and get them into the spirit of their job."

So that is my text, after I had been groping around for it for months. I have collected piles of statistics about how training-school teachers are preparing teachers, the courses required, the years required, the admission requirements, and what is done for practice teaching. But I am going to use my ten minutes in telling how I believe training schools for teachers can do for student teachers what that California girl told me to do—get them into the spirit of their job. That is the first aim in training teachers. A training school that does not send its students out into schools with a pride in their profession, a belief in teaching as a life career, a spirit of love and consecration to their work, such as the seminary does for the priest—that training school is a failure and is responsible for the unwillingness of young teachers to do the work of the rank and file—namely, the fundamental job of the elementary teacher.

Since I am a practical worker in the schools and not a theorist on education, I must speak from the point of view of what I personally believe to be the practical needs in the training of the young teachers who have come to me or under my observation.

A training school must give first, a practical concrete training which will help the young teacher over the difficulties she must meet when the door is shut on her and she is face to face with fifty wise young street gamins taking her measure, of fifty sons of upper-tendom ready to treat her as a servant if she lets them. It is all very well to know the five formal steps

of teaching and to be able to write a thesis on the project method, but what is the good of it all if those fifty boys are going to begin throwing spit balls before the teacher gets the first of the five formal steps started, and all because she did not know how to collect their caps or give out their paper.

Second, the training school must make teachers; in the second place, see the difference between teaching a subject and teaching children. Many training schools are teaching students how to teach a problem in arithmetic so that the teacher's interest is all in the subject and not in the child. The student teacher must learn the difference between teaching subject matter and teaching children to learn that subject.

Third, the training school must make its student teachers value accuracy in the knowledge of subject matter. There should be review courses in the subject matter of the elementary school, and student teachers for the elementary school should be required to pass tests in the subject matter just as the high schools require it for their special subjects. If the teacher is inaccurate in her knowledge of her own subject matter how can she make children appreciate and value thoroughness, a quality which lies at the very root of honesty and truth?

Fourth, the training school must teach its students how to study and analyze a course of study and its syllabus. The teacher must learn how to interpret a course of study and to subdivide it into portions of time, else the entire term will pass and the teacher will still be at work on a single point.

Fifth, lastly, the training school for teachers can make its students get into the spirit of their job by raising institutions for training teachers themselves to a level that makes graduation from a teachers' training school be regarded with the same pride as a college degree. There have been wonderful steps forward in this respect in the past two years, but still more can be done, and it is up to the training school for teachers in city schools, where the big masses congregate, to carry on the work. It is not yet a lifetime since a degree in civil engineering became a source of intense pride to the young men who hold it. Why not similarly a degree in education among teachers in city schools?

IMPROVEMENT AND PREPARATION OF TEACHERS WHILE IN SERVICE

PETER A. MORTENSON, SUPERINTENDENT OF SCHOOLS, CHICAGO, ILLINOIS

Teaching is a profession. We do have a body of classified knowledge not common to all. Teachers are selected with more than ordinary care, because of ability, fitness, and skill. In a most definite way, this technical knowledge and practical skill is applied to the service of the community as a whole. Because it recognizes the need of minimum standards of preparation for those entering this public service, the State certificates or licenses those who are to exercise their specialized skill, by that very act recognizing the members of the profession as serving a distinct social need.

The educative process is the mental reaction of the pupil to the stimulus

of the teacher or classmates. It consists in training boys and girls to live together effectively and happily in a more or less complex civilization. Education for the primitive life of our fathers was relatively simple; education to enable our youth to make their living together as efficient as possible in a complex organization, becomes in itself more difficult.

Because this is true we not only provide professional training for the teacher of the class, but also for those who supervise the teaching. We have specialized in the art of building courses of study and in the technique of selecting textbooks for the classroom. We recognize the need of expert educational guidance in the planning of hygienic, well-arranged school buildings, and in the accepted means for maintaining a modern, highly organized school system.

Having conceded the imperative need of specialized training for service, let us consider the problem of maintaining professional growth while in service. Teachers enter the work with a rudimentary conception of the standards that should govern a professional group as a whole. The obligation most easily grasped is akin to the primitive notion of self-preservation. It is approached through organization to secure better working conditions, more adequate compensation, more certain tenure, and other conditions conducive to contentment and efficiency.

It is but a step further to seek an opportunity for the discussion and exchange of the knowledge and experience of individuals through committee meetings, conferences, journals, and teachers' councils. It is difficult to conceive of adequate professional growth without these means of making available this common knowledge.

Last, but not least, is the obligation, both from the standpoint of the profession and the good to the community, to insist upon high and growing standards of preparation. This obligation is common to all the learned professions.

The problem is complicated by certain conditions and facts inherent to the teaching population. Teachers enter at different levels of the school system, with varying degrees of preparation and various ideals. We have the rural school teacher, with little or no professional preparation, and the teacher with but a few weeks or months of training. The number of these is legion, but their professional influence is almost nil. There are many such with latent ability or native skill, but the chances for development are limited by lack of opportunity or brevity of service, without organization or inspiration.

In the larger cities, the accepted standard of preparation is two years of professional training beyond the high school, while the teacher begins her teaching in the high school with a college degree and little or no professional training. In consequence, the elementary teacher is much better prepared in the technique, but lacks the broader culture of college life. Unit supervision is in the hands of a principal, with the basic training of the teacher somewhat extended, plus practical experience in administration, with more or less added professional training.

The nature of the problem is further complicated by the fact that teach-

ers within the system should and do seek promotion and advancement. The ambition to grow into wider spheres of usefulness, or to be promoted into fields for which one is better suited, or in which compensation or responsibility may be greater, is commendable, and opportunity to prepare for advancement should be afforded.

Moreover, the rapid advances and the far-reaching changes in professional aims require constant growth and development on the part of teachers, while actually engaged in service. The new points of view in the older subjects, such as history, mathematics, English, and geography, require a constant readjustment of perspective in order to teach them in accordance with modern thought.

The introduction of new subjects, such as thrift, community health, vocational and industrial subjects, plays, games, and the social studies, require that a teacher should either lead or lag behind.

The teacher must be familiar with the distinctively new forms of educational technique, developed by the profession, such as mental and achievement tests, educational measurements, problem-project teaching, the socialized recitation, and supervised study. Thus do we differentiate between the progressive and up-to-date teacher and the typical school teacher of tradition and the comic supplement of yesterday.

A young teacher apologized to her friends for her failure to keep up her correspondence during the year by paraphrasing, "I was not dead, but teaching." Verily, "They that watch over Israel neither slumber nor sleep", and they must not be dead.

A teacher comes into daily contact with minds that are inferior, from the standpoint of maturity and experience. She needs contact with her equals in class, committee, or council to prevent her from becoming critical, self-conscious, or superior. She needs these contacts with adult minds for her social good. In "The Doll's House," Nora maintains that until she is a normal human being, she is not fit to become a mother. The teacher who is a normal adult human being is a better teacher because of it. Because she commands social and professional respect among her adult equals, she acquires self-respect.

The standing of the profession as a whole is determined by the average individual ethics of its members. The greatest crime in ethics is stagnation. The ruts begin to form when study ceases; crystallization sets in when routine begins and teaching becomes irksome. Continued growth is a professional obligation.

The problem is before us. Its solution suggests two alternatives:

(1) Fixing requirements and leaving to applicants the responsibility of meeting them. This can succeed only when a surplus of teachers is available. It does not meet directly the need of stimulating and guiding the growth of teachers already employed.

(2) Fixing the requirements at a definite level for those entering the system and then raising the requirements for those continuing and advancing in the system, and providing opportunities for training while in service.

This training may be enforced by making salary advances contingent on

further study in summer schools, extension courses, and during leave of absence for study. It may be definitely encouraged through educational leadership, through the above means, through committees formed to develop courses of study, syllabi, or methods; it may be extended by means of definitely organized teachers' councils, engaged in the study of specific educational problems.

The fundamental position is that in the long run, the school system pays, directly or indirectly, for training of a teacher in service, just as it does for the training of those in preparation.

PROFESSIONAL STANDARDS FOR CLASSROOM TEACHERS

JESSIE A. SKINNER, JEFFERSON HIGH SCHOOL, PRESIDENT OF THE PORTLAND HIGH SCHOOL TEACHERS' ASSOCIATION, PORTLAND, OREGON

When I received this subject, I thought with Napoleon "Thirty centuries have the pyramids looked down upon you!" Professional Standards for Teachers! It is like Sally Ann's "old dress that has been turned wrong side out, and hind side before, and sponged and pressed and made over until you can't tell whether it's silk or calico or what." It has been lengthened, shortened, narrowed, taken in here, let out there, combined with new material, panelled, ruffled, and frilled. Yet that same old dress has to be made over once more and made to look like new! Can anybody be deceived? Perhaps not. Only a few who have recently moved into the neighborhood. The old timers know the dress by heart, can tell the color a mile away, distinguish the material in the dark, and recognize the pattern if they saw it in *Vogue*. It is the same old dress.

A teacher knows—that is any one here knows—that she should have a high type of mental equipment; that she should improve by professional study; that she should have a fine attitude toward her work; that she should be loyal to superiors; coöperate with all; give efficient service to community and State; be an example to all in word, in deed, in thought; so live, so die, go home to glory and wear a crown forever and ever.

Teachers are of two classes, those who do not need a speech like this and those who do. The people who are here are of the first kind; they attend teachers' meetings, read teachers' magazines, know the creeds of professionalism. Those of the second kind are not here—they do not care for educational meetings, will not read the magazines, and if they found this in their mail, would throw it in the waste basket.

One who enters the teaching profession, if only for one or two years, until the law office can support itself or sweetheart earn enough to support two, should enter it with the idea of giving to the work all one has to give. In some way or other, such a person should be made to feel that there is an obligation to the profession more vital than her ability to draw a pay check. The teachers who are trying to do something for the schools, for the community, for the teachers themselves find such expressions familiar but tiresome. "Oh! That doesn't make any difference to me. I

don't expect to be here another year." "Tenure is all right for you people but it doesn't interest me." "A retirement fund is a good thing for the old teachers, but I don't expect to teach all my life." "Why should I join any teachers' association? I don't care anything about it. It doesn't do me any good." "Oh! don't talk to me about school, I just hate it."

I should like to have this teacher change the "I don't expect" into an "I do expect." Let her say, "I may not be in this work long, but while I am in it, I expect to give to all phases of it, my interest and attention. I'll know everything I can about it. I'll put my best effort into it, and in doing so, I'm sure I'll find it interesting and enjoyable. Perhaps, too, I can make a place for myself that will be worth while, so that when I leave, I shall feel I have done something to help along the biggest thing in the world."

What a joy, what an inspiration it would be, if we all talked like that! Too many teachers are ashamed of and decry their own profession. They will not talk shop because they do not want to be known as school teachers. Did you ever know a real doctor who wasn't interested in his profession, in his patients, and who did not like to talk about them? Doctors talk operations; lawyers talk cases; engineers talk projects; business men talk business; society women talk bridge; married women discuss their maids and their children. "Talk shop?" Everyone talks shop. Why shouldn't a teacher talk about school? It is the biggest business in the world and the one in which the most people are vitally interested. If this type of teacher would change her attitude toward the profession, be interested in it, and quit deprecating the fact that she is a teacher, she would do much toward popularizing education with the public. Rudyard Kipling says that "a man who talks shop is always interesting because he knows what he is talking about."

The one who goes to the other extreme, who never puts on the exhaust with reference to school affairs, who carries a critical attitude wherever she goes, is as bad as the former. I can readily see why others would not care to be in the same class. She reminds me of the story of the negro servant who gave out with equanimity the same kind of feed to all the animals.

"Jim," said the farmer, "have you fed the horses?"

"Yassir."

"What did you feed 'em?"

"Hay."

"Did you feed the cows?"

"Yassir."

"What did you feed 'em?"

"Hay."

"Did you feed the ducks?"

"Yassir."

"What did you feed 'em?"

"Hay."

"Did they eat it?"

"Nawsir; dey didn't zactly eat it, so far as I saw, but dey was talking about it when I lef'."

With all the routine of classroom work, with the weariness that comes at the end of the day, it is hard to keep up one's general information, one's interest in community affairs and community problems. But the teacher should establish as many lines of communication with the world outside of school as is possible. She should know her community and in what ways she can best serve it. Too many teachers have their first introduction to the community when they ask for an increase in salary.

To give efficient service, the teacher must realize the importance of her work and its far-reaching results; must realize also that much she does will never be paid for except in the satisfaction of well-rendered service. We have heard much of the glory of school teaching, of what a great and noble work it is, and sometimes we get tired of hearing about it. We'd like to have the public show that it really means what it says. We'd like to have it think as much of education as it does of its automobiles, of its tobacco, of its theaters. But what other occupation offers such opportunity for real service in helping to build the kind of citizenry the Nation needs?

St. Peter stood at the gate of Heaven receiving those who came and questioning them concerning what each had done. There was the lawyer, who with his record of fairness and justice had gained an enviable position in his town; the doctor, who with his skill had relieved the pain and suffering of his fellows; the minister, who had guided their souls aright; the legislator, whom his townsmen had honored with a place in the law-making body of the State. Then the school teacher. "And what have you done?" asked St. Peter. "I? Why I started each one of these on his way to success: I gave him the ambition to be a strong and useful citizen."

Can any work be more far-reaching in its influence? How necessary then that we give *real* service? Do teachers ever try to "get by"? Are we ever time-servers instead of service-givers? We should achieve, not merely serve time. An interpretation of service submitted by a postal carrier and given out by Ex-Postmaster General Will H. Hays, says,

"One of the greatest hindrances to the smooth revolution of the industrial wheel is the idea that a person's time is worth so much an hour. One hour of your time or my time in itself is simply worth nothing. One hour of your service, one hour of my service—that's a different proposition."

The nature of the educational system is such that it demands leadership and coöperation. A football player may think the quarterback would have done better had he called an end-run instead of a line-back: but it isn't his job to do the signalling. It is his to play the game, play up, and play it well. If the teacher doesn't know the joy of doing real team work, then it is time to get busy. If she cannot do it, then let her get a little business of her own, where team work isn't essential.

The teacher should be ready and willing to serve on committees when called on to do some important work outside of her own classroom. True,

it is easier not to; but whoever achieved anything without effort? The principal of the school in which I teach said to me not long ago: "Mr. S. is a wonderful man. I couldn't get along without him. That athletic work takes so much time, and he looks after it all. And Miss B. with the school magazine, Mr. R. with the band, Miss S. with the scholarship committee—what would I do without them? I couldn't run my school." Then he turned to another and said "You'd better go home," adding "I wonder how many principals have to tell their teachers to quit working?" We should not like to fail him *or* our school. Is such coöperation worth while? Of 217 students that were graduated from Jefferson High School this June more than 170 have signified their intention of continuing their education in higher institutions of learning.

The teacher, and I may add the principal and the superintendent, should be fair and just and should deal out that justice without fear or favor. Our work should be bigger than our job and John should be punished or promoted according to his merits—not according to the position his father holds in the community. We have talked about this for a long time; but the fear of our position has made cowards of too many. It is impossible to make honest citizens if we set an example of dishonesty.

In all phases of her work, the teacher should be human. She should have such an attitude toward her pupils that would not make them feel as the little boy who in an essay on Gender wrote the following, "Gender is of three kinds, masculine, feminine, and neuter. Masculine is the man sect, feminine the woman sect, and neuter things having no life. Examples, hero, tigress, and teacher." She should have a real human interest in boys and girls as such, not as so many containers to be filled with facts. She should be a student of psychology written and personality unwritten, remembering that John and Mary, Chauncey and "Anne, spelled with an *E*," Izzy, Ole, Anatole, are all problems that *cannot be solved by the book*.

She should be a real human being in her relations to other people; should not get the idea that intellectuality will make up for everything else. She should avoid the critical attitude that makes people uncomfortable in her presence. She should surround herself with professional books and magazines and command respect for herself and her profession. She should quit being sorry for herself, should like her profession or quit it, and serve herself and the cause of education by doing so.

PRESENT-DAY OBJECTIVES OF AMERICAN EDUCATION

JOHN J. TIGERT, U. S. COMMISSIONER OF EDUCATION, WASHINGTON, D. C.

When etymological derivations were fashionable, we used to begin the definition of education by showing that the word is simply a transliteration of a Latin term composed of the preposition "e" (out) and the verb "duco" (to lead). Education literally is "leading out" or developing the latent was wont to say, "Every boy or girl is a bundle of possibilities." The

function of education is to untie the bundle so as to get the maximum from its contents. Education consists in the most complete and harmonious realization of all the powers of man for the promotion of his own welfare and the welfare of his fellows.

It is confusing to some that education should receive a new definition in each new age and that educators should define it in such a myriad of ways. One element in education is perennial, but the other element is in a constant flux. The human element is unchanging, but the world in which we find ourselves is constantly changing. Hence, in a certain sense, education is always the same, it is always developing the individual; in another sense, it is always changing to adapt man to his shifting environment.

The world has changed more, perhaps, in the past half century than in any equal period of its history. Thirty years ago no man had seen an automobile. Today, he sees little else. Science, invention, and art have so transformed life that Abraham Lincoln, for instance, would scarcely be able to recognize this as the country in which he lived. Some of our forefathers would have difficulty in recognizing the planet upon which they lived.

Modern education consequently has been compelled to transform itself in accordance with these radical changes in our mode of living. Before the introduction of machinery and the industrial revolution, before the rise of democratic governments, education essentially sought different objectives from those of today. For centuries, its chief program was to cultivate "the humanities," to awaken within the soul and mind of man an appreciation and a love for literature, history, religion, philosophy, and art. Its ideal might be found in the most complete spiritual satisfaction, mental emancipation, and appreciation for the rights of others.

The new world in which we live has added in manifold ways to the objectives of education. Education means today a preparation for living according to the highest standards of this age. It differs from the older education as modern life for which it is a preparation. If more emphasis is laid upon vocational, industrial, and practical business education today than formerly, it is because it is an age of new vocations, industrial expansion, and business opportunity. If education for life in a democracy has essential differences from education for life under older and less liberal forms of government, it is because it reflects a larger participation on the part of the citizen in the affairs of government, and a greater political right and responsibility; if education is more complicated and more exacting than formerly, it is because modern life is more complex and its needs correspondingly multiplied and varied and because modern invention has made the world a neighborhood.

The exigencies of modern life with its variety of complex problems make new and greater demands upon the individual for mental and physical preparation. New crises are ever disclosing old weaknesses and unfolding new demands and possibilities. Education therefore must be evolutionary and plastic. It must be sensitive to changing needs but must never be decoyed from its path by wanton caprice or passing fads.

The objectives of education in America at present are comparatively simple and well defined though plans for their accomplishment are not uniform and are somewhat intricate and hazy. We have committed ourselves unreservedly to a policy of universal education, with equal opportunities to all. We have the most elaborate system for the education of our citizenship that any nation possesses and we spend more than a billion dollars annually upon it—far more than any other people. We have adopted the ambitious program of putting eight years of elementary and four years of secondary education within the reach of every child in America. We have gone far toward compelling an elementary education by law in every State in the Union. We justify our program, first, because of the necessity of preparing a citizenship that is able to participate in our democratic government, and, second, because of the desire to provide for equality of opportunity for individual development for which our democracy stands. Under older conceptions of government, monarchies, oligarchies, and aristocracies, only the leaders were educated, but in a democracy where the people are the rulers, all must have education.

We have boasted no little about our great public-school system, but we have only made a beginning towards uniform opportunity in this country. To put our dream into general and practical effect is the great problem that challenges educational leaders today.

Modern education in our democracy means preparation for intelligent citizenship. We are coming to understand in all the practical difficulties that are arising in social, political, and industrial troubles that a democracy cannot be satisfactory without universal education. As has been noted frequently of late, it is as necessary to make democracy safe for the world as it is to make the world safe for democracy.

We must teach the American people more generally and more effectively than we have been able to do in the past the duties and rights of those who share in the responsibility of government. I believe that the study of the constitution and the history of the United States should be made compulsory in our school curriculum.

With the increased complexity of modern living and the more scientific and systematic character of present-day business and vocations, vocational education has become far more necessary than in the past. Certainly civilization should not lose its culture and refinement, but equality of opportunity contemplates that everyone must have the means of fitting himself for any occupation which is useful and lawful according to his choice. This means that those who enter industrial, commercial, and technical callings are entitled to educational opportunity which will fit them for their chosen places as effectively as those who may enter the learned professions and the so-called higher walks of life. It has not always been so. While cherishing all the best fruits of the old we must give more effective training to those who must engage in the modern arts and crafts to make a living for themselves and their dependents.

In the years just preceding our Civil War certain men wanted agriculture taught in the University of Michigan. These men were ridiculed

and they went up to Lansing to found the first agricultural college in this country. Since that day agricultural colleges and experiment stations have become general throughout the States. The Federal Government greatly stimulated and encouraged the early growth of these colleges of agricultural and mechanic arts by grants of lands and has since continued to encourage them by annual grants of Federal money. Soil fertilization and conservation, seed selection, intensive cultivation, study of markets, transportation, crop rotation have all been reduced to scientific procedure. Formerly, good or bad crops were attributed to the providence of God; today they are attributed to the knowledge and ignorance of men. Once the name "farmer" was an opprobrious synonym for ignorance. Today it connotes education. The successful farmer today requires technical, scientific, and business training.

The business opportunities in America were once so vast that a business man seldom failed. Business was almost fool-proof. Today competition has become keener, business has widened its scope, and the old haphazard methods are being abandoned. New means of transportation, large scale production, complicated systems of buying and selling, and the reduction of business to scientific methods, together with various other factors of expansion and improvement, have produced a necessity of specialized education for the best success in business.

With the complete recognition of woman's right to participate in the government, together with a widened participation of women in business and industry hastened by the war and the shortage of men during the period of the war, we have created a demand for a new type of education for the women of America. Home making has been and should always be, we believe, the life work of most women. For them our schools are offering courses in domestic science and arts in the complicated fields of rearing, clothing, and feeding children, as well as in the economic and efficient management of the household.

But the schools are likewise called upon today to provide opportunity to our girls and young women who must support themselves and seek their happiness in legitimate vocations and professions.

Revelations during the war period have made many other demands upon our educational program. Perhaps the most appalling revelations were that one third of our young men were physically unfit to bear arms and one fourth of them were illiterate in a real and practical sense. The dangers arising from an empire of heterogeneous races which have immigrated into America and largely supplanted the original homogeneous stock have laid an additional burden upon education.

We live in a world becoming constantly more and more taxing to body and nerves and which more and more confines our people to factories, desks, and shops. With one third of our people physically subnormal and no adequate provision for proper health and physical education, we shall certainly become a puny people. This must not be; the correction can only be found in an adequate program in our schools for developing strong

bodies and hygienic habits. Further, our program must include the provision that boys and girls shall not grow up untouched by the school, ignorant of the English language, of our ideals and customs; that adults shall not continue to live in America in similar ignorance, and that these latter may find the means for further instruction if they are willing to pursue it.

*THE PROFESSION APPRECIATES FOUNDATIONS EARLY
ESTABLISHED IN MASSACHUSETTS AND HER
PRESENT INTEREST IN EDUCATION*

SUSAN M. DORSEY, SUPERINTENDENT OF SCHOOLS,
LOS ANGELES, CALIFORNIA

As representatives of the National Education Association we have listened with interest to the gracious words of welcome from citizens of Massachusetts. In turn we desire to express our sense of the honor and privilege extended to our organization of meeting in this city. This group of teachers always rejoices when Boston is the host. With respectful, yes, almost reverent attitude we approach your confines because we recognize that Massachusetts has been the "teacher of teachers" and that in coming here we are returning to the place of our educational nativity.

The early determination of the colonists to compass the education of their children at all costs has been well set forth by one of your own great citizens. "The Pilgrim Fathers, amid all their privations and dangers, conceived the magnificent idea not only of a universal but of a free education for the whole people. To find the time and the means to reduce this grand conception to practice, they stinted themselves, amid all their poverty, to a still scantier pittance; amid all their toils, they imposed upon themselves still more burdensome labors; and amid all their perils, they braved still greater dangers. Two divine ideas filled their great hearts—their duty to God and to posterity. For the one they built the church, for the other they opened the school."

In successive acts of legislation and in the admonitions given to magistrates this persistent purpose, this undying aspiration to compass the education of their children are recurrent until they find complete and exhaustive expression in the Massachusetts Constitution of 1780, a document that deserves to rank beside the great pronouncements of our ancestors. After specifying that the diffusion of wisdom and knowledge, as well as virtue, among the people is necessary to the maintenance of their rights and liberties, it prescribes that it shall be the duty of legislators and magistrates in all future periods to cherish literature and science and especially the University of Cambridge and public schools, and not only that, but to encourage private societies and institutions by rewards and immunities for the promotion of arts, sciences, commerce, trades, manufacture, and the natural history of the country. Finally, in enumerating the duties of these same magistrates, there follows this injunction: "To countenance and in-

culcate the principles of humanity and general benevolence, public and private charity, industry, frugality, honesty and punctuality in their dealing, sincerity, good humor, and all social affections and generous sentiments among the people." So exalted a sentiment of the duty of magistrates in the education of the children could have been conceived only by a people whose genuine worth and downright earnestness are hardly equaled in human annals. One could wish that this provision of the Massachusetts Constitution might be transcribed as a frontispiece in every history textbook in the land so that the youth of America might know what manner of education our New England ancestors coveted for future generations.

The incomparable argument for free schools, however, is attained by your Horace Mann, the greatest interpreter of public education our country has yet produced. His sublime conclusion in the whole matter of free public schools is this: "The successive generations of men, taken collectively, constitute one great commonwealth. The property of this commonwealth is pledged for the education of all its youth, up to such a point as will save them from poverty and vice, and prepare them for the adequate performance of their social and civil duties." Then follows the conclusion of the argument: "The successive holders of this property are trustees, bound to the faithful execution of their trust by the most sacred obligations; embezzlement and pillage from children and descendants have not less of criminality, and have more of meanness, than the same offences when perpetrated against contemporaries." We teachers of the twentieth century accept this conclusion of the great New England educator as the very magna charta of public education. Because this commonwealth has cherished education as the right of every child with the same inflexible purpose with which she has cherished liberty as the right of every man, we are here tonight. It may be added that only as successive generations *accept* this dictum—namely, that they are pledged to the education of the children of the next generation, can we hope to progress or even survive.

In retrospect we skim the centuries through which generations of New Englanders wrought mightily against the stern forces of an unfavorable environment and everywhere we see the same unyielding purpose to start the next generation better equipped than the former. Not only in New England traditions, her laws, her institutions, but in her monuments and her memorials are evident the recognition of an educational duty to posterity and an inflexible purpose to discharge that obligation with full measure and in worthy fashion.

Amid our own educational riches we sometimes almost marvel at the imperfect and insufficient tools with which our ancestors wrought. The common school with its hard benches and meager instructional equipment seems as naught compared with the palatial housing and the wealth of material of these later years. To a generation that clamors unceasingly for new texts, new pictures, new devices, new equipment, it seems incredible that a single book, the New England Primer, should for one hundred and fifty years have served as a veritable talisman of primary education. Perhaps it had merits that we moderns fail to appreciate. Like its

users it was a sturdy text with no easy devices, no soft doctrine of any sort. The very young child of those heroic days was faced at the outset, not with captivating fairy tales, but with the stern statement of his New England Primer:

In Adam's fall
We sinned all.

Its scanty illustrations, such as a woodcut of John Rogers burning at the stake while his wife and nine children gaze helplessly on, were not conducive to merry thought. Yet out of the common school of New England with such meager equipment there have come many generations of thoughtful men and women who have cherished public education and contended for it as the *right of every child*. With fervent gratitude we record the fact.

Not merely free education but progressive education, the best to be had, has been the goal of New Englanders. In every type of school, from the primary grade to the college, Massachusetts has pioneered, placing the entire Nation under everlasting obligations for her successful educational ventures.

We pause here to record another service. What words can stress the debt of this great Nation to the army of New England's school teachers who have moved ever westward with the advancing people, imparting to successive generations the wisdom, courage, and character of the "Down-East school ma'am." The graduates of ever honored Harvard and the galaxy of New England academies, colleges, and institutes have been in the van of civilization doing a man's work. Under their trained leadership railroads have been builded, mountains leveled and tunneled, rivers spanned, farms have been tilled, deserts have been conquered and, better than all, the battles of freedom have been fought while equally well have they wrought in the tender ministries of the spirit for those who suffer in body or mind.

The educational service of Massachusetts has not been confined to accomplishments through the schools. Leave out of our history those teachers of the Nation who as bards, philosophers, historians, artists, scientists, reformers, and divines have made New England famous, and measure, if you can, how much of wisdom, inspiration, and spiritual courage, yea how the very sinews of the soul would be gone from our National life. Lessons learned from The Quaker Poet of Whittier Land, The Seer of Concord, The Bard of Cambridge, the historians of Boston, "The Autocrat of the Breakfast Table," the pre- and post-war orators, the Boston preachers of righteousness, the fighters of the battles of freedom, have been transfused into the very life blood of our Nation. That is the debt we owe to Massachusetts.

This debt is not all to the past. The noble work of educating the people still goes on. Wherever courage, initiative, and a determined purpose directed to a worthy end are needed there are found today men and women

of Massachusetts. "There were giants in those days," but history will record the same verdict of the Massachusetts men and women of today.

These representatives of the National Education Association, gathered from the four corners of our land, from her cities and hamlets, from her vast prairies and lonely deserts, from her mountain sides and valleys, desire to acknowledge with grateful emotion the educational debt of America and especially the debt of the public schools to the Massachusetts Bay Colony, to Boston, and to the Massachusetts of the past and of today. May this great commonwealth never falter in the sublime task to which her founders dedicated themselves—namely, the service of God through the church and the service of posterity through the public school.

THE DEMOCRATIC AWAKENING AND PROFESSIONAL ORGANIZATION

CHARL ORMOND WILLIAMS, SUPERINTENDENT OF THE SHELBY COUNTY SCHOOLS, MEMPHIS, TENNESSEE, PRESIDENT OF THE NATIONAL EDUCATION ASSOCIATION

The National Education Association is most fortunate in meeting here amid scenes that mean much in our American life. It is a great privilege to meet in this city. We know that hearts and homes are open to us here today. We know that citizens have laid aside their usual work and pleasures to devote themselves to the preparations which make these great meetings successful. Some of us, who have been near these men and women as they have been doing their work, know—as most of you cannot know—how great the effort has been. Recalling the inspiring leadership of Horace Mann and the men and women who have followed him, we had expected great things of Massachusetts, but the reality has exceeded our expectations. Representing this great Association—this magnificent Assembly—I join Mrs. Dorsey in thanking you from our hearts most earnestly for this wonderful reception.

We are entering upon a new era in education. The world is realizing more and more the primary importance of educated leadership and the fundamental necessity of intelligent citizenship. There is no other safe foundation for democracy. This fact places a new responsibility upon teachers everywhere. The individual teacher has an opportunity for larger service than she has enjoyed in years gone by. That opportunity has come in consequence of the development of a new idea in professional organization—the idea of representation.

It took centuries of political experiment to develop the idea of representative government. Nations founded upon conquest came and went. Even the Roman Empire, which granted rights of citizenship to conquered peoples, failed to survive. Lacking the idea of representative government, it was unable to make the individual citizen responsible in the affairs of empire. Not until—in the thirteenth century—the principle of representa-

tion had birth in England, not until in later centuries it was extended and developed in America, did it become possible to build a vast Nation in which the individual citizen had responsible part.

This principle of representation which has had such great consequences in the development of modern democracies is now making itself felt as a powerful force in the professional organization of teachers. It was indeed an inspiration to see gathered at Des Moines a year ago the chosen representatives of the teachers of the Nation. It was a great satisfaction to realize that for the *first* time in American educational history there had been brought together a body of men and women, fully qualified to express the ideals and purposes of a membership of over 50,000 teachers. I am glad to report that growth in membership has continued and that you who sit here today carry the responsibility of acting for more than *twice* 50,000 teachers. What you say here and what you do here will be carried back to every community in the United States and will be a quickening influence in the lives of your colleagues who are not able to be present during these great days.

Inspiring personal contact between teacher and pupil is the firing-line of education. Without it education cannot produce a great citizenship. Time was when almost the entire attention of educational leaders was fixed upon these contacts within the schoolroom. Education carried much of the idea of cloistered isolation. That day is past. The true teacher of today is great, because he brings into his soul touch with pupils the influence of a life rich in the inspiration and wisdom of the world of affairs. We are coming now to see that if the teacher is to be all that he should be in his relations with pupils, he must himself participate in the responsibilities of citizenship and must share in the improvement of his profession. Inspiration is the soul of great teaching. No one can estimate the inspiration that is generated by the National Education Association with its growing membership of over 100,000 teachers. We are proud of this great growth, but growth in membership is only one of the Association's significant achievements of the past year. I need not describe these achievements in detail. They are fully covered in the report of the Secretary and in the reports of departments of the Headquarters Staff. The development of this staff is itself an achievement of high significance. It is only a brief time since the headquarters were moved to Washington, where Secretary Crabtree and a handful of assistants were housed in rented quarters. Soon the Association added a field-secretary and an assistant-secretary. The next year it moved into its own home on Sixteenth Street. An Editorial Department was added. Other departments were further developed. During the past year a Research Department has been created. Now instead of the mere handful of faithful workers of a few years ago, the Association has a well organized staff of from fifty to seventy-five employees. This staff works in offices fully equipped, according to the best practices of administration, to handle the growing work which the Association is called upon to do. Before I became president, I had been proud that the Association had

bought its own home in Washington, but I had not realized the vast extent of the work that is being done at Washington. I had not realized how fortunate the Association is in having a body of trained men and women who bring to their work the accumulated experience of continuous service in the field of professional organization. I want to commend to this Representative Assembly the vision and the devotion of the Headquarters Staff.

In making the program for this meeting we have taken council not only with the Headquarters Staff and with members of the Executive Committee, but with other men and women from every section of the United States. We have endeavored to make the program represent education as it is today and forecast the needs of education as they will be tomorrow. It is natural and inevitable that the theme of these meetings should be Education and the Democratic Awakening. There is definite connection between the democratic awakening that followed the war and the intensified interest in educational endeavor which is sweeping the civilized world.

The democratic awakening is affecting education profoundly. It is influencing the technique of instruction. Socialized recitation, project method, and other devices designed to develop individuality are being used more widely than in years past. The attitude which parents and teachers have toward children shows larger recognition of the child's point of view. Superintendents are finding ways of utilizing the initiatives and originalities of the teaching force in the improvement of the course of study and school management. People generally are coming to understand that education for political democracy must be followed by education for social and industrial democracy, if the future of civilization is to be secured. The leaders of humanity are facing with new courage the task of reconstructing the world's relationships, so that the interests of the common men and women shall receive larger recognition when world policies are shaped.

These are some of the things that have come in consequence of the democratic awakening. For education they mean a new perspective, new problems, and new hope. The thinking leadership of the civilized world is determined that every citizen must be educated for a place in peaceful society with as much thoroughness as in times of war he is educated for a place in the army. The world is challenging its educational forces to produce an education fundamentally sound in quality and abundant in quantity. Professional organizations have taken up the challenge and are destined to become the policy-determining agencies of the future. They have developed a new educational leadership—a new statesmanship. The significance of this new educational statesmanship is best seen in the light of history. Education in America has developed piecemeal. It is the product of experiments and rivalries—of enthusiastic and partial attempts to meet the educational needs of a democracy that has grown so rapidly in extent and complexity as to leave many educational plans out of date before they had become fairly established. There have been movements for academies and Latin schools and brilliantly led efforts to develop elementary schools both public and private. Secondary education has been the chosen goal of

one group of educational leaders, while the enthusiasm of another group has sought all it could get for the development of higher education. Other leaders, with a vision of the importance of maintained intelligence among our entire citizenship, have worked for the establishment of free public libraries. Still other men and women have realized the importance of professionally trained teachers and have lent their energy to the development of normal schools and teachers' colleges. Too frequently these leaders have worked at cross purposes. They have sometimes feared lest the success of another enterprise might interfere with the development of their own. They have not often enough been able to see that the education of a democracy is a *great single comprehensive* task.

The new leadership is coming to see education in this broader and more fundamental light. It is only a matter of time until every State in the Union will have a program of education sponsored by the leadership of a great association designed to develop a system that will promote every type and kind of education. Educational leaders will have not less enthusiasm for their special work but more appreciation and more enthusiasm for educational enterprise generally.

It is only a matter of time until education will have larger National recognition and support, just as agriculture has grown in the support which it receives from the Federal Government. The Constitution of the United States gives the control of education to the various States. We could not if we would—and we would not if we could—change this fundamental principle of the American Government, but we must face squarely the fact that no one can be a citizen of the United States without first becoming a citizen of a State. If the United States is to have the kind of citizenship that its place in the family of nations demands, it must share with the States the great responsibility of public education. This responsibility is expressed in the Towner-Sterling Bill. This bill is sound. It is necessary. It represents the best educational statesmanship of our times. Daily it grows in strength with the people. A year ago the ultimate realization of its aims might have been doubted. To doubt it now would be to doubt the very tides.

The leadership of America in the affairs of the world is the greatest opportunity that has come to a nation in all history. It has been the aim of this program to recognize this great opportunity and to discuss the fundamental things needed to develop an educational system that will enable the Nation to meet its growing obligations.

Looking forward to the coming world conference on education, an attempt has been made to present the new world outlook in its relation to our educational problems. We are proud to have with us the President of our great sister organization overseas. We are proud of the record of that association with over a hundred thousand members. Education everywhere has been benefited by the fight that it made for the Fisher Bill and by its more recent fight for adequate salaries and improved conditions generally.

You heard discussed this morning the problem of the training of teachers

in its various aspects. We all have as a result of that meeting a new appreciation of the importance of the trained teacher. Failure in wartime to respond to the call for volunteers casts a stigma upon any community. May the day soon come when failure to send into the teacher-training institutions its proper quota of recruits will likewise be deemed unpatriotic. The teacher is the real maker of history, and no nation can rise above the vision and the character of its teachers.

Rural life and education have been emphasized in this program. It would be folly to contend that our rural life is more important than our industrial and commercial life. The welfare of all is found in the prosperity of all. But our rural life presents peculiar problems, serious problems, which must find solution in education. A survey of the disgraceful conditions in tens of thousands of rural schools is ample evidence of the need for constructive work. The farm boy and the farm girl are entitled to a square deal. The Nation cannot afford not to give them a square deal, for it is from the underlying bed rock of the common people on the farms that the leadership of the Nation is continually recruited.

These are only a few of the problems that we are here to consider. We are here representing every portion of the Nation. We are here to meet together and to work together. We are here to get the inspiration of worthy ideals fostered by common action. We are here, because a country that is worth dying for is worth living intelligently for. We are here in the spirit that sent our fathers to these shores. We are here to forget self and to grow in service to the Republic. We are here representing that system of public education by which the Nation has been great. We are here to dedicate ourselves anew to the further improvement of that system to the end that education of the people, by the people, and for the people shall make good the glorious promise of democracy.

DEMOCRACY IN THE CLASSROOM

EFFIE MAC GREGOR, MINNEAPOLIS TEACHERS' LEAGUE,
MINNEAPOLIS, MINNESOTA

The great Theodore Roosevelt has said that we have before us the great task of "trying to save America," and he adds, "we have a fifty-fifty chance." These are portentous statements.

We are enamored with the words "to save America." That phrase carries with it the idea of dramatic action, of beautiful but self-satisfied heroism. Yes, we are all willing "to save America."

But what about this "fifty-fifty chance"? One must pause here and consider well when one remembers the broad and deep patriotism of the man who said these words. Here is an un-American idea, for it does not insure a happy ending, even hints at a possible failure.

What is to be done about it? Shall we pause and then pass on, taking the happy ending for granted, or shall we stop and begin to interest ourselves in the constructive continuance of the foundation necessary "to save America?"

It is to be hoped that every American in every walk of life will stop and having stopped will take his individual place in the further construction of this mighty foundation which was so courageously begun by our ancestors, in this very place, some three hundred years ago.

Every American citizen should study and know his particular part in relation to the whole, and knowing, should, with deepest gratitude pledge his service to the construction of a safe National foundation. What service can the classrooms of the public schools of our country render democracy?

Long ago the world's greatest teacher said, "Ye shall know them by their fruits" (Matt. 7: 16). We may hope for success in our experiment in democracy, we may talk about it, write about it, and even sing about it, but we shall have no democracy until we have demonstrated democracy.

This may sound pedantic to the great majority of American people, but then the great majority of American people have not taught school in the greatest democratic institution on earth, the public school of the United States, so they cannot know that every classroom in our public-school system is at the present time a near demonstration of democracy.

It was my privilege to attend the convention of the Department of Superintendence of the National Education Association, held in Chicago last winter. There I heard a definition of democracy which exactly described my idea of democracy in the classroom. Dr. Aydelotte said, "Democracy is the art of living together." This remarkable definition served to remind me that every classroom in our country is definitely working on just that project, "the art of living together."

If our project is to be a contribution from the classroom to this foundation which must be "built on a rock" if we are "to save America" then, as educators, we must have definitely in mind just what is needed to insure the success of our contribution.

The first requisite is a classroom teacher who has a definite idea of the meaning of democracy. It will, of course, be an individual idea, but to be of real service it must be all inclusive. She must realize that while she is teaching subject matter, she is at the same time living with a group of boys and girls who will strengthen or weaken our National foundation in proportion as they make this living together an art. She must then fully appreciate that the institution of public education in the United States is the great laboratory in which this tremendous experiment can be tried and proved.

Further essentials to our project are the boys and girls who come from any and every sort of American home.

Every classroom teacher knows that she must have three great objectives in mind if democracy is to succeed. Her first great objective is that of character building. She knows that the individual contributes power to self and to the Nation, only as he realizes that individuality and character are synonymous.

She knows too, that the development of character is largely due to religious teaching. But she works in a country where liberty and license

have been confused in several instances. To bring order out of chaos, in this instance, she remembers that we are proud to call ourselves a Christian Nation, so she boldly accepts St. John's definition of Deity: "God is Love"; and then proceeds to build character in the classroom on the two great commandments, "Thou shalt love the Lord thy God with all thy heart, and with all thy mind, and with all thy strength"; this is the first commandment. And the second is like, namely this, "Thou shalt love thy neighbor as thyself. There is none other commandment greater than these." (Mark 12:30-31.) And under her guidance every boy and girl learns that to be a "short sport" is simply not loving your neighbor as yourself. They learn too that to be "square" one must necessarily give one's neighbor considerable thought. In short, the second great commandment becomes the yardstick of all classroom coöperation. By following this method more or less closely, character is strengthened in the classroom. It is to be hoped that some day soon our Nation may see the need of definitely admitting these two great commandments into the public school as part of our curriculum.

The second objective of the classroom teacher is the development of civic responsibility. The classroom teacher knows that if she is to throw weight on the side which will insure the safety of America she must instil individual and collective civic responsibility in the boys and girls with whom she lives. She must bring to the realization of every child that we live in a Nation having "a government of the people, by the people, and for the people" and such a government can only continue as every individual takes active part and serves, "with malice toward none, with charity for all, with firmness in the right, as God gives us to see the right."

And last, but quite as important as character building and civic responsibility, is the development of individual and collective social effectiveness.

We live in a Nation which is much more impressed by speed than by grace, but nevertheless there can be no real harmony in living without grace. Included with love and service to our fellowmen must be an appreciation that living, itself, can and should be an art. Art of any kind comes into being through the love of beauty. We are teaching beauty when we teach love for our fellowman and when we emphasize the need of service in life, but added to these teachings must be the development of a real appreciation of the social graces.

When we shall have learned in the classroom, in the home, in our business, civic, and social National life that we must follow some definite and inclusive rule as a basis for character building, that civic responsibility begins with the individual and that a love of beauty is an essential to living harmoniously, then we shall have demonstrated democracy. We may then join Whittier in gratitude and in prayer:

For art and labor met in truce,
For beauty made the bride of use,
We thank Thee; but withal we crave
The austere virtue strong to save—
The honor proof to place or gold,
The manhood never bought or sold.

If the National Education Association can be the channel through which the American public may realize as never before that the institution of public education in our country is our greatest agency toward the demonstration of democracy, then we shall have rendered the greatest service of all, not only to our Nation but to mankind.

THE NEW OUTLOOK

KATHERINE D. BLAKE, PRINCIPAL OF PUBLIC SCHOOL NO. 6,
NEW YORK CITY

Three centuries ago a new outlook was given to the world by a group of men in the tiny cabin of a little ship anchored not far south of this town when they wrote and signed "The Compact," in which all men were treated as equals unlimited by restrictions of wealth, education, or religion. It is fitting that we educators on this historic ground near the Cradle of Liberty, should seek a new outlook for this troubled world. It is America's gift to light the world to new things. The document, the signing of which we celebrate today, so lit the world that despotism has been everywhere overthrown until today the republic is the rule among governments, and the monarch is the vanishing exception.

Do we need a new outlook in education? The whole world needs it! Schoolhouses are either crowded far beyond capacity, or empty because of lack of teachers. Two million children in these United States annually repeat their grades, thus learning the lesson of failure in early life, to be hindered by it for the rest of their days. In New York City last year 50,000 boys and girls left school before completing their elementary studies to go to work—most of them without needing to do so.

Men, like Frankenstein, have created a giant to do their work, and unless controlled, it will destroy humanity. Steel rules the world today and "Standardizing" and "Efficiency" have been our watchwords till our schools are dangerously like factories where we try to make all children meet the same standard of knowledge.

The scientific gardener knows that you can only improve plants by giving them food, sunshine, air, and room to develop. We must try to realize that we are but a step beyond the plants and that the same things will develop the children—food, sunshine, air, and room—space for freedom.

There is nothing the matter with our children. Daily I marvel at their intelligence and above all at their patience with grown-up ways. They are much more clever than we. They are true democrats and recognize no class distinctions; no color line is drawn by children until taught by their elders to draw it. No wonder Christ said "Of such is the Kingdom of Heaven." Some day we shall know enough to "let a little child lead us."

They have the new outlook if *we* have not, as Herbert Johnson has shown us. A generation or so ago the small boy sat up by the light of his lamp reading "Deadwood Dick's Defy." Today with an electric bulb to light him he is studying "The Radio News" to find out how to make his

crackerbox radio outfit louder and better—and we still feed children foolish fairy stories instead of science. Let the little child lead us! How fast the child is leading us! Almost daily the papers tell us of some wonderful child: a four-year-old knows three languages and discusses current topics intelligently; a girl of eleven enters Columbia Law School in the fall. And we still measure education by hours! We study boundaries in geography when airplanes and radio are setting boundaries at naught and making brothers of the peoples of the ends of the earth.

Our work is the most inspiring work in the world, yet adherence to tradition renders it drudgery. The teacher's job should be the most enviable position in a civilized community. It is our duty to make it so, and in order to do this let us write tonight in our hearts a new Declaration of Independence—the Declaration of Independence for Children—the right of life, food, liberty, to learn the things suited to each one's intelligence, and the pursuit of happiness, play space and the right to rove as youth always desires to do.

Then having written this declaration let us demand and continue to demand for the future State builders. What is money compared with a thinking human being!

Ambassador Sir Auckland Geddes recently said, "An ambassador's duty is to promote the cause of peace." How infinitely more is it the duty of the teacher. He added: "You and your companions in the teaching profession have almost absolute control over the mental bias of the citizens of the future. If you are understandingly faithful to your trust, there will be new hope for mankind and for the peace of the world."

The peace of the world is in our hands. We can keep pure the waters of life, if we are faithful to our trust. With the peace of the world there will be no need to demand money for schools. Funds will come as a natural right. Let us keep President Meiklejohn's words in our hearts: "There is only one real vice, hatred; and only one virtue, love. Hate wishes to destroy; love would create. Where hate comes in, life fails. Where love comes in, life is sane."

With love as our guide, a new outlook will be ours, and the peace of the world will come.

THE WOMAN OF AMERICA AND THE DEMOCRATIC AWAKENING

MAUD WOOD PARK, PRESIDENT OF THE NATIONAL LEAGUE OF WOMEN
VOTERS, WASHINGTON, D. C.

At the base of the belief in democracy lies the conviction that control by the whole people is better than control by a single group for the reason that each group brings to the task not only its own human qualities and interests but its special group experience.

Necessarily each separate group has its special experience to contribute. Women, in one sense a group—the largest group any orderly government

has ever admitted at one time to a share in the conduct of national affairs—have certain ideas and tendencies, the result of racial experience, in common with men. They have also special interests due to their special training and they must contribute these wisely, advisedly, and sanely if they are to be helpful in political life.

The enfranchisement of women, if it is to realize its potential usefulness, must really be an awakening to three things, not merely to the possession of the vote. There must be an awakening to the real meaning of the new opportunity—to an understanding of the common interests women share with men—and to an intelligent comprehension of women's own special limitation as well as their own special qualifications.

Women are the practical sex, the serious-minded sex. Except inadvertently we will not, as voters, contribute to the gaiety of nations. As practical persons women have had peculiar experience in matters concerning home-making and the care of children; as serious-minded folk we realize the defects in our education and are trying in all earnestness to remedy them that we may vote intelligently.

Because of the special training life has given us, we realize better than men do the need for public education. I believe, therefore, that such an organization as the National Education Association ought to rejoice in the enfranchisement of women. We come into political life as a group whose interest in education is deep and whose knowledge of its need, intimate, for it falls to the home, and always will fall to the home, to lay the foundation on which the school erects its structure. I see in the enfranchisement of women and in the desire of every thinking woman to use her privilege and right of citizenship wisely and well, a more intelligent coöperation between the home and the school, and for the work of formal education a more solid foundation. The common interests of women will always be the child and it is the aim of the schools of citizenship conducted by our League of Women Voters to train women to such use of the franchise as shall make their vote the powerful and devoted ally of all forward-looking plans for education.

*MESSAGE FROM HONORABLE CHARLES EVANS HUGHES,
SECRETARY OF STATE*

PRESENTED BY ANDREW F. WEST, DEAN OF GRADUATE SCHOOL,
PRINCETON UNIVERSITY, PRINCETON, NEW JERSEY

It is idle for those who are distressed by some of the tendencies of our time to indulge the notion that there will be a diminution of popular control or increase of respect for mere tradition or authority. The will of the people will be expressed and slight hindrances will be interposed to the satisfaction of their desires. As the restraints we believe to be important to our security and progress must be self-imposed, there is no reason why we should entertain the delusion that democracy will confer blessings except in so far as it represents the rule of an intelligent and cultured people.

We cannot fail to be gratified by the evidence on every hand of an increased demand for educational opportunity, and it is most encouraging to observe the extraordinary efforts that are being made, especially in the field of higher education, to provide new facilities. Public funds are available to an unprecedented extent, while the outpourings of private benevolence have gone beyond anything that we have hitherto deemed possible. But it is also apparent that there is much confusion with respect to standards and aims and that there will be little gain in considering the mechanism of education until we have re-examined the more fundamental needs.

It is not likely that there will be lack of opportunity for vocational education—for the sort of training which will fit men and women to earn a living. The exigencies of our complex life are too apparent and the rewards too obvious to admit of neglect; and we shall have whatever vocational or technical schools are required. But democracy cannot live on bread alone. It is not enough that one shall be able to earn a living, or a good living. This is the foundation but not the structure. What is needed is to have life more abundantly.

From the standpoint of the individual the exclusively materialistic view is inadmissible, for the individual life should be enriched with the ampler resources of a wider culture. What is most important, however, in view of our social and civic needs, is that the door of hope should be kept open by maintaining the opportunities and standards of general education—thus giving to those who start amid the direst necessities and with the most slender advantages the chance to rise. This is of especial importance to our working people, who are not to be viewed as mere economic units but as our co-laborers in the great enterprise of human progress. The American ideal—and it must be maintained if we are to mitigate disappointment and unrest—is the ideal of equal educational opportunity, not merely for the purpose of enabling one to know how to earn a living and to fit into an economic status more or less fixed, but of giving play to talent and aspiration and to the development of mental and spiritual powers.

It is impossible to provide a system of general education and ignore the need of discipline. The sentimentalists are just as dangerous as the materialists. No one will dispute the importance of making study interesting, of recognizing the individual bent or special gifts. But the primary lesson for the citizens of democracy is self-control, and this is achieved only through self-discipline. As I look back upon my own experience I find that the best lessons of life were the hardest. Even along the line of special aptitude it is the severe mental exercise, the overcoming of real obstacles that counts. My mother's insistence upon daily exercises in mental arithmetic has been worth more to me than all the delightful dailyings with intellectual pleasures I have ever had. Life is not a pastime, and democracy is not a holiday excursion. It needs trained men to think, whose mental muscles are hard with toil, who know how to analyze and discriminate, who stand on the firm foundation of conviction which is made possible only by training in the processes of reason. The sentimentalists

must not be allowed to ruin us by dissipating the energy that should be harnessed for our varied needs.

When we consider the true object of education, to give the training which will enable one to make the most—that is, the best—of oneself, we must realize that the foundation should be laid in a few studies of the highest value, in self-discipline, and that there should be supplied every incentive to attain that mental and spiritual culture which connotes, not merely knowledge and skill, but character. This means self-denial, hard work, the inspiration of teachers with vision, and an appreciation of the privileges and obligations of citizenship in democracy.

In the elementary schools, it means that sort of training which insists, at whatever cost, on the mastery by the student of the subject before him, on accuracy—the lack of which, I regret to say, is now conspicuous in students of all grades—the correct use of our language, and the acquisition of that modicum of information which everyone should possess.

In the secondary schools (our high schools and academies) it means that we should stop scattering. There is at present a bewildering and unsuccessful attempt at comprehensiveness. It fails of its purpose in giving neither adequate information nor discipline. It asks too much of the student, and too little. I believe that we need to have a few fundamental, substantial studies thoroughly mastered. I am one of those who believe in the classical and mathematical training, and I do not think that we have found any satisfactory substitute for it. But the important point is the insistence upon concentration and thoroughness. The function of the secondary school is not to teach everything but really to teach something, to lay the basis for the subsequent, and more definitely specialized, intellectual endeavor.

I think, also, that we have done too much to encourage intellectual vagrancy in college. Of course there should be opportunity to select courses having in view definite scholastic aims, but we have gone so far that a "college education," outside of technical schools, may mean little or nothing. It is a time for reconstruction and for the establishment of definite requirements by which there will be secured better mental discipline, more accurate information, and appropriate attention to the things of deepest value which make for the enrichment of the whole life of the student.

We have given too scant attention to the demands of training for citizenship. This implies adequate knowledge of our institutions, of their development and actual working. It means more than this in a world of new intimacies and complexities. It means adequate knowledge of other peoples, and for this purpose there is nothing to take the place of the humanities, of the study of literature and history. When I speak of the study of history, I do not mean a superficial review, but the earnest endeavor to understand the life of peoples, their problems and aspirations. And at this time it is not simply or chiefly the history of a distant past that it is most important to know; it is recent history, with sufficient acquaintance with the past to understand the extraordinary happenings and develop-

ments which have taken place in our own time, so that through a just and clear discernment our young men and women may properly relate themselves to the duties and opportunities of their generation.

We must not forget the many schools of experience, in one or more of which every American must take his course, but what we have regarded as the American character, that which we delight to praise as the dominant American opinion because of its clear, practical, and intelligent view of affairs, has resulted from the interaction of the influences of the colleges and universities on the one hand and of these schools of experience on the other. We cannot afford to do without either. And the most pressing need of our day is attention to the organization of American education.

THE PEACE-TIME PROGRAM OF THE AMERICAN LEGION

ALVIN M. OWLSEY, NATIONAL DIRECTOR OF AMERICANISM COMMISSION,
THE AMERICAN LEGION, INDIANAPOLIS, INDIANA

It is an honor and a privilege to address an audience such as this. I eagerly bring you a message from the American Legion. I pray inspiration for its delivery. Hear me in my cause!

We cannot speak of a peace-time program without being mindful of those gallant and heroic men and women whose sacrifice made possible our peace. The outstanding and overshadowing problem of The American Legion and her first supreme consideration is to fight the peace battle for the blind, the insane, the sick and wounded, who now lie on beds of suffering, and see that those yet unprovided for shall find their way to comfort and ease. The great heart of the Legion bleeds to see these men and women shamefully neglected. I tell you tonight on good authority the Legion is not satisfied with the treatment of our sick and wounded. Confusion, red-tape, short-sightedness, public apathy, and selfishness have stood in the way of a speedy solution of our hospital situation. Nothing is too good for these men and women! Favorites of the Mother Country! Defenders of our homes and firesides! Lovers of Liberty! Soldiers of Ideals! Crusaders for all mankind! Your fight is our fight. It will end when you are returned well to our midst.

Many friends say to me, "The American Legion was organized as a result of a war, a great and terrible war; what then is this Legion doing in time of peace?" To these friends I am glad to answer, "The American Legion is building a city. Like Legions of old Rome from which we take our name, on going into camp we are tracing the streets and walls of a strong fortress before the sun goes down."

What is war? It is the means of making a just peace, nothing more or less. Therefore the organized Legion, be it Roman Legion or American Legion is primarily and fundamentally a forged and tempered instrument of peace. No better example can be found than in the glorious record

of the first known legions and legionaires of history—those iron cohorts that established and guarded the majesty of the peace of Rome throughout the civilized world two thousand years ago, when the

. . . . Wild peoples of the North
 Stood fronting in the gloam,
And heard and knew each in his mind
A third great sound upon the wind,
The living walls that hedge mankind,
 The walking walls of Rome.'

The cities still stand that they builded in time of peace, those legions of the Pax Romana that stood guard from Edinburgh to the deserts of Arabia. Once I stood on the old city wall of the city of Chester in western England, a city whose streets still follow the lines laid out by the Romans who first camped there. At my feet I saw in crumbling stone an ancient anchorage for ships. Below this anchorage was meadow land. Two miles away today the river runs that had borne the galleys of Rome to that anchorage two thousand years ago. But the city stands and flourishes, whose very name of Chester harks back to the "Castrum" of that legion of old Rome that marked it out.

Not only in England, but across all Europe those legions have written their names in the proud appellations of pinnacled cities. Even the names have been distorted in the long passing years, till Cæsarea Augusta has become stately Saragossa in Spain and white Colonia on the Rhine is called Cologne by us of English speech. But the cities abide and prosper, not unforgetful of that day long past that saw their birth—the armored soldiers carrying stone, the tents of the generals, the crested centuries, the engineers, and the cavalry. *Those were the legions of Rome; they built cities and defended them.*

And we likewise of this Legion of America are building no small town today, but rather a high and holy city for the generations of Americans yet to come. There shall be white halls of council in this city, and pleasant parks through which the children stray. There shall be palaces of art and stately libraries, and above all there shall be homes—the homes of America—those homes whose four walls clasp and shield the strength and happiness of a nation. Not in any vain glory do I say this, but rather in great humility—we of the American Legion have turned from the dust of battles to build a city for the housing of the hopes of all mankind. The watchword of this city shall be the word, Liberty, and across its loftiest archway shall be written the word, Law; and the name of the city is America.

In this city shall be schools. In the youth of a nation is that nation's hope; and it is the youth of the nation that shall inhabit that white city that is the America to be. We are not yet a nation of descendants, thank God, we are a nation of ancestors. The true American still dreams of the future of his children rather than of the past of his forefathers, however

eminent those may have been. The true American still regards himself as the founder of a family rather than the descendant of any family, however honored. The future of his children is his guiding star.

From the dim beginnings of the Republic this white ideal has been the guiding light of all American activity. The American is a founder of schools. A cattle trail gave its name to the University of Oxford, and Cambridge speaks today of a river and a bridge; but from Yale to Leland Stanford the high roll of American universities bears to a surprising number the names of the American men of affairs who devoted their private wealth to the founding of public institutions of learning, nor is that all. The history of the American Republic is the story of westward expansion across a continent, the story of the winning of a wilderness for civilization. It is the history of the pioneer walking westward into the far regions; the pioneer clearing forests for cultivation and driving his plow across innumerable meadows; the pioneer-builder dreaming and creating farms and towns. But this American pioneer was a dreamer and creator of schools as well. Wherever this pioneer advanced into the wilderness, the school advanced into the wilderness. After provision for food and shelter, the elemental necessities; after the planting of the corn and the building of the log cabin, the pioneer's first thought was of a schoolhouse for his children. The history of humanity had never seen the like before; a great race of men who lived for an ideal, who faced and conquered hard seasons and crushing labors for the sake of generations yet to come. Driven by that deep thirst of knowledge that he had no hope of satisfying for himself, the pioneer of America consecrated his life's endeavor to the education of his children. This is the glory of America.

Let me tell you the dream of The American Legion, of this new Legion of soldiers carrying stone for the building of cities. This dream of ours is a vision of a white city with schools, down whose pleasant ways no child wanders in unwilling ignorance. We shall build this dream in stone for housing the fates of mankind.

How shall we face this task, how meet and conquer it? By the strong and centered will of a million ex-service men whose posts are established throughout the land, whose influence extends into the remotest village, and who are available and eager to coöperate with every American institution and association that is forwarding the cause of education in America today.

Let us take counsel together for the awakening of America to her educational needs. Awakening is the thing that is needed; if the people have forgotten for a time the bright ideals of the pioneers who dreamed of cities and schools, let us bring them back to these worthy considerations from which spring the motive power of the world's progress. It is for us to bring that time nearer. The laws still stand on the statute books of all the States that call for the attendance of every child at school. In the constitution of every State of the Union is written a guaranty of adequate education for the youth of the land. These guarantees are idle

without their application; the latter is empty without the spirit. The constitutions and statutes that provide for the education of the youth of America are wise and proper, yet two children out of every five are not attending school.

Are our constitutions empty words, are our statutes nothing but delicate pleasantries? Not so in this city with schools that we of the Legion have devoted ourselves to building. We have the word of the law; let us live in it. To the carrying out of the spirit and letter of the statutes that provide for the compulsory education of the children of America, the American Legion is irrevocably committed.

The education of American children must be an American education. It must prepare the children of America for American citizenship, and the high goal of American citizenship has not yet been reached. We Americans must know the details of our government and our history as well as we know the details of our daily lives, before we can fully and rightfully arrogate to ourselves the management of our national affairs. And for that, if for no other reason, must we have civil government and American history established as compulsory studies in our schools, and we must compel the study of these subjects till every American citizen-to-be has acquired a full knowledge and complete realization of the rights and privileges and duties of American citizenship. To this principle the American Legion in national convention assembled has thrice committed itself in no uncertain terms. It is our dream to see the schools of America set apart, in the minds of men as well as in the streets of the cities—set apart from and above the office building and the factory, in recognition of this their mighty function for the development of American citizens.

And then it is my dream that every schoolhouse in this land shall fly from their staffs from dawn till set of sun the flag of this Republic. That mighty flag—that emblem of human liberty—must fly over every schoolhouse as the symbol of that bright American ideal of which the school is the living spirit and the vital source. One flag floating above all the schools, as the symbol of a united nation—the sign of America made visible. And this brings with it as naturally as the sunrise follows dawn, the establishment of one language in all the schools for the expression of the soul of America. As the flag is America made visible, so the language of Jefferson and Lincoln is America made audible.

Community of language is the strong fastener of the ties that bind mankind. The use of a common tongue overlaps political boundaries. When ancient Greece was divided into free states by the hundreds, still the soul of Greece was one; and in Athens or in Argos, in Corinth or in Syracuse, the command of the language of Homer and Demosthenes distinguished the Greek from the barbarian. And when the ordered Legions brought the great western nations under the rule of Rome, it was the Latin language that fused alike the Gaul and the Briton, the Bavarian and the Spaniard into the Roman citizen and the upholder of the laws of the Roman state.

This America of ours was established by men of Saxon and Celtic strain who spoke the tongue of England. We have made that tongue our own.

More people speak this language in America than in all other countries of the world combined. It is the speech of the founders of the Republic. Our national constitution is written in this language, our histories and our literature, and the songs we sing of home. We turn to Greek for the origin of the drama, and to Latin for the origin of laws, and to French for the first beginning of modern thought; but on this, the anniversary of American freedom, I declare by the Goddess of Liberty we do not turn to Greek or Latin or French for the Declaration of Independence of the United States of America! That declaration and our Constitution comprise our greatest national heritage; they are the twin sources of the great current of American life today. Shall those epoch-making documents ever be studied in our schools and interpreted to our children in any language but the original? It cannot be. It must not be. One flag above our schools and one language in our schools, the flag and the language of America, of America one and indivisible—

“Until God loosen over sea and land
The thunder of the trumpets of the dawn.”

I have nothing but praise for the program of education for the immigrant that is now being attempted by the department of Labor. Nevertheless I maintain, and all thinking people must agree with me, that here is an impossible situation and it must be remedied. Therefore, let me tell you tonight I have faith that the National Americanism Commission of the American Legion is going to recommend to the Legion in national convention assembled in New Orleans in October of this year, that the Legion demand that this great national necessity of education be fittingly recognized; that we no longer palter or equivocate; that a separate Department of Education be created by act of Congress; and that the head of this Department be seated in the President's Cabinet.

This message then I bring you from this Legion of the veterans of America who have consecrated themselves to the building of a city strong against all disaster in the days to come. This city of ours shall be a city with sentinels, and you of the Army of Education and we of the American Legion shall mount guard along its walls, vigilant alike against ignorance within and aggression from without. This city shall be a city with towers, and you and we shall build it upward in the sunlight of that peace of which the price is eternal vigilance, till its high skyline traces across the very heavens the story of the greatest renaissance known to history, the American renaissance of art and knowledge under liberty.

This city shall be a city founded on a rock, the rock of service willingly accorded a free nation by you who teach and by us who strive; by us who quarry the stone and bring it to you, who shape and set it in the walls. We bring you our sympathy and strong hope and the offer of the best in our power. May you say of us in the days to come, more even than men said of those Legions of old Rome—may you say: *This is the American Legion; it defends cities and it builds them higher and lordlier for the generations to come.*

OUTSTANDING NEEDS OF RURAL LIFE TODAY

GEORGE A. WORKS, PROFESSOR OF RURAL EDUCATION, CORNELL UNIVERSITY,
ITHACA, NEW YORK

Not even a birdseye view of this significant problem can be obtained in the limited space of fifteen minutes. It seems best therefore to make a brief and necessarily dogmatic statement regarding the farmer's situation and with this as a background to develop more fully an aspect of the relation of the educational system to the present status of rural life.

The outstanding needs of country life are fundamentally of an economic nature. The farmer needs an opportunity to carry forward his vocation under conditions as well adapted to farming as the conditions which surround our industrial life are adjusted to its needs. He needs an opportunity to make a living with reasonable hours of labor and without exploitation of his children. To be more specific the farmer needs a system of credit that shall be as fully adapted to farming as commercial paper is to the credit needs of the business man. He needs to have the way open for coöperative enterprises that are as well adapted to the demands of his vocation as business corporations are adjusted to the great enterprises of our urban centers. He needs a tariff, or no tariff, that shall be as fair to his industry as it is to "infant" industries that function through and are responsible for our gigantic business enterprises. Furthermore, he needs to have those not living on farms know that these opportunities are not his under present-day conditions. The farmer neither needs nor wants special favors for his chosen vocation. He knows it is basic to the country's welfare, and he realizes that when he is given equality of opportunity with other business men farming will find its proper place in the Nation's life. Equality of opportunity cannot be secured, however, unless there is recognition in legislation, and in the thought of the Nation of the fact that agriculture presents its peculiar problems that can be met only by conditions adapted to the needs of the vocation.

Turn now from this phase of the subject to the aspect with which this organization is primarily concerned—namely, education. What is the outstanding need of country life? The reply is the same as for the economic aspect—namely, an opportunity for the farmer to secure for his children education that will meet their needs as completely as the schools in the centers of population meet the needs of urban children. He is entitled to the privilege of such educational facilities under conditions of taxation and school support that do not impose a special burden on him, because he has chosen to render his social service through farming. Today he lacks this opportunity.

Much that in recent years has crept into the discussion of educational problems relating to the open country is both fallacious and pernicious. Reference is made to the idea so frequently heard from the platform and so commonly found in the literature treating of the so-called "rural problem" that the rural school should be used to stem the tide of the movement from country to city. The advocates of this view would dedicate

the country school to the task of keeping country-reared boys and girls on the farms. It is fully as unsound as the popular slogan "back to the farm." Apparently this doctrine had its origin in one fact and a fallacious assumption: the "decline" in our rural population and the conclusion that it was an evil. Both of these are of sufficient importance to justify consideration in detail.

Taking the definition of the Federal Census the change in rural population that has taken place in the last forty years is as follows: 1880, 71.4 per cent; 1890, 64.6 per cent; 1900, 60.0 per cent; 1910, 54.2 per cent, and 1920, 48.6 per cent. When the last census was taken, for the first time in our history, the majority of our population was living under urban conditions. Even more striking has been the increase in the proportion of the country's population living in towns of 8000 or over. In 1790, 3.3 per cent of the people were living in such places, but by 1920 it had grown to 43.8 per cent.

It has been assumed that this falling off in the proportion of rural to urban population is an unfortunate thing for the country. So general is this notion that it may be well to consider some of the elements involved. In discussing this aspect the following points should be borne in mind:

1. There has not been an actual decline in the number of persons living on farms in this country. The decline is in reality a failure of rural population to retain its relative importance as contrasted with the number of urban dwellers. The census for 1920 shows that during the preceding decade the urban population increased 25.7 per cent, while in the same period the increase in rural population was but 5.4 per cent. The so-called decline has in reality only been a failure of farming to increase, in the number of workers engaged in it, as rapidly as other industries.

2. The physical production of farm products previous to 1900 increased more rapidly than did our total population, and since that date it has kept pace with the increase in total population. Differently stated, during the past twenty years the farmers of this country have increased their production as rapidly as the demand for agricultural products has taken place because of growth in population. It is true that farm products have increased in price, but so have other commodities and such increase in price as has taken place has not resulted in opulence on the farmer's part.

Why has this marked decline in rural population occurred? Primarily as the result of two fundamental changes that have taken place in farming. As a consequence there has been no place on the farms for all who were born and reared there. The relation of these economic forces is so significant in considering the educational needs of country life that they should have at least a brief consideration. (1) The introduction of improved machinery has reduced the proportion of the population necessary on the farms to produce the required food supply. A few illustrations will give concreteness to this general statement. In 1850 it required 57 minutes of man labor to produce a bushel of corn, but in 1894 only 22.5 minutes were required. In the period from 1850-1895 the amount of time in human labor required to harvest a ton of timothy hay decreased from 21 hours

and 50 minutes to 3 hours and 56.5 minutes. In the production of a bushel of wheat the reduction was from 3 hours and 3 minutes in 1830 to 10 minutes in 1896; and in oats from 1 hour and 39 minutes in 1830 to 10 minutes in 1893. Quaintance, who made a study of this problem, computed the amount of man-power saved in the production of nine leading farm crops in 1896 as contrasted with the labor that would have been required to produce those same crops at periods ranging from 30 to 60 years earlier when hand methods prevailed. He found that it required only 21 per cent as much time in human labor on the farm in 1896 as would have been required at the earlier dates to produce the same crops.

The introduction of farm machinery has resulted in an increase of the number of acres that one farmer can handle unless more intensive methods are used, and in an increase in the number of horses per worker. In 1880 the average number of acres in certain specified crops per worker was 23.3, and in 1890, 27.5 and by 1900 it had grown to 31.0. The increase in horses per worker for the same dates are furnished by the figures: 1.7, 2.2, and 2.3.

An interesting illustration of the application of these forces is to be found in the period from 1900 to 1910. In that interval the most marked decline in the proportion of rural population took place in the most fertile farming sections of the country, and it was accompanied by a decline in the number of small farms in those regions. In 1900 there were in these areas 5.7 horses per hundred acres of crops, but by 1910 this number had increased to 6.5. It is an illustration of what has taken place generally during the past half century: the release of man power from the farms by the application of machinery and horse power.

2. The occupational geographical division of labor has stimulated the movement cityward. A century ago the farms were practically self-sufficing. Since that time a large number of activities has been transferred from them to centers where they can be so conducted that the desired products can be more economically manufactured, or a better standardization secured. By this process an enormous amount of work has been removed from the farms with a consequent decrease in the labor demand on the farm. The activities that have been taken from the farm are largely concerned with the production of commodities for which there is almost unlimited demand providing they have sufficient variety of form, are cheap, and there is adequate purchasing power. This has left to the farm the production of commodities for which it is possible to develop only a limited demand. An increased call for the products of the farm is contingent upon growth in population, and as has been stated, the physical production in agriculture has kept pace with the increments in population.

If those who believe the rural schools should have been used to stem this movement could have had their way it is very unlikely that they would have been able completely to accomplish their ends. If they had done so it would have been extremely unfortunate from an economic and social viewpoint for the country as a whole. Both country and city have had to face serious problems as a result of the migration cityward, but these prob-

lems are less momentous and less acute than the ones we would now face if the movement had been stopped in the suggested manner.

The school system should never be used to hold children in the country, because it is their place of birth any more than it should be an instrument for fixing other class distinctions based on occupation or social standing. The basic factor that should and does determine the number of people on farms is an economic one. Men will engage in the farming vocations in adequate numbers when the financial and other rewards that one gets for service in them compare favorably with what his capacity, training, and effort will bring to him in other lines of human endeavor.

In passing, it is interesting to note that the propaganda for people to remain on farms comes primarily from city or town people. So pronounced is this that one is led to wonder if it is not largely the attitude of mind of those who think of farming in terms of its possibilities as a source of cheap food rather than as a basic vocation that conditions the life of millions of our people. The keen interest manifested by urban organizations in putting funds into propaganda designed to retain young people in the country through artificial incentives is all too common evidence of this point of view. More surprising still is the fact that governmental agencies should be used for this purpose as they have been in recent years. It is to be hoped that there will be a general awakening in the near future to the viciousness of activities of this nature. The country needs capable men and women in its rural citizenship, but they should be there because of the conditions surrounding farming and as the result of the working of an educational system characterized by adequate provision for vocational guidance and not as the outcome of propaganda.

This leads to the second aspect of the educational question. Does the farmer have school facilities that are adequate for meeting these problems? Again in order to save time it is necessary to be dogmatic and state that he does not. He should have a school system that will meet the needs of those of his children who decide to cast their lot with the city and it must also meet the needs of those who determine to render their service through farming. President Waters made from the platform of this association one of the most fundamental statements that has ever been made bearing on this question. He said, "Children born in the country are entitled to as much freedom of choice of occupation as are those brought up in town and are entitled to as substantial help from the public school in making an intelligent choice." We must not lose sight of the fact that individuals and society will be best served when the school helps every child to find the place in which he can render the most effective service and prepares him broadly and effectively for that service. This is true whether he be country- or city-born.

Even a cursory analysis will convince any one that the open country is not supplied with schools that can meet these problems. A general level of schooling has been reached such that the high school becomes an important factor in meeting the educational needs of country life. Yet this institution is so bound by tradition and the influence of college-entrance

requirements that it is falling short of meeting the needs of country life. Our systems of school support are such that the country is at a distinct disadvantage in furnishing to its children school facilities that compare favorably with those available to city children. For years the farmers have been exploited in the economic sphere by the urban interests and today our State systems of school support are exploiting him and his children in the educational sphere. If the virile men and women are to remain on the farms of this country these conditions must be remedied.

In conclusion the outstanding need of country life today is clear thinking and fair action with reference to the country on the part of those who live under urban conditions. The farmer asks for no special concessions, but he does demand, and he is entitled to a chance to conduct his vocation under conditions as well adapted to his needs as other business interests have surrounding them. He should have a school system that will meet the need of his children regardless of where he chooses to render his social service. There is need for action in recognition of the fact that there is scarcely a State in which the school support is so organized that this can be done at present on an equitable basis. Unless these needs are recognized, in the long run the Nation as a whole will have to pay for their neglect.

CONSOLIDATION, SUPERVISION, AND ADMINISTRATION OF A COUNTY SYSTEM OF SCHOOLS

AGNES SAMUELSON, SUPERINTENDENT OF PAGE COUNTY SCHOOLS,
CLARINDA, IOWA

The time has come in our great national development for a consideration of the most outstanding educational problem facing our country today—that of the rural school. Involving as it does the education of half the children enrolled in the public schools, the industry in which one third of the people are actively engaged and all are materially concerned, the very “foundation of civilized society” as the inscription over the station in our capital city designates the farm, is it too much to say that the future welfare of our democracy depends upon our solution of this problem? To rebuild the rural school to meet modern conditions and be restored to its place of pre-eminence in community life; to reorganize the county system of schools so that an efficiency competing with that of the best city school administration may be developed, is the task now demanding the focus of attention. The National Education Association has emphasized the significance of this fact by the adoption of the rural-school problem in its major program and the selection for the first time of its president from the county superintendency—that group whose leadership should furnish the most positive contribution to the achievement of this imperative goal.

Since the most insistent demand in this period of democratic awakening is for the improvement of rural education, it is of primal importance that modern efficiency standards be inaugurated into the business of the rural

school, and the position of county superintendent be elevated to its rightful professional standing. Not until this is done can far-reaching results be obtained. This means not simply to stop, look, and listen, but actually to start a program of educational reconstruction adequate to serve the new order of things in a modern rural world. The industrial and agricultural revolutions have made miraculous changes in farm life; the rural school must keep pace with the call of the age for efficiency. This can no longer be done through the machinery of the district school system of organization, which served the oxcart days so satisfactorily, but is too cumbersome for this airplane era. The tendency now is for the establishment of a county unit system of administration such as is wholly or partly in force in twenty States. In this larger plan of organization, the general oversight of the schools is directed by a county board of education with the county superintendent as the executive official. If properly developed and not too highly centralized, the county unit with its equalization of school taxation and educational advantages should be of substantial help in solving the rural-school problem by its making efficiency possible in the county schools through the facilitating of consolidation, the strengthening of supervision, and the unifying of administration.

Consolidation should be of first importance in any rural-school betterment program since it has made such strides in many localities that some policy of mapping out entire States into possible districts should be adopted in order to insure the proper distribution of territory and the best interests of all concerned. By consolidation in this connection is meant the uniting of districts into large enough areas to bring together enough children to maintain a twelve graded school, and sufficient funds to support the school and furnish transportation at reasonable cost. That no consolidated school has ever been dissolved by a vote of the people after operating a graded school is a telling endorsement of consolidation as the ultimate solution of the rural and village school problem.

Many theories have been advanced and experiments tried in the attempt to continue the one-teacher school as the type of modern rural education. The enlargement of the curriculum to include vocational subjects and its enrichment by art and music; the serving of hot lunches; the participation in club work, recreational and community center activities; the raising of teacher qualifications through normal training; the development of exceptional demonstration schools; the use of standard tests and measurements; have all been strong factors in rural school improvement, while standardization of rural schools has brought the highest state of efficiency that it is possible to have in the ungraded school.

But in spite of the transformation accomplished by these motivations, the fundamental weakness has remained the same. These splendid plans have aimed correctly, but have missed the mark in not providing any division of labor or graded school conditions. It is not a question of curriculum or equipment or teacher, but of a system that has outgrown its usefulness. The one-teacher school must give way to the consolidated

school as did the stage coach to the automobile and the tallow candle to the electric light. This new and larger school bringing better buildings and equipment, increased library facilities, improved sanitation, more regular attendance, more skillful instruction through trained teachers and supervisors, direct community contact, gives the farmer's child the same opportunity to secure a high-school diploma at home as the favored city cousin and thereby equalizes their educational advantages. As the child is the reason for the school, so the equalization of educational opportunity is the reason for the consolidated school.

Although the success of consolidation in every part of the country bears the searchlight of investigation, yet to convince the people to accept it is not always easy as any one who starts out as a Pied Piper to play the tunes of better rural schools soon discovers. The Stubble of Indifference and the Briars of Selfishness beset the pathway; the Bridge spanning the Stream of Tradition swelled by the Rivulets of Inconsistency and Sentiment must be crossed and the Mountain of Ignorance tunnelled. This often leads to the Jungle of Obstinate Opposition with its pitfalls which ensnare the incredulous, absorbing the "Yu-can't-haul-'em" propaganda. Even then if the Piper's song strikes a responsive chord in the community ear, sometimes legal talent will have rolled up red tape that has to be unwound via the Supreme Court route before the building can be dedicated to the cause of boys and girls. But over 10,500 of these splendid school plants attest the fact that Progress like Truth shall prevail whenever the opposing forces of any reform movement are met by the advancing armies of community coöperation, clear-cut vision, and strong leadership.

In striking contrast to these mighty bulwarks of American democracy marking the epochal development of rural education from the pioneer to the centralized-school stage, stand 210,000 one-teacher schools still in the second or box-car type of advancement. Not until the 170,000 of these schools are merged into consolidation areas, as is estimated can easily be done, and the remaining given the best that standardization can provide, will the equalization of educational privileges for the rural children become a reality.

This leads to the question of whether this program of re-building the rural school should be left solely to the initiative of the community and the leadership of the county superintendents, or some plan of speeding and facilitating consolidation be advocated. Some assert that the first way is more democratic; others declare it is the duty of the State to legislate in behalf of consolidation, as waiting for all the people to be ready to vote for it is like waiting on the banks of a stream for all the waters to rush by before attempting to cross. Without the people is it impossible to make and hold substantial headway; on the other hand, while waiting for the favorable sentiment to crystallize into action, the present generation of children will have been thrown into life's complex arena unable to cope successfully with the issues of their work-a-day world because of the gross educational inequalities of their youth. Is this not a challenge to in-

different and obstinate communities to measure up to their citizenship responsibilities? The county unit is really working out in a democratic way by giving aid to weaker districts and expending funds in a wiser way. The county superintendent burdened with innumerable duties has been sounding the bugle call in no uncertain tones, but needs a more business-like organization through which to work, more freedom from details, and more time for aggressive efforts in educating the people and selling the schools to the public. Whatever plan is applicable to the present situation, it is indisputable that more favorable legislation, less legal entanglements, and proper distribution of territory by some given authority are essential factors in hastening the march of consolidation. The end to be attained is the same—that of building schools befitting a democracy, so that the now remarkable schools may be in reach of every child.

Great as is the drawback of the district unit for the spread of consolidation, its effect upon the status of rural-school supervision is even more conspicuous. That the rural schools, taught largely by an inexperienced teaching force whose need for skillful direction is the most urgent, receive the least expert supervision is one of the incongruities of the public-school system. City school authorities have understood that it is as impossible to operate a school system without supervision as a factory without foremen; that massive buildings, elaborate equipment, and normal-school graduate teachers are not sufficient to insure a good school, and have provided for the supervision of instruction from the kindergarten through the high school. For the rural standards to be any less, is unjust, undemocratic, and un-American.

Many conditions tend to reduce the efficiency both of administrative and instructional supervision to such an extent that not even the most competent superintendent without a staff of supervisors can do justice to the situation. Too many schools for one person to give effective visitation, the average being one hundred thirty-two teachers in eighty-four buildings, the jurisdiction often covering six hundred square miles; the changing personnel of teachers with one third of them untrained and inexperienced each year; the inadequate equipment; the heavy office duties; limited authority in levying and expending school tax; the responsibility for school law enforcement; the unwieldly number of directors; the inertia of the boards and the indifference of the public toward educational reform, are some of the handicaps that make it difficult to accomplish results. With enough duties to keep four or five experts busy, the eighty-two per cent of the county superintendents who are without assistance are obliged to resort to circular letters and other indirect methods of supervision.

The remedy is not hard to find; consolidation, to furnish the conditions for achievement of efficiency; a business-like unit of administration and a profession of county superintendents responsible for achieving that efficiency. While waiting for these dynamic changes to materialize, it is unfair to neglect the one-teacher schools in which so many children are spending all their school days. Twelve States are blazing the trail in

developing professional supervision by the helping-teacher plans, while some of the southern States are trying out the industrial supervision agencies. These plans are accomplishing not only schoolroom results, but also radio wonders in drawing the people of the communities together. A survey of the helping teacher method shows the success of supervision in improving the efficiency of the teaching body. The teaching quality must be of the finest type possible, so that instruction may be translated into an educated citizenship—the foundation of any democracy. Raising teacher standards is not enough—this must be paralleled by provision for the improvement of teachers in service. The yearly inspectional visitation by a county superintendent should be converted into closer constructive supervision by well-trained supervisors—at least one for every thirty teachers.

No one realizes this more keenly than the politically-elected would-be efficient county superintendent serving in States where the county is the unit for supervision and the local district the basis for administration. Since the type of the administration has a direct bearing on the quality of supervision and the time that can be given to it, better results might be expected if the unit for both purposes be the same. The starting point is with the changing to the same system of organization that is used in all other county business. The district plan is linked with the ungraded school, and the case against it as conclusive: expensive, because of the small taxation possible; clumsy in operation, due to excessive number of school boards; undemocratic, as a result of these inequalities, and unprogressive, with generally incompetent officers. The local boards might well be retained to help adjust the traditional to the new system, but the entire school affairs of the county should be entrusted to one county board of education composed of members of sound business judgment. Authority to appoint the county superintendent from any locality and fix his salary; to select teachers; to levy and equalize the school expenditures; consolidate small schools should be delegated this board with a responsibility to the people directly for the success of the system.

Furthermore, twenty-eight States continue to select their county superintendents through party politics; eighteen have two-year terms and two allow two terms only. This condition along with the status of rural-school supervision has gradually developed with the growth of the rural school system and its efforts to adjust itself to a modern agricultural environment. From a mere clerk for the early school committee and a keeper of records in the new States—a minor elective office usually held by a minister or an assessor or person of another calling—the county superintendency has evolved into a position of such large proportions as to warrant its being organized into a department of education. Every legislative session has increased its duties until it now requires initiative, executive, and technical skill rather than simply clerical ability. Since it is developing into the most commanding position in the public-school field, its election should be on the same plan as the city school superintendency and the high-school principalship instead of being tied to court-house politics. A con-

tinued dependence upon political affiliation rather than educational merit with consequent salary and tenure discriminations will tend to make the county superintendency too much of a blind-alley proposition to challenge high-class leadership to train for life service careers in this phase of rural education. The position is of such pivotal importance that it should cease to be the football of politics or a stepping-stone to other positions. The efficiency of the rural schools will not go beyond his ideals for them, nor will the carrying out of policies of State departments of public instruction exceed his coöperation. As chief executive officer of the county board of education, he should have large powers in assigning teachers, establishing methods of instruction, selecting textbooks, preparing courses of study, superintending schools and formulating policies. Sufficient office force should be allowed to relieve him of the pressure of clerical demands and supervisors sufficient for efficient instruction. Being thus endowed with authority, recognition, remuneration, assistance, and responsibility, the office should attract the best talent in the educational markets and more progress be made in a decade than is now possible in a quarter of a century.

Since the county superintendent plays the leading role in this program of advancement, he should have peculiar qualifications for the work. His technical training will enable him to understand the principles of school-house construction, carry on building campaigns, prepare salary scales, plan budgets, and direct the procedure of consolidation, supervision, and administration with business dispatch. His background of experience will give sympathy and poise. In addition he will be strong in executive ability, progressive in forming policies and aggressive in promoting them; willing to work, ready to coöperate with subordinates as well as superiors; broad in scholarship; spacious in mind; masterful in leadership; expert in rural life matters. If the three thousand eighty-seven rural superintendents now in service were to be measured by this score card of personal and professional qualifications, the number rating above normal would be surprisingly large.

The outlook is hopeful. With such reconstruction and leadership forthcoming, as the signs on the horizon indicate, the village and rural school of the future promises to be the rival of that in any metropolis; its supervision as direct and its administration as easy. Then will the rural educational deficiencies revealed by Democracy's torch be wiped out and the rural child given the equality to which his birthright under the American flag entitles him. That the public schools function alike for all the children of all the people is the vital fact in this democratic awakening, for the eyes of the nations groping for the light of democracy in order to find their way to a more beautiful and enduring civilization are upon America. Thus will the principles of justice, fair play, and liberty become the compelling force for world betterment in so far as they are reflected in our most democratic institution—the public schools. This is America's challenge.

STATE AID FOR TEACHERS' SALARIES

JAMES H. KELLEY, EXECUTIVE SECRETARY, PENNSYLVANIA STATE EDUCATION ASSOCIATION, HARRISBURG, PENNSYLVANIA

The present movement toward centralization in support and direction of public education aims at a better balance between central and local control. Until quite recently education was considered a local function, but now it is commonly accepted that education is also a State function, and even of vital National concern.

A little over one hundred years ago (in 1809, to be exact) the legislature of Pennsylvania passed an educational act to furnish gratuitous instruction to children whose parents were too poor to pay for it. To designate such children was humiliating; to place them in these pauper schools proved ineffective. It was not until 1834, only eighty-eight years ago, that Pennsylvania founded a system of free public schools. But when the enthusiasm of the moment had abated, that law, championed by Thaddeus Stevens, appropriating \$75,000 of State money for public education, met with such a storm of criticism that at the next election nearly all the legislators who had voted for the bill were defeated. The following legislature was flooded with petitions from nearly three fourths of the sixty-seven counties asking for a repeal of the law. The senate yielded and voted to return to the pauper act of 1809. But the Governor stood firm for the new bill and declared that through the new law "the odious distinction between rich and poor, wealth and indigence, which has heretofore precluded the children of many indigent, though honest and respectable parents, from a participation in the advantages of education under the present system, will be exploded; and the poor man's child will be placed on an equality with that of his wealthier neighbor, both in the schoolroom and when indulging in necessary recreations." The act was saved by a vote of the house of representatives, but the heroic Governor went down to defeat. In the House the act was saved by a man who blazed forth like a pillar of fire, encouraging the weak-hearted friends of free schools and terrifying their opponents. That speech laid the foundation of State support in Pennsylvania for public education.

The law of 1834 was saved for Pennsylvania and for the United States. The principle of State aid for public schools was established in the Keystone State. Do you wonder that the education building authorized by our last legislature is to be called the Thaddeus Stevens Memorial?

The history of State support of public education may be represented by broken lines with a rapid rise here and there but with long barren, tedious plateaus in between. Recently, under the leadership of Thomas E. Finegan in an effort to boost Pennsylvania out of her rank of twenty-first among the States, we made another splendid ascent, and one of the outstanding features of the new legislation, comprised in the sixty educational laws enacted by the Legislature of 1921 and approved by Governor Sproul, is increased State support for teachers' salaries.

A critical study of the principle of State support reveals: First, that it has both central and local aspects. The authority to take private wealth for public purposes belongs to centralized government, yet such central authority should seldom if ever provide all the funds needed. It should rather supplement funds raised locally and leave to local officers the carrying out of tax laws.

Second, since it is conceded that the State has the right to prescribe minimum qualifications for teachers, minimum salaries, and a minimum school year, the State must of necessity grant support because of inequalities of local districts in their ability to meet the standards prescribed.

Third, if the local machinery breaks down in the education of future citizens, the State must step in and provide the necessary means.

The principle of State support of public education is further justified by the protection it gives society from ignorance, by the leaders it develops, by the protection of children against unconscious injustice which backward districts unwittingly yet disastrously perpetrate and by the encouragement of vocational and special schools for the citizenship training of those who, in the late William Hawley Smith's phraseology, are "born short or long."

As to the proportional amount of State support for teachers' salaries, there is no well-defined ratio between the State's contribution and the amount raised locally. It varies from a mere pittance, 4 per cent in one State, just enough to salve the conscience of legislators, to nominal grants paid to wealthy, progressive districts, up to 50 per cent of the teachers' salaries in some States, but in the entire United States about 77 per cent of the total revenue for schools is derived from local sources. The greater the inequalities in wealth and interest in education among the various districts of the State the greater is the amount of State support needed. The larger the income, inheritance, and business taxes collected by the State, the greater is the amount of State support, which the districts may justly claim.

May I cite four specific cases: 1. The State of Washington is conducting a vigorous campaign "Thirty-Ten" to change the ratio between the State and the local support. At the present time the State Board of Equalization collects \$20 for each child of school age in the State. Every County Commissioner is required to collect \$10 for each child of school age. The School District levies a mill tax on the assessed valuation of the district. It is proposed to increase the State's contribution from \$20 to \$30. If this law is enacted next November, the State of Washington will finance about one half of the current running expenses of its common schools.

The campaign is to re-proportion the school budget rather than to increase it. At present the State pays one third, the counties one sixth, and the local districts one half. Under the proposed plan the State will pay one half, the counties the same, one sixth, but the local districts one third instead of one half.

2. The State of New York is strongly committed to State support for public education. In a recent address Governor Miller said: "There is to be appropriated \$44,000,000 directly by the State to aid the schools

of the State. It cannot be less. It is bound to grow more. The State relieves the communities that are suffering with heavy taxes and cannot afford to pay for education. I think the State will probably more and more have to contribute to localities which are suffering under a large tax rate, for maintenance of schools.

"That is one of the reasons that I am so optimistic today that the race is getting better. We contribute most to education, which is a sign of betterment of the human race, and when we are aiding education we are aiding the influence which contributes the most to better government."

The amount to be spent next year in New York for the public school system is 33.7 per cent of the total amount of the State budget of \$133,147,807.

3. The equalization scheme of State aid for teachers' salaries has just been splendidly exemplified by the 1922 legislature of Maryland. In addition to establishing a minimum salary schedule for teachers, a minimum school term of eight months, competent supervision for every group of forty elementary teachers, that body singled out fifteen counties that are unable to meet these requirements without confiscatory taxation and gives these counties adequate State support. Maryland has introduced two new principles in State aid. First, instead of enacting a general law for equalization which always develops animosity between counties with rich cities that need no aid and counties with less wealth, she appropriates money specifically to those counties that unquestionably need a subsidy from the State. Second, instead of allowing all the State money to go for teachers' salaries, she has specified that 24 per cent of it must go for current expenses other than salaries. She thus avoids the criticism that teachers work for State support in order that their own salaries may be increased.

4. In Pennsylvania the total State appropriations and the amounts appropriated biennially the past ten years range from \$15,550,000 in 1911, which was 26.2 per cent of the amount appropriated for all purposes, up to \$30,710,000 in 1921, which is 26.3 per cent of the total legislative appropriation of \$116,700,000. Thus there has been a distinct gain of nearly 100 per cent in the amount of money appropriated for public education in ten years. This seems like a splendid increase, and it is, but when we compare the amounts spent on education with the amounts spent by the State for all purposes, we see a net gain to the schools in ten years of only 1/10 of 1 per cent. Pennsylvania is not yet giving enough State support to the public schools. But when the allotment of State appropriations for teachers' salaries in rural districts is studied, the real gain to public education is apparent. In 1918-19, in four rural counties (Bucks, Cameron, Centre, and Pike) the total salaries paid teachers was \$282,333 of which the State paid \$95,257. In 1920-21 these four counties paid their teachers \$473,400, of which \$207,622 came from the State. Here is an actual gain in teachers' salaries of 67.6 per cent in two years, much of which is due to the encouragement and support of the State. During that time the actual amount distributed by the State to these four counties increased by \$112,365, a gain of 84.7 per cent.

In Pennsylvania any rural (fourth class) district that employs a teacher of minimum approved qualifications, namely, graduation from a two-year State Normal School course after graduation from a full four-year high school course, must pay that teacher a salary of at least \$100 a month. Of this amount the State will pay 50 per cent. These are minima requirements. There is nothing to prevent such a district from employing a teacher of higher qualifications and paying as much salary as it considers the services of the teacher worth.

The States have gradually won the right to prescribe minimum qualifications for teachers, minimum salaries for such qualified teachers with reasonable increments from year to year for satisfactory service, a retirement age when teachers grown old in service must retire, a minimum school year and minimum standards in school building and playgrounds. Add to these requirements compulsory attendance, consolidation of rural schools under certain conditions, and standardized courses of instruction and we have a reasonably centralized State school system capable of rendering competent and efficient service for our citizens-in-training. For these requirements the State must and does pay. The efficiency of such a system of centralization of control and of support may well be gauged by the following criteria: (1) Does it promote local participation of citizens in school affairs? (2) Does it foster autocratic control by the State Department of Public Instruction or a spirit of helpfulness and encouragement? (3) Does it encourage the introduction of new features of school work where they would not be undertaken by communities of their own volition? (4) Does it reward districts for increasing the true tax rate and penalize those that lower it? and (5) Does it allot support according to the school units such as a teacher and her class and thus equalize the tax burden?

State support of teachers' salaries rightly administered is found to stimulate local initiative, to equalize the burden of taxation, to spur negligent communities, and to go far toward accomplishing our splendid goal of public education: equality of opportunity.

Author's Note.—Grateful acknowledgment is hereby made for material used in this paper to Frank P. Graves, Commissioner of Education, New York, Fred Englehardt, Director Bureau of Administration, Department of Public Instruction, Harrisburg, Pa., and Harlan Updegraff, Professor of Administration, University of Pennsylvania, Philadelphia, Pa.

NATIONAL RESPONSIBILITY FOR THE IMPROVEMENT OF RURAL SCHOOLS

MABEL CARNEY, DEPARTMENT OF RURAL EDUCATION, TEACHERS COLLEGE,
COLUMBIA UNIVERSITY, NEW YORK CITY

The weakest link in our whole system of American education is the rural school. So weak is it, indeed, that for thousands of children it is practically a broken link barring them forever from their possible opportunities.

Those who question the truth of this statement need make but a cursory study of facts to be convinced.

Thirty-eight per cent of all school children in the United States are in one and two-teacher rural schools. For these eight million children the per capita expenditure for educational purposes is \$24 annually, while for city children the same figure is \$40. For them also the annual school term averages 38 days shorter which means, in the large, that country children have an actual elementary school period of only six years whereas urban children under better teachers and better conditions have eight years.

But this is not all. Even the meagre terms supported for rural children are but poorly conducted and less well attended. Country children lose 28 per cent of the seven months' school term provided for them. Urban children lose a much smaller part, only 21 per cent of the nine months' term provided in cities. So great is this handicap that illiteracy is twice as bad in rural areas as in urban districts, and child labor among country children three times as frequent as among urban children. Because of the heavy toll of manual labor upon the young people of the farms, high school advantages for rural youth have been sadly neglected and are estimated to be but one sixth as generous as those provided for urban youth.

Most serious of all is the teaching situation. "As is the teacher so is the school." Viewed from this angle but little can be expected of the rural school. Just half the rural teachers of the United States, or 150,000, have never completed a four-year high school. Ten per cent or 30,000 have finished only the eighth grade. Only 2 per cent are normal-school graduates, and 15,000 (chiefly in negro rural schools) are no more than sixth-grade product.

Contributing still further to the menace of this situation is the scarcity and inefficiency of rural-school supervision. Only twelve States provide professionally-prepared supervisors for rural schools, while the whole problem is still further complicated in 29 of our 48 States through the political election of county superintendents on a basis of partisan politics.

To vitalize these general facts take a few concrete illustrations.

"High school?" interrogated the 14-year-old boy who had ridden for a hundred miles directing us over the vast domain of his father's cattle ranch in Southwest Texas, "Am I goin' to the high school? I reckon not. Say, what is a high school, anyway?"

"Yes," drawled the father of 10-year-old Mary with unworried complacency, "Mary does real well. Hardly a day but she picks her 100 pounds of cotton just like any hand. *School?* Naw—she can't go to school much. I need her too bad in the patch."

Very different indeed was the attitude of the young mother in Northern Montana who exclaimed with anxiety: "It's snow in the winter, floods in the spring, and fires in the fall! But if the State doesn't keep these roads open, so that our children can go to school and get a little education we are going to descend upon Helena in body. It's no wonder that rural illiteracy is as bad as you say if many country children have roads like ours."

The scene shifts this time to New England, with an intelligent city boy commenting upon school conditions in the rural neighborhood where he spends his summers: "Just wait till you see what these poor country children have to put up with—a little mite of a schoolhouse, 107 years old, set *right along the side of the road without an inch of ground for baseball or anything!*"

Small wonder that this lad should have been so unfavorably impressed with the school facilities of his rural companions. For had he not attended school in an iron-mining village of northern Minnesota where school revenue had been so plentiful that, after every conceivable investment for education had been made, funds still remained and were finally used for the placing of a \$10,000 painting across the front wall of the school auditorium.

Then again, in the Appalachian Mountains after two days spent in seeing the most miserable and abject conditions of rural education that could possibly be imagined. "And just how did you happen to become county superintendent here?" I finally inquired with as much grace as possible of the inefficient and disinterested youth, himself only 24 years old and but a ninth grade product, who held the destiny of 5000 school children in his untrained hands. "Well," he explained with echoes of a grievous complaint still strong in his voice, "you see it was this way: I didn't want to be county superintendent. I wanted to be *sheriff*. But they (the local politicians) made old Browne sheriff and they said I'd have to be county superintendent for a while."

And finally—this glimpse from the far South: "Yes," continued the State Agent of Negro Education, a white man himself, of scholarly attainments and true democratic principles, "we have in the negro problem, so-called, *one of the most significant aspects of rural education and an unanswerable argument for Federal aid to education*. Eighty-five per cent of the 12 million negroes of the United States still live on the land, making this question very largely a problem of rural welfare. That the whole issue presents a situation for Federal subsidy you must agree, when I tell you that we have counties right here in this State which expend an average of \$28.42 a year for the education of each white child and only 87 cents a year for the education of each negro child. Of course as a matter of fact the negro children are simply not in school. But when one picks up a daily paper and sees all the unrest and race conflict which ignorance and prejudice have produced, he is well ready to try a program of education and enlightenment for a while. All this, as I have said, is very largely a rural problem and a question of Federal aid."

Let it not be inferred however from what has been said that rural education is making no progress. Indeed there is undoubtedly no field of education where greater strides have been made. Ever since the Report of the Country Life Commission in 1908 the upward trend in this field has been steadfast and pronounced. Even the gains of the last decade make a creditable showing.

In this brief period, consolidation, commonly regarded by all as the best and most universal solution of the rural-school problem, has increased no less than six-fold, making a present National total of 12,000 schools of this type. The county unit has spread from eleven States to twenty-one; real professional supervision for rural schools has more than doubled in area and been greatly developed in technique; educational expenditure for rural children has increased from an average of \$13 per capita to \$24; rural-school nursing has been widely extended; rural illiteracy vastly reduced; and high-school opportunity for country children many times increased. More significant still has been the advancement of standards for rural teachers and the general development of departments of rural education in normal schools and teachers' colleges. Most noteworthy of all, however, has been the fundamental growth in scientific attitude and scholarly attainment which is rapidly transforming the whole rural field from a mere game of chance into a recognized and respected phase of the great profession of education.

In all this, the Nation owes much to the modern pioneers who have fought the good fight and made these gains possible. Most indebted of all is it to that unsung and uncrowned hero, the typical county or rural superintendent, who, when any good at all, is the best, most versatile, most courageous, and most worthy and wisest figure on the whole stage of American education.

But with all that has been accomplished much remains to be done. Mountains of prejudice, both urban and rural, must be removed, and long days of labor lavishly expended before country children as a whole may receive the full measure of the birthright due them. In this greatest and most important task of modern education several needs predominate. Chief among these are the following:

1. First the definition and establishment of a sound philosophical basis.

Some there are who would vocationalize the rural elementary school, limit it to the contacts and ideals of the immediate community, select its teaching content in terms of adult needs, reduce its responsibility for perpetuating the world's best social inheritance, and so restrict and blindfold country children as to force them of necessity, through ignorance or compulsion, into farming as a life vocation.

Time forbids an elaboration of this point, but woe unto the governments or to the people anywhere who fail to realize the dangers of this policy and to safeguard the youth of their farms from such exploitation.

2. Important also is the urgent necessity for the reorganization of rural education. Here the wide applications of consolidation, the necessity for a larger taxing unit, and the demand for a wise adjustment between lay and professional control, are all commonly recognized.

3. Important too is the third and unquestioned need for increased aid to rural education, particularly in its elementary and non-vocational aspects.

The total biennial appropriation of the United States Government for general education is \$600,000. For agriculture and vocational education

the biennial appropriation is over 53 millions. So extreme is this situation that the Government seems to say in action if not principle: Would you be well cared for in the average rural community? Then choose your career as a pure-bred pig or a Jersey calf and not as a free-born American child. Or if choosing childhood be sure to begin at about 15 years of age so as to avoid the neglect of early school life.

4. If reform is ever to be realized on the whole fundamental problem of rural education in all its significant aspects it must come largely through a general awakening of public sentiment and a great stirring of public conscience.

5. This, in turn, demands the training and development of a permanent leadership for the rural-school field, which is fast becoming a reality, and which must be the equal in every respect of the best lay and professional leadership now serving the most favored urban schools.

With only one of these needs, however, are we primarily concerned tonight. This is the question of Federal aid particularly as outlined in our own Educational Bill now before the Congress of the United States. Not a feature of this bill but would mark a milestone in rural progress, not a feature but would enrich opportunities ten-fold for country children everywhere—a bill, in fact, whose every provision was planned with the specific needs of country children clearly in mind. Literacy, Americanization, health, teacher-training, and the equalization of educational opportunity—who can question but that all of these are even more urgently necessitated by conditions in the open country than in urban centers? And with these needs and conditions of rural childhood thus plainly before us how can we pause, how lose heart, or quibble among ourselves over petty details and argumentative theories? While we hesitate and dispute eight million children are losing the opportunity of childhood which is rightfully theirs. The spirit of these children and of all that is fair and just and truly American calls directly to each of us in this great assemblage of educators to support this bill—to labor consistently, in season and out, until its fundamental measures are realized, and life for all children, especially country children, is thereby vastly enriched and enlarged.

A NEW TYPE OF LEADERSHIP TO CARRY OUT THE NEW POLICIES

MARY MC SKIMMON, PRESIDENT OF THE MASSACHUSETTS TEACHERS'
FEDERATION, BROOKLINE, MASSACHUSETTS

The new policies to be incorporated into the educational life of America, might be counted in the aims and hopes of the forty-one departments that make up this program. If I understand the most significant of them they are these:

1. A well-trained, superior teacher in every classroom. At present, we

have some 30,000 teachers in our schools who have barely passed the eighth grade.

2. The elimination of illiteracy, of whose extent we were seemingly unconscious, till the revelations of the draft compelled us to stop bragging, and face the facts—sick at heart though they made us.

3. The need of finding out what we mean when we glibly talk of Americanization, and broadcasting its principles when we have found them.

4. Teaching the fundamentals of citizenship throughout the elementary and secondary schools. If this is accomplished we may fervently pray for two results. First, that the best in intellect, character, and endowment of grace and power, may be led to enter the profession of teaching in our land, with the same glow and zeal that our boys went to war for the defence of her principles. Second, that the nation so taught and trained may learn to live at peace industrially.

5. Bringing nearer to reality the facts on which our government was based; that all men are created equal, and have a right to life, liberty, and the pursuit of happiness, by starting children along that happy path, as yet seen only in dreams, of "Equal Educational Opportunity." But perhaps what looks like an iridescent dream to economists and law makers, might become a reality, if we were only convinced where the country's real wealth lay.

These are some of the policies of today awaiting the new leadership. And first of all this leadership will help the well-trained superior classroom teacher to be a discoverer. We are told that the army intelligence tests revealed the fact that only ten per cent of the splendid intelligence of our soldiers was found among the college graduates. The rest of it belonged to the product of the common schools, some of the highest having left school at the fifth or sixth grade. Inspired by the new leadership, every youth of this grade A will be discovered and given a complete educational training of the best the land has to offer. So long as the money paid for chewing gum is still twice as much as the bills for textbooks, we feel sure that there is wealth enough scattered over our broad acres, to salvage the 90 per cent of highest ability, for the broad training of our universities, which, crowded though they may be, can still make room for this aristocracy of ability. Perhaps this 90 per cent could find work for their talents in the halls of legislature, not overcrowded with such qualities of lofty power. And, perhaps New England could avail herself of enough of it, to harness her tremendous wealth of waterpower, most of which today dances idly babbling to the sea, to light her cities, and give the power to her factories, and heat her houses, saving coal for less favored spots. Perhaps some of the 90 per cent can find out how to solve the racial problems, and do away with the industrial horrors that have shamed us these glorious June days.

But the new leadership has another task for the superior, well-trained teacher in every classroom. It must learn how to assure that American teacher of public respect. Is it not a curious state of things, that in a

Democracy whose very existence depends upon the school-trained intelligence of its people, that the worst sneer the Chairman of the House Committee of Ways and Means can fling at an invalid gentleman, once the President of the United States, is to call him a school teacher? and to recite the doggerel of a bygone generation of naughty boys:

"Goodby scholars, goodby school;

Goodby teacher, you darned old fool!"

Why should we wonder that the best and brightest of the college men and women of this year's harvest, ready to choose their life work, hesitate, refuse to enter a calling savoring of reproach and scorn a bit overdone for jailbirds. How many organizations of teachers have taken any united action in resenting insults to their profession? Certainly a new leadership is awaited who shall stand for a new loyalty to the good name of our calling, who shall know how to deal with the politician who sits in judgment on what the history teachers shall be allowed to discuss, or "what Albany incantation they shall be compelled to sign."

When the new leadership shows us how to establish the democratic principles through the work known as Americanization, perhaps it will teach us how to make the classroom a democracy, without the danger that the new freedom shall become anarchy. Perhaps it will show us how to make the knowledge and practice of citizenship, arouse as strong an appeal, and have the splendid value that athletics now have to the favored and selected groups that profit so well by them now. But if it is leadership of the best and truest American citizenship it will be very wary before closing any door of growth and development to the slowest child through the results of any one so-called "intelligence test."

America is opportunity and no intelligence quotient justifies the blotting out of hope from any child of America. This leadership will see that the results of intelligence tests are not left to the moth and rust of classification, but are taken into the daylight where something is done about it. Reduce the number of children to the teacher by one half, O wise new Leadership, and see if you will not reduce the number of the mentally retarded in the same measure. This is the first step, waiting to be taken in equalizing educational opportunity. This will give the lower part of the class a chance to find out what the teacher is trying to do, a chance for interest, and habit and initiative, and utilizing the socialized recitation, and supervised study, and the project method.

But while we wait for the new leadership is it not already with us? How far have we gone in pursuit of the ideal that President Aydelotte gave us, when he told us that the crying need of the world is for us to understand each other? To do this our youth must know how to talk and how to defend their own thoughts. To have imagination to understand the other man's point of view. To develop the power to convince others of our point of view. How far have we gone in realizing Sir Auckland Geddes' ideal in his Washington address, that the end of education is "to turn out minds that see facts in a certain color." What have we done in

response to Dr. Spaulding's inquiry as to the pigments we have always put into the dye-vats of American education that he calls, "The deep all absorbing overwhelming color of individual success through individual effort for material prosperity." How hard have we worked to change this color to "patriotism, honesty, sincerity, goodness, courage, sympathy?" Who shall arise out of all the confusions of aims today to give us the sanctions for this teaching, since we are forbidden to teach them under the sanctions of religion?

While we wait and hope for the light of the new leadership that shall stand as a beacon on our storm-beaten coasts, our spirits sing with joy at the brave, clear shining of ten thousand times ten thousand little candle lights gleaming bravely through the storms of contending factions. They are the glowing hearts of three quarters of a million teachers, to each one of whom some little community group turns for leadership.

While the world awaits the leadership of trumpet-toned authority this army moves to its work guided by the music of the marching of little children's feet. Amid the confusion of tongues they hear again the voice of the poet, prophet, teacher, Emerson who has his greatest message for them:

"To whatsoever upright mind, to whatsoever beating heart I speak, to you it is committed to educate men. By simple living, by an illimitable soul, you correct, you instruct, you raise, you embellish all. According to the depth from which you draw your own life, such is the depth not only of your strenuous effort, but of your manners and presence.

"And the passionate sea of controversy is hushed, and the classroom teacher, humble in her responsibility, speaks with a voice as calm as silence, "Give me my share of the work, O noble Leadership of the land, for the hardest gives me the sweetest joy."

THE RESPONSIBILITY OF THE COLLEGE AND THE UNIVERSITY IN A DEMOCRACY

HENRY W. HOLMES, GRADUATE SCHOOL OF EDUCATION, HARVARD
UNIVERSITY, BOSTON, MASSACHUSETTS

William James once wrote of the effect of certain words and phrases on the human mind: They make people talk, he said, "as if they were going up in a balloon." *Democracy* is a word of that sort. It is hard to use the word or its derivative *democratic* without climbing onto mental stilts; and the reason for this is that the idea of democracy is actually exalted. It is natural to "talk big" when one talks of democracy, because democracy *is* big.

But no man or woman of sincerity wants to take it out in "talking big." Exaltation of any sort must leave us clearer about our duties or firmer in the accomplishment of them, or we had better avoid it altogether. That too would be, of course, a poor choice; for life without some occasions of

dedication, prophetic vision, and strong emotional response, whether to persons or to causes, would be not only "quiet and dull" but also fruitless and mechanical. In the economy of human nature, which conditions all social advance, emotion has its special and indispensable function, but we must make sure that it is refined by thought and checked by practical activity.

May I take for granted, then, our common response to the emotional challenge of the word *democracy*, assuming that there is a genuine "democratic awakening" in which we share; and may I therefore attempt here, not to stir you to renewed enthusiasm, but to deal with some of the problems of thought and policy which democracy presents, especially in its demands on the colleges and universities of America?

Democracy, strictly speaking, is just a mode or process of government, to be contrasted with monarchy, oligarchy, or autocracy. It is government not merely with the consent of the governed, but by their mandate and subject to their control. Its basic principle is political liberty, its typical figure the free and responsible individual citizen, debating public issues, casting his vote, accepting the popular decision, serving in office. Taken merely in this sense, democracy is an achievement dearly bought, difficult to maintain, perplexing to carry forward under new conditions. It is a heritage which must be handed on to each new generation as a precious gift, with admonition as to its use and warning as to its dangers. It places a heavy burden on education, both systematic and informal, and particularly, of course, upon the common school.

But the theory of democracy has a scope wider than politics and implies an ideal more fundamental and even more difficult to realize than the ideal of individual liberty. It was no accident that the nineteenth century saw democracy in government established here and in France and in England and saw also the birth and growth of a new social conscience, which seeks to improve the conditions of life and make it possible for men to live happily and worthily under the liberty their fathers won. The nineteenth century abolished slavery, reformed the prisons, established hospitals, asylums, and charitable enterprises in unprecedented number, expressed in prose and verse a new human sympathy, liberalized religion, and made education, at least in theory, a universal privilege. Democracy in its political form came as part of a more profound and more compelling movement for the betterment of the common life. It is possible, therefore, to speak of democracy as an effort to achieve social justice, which had its beginning in simple humanitarianism and has developed both in theory and in practice to our own day. It is democracy as a wider movement for popular rights and human good, over and above the suffrage and freedom under the law.

Education is part and parcel of democracy in this humanitarian sense. We educate today that men may live a fuller life, and we call upon statesmen and men of practical affairs to make good our effort by the application of the ideal of democracy to social and industrial conditions. So

long as it is impossible to abolish child labor in the United States, democracy has an unaccomplished work to do in our own land. And this is but one among the many tasks of democracy on its humanitarian side.

Have we exhausted, then, in these two ideas—political liberty and social justice—the meaning of democracy? I see an even greater thing, an obligation laid upon democracy by the whole process of history and by the present state of the world, a vision that has haunted philosopher, poet, theologian, and statesman since men first began to reflect upon their fate: the unity of mankind in the mastery of life.

I can best begin by pointing out a defect in the ideal of democracy as I have so far presented it: namely, the lack of completeness, of final or substantive character, in either the political or the social definition of democracy. There is an aesthetic or perhaps a moral fault in both, for dearly won and precious as they are, nevertheless they stand as means and not as ends. They clear the way for democracy, establish it as a form, but do not tell it what to do. Will men be content that there shall be no interference among them with each other's dues, no privilege or tyranny? Political democracy lies too close to the mere conception of individual rights to be a final social philosophy. It is not enough that men should stop trespassing upon each other's fields. If religion, especially Christianity, does not mock us, men have a work to do together, a work which transcends the personal fortunes of any single man, or all these taken in their aggregate as separate interests. Nor is it enough that every man shall have his chance. His chance for what? Have life and liberty no end but the pursuit of happiness? The canker of separateness and isolation lies at the heart of every individualistic theory of human good. It is not enough that the road should be open to talent. It is not even enough that each shall make the most of himself for the common good. The common good must be known and consciously advanced: there must be participation in it and in the achievement of it. Political democracy emphasizes the distinction between men as equals: to each his own, equality before the law. Philanthropic democracy calls for human sympathy and kindness: *noblesse oblige*. Each leaves us with a view of men struggling separately, individually, either to maintain and advance their own purposes, although with fairness and even with kindness and helpfulness, or sacrificing themselves as individuals to other individuals. Neither presents a picture of men working together for universal ends. Completed democracy pictures a community of interest, not a uniform life but a unity of purpose, an understanding shared by all, a fate which all help to advance, a mastery of nature and its own character on the part of humanity in common. The ideal of democracy finds its fulfillment, I submit, in the conception of mankind united in knowledge, in faith, in purpose, in action, and in command over the forces of life.

This conception is not new, still less original. It is probably older than Christianity; it is certainly implied in Christianity; it is spread upon the pages of modern philosophy and sociology and the philosophic treatment of

history and of biological science. You may find it in Hegel and in Comte, in Royce, and in H. G. Wells. It keeps various philosophic company, but it is persistent and, unless I am mistaken, it has become clearer in the course of time. Democracy looks toward unity through the free choices and decisions of enlightened minds. It looks toward unity not by domination—but by a sharing of purposes and accomplishments among free men. And the ideal of democratic unity is not empty—the mere achievement of oneness: it proposes the common accomplishment of substantial goods and the sharing of them—things material and immaterial, food and beauty, highways and justice, health and knowledge, enjoyment and peace. It is to be a unity both living and full. But this theorizing about democracy and unity, you will say, is a remote and speculative business. The world is still far from being united in any but the most external way. We are not even willing to make the League of Nations a solid reality.

What has the ideal of democratic unity to do with our present problems of education? It is a force that moves us in education more than we are often aware of, and especially, perhaps, in higher education. At Commencement the President of Harvard University admits the graduates of the college into the “fellowship of educated men” and the recipients of the doctor’s degree in philosophy into “the ancient and universal company of scholars.” What do we ask of education in the end if not that it shall lead men into a more rational loyalty to common aims? For what purpose do men labor for the advancement of science if not that we may be united in faith and power in the light of truth? The question, it seems to me, is not a question of the force and value of democratic unity as an ultimate ideal, an ideal to be achieved largely through education, but of our present responsibilities and duties.

It is just because the full measure of democracy cannot be achieved suddenly or by force, just because democracy in any of its aspects, but especially as it points toward unity, depends so largely on education, that educators may well ask themselves in what way their present policies and programs serve to forward democracy at all. Let us admit that our children’s children will still be working slowly toward a completed democracy. What is the step we ought to take today? If the ideal of democracy as I have sketched it finds any acceptance in your minds, how can it be brought to bear on any practical issues of the present?

In the first place, freedom and unity, like charity, ought to begin at home. I do not mean that we ought to have no care for international relations or make no effort to educate toward international understanding. On the contrary—but that, as Kipling used to say, is another story. Our chief duty now is to contribute through education to the development of a fuller measure of democratic unity here in America. Our peace is not secure; we are not sufficiently productive nor economical of material things or human talent; we have not achieved equity, much less equality; we sacrifice beauty to machinery and organization. These goods which we are so far from having are both the conditions and the fruits of a free, united life.

We have to develop a people that can work through them toward freedom and unity, and by freedom and unity secure and maintain them. I grant that education cannot do more than its part: social legislation, the restriction of immigration, sound economic policy, and at least eugenic intelligence if not measures of eugenic control—these and many other efforts must supplement what education can do. My point here is that the problem presents itself most pressing at the moment as a *national* problem. The ideal of democracy calls upon us now to serve democracy first in these United States.

Here I must take a moment to urge the importance of national responsibility in education. I believe in the Towner-Sterling bill because I find in that measure a justifiably limited provision for pooling national resources, both material and spiritual, for the stimulation and maintenance of education as a national interest.

I would urge, too, the need of developing teaching as a profession. State action, in the general sense of public action, may stifle freedom in education if it is not corrected and held true to its course by the professional conscience and scientific knowledge of a united body of teachers. Teachers as individuals need more rest, more recreation, more pay. Education for democracy in America needs a body of teachers better organized to secure these things and at the same time to raise the standards of professional training until every teacher may be a skilled and intelligent practitioner at first-hand, not a mechanical worker under orders.

Higher education has an almost unlimited number of duties, difficulties, and perplexities. I am not commissioned or prepared to deal with any of these except the general problems of policy which appear when higher educational institutions face squarely the ideal of democracy in this nation.

Everyone knows how great is the present pressure on the colleges and universities. They are called upon to receive students in numbers which tax their resources to the utmost. This circumstance brings forward sharply the whole problem of the service higher education must render to the nation. If higher education is to do its part in the building of a free and united people for America must we not receive into the colleges, and somehow make provision for, every youth (and maiden) that applies? This is the problem of limitation of numbers or, if you like, of limitation of educational opportunity. It is not solely a problem of higher education, but of the regulation of education all along the line, most acute at the moment in the college. I find three chief questions involved in it: the economic question, the question of intellectual standards, and the question of racial adjustment.

1. If our social and economic organization were such that every boy and girl who can use profitably a college education could afford it, there would be no economic problem. It may be that Professor Carver is right and that no man is worth more than he has. It may be that the Socialists are right and that wealth ought to be distributed on an absolutely new basis. I am not an economist and I am not inclined to accept the socialistic doctrine. The fact is that thousands of boys and girls do not get a college

education because they cannot afford it, yet ought to have it for their own sakes and for the sake of the State.

It is not a sufficient answer to say that a poor boy can earn his way through college. The founding of State universities will not solve the problem, for the greatest expense is not tuition, but maintenance. The experiment of President Morgan at Antioch College is the most radical and promising now in view, since he combines productive labor with education; yet not every college can be of the Antioch type. The movement for "salvaging" gifted children for higher education, started here in Boston by Mrs. Joseph E. Worcester, deserves the fullest support. Further endowments for scholarships are a necessity; State scholarships on a competitive basis are very desirable. The development of university extension, with the complete use of local facilities to minimize expense to the individual, should be carried forward. The problem is not, of course, a problem merely of expense to the individual; it is a problem of the financial resources of institutions—ultimately a problem of public wealth. Perhaps the most promising suggestion for its solution is to be found in the practice of the Harvard Graduate School of Business Administration, wherein endowment takes care of research, tuition covers instruction, and a loan fund meets individual needs. I know of no social calculus by which we can determine how much of an individual's higher education he ought to pay for himself and how much he ought to get from public or from semi-public funds. If there is any principle to be found under our present economic system it is probably the principle that the cost of higher education should be considered in part a gift to the individual, which he ought to return to his own college or to another, as and when he can. But the main fact to be kept constantly in view is that there is economic unfairness and waste in our present situation, which we ought to mitigate by any and by every means. College education is not uniting us as it ought to, because too many boys and girls are missing it for lack of means.

2. On the other hand, many who can afford it and are supposed to be getting it are actually missing it, even if they earn a degree. Some of them are intellectually incapable of profiting by it; some are playing with their opportunity and shirking their duty; for some the thing they get is unsuited to their powers, although they might profit by something else.

Schools and colleges should maintain standards rigorously, select by every available means, including intelligence tests, and beware of condemning any individual except on the basis of established fact. As to the waster, the boy or girl to whom college means athletics or a good time, cramming and tutoring and bluffing, we need only greater determination combined with a reasonable willingness to "save the pieces." The opportunity for higher education should not be standardized, bookish, or "highbrow"; it should be diversified and fitted to many types of mind; there is need for an even greater variety of collegiate institutions, with a common insistence on certain fundamentals—English, for example, and the social studies; and for educational and vocational guidance.

3. The most difficult question of all is the question of racial adjustment in our colleges. What ought the colleges to do, not to "assimilate" or "Americanize" new races by bringing them into conformity with the manners, culture, and points of view of an older stock, quite probably itself provincial, but to contribute to the synthesis of races from which shall emerge a new and stronger people? This problem is under consideration at Harvard College now. As a member of the committee which is to deal with it, I am seeking first of all for the facts of the situation as it there concretely presents itself. Here I can speak only in terms of principle.

To return to the idea of democratic unity in its National application, we have to contribute through the colleges to the growth of a free and united American people. The immigrant races are here, demanding higher education. The problem must be faced as a National problem and as a problem of the future. Race prejudice must be set aside, and narrow, personal, provincial views with it. We may urge the restriction of immigration, but that is not the problem as it faces education. What shall the colleges do with students of immigrant races as they stand? Well, first, in the large, there can be no race discrimination in higher education. Everyone that can prove his power to profit by it must have it, no matter what his race, color, religion, or previous condition of servitude.

Nor can any single institution organize itself on the principle of exclusiveness without loss and shame. To be true to its ideal as an institution of higher education in a democracy, every college must take its fair share of students of every race and take them as they come, rich and poor, cultivated and uncouth, those that are easy to deal with and those that are not. Such tests of admission as are applied must be applied openly without discrimination and must measure the individual as an individual. I am now convinced that the question of racial adjustment in the colleges is not a question of discriminating between the "desirable" and the "undesirable." No one, whatever his birth or station, should be admitted unless he is desirable in the educational sense—that is, unless he can be instructed and disciplined so that he may be graduated into the "fellowship of educated men."

But the problem presented by a large proportion of students of a single race is a different problem. Every one of them may be "desirable"; but in a college, as in a nation, there may well be the necessity of keeping the proportions of all the racial groups such that the entire student body may become and remain united. What is to be feared is segregation, the "lumping" of students of one race into a defensive, suspicious, separate group. That prevents unity in the college, works against it in the nation, denies it as an ideal.

But if the limitation of racial groups in single institutions is undertaken at all, on this or on any other ground, it must be accompanied by certain efforts, made in all good faith, to prevent evils to which it may give rise. There must be conference among institutions to see that the total opportunity for higher education open to every race is ample. Within the institution, in its classes and in its student activities, there must be constant

effort on the part of authorities and students alike to mingle and unify the old and the new. The college must influence preparatory schools and student clubs to abandon exclusiveness and prevent segregation.

There should be no jumping to the conclusion that limitation of racial groups is necessary anywhere. The problem ought to be faced squarely, not only by separate institutions but by all institutions in conference, not excluding State institutions. It is a social problem of National scope, not a question of maintaining a class tradition in a particular college or university. With due regard to the scope of its own work, its limitations of resources and possibilities, every institution of higher education in this country should look upon all its problems with an eye single to the service of the Nation.

IMPROVEMENT OF MOVING PICTURES

WILL H. HAYS, PRESIDENT MOTION PICTURE PRODUCERS AND
DISTRIBUTORS OF AMERICA, NEW YORK CITY

The National Education Association holds its convention in the home of its ancestors. We remember the law passed in Massachusetts in 1647 which required each town of 50 householders to "appoint one to teach all such children as shall resort to him, to write and read," and I approach your venerable family tree with a consistent humility, inasmuch as this instrument of education, the motion picture, has hardly reached the age of a high-school graduate. In a little over fifteen years it has grown from a naked idea until today it is the principal amusement of the great majority of all our people and the sole amusement of millions, one of the greatest industries in America, having an investment in real estate, studios, and equipment of nearly \$500,000,000, with probably \$50,000,000 paid annually in salaries, \$200,000,000 spent annually in production, and \$800,000,000 spent annually for admissions.

A few years ago such a meeting as this would have been impossible. You would not have felt that you were warranted in taking time to discuss the motion picture in education. But today the educators of the country are appreciating its value, and it has been with peculiar pleasure that I have noted this interest as evidenced by the invitation that brings me here to the National Education Association.

There has been some query as to just what this new effort which the industry is making at this time is all about. It is simply that these men who make and distribute pictures have associated themselves together to do jointly those things in which they are mutually but non-competitively interested, having as the chief purposes of such association two great objectives—and I quote verbatim from the formal articles of association, which have been filed at Albany: "establishing and maintaining the highest possible moral and artistic standards in motion picture production, and developing the *educational* as well as the *entertainment value* and the general usefulness of the motion picture."

This is the legal statement of a legal purpose by a legally organized body. It creates no super-court autocratically to pass upon pictures, nor does it place anyone in the attitude, and most certainly I shall not be placed in the attitude, of being the judge of the morals of those who are in the industry. The purposes of the association are stated in its articles, and no articles of association breathing a more important message could well be found.

The importance of the association's first great purpose, "to establish and maintain the highest possible moral and artistic standards in motion picture production" and the fact that its realization is now progressing can not be overestimated. And there is no group in this country more interested than are you teachers in its consummation. While this is true, you, of course, have a special interest in the second great objective, that is—"to develop the educational as well as the entertainment value and general usefulness of the industry"—and for the attainment of both ends I want your sympathetic coöperation.

The motion picture is essentially a source of amusement, and its importance in that regard is measured only by the imperative necessity of entertainment for our people. In all the big cities and maple-shaded towns and villages which comprise America there are perhaps fifteen thousand motion-picture theaters and in those theaters fifteen million seats. Taking into account at least two performances a day and applying the collected statistics, we estimate that within every twenty-four hours between Maine and California twenty millions men, women, and children look for an hour or two on the motion-picture screen. They come with no preoccupation; not out of duty nor out of solicitation, but just in that mood of reception and relaxation, in that state of mind and emotion which a master psychologist, a great teacher, would want them to come, having the desire to make the strongest possible impression upon them. U. S. Commissioner of Education John J. Tigert said recently, "Within the celluloid film lies the most powerful weapon for the attack against ignorance that the world has ever known."

Obviously, it is true that the influence of the motion picture on our National life is, indeed, absolutely limitless—its influence on our taste, its influence on our conduct, its influence on our aspirations, its influence on our youth, and its consequent immeasurable influence on our future. And so its integrity must—and shall—be protected just as we protect the integrity of our churches, and its quality must—and shall—be developed just as we develop the quality of our schools.

I wonder if you realize, you teachers and all those who have at heart the general welfare—what the motion picture means to the youth of this country? I approach this subject not merely from the viewpoint of the men who have millions of dollars invested in the business, but from the viewpoint of the fathers and mothers who have millions of children invested in the business. We say 20,000,000 a day see motion pictures. Possibly half of this number are children.

Above everything else perhaps is our duty to youth. To teachers I do not have to say that this industry must have toward that sacred thing, the mind of a child, toward that clean, virgin thing, that unmarked slate, the same sense of responsibility, the same care about the impressions made upon it that the clergyman, or the most inspired teacher of youth would have.

So certainly is the improving of this industry a matter of immediate concern to everyone, that I earnestly ask and hope to receive the advice and coöperation of the public. Too much can not be expected too soon, either in the raising of the morals and artistic standards or in the development of the educational value. There can be no overnight miracle, but preferred attention is being given to purposes of the association right now in the pictures which are now being made. Every day there is opportunity in the studios to take that action at the place and at the only place where effective action can be taken. Responsibility for these pictures now being made by the members of our association can not be avoided. They will be the proof either of our honesty of purpose or of our failure. They will be the proof either of our ability to correct our evils ourselves or of our inability to run our own business. The members of this association, acting on that definite knowledge, are doing everything in their power at this moment to live up to their professions, and the pictures will soon show the results of their efforts.

While asking for your aid and coöperation I would like to ask, too, that you judge us by our actual performances rather than by any promises we may make. We are building this industry for years to come—for generations to come, and though our progress may perhaps be slow at the beginning, the results, we are confident will be permanent and certain.

It has been said repeatedly that certain objectionable pictures which have been made are the class of pictures the public wanted, this deduction being based upon box-office receipts. One way for you to help us make good pictures is very easy, and that is by refusing to patronize bad pictures. I am not suggesting an alibi for the motion-picture business; I am only emphasizing that this is not a one-man's job, nor the job of one group; it is the multitude's job; in doing it there is work for all. One of the largest producers has told me that in his opinion the outstanding financial successes in the last eighteen months have been clean pictures. I may not know thoroughly the picture business, but I do know thoroughly the American public, and I know that its manhood and womanhood is sound and will support clean pictures. And the American public is the real censor for the motion picture, just as it is for the press and the pulpit.

May I refer a minute to this question of censorship, which is an incident in the matter? The people of this country, of course, are against censorship fundamentally—are against censorship of press, against censorship of pulpit, and against censorship of pictures. But just as certainly, my friends, is this country against wrong doing—and the demand for censorship will fail when the reason for the demand is removed. As we move

toward the consummation of the objects of our association so in like degree will recede all demands for censorship.

I am against political censorship, of course, because political censorship will not do what is hoped for it in the last analysis. The motion-picture business objects to political censorship for one great reason—because the motion-picture business is an American business. But there is one place and one place only where the evils can be eliminated and the good and great advantage of motion pictures retained, and that is at the point where and when the pictures are made. And it *can* be done then and there, make no mistake about that. There is no twilight zone in the matter. Right is right and wrong is wrong, and men know right from wrong. The corrections *can* be made, real evil *can* and must be kept out, the highest standards of art, taste, and morals *can* be achieved, and it is primarily the duty of the producers to do it.

I reiterate, it can not be done in a moment. It can not be done without the aid and support of the public, and that support I know you will give. And with the raising of the moral and artistic standard comes the development of the educational value of the motion picture. You are not unmindful of the great educational value of the entertainment picture as such. It must be the purpose of the industry to strive continually to make presentations historically correct and give authentic portrayals of customs, costumes, and habits.

In addition to the general educational value of entertainment pictures, we are together concerned, of course, with two additional phases, first the pedagogic picture and then the picture which is semi-educational and semi-entertainment. It must be that the motion picture is a distinct contribution to visual instruction. The quick way to the brain is through the eye. Scientific tests which have been made and which are being made and with which you are familiar seem to prove the value of the motion picture in the classroom.

The producers are interested in this educational work. They realize its importance and the industry is eager to help. Up to the present time it has been easy for producers to meet the requirements of the educational field, for the demand for strictly instructional classroom films has been small. Films are costly and unless a single film can be used over and over it can not be made without great loss. If educational films are to be produced accurately and in sufficient numbers, better methods of distribution must be worked out. Again those who produced the films were not trained educators and therefore unable to produce pedagogically sound films, while at the same time the educators, whose advice has been available, have too often proved unable to adapt themselves to the peculiar technical demands of screen production. Before great progress can be made there must be some method worked out to bring together the men and women who are skilled in the methods and mechanics of picture production.

Much has been done with the motion picture already as an instru-

mentality of instruction, but the surface has hardly been scratched. Certainly the educators of the country are awakening to its possibilities. Four non-commercial magazines are or recently have been in existence, dedicated to the discussion of the problems of visual education. Various museums of natural history have used films for lecture purposes in small museums and public schools.

The educational value has been appreciated and tried out in various directions. Recently the American City Bureau inaugurated a film service on municipal and civic subjects. In Washington representatives of the National Academy of Science, the American Association for the Advancement of Science, The National Research Council, and the Scripps Interests are joined to promote science service which, among other things, seeks to educate the popular mind by putting into screen form stories of scientific discovery and invention. The Society for Visual Education has produced many films of educational nature. Professors in many schools and colleges are talking of filming the materials of their courses and Yale is said to have under production 100 reels showing its famous *Chronicles of America*.

The Society of Visual Education prepares and distributes motion-picture films, which will be pedagogically sound textbook supplements for the use of teachers. Besides this Association and the Visual Instruction Department of your own organization, there are two other groups of educators in the motion-picture field—the National Academy of Visual Instruction and the Visual Instruction Association of America. An incomplete list shows twenty-eight colleges and universities which have organized departments for the distribution of films. At least seventeen of our largest educational institutions are giving courses to their students on the use of the motion picture for visual instruction. Several large universities are conducting scientific research into motion-picture problems. The best material ever produced in the study of the psychology of reading has come through the motion pictures of the eye, which have been taken by the Department of Education of the University of Chicago. Again, our knowledge of the processes by which children learn to write has been greatly increased through motion pictures, photographs of hand movements taken by the same university.

Thirty-four cities, including New York, Chicago, Cleveland, Detroit, Indianapolis, Los Angeles, and San Francisco, are now using pedagogical films in their classrooms and assembly halls. New York spent approximately \$10,000 for this purpose last year, while Los Angeles spent \$25,000. There are probably about 10,000 projecting machines installed in schools and churches. If methods can be found for easy payments on machines and effective methods for distribution of films, this field will grow with great rapidity.

The motion-picture industry will coöperate with the National Education Association fully to that end. On behalf of our organization I offer to your association all of our facilities to aid in your experimentation.

There is already a great demand for pedagogic pictures. I propose that we jointly study that demand and that we jointly find ways and means of supplying it. Let a committee be appointed of this association made up of the very best talent within your ranks; let them meet with the great producers of the country and find ways to use our facilities. We ask you to aid us and to let us aid you in the study of the whole problem of the use of the motion picture as a direct pedagogic instrument. Let us together find the means of making pedagogic pictures which are scientifically, psychologically, and pedagogically sound. Not only can we take care of the demand which now obtains but the great demand which is imminent and which will certainly come, must be met, and met by the producers with a supply that measures up to the ideas of the educators of the country.

It can never be said again, and I think it has been suggested, that the producers do not want to furnish educational pictures. The producers want to serve America. They know that there is no more important and lasting service which they can perform than to aid you in the actual educating of the youth of the country by this new means and make yet more efficient if possible the work which you, the teachers, are doing in the fulfilment of your noblest and most useful of all professions.

Nor will you be unmindful of the great good done by this industry. The motion picture has carried the silent call for virtue, honesty, ambition, hope, love of country and of home to audiences speaking twenty different languages but all understanding the universal language of pictures. There may be fifty different languages spoken in this country, but the picture of a mother is the same in every language. It has brought to narrow lives a knowledge of the wide, wide world; it has been the benefactor of uncounted millions. It is the poor man's pleasure; grand opera for the well-to-do, but pictures for the man who works with his hands. As we serve the leisure hours of the masses with right diversions, so do we rivet the girders of society.

Those who are responsible for this industry do not minimize their responsibility, nor would they shirk it. With your help and the help of thinking people in this country in supporting the good pictures, we can accomplish the purpose of this association. The motion picture industry accepts the challenge in the demand of the American people for a higher quality of art and interest in its entertainment. The industry accepts the challenge in the demand of the American youth that its pictures shall give to them the right kind of entertainment and instruction.

We accept the challenge in the righteous demand of the American mother that the entertainment and amusement of that youth shall be worthy of their value as a most potent factor in the country's future. We accept the challenge in the proper demand of the educators of the country that the full instructional value of motion pictures shall be developed and used. We accept full responsibility. It is a service and "service is the supreme commitment of life." It is a service which needs the very best from all, and I have great faith in its fulfilment.

OUR NEED OF AN INTELLIGENT ELECTORATE

JAMES E. RUSSELL, DEAN, TEACHERS COLLEGE, COLUMBIA UNIVERSITY,
NEW YORK CITY

The proposition that the rulers of a people should be educated needs no demonstration. Democracy, of all forms of government, is most in need of education. Its leaders must be discovered in the mass. They are not born to greatness, and greatness is not thrust upon them: they must achieve distinction and hold the support of willing followers. Herein lies the problem peculiar to democracy. In other forms of government, leaders are set apart by birth or divine right for the part they are to play, but true democracy recognizes no privilege of class or sect or place. The new democratic ideal of education is not only to develop leaders but also to lift the whole mass, to make them fit to rule and to be ruled by leaders of their own choosing. The safety of a democratic state, therefore, rests in its final analysis upon an enlightened body of citizens.

In our government all citizens may participate in elections, but political power passes over to officers who represent at best merely a majority of electors. Even a determined minority may hold the balance of power and have their own way, regardless of public opinion. Indeed, it is common observation that public opinion is shaped by skillful propaganda along lines at first desired by few, but ultimately accepted by many. In this way, we get our constitutional amendments and so, too, we fortify the sway of political bosses. In the one case the eyes of believers may be turned heavenward so high that vision of things on earth is impossible; the way of the venal boss is to keep the noses of his supporters deep enough in the trough to prevent them from seeing what happens on the other side of the fence. A superficial view of our government, therefore, might easily lead to the conclusion that it is really not a democracy, but an oligarchy. The inference follows that if rulers are few, our best educational course is to recognize an aristocracy of intellect and accord it appropriate honors.

This superficial view—which some of our people always take and all of our people sometimes take—is responsible for most of the ills in American education. When power belongs to few, why trouble about the education of the many? Time, labor, and money may all be saved by limiting the scope of effort. This was precisely the view taken when our provincial schools were established for the training of leaders of Church and State. It was a direct inheritance from our English ancestry. It is the age-old ideal of education under every form of ecclesiastical and monarchical control. It began probably when the cave man found it safer and more congenial to live with his fellows. Patriarchal and tribal government promoted its development. It was hoary with age when Assyria and Egypt found it adapted to their needs. It attained perfection in Greece, and survived for centuries in Rome. It has made modern Europe, and has come down through the centuries to our own day in perfect form in China. Reduced to its simplest returns, it is a system that aims to give leadership

to a privileged class, to help up a few, and to keep the many down, to promote some to positions of authority, and to make the masses contented with that position in life to which it has pleased God to call them. It has begotten in America a scheme of education controlled from the top downwards; it accounts for the inclusion in our curricula of materials designed to function only in the lives of the select few; it has shaped our system of school administration according to the whims of local pride and passion; it gives employment to incompetent teachers; it breeds distrust and suspicion between the schools and the public that they should serve. In a word, the theory that government is safe when leaders are competent is traditional in this country. The time is coming when we must rid ourselves of the notion that an aristocracy, even an aristocracy of intellect, is a safe guide in American education.

If training for leadership, or rather opportunities for training leaders, were a sufficient guarantee of the safety of the state, we should be living in a political millennium. Nowhere else in the world is provision made for so many aspiring candidates for leadership, or for so many different kinds of leaders. We have erected technical schools for almost every conceivable type of professional worker. It is a long and imposing line from schools of theology and law, through medicine and engineering, to agriculture, business, and the household arts. We boast of our educational ladder reaching from the gutter to the university, and we take pride in the numbers that cling to it. The wonder is that so few who reach the top show any gratitude to those who built the ladder and helped them climb it. Whatever the fault, the fact is that those who owe most to public support are not rendering to the public the service that the public is entitled to receive.

Coincident with the extraordinary increase in the past few years of those seeking higher education is the increasing distrust of the integrity and unselfishness of those best equipped to lead. In fact, expertness in technical lines is no longer synonymous with leadership in professional service. The common man dreads the lawyer as the burned child dreads the fire. The leader of hundreds of thousands of labor unionists voices their sentiment when he says "God save us from the courts." Some millions of Protestant churchmen show their estimate of the worth of religious leaders when they fix the average salary of a clergyman at \$800 a year. There are more readers of newspapers, with less faith in what the papers print, than ever before in our history.

This distrust of leaders and the denial of authority that leadership implies is reflected in the prevailing social unrest, the recent outburst of crime, and the general disposition to lawlessness in all sections of our country. The popular remedy is to enact more specific laws and to insist on more rigid enforcement of police power. But is it just such conditions that government is designed to meet. Our constitution provides the foundation upon which just and equitable laws may be based. And with just and equitable laws, a democracy is safe, provided—and here is the rub—the people will observe the laws.

Leadership implies a following. Leaders may be never so wise, never so capable, never so patriotic, but if they have no following, their wisdom, their ability, their patriotism goes for naught. The safety of the state depends quite as much upon obedient followers as upon efficient leaders. And many are the expedients recorded in history for securing an obedient following. Fear of marauding foes has always been a potent force, and the body of external aggression is paraded on occasion even in our own halls of Congress. The wrath of the Gods has often been invoked with great success. Military discipline has played its part. The amelioration of popular discontent has repeatedly been sought in largesses of food, land grants, and wage adjudications, but history shows that such efforts are but the first signs of national decadence. And strongest of all forces in securing a submissive following is custom embodied in tradition and reinforced by poverty, caste, and class distinctions. The world over to-day—barring our own land and certain British commonwealths—the masses of the people do what their parents did and what others of their class are accustomed to do. Just as the exercise of habit induces a certain degree of satisfaction in the individual, so conformity to custom begets contentment in society.

The problem, as I have stated it, when restricted to the safety of the state, is twofold: the training of efficient leaders and the securing of contented followers. The training of leaders devolves more and more upon our colleges and special schools. Every such school that I know is striving to improve the quality of its output. Curricula are being strengthened and methods of teaching bettered. Standards of scholarship are being raised by demanding both broader culture and more scientific knowledge. Add to these attainments the spirit of patriotic service, and the professional schools of America will have done their full duty.

The second part of our problem—namely, the training of followers—is far and away the most difficult of solution. For us in America it is not only the most imperative, but it is the most baffling, because the least understood and the least appreciated. Its magnitude is measured by millions of children and other millions of adults. Its complexity is intensified by widespread illiteracy and the infusion of foreign languages, customs, and traditions. And for its solution we have no satisfactory body of knowledge and no accepted system of instruction. The character of our school work in the past, even in the public schools, has been formulated according to the needs of those who are going forward to positions of leadership. What are we going to do for those left behind? Can anything be done that will make for the safety of the state? Is it possible through schooling to contribute to the contentment of the masses? My answer is that just because it must be done, it can be done, and will be done, by the school teachers of America. I should be less confident of my answer, were it not that we have before us the most conspicuous example of the efficacy of public education that the world has ever seen. It is an example that warns us what to shun as well as an example that inspires us with courage to

proceed. I refer to the German system of popular education as developed during the past century and brought to fruition in the world war.

A century ago Germany was a poverty-stricken, quarrelsome, politically distracted country. They had a few capable leaders, but the masses of the people were intractable and belligerent. There was no harmony in ideals, no unity in endeavor. But from her poverty, Germany erected universities for the leaders and public schools for the masses. She developed a teaching profession that has had no equal in scientific attainments or in loyalty to the state. She gave those teachers high social rank, paid them well for their services, and supported them in old age. They in turn upheld the standards of the realm and converted, within two generations, the self-indulgent, easy-going, individualistic Teutonic stock into obedient subjects of a ruthless military despotism. So thoroughly was this schooling done that dependence upon authority became the cardinal virtue of the German people. The masses were molded into one mighty machine, contented at home, efficient in business, and equally fitted to fight their way in world industry or a world war. And however we may laud the rest of the world for their prowess in checking German aggression, a dispassionate judgment will not accord the victory solely to the military superiority of the Allies. Germany was not merely defeated in battle. She lost the war because her soldiers and the masses back of them lost confidence in their leaders. The whole superstructure of the state crumbled when its foundations were undermined.

From our standpoint, we see in the German system of education and in its logical outcome in the war a horrible example of what not to do, but we must be impressed with the fact that Germany has demonstrated that a vast population can be molded by education into the likeness of an ideal, even though that ideal, when realized, turns out to be not a god, but a golden calf. What German teachers have done, American teachers can do. We can set up an ideal characteristically American, and we can realize it, if the public will give us the necessary support. Not blind obedience but voluntary coöperation shall be our watchword. We shall seek contentment through intelligent exercise of our individual talents and find happiness in the possession of our own attainments.

I grant that our problem is infinitely more difficult than the one submitted to German teachers. It is far easier to quench ambitions than to arouse them and direct them aright. Never before has a nation been founded on the proposition that all men are created equal, and nowhere in history has intelligent self-direction been set up as a national ideal of education. It may well be doubted that such an ideal is possible of realization. Our own experience should make us skeptical of its practicability. When only four or five in the hundred of those who begin the climb of our educational ladder ever reach the top, what of the attitude of those dropped by the way? Should those who fail through no fault of their own be expected to rejoice in the success of their rivals? Is human nature so constituted that superior ability when denied its chance will acquiesce in

the leadership of inferior talent? How can contentment be secured under a system of free competition without that equality of opportunity which we laud in theory but neglect in practice? Difficult as our problem is, I do not despair of its solution. My faith is confirmed by the righteousness of our cause.

Up to this point I have been reckoning with conditions as they are rather than with things as they might be. I have tentatively accepted the doctrine that the whole educational problem of statecraft is the training of efficient leaders and contented followers. But this dichotomy of the educational process is purely logical. Leadership is a relative matter. Every normal human being may be at once leader and follower. I may excel in some particular, but there are a thousand things that others can do better than I can. Most of us take our religion ready-made. We depend upon the press for most of our current information. The wisest of us consult reputable physicians when we need medical advice, and much as we dread the lawyer, we do go to him when we get into legal trouble. And for food, shelter, and clothing we are dependent upon those who have the technical skill to do that which is beyond our range. Independent we may be in some small way, but in the large, our lives are bound up with others. If only we knew how to choose our leaders, and had the grace to follow them as we expect to be followed in our own specialties, we should soon arrive at a social millennium. And here is the clue to our educational maze. Leadership is expert service rendered to appreciative recipients. It is the interplay of service and satisfaction that begets mutual understanding and bridges the gulf between leader and follower. Expertness, mere efficiency, therefore, should not be the sole object of vocational training.

We earn our living by the skills that we possess, but we spend our lives and our substance in getting the fruits of others' labor. In every article purchased, in every acquisition, whether for pleasure or for profit, a choice is made, and back of that choice stands our own valuation of the worth of an expert in a field not our own. A sympathetic understanding of our social and economic problem is unthinkable, so long as half of the world is ignorant of how the other half lives. We need more knowledge of what men do and what they get from their labor, more information on what constitutes values in terms of our own needs. The editor of a popular magazine has recently told his readers that "after all, economics is little else than the study of man as he goes about his daily tasks of sowing, reaping, hiring out his labor or engaging that of others, trading, mining, manufacturing, buying, selling, renting, transporting the products of his own hands or of the soil, doing his best to keep a tight roof over his head and straining every nerve to provide for his children and to create some overplus of savings wherewith to stake other men who would engage in enterprises not immediately productive. If there be any study more homely, more democratic than this, any that clings closer to the soil or lies nearer to man's bone and marrow, it would be hard to name."¹

¹ *Saturday Evening Post*, June 24, 1922.

I should hesitate to suggest this addition to the curriculum of our public schools, if I did not think that much of what is now taught could profitably be displaced. I wonder why it is that we teach with such complacency the life history of the honey bee and humming bird, the brook trout and the woodchuck, and fail to include in our study the life history of the coal miner and the fisherman, the cotton planter and the dairyman, the textile worker and the engineer. More knowledge of things that count in everyday life is the chief desideratum in that phase of education in which people should be taught to follow expert guidance.

There is a corollary to this proposition that from the standpoint of public safety is more significant than is the main thesis. It is this: the ability to give expert service brings its own reward. Emerson expressed the idea which someone has put into these words: "The man who can write a better book, preach a better sermon, or make a better mouse trap than his neighbor, though he build his house in the woods, yet will the world beat a pathway to his door." The man who can do something well is sure to take pride in his handiwork; pride in his work will keep him everlastingly at it; industry backed by skill insures a living that satisfies; it leads to a competency of possessions that must be guarded. The ability to give an honest day's work, whether in professional pursuits or in manual occupations, is the first step in the evolution of the conservative citizen. It is a standing invitation to all onlookers to admire and to emulate. It begets leadership and that joy in work that relieves labor of its drudgery. In such a case, the job seeks the man and pays him his price. It makes him, however humble his trade, a capitalist, who has need of an education that will enable him properly to care for his income and invest his savings. In this direction lie social well-being and civil order. Vocational training is the stepping-stone, and not until every available person is provided with the means of becoming an expert worker, and trained to enjoy the income of his capital, shall we have that equality of opportunity which is the birth-right of all Americans.

The trend of my argument has carried me beyond the bounds apparently set in the topic assigned me. If the topic implies that an intelligent electorate is necessary only in respect to the choice of political leaders, it does not go far enough. Legislation and administration of government under law are necessary functions of society, but unless the letter of procedure conforms to the spirit of progress, there is no assurance of safety to the state. My view is that the right spirit comes from enlightened public opinion that voluntarily chooses to follow expert guidance in every phase of life.

Furthermore, I denounce as un-American the notion that our leaders constitute an aristocratic class entitled to superior advantages and privileged to exploit those less fortunate. When it is conceded that each normal person may be a leader in his own way, class distinctions disappear, and the only honor that is justified is the respect paid to work well done. If this world is to become a better place to live in and life made better worth

living, we must accept the Christian doctrine that service is the only true criterion of greatness.

Democracy, of all forms of government, is, as I have said, most in need of education. It must have leaders, both priests and prophets, not only those who work in the present, but also those who have a vision of the future. No education that can be given is too good for those who will use their powers in the service of mankind. No sacrifice is too exacting, if thereby those in need of guidance get the help they should have. Confidence in the integrity and unselfishness of leaders is the first essential in the democratic program of social reform.

The other factor I have stressed at greater length, because it is foreign to popular belief. The maintenance of civil order and social security logically precedes the rise of leaders. Unless one can work unmolested and be assured of the fruits of one's labor, there is no incentive to effort. Happy is the land where peace prevails. Contentment is a public blessing worth striving for.

It is obvious that at times and with certain groups of our population, we have tried every known means of securing respect for law and order. Even the hope of happiness in a heavenly state has been preached as adequate recompense for ills suffered in this life. Military discipline has been imposed in times of national peril, and our people have cheerfully borne its restrictions. Unbounded faith in the ultimate working together for good of all things American has made many of us incorrigible optimists. We acquiesce in decisions reached by unfair means in the expectation that time will bring a change.

There are signs, however, that our people will not long remain as docile as they have been in the past. Population is shifting from the country to the city. Elbow room is growing less. Competition is getting keener, and every year makes it harder for some to maintain a decent standard of living. The Old World with its woes stands begging at our doors. Discontent is spreading like a fatal disease among great groups of our citizens. This tendency, unless checked, can have only one result: our experiment in democratic government will surely fail, and with it, the hopes of a world worn out with travail of new-born ideals of freedom. The outcome rests with the teachers of America—teachers in the public schools, teachers in the colleges and universities, teachers in the press, teachers in the home and in the church teachers in business, and teachers in industry. There is no greater patriotic service. Are we ready to do our share?

THE EDUCATION OF OUR ILLITERATES¹

THOMAS E. FINEGAN, STATE SUPERINTENDENT OF PUBLIC INSTRUCTION,
HARRISBURG, PENNSYLVANIA

The illiterates of the country may be divided into three classes: the negro illiterates, the native-born white illiterates, and the foreign-born white

¹ This address was given before the Illiteracy Conference on July 6, 1922.

illiterates. The great mistake is often made of regarding the illiterates of the country as foreign-born white. The census of 1920 shows the number of each of these classes of illiterates to be as follows: negroes, 1,842,161; native-born whites, 1,242,572; and foreign-born, 1,707,145, with a total of 4,791,878.

From these figures it appears that nearly two thirds are native-born and only a little more than one third are foreign-born. The shocking feature of the situation is that one fourth of them are native-born white. A further study of the 1920 census shows that of these illiterates 687,618 are between the ages of 10 and 20; 4,103,260 are above 20 years of age. Those between 10 and 20 are classified as follows: negroes, 329,120; native-born whites, 201,903; and foreign-born, 56,595.

The humiliating feature of this analysis is that more than one half million of American children—born in America since the dawn of the twentieth century—are illiterate.

In considering the figures given by the United States census we must keep in mind the standard for determining literacy which the Government has adopted. Under this standard a person possessing the slightest ability to write, even though it be simply the mechanical ability to write his own name, is classified as literate. If the literacy of the country were to be based upon what we might call a functioning literacy—or a literacy of fourth grade achievement—the number of our illiterates would be more than doubled. We must also give careful consideration to the actual results revealed by the draft which showed that 25 young men in every 100 did not possess a functioning literacy.

The Nation should strike a swift blow at the illiterates between the ages of 10 and 20. Not one of them should be permitted to reach 25 years without obtaining a literacy achievement equivalent to the completion of the sixth year of our elementary public-school course. There should be no compromise on this question. No child in America capable of being taught should be illiterate when he reaches his "teens."

There should also be inaugurated an effective program which, within a decade, shall be able to reach every native white illiterate under the age of forty and teach him to read and write.

Negro illiteracy was reduced six per cent during the last decade, but that there are still approximately 2,000,000 illiterates among the negroes and that a large per cent of these are found in eleven States make the question an acute problem of National importance. The Nation should no longer tolerate this injustice to these people. Many of the States carrying this burden have shown commendable courage and vision in the work which they have undertaken.

Each of the classes of illiterates defined has its own peculiar problem, but the questions involved in the education of the foreign illiterates are probably the most troublesome. There are 1,707,145 in this group, measured by the standard of the literacy employed by the Government in its census enumeration.

In spite of the subnormal immigration, of more stringent legislation, and of marked increased effort to provide educational facilities for illiterates within the last decade, there has been but little reduction. No State has inaugurated a sounder or more effective program in this field or waged the battle more persistently than the State of New York or the State of Massachusetts, and yet in spite of it all the number of foreign illiterates in each of these States has been only slightly reduced during the past decade.

From the founding of our National Government until 1882, Congress imposed no restrictions whatever upon immigration. We opened wide our doors and encouraged all who would to come. Through the Congressional Act of 1882 the Government entered upon a policy of selective immigration which has been gradually strengthened. The whole subject of immigration has been one of extensive Congressional investigation. President Roosevelt carefully considered the subject in comprehensive messages to Congress and advocated the sound policy that our immigration laws should be amended in a way that would enable the Government "to keep out all immigrants who will not make good American citizens."

The amendments to the immigration laws in 1897 conferred upon the Government officials enlarged powers in dealing with the immigration problems and also definitely described the classes which might be excluded from admission to the country. The strengthening of the immigration laws and the stricter enforcement of their operation did not result in the restriction of immigration. The number of immigrants who came into this country increased at a rapid rate. In 1914 the number reached 1,218,480. The number of illiterates among the immigrants coming to this country has constantly increased assuming proportions which bear important relations to the social, economic, and political interests of the Nation. The number of illiterates coming into this country during the years preceding the outbreak of the war increased in eighteen of the leading States of the country, including Massachusetts, New Jersey, Connecticut, New York, Illinois, California, and Pennsylvania. The census of 1920 shows that the approximate number of illiterates above the age of sixteen in the United States is five million. This number would have been greater had there not been a suspension of immigration during the War.

Students of social and political problems have anticipated the embarrassment which was bound to come to this country through the admission of these illiterates without a definite policy requiring them to meet educational standards after entering the country. For some years those giving this subject careful thought have advocated a literacy test. Senator Lodge introduced in 1896, twenty-six years ago, an immigration bill containing a literacy test. This measure proposed the exclusion of all persons between fourteen and sixty "who can not read and write the English language or some other language." The Lodge measure passed Congress in modified form, but was vetoed by President Cleveland. President Taft vetoed a similar measure in 1913, and President Wilson vetoed one in 1915, and

again in 1917. Congress passed the 1917 measure over the veto of the President, and the provisions of this Act became effective on May 1, 1917.

Under the terms of this law, all aliens are to be excluded who are over sixteen years of age, who are physically capable of reading but who cannot read. This law exacts that a test shall be given each alien before being admitted, and that such alien must be required to read "not less than thirty, or more than eighty words in ordinary use." The law does not exact that the alien shall be able to read English. The law is satisfied if the alien reads in English or some other language or dialect. The law furthermore exempts those from this test who seek admission because of religious persecution and certain others who are relatives of American citizens or of admissible aliens.

The reports of the Commissioner General of Immigration show that the rejections due to illiteracy have been as follows: 1917, 391; 1918, 1,598; 1919, 1,456; and in 1920, 1,639. The reports of the Commissioner General of Immigration also show that from 1918 to 1921 the following number of illiterates were admitted: 1918, 3,512; 1919, 1,817; 1920, 15,094; and 1921, 27,463. These figures warrant the prediction that the literacy test prescribed under this Congressional Act will not prove sufficient defense against the continued admission of illiterates.

In all the discussion which has taken place upon this subject, there has been a common agreement that the initial step necessary in the solution of this problem is to teach these illiterates to speak and write the English language. These people cannot become happy, contented, useful citizens until they are able to express their needs, desires, and thoughts in the common language of the country. They have practically entered a new world, in which individual rights and governmental authority have such an entirely different status and are based on such different principles of political philosophy that they must also become interested in and be able to inform themselves upon the social, industrial and political questions which are fundamental to the progress and prosperity of a democracy.

We are therefore confronted with the problem of giving instruction in the fundamentals of an English education to a vast army of at least 5,000,000 adults who are now within the boundaries of the Nation, and such additional illiterates as may be admitted in the future under the immigration laws.

The question therefore naturally arises, upon whom does the obligation rest of assuming the burden and responsibility of providing educational facilities for this great body of illiterates? All questions related to and growing out of the immigration problem are national. The National Government controls every phase of the immigration question. It determines what aliens may be admitted to this country, the conditions upon which they may be admitted, and it also prescribes the basis upon which they may be naturalized and admitted to American citizenship. The whole problem of adult illiterates is therefore a National and not a State problem. The National Government should therefore recognize the

necessity of attacking this problem without further delay, and should enact such laws and provide such funds as are necessary to construct an organization and execute a plan which shall, within a reasonable period of time, wipe out adult illiteracy in this country.

Had the policy recommended by President Grant in his message to Congress one half century ago been adopted, this country would have no problem in adult illiteracy today. Grant's vision enabled him to see the evils which would accumulate under the policy of the Nation admitting to its shores from year to year a large body of adult illiterates. Grant saw the wisdom of insisting that all foreigners, literate as well as illiterate, who came to this country should be trained to acquire a usable knowledge of the English language.

Several measures relating to this problem are before Congress, and we may reasonably expect that in the near future the Federal Government will assume this obligation and responsibility and take up the burdens involved in the solution of illiteracy. When the National Government does undertake this work it should be upon a plan which recognizes the public-school system of each State as the chief agency through which this work is to be performed. Without financial or economic loss of any kind the several States may therefore enter upon a definite program which contemplates the teaching of every illiterate within their borders to read and write in English.

If the Nation is to approach this problem in a serious, determined manner, we must comprehend a plan which will provide instruction in English for 5,000,000 adults, one third of whom speak an alien tongue. This means that provision must be made for giving instruction to a body of illiterate men and women who are equal in number to at least one fifth of all the children enrolled in the public schools of America. A plan to provide educational facilities for this large number of adults must be founded upon a system similar to that constructed for the education of the children of the Nation. Wherever public-school systems are maintained it has been learned from experience that attendance laws cannot be effectively enforced without a census of the children who are required to attend. An effective National program for the instruction of adult illiterates cannot be inaugurated until a census of the illiterates in each school district is made available for the school authorities.

This information should be available by wards for the cities, and by districts for the townships. The immigration officers at the ports where immigrants land should obtain the names and the destination of those who are illiterate. The National Government and the State within which these illiterates take up residence should know where such illiterates may be found, and each school district should have such data.

Each State must be recognized as an administrative unit. The States must, in turn, be divided into zones or districts, based upon the extent and topography of the State and the number of illiterates therein. For geographic and other reasons it will be necessary to subdivide some of these

zones or districts, which will be in charge of an experienced worker in the field of adult education. This director should devote his whole time to such work and should be a paid employee of the Government. In some of the zones containing the largest number of illiterates—as for instance, New York, Chicago, and Philadelphia—the director should have assistants who are familiar with the difficulties involved in reaching the home through the education of the illiterate women. School superintendents and other employees of the public-school system, and others interested in this phase of our educational problem may be employed to advantage in the supervision of this work under the zone director without compensation.

A Citizens' Committee should be organized for each district within a zone. This committee should contain representatives of leading industrial and mercantile plants, of labor organizations, of city or county authorities, of local school authorities, of each of the great divisions of religious faiths, of civic organizations, and of the organized activities of women. The zone director should coördinate the work through this committee so that each agency in the zone may be given a definite piece of work to perform, and such agency should be held responsible for the accomplishment of such work.

There should be no waste of effort and no overlapping of functions. The zone director and the citizens' committee should determine what classes shall be organized and where they shall be maintained. When these questions are agreed upon, the director should, in coöperation with proper local authorities, organize such classes. He should then place in the possession of the committee the names and addresses of the illiterates in that community to be served by such classes, and arrangements should be made through the committee utilizing every agency interested in such work to have each of the organizations or interests represented on such committee become responsible for a complete canvass of these illiterates and to induce them, if possible, to attend such classes. *

The public-school system with its organization and equipment should be utilized to the limit. The social and recreational features of school work should bring the home in closer contact and under greater influence than ever before. The foreigner may be reached through these avenues. Games and amusements which men and women usually enjoy may be made an effective agency in teaching English to foreigners.

The great potential power of music should be made a vital factor in reaching the foreigner and in teaching him English. We must marshal the musical talent of our foreign population and make it a mighty power in developing patriotic ideals.

All the socializing processes and influences of our public system of education, through the schools as community centers, should be employed in enabling the foreigner to interpret American standards and ideals and in obtaining those things in life for which his heart has yearned, and which he came to America to obtain.

While all of these agencies will be of great aid in promoting education among the foreign population, it will be necessary not only to establish

classes in public day schools to teach English to our non-English speaking population, but it will also be necessary to organize evening classes. The law should make it mandatory upon school authorities to establish either day classes or evening classes whenever ten or more adults unable to read or write English express a desire to receive instruction in that subject.

It will not be possible to reach all illiterates through the establishment of either day or evening classes. Large numbers who have worked all day will not be in proper physical condition for the mental concentration required in attendance upon classes in the evening. Others who are somewhat timid will not care to go to these classes which are maintained in public places. Whenever it is impossible to induce these men or women to go to a class in a school house, the privileges and opportunities of such classes should be taken to them. Thousands of these illiterates must, therefore, be reached through the industrial plants in which they are employed.

In many instances it will be possible to organize classes in church or in connection with auxiliary societies of churches. In some places, churches have already organized such work. This service should be cordially accepted and encouraged.

It will be necessary in many cases to go into the home to reach some of these deserving people. This will be particularly true of the women. The whole plan of this service must contemplate that the interests and needs of women shall be given the same consideration as those of the men. Home classes especially for the women should therefore be maintained.

When classes are organized in day schools or in industrial plants or factories, it must be done under stipulated agreement at a time which will interfere as little as possible with working hours. The management of industrial plants may not always be able to give the time required for this period of instruction. There are, however, many such plants which will find that the amount expended for this purpose will result in substantial reduction in expenditures under the provisions of the industrial compensation law. Those who are to receive the instruction should be made to feel that the benefits to be derived therefrom will more than compensate them for the time given to this work. It may often be found advisable and equitable for employer and employee to share in this expenditure. Classes in day schools and in industrial plants and factories should be formed for such hours as will probably best serve the convenience of employees when they are free for such purpose. In agricultural sections classes should be organized at the periods of the year when farm work is not pressing. The adjustment of this question is delicate and difficult, but the importance of the situation requires that an adjustment be made.

Organized labor has generally shown a lively interest in the education of the adult illiterate. If this great organization would exert the full power of its influence in behalf of a campaign to induce every alien to learn to read and write English, it will be one of the most potent factors in the solution of the great problem of illiteracy.

In addition to the influence which this organization may exercise upon the minds of the illiterates, its active coöperation in this work will stimulate the thought and sympathy of large numbers of men who are competent to teach the illiterate and who may render invaluable service in this field. A wise program which deals with this subject will cordially welcome the coöperation of labor unions and will seek their advice and counsel in the preparation of plans to provide instruction in any community for the adult illiterates.

There is no organization in the country whose members are better informed of the necessity of inaugurating a plan to wipe out illiteracy than the American Legion. They saw with their own eyes that among the men in their ranks drafted to fight the battles for the preservation of civilization and of democratic institutions one fourth of them did not possess sufficient education to interpret properly the orders from their superiors and thus were unprepared to become efficient soldiers.

Provision must be made for a body of properly trained teachers to give instruction to the alien. Many successful teachers in public and private schools have proved an absolute failure when assigned the task of instructing alien adults. The successful teacher of the adult illiterate who speaks a foreign language must know the best method by which these people may be approached as well as the means and methods of instruction. Persons who have not had experience in this field and who have not made special study of the problems involved in teaching adult illiterates may do incalculable harm by undertaking such work without proper supervision. A large number of men and women have made special study of this field during the past ten years and certain well-defined methods of procedure have been established. These should be observed. Teachers and others who volunteer their services or who undertake the work for other reasons should be given special training.

Many of our universities and colleges now give courses in Americanization. These courses have provided many trained supervisors and directors in this new work which has naturally fallen upon the public-school system. Some of our State normal schools have also undertaken to train these educational workers. In many instances summer classes have been successfully maintained in these institutions.

However, the most effective method of training teachers for this special service is through institutes which are held in the large industrial centers. These institutes cover from one to two weeks and are under the direction of men and women who have had large experience in the instruction of adult illiterates—those of native and also those of foreign birth. This method is inexpensive to the State and community and brings the opportunity to receive training without expense to a large number of teachers. The institute may also be made an agency for informing the public and developing a sentiment which will give support to the movement to wipe out illiteracy.

When these people have acquired the ability to read and write English, proper literature should be supplied them to direct the lines of reading

which they shall follow. Unless the habit and desire to read is cultivated and directed from proper courses, it will be stimulated from dangerous agencies. Those who have acquired only an elementary knowledge of reading may be made the subject of propaganda which will be destructive to our whole social fabric. Follow-up work along these lines is necessary, and should be provided. The public schools are in a position to render a vital service. The libraries of the country are prepared to aid and will cheerfully coöperate as they have been pioneers in this field. Travelling libraries for camps, industrial plants, and communities in which libraries have not been established should be provided. The public press should be made one of the first textbooks used in this undertaking.

Selected courses of reading adapted to the purpose in mind should be prepared. These should point out America's true relation to the world, America's philosophy of life and government, America's high-minded dealings with the nations of the world, America's history and traditions in protecting individual rights and national freedom, her championship of equality of opportunity, and her exalted standards of honor, right, and justice.

The establishment of these classes and schools, and all the energy, labor, skill, and patriotic endeavor which the school authorities, the churches, the management of industrial plants and all other agencies interested in this problem may put into the work will not succeed in placing America's army of illiterates under instruction. If we are to succeed in teaching these illiterates to read and write in English, there must be reasonable compulsory statutes requiring all under certain ages to acquire a usable knowledge of English within a specified number of years. No person should be admitted to citizenship who cannot meet such requirement. To make such compulsory statutes effective, the employment of illiterates should be conditioned upon their entering classes for instruction and continuing therein until they obtain a usable knowledge of English.

The private day school has become an important factor in America's education. The service which it performs has a direct bearing upon the subject under consideration. Every private elementary school to which children are admitted during compulsory school ages should be required to maintain standards equivalent to those required in public elementary schools. Buildings, equipment, safety requirements, sanitation, school term attendance, and curriculum should be the equal of those required in a public-school system. Elementary schools are maintained in many States in which the general instruction is in a foreign language. If the Nation and the States are to utilize their educational and financial resources to wipe out illiteracy and to produce a nation of English-speaking and American-thinking people, mandatory laws must be enacted and enforced which shall require instruction in English in every public or private elementary school in America.

In many cities and communities this work of instruction has been under way for some time and an organization in coöperation with the schools, with chambers of commerce, with women's clubs, or with church or other

organizations has been established. In these cities or communities such organizations should be made the nucleus for an enlarged organization able to bring under instruction every illiterate in such communities.

Our commercial and industrial life and the opportunities afforded under our form of Government have always attracted and should continue to attract to America large numbers of immigrants. The great majority of those who have come have made a large contribution to our prosperity and our civilization. They came here because they believed greater opportunities were to be found in America to improve their social and living conditions than could be found in any other country in the world. They are numbered among the best citizens of the Nation. This type of immigrant should be encouraged in all proper ways to continue to come into our country.

Is it not reasonable to assume that if a young man, because of the lack of fundamentals of an education in English is disqualified to discharge his duties as a soldier in times of war that he is for the same reason disqualified to perform his obligations in the civil affairs of citizenship in times of peace? Can an uneducated man be more effective in civil affairs than he can be in military affairs?

Should not the Nation, therefore, prescribe as its minimum intellectual standards for all citizens in times of peace those which are the equal of the intellectual standards prescribed by the Government for military service in times of war?

Reports of Committees

*REPORT OF THE SUB-COMMITTEE ON SALARIES*¹

MYRA L. SNOW, SEATTLE, WASHINGTON, CHAIRMAN

Outstanding facts which present themselves in the salary situation are, on the whole, encouraging. In a year when retrenchment and wage reduction are the general order in industry and business, teachers' salaries are holding prevailingly steady. Out of 67 cities of the United States, including all those of over 100,000 population and others which pay salaries comparable with these, in March, 1922, four reported increases for the coming year, five were hopeful, five did not reply, and two were doubtful. All the others expected to maintain schedule, which would include automatic increases. Of the five not replying in March we know that three maintained schedule. Out of 116 cities between 25,000 and 100,000 population 46 cities will increase from 50 to 100 per cent of the salaries of their teachers next year either through automatic increase or from actually raising the whole schedule. Sixty-one reported that from 50 to 100 per cent of their teachers will receive the same salary next year, while only six reported any decrease. Five of these six were to decrease less than 20 per cent of their teachers. Of cities under 25,000, 188 of 488, report that from 50 to 100 per cent of teachers will receive increases, in 317 of the 488 from 50 to 100 per cent of salaries will be maintained. Only 68 of the 488 report any decreases and most of these report a small percentage to be decreased.

It is encouraging that so many of the smaller cities are adopting salary schedules. Out of 447 cities under 25,000 population 372 operate with established schedules. It is desirable to work for the establishment of regular schedules in all cities and towns and county schedules for rural teachers where a county unit makes such possible. It is a little more difficult to set aside a schedule than arbitrarily to cut teachers' wages.

There has been a decided tendency, especially in the larger cities, to increase the room load of each teacher in order to meet the need for retrenchment; while generally this was a choice between two evils, we must be on our guard to bring numbers back to the best working basis as soon as possible. This touches the immediate best interests of the child. A good teacher with a large room can do better work than the poor teacher with a small room, hence the necessity for maintaining salary, but the public must be made to see that the good teacher with a moderate enrolment gives best service to boys and girls.

In 44 cities of over 100,000 population the median is 38 pupils per room in grades and 25 per room in high schools. These numbers are slightly smaller for grades and about the same for high schools in some 700 smaller cities reporting.

¹ In addition to the chairman, this committee includes the members listed on page 29.

Practically all cities grant some allowance for sick leave with salary but this is very inadequate in over 50 per cent of the cities reporting. Ten days on full salary is the median allowance made by cities over 25,000 population and three days on full salary the median allowance made by those under 25,000. While we have no statistics to bear out a statement we believe we are entirely within the facts when we say that at least 50 per cent of teachers' illness is traceable directly to contagion in the school-room, or the result of conditions under which work is done. In view of this we should work for adequate sick leave allowance with salary.

It is interesting to note that while many of us find that our nominally increased salaries do not reach as far as they did in 1913, statistics show that purchasing power, or real wages, of the average United States teacher's salary has actually increased 13 per cent since that year. In *money* the average salary has risen from \$515 to \$1017 in the last ten years. Government figures on cost of living show, as stated above that this amount is only 13 per cent greater in *purchasing power*. A comparison of median salaries in 28 cities of over 100,000 population in 1912-13 and 1921-22 shows that in six of these cities the percentage of salary increase has been swallowed up by the increased cost of living and the present "real wage" is actually lower than in 1913. The index of living cost is going down slowly since it reached a peak in 1920. If this decrease continues our "war raise," which by the way, did not generally come until 1920, may really become an appreciable increase in "real" salary and may form the beginning of that professional increase we have been working for. At present on the average we are just about holding our own while probably one fifth of the teachers the country over are working with lowered standards of living—this is an estimate for which we have not adequate data, but it is borne out by statistics in the cities. The great problem before us is to get the actual status of salaries and living costs before the general public. When school patrons realize that teachers are entitled to a professional increase which they have never received there will be less talk of going back to pre-war levels. Teachers themselves must believe in their own cause, must acquaint themselves with the available statistics, and must realize that a principle is involved, that the future good of America's youth depends upon the type of teacher employed in the public school. I quote from the *Washington Education Journal*, of March, 1922: "Teachers were among the last to receive salary increases in the wake of the rising cost of living; they should not be among the first to be reduced. Since teachers' salaries lagged so far behind the rising costs of living, they never reached a high peak elevation as did war profits and war wages. . . . Adequate salaries are the least expensive net investment school boards and the paying public can make in their schools, not only because a good teacher is worth all she costs, but also because . . . most of the salary of the teacher goes right back into the same community."

Reports on the single salary schedule in the five larger cities where it is employed make an interesting and enlightening study. Fifty-three answers

to questionnaires were received from various administrative and executive heads in these places. Of these 41 made no objection in theory and 38 no objection in practice, 51 reported that it had a good effect on the morale of the corps, 17 that it eliminated class distinction between grade and high-school teachers, and 20 that it decreased such distinction, 34 reported a good effect on efficiency in teaching, and all a good effect on preparation of teachers. The basis for promotion being training, experience, and efficiency, the rating question becomes a prime factor in the operation of the single salary schedule. This problem of rating, however, is facing us squarely in every system. We may avoid the issue, but it will be only for a short season. We have met it in Seattle this year in practically every conversation we have had with a business man concerning salaries. I have no doubt every salary committee in the country could testify similarly. We must meet the issue and work toward a solution within our own organizations or a merit system designed by outsiders with no appreciable understanding of school problems, will be forced upon us. A member of long standing on the Seattle School Board who has stood consistently for low salaries, told me this winter that he would heartily favor a higher wage than we have ever thought of for a teacher who was teaching very successfully after long years of service but that we could never get any business man to favor a scale of automatic increases whereby a beginning teacher could reach the height of her profession, from a salary standpoint, in seven or eight years. I believe I am voicing the sentiment of the majority when I say we do not want to work under a "merit system" as usually administered and understood today. Can we make a scientific study of the whole rating question and if humanly possible evolve a working plan? I should like to recommend this as a major matter for consideration in the Association the coming year.

Suggested by the rating problem two injustices in salary administration come to mind. A study of comparative grade and high-school schedules in all the large cities of the country shows that there is great discrepancy in the number of steps between minimum and maximum salaries for the two groups and a corresponding discrepancy in the amount of increment in each step. In 27 of 67 cities of over 100,000 population the increment of the high-school teachers' yearly increase is larger than that of the grade teachers. Since the extra expense of high-school teachers' preparation is taken care of in the differential regularly established on the basis of paying for extra preparation, this seems unjust, as a high-school teacher's value to the community does not increase at any greater rate per year than does that of the grade teacher. A second thing which needs adjusting is the prevailing custom of giving credit for only a small part of a successful teacher's experience when she begins work in a new field. One year, two at the outside, are all that are necessary for a teacher to become adjusted to the new system and all other experience should be credited.

A study of the rural-school situation from the salary standpoint leads one to the conclusion that the tragedy of American education lies in these

schools which still employ teachers whose median salaries range down to \$239 a year. From statistics filed in the Research Department of the National Education Association it is estimated that a total of 39,430 rural teachers during the school year just passed have received an annual salary of less than \$500. The median salary for the whole country, of 143,573 rural teachers reported for, is only \$774. How can we dream of an enlightened America until such conditions are bettered? *The remote school with very little supervision needs the trained, experienced teacher more than does the city with its close supervision.* Following are figures from which you may draw your own conclusions. The median salary in one and two teacher schools, 1921-1922, ranges from \$239 to \$1269, in consolidated schools from \$600 to \$1550. Consolidation is doing its part to solve the rural problem but the median for consolidated schools throughout the country of \$987 is far too low.

An adequate minimum wage law for teachers would seem one way of attacking this evil. Minimum salary laws have already been adopted by a number of our States. In some of them, however, the minimum fixed is so low that it affects but a small percentage of the most flagrantly underpaid teachers. Enactment of laws fixing higher minima and containing proper certification provisions, so that they become completely operative only after such a period of time as would allow teachers of a State to take necessary training, ought to relieve the situation. This consideration of professional training and minimum wage brings us to the conclusion that the economic solution must eventually become the professional solution. Teachers will invest money in training which will bring adequate returns in salary. We are very, very far from a professionally trained teacher in every schoolroom in America. In 45 cities of over 100,000 population one requires no training beyond eighth grade, five require only two years of high school, and one only four years of high school. In 540 cities under 25,000 population, 16 require no training beyond eighth grade, 13 require one year high school, 97 require two years of high school, six require three years, and 69 require only four years beyond eighth grade. I have no statistics for rural communities, but it is safe to say that no trained teacher is working today for less than \$500 per year, and no teacher who is compelled by law to invest in a two-year normal course before she can teach even a one-room rural school will teach that school for \$774 a year, the present median salary in such schools. While on this subject of economics and professional training I want to treat one more matter which I believe needs constructive consideration and remedial action, legislative or otherwise. Concerning this I have no tabulated statistics. I am judging from conditions which I have observed in several normal schools. Each can verify for himself the point as touching his own local normal. I have found that the highest paid teachers in many normal schools are those who teach academic subjects to the students. Mathematics, geography, and history teachers, and teachers of theory, draw the salaries which approach adequacy, while instructors in the training school with the student

teachers draw salaries almost if not quite as low as we should expect the normal graduate to command after a year of teaching. Here is a real wrong to be righted. The strongest personality, the most inspiring and efficient worker, the greatest breadth of vision and the keenest mind should be found where the instructor can exert the greatest influence on the future work of the student teacher. There is no way to obtain for such a position a person who has the desired qualifications save by paying a convincing salary. Let us investigate this.

Another proof that the economic is going to be the professional solution is found in the single salary cities, where teachers are taking much interest in university or normal work which will add the desired increment to next year's salary. It is also encouraging to know that in thirteen of the 67 largest cities in America, salary recognition of some kind is given to those teachers who attend summer school. In six of these cities some provision is made for leave of absence to study with part salary. Thousands of teachers for years have been spending their hard-earned pittance to improve themselves with no such recognition. The bridge is being finally built, though over the bodies of the many who fell fighting in the stream, so let us continue to educate and to legislate.

In conclusion I wish to acknowledge the splendid work done by the Research Department of the National Education Association, under the direction of Mr. John K. Norton, in compiling statistics for the salary committee. These tabulated statistics are published in a bulletin easily obtained by anyone interested. I also wish to acknowledge the help obtained from the U. S. Bureau of Education, from the report of the Seattle Principals' Association on the single salary study, Mr. Dio Richardson, chairman; and from the extensive study made by the Salary Committee of the Seattle Grade Teachers' Club, Mrs. Dora S. Herren, chairman.

To summarize the points which I wish to leave for your consideration: (1) Possibility of helping the rural situation through consolidation, adequate State minimum wage laws for teachers, and adequate certification laws; (2) need for placing highly paid, efficient teachers in charge of student teachers' practice work in *all* normal schools; (3) open minded study of the possibilities of the Single Salary system; (4) education of the public concerning salary status as evidenced by relation of "money wage" to "real wage," and (5) a thorough and scientific study of the possibilities of a rating system which shall be just and which shall make it possible to solve salary problems in a large school unit.

*REPORT OF THE SUB-COMMITTEE ON TENURE*¹

HARLAN UPDEGRAFF, PROFESSOR OF EDUCATIONAL ADMINISTRATION,
UNIVERSITY OF PENNSYLVANIA, CHAIRMAN

The Sub-Committee on Tenure has, during the last year, been engaged in gathering such facts as will assist in a solution of the controversial ques-

¹ In addition to the chairman, this committee includes members listed on page 29.

tions that have arisen regarding tenure. One aspect of this study has been completed and is reported upon herewith. Other studies are being made, and as they are finished, reports covering them will be made.

This report contains a Digest of State Laws in the United States containing tenure laws in force at the present time. In addition are given the new tenure law recently passed in California, which has a number of excellent features, and a copy of a bill presented to the Ohio State Legislature which failed of passage but which is considered by many to be the best legislative measure upon this subject that has yet been prepared.

This material is printed in the hope that it may be of assistance to teachers, superintendents, and school boards in the framing of legislation for their own States.

The Digest of Laws was prepared by Mr. Joseph Bardy, of the West Philadelphia High School for Boys, under the direction of the Chairman and with the assistance of the members of the Practicum in Educational Administration, University of Pennsylvania.

APPENDIX 4, STATE LAWS

California, 1921

ASSEMBLY BILL No. 378

CHAPTER 878

An act to amend section one thousand six hundred nine of the Political Code, relating to the powers and duties of boards of school trustees, and city, and city and county boards of education.

[Approved June 3, 1921]

The people of the State of California do enact as follows:

SECTION 1. Section one thousand six hundred nine of the Political Code is hereby amended to read as follows:

1609. Boards of school trustees, and city, and city and county boards of education shall have power and it shall be their duty:

First—To employ a principal for each school under their control, and they may employ a district superintendent for one or more schools employing eight teachers or more under their control. In each city school district governed by a city board of education, such board may employ a city superintendent of schools and such deputy or assistant city superintendents as it may deem necessary and fix and order paid their compensation unless the same be otherwise prescribed by law. Any deputy city superintendent of schools, or assistant city superintendent of schools, or district superintendent may be elected for a term of four years.

Second—To employ the teachers, as provided in part fifth of this section; also to employ janitors and other employees of the school; to fix and order paid their compensation, unless the same be otherwise prescribed by law; *provided*, that no board shall enter into any contract with such employees, other than teachers, to extend beyond the close of the next ensuing school year; except that teachers may be elected on or after May second for the next ensuing school year and each teacher so elected shall be deemed re-elected from year to year except as hereinafter specified; *provided*, that any teacher who shall fail to signify his acceptance within twenty days after notice of his election or employment shall have been

given him by the clerk or secretary of the governing board of the school district, or shall have been mailed to him by such clerk or secretary by depositing such notice in the United States post office, with postage thereon prepaid, addressed to such teacher at his last known place of address, shall be deemed to have declined the same. Any board of trustees, or city, or city and county board of education may arrange to pay the teachers or principals so employed by them in ten or eleven or twelve equal payments instead of by the school month; *provided, however*, that where the board of trustees or city or city and county board of education arranges to pay the teachers or principals so employed by them in twelve equal payments for the year, they shall begin such payments on the first day of the calendar month following the opening of schools for the current year in all cases where school is opened during the month of July, and in all cases where school is not opened during the month of July, the board of trustees or city boards or city and county boards of education may withhold such warrant or warrants which may have fallen due prior to the opening of school until the teachers or principals so employed by them shall have returned to the employment for which they were engaged by the board of school trustees or the city or city and county board of education and shall have resumed their respective duties, and then such payments shall be continued from month to month on the first day of each calendar month thereafter until said teachers have been paid the full amount due to them for that fiscal year; *provided*, that a teacher who serves less than a full school year is entitled to receive as salary only an amount that bears the same ratio to the established annual salary for such position as the time he teaches bears to the annual school term; *provided*, that whenever the first day of the month falls upon a holiday, payment of teachers' salaries shall be made on the following day.

Third—To appoint, and, in their discretion, pay district librarians, and enforce the rules prescribed for the government of district libraries.

Fourth—To employ in their discretion supervisors of subjects and fix and order paid their compensation unless the same be otherwise prescribed by law.

Fifth (a) To employ, as teachers, only persons who hold legal certificates for teaching in full force and effect, and on file at the time of such appointment in the office of the county superintendent of schools, to serve as substitutes, probationary or permanent teachers, and to give the county superintendent of schools immediate notice in writing of such employment on blanks furnished by the superintendent of public instruction, stating the name and address of each person thus employed.

(b) To fix and prescribe the duties to be performed by principals, teachers, librarians, janitors, and all other employees in the school district.

(c) To classify as substitute teachers those persons employed as teachers from day to day for less than one school year, to fill positions of regularly employed teachers absent from service.

(d) To classify as probationary teachers those persons employed as teachers for the school year, and who have not been classified as permanent teachers, as hereinafter provided, such classification to be made at the time of employment, and thereafter in the month of July of each school year.

(e) To classify as permanent teachers all persons who shall have been successfully employed as teachers by the district for two consecutive years at the time of classification; *provided, also*, that the two years of successful service shall have been performed in a district employing at least eight teachers under a principal who shall devote at least two hours per day to supervision in the school or schools under his control. Such classification shall be made at the end of the two years of such employment.

(f) To grant leaves of absence to teachers.

TENURE LAWS IN THE UNITED STATES

State	California	Maryland	Massachusetts	Montana	New Jersey	New York	Oregon
I	2	3	4	5	6	7	8
Tenure	Indefinite	Permanent	Permanent	Indefinite	Permanent	Permanent	Permanent
Application State-wide	All principals and assistant teachers			Any district in the State	Any school district of the State		School districts population of 20,000 or more
Not State-wide	Districts with 8 or more teachers		Every town except Boston			Schools of a city	
Educational Qualifications for Protection under Tenure Laws	Legal certificates for teaching in full force and effect, and on file in the office of the county superintendent of schools				A proper teacher's certificate in full force and effect	Teacher's certificate or diploma from State normal school or State normal college. A board of educ. may prescribe additional or higher qualifications	
Probationary Period	Two years	Two years	Three years	Two years	Three years	One to three years	Two years
Dismissal after Probationary Period Usual Causes	Immoral or unprofessional conduct, incompetence, evident unfitness, insubordination	Immorality, misconduct, insubordination, willful neglect of duty	Unbecoming conduct is the only cause specifically mentioned	Immorality, unfitness, incompetence, or violation of rules	Inefficiency, incapacity, conduct unbecoming a teacher, other just cause	Neglect of duty, incapacity to teach, immorality, other sufficient reasons	Gross dereliction of duty, misconduct on the part of the teacher
Other Causes	Decrease in no. of pupils in district; discontinuance of a certain kind of teaching		Decrease in the number of pupils in schools of town		Natural diminution of number of pupils in school district	Treasonable or seditionous acts or utterances	

Written Charges	By governing board	By Co. Bd. of Educ. on recommendation of Co. Supt.	By school committee	By Board of Trustees	Board of Education; signed by persons making charges	Procedure not specified	Board Directors; Supt. or any person through Supt. or Board Directors
Notice	Ten days	Ten days	Thirty Days	Teacher, May 1; principal, Feb. 1	Reasonable	Reasonable	Ten days
Hearing	Public; witnesses; counsel; trial—completed in 10 days	Procedure not specified	Before school committee; one witness	Not mentioned in code	Counsel; procedure not specified otherwise	Counsel; procedure not specified otherwise	Summary; not more than 10 witnesses; counsel
Removing Agency	Boards of School Trustees, city and Co. Bd. of Educ. Affirmative vote of majority of board	County Board of Education	School committee; two-thirds vote of whole committee on recommendation of superintendent	Majority of members of Board of Trustees	Board of Education	Majority vote of the Board of Education	Majority of members of Board of Directors; final if 5 of the 7 members vote for dismissal
Appeal	Court of competent jurisdiction on a question of fact and law	State Superintendent of Education is not unanimous	No appeal provided for	County Superintendent	Commissioner of Education	Commissioner of Education	Three Trial Commissioners, appointed by presiding judge of circuit court to serve a year
Miscellaneous, including Suspension, Demotion, Rank, Salary, Resignation	Resignation not later than the close of the school year	Resignation; 30 days' notice during June or July	Suspension without loss in pay if charges are not sustained; reduction on general salary revision	Suspension without loss in pay if charges are not sustained			Reduction of salary or demotion in rank only after hearing, as under dismissal
References	School Law of California, 1921, Section 1609, Article 7, pp. 129-34	Maryland School Laws, 1918, Chap. 506, By-Laws 13, pp. 23-4	General Laws, Relating to Education, 1921, Chap. 71, Sec. 42, pp. 39-41	School Laws of Montana, 1915, Chapter 8, Section 801; Section 805, pp. 59-61	N. J. Laws, 1914, Chap. 243, B. L. 1909, pp. 66-8; N. J. Laws, 1918, Sec. 116, pp. 60; Appeals, pp. 297-8	Education Law, 1921, Article 20, Sections 550-68, pp. 171-7; Article 33-A, Section 872, pp. 264-6	Oregon School Laws, 1921, Chapter 10, Sections 391-404, pp. 120-31

(g) To accept the resignation of any teacher and to fix the time when such resignation shall take effect, which date shall not be later than the close of the school year during which such resignation shall have been received by such board.

(h) To dismiss substitute teachers at any time at the pleasure of the board.

(i) To dismiss probationary teachers during the school year for cause only, as in the case of permanent teachers, except that on or before the tenth day of June in any year the governing board may give notice in writing to a probationary teacher that his services will not be required for the ensuing school year. Such notice shall be deemed sufficient and complete when delivered in person to the teacher by the clerk or secretary of the governing board of the school district or deposited in the United States registered mail with postage prepaid, addressed to such teacher at his last known place of address.

(j) To dismiss permanent teachers, principals, or supervisors of special subjects, except as hereinafter provided, only for one or more of the following causes, after a fair and impartial public hearing. Causes for dismissal are immoral or unprofessional conduct, incompetence, evident unfitness for teaching, persistent violation of or refusal to obey the school laws of California, or reasonable rules prescribed for the government of public schools.

Dismissal for cause shall be made only after the following provisions shall have been complied with: The governing board shall give at least ten days' notice in writing to any permanent teacher or principal or supervisor of special subjects against whom charges shall have been preferred, which notice shall state fully the charges, and the time when and the place where such hearing is to be held.

The governing board shall hold such hearing under reasonable rules which it shall adopt, and the teacher against whom charges shall have been preferred shall have the right to be represented by counsel, and to call witnesses on his own behalf and take their testimony at the hearing and to cross examine all other witnesses who may testify at such hearing; *provided*, that such hearing shall be confined to charges only.

The board may dismiss any permanent teacher after a hearing as in this section provided, upon proof of the charges covering any one or more of the causes for dismissal enumerated in this section, upon the affirmative vote of the majority of the board. No member of the board shall be qualified to vote who has not been present throughout the entire hearing. Such trial shall have been concluded and the decision rendered within ten days after the beginning of said trial.

It is hereby provided, however, that whenever it becomes necessary to decrease the number of permanent teachers employed by a school district on account of the decrease in the number of pupils attending the schools of such district, or on account of the discontinuance of a particular kind of teaching service in such district, the governing board may dismiss such teacher or teachers at the close of the school year.

If the dismissal of such teacher or teachers shall become necessary on account of the decrease in the number of pupils attending the schools of the district, such teacher or teachers so dismissed shall be the teacher or teachers last employed by the district.

If the dismissal of such teacher or teachers shall become necessary on account of the discontinuance of a particular kind of teaching service in the district, the teacher or teachers so dismissed shall be the teacher or teachers engaged in the type of teaching work so discontinued. If such a course is re-established within one year from the time of such discontinuance, the teacher or teachers so dismissed shall have the preferred right to appointment as teacher or teachers of such course.

The board shall give any teacher who shall be dismissed under this proviso a statement of honorable dismissal.

Nothing in this act shall be construed in such manner as to deprive any teacher of his rights and remedies in a court of competent jurisdiction on a question of fact and law.

Sixth—To provide in cities, and in cities and counties, having boards of education, and in other districts employing thirty or more teachers for the payment of the traveling expenses of any representative of the board of education, when performing services directed by said board.

All employments under the provisions of this section shall be subordinate to the right of the legislature to amend or repeal this section at any time, and nothing herein contained shall ever be held, deemed or construed to confer upon any person employed pursuant to the provisions hereof a contract which will be impaired by the amendment or repeal of this section.

Ohio, 1921

OHIO STATE TEACHERS ASSOCIATION

A Bill to provide for the employment of teachers on Indefinite Tenure, 1921

Re-employment of any teacher who has been employed three consecutive years in any school district of the State, if made in that district, shall be for an indefinite term which shall continue until death, retirement as provided by law, or resignation or dismissal as hereinafter provided, except that any teacher who has been employed consecutively for six or more years in any district in the State at the date upon which this act shall become effective shall be thereafter on indefinite tenure in that district.

Provided, however, that when any teacher shall have been placed upon indefinite tenure in any district and shall afterwards accept employment in another district of the State said teacher shall be upon indefinite tenure in said other district after one year, if re-employed therein. Also, when a teacher, after an interim, is re-employed by a district in which said teacher had already served on indefinite tenure, said re-employment shall be on indefinite tenure.

Provided further that, if, after the expiration of the probationary period of three years, a board of education is unable to decide definitely whether a teacher's service has been sufficiently satisfactory to justify indefinite tenure, the board of education may, upon the recommendation of the superintendent of schools in writing, extend the probationary period by another year, but at the end of this fourth year the reappointment, if made, shall be upon indefinite tenure.

Upon proof of neglect of duty, insubordination, conduct unbecoming a teacher, or immoral or criminal conduct, any teacher whether serving upon definite or indefinite tenure may be dismissed at any time by a majority vote of all the members of a board of education, but no teacher shall be so dismissed until furnished with written statement of charges against said teacher signed by the superintendent of schools or the board of education and given a reasonable opportunity of refuting such charges at a hearing before the board or in some other manner agreed upon by the board of education and the teacher. Pending a hearing on said charges and final determination thereof said teacher may be suspended by the superintendent of schools or board of education, but such suspension shall be without loss of pay only in case the charges are not sustained.

Should it be evident to the superintendent of schools or the board of education that the services of a teacher serving upon indefinite tenure are not satisfactory and should be discontinued on account of incompetency, inefficiency, neglect of duty, or lack of professional growth, said teacher shall be notified in writing of the alleged deficiencies not less than sixty days before the end of the school term of the school year. Said notification shall be signed by the superintendent of schools or the board of education and shall name a date and place at which the teacher may appear before the board of education and make answer to said com-

plaint, or in some other manner agreed upon by the board of education, and the teacher may make such answer, provided that the date of such opportunity for hearing before the board of education or for other answer shall not be sooner than ten days later than thirty days from receipt by the teacher of said notification of alleged unsatisfactory service.

If, after notification to teacher of alleged unsatisfactory service the teacher fails to make answer at the time and place set therefor, or after the teacher makes such answer at the set time and place, the board of education may by majority vote of all the members thereof release said teacher from its service, except as hereinafter provided.

Upon request made to the superintendent of public instruction, by any teacher serving on indefinite tenure against whom complaint is made and time and place fixed for answer thereto, the superintendent of public instruction shall attend the meeting of the board of education at which the teacher's answer is to be given and shall take note of the charges and the answer thereto. No action of a board of education in dismissing a teacher in any case in which the superintendent of public instruction was present at the hearing of complaint against said teacher shall be effective unless such dismissal is approved in writing by said superintendent of public instruction.

No elementary or special teacher shall be placed upon indefinite tenure unless said teacher has had education and training equivalent to at least graduation from a first-grade high school and two years' work in a normal school or college approved by the superintendent of public instruction, but this provision shall not apply to teachers who have had six years or more teaching experience in the public schools of Ohio prior to September 1, 1921.

No superintendent of schools, assistant superintendent of schools, county or district superintendent of schools, supervisor of schools or special subject, principal of elementary school, principal of high school or teacher in high school shall be placed upon indefinite tenure unless said superintendent, supervisor, principal, or teacher has had education and training equivalent to graduation from a first-grade high school and graduation from a four-year course of a college approved by the superintendent of public instruction, but this provision shall not apply to persons who have had six years or more experience in the public schools of Ohio prior to September 1, 1921, in any one or all of the kinds of educational work enumerated in this paragraph.

The superintendent of public instruction shall prescribe and require such study or other means of professional growth from time to time as a condition of indefinite tenure as in his judgment shall seem necessary. The said requirements fixed by the superintendent of public instruction shall be the minimum required for all districts of the State, but any district shall have the right to establish higher professional requirements for continued indefinite tenure, with the consent and approval of the superintendent of public instruction.

. . . Nothing herein contained shall be construed as limiting the right of a board of education to release a teacher serving on indefinite tenure when an actual decrease in the number of pupils in a school district renders such action advisable. *Provided*, however, that release for such cause shall take place only at the close of the school term of the year and that any teacher so affected shall be notified in writing not later than April 1st of said year that his services will not be needed that following school year on account of the decrease in number of pupils.

*REPORT OF THE SUB-COMMITTEE ON PENSIONS*¹

PHILIP E. CARLSON, PRESIDENT OF MINNESOTA EDUCATION ASSOCIATION,
MINNEAPOLIS, MINNESOTA, CHAIRMAN

The Committee on Salaries, Tenure, and Pensions met yesterday morning and unanimously adopted the following resolution which we submit to the Representative Assembly for its endorsement. "We believe that no subject coming before the Association at this time is more vital to the progress and advancement of American education and the legitimate professional interest of the teachers than the establishment of satisfactory permanent teachers' retirement funds where such funds do not now exist. We urge the membership of the National Education Association in each State to take such steps as will secure the enactment of legislation providing such funds where they do not now exist. Every year of delay increases the burden of superannuation and the resultant inefficiency in our public schools, and causes privation to hundreds and anxiety to thousands of teachers.

"We believe that satisfactory results can be secured with the greatest expedition and certainty if the Association continues the work which it has begun and authorizes and directs the appropriate committee to hear all persons interested in the problem and directs the committee to prepare and complete its report with conclusions and recommendations sufficiently in advance of the next annual meeting to permit it to be printed in the JOURNAL at least one month before the annual meeting, and that such report be submitted to the Representative Assembly in such manner as the Representative Assembly shall decide. Dated at Boston, Massachusetts, July 4, 1922, and submitted to the Representative Assembly July 5, 1922, for your endorsement."

It seems only proper that as chairman of the Pensions Division of the Committee on Salaries, Tenure, and Pensions I should briefly give the history of what has happened during the last two years.

At the Salt Lake City meeting two years ago the following resolution was adopted: "We hold that provision for the retirement of superannuated teachers is fundamentally a part of the salary problem, and we invite the Federal Government to interest itself in a fund for that purpose."

In the Des Moines meeting last year the following motion was made and carried: "That the Committee on Salaries, Tenure, and Pensions be instructed to study the suggestion and report back to the Representative Assembly."

I may say that as chairman of that Pension Committee it was my first thought that the three units of government ought to contribute to the retirement fund, these three units of government being the Federal Government, the State government, and the local district, and wherever the State legislature so decided the teachers might be asked to contribute to the fund

¹In addition to the chairman, this Committee includes the members listed on page 29.

in addition to the contributions made by the three units of government, these contributions to purchase an annuity in addition to the pension provided by the government contributions.

You have all heard the statement made that Providence in some mysterious way takes and governs the destinies of nations. It seems that Providence also had something to do with the study of the pension problem because in the midst of my study of the pension problem, as secretary of the Minneapolis Teachers' Association, that Association decided to engage experts to study the financial status of the Association and to determine that status; and while they were working on that situation I had several conferences with those experts and in talking the matter over we decided that so far as we were concerned we were in favor of the Federal Government merely taking care of the accrued liabilities. We decided that whenever we are ready to adopt the pensions system for teachers in any State the accrued liabilities is the obstacle that stands in the way, and so far as we were concerned we were ready to recommend that the Federal Government should take care of the liabilities already existing because of the fact that the teachers had already taught for a number of years.

In all fairness to the Committee today, the large committee and the sub-committee, I want to say that no action has been taken with regard to that recommendation, and that that recommendation by me will have to go over until next year and be acted upon at our next annual meeting.

These are just a few of the fundamental principles of any sound pensions system. In the first place we want a retirement system in every State and Territory of America that will guarantee not 80 per cent of the pension promised, as we did in Minnesota last year, or 60 per cent, as we are doing this year, but 100 per cent of the annuity promised by the legislation enacted. That is what we want not only in New York, Vermont, and New Jersey, but in every State in the Union. We want every teacher guaranteed that.

In the second place, we want a disability allowance, so that if a teacher becomes disabled either mentally or physically she may be given a retirement allowance regardless of the age attained.

These are my recommendations. We want a pensions system where the contributions after they have once been made are non-forfeitable. After the State has once contributed towards the teacher's retirement that fund belongs to her or her estate and should never be forfeited, regardless of whether the teacher remains in that State or goes to another State or retires entirely.

We want an adequate pensions system, a system that will guarantee to the retiring teacher a requirement allowance that will be comparable with her salary. We want an equitable retirement system, and by that I mean that the classroom teacher who has been teaching at a low salary in comparison with the higher paid teacher should get a pension comparable with her salary at the time of retirement.

I am speaking for myself only as the chairman of the sub-committee. It

is my hope that whatever the personnel of the Pensions Committee may be next year, it will continue to study these problems and make a definite report next year on the matter. I move the adoption and endorsement by this Representative Assembly of the report I submitted at the beginning.

REPORT OF COMMITTEE ON RURAL EDUCATION¹

JOHN F. SIMS, PRESIDENT STATE NORMAL SCHOOL, STEVENS POINT,
WISCONSIN, CHAIRMAN

The objective—The objective of all efforts made in the improvement of rural education must be, if we hold allegiance to our American ideals, that the educational opportunities provided for children living in the rural areas of our country be made the full equivalent of those offered to children in the most favored urban communities.

Country-wide inequality of educational opportunity exists today—This is revealed in the shorter school year, the lack of proper equipment, the smaller amount of expenditure per capita, the smaller percentage of properly trained teachers, and inadequate supervision.

It is due among other causes to the following:

1. To the conservatism of rural people, who have too long been satisfied with an elementary curriculum only, with inferior educational facilities. As the fountain cannot be higher than the source, so the school cannot be far in advance of the community whose educational wants it is designed to supply, and from which it derives its moral and financial support.

2. Rural communities lack the vision of what a good rural school is and what it will do for them and their children. Many districts maintain schools merely to comply with the provisions of the law. The almost insuperable obstacle in the way of previous efforts at regeneration of rural education is the isolation of the rural school (now happily being overcome). This makes for indifference to the problem.

3. Rural leadership, based upon a sympathetic knowledge of rural life and its needs, plus the constructive imagination which visions what ought to be in order to satisfy these needs, reinforced by an executive ability which can arouse to action rural people who are to be the beneficiaries of better schools, is to be found in rare instances only. Where there is no vision the people perish, and desired progress will come only when rural people want something better. The hope of tomorrow in education lies in the improvement and development of schools as they are.

4. The assessed valuation of many school districts is so low that people cannot provide sufficient funds by taxation. The additional revenue from State sources is insufficient, while National reservoirs of revenue have not yet been tapped.

5. In the 185,000 districts maintaining one-teacher schools are found 555,000 school officials, many of whom receive small salaries and enjoy

¹ In addition to the chairman, this committee includes the members listed on page 35.

the prerogative of holding office to such extent that any change reducing the number of officials is vigorously opposed.

How to change what is in rural education to what ought to be—1. A larger unit of taxation and administration, the consensus of opinion being the county.

(a) Education is not a local problem, for the perpetuity of the State and Nation is concerned in its solution.

(b) Many rural communities cannot meet the expense of the schools which they ought to maintain.

(c) A county tax equalizes the burden of taxation, while under present conditions districts of low assessed valuation too often pay the higher tax rate.

(d) Local revenue should be supplemented by funds from State and National sources. As was pointed out at the Chicago meeting of the Department of Superintendence earnings, profits, and incomes must more and more be made a basis of taxation, in addition to property, or even in lieu of property.

(e) Every friend of education should battle valiantly for the passage of the Towner-Sterling bill, as provision is therein made for apportionment annually among the States of \$15,000,000 for the better preparation of rural teachers, and of \$50,000,000 for the equalization of educational opportunity.

(f) One half of the States are now administering their schools by means of an elective County School Board or Board of Education, of from three to seven members, empowered in general: (1) To select an expert educational officer, known as the county superintendent, to be its educational advisor and its executive officer; (2) to appoint upon the nomination of the county superintendent, assistant superintendents and supervisory teachers; (3) to carry into effect the State course of study and the recommendations of the State superintendent; (4) to recommend to district boards competent teachers and principals and to approve their selection; (5) to change boundaries of districts, to consolidate schools, and to supervise transportation of pupils, and (6) to provide more adequately for rural high schools.

(g) Bulletin No. 44 U. S. Bureau of Education states that in a county in Utah, after the adoption of the county unit plan the number of pupils who finished the eighth grade increased fifty per cent and the high-school enrolment increased five hundred per cent.

2. Establishment of consolidated schools and rural high schools.

(a) The chief obstacles to consolidation are the small taxing and administrative unit; the traditions, prejudices, and conservatism of rural people; the fear of increased taxation and possible deterioration of property due to greater distance from the school; bad roads making transportation difficult, and the loyalty of adults to the school in which they themselves were educated who believe that what was good enough for them is

good enough for their children. The educational harvest in rural communities must not, however, be gathered by antiquated machinery.

(b) Consolidation means better attendance, better teacher training, making the school a community center, enriched courses of study, the use of a stimulating environment in teaching, training which gives power to solve farm and community problems as well as the development of power to excel in other vocations.

(c) An adequate working law should be formulated in each State providing for consolidation. Perhaps two thirds of our 185,000 single districts could be so taken care of. Witness its growth in Ohio, Indiana, Iowa, in New England, in the South, and in the far West. Wherever the larger taxing and administrative unit prevails its growth has flourished most completely.

(d) Consolidation is a dynamic movement—the most highly consequential movement now under way, looking toward the creation of better educational facilities for rural children *at home*, and it should be fostered.

3. Better trained teachers.

(a) The teacher is the soul of the school. All instruction must minister through the child's own self-activity, to his development mentally, morally, and physically. Knowledge comes through exercise of his mind, while discipline implants the feeling of personal accountability, and recognition of the rights of others, demanding the exercise of conscience, and both making for right thinking and right behavior, the two most important functions anyone is called upon to perform.

(b) Active agencies for the preparation of rural teachers are training courses in high schools, county training schools, and State normal schools. Universities are now beginning to catch the vision.

(c) The content of courses for their training may be classified as professional, academic, and environmental. The professional makes for the development in teachers, of social amenities, appreciations, ideals, skills, and a sense of responsibility; the academic for scholarship which gives the teacher confidence in himself and inspires the pupils' confidence in him; while the environmental enables him to use the rich suggestive material which lies in close proximity in such a way as to make it dynamic in the child's development. The following must be stressed: (1) The three R's with history, geography, business essentials, literature, and nature; (2) some skills in the lines of music, physical training, agriculture, farm mechanics, cooking and sewing, debating and public speaking; (3) the appreciations of art, music, nature, courtesy or social amenities, and education, and (4) the ideals of patriotism, industry, coöperation, fair play, and achievement.

(d) All institutions training teachers should maintain observation and demonstration schools of the highest degree of efficiency under their own direct supervision, and likewise afford an opportunity for practice teaching in rural schools.

(e) Courses of study should be extended to two and within a decade to four years of professional training beyond the high school. It is modest

to say that today the rural child has but one chance in fifteen or twenty to be taught by a teacher of the standard preparation of high-school graduation, plus two years of normal training.

(f) The standard of rural teaching must be raised. Our best rural teachers come from the rural areas. Special inducements must be offered in the way of remuneration. Young people will not prepare for this responsible work as long as the salaries paid are less than wages paid to unskilled labor. Says Vice-President Coolidge, "We have lost reverence for the profession of teaching and bestowed it upon the profession of acquiring." Rural communities will never get more than they are willing to pay for. Better salaries and a more attractive life, including teacher-ages, must lie at the bottom of any wide improvement.

(g) Is the time not ripe for the State to offer scholarships in the normal schools to attract the best of our rural-minded young men and women into this field? Scholarships of two or three hundred dollars per year offered to the best fourth of a high-school graduating class would improve the output of rural teachers and give to rural teaching the standing it sorely needs. Given the proper supply, rural communities will choose these competent teachers. During the war the S. A. T. C. was organized in the normal schools and colleges to meet the crisis. Is it not the part of wisdom to follow such a practice in meeting the educational crisis?

(h) All of the professions are demanding higher training in order that their members may render better service. Why should rural teaching be a laggard? Surely it requires as skilled a practitioner to deal with the mind as with the body.

The arousal of interest of rural people in their own schools—1. Rural schools must train the children for their own needs, sending them out from the portals of the school with a fund of knowledge, a capital of skills, and a character strengthened by wholesome discipline, fitted to cope confidently with their own local, State, and National problems.

2. For the first time in our history the urban exceeds the rural population, so that rural education becomes an urban problem, for the world must be fed, clothed, and sheltered.

3. Inequality of educational opportunity must give way to equality of educational opportunity.

4. Rural people must arouse themselves or be aroused to a sense of the problem. Detailed inspection by competent National State officials reveals the need for betterment, the coördination of what is with what ought to be.

5. These officials and others associated with them—just as the "dollar-a-year" men a few years ago—must have wisdom allied with real and clear vision, to accomplish this wonder in education like that in industries, in transportation, in conservation of food, in unparalleled and almost unbelievable preparations for waging victorious war, and in philanthropy such as was witnessed in the recent war.

6. Nor should the enlistment in this cause of women, in whom faith in education is an enduring power, be overlooked. The organization of

woman's clubs, with woman's active participation in political life, are unconquerable forces when once set in action, as they surely will be, to make equality of educational opportunity a living reality. Let no effort be spared to secure their enthusiastic coöperation.

7. Direct and indirect appeal through literature, cartoons, posters, moving pictures, victrolas, the press, and the platform must be made to give the rural children as good a chance in life as any children get, and to get that chance at home. It is not enough that the opportunity be found elsewhere. To seek it elsewhere is a transfer of allegiance from the home school, which home school should be fostered with affection.

8. The voice of the rural people thus aroused must and will be heard in the halls of legislation, and when heard, just as truly as night follows day, it shall succeed in having: (a) First-class schools in every community, rural as well as urban; (b) competent rural teachers who are high-school graduates with two and eventually four years of normal training, the result of better teacher training; (c) the county unit of taxation and administration; (d) the consolidated and rural high schools, and (e) equality of educational opportunity for twelve full years of school work at home. Said Lincoln, "The American youth are entitled to an unfettered start and a fair chance in the race of life."

9. To this program we pledge our loyal and continuous support until it is realized. Education surpasses in importance all other governmental activities, being the life blood of the Nation. Education must not be looked upon as an expenditure, but as an investment which pays large dividends in knowledge, ability, and character. The strength of the Nation is to be found in its mental and spiritual power.

REPORT OF THE COMMITTEE ON THE COUNTY SUPERINTENDENTS' PROBLEMS¹

LEE L. DRIVER, DIRECTOR OF THE BUREAU OF RURAL EDUCATION,
DEPARTMENT OF PUBLIC INSTRUCTION, HARRISBURG,
PENNSYLVANIA, CHAIRMAN

One does not have to study the rural-school problem long until he becomes convinced that its success or failure centers in and around the office of the county superintendent.

The history of the office of the county superintendent is one of unusual interest because it is the outgrowth of peculiar evolution. The original unit of school administration being the local one-room school, the authority of its control naturally surrounded that one small unit. It became evident in progressive States that the local unit was not the proper one for school administration. It also became evident that it was necessary to have an organization of a larger unit even though the control remained in the smaller section. This led to the organization of the office of county superintendent, the county being the logical unit for such administration.

¹ In addition to the chairman, this committee includes members listed on page 29.

The placing of any authority, or control, in any way other than that of the small local unit naturally brought on the opposition of those in local control. Immediately the spirit of selfishness and fear of the loss of personal control became evident. Only by the strong effort of real leaders was any reform brought about. In all the States first having had the district, or one-school unit, violent opposition to the county superintendency was aroused. In many States the office was practically ignored in every particular except those specified by law. The local directors looked upon it as an usurpation of authority and infringement upon their personal rights. They thought they could see the time coming when they would not be permitted to levy the local tax; determine the course of study; select and purchase the textbooks; pass judgment upon the qualifications of teachers; employ and place teachers—in short, they looked upon it as the beginning of the end of purely local control. Gradually, however, these local districts were convinced that instead of losing their identity in a small unit, they were really becoming identified with the larger and more essential unit.

But this has occasioned a tremendous struggle, especially in the eastern States. The States of the Mid-west and West, being organized so much later, availed themselves early in their existence of the organization of county schools.

The task usually assigned to this school official was that of licensing and revoking the licenses of teachers. In many States that is practically the only legal authority given a county superintendent today.

With additional duties and powers placed upon the county superintendent, we have found a gradual growth in the way of qualifications from a lack of special training, almost to the degree of ignorance, to that of a highly specialized official. Even today we have two extremes, from some States requiring little or no special training to those requiring a college, or normal-school graduation, with from one to two years of professional training.

It has been a difficult task to raise the qualifications of the present standard, and it will be equally as difficult a problem to make other necessary changes in its development. It seems practically impossible to get any legislation that will affect the present incumbents. Many of these who are directly affected are usually opposed to any qualifications which they do not possess. The only way of solving this problem is to raise the qualifications to where they should be and exempt the present incumbent for the succeeding term and trust to the natural processes of nature to remove inferior people.

No school official has a more difficult task either in administration or supervision. The remoteness of his schools, oftentimes almost inaccessible, the lack of contact with his teachers, the handicap in the placement of authority, all contribute to the difficulties in the solution of his problem.

The personnel of the county superintendent must be of the very best. He must understand the rural mind and the people of his particular county.

He must be an expert in judging and handling people. He must be fearless enough to attack his problem in the face of opposition, promoted and encouraged by every known objection. He must have a working knowledge of the solution of the problems that are to contribute to the success of his schools. He must know the far-reaching influence of health education and be prepared to introduce it into his schools. He must understand the value of vocational education and appreciate the difficulties of installing the equipment for it. He must have a working knowledge of school architecture, heating, and ventilation. He must also be acquainted with the means of physical development. He must also have a high knowledge of civics not only as it affects his local community but as the community will be affected by its relation to the greater unit. In fact, he must have a real vision and be able to inspire his teachers, pupils, and patrons with the same zeal and fervor that he himself has.

Students of rural education are practically agreed that the rural schools cannot come into their own until the county superintendent shall be the one who is especially trained academically and professionally. Even some States are now planning the organization of special schools to be held each year during which time intensive courses will be given to county superintendents. These courses will be on the problems peculiar to the rural schools of the State in which they are held.

Being the leader of the county institute he must be able to work out and devise a program suitable for the particular needs of his teachers. The purpose of the county institute has so changed in the last few years that it is no longer the humdrum institute that it used to be. It is no longer a school of instruction, but rather a week in which to organize thoroughly teachers for the program of the year. It is an opportunity for a real constructive service.

The county superintendent must be the leader in the enforcement of the compulsory attendance laws, especially in those States having a county or State attendance officer, who must of necessity depend more on the county superintendent than any other individual.

His restrictions depend largely upon the method of his election. If elected by popular vote, he becomes the target for the "Outs" who want to become the "Ins." His office becomes too often political spoils. Qualification and professional standing count for little when stacked up against the desire to give some deserving partisan a job. Seemingly, the only protection against conditions of this kind is a restrictive educational qualification. This, of course, is a very difficult thing to obtain in States where the office of county superintendent is made a political football.

The same condition obtains—but in much less degree—where a large electorate is to be found. It is minimized in the small electorate and practically eliminated in those States where the county superintendent is appointed by the State Commissioner of Education.

Residential qualification is also an unfortunate limitation. Those States requiring that the county superintendent be a resident of the county in

which he is elected suffer more than those who are unlimited, or limited by State residence. It so happens that many times the electorate is completely handicapped and limited to practically no choice whatever by required qualifications and county residence. It is the limitations that should be removed and not the qualifications.

Tenure of office is an important factor in determining the efficiency of the county superintendent. Those States suffer most in which the constitution limits the service to not more than two terms of two years each. It is easy to see that a superintendent cannot do any real constructive work and inaugurate and carry out any constructive policy in so short a time. Those States in which length of term is limited by efficient service are those who receive the greatest benefits from this office.

There always comes a reaction to any progressive movement, and this reaction is bound to occur at the time when the superintendent is to be reelected wherever the length of term is so limited.

The present combination of administration and supervision is an unfortunate one for the county superintendency. The county superintendency should be largely administrative with but little supervision. This, of course, would necessitate that he be given sufficient assistants, either as assistant superintendents, or helping teachers, that the supervision may be done by those especially trained for the purpose. There should be ample provision made also for clerical help. A superintendent should never be required to do work of that kind.

In most States the county superintendent is given but little, and in some cases, practically no legal powers other than that of granting and revoking teachers' licenses. This is unfortunate. He should be given certain definite responsibilities and should be held responsible for their enforcement. Power to enforce reasonable rules is necessary to the best functioning of the office.

He should have general administration in recommending and placing teachers. He should pass judgment upon the character of school buildings and the location of the same. He should be a factor in the selection and adoption of textbooks where State adoption does not obtain. He should also recommend and be a party to the making of a course of study where such is not provided by State boards of education. He should have the power, with certain limitations, to introduce constructive policies.

His office should not, however, be separated or estranged from that of the electorate, or the directors of local schools. There must be a certain amount of local responsibility and power, but the two should be so interwoven that one could not exist without the other. The rapid changing of boards of directors—too frequently elected for reasons other than that of school administration, and too often untrained in the arts of school work neither administrative nor professional—necessitates more permanent powers being given to the county superintendent.

The committee, in order to get the reaction of the men in the field, sent a copy of the attached questionnaire to ten of the leading county super-

intendents in each State having such an officer, and to district superintendents in those not having them.

The reaction to the questionnaire has been very interesting. To the first question, What in your judgment is the paramount outstanding need of the office of county superintendent?, we found a universal agreement upon four points: (1) High professional and academic training; (2) experience in teaching; (3) the elimination from political influence; and (4) assistants trained especially for supervision.

To these were added (1) The tenure of office; (2) moral courage; (3) increased salaries; and (4) greater legal powers.

One superintendent in answering this said, "Public recognition that the office is one of importance educationally." This superintendent has struck a vital point. Too often the office of county superintendent is looked upon as a political plum and is not considered important educationally. Consequently, the incumbent is looked upon more as a politician than a leader in education. Such a man's career is usually described as spending one day of his term as election day, and the remainder of his term in preparing for that event.

County commissioners too frequently do not recognize the importance of this office. If the superintendent is not assigned to some dark obscure room in the basement, or to some poorly ventilated, hot, oppressive room in the attic, it is because there is some room in some other part of the building of less value. It is significant that in many States the commissioners have had to be required by law, and oftentimes have had to resort to the courts to furnish the county superintendent with an office at all. This objection, however, can be eliminated only in one way and that is by the county superintendent being a man of sufficient standing to command the respect due that office.

The second part of the question was to name five other needs for advancing the county superintendency. To this question we have the following answers:

(1) Power, (2) trained teachers, (3) greater supervision, (4) executive ability, (5) professional character, (6) different methods of selection, (7) more legal authority, (8) increased salaries, (9) sufficient number of supervisors, or helping teachers, (10) clerical help, (11) security of tenure, (12) larger unit of administration and taxation, (13) elimination from political influence, and (14) definite assigned responsibilities.

Two striking answers received to this question, What is the paramount outstanding need of the office of county superintendent? were:

(1) "Our greatest need could be supplied by trained experts in the office of the county superintendent who would devote their entire time to the work of the community under the direction of the county superintendent."

(2) "Men and women with vision."

The five needs for advancing the county superintendency were given by another as: *What he should have:*

(a) Consecration, (b) training, (c) courage, (d) initiative, (e) sense of humor, and (f) passion for service.

Added to this was: *What is expected of the county superintendent?*

(a) Patience of Job, (b) wisdom of Solomon, (c) forbearance of Moses, (d) gentleness of a dove, (e) grace of God, and (f) perseverance of the devil.

The second question of the questionnaire referred to the best methods of selection and why. County superintendents are selected by popular vote in — States; by the vote of directors, or trustees of the school townships in — States; by county boards of education in — States; appointed by the State superintendent, or commissioner of education in — States. Practically every superintendent elected by popular vote gives it as his judgment that the best method of selection would be by a county board of education, indicating that the method by popular election is most unsatisfactory. The same opinion was expressed by those in States where the county superintendent is elected by district or township directors, or trustees. Without exception those who are now elected by county boards of education express themselves as being satisfied that this is the best plan. It might be said in passing that many of these superintendents have been elected by other methods, the county unit having been inaugurated since they began to serve. Without exception, the States in which superintendents are appointed express their satisfaction with that method. The reasons given for election by county boards of education, with the county unit, or the appointment by the State Commissioner of Education were: "Minimizes the office from politics," "Frees the candidate from local entanglements," "Eliminates undue personal pressure on the part of those wishing special favors," "Adds dignity to the office," and "Would make the office a real clearing-house for educational matters." Another significant reason given was "The county board of education being selected for school purposes will naturally be people of higher training and more representative of best interests than they otherwise would be. This will insure on the part of the board a higher ideal of what the county superintendent should be.

To the third question, and a very important one, What are the important powers that a county superintendent should have?, there was an almost unanimous reply. We quote directly from three answers.

"The county superintendent should have the power to hire or select his rural supervisors and they should be directly under his charge and supervision. He should have much to say in the selection of teachers of the county who are to work under him. He should direct the work of the truant officer and county nurse."

"Appointing his corps of office assistants and supervisors, recommending teachers, assigning teachers to different schools, recommending salary scales, recommending course of study and school schedules."

"The Superintendent should have the power to nominate teachers, supervisors, and so on, to recommend textbooks, to recommend courses of study, and in general in all matters connected with the schools should have the

well recognized right to appear before the school committee with recommendations."

To these might be added: (1) Approval of school buildings and school sites, (2) approval of school equipment, and (3) assist in making out the school budget and tax levies.

To the second part of the question referring to some things that county superintendents are required to do which takes more time than is justifiable, we find nearly all mentioned some form of a given report.

It is interesting to note in the fourth question, What should be the legal standards for county superintendents as to academic training, professional training, experience, and tenure of office?, there was almost a unanimity of opinion. County superintendent should be a university, college, or four-year normal school graduate, that he should have at least one full, and better, two years of professional training, or, that he should have at least five years' experience in teaching, part of which should be in rural schools.

The tenure of office varied from four years to "during efficiency and good behavior."

The answer to salary varied with different parts of the country, every State practically thinking that an increase of salary would increase the standards of the office. These answers varied from "twenty-five hundred and expenses" to "the sky as a limit." All indicating that county boards of education should be given the right to fix the salaries with a given minimum required by law.

It is interesting to note that the salaries of superintendents in America vary from as low as less than a thousand to ten thousand, including five hundred dollars for traveling expenses.

5. (a) Should the county superintendent be given chief authority in the certification of teachers? The answers are almost unanimously in the negative.

(b) "The recommending of teachers." The answers are unanimously in the affirmative.

(c) "In the assigning of teachers." The answers are unanimously in the affirmative.

To the second part of the question as to How should assistants to the county superintendent be appointed?, two answers were given: (1) "By the county superintendent," (2) "Majority of the county board upon the recommendation of the county superintendent."

6. What in your judgment is the best rural school unit for (a) Administration? The answers are practically unanimous—"The county." Only a few felt that in their particular county there were objections that would be difficult to overcome.

(b) Supervision? The answers are unanimous—"The county." Some suggest a subdivision, but still supervised as a county unit.

(c) Taxation? Most of the answers are that there should be a county unit of assessment and also a county unit of taxation not interfering in any

way with the privilege of local communities to assess a special tax for any purpose applying only to itself.

7. What per cent of rural-school support should be raised by the following units?

- (a) The local community,
- (b) The county,
- (c) The State,
- (d) The Federal Government.

There was some difference of opinion as to this, but all agreed that the local community, the county, and the State should participate in school support. Practically all insisted that the Federal Government should also be a factor in local school contribution.

The second part of the question, Do you believe in special State aid in addition to (c) above for the purpose of equalizing educational opportunity in poorer communities?, the answer without exception was Yes.

8. (a) With more than one supervisor in a county, would you advocate assigning them to different geographical sections of the county or to different types of work as primary, grammar grades, etc.? The answers to this were rather evenly divided between the two methods.

(b) "What should be the maximum number of teachers for each supervisor?" This varied from twenty-five to one hundred teachers.

(c) "Name the chief qualifications which you think a rural school supervisor should possess." This answer included all the qualifications already given for the county superintendent. To those already mentioned might be added—

"The ability to lead young teachers."

"The ability to demonstrate good teaching."

"Special training for the one-room rural school."

9. Should the county superintendent take the initiative in consolidating the schools of his county? If not, who should? Practically every answer was that the county superintendent should take the initiative. Oftentimes it was suggested that he be in conjunction with boards of education, State Department of Public Instruction, local school organizations such as Parent-Teachers' Associations, Grange, Home and School Leagues, etc. This does not mean that he should be the avowed leader of the movement, but he should be recognized as the power behind the throne upon whom local leadership, which is always essential to the success of the movement, can depend. It is significant that the answers from those counties that have made signal progress in rural-school consolidation are unanimous in the point that the superintendent must take the initiative.

10. What are your chief recommendations for the improvement and development of a profession of county superintendents?—is, in the judgment of the Committee, the most important question asked in the questionnaire. It is in this question that the superintendents were given the opportunity to reflect their own notions of their own job. Without exception, the superintendents have stated that there must be a high standard

of qualifications, longer terms, or extended tenure of office, liberal salaries, opportunities afforded for conferences and summer-school work, a liberal vacation period, opportunity for advancement professionally, attendance upon all gatherings of his own profession, his attendance at college, university, or other schools, and by being identified with local organizations whose purpose is to elevate the standard of society.

Among suggestions offered by members of the committee were the following:

"As I see it, the County Superintendent has not had as much attention paid to him and the great work he is trying to do. In some States that office is fairly well equipped with the supervisors. In other States it is not."

"There is, however, a growing sentiment in the State in favor of the county unit plan of school administration, and I believe that we can secure it in a very satisfactory form in the next legislature. I am convinced that one of the most valuable things the committee can do is to educate the public to realize that school administration is a specialized business requiring training and experience and that our smaller schools are being handicapped by the retention of an outworn system."

"It is a difficult matter to get the general public to realize the importance of school work as viewed by a county superintendent. However, I believe that a change for the better is coming in this county and State. After all, it is a systematic and persistent campaign of education that will put any of these problems through."

"I have felt that one of the greatest handicaps is the lack of knowledge of the needs by the community. It is hard for the school people and for the County Superintendent to progress much faster than the community in which they are working. The community must be educated to an appreciation of the different values of school work. Our school boards are constantly changing in rural communities and just as this work has been accomplished to some extent, a new board comes in and perhaps a great deal of the work must be done over again."

"Better trained and better prepared county superintendents are being selected as the communities are becoming more interested in school problems. On the other hand, it takes a great deal of leadership in the county superintendent's office to conduct the educational program that is needed in the communities. One is so much dependent upon the other that the growth, of necessity, must be slow."

"It is a crying need that the office of county superintendent be taken out of politics, to the end that our education system may be directed by highly trained people rather than by an individual who may happen to be nominated and elected many times wholly unfit for the position."

"A professionally trained county superintendent is the first essential for rural school improvement. The several State legislatures should enact laws which provide adequately for the appointment of a professionally trained county superintendent in each county of the several States."

"The big outstanding problem of the county superintendents is the

lack of administrative and executive power. This handicap makes the task of the county superintendents well-nigh impossible of accomplishment."

(1) "A professionally trained county superintendent who shall possess a fair craft spirit. I believe this ideal can be approached only through a disassociation of the county superintendent from politics and through security of tenure of office. Also undoubtedly the county superintendent should receive as good remuneration as the city superintendent if we hope to attain the ideal."

(2) From some points of view, the county superintendent of education, however well remunerated; however secure in his tenure of office; and however greatly his office may be disassociated from politics, can never function professionally until there are larger revenues to provide school plants, including equipment, and attractive remuneration for principals, supervisors, and teachers.

(3) The county superintendent also must inevitably face the big problems of health education, vocational education, education for citizenship, and education for leisure occupation. Some of these are more difficult of solution for the county superintendent than they are for the city superintendent."

County Superintendents' problems can be largely limited or at least benefited by cultivating a more generous public opinion and sympathetic attitude toward the work of the rural schools.

Another member of the committee says that this problem should be studied, thus:

"1. How to secure strong county superintendents, by—

- (a) Making the qualifications higher through legislative enactment;
- (b) Attaching prestige to the work;
- (c) Securing better pay for the work.

"2. How to make their work effective, through—

- (a) An adequate supply of strong teachers;
- (b) Means of real supervision of classroom work;
- (c) Clerical assistance.

"3. How to sell the schools to the people."

We quote the following from a Maryland school bulletin—April, 1921, "A Tentative State Program, Public Elementary and High Schools, 1922-1923":

"In Maryland, the county superintendent is the most important educational officer, if not the most important county official. His duties are manifold and specific under the law, and the minimum qualifications—college graduation plus one full year of professional preparation at a standard college or university, and successful professional experience are higher even than the minimum requirements for judges of the circuit courts. Other States are beginning to recognize more and more the importance of professional leadership and executive and administrative ability in the office of county superintendent of schools. New Jersey now has a minimum salary of \$4000 paid in whole by the State; and California proposes a salary from \$4000 to \$6000, paid in part by the State."

It would seem from all the reaction that this committee has been able to get that the biggest problem lies within the county superintendent himself, who should be a man of the highest efficiency.

This can be brought about only through an education on the part of the people for a public demand for a well-trained, experienced superintendent with a real vision of his problem. The county superintendent is the hub of the county educational wheel. He is the center reached from every nook and corner of his county. He is the one that must be supported by, and in turn, support every school within his jurisdiction. He must keep ahead of the procession—must lead, not follow. This can only be done when he is able to inspire confidence by his power and ability to lead.

Such a man will be selected only by an electorate capable of passing intelligent judgment.

To solve the county superintendents' problem let us suggest:

(1) High qualifications, consisting of academic and professional training, and number of years of actual experience in the rural schools.

(2) Eliminate the office from politics by having him selected very much as a city superintendent is now selected, that is, by a board small in number, selected especially for the purpose of conducting school affairs; or appointed by a similar State Board, or Commissioner of Education. This County Board of Education could be selected by the directors of the schools and in that way be thoroughly identified with local sentiment, needs, advice, and control.

(3) Give him plenty of well-trained assistants, or helpers, to relieve him of his supervisory work.

(4) Give him at least limited powers of administration and control over his schools by requiring his approval of teachers, school-building equipment, transportation, and organization.

All of which should be backed by an adequate financial support to carry it into effect. This can be done only through an education of the leaders of public opinion to the needs of the office. The National Education Association should lend its force, energy, and prestige to the support of such a campaign.

*REPORT OF JOINT ADVISORY COMMITTEE OF THE NATIONAL EDUCATION ASSOCIATION AND THE AMERICAN LEGION*¹

HENRY J. RYAN, CHAIRMAN OF THE AMERICAN LEGION COMMITTEE
ON EDUCATION, INDIANAPOLIS, INDIANA

The suggestions which the committee has to make are brief. The report itself is brief. Before I read it I would beg your indulgence for just a moment. After the eloquent address uttered last night by Colonel Owsley it becomes unnecessary to again express the interest of the American Legion in the cause of education. Not as an educator, but as an enthusiast for education, I want to say this: not only the world, but also America

¹ In addition to the chairman, this committee includes the members listed on page 30.

has come to a crisis. Ignorance has precipitated it. If we cannot or refuse to settle the problems confronting the cause of education it is ridiculous to assume civilization can be perpetuated.

By instinct I am an optimist. By force of reason I am a pessimist. And a pessimist is nothing but a disappointed optimist. In the war this Nation ascended to the very pinnacle of ideals, which when they become the life aims of a people assure to that people fortification and endurance. But the spirit of the wartime is dead—not dying—it is dead. The pledge we made to raise the standard of citizenship has been drowned by the swift rushing waves of commerce and materialism.

A few months ago this Nation called a conference on the limitation of armaments, in an attempt to solve a problem which impedes the progress of the world. But what the world is more in need of is a conference on the limitation of ignorance. At the conference our great President made an epoch-making address. Among other things he said (I rely upon a faulty memory): "I once believed in war. I now believe that public opinion rules the world." But, my friends, of what value is public opinion if it be ignorant opinion? Ignorant public opinion can destroy the world; even as today we see destruction on every hand in this fair land. Only the other day at Herrin, Illinois, and there were more human lives lost than were lost when Fort Sumter was fired upon. And this is but an insignificant reference to the disturbances which are a menace to internal peace. Those poor people were murdered by the sharp and deadly weapons of ignorance. The time has come when we must do one of two things in this country. We must take the vote away from every man and woman who cannot cast it intelligently, or we must educate all the voters. To do the first would be to destroy not only the spirit but also the very form of our government. To refuse to do the latter is to pay hostage to the hosts of chaos and destruction. "Emancipation is but half completed, slavery is but half abolished while millions of freemen with votes in their hands are permitted to remain in ignorance."

I end as I began. We have come to a crisis in the world's history. Once again humanity stands at the crossroads. The road that leads to peace does not begin at Washington, nor Versailles, either. It can not be bought with parchments sealed with wax. It is not the offspring of expedient politicians whose vision ends where they adjust their eyeglasses. The road that leads to peace begins at the schoolhouse. Only the schoolhouse can bring peace to the world, peace and inspiration for all time. Let the teacher be broad, trained, and equipped to build the souls, the hearts, and the minds of the boys and girls of America. They are a saner and better investment than soldiers.

And now I come to our report. The joint committee on American Education week representing the National Education Association and the American Legion points with pride to the accomplishments of the last year. It feels, considering the magnitude of its undertaking, that it has been effective, inspiring, and worthy of continuance. It therefore recommends that American Education Week be continued.

Your committee is mindful of the things which were left undone because of lack of coöperation on the part of some teachers, schools, churches, civic bodies, and State governments. It would emphasize the importance of securing the coöperation of every force for good in America, if this week is to be worthy of its name and the Nation to take her rightful stand on the greatest question of the century, which is education.

This year Education Week will be from the 3d to the 9th of December. Its purpose is as follows: To promote the cause of education; to raise the standard of citizenship; to arouse the intense, determined, and genuine interest of all the people in better education; to emphasize the value and need of education in a representative government; to extend education to all the people; to show that education is an investment and not an expense, without which posterity is doomed to chaos.

Your committee recommends that Education Week this year and in the years to follow be under the joint auspices of the American Legion, the National Education Association, and the Federal Bureau of Education. This is made in the belief that education of the people is the Government's first obligation to its security and perpetuity.

It shall be the committee's aim and to this end it shall toil untiringly, to unite in our great cause every civic and patriotic body in the nation. In fact, education week will be a challenge to all the forces that hold themselves dedicated to an intelligent electorate and a nation stronger in security by the power of individual culture, patriotism, and character. All civic and patriotic organizations will be cordially invited to join our cause and to make this week the time to crystallize the educational thoughts of the people and the Nation, in order that from the week may come a year, every day of which shall be devoted to the schoolhouse which after all is the cradle of the Nation, the source from which springs the virile manhood and noble womanhood by which the Nation will be known and civilization secured.

*REPORT OF LEGISLATIVE COMMISSION*¹

GEORGE D. STRAYER, PROFESSOR OF EDUCATIONAL ADMINISTRATION,
COLUMBIA UNIVERSITY, NEW YORK CITY, CHAIRMAN

Your Legislative Commission has in accordance with the action taken by the National Education Association at its last annual meeting actively supported during the last year the Towner-Sterling bill, now pending in Congress. Two general conferences have been held in Washington with the representatives of other organizations who are supporting the educational bill. They have unanimously and enthusiastically agreed to continue to work in coöperation with us for the realization of our common purpose. Numerous meetings in support of the measure have been held in all parts

¹ In addition to the chairman, the committee includes members listed on page 28.

of the country with audiences, both lay and professional, numbering hundreds of thousands. The response has been most encouraging. Local, State, and National civic and welfare organizations have recorded themselves in decisive terms in favor of our program.

It is to be regretted that the bill has been held in the committees of Congress awaiting the recommendations of the President on the reorganization of executive departments. On the other hand, a committee which visited the President of the United States on May 5 was much encouraged by the cordial and genuine interest which he indicated in the program of our Association. Without proposing to quote him, those who visited the President are nevertheless convinced that the administration will recommend the creation of a Department of Education and Welfare. We believe as well that both the President and Congress will favor Federal aid for the promotion of those special phases of education provided for in the Towner-Sterling bill. We look forward to the report of the Joint Committee of Congress on the reorganization of executive departments. If such a report is not forthcoming by the first of the year we will be in position to urge that our bill be reported out of committee and that it be considered on the floor of both Houses.

A detailed report of the legislative situation will be found in the report of the Field-Secretary, which is included in the report of the Secretary of the Association.

It is encouraging to note that many senators and representatives have pledged their unqualified support to the bill. In many States, and in a very large number of Congressional districts, candidates for election this coming fall have at the request of the friends of public education indicated their position with respect to the bill. The reports as they have come in to national headquarters are gratifying.

We believe that the discussion which has taken place during the last year has helped to clarify the thinking of the people of the United States, and that such thoughtful and unprejudiced consideration of our program has resulted in strengthening our cause. The Towner-Sterling bill, developed as it was over a period of two years with the coöperation of the thoughtful leaders of all branches of our profession, presents a positive program for the improvement and development of public education in the United States. In accordance with the provision of this bill we hold:

First, that the Federal Government should increase the effective operation of its existing educational activities by unifying them in a Department of Education under a Secretary of Education. The creation of such a department will, we are convinced, provide the sanction and recognized leadership necessary to the highest development of our public-school system.

Second, the Federal Government should extend the established principles of Federal aid to the States in order to encourage and to assist the States in the development of a program which will make for the elimination of certain recognized defects in our educational system, existing quite generally throughout the country.

Third, that these desired ends can be attained without interfering with the right of the localities and of the States to control, organize, administer, and supervise their own schools.

Good administration demands the organization of a Department of Education. There is at present no coördination of the many agencies responsible for the educational activities carried on by the Federal Government. The promotion of education is at the present time a subordinate function scattered among seven of the ten executive departments of government. The duplication, overlapping, and working at cross purposes, which is characteristic of the present situation, can be remedied only by means of the establishment of a single governmental agency dealing with education. The Federal Government appropriated for education for the year ended June 30, 1921, \$149,608,482. The United States Bureau of Education, commonly recognized as the one governmental agency providing for national leadership, had available for maintenance during the same year \$162,045. The creation of a Department of Education is justified upon the basis of the present educational activity of our National Government.

The Federal Government cannot be indifferent to what is being done in education in the several States. The ill effects of mal-education and the lack of education are as inevitable as are the good effects of proper education. The guaranteed freedom of movement from one State to another makes us as interdependent educationally as we are economically. The primary national importance of education demands that it should be made the equal of those other general welfare activities of our government now holding cabinet rank, but not exercising national sovereignty, such as Agriculture, Commerce, and Labor, each of which exists as a constructive governmental agency to promote the general welfare.

A Department of Education is justified by the general welfare provision of the Constitution and by the historical development of our National Government. The organization, supervision, and administration of education is in all modern nations except the United States, included among the sovereign powers, because education is deemed necessary to the preservation and advancement of the Nation. In the United States the sovereign power over education is by the Tenth Amendment to the Constitution reserved to the States respectively or to the people. But the National consequences of education as carried on by the several States are as far-reaching and as inescapable in the United States as they are in those nations which directly exercise sovereign power over education. The exercise of every sovereign function of the United States is determined by the education which is provided by the States. What is being done in the field of education is the most important thing nationally that is taking place in our country.

We have already established in principle and in practice the right and obligation of the Nation to aid the States in the development of their public-school systems. From the very beginning of our history down to the present time the Nation has seen fit through grants of land and of

money to aid the States in the development of their schools. This aid has been given without infringing upon the constitutional right of the States to control their own schools. The Towner-Sterling bill explicitly safeguards the control of education by the several States in no uncertain terms. It provides that "all the educational facilities encouraged by the provisions of this Act and accepted by a State shall be organized, supervised, and administered exclusively by the legally constituted State and local educational authorities of said State, and the Secretary of Education shall exercise no authority in relation thereto; and this Act shall not be construed to imply Federal control of education within the States nor to impair the freedom of the States in the conduct and management of their respective school systems."

At the end of each section authorizing an appropriation is added a further specific provision, "that all funds appropriated" for the particular purpose specified "shall be distributed and administered in accordance with the laws of said State in like manner as the funds provided by State and local authorities for the same purpose, and the State and local educational authorities of said State shall determine the courses of study, plans, and methods for carrying out the purposes of this section in said State, in accordance with the laws thereof."

The Federal Government should assist the States in remedying the commonly existing defects in our educational system. Such aid from the Federal Government is justified by the very nature of our democracy. The most fundamental of all of those principles which underlie our government proposes that there shall be equality of opportunity, and as a corollary of this provision that the burden of supporting those services which make for the common good shall be spread as evenly as possible upon all of our people. The States vary greatly in their ability to support education. From the latest available data the true wealth per capita is found to vary in the several States from \$726 to \$5038. The contrast is quite as startling if the true wealth per pupil enrolled in schools is taken. Here the variation runs from \$2561 to \$19,377. The actual variation in ability to support education is even greater than would appear from these figures since income varies even more greatly than does wealth.

The income derived by citizens of the wealthier States is dependent upon a market which is Nation-wide. Income and excess profits taxes and internal revenue receipts generally are collected very largely in the States engaged in the manufacture and distribution of goods. These incomes and profits are derived from sales made to citizens throughout the Nation. For example: during the fiscal year 1920-21 the State of North Carolina paid \$79,573,000 in internal revenue on the manufacture of tobacco. The product was used and the taxes actually paid throughout the length and breadth of the land.

Neither ignorance nor learning can be segregated within the borders of any State. Education, or the lack of it, is felt throughout the Nation. Ignorant men move from one section of the country to another. College

graduates from the State universities of the Nation are to be found in all parts of the country. The figures show that from 16 to 63 per cent of the graduates of these institutions are distributed in States other than those in which they received their education. In like manner, in the privately endowed institutions of the United States from 20 to 83 per cent of the graduates are found in the States other than those in which the institution is located.

It is of the utmost importance that our system of education be developed along the lines proposed in the Towner-Sterling bill. Illiteracy is a National liability and a National menace. The census returns show six per cent of our population above ten years of age who are confessedly illiterate. When one remembers that this census excludes from the illiterate group anyone who has had the slightest amount of schooling anywhere, it is easy to understand why it was that in the army 24.9 per cent of the drafted men were found to be unable to read simple English. The census itself, however, shows that the number of illiterates recorded in 1920 was greater than in 1910 in twelve States. For example, the census shows that the total number of illiterates in New York, Massachusetts, Illinois, Ohio, and New Jersey was 954,131 in 1910, and 1,400,283 in 1920.

If we are to be fair to those who come to us from other lands, and if we are to preserve our American institutions, it is of the utmost importance that a program of education which will provide for the Americanization of the foreign-born be developed throughout the Nation. In the report compiled by the Civic Development Department of the Chamber of Commerce of the United States, appears the following:

"It may be truly said that one result of the war was to bring home to the American people as a whole the importance of assimilating the new-comer to this country. Investigations revealed a condition which but few outside of our social and civic agencies have realized, such as the existence of groups and colonies of unassimilated immigrants unable to speak the language of their adopted country, and almost wholly ignorant of its manners, customs, and political and civic institutions."

The economic well-being of the country and the personal happiness of all is dependent upon the development of a more adequate program of physical education and health service. Not only in times of war but in times of peace as well, the well-being of the individual and the progress of the Nation depend upon the physical condition of the people. It has been estimated that the economic loss in a single year from preventable disease and death is \$1,800,000,000 among those classified as gainfully employed. There is experimental basis for the statement that this loss could be materially reduced and leave an economic balance in the working population alone over and above the cost of prevention of at least a billion dollars annually. The program of physical education and health service should be encouraged by national sanction and promoted by national aid.

A large percentage of teachers in American public schools have neither the education nor the professional training necessary for efficient service.

Uneducated and untrained teachers in any of the schools of the Nation are a national liability. It is estimated that there are thirty thousand teachers in the United States who have no education beyond that furnished in a one-teacher rural elementary school. There are seven States in which forty per cent or more of the teachers hold licenses which require less than a high-school education. For the whole of the United States not more than twenty-five per cent of the teachers hold licenses which require two years' professional training beyond high-school education, a standard which has been acknowledged as proper minimum preparation for teaching in the elementary schools.

It has been suggested that the granting of Federal Aid will diminish local interest and local support. That this cannot be true will be acknowledged by those who read section 12 of the bill, which provided "that the sum or sums provided by the State and local authorities for the equalization of educational opportunities for the promotion of physical education, and for the preparation of teachers, shall not be less for any year than the amount provided for the same purpose for the fiscal year next preceding the acceptance of the provision of this act by said State." That Federal aid has not tended to diminish State support, but that the opposite is true, appears from the fact that State support of colleges of agriculture and engineering has been increased many-fold during the period covered by Federal support for these institutions. In the more recently developed field of vocational education we find a like result. In 1916 twenty-two States provided \$3,418,719 for vocational education. With Federal sanction and aid provided forty-eight States have developed a program of vocational education in 1921, which they supported by appropriations amounting to \$14,377,502. For the same year, the Federal government appropriated only \$3,097,932.

The grant of Federal money to the States is still further safeguarded in the Towner-Sterling bill by Section 12 which provided that no money apportioned to a State under the provisions of this act "shall be used by any State or local authority directly or indirectly for the purchase, rental, erection, preservation, or repair of any building or equipment, or for the purchase or rental of land or for the payments of debt or interest thereon."

In order to make effective the purpose of the National Government, the bill provided that States which share in any appropriation which may be made for the equalization of educational opportunity shall provide: "(a) A legal school term of at least twenty-four weeks in each year for the benefit of all the children of school age in such State. (b) A compulsory school attendance law requiring all children between the ages of seven and fourteen to attend school for at least twenty-four weeks of each year. (c) That the English language shall be the basic language of instruction in the common school branches in all schools, public and private." No one has suggested that these requirements are too high, or that they in any way interfere with the right of the States to control their own schools.

It is especially appropriate in this place and at this time to reassert a principle that has been irrevocably established in our National life, the

principle—namely, that public education is more than a matter of local or even State concern, that it is in truth a matter of the deepest National concern, and that the Nation as a Nation has a stake and an interest in the welfare and development of every child in the land.

It is appropriate in this place and at this time to reassert this principle because its establishment was due primarily to men from New England. It was Rufus Putnam, of Massachusetts, who secured in the Land Ordinance of 1785, that far-reaching provision which has set aside for "the support and maintenance of public schools" the sixteenth section of every township in every State that has since been carved from the National domain. It was Nathan Dane, of Massachusetts, who drafted the ordinance of 1787, which placed religion, morality, and education at the foundation of the States formed from the Northwest Territory. It was Manasseh Cutler, of Massachusetts, in 1787, who stood first and foremost for the Federal land-grants which made possible the State universities of our Middle West. It was a Senator from Vermont, Justin S. Morrill, who fought through three sessions of Congress for the legislation which, within a decade after its approval by President Lincoln in 1862, secured the establishment in every State of the Union of a "College of Agriculture and Mechanic Arts," under National support but with complete State control. It was a sun-crowned son of Massachusetts, Charles Sumner, who fathered in the Senate the bill introduced in the House of Representatives by James A. Garfield in 1867, establishing a Federal Department of Education. It was Charles Sumner who said that, if he could have his way, he would place the head of the Department of Education in the President's cabinet. It was another great Senator from Massachusetts, George F. Hoar, who in session after session urged Congress with cogent force to appropriate for the support of public schools throughout the country the National funds arising from the sale of public lands. It was the venerable and honored Senator Charles S. Page, of Vermont, whose name was first connected with the legislation which is known today as the Smith-Lever act, and also with the bill now known as the Smith-Hughes act which, passed with the complete and cordial support of the New England States, has been the Nation's first great step toward the solution of the problem of vocational education.

Notwithstanding all that has been so nobly wrought, there are unfinished tasks before us. No State today can be educationally self-sufficient. No American citizen, no matter what his color, what his occupation, or what the land of his birth, can, with safety to our social order be merely "hands and feet to fetch and carry." Human destiny, to an extent never known before, is now in the hands of the people. The fundamental problem that now confronts us is to raise the common man not so much to a greater degree of skill and industrial efficiency as to those higher planes of thinking, feeling, and social action which the complexity and interdependence of life demand. This can be accomplished through education and only through education. It was Horace Mann who said of any man who would claim

the "elevated rank of an American statesman" that he must "speak, plan, labor, at all times and in all places for the culture and edification of the whole people."

It is, therefore, most fitting and appropriate at this time and in this place that the National Education Association, in full accord with the ideals and the teachings of these illustrious sons of New England, reaffirm its sincere, devoted, and unqualified support of Federal aid and Federal recognition for public education as embodied in the Towner-Sterling bill now pending in the Sixty-seventh Congress.

REPORT OF COMMITTEE ON FOREIGN RELATIONS¹

AUGUSTUS O. THOMAS, STATE SUPERINTENDENT OF PUBLIC SCHOOLS,
AUGUSTA, MAINE, CHAIRMAN

Your Committee on Foreign Educational Relations recognizes the tremendous influence which may grow from a World Conference on Education which this Association has authorized for 1923 at such time and place as may be chosen. It also recognizes the magnitude of the undertaking. Already plans are maturing and widespread interest is manifested in the procedure. There is faith also in its timeliness and results. Only one who is directly connected with the movement can have an idea of the tremendous interest of the nations throughout the world, and the interest and coöperation of our own people for its success.

Principles of education universal—In their struggles to overcome the handicap of four years of devastating war the nations today recognize that they are a community separated only by a few hours of time and a few miles of distance, touching elbows, borrowing household utensils and table furnishings, like neighborly women, and that in order to prosper and be happy they must live in peace with one another. Each must be actuated by intelligent and unselfish motives. In order that this may prevail a knowledge of conditions, aims, hopes, and motives must be known to each other, and as children in the family of nations they must be brought up in such a way that they shall know each other well and shall be kindly in their ways one to another.

The belief in education and its necessity for both individual and groups of individuals as nations and as a world community is now a fundamental among all peoples. The knowledge which is of most worth to the world and the ultimate aims of education are universal and upon them all nations may stand as upon a common ground. Science, discovery, letters, music, art, history, and the great virtues of faith, hope, and charity form a universal language. Personal freedom and higher governmental efficiency are in direct ratio to the intelligence and understanding of the people. If this is true then the nations of the earth can come together for a discussion of the methods, movements, processes, attitudes, and fundamental principles of school organization and of education.

¹ In addition to the chairman, the committee includes the members listed on page 28.

Some history of world movements—The Panama-Pacific Exposition held in San Francisco in 1915 celebrating the opening of the Panama Canal which brought the nations of the world 10,000 miles nearer together; even with war in Europe it afforded opportunity for conference on many phases of education. Of these conferences there were 928 in the course of the Exposition with 31 nations participating. The most notable of all was the Congress on Education under the auspices of the National Education Association which convened that year at Oakland. The influence of that Congress cannot be judged until the results of future conferences and congresses are known. The resolutions adopted at that time may well be set up as the genius of the coming World Conference. That resolution reads:

"Perhaps the greatest task which lies ahead of the schools in all lands and countries is that of bending its energies towards the creation of a new order of international friendship, justice, and goodwill. Upon the public educational system of each state and nation lies the responsibility of enlarging the national conceptions and promoting goodwill among the nations of the earth. Entirely new values and standards for judging need to be created among the different peoples. The emphasis now placed on the deeds of the soldier should be shifted to those who have created the best of our civilization and rendered the most lasting benefits to mankind."

The years that have passed since that resolution was framed have been full years. The old world has been rolled up as a scroll and laid away and a new world is in the making, a cycle has passed, and a new one has come. It is for education to take this young age as it takes the young child and lead it into safe paths and broader, kindlier virtues. If education fails now its failure will be irretrievable. Out of the old methods and principles we would weave new standards and values.

The genius of this Conference is to promote through education a better understanding among the nations, to determine those elements, principles, and attitudes which may be universally applied, and which will develop through our schools the spiritual values necessary to reinforce the great work of the Conference on Limitation of Armaments, looking to lasting peace.

The objectives of the proposed International Congress are:

1. To promote peace and good-will among the nations of the earth.
2. To bring about a world-wide tolerance of the rights and privileges of all nations.
3. To develop an appreciation of the value and the inherited gifts of nationality through centuries of progress and development.
4. To secure more accurate and satisfying information and more adequate statements in the textbooks used in the schools of the various countries.
5. To foster a national comradeship and confidence which will produce a more sympathetic appreciation among all nations.
6. To inculcate into the minds and hearts of the rising generation those spiritual values necessary to carry forward the principles emphasized in the Conference on the Limitation of Armaments.

7. Finally, throughout the world, in all schools, to emphasize the essential unity of mankind upon the evils of war and upon the absolute necessity of universal peace.

These objectives are to be secured through the following means:

1. The teaching of international civics which will acquaint the rising generation with the various points of contact made necessary and facilitated by the modern means of communication and trade.

2. By the organization of textbook material used in the schools such as will give a more accurate visualization of the dominant traits and ideals of the nations.

3. Through the exchange of teachers and through scholarships to students of foreign countries.

4. By a program looking to universal education and to character education, conduct, and behavior.

5. Through an exchange of articles on education setting forth programs and methods used in the various countries and through an exchange of educational periodicals.

6. The designation of a day to be observed by all which may be known as "World Goodwill Day," upon which programs may be given such as will promote international friendship.

The objects of the world's unifying movement can be brought into world conformity essential to peace and good-will among men only through the schools of the nations and by teaching the rising generation the common origin of their kind and the common future of their descendants. The school, therefore, is the initial decisive factor in the future of civilization.

Suggestions for world conference—1. It would seem wise to devote at least two general-session programs of the National Education Association in 1923 to addresses by prominent persons on subjects of world importance. These sessions should come near the beginning and near the close of the program. The closing session should be devoted to phases and themes of good-will among the nations with a note of universal peace and forward vision.

2. The Conference should cover two weeks beginning one week earlier than, and closing with, the regular session of the National Education Association.

3. The first week may well be devoted to sub-conferences on special subjects or departments or phases of education which may be necessary to round out and approve the findings of the sub-conferences. All plenary sessions should be open to the general public.

4. Near the beginning of the National Education Association program there shall be presented a pageant portraying the contributions to education and to civilization of each of the nations interested.

5. The invitation to the World Conference will be forwarded to the nations with whom we are near in touch with special information immediately upon the selection of the place of holding the 1923 meeting.

6. It is planned that each nation shall present a brief account of educational conditions in that country which shall constitute the basis for the general conference. This may be a part of the printed volume of the proceedings of the World Conference as a matter of historic and professional value.

An international education association—Out of the 1923 World Conference it is expected there will come an International Educational Association as a permanent organization which shall keep in touch with educational procedure throughout the world and the exchange of educational ideals. This Association may follow in the main the National Education Association in form of organization, with various departments and divisions which shall deal with specific phases of education. Such an Association will not only bring the nations of the earth together but will tend to create an international comradeship, wholesome and far-reaching. Such an Association may well become a federated body with delegates from the numerous educational associations of the countries represented. Its meetings may occur at such stated intervals as seem expedient; international committee may be formed for the study of world educational interests. Textbooks, courses of study, methods of instruction, educational philosophy, international civics, ethics, character education, exchange of teachers, little journeys, the question of illiteracy, universal education, and others without end may be considered. The various educational organizations of all countries should participate. Your Committee realizes that such an undertaking will require much work and perseverance, but it is within our possibilities. Moreover, this association of world character may coöperate with the score or more of organizations now doing a most commendable service in international fields and intensify their results. Such organizations include: The World Association for Adult Education, The American University Union in Europe, The Workers Educational Bureau of America, The International Correspondence Bureau, The Auxiliary League, The International Language Association, The Pan-Pacific Union, The Education Division of the Pan-American Union, The Junior Red Cross, The Institute of International Education, The International Bureau of Teachers' Associations, American Field Service Fellowships for French Universities, The Rhodes Scholarship Trust, The International Kindergarten Union, Bureau of Educational Experiments, The Educational Organization of Home Economics Teachers, The Scandinavian Foundation, and many others.

Out of this movement there will grow a greater uniformity of system of weights and measurements, monetary systems, technical terms in science, technology, medicine and commerce such as will greatly enhance the understanding of students and scholars as of all peoples.

Bureau or Council of International Research—There should be created along with the International Education Association a Bureau of International Research or world clearing-house for education. This council should be made up of representatives selected by the principal teacher's

associations of each country. It should be the duty of these representatives to keep in close touch with each other and to furnish the representatives of their countries copies of the results of various educational investigations that have taken place in their country. It should be a means of carrying a "concert of opinion" on important educational questions to all peoples. From time to time coöperative international research might be directed through these representatives by the officers of the International Education Association. Where a Research Department is maintained by the teachers' associations of a country a member of this Department would probably be the logical representative of this Bureau of International Research. Where such a Department is not maintained some other officer of the teachers' association should be delegated to serve. It is the recommendation of your Committee on Foreign Relations that this organization be definitely considered in the coming World Conference on Education, that the achievements made be carried on with benefit to the whole world. We realize that in order to do this the whole question of finances must be carefully studied and that definite foundation be provided. It would not, however, seem difficult since there could be no greater work accomplished by persons of means who wished to render a direct service to humanity.

World Peace Exposition in 1930—The Committee on Foreign Relations as a personal privilege suggests that the National Education Association promulgate the idea of a World Peace Exposition in 1930 which will bring together the nations of the earth with their great contributions to education, commerce, society, and government. The far distant date named recognizes the fact that many of the nations of the earth now struggling to free themselves from the handicap placed upon them by the World War will by that time have recovered to such an extent and the financial condition of the world be such that an undertaking of this character may be in order. The last great exposition, the Panama-Pacific Exposition in 1915, even with war in Europe, was a wonder work and its benefits to the world shall be pyramided with time. In 1930 with the discoveries and inventions in modes of travel and with all the arts of peace the nations of the earth will be living in the "city of life" on the same street. In this exposition there should be portrayed in the buildings of the nations by art and architecture the great contributions to humanity. Centering around the exposition may be the Congress in which will be brought together the master musicians, the great artists, the great scientists, the great inventors, the great scholars, the great theologians, the leaders of thought of the whole world who would leave their contributions as a legacy to society. There should be portrayed also in pageant the achievements of the past, and there should be symbolized the hopes and ideals of the future. Such an exposition would mark the beginning of the new age and would proclaim to the world that the true progress and happiness of the race lies in the work of peace alone. Instead of destroying the works of art and science of former centuries it would point the way to higher achievements. This would be one of the great questions to be discussed and to receive definite action in the World Conference in 1923.

Conclusion—The dynamic forces which make for peace or war are formed when the young are taught. The teacher whether mother, priest, or schoolmaster is the real maker of history, and the school will shape the destiny of tomorrow. It is fitting, therefore, that the educational forces of the world should join hands in sympathetic comradeship. Out of this movement may issue a spirit in which international hatreds shall cease and be replaced by a friendly competition for the betterment of mankind securing for all men more equal opportunity and the removal of unjust discriminations against many people because of fortune, race, or creed. It is the duty of the school to see that the waters of the well of peace are kept pure.

REPORT OF THE COMMISSION ON THE COÖRDINATION OF RESEARCH AGENCIES¹

JESSE H. NEWLON, SUPERINTENDENT OF SCHOOLS,
DENVER, COLORADO, CHAIRMAN

The Commission on the Coördination of Research Agencies held its first meeting at Atlantic City in 1921 at the time of the meeting of the Department of Superintendence. About a dozen members attended, and these decisions were made:

1. It was voted to ask the National Society for the Study of Education to devote one volume of the 1922 Yearbook to a report on the use of intelligence tests in school systems. That report is now in print.

2. It was decided to memorialize Congress to appropriate \$30,000 annually for the inauguration in the U. S. Bureau of Education of a special division to serve as a clearing house for educational research. A subcommittee of the Commission took this matter up with leaders in Congress, and found that under existing conditions it would be impossible to obtain an appropriation to set up an effective department of this kind.

3. The Commission recommended that an N. E. A. committee on the supervision of classroom instruction be appointed. I believe this recommendation has not been carried out.

4. It was decided to recommend that the Commission be continued with an appropriation to make possible a meeting during the school year 1921-1922. At Des Moines the delegate assembly approved this recommendation and appropriated \$2500 for the use of the Commission. Miss Williams continued the Commission with its present membership.

The appropriation was not large enough to make possible a meeting of the entire Commission. The chairman, therefore, with the approval of the executive committee of the Association, called a meeting of an executive committee of the Commission consisting of members who were experienced in research or who, as executives, were alert to the needs in this field. This meeting was held in Chicago on April 29 and 30, and was attended by the following: Jesse H. Newlon, Franklin Bobbitt, Thomas H. Briggs,

¹ In addition to the chairman, the committee includes the members listed on page 34.

B. R. Buckingham, C. P. Carey, J. W. Studebaker, Stuart A. Curtis, Virgil E. Dickson, George Melcher, Frank G. Pickell, W. W. Theisen, and J. K. Norton. Mr. Norton was chosen secretary. The resolutions adopted by this sub-committee, and later approved by the Commission at its meeting here in Boston, are appended to this statement.

This subcommittee worked continuously for two days. All present recognized the imperative necessity of obtaining a better coördination of the educational research agencies of the country to prevent duplication of effort, and of devising machinery whereby certain information, chiefly of a financial nature, can be quickly collected each year and be placed in the hands of executive officers responsible for the determination of policies.

Following is a summary of the more important actions of the executive committee:

1. It commended the establishment of the Research Department in the National Education Association headquarters.

2. It strongly recommended that funds be provided for the collection of a working library for the use of this department, this library to consist mainly of current educational reports and publications.

3. It recommended that this department collect annually for quick dissemination information on certain topics of major importance to those responsible for the determination of educational policies. A definite method was outlined for this procedure. The Commission recognizes that the Research Department will at present be able to do only a small part of the important work necessary, but it believes that the department as at present constituted can do some work of great value to the profession.

4. A resolution was adopted recommending the appointment by the president of the Association of an advisory committee of five to coöperate with Secretary Crabtree and Mr. Norton, head of this department, in outlining the work which the research department can do for the profession as a whole, as distinct from its service to the Association headquarters staff.

5. A sub-committee of three, consisting of Dr. Thomas H. Briggs, Dean Burdette R. Buckingham, and Dr. Stuart A. Curtis, was appointed to work out a systematic and comprehensive classification of educational activities and functions, covering the entire field of education, and to work out a terminology that might be generally accepted. The Commission is agreed that such a system of classification is essential in the development of information-collecting agencies and of research along effective lines.

6. A sub-committee of three, consisting of Superintendents Virgil E. Dickson, J. W. Studebaker, and George Melcher, was appointed to review the research and investigation being carried on by committees and commissions of the Association itself, and to report a plan for the proper coördination of the work now being done and which needs to be done in the immediate future. It is important to avoid duplication of effort on the part of the Association.

7. It was recommended that the Commission be continued. The work of the Commission requires another year at least for completion.

The two outstanding needs at the present time are, first, the prevention of duplication, and, second, greater speed in the collection and dissemination of certain statistical information. At present there is a lamentable duplication of effort. City school systems are bombarding one another with questionnaires dealing with the same problems. In a period of less than six months one city school system received seventy-four major questionnaires from responsible sources—city school systems, colleges, and universities, committees representing teachers' associations, and from graduate schools of education—dealing with such important subjects as finance, building policies, curricula, supervision of instruction, and vocational education. At the outside, fifteen or twenty questionnaires properly devised would have secured all the information required by these seventy-four questionnaires. One questionnaire on finance from a given school system should give practically all the current information that is required by other school systems in a given year.

In a similar manner there is considerable duplication of effort by schools of education, State departments, and other research agencies. Graduate students frequently work upon problems that overlap. The time and the resources of departments of education are wasted in collecting necessary information which other agencies are also collecting. A thorough coördination is necessary to prevent this duplication.

It is imperative, likewise, that our machinery for the dissemination of a certain type of information be extended and speeded up. I refer to current information relating chiefly to finance, attendance, number of teachers, organization, building programs, and types of schools, and not to the more detailed and searching statistical studies which require time for accurate and careful preparation. Many an executive finds, after he has been through a fight, that he could have better defended his position or recommended more wisely if he had had in time certain important information.

The U. S. Bureau of Education has done most effective work, and no criticism is offered of its valuable service in the collection and dissemination in a detailed way of statistical and other information touching all phases of public education, but it is not possible for that Bureau, under present conditions, to collect and disseminate certain information as quickly as it is needed.

There is every evidence that the research agencies of the country are eager to coöperate upon any practical basis. Our problem is to outline a method and to establish a clearing house. An adequate solution of this problem presents many difficulties. The Commission believes that the Research Department at Association's headquarters can perform a most valuable service, especially if funds can be provided for enlarging the staff and extending the facilities for work, but the Commission is likewise unanimous in its belief that the only agency that will ever be able adequately to meet the demands is a Federal Department of Education. Without doubt, one of the most important functions of the proposed Fed-

eral Department of Education must be that of research, involving the coördination of educational research agencies throughout the country, and a means for the quick collection and dissemination of up-to-the-minute information on certain topics. To carry this work out adequately will demand a generous provision of funds and the prestige which only a Federal department can command. It will demand the most highly trained staff of statistical experts to be found in the educational world.

The Commission, therefore, strongly urges that the Association renew its efforts to secure the creation of a Federal Department of Education.

Two other resolutions were adopted touching matters not directly within the work of the Commission.

1. It was recommended that the Association constitute no commission to deal with problems requiring conference without appropriations sufficient to cover the expenses of at least one meeting a year at a time other than the date of one of the national conventions of the Association and that membership be so limited as to make such meetings possible.

2. We believe that, next to the collection and dissemination of accurate data concerning the public schools to the profession, the most important problem which will confront the profession in the next decade will be the education of the lay public to the needs of the schools. The Association, through the *Journal of the National Education Association* and in many other ways, is arousing the profession as never before in our history, but we are neglecting the agencies of publicity and education through which the general public is reached. The needs and the work of the public schools are not being adequately represented before civic bodies, in the daily press and those magazines of wide circulation which make an appeal to the general public, or through the moving pictures. The task is enormous and complicated. The Commission recommends that the Association create a committee on publicity, with adequate funds at its disposal, to formulate plans whereby a correct impression of present-day educational ideals, methods, and tendencies may be placed before the public through the agencies of magazines, newspapers, motion pictures, and civic bodies.

Following is a detailed list of the recommendations adopted by the Commission. Your approval of these recommendations is asked:

- I. That the Commission be continued with a reduced membership and with an appropriation of \$2500 for the coming year.

- II. That the delegate assembly approve the following resolutions adopted by the sub-committee and approved by the Commission as a whole:

1. The Commission on the Coördination of Research Agencies approves of the recent establishment of the Research Department of the Association and recommends that such a department be maintained at the National Education Association headquarters as a clearing house for the research activities of the Association.

2. The Commission on the Coördination of Research Agencies recommends that the Research Department of the Association take immediate

steps to gather together a "working reference library" of educational information containing such material as the following: State and city school reports, courses of study, research reports, and similar educational material. (It was brought out in discussion that this library should be sufficiently comprehensive to make it possible for the director of the department to meet current requests for educational information. It should not become too cumbersome, however, and from time to time out-of-date material should be disposed of, either by giving it to some educational organization that will preserve it, or by destroying it.)

3. The Commission on the Coördination of Research Agencies recommends that the Research Department be responsible for gathering information and formulating statements of current and future problems and tendencies in educational work.

4. The Commission on the Coördination of Research Agencies recommends that the following committee of three, from its own membership, be appointed to work out a systematic and comprehensive classification of educational activities and functions: Thomas H. Briggs, chairman, Stuart A. Curtis, and B. R. Buckingham. It is recommended that this committee be allowed a fund not to exceed \$600, to be used as it sees fit in carrying out its work.

5. The Commission recommends that a committee of three, constituted of the following members, Virgil E. Dickson, chairman, J. W. Studebaker, and George Melcher, be appointed to ascertain what research activities are being carried on under the auspices of the National Education Association. It shall be the duty of this committee to find out what is being done and what is anticipated by the various committees. On the basis of this investigation, this committee shall report a plan for the proper coördination of the work of the research activities of these committees. A copy of this report is to be sent to the chairman of the Commission and to the director of the Research Department of the Association.

6. The Commission recommends that an advisory committee of from five to seven members be appointed by the National Education Association to work in coöperation with the Research Department of the Association. The duties of the advisory committee shall be to counsel with the director of the Research Department in formulating policies of the Department, and to give support to the director of the Research Department in carrying out the plans formulated.

7. The Commission recommends to the National Education Association that it add to its organization a committee on publicity. The duty of this committee shall be to formulate plans whereby a correct impression of present-day educational ideals, methods, and tendencies may be placed before the public through the agency of magazines, newspapers, motion pictures, and the like. This committee, in order that it may function properly, should be adequately financed.

8. The Commission, realizing the broad scope and great expenses connected with any completely adequate plan for organizing the investigational

activities of the Nation in the educational field, recognizes that no agency in the coördination of these activities will be adequate unless it has the prestige of the Federal Department of Education behind it, as proposed in the Towner-Sterling bill. With this in mind, the Commission unanimously endorses the Towner-Sterling bill.

9. The Commission offers the following suggestions concerning the recently established Research Department of the Association:

(a) That the Research Department of the Association be responsible for the coördination of the work of the educational research agencies of the country, by formulating, issuing, tabulating, and making available through publication and by other means, standard questionnaires on topics of major importance to those interested in educational problems.

(b) That the following working program for the Department be adopted for the immediate future.

(1) The director of the Department should, by May 15, 1922, send communications to a selected group of educators representing various educational fields, requesting a statement of the major problems in which they are interested.

(2) Based upon the returns of these communications, the director should prepare a list of the problems of most common interest and submit this list by June 15, 1922, to the members of the Commission for criticisms and suggestions.

(3) Not later than August 15 the director should submit to the members of the Commission, for their criticisms and suggestions, detailed questionnaires covering the topics selected for study. These questionnaires should be accompanied by specific plans for conducting the investigations based upon these questionnaires, either directly by the Research Department of the Association, or by allocation to other responsible persons and agencies.

(4) The director should issue, as early as possible, in the *Journal of the National Education Association*, in the name of the Commission, if advisable, a statement of the investigations to be carried on by and in coördination with the Research Department of the Association. This statement should contain a calendar showing the approximate date upon which the returns of the various investigations may be secured from the Research Department of the Association or from the coöperating research agencies.

(5) The Research Department of the Association, as rapidly as proves feasible, should extend this plan of coördinating the collection, compilation, and distribution of desired educational information to include a wider and wider range of educational problems.

*REPORT OF COMMITTEE ON SOURCES OF REVENUE*¹

WILLIAM B. OWEN, PRINCIPAL CHICAGO NORMAL COLLEGE,
CHICAGO, ILLINOIS, CHAIRMAN

The report of the Committee on Sources of Revenue is essentially a report of progress. In order to make this Representative Assembly acquainted with the status of the work of the Committee and its general purport, may I briefly rehearse the history of the Committee?

The Committee was appointed at Salt Lake City in 1920. The purpose of the Committee was to establish or instigate a kind of investigation of the revenues on which we are dependent for the conduct of the public schools that would put the public-school people in possession of the facts, particularly those facts of comparative value that the individual States and cities so often need to know.

During the year between 1920-1921 the Committee attempted to find out how to go to work. We were confronted with the fact that we were trying to use the leftover time of a number of busy people with heavy public responsibilities to do a piece of work that would require the continuous efforts of people who had nothing else to do for a long period of time. And after considerable deliberation the Committee decided not itself to attempt any research work at all until we could get before the Association the fundamental question of policy as to how this Committee was to do its work. As a result, at the Des Moines meeting in 1921 the Committee made a brief report, which I think was fundamental in the policy of the Association as a whole. That report I should like to read as the basis for what I shall have to say later.

The report was this:

It was recommended and moved

1. That the Executive Committee be authorized to establish as soon as the finances of the Association would permit, a department of investigation and research in the secretary's office at Washington.

2. That the head of this department be a trained student of economics and statistics.

3. That this department inaugurate immediately a continuing service to the affiliated State and local associations with respect to the sources of school revenue and finances through the Journal of the Association and through bulletins and more comprehensive studies.

4. That these studies contemplate the development of a comprehensive standard treatment of the whole subject of school economics.

5. That the Association invite the affiliated State associations to create State committees on revenue to cooperate with the department at the national headquarters, and with the Committee on Sources of Revenue of the Association.

These resolutions I repeat—they are in the minutes of last year—just to get before us again what was adopted and approved by the Association.

The Executive Committee acting through the secretary was kind enough to consult at all times with the chairman of the Committee on Sources of Revenue as to the selection of the person who should be put in charge of this new department.

¹ In addition to the chairman, this committee includes the members listed on page 28.

Briefly, we combed the country for a person who would measure up to the standard set in this resolution and we finally after continuous effort succeeded in getting the person who at the time we thought to be entirely competent to do this work; and I am sure anybody who knows anything about what has happened since the first of March knows that we were successful in getting in Mr. John K. Norton, a most competent leader. I think we were unusually lucky in getting him to inaugurate this work. Now we lived up to that standard. We were to have a trained expert.

Then the next thing we attempted to do was to define the problems confronting us, and the Committee on Sources of Revenue met in Chicago and acted on the assumption that it was to become primarily an advisory committee to this department.

These committees are made up of people who are bearing heavy responsibilities as classroom teachers or as public administrators. These people do know the problems that they have to meet, at any rate. Sometimes they know them in a very stressing way. They can select problems; they can indicate emphasis; they can suggest relative improvements; and then the Research Department can carry on the strictly narrow, technical work of investigating, gathering, evaluating, and organizing the data for presentation, and then the committees can come again to evaluate these conclusions from the standpoint of the practical worker in the field. That is what this committee is trying to do.

We have selected two or three of the problems pertaining to school revenue and these are now under investigation, but our specific report will not contain anything regarding school revenues themselves.

In the recommendations made at Des Moines it was directed by the Association that this department inaugurate immediately a continuing service to the affiliated State and local associations through *The Journal*. Now, if you will note, this has been carried out to the letter, since Mr. Norton became head of this department. In the April number of the *Journal of the National Education Association* you will find an article entitled, "Have Teachers' Salaries been Increased?" That was Mr. Norton's first contribution. In May we have another article on The Salaries of Elementary Teachers, 1921-22. In June we have another article on Cost of Education, 1890-1920. One of those articles I should like to discuss but time forbids—a new method of interpreting the whole situation economically. I hope we all recognize that *The Journal* is going to keep us in connection with this department.

Now, we said also that we should have bulletins, and we have here for distribution at this convention one of the first fruits of this department inaugurated only in March. If you sought to find a better illustration of promptness and efficiency and vigorous execution I should like to know where you could go, even in private business. Facts on the Cost of Education and What They Mean, a 65-page pamphlet with many tables, published by the National Education Association, compiled and organized by the new department, will be distributed to you.

Now, members of the Association, this is the essence and substance of my report. It is a report of progress. I should like to close by saying, what I intimated at the beginning, that the biggest thing this Association can do is to learn how to work effectively and economically through this department and its committees so as to put our growing revenue into service for us; and we have made a beginning, at any rate, in the right direction.

*FINAL REPORT OF COMMITTEE ON HEALTH PROBLEMS IN EDUCATION*¹

THOMAS D. WOOD, COLUMBIA UNIVERSITY, NEW YORK CITY, CHAIRMAN

The Committee on Health Problems in Education of the National Education Association with the continued cordial and effective coöperation of the corresponding Committee of the American Medical Association has continued its work during the past year with a sustained interest in the Committee program and a steady demand for the reports which have been issued by the Joint Committee.

Educational and health officials, child welfare organizations, Red Cross workers, and other individuals and organizations in this and in other countries are looking to your Committee in increasing numbers for health standards and literature.

This Committee on Health Problems was created as a Committee of the National Council of Education at the meeting in San Francisco in 1911 at the suggestion and request of the American Medical Association, which was in session at the same time in Los Angeles.

At the meeting of the National Education Association in Des Moines, July, 1921, this Committee was formally adopted as a Committee of the National Education Association.

After a careful survey of the general field the Committee decided to give attention first to the health problems of rural schools.

The first report of the Committee was a valuable bulletin entitled "Country School Houses," prepared by Fletcher B. Dresslar, a member of our Committee. This report was printed and distributed in 1912 by the U. S. Bureau of Education. Unfortunately this bulletin is out of print.

The Committee literature still being distributed in original or repeated editions includes the following:

1. "Minimum Health Requirements for Rural Schools." Two editions of 800,000 copies of this report have been distributed. A third edition of 10,000 copies is now being distributed. Unprejudiced evidence from many places shows that this report has exerted a major share of influence in the marked improvement in rural-school sanitation in the United States during the last eight years. Several States have adopted this report as the standard for rural schools.

¹ In addition to the chairman, the committee includes the members listed on page 32.

2. "Health Essentials for Rural School Children" was printed in 50,000 copies. This first edition was exhausted, and a second revised edition is now being distributed.

Most of the copies of this report have been used as supplementary texts on health in the training of rural-school teachers in the normal schools, and as practical hand-books by rural-school teachers and supervisors.

3. "The Health Chart Report." The first edition of 10,000 copies of the illustrated Health Chart pamphlet was soon exhausted and a second edition of 10,000 is now being distributed.

This pamphlet not only serves to illustrate and explain the health charts but is being extensively used for health instruction in both city and country schools and also as a guide in making health posters and scrapbooks.

4. The "Health Chart Set" comprises 58 charts each 22 x 28 inches. Over 1000 complete sets of the health charts (including 58,000 charts) have been distributed in our own and in foreign countries. Many orders for individual charts have been received. One State department of health has recently ordered 2400 copies of individual charts.

The above mentioned bulletins and the health charts are being sold by the Committee at the bare cost of printing.

5. "The Teacher's Part in Social Hygiene" was published last year with the coöperation of the American Social Hygiene Association, and this co-operating Association presented the Joint Health Committee with 5000 copies of this valuable bulletin. The demand for this pamphlet report is rapidly increasing.

Constructive coöperation between organizations and committees is a prominent part of the policy of the Joint Health Committee.

6. "Health Improvement in Rural Schools" is the title of a report which has been in careful process of preparation for several years. This is just coming from the press to complete for the time being the introductory plan of the Committee to promote the entire health program of the rural schools.

7. "Health Service in City Schools of the United States" is the report of a survey, conducted by our Committee this year, of the health work which is being done in the city school systems of this country. Over 620 six-page questionnaires were sent to city superintendents of schools. Filled out questionnaires containing much valuable information of current accomplishment have been received from 340 (54.6 per cent) of the superintendents.

Your Committee expresses here sincere appreciation of the splendid help and coöperation from the 340 superintendents who responded so promptly. This report will be printed and ready for distribution within a few weeks.

8. "Daylight in the School Room" is the title of a valuable report on school lighting which was prepared in 1921 by a sub-committee under the chairmanship of Dr. Edward Jackson, eminent ophthalmologist of Denver and a member of our Joint Committee.

This report has been printed in several scientific and educational magazines.

9. A partial report on "Ventilation of School Buildings" has been prepared by a sub-committee of which Dr. R. W. Corwin of Pueblo, Colorado, is chairman. Further work on this study is being conducted under the leadership of Mrs. Ira Couch Wood, of Chicago, another member of this sub-committee.

10. Appointment of Committees on Health Problems in Education, in the several States.

At the meeting of the House of Delegates of the American Medical Association in New Orleans in May, 1920, it was voted to urge upon each of the State medical societies that a committee of five physicians, members of the society, be appointed to coöperate with a similar committee of the State teachers' association as a joint Committee on the Health Problems in Education in that State. It will be recalled that at the meeting of the National Education Association held in Des Moines, Iowa, in July, 1921, this action of the American Medical Association was heartily endorsed and each State teachers' association was urged to appoint such a committee in response to the request of the State Medical Society. All but five of the forty-nine State medical societies have appointed such State committees of physicians and have reported their personnel to the Secretary of the Council on Health and Public Instruction of the American Medical Association. Our Committee urgently requests every State teachers' association to appoint a like committee of teachers to coöperate with the medical committee.

While our Joint Health Committee of the National organizations of teachers and physicians can propose material and secure data of great value, and can recommend measures which would secure better health conditions in the public and other schools of the country, it is obvious that if such measures are to be generally adopted and put into practice it must be through the efforts of many groups dealing with these activities in the several States and communities. Our committee will find one of its most effective fields of usefulness in serving as a medium of inter-communication and coördination of these several State committees.

The coöperating medical group of our Committee has initiated the custom of holding at the time of meeting of the American Medical Association an annual conference of the members of the Committees of the several State medical societies. Our Committee recommends that a similar plan be instituted for the committees of the State teachers' associations and that our Committee be authorized to arrange for such a conference at each annual meeting of the National Education Association. The interchange of information regarding progress in the several States in solving the health problems in education together with the opportunity for discussion and suggestion which such a conference would afford could not fail to be helpful in promoting this great movement.

The Joint Committee acknowledges with great appreciation the generous, substantial, and continued coöperation and support of the Elizabeth McCormick Memorial Fund of Chicago.

Throughout the existence of our Committee the coöperation of the U. S. Bureau of Education has been of great value.

At the annual meeting of the Joint Health Committee on February 28 in Chicago, unanimous support was given to a resolution that a committee should be appointed to prepare a program of health education for public schools and teacher-training institutions of the country. This is by far the most extensive and important project which your Committee has yet undertaken.

So active was the interest manifested by the members of the Committee in this plan that on April 22 seven members of the Joint Committee met in Pittsburgh entirely at their own expense and spent two days in developing the plan for this program of health education.

This wave of intense interest in, and intensive development of health work in the schools, accompanied by unprecedented stimulation of interest in health by voluntary organizations outside of the schools, and contribution to the schools of a fascinating and confusing mass of material and devices for health work and health teaching from many outside sources, makes it all the more desirable and necessary that the educational forces within the schools should study, interpret, and coördinate the materials and methods in the field of health education, so that the schools of the country may be provided with an educationally sound program of health teaching and training.

This program adopted by the Committee provides for sub-committees to grade the health-teaching material for the kindergarten, elementary, and high schools and also for the normal schools and other teacher-training institutions. These sub-committees further will provide technical groups to judge and organize material from the standpoint of teachers in the schools, physicians, educational psychologists, dentists, nutrition experts, teachers of physical education, biologists, and public-health specialists.

This program of the Committee would involve the work of several years, and during this period of thorough investigation and consideration of the multitude of problems involved our Joint Committee would plan to issue a preliminary report within a year or eighteen months to provide the best available guidance to the schools of the country relative to health teaching in the immediate future.

Extensive study and experiment by our Joint Committee, assisted by the various technical committees referred to, would be necessary to solve some of the many problems in this field which are now pressing for answer.

In this new project the members of the Joint Committee have proposed for themselves and for their chairman, a task of National scope and of great importance in the program of public education.

This Joint Committee seems peculiarly situated and constituted to attempt under distinctively favorable auspices this pressing educational task.

This work can be confidently undertaken by your Committee, if the proper encouragement is given and if adequate financial support is provided.

If the preparation of a program of health education—in scope and character like that briefly explained in this report—is to be carried out with reasonable efficiency, an additional appropriation of \$5000 a year for at least three years is urgently needed to provide the secretarial and clerical aid required. Perhaps it is not necessary to add that no part of the appropriations here recommended is intended for any member of the committee, but simply for the secretarial and clerical work involved.

In addition to the committee program and reports already mentioned, we are working toward the publication of the following bulletins:

1. Mental Hygiene for Normal Children: What Every Teacher should know about it.
2. Standards of Health Norms and Defects of School Children.
3. Making Athletic Games Safe and Healthful for School Children.
4. Health and Efficiency for Teachers.
5. Essentials in the Hygiene of Instruction and School Management.

To continue with reasonable efficiency the program already under way, and outside of the preparation of a Program of Health Education, the Health Committee respectfully asks for an appropriation of \$2000 for the coming year from the National Education Association. Your Committee, according to the custom of many years, confidently expects from the American Medical Association an appropriation equal to that which may be granted by the National Education Association.

REPORT OF THE EDITORIAL COUNCIL¹

WILLIAM C. BAGLEY, EDITOR-IN-CHIEF OF THE JOURNAL OF THE NATIONAL EDUCATION ASSOCIATION, NEW YORK CITY

This report of the Editorial Council to the Representative Assembly will be brief. The Council has held two meetings during the year, one at Chicago in February and one here in Boston, yesterday. The sessions have been devoted largely to informal discussions of the problems involved in the publication of the *Journal of the National Education Association*. These discussions have been rich in concrete and detailed suggestions toward the improvement of our official publication.

In a more formal way the Council has reindorsed the general editorial policies of the *Journal* as outlined at some length last year at the Des Moines meeting, and has requested that I convey to you this reindorsement and the recommendation that the policies in question be accepted as a provisional guide for the editors of the *Journal* during the coming year.

The Council has also asked me to express its cordial and sincere appreciation of the work that has been done for the *Journal* by the Managing Editor, Mr. Joy E. Morgan, and the Business Manager, Mr. Ray S. Erlandson. May I add to this my personal gratitude to these two men? It has been through their tireless efforts that the *Journal* has so quickly

¹ In addition to the chairman, the council includes the members listed on page 31.

achieved a measure of success that I, myself, believed unattainable within ten years. But this is far from saying that the *Journal* has yet become the publication that our Association needs and must have. The growth of the Association has already reached the point where, even in our largest meetings, only a small proportion of our membership can be present. What the individual member receives directly from the Association, then, must come very largely through the *Journal*. Indeed, it is this agency that we must depend upon primarily to hold and increase our membership. The very practical ideal which Mr. Morgan cherishes is to make the *Journal* itself, if I may use the phrase, "worth the price of admission alone."

To do this will be no easy task. Our audience is far from homogeneous in interests, tastes, needs, and attainments. We must make our *Journal* worth while to every member of the Association without sacrificing its fundamental purpose, which is to promote the aims and ideals, the policies and programs of the Association. These have to do largely and necessarily, not with the technical and detailed problems of the teachers' daily work, but with the broad and comprehensive problems of educational policy and polity. We should reveal a most lamentable ignorance of human nature if we were to assume that every teacher will be interested in these matters. Rather we conceive it to be the duty of our *Journal* so to present these great issues that their vital relationship to the daily work and the professional welfare of every individual teacher will be clear and unmistakable; so to set forth the Association's program and policies that they will arouse the interest, catch the imagination, and fire the enthusiasm of every teacher in the land.

This, you will agree, is an ideal that will be fairly difficult to realize. I have often been accused of being an idealist and a dreamer. I pass the gentle indictment on to my good colleague, Mr. Morgan, and however it may be with me, I wish to say that he is that kind of idealist who not only dreams dreams, but also takes off his coat, rolls up his sleeves, and works in season and out to make his dreams come true.

In its sessions, the Editorial Council has given careful consideration to the criticisms that have come from members and others regarding the conduct and policies of the *Journal*. Most of these criticisms have been of a constructive and most helpful type, pointing out real deficiencies and suggesting means of improvement. There has been, however, a fundamental criticism involving so important a policy that the Council has felt it should be transmitted to the Representative Assembly. It has to do with the attitude that the *Journal* should take in its editorial columns toward controversial questions. The specific issue is an editorial in our May number regarding the Towner-Sterling bill. I accept full responsibility to the Association for all editorial pronouncements that have appeared in the *Journal*, although I have not written, nor should the editor write, all of the editorial articles. The article in question I did write. It was a challenge to the opponents of the Towner-Sterling bill to put forth a constructive program that will promise to correct the universally recognized and far-reach-

ing defects of public education—a constructive program that will promise to achieve this end more quickly and in a better way than do the provisions of the Towner-Sterling bill. The editorial deliberately charged the opposition to the bill with having so far “achieved nothing more than a tragic bankruptcy of constructive ideas.” It stated that the Association would be glad to consider any rival program that had constructive features. It stated that the continuance of an exclusively negative opposition to our bill could be interpreted only as a willingness upon the part of the opponents to let the gross inequalities, inequities, and inefficiencies of our educational system remain uncorrected. It further stated that the repeated gross and deliberate misrepresentation of the bill by certain of its opponents had already been interpreted to mean that these opponents were animated by motives that would not bear the light of publicity. In the name of peace and harmony it called upon the opponents of our bill either to come forward with a constructive program of their own or to get behind our program and work with us for the enactment into law of the most comprehensive measure for the promotion of public education that has yet been proposed.

Up to date this challenge has not been accepted, but we have received from two sources violent protests—one against permitting editorials of the *Journal* to deal with controversial topics, the other accusing the editor of using the columns of the *Journal* to give vent to his “personal spite.”

It has been the position of the editors that any measure which has received the official indorsement of our Association can no longer, in the publications of the Association, be regarded as a “controverted question.” Certainly when a measure has received for four successive years an indorsement without a dissenting vote, for the *Journal* to regard it as still a controverted question would be gross disloyalty to the Association itself.

I may say that the Editorial Council has unanimously indorsed this position and has approved of the editorial in question. But I believe that the time has come for the Representative Assembly, in justice to the editors of its *Journal*, to decide an important question. Do you wish your official publication to “pussy-foot” on your program? Or, do you wish your *Journal* to speak as forcefully and cogently as it can and *militantly when necessary*, always with due consideration for the essential dignity of our profession, and never forgetting that no problem associated with the children of our Nation should be touched except with a reverent hand? Shall we remain continually in the bowed posture of humble petitioners or shall we stand upright and four-square in full confidence that our cause is just and right and fortified by the knowledge that what we ask is not for ourselves but for the children of the Nation, for our country, and for humanity?

If the latter is your wish will you let me advert here to an illustration of what I have in mind? Will you permit me as the editor of your *JOURNAL* and in the name of this Association here and now publicly to resent the misrepresentation of our National program that appeared in this

morning's issue of the *Boston Herald*, and to demand from that journal the retraction of the specific charge which closes the final paragraph of its editorial on the Towner-Sterling bill?

I shall read that paragraph:

"We have been asked to specify how the enactment of such a measure as the Towner-Sterling bill would be a long step toward the disintegration of our federated republic. If it is not a step toward the disintegration of the republic through the concentration in Washington of an education propaganda, then there can be no excuse for the experiment. If the backward states feel that they need assistance in advancing the cause of education, they will be generously aided by the friends of education in states like Massachusetts, which have always led in educational endeavor—but they must not expect the State of Massachusetts or any other forward-looking State to sacrifice her independence at the behest of socialistic theorists."

The Towner-Sterling bill is the child of this Association. It embodies two great proposals: the creation of a department of education with a Secretary in the President's cabinet, and Federal aid for public education especially in the common schools. These are the "socialistic theories" which the *Boston Herald* charges you with propagating. If you are "socialistic theorists," Charles Sumner was a "socialistic theorist," for it was he who made the first strong and cogent appeal for the appointment of a Secretary of Education. If you are "socialistic theorists," George F. Hoar was a "socialistic theorist," for it was he above all others who urged that the proceeds from the sale of public lands be devoted to the common schools as opposed to the agricultural and mechanical colleges.

And may I say a word in conclusion not as your editor, but as an American citizen? I was brought up in Massachusetts. For eight generations my forefathers had lived and worked and died within the boundaries of this State. At home, at church, and in the public schools of this Commonwealth, I was steeped in the great traditions of New England. Its great men were my boyhood heroes, and Charles Sumner, one of the greatest of them all. As a boy I listened to George F. Hoar, then a venerable man. It was not beneath the dignity of our great Senator to come to the schoolhouse and talk to boys and girls. If those who are fighting for Federal aid for the common schools are "socialistic theorists," I, for one, am proud to take my place in that group along with George F. Hoar.

I am sure that the *Boston Herald* did not express the true sentiment of New England toward our National program. But if I should chance to be mistaken I still should not despair. I love New England, but I have lived for the greater part of my life in the Middle West and the Far West. I know that out there on the wide plains, and beneath the sunlit peaks of the Rockies, the Sierras, and the Cascades, and along the great valleys of the Pacific slope, there is a new New England that will not let the ideals of the old New England perish from the earth.

REPORT OF THE ADVISORY COMMITTEE OF SUPERINTENDENTS

APPOINTED TO COÖPERATE WITH THE CHILDREN'S BUREAU, U. S.
DEPARTMENT OF LABOR

MARY D. BRADFORD, KENOSHA, WISCONSIN, CHAIRMAN

In the Spring of 1921, President Hunter, of the National Education Association, at the request of Miss Lathrop, then the Chief of the Federal Children's Bureau, appointed a special Committee of School Superintendents to coöperate with the Children's Bureau in advancing certain measures for the benefit of children in industry.

One of these measures was the improvement of standards of physical examinations given to children applying for employment certificates or work permits. An important step towards the accomplishment of that aim had already been taken before the Advisory Committee was appointed. This step consisted of a report made by a Committee composed of School Examining physicians and other experts in the field of physical education, pediatrics, and industrial hygiene. This report, now available as Physical Standards for Working Children, Bureau Publication No. 79, recommends for general adoption certain definite standards of physical development and fitness for children entering industry; and outlines methods to be used by examining physicians to determine whether these standards are met.

The first suggestion was that the Advisory Committee of School Superintendents would make a critical study of the report of the Physician's Committee and offer suggestions as to ways in which the gradual adoption throughout the country of a sound and thorough system of medical examinations of children applying for work permits may be secured.

The following Superintendents accepted membership on the Advisory Committee:

PERER MORTENSON.....	Chicago, Illinois
SUSAN M. DORSEY.....	Los Angeles, California
SAM SLAWSON.....	Bridgeport, Connecticut
S. E. WEBER.....	Scranton, Pennsylvania
THOMAS E. JOHNSON, State Superintendent of Schools.....	Lansing, Michigan
Chairman, MARY DAVISON BRADFORD.....	Kenosha, Wisconsin

This Committee met in Chicago on February 26, 1922, at the time of the meeting of the Department of Superintendence. Miss E. N. Matthews, Director of the Industrial Division of the Children's Bureau, was present. The question of holding one or more conferences in connection with the National Education Association was discussed, and Miss Matthews presented the results of a letter of inquiry sent out by the Bureau to all State superintendents of schools to city superintendents in the most important industrial centers where large numbers of certificates are issued, and to other persons and organizations interested in these problems, asking their opinion as to the advisability of holding such a conference, and requesting suggestions as to topics which they considered most important for discussion.

The responses showed a great deal of interest in the plan, practically all of the ninety-three persons who replied being in favor of the idea. Many felt that such a meeting would be productive of exceedingly valuable results.

The different topics proposed by the correspondents for discussion had been classified by the Bureau and those most generally desired were thus definitely determined. With the topics selected, there remained the selection of those speakers who, through successful experience in dealing with one or another phase of this problem, would effectively present this carefully projected program. Here, again, the knowledge possessed by the Bureau of the entire field furnished indispensable aid.

The conferences thus planned with such painstaking care are set forth in the program of these meetings. They occurred on July 5 and 6 at the Boston Normal School. This is the first time in the history of this Association that the interests of the child in industry have been made the sole subject of consideration in programs occupying two full sessions. Conventions of attendance officers and Vocational Education and Vocational Guidance conferences have dealt with the problem of the working child, but it is a distinctly new thing to recognize this as a matter for teachers and school administrators to consider.

The Advisory Committee feel that the success of this first conference under these auspices augurs fuller appreciation and support of the Children's Bureau in its work of conserving the Nation's most valuable resource, and recommends that a similar conference be arranged to be held at the time of the next meeting of the National Education Association or of the Department of Superintendence.

*PROBLEMS AND STANDARDS OF EMPLOYMENT CERTIFICATE ISSUANCE*¹

During the week of the annual meeting of the National Education Association in Boston, a Conference on Problems and Standards of Employment-Certificate Issuance was held under the auspices of the U. S. Children's Bureau in coöperation with a committee of school superintendents appointed by the National Education Association. The object of the Conference was to increase interest in the administration of child labor laws and to develop standards of administration through the exchange of experiences of school and labor officials charged with the issuing of work permits. Throughout the meetings the conviction was again and again expressed that the transition from the school room to gainful employment is a phase of the child's life which the school cannot afford to ignore. The school's interest and responsibility in this transition have been recognized

¹ Report of conference on employment-certificate issuance, held under the auspices of the Children's Bureau, U. S. Department of Labor, in coöperation with the National Education Association, held at Boston, July 5 and 6, 1922.

This report was furnished by Miss E. N. Matthews, Director of Industrial Division, Children's Bureau.

under the child labor laws of many States, which give to school authorities the duty of issuing work permits to children leaving school for work.

The first session of the Conference was presided over by Miss Grace Abbott, Chief of the Children's Bureau, who sounded the keynote of the meeting when she stated that the protection afforded children leaving school for work depends first, on the carefulness and social vision with which work permits are issued, and second, on factory and workshop inspections. The subjects for discussion covered two important aspects of employment certificate issuance: the organization and function of the local issuing office and the supervision of local issuance by State agencies. In the opening paper, Miss Anne Davis, Director of the Vocational Guidance and Employment Certificate Bureau of the Chicago Public Schools, showed how through careful organization of the issuing office child labor may be reduced to a minimum and large numbers of children kept under the protection of the schools even after they have gone to work. Among the details of such organization Miss Davis mentioned the importance of familiarizing school principals with the procedure of securing employment certificates in order that children may not be permitted to break their school ties and apply at the certificating office until they have met the legal requirements for working papers. Through coöperation with the employer, requiring him, for example, to return a certificate promptly when a child leaves his employ, the issuing office, she stated, is enabled to maintain close supervision over children who are out of work, seeing that they are returned to school if they do not find immediate employment. Through the physical examination which is made in the issuing office many children unfit for work are kept in school until their physical defects are cured, and by means of reexaminations when a child changes to a new job a certain amount of health supervision of the working child is maintained. The schools, also, Miss Davis pointed out, through the issuing office may oversee the general welfare of working children by making from time to time careful investigations of local establishments to which children are sent to work.

Mr. Arthur P. Lederle, Supervisor of Attendance of the Detroit Public Schools, in a discussion of The Relation of Certificate Issuance to the Enforcement of School Attendance Laws, likewise emphasized the importance of a proper handling of certificate issuance in reducing child labor and increasing the length of school life. According to the Michigan child labor law, a child of 14 may secure a permit to work only if his services are necessary to the support of himself or his parents. Except for this "economic necessity" clause, stated Mr. Lederle, practically all the 25,000 14 and 15-year-old children of Detroit would be eligible to leave school. "There were," he continued, "only 263 of these children out of school and employed in June, 1922, and I am confident that in June, 1923, Detroit will be able to make the proud boast that not a child under 16 is permitted to leave school to go to work."

The discussion on the organization of the local office was continued by

Miss Edith Campbell in a paper on *The Value of Certificating Office Records to the Student of Child Labor Problems*. Miss Campbell illustrated from the experience of the Vocation Bureau of the Cincinnati Public Schools, of which she is director, how statistics of work permits bear the same relation to school problems as vital statistics to health education. Thus, the large percentage of retardation found among applicants for employment certificates has led, she stated, to a reorganization of grade work in the Cincinnati schools; and the lack of correlation found between the grade completed by the worker and the character of his job, between the degree of training and the amount of wages, has led to studies of occupations by the issuing office in order that with more definite knowledge of what industry wants the schools may more effectively educate the child for industrial life. In stressing the need for care and supervision of children who leave school for work before completing the high school—between eighty and ninety per cent of all children entering school—Miss Campbell pointed out that whereas the child who goes to high school has a “running chance of school supervision until he is seventeen or eighteen, the working child in many States is thrown out at twelve or fourteen.”

The question of State supervision of the work of the local office aroused unusually keen interest in both school and labor officials. State Supervision of the Issuance of Certificates was the subject of a paper by Mr. Taylor Frye, of the Wisconsin Industrial Commission. Under the Wisconsin law the supervision of work permit issuance is not in the school system but in the State factory inspection department. It is interesting, however, that of the 209 permit officers appointed by the Commission, 108, according to Mr. Frye, were school officials. The Commission, Mr. Frye explained, has complete authority in interpreting and applying the State child labor law, and makes rulings which are of State-wide application and have the force of law. Nevertheless, even under this system of enforcement by a labor body, the closest possible cooperation with the schools is sought; in addition to certification by the schools as to educational attainments, the recommendation of school authorities is requested for or against issuance in every case, and in no instance, declared Mr. Frye, is a permit issued against the recommendation of the school principal. The discussion of the relation of State agencies to issuance was continued by Mr. Pringle, of the State Board of Education of New Hampshire, and by Mr. Sturges, of the Connecticut State Board of Education, in both of which States the control is entirely in the hands of the schools, and by Mr. Small, of the Massachusetts State Department of Education, who referred to the importance of the State continuation school system in maintaining effective supervision of the working child.

At the second session of the Conference, presided over by Mrs. Mary D. Bradford, chairman of the cooperating National Education Association Advisory Committee of Superintendents, methods of administering the various standards of the child labor laws were discussed. A paper on the enforcement of an age standard, presented by Miss Esther Lee Rider,

of the Alabama Child Welfare Department, made the point that if the schools required proof of age on a child's entering school many of the difficulties of effectively enforcing the minimum age provision of the child labor law would disappear. In the discussion following this paper it was stated that a number of cities, among which are New York, Boston, and Cincinnati and Akron, Ohio, are following this practice. Miss Jeanie V. Minor, of the New York Child Labor Committee, described the three kinds of educational standards now common in child labor laws—completion of the work of a particular grade; school attendance for a certain number of days during the preceding school year; ability to pass an educational test. Miss Minor pointed out the necessity of a grade standard supplemented by the other requirements, recommending that schools be more nearly adapted to different types of children so that a grade standard would not be impossible of attainment by children of less academic types of mentality. Speaking on the "best interests" or "poverty exemption" clause contained in many child labor laws, Dr. E. J. Lickley, director of the Compulsory Attendance and Child Welfare Department of the Los Angeles Public Schools, referred to the responsibility of the school system in making provision for the comparatively few children who would otherwise be obliged by poverty to curtail their schooling. In describing the certificate issuance system in California, Dr. Lickley, like many of the speakers, laid special emphasis upon supervision of working children by the schools. "We do so little for the boy or girl who leaves school. We are willing to spend any amount of money on boys and girls so long as we can keep them in school, from the kindergarten until they get a degree from the State University, if they will only stay in school. But the ones who need the care of society the most are those who are forced out into industry. The minute they go we let them shift for themselves."

Considerable discussion was evoked by a paper on The Enforcement of a Physical Standard by Dr. Wade Wright, director of the Industrial Clinic of the Massachusetts General Hospital. The accomplishment of corrective medical treatment at the time of application for an employment certificate, said Dr. Wright, "is a tardy effort to compensate for the essential or unnecessary shortcomings of school medical inspection service, and at the present time the greatest value of the medical examination made as a prerequisite to the issuance of an employment certificate lies in its revelation of the inadequacy of the existing mechanism for the care of the health of children of school and pre-school age." That this is so, Dr. Wright continued, in no way detracts from the value of physical examination prior to certification as a means of preventing the employment of substandard children at unsuitable work, and for comparison with findings of examinations made during a child's working life as a basis for ascertaining the physical effects of early employment on the undeveloped physique.

On the whole, the Conference left the impression that the issuance of employment certificates is far more than a routine administrative job; that it involves rather a succession of important problems which need to

be carefully and thoroughly solved if children are to receive the protection which the child-labor laws are designed to give. To the solution of these problems, however, a great deal of organization to take care of details and a great deal of interest in the details must be brought to bear.

At the close of the Conference a resolution was passed asking the Children's Bureau to call a similar conference in connection with an early meeting of the National Education Association, at which special attention should be given to standards and enforcement of child-labor laws relating to the regulation of street trading among children.

*REPORT OF THE COMMISSION ON THE REVISION OF ELEMENTARY EDUCATION*¹

MARGARET S. MC NAUGHT, STATE COMMISSIONER OF ELEMENTARY
SCHOOLS, SACRAMENTO, CALIFORNIA, CHAIRMAN

The Commission on the Revision of Elementary Education submits herewith a report of work accomplished and work planned that will help to solve problems now confronting elementary school teachers and administrators.

The reorganization of elementary education must take into account not only the new and different conditions of living in these days, but the causes—social, economic, political, and ethical—that have brought about these conditions. It must also look far enough into the future to get as clear a picture as possible of what life is to be when the children of today are grown to manhood and womanhood.

But the past of which we know gives us perhaps the best basis for necessary changes. Old truths that are universally conceded to be fundamental to a democratic form of government must be taught and experienced rightly. Among these is the right of every child to a fair chance. This is merely a corollary to Jefferson's statement that life, liberty, and the pursuit of happiness are the inalienable rights of all men.

We have thought that, in providing free public-school education for all the children of the land, we were carrying on our schools in accordance with this great fundamental principle of democracy. We know now that the mere provision of opportunity does not offer a fair chance, and we also know that, in order to give each child his own fair chance, individual differences of physical and mental equipment, as well as social environment involving many conditions, must be considered.

It is futile to provide educational opportunities for those who cannot use them, and almost criminal to deny children those types of educational opportunities that they are capable of grasping.

The first step in the reorganization of elementary education then is not that which changes the general method of procedure in the teaching of various so-called school subjects, nor is it the revision of school textbooks,

¹ In addition to the chairman, the commission includes the members listed on page 32.

nor the arrangement of better sequences in carefully wrought-out curricula. The first step surely is that which insures the adjustment of school methods, curricula, and organization to the individual differences of pupils. This fact of individual differences is so apparent and so dominant that it cuts across and is capable of rendering non-effective every other educational plan, no matter how beneficial it may prove for a certain indeterminate portion of boys and girls of elementary-school age.

It is the insistence of this truth, the individual right of each child to be educated in a way that is best for him, that is at the bottom of what are sometimes frantic efforts of teachers and school administrators to reach a plan of procedure by means of mental and educational tests.

In order to give help, literally, first aid, at a time when it is sorely needed, the Commission urged Dr. Lewis M. Terman, of Stanford University, in 1919, to become chairman of a sub-committee that would prepare a report on the value of intelligence tests and school reorganization. It was Professor Terman's understanding that several hundred dollars would be available from the treasury of the National Education Association for the purpose of defraying the expenses of a somewhat detailed investigation of school grading by mental tests. As the expected funds were not available at a sufficiently early date, certain changes were necessary in the plans of the sub-committee. Instead of an investigation of the entire question *de novo*, it was decided to offer brief summaries and interpretations of typical experiments already under way in a number of school systems of the country, which have for their purpose the adjustment of school methods, curricula, and organization to the individual differences of pupils as shown by mental tests. The result is a little book, which is offered to the educational public in the belief that it will prove of universal interest and help to the increasing thousands of teachers and school administrators who use mental and educational tests, but are often at a loss to know what adjustments to make in the light of their test results.

The other members of the sub-committee, each contributing a chapter, are Virgil E. Dickson, A. H. Sutherland, Raymond Franzen, C. R. Tupper, and Grace M. Fernald.

The book is being published by the World Book Company; and the Commission hopes it will be ready for distribution in time for the N. E. A. convention in Boston, 1922. All members of Dr. Terman's committee, including himself, waive rights of royalty in favor of the National Education Association.

Miss Olive M. Jones has prepared a report on the Delinquent Child in the Public Schools. This report, based on facts by one eminently qualified to interpret them, is submitted by the Commission with the feeling that it will enable cities to know what to do with certain children who do not thrive under conditions well suited to other children and who, because of this inability either to adjust themselves or to be adjusted, are obstacles to their own advancement and a menace to their schoolmates. This report is thoroughly constructive, and like Dr. Terman's, is designed to help in the reorganization of the elementary-school system.

Dr. Clara H. Town was asked by Miss Anna L. Force at the very beginning of the work of the Commission to undertake a careful study of the mentally defective, the blind, the deaf, and the crippled children in the public schools. This work has been in progress for several years, having been delayed somewhat by Dr. Town's absence in Europe, where she was studying at the University of Paris. The report is now completely finished and is a scholarly and valuable addition to our educational literature. It, too, will be a help to school administrators in fixing conditions for elementary education. It has been submitted, with the consent of the National Education Association, to the World Book Company for publication.

A short report by Miss Abbie Louise Day on Minimum Essentials Critically Considered and Bibliography is a careful little study full of helpful suggestions. This has also been submitted to the World Book Company.

Miss Elizabeth A. Woodward offers a report on Elementary Adult Education in the United States. This was almost ready for publication a year ago. During the past year Miss Woodward has put additional time and study upon it in order to render the report still more valuable. We have learned, again from past experience, that it is impossible to give a child his fair chance in education if we leave his parents uneducated; moreover, in the reorganization of elementary education, the education of the adult for his own sake must be taken account of. Is elementary education only for children? Miss Woodward's report has been submitted to the World Book Company.

Commissioner Payson Smith has presented two admirable preliminary reports upon his Commission work, *School Laws Affecting Elementary Education*.

Mr. Carroll G. Pearse has consented to render a report upon *Teacher Training for Elementary Schools*. Heavy responsibilities have prevented Mr. Pearse from having his report ready for the Boston meeting.

Miss Theda Gildemeister reports progress on the preparation of a bulletin on *The Teaching of English in the Elementary Schools*. Other members of the Commission are to work with her upon this heavy task.

Miss Georgia Alexander expects to have completed for the Boston meeting her report on *The Immediate Environment of the Child*.

Miss Frances Harden will offer additional material to her study on *Home Environment*.

In 1918 the National Education Association Commission on the Reorganization of Secondary Education set forth the main objectives upon which work in secondary education should be focused.

These objectives are just as important for elementary as for secondary education; indeed their attainment is not possible through secondary education alone. It is obvious that elementary education must also be directed toward the same objectives. The first of these objectives is health. Our Commission has begun its definite work of reorganization in the School System with a report by Mr. Clark W. Hetherington on *Physical Edu-*

cation, a Program for the Public Schools. This report has been accepted by the World Book Company and will be in circulation in two or three months. Like Dr. Terman's report, it is a book outlining definitely a plan of procedure in which the schoolyard is the community social play center of the child. Standards of living are associated with this program of activities, which makes the report one of high import. Moreover, other objectives are through this program reached as they could not be by other means. The program has been worked out experimentally, and every word of it is based on research. The Commission submits this as its first contribution to the reorganization of what might be called the material of elementary education. Mr. Hetherington, like Dr. Terman and all the others, has generously waived all royalties in favor of the National Education Association.

The plan of the Commission is to have other books and bulletins on other educative material follow this one, attention in all the series being given to the "inner urge," the way children tend to learn, rather than to how children can be taught.

OUTLINE OF REPORT ON EDUCATION OF THE IMMIGRANT

SURVEY AND PRESENT TENDENCIES OF TWO YEARS' WORK—1919-21— ELEMENTARY EDUCATION OF NON-ENGLISH-SPEAKING ADULTS

ELIZABETH A. WOODWARD, UNIVERSITY OF STATE OF NEW YORK,
ALBANY, NEW YORK

The report comprises three sections:

1. Four-page questionnaire on work with non-English-speaking adults; the compilation of results: 82 cities (representing 36 States) replied or filled out the blanks.
2. General comments on the results of the questionnaire.
3. A compilation of special reports representing five distinct phases of the work—one State report covers progress in all fields; other State reports deal with statistics, factory classes, community organization, and teacher training, respectively. Eight city reports give details of progress and methods of work in fields representing both large and small cities. One special report summarizes existing programs of immigrant education in the United States. Reviews of three important organizations for immigrant education are included: one National, one interstate, and one of a typical city council.

THE COMMITTEE AND THE QUESTIONNAIRE

The fact that English to foreigners is usually given in night schools and day classes under the departments of elementary education caused the Commission to regard this ever-growing field of educational endeavor as normally within its scope of supervision.

The close relationship between the progress of the school child from an immigrant home and the educational needs of non-English-speaking

parents is widely recognized and demands greater attention from teachers and school officials.

The Chairman of the special committee decided, in consultation with the Chairman and members of the Commission, that the study of methods and work with non-English-speaking children should be taken up in a later report.

The Chairman of the Committee on Adult Immigrant Education consulted with specialists who had compiled the Carnegie Americanization Study before taking new steps in this field of investigation. It was learned that their study ended in November, 1918. The N. E. A. Committee therefore decided to begin its investigations where the Carnegie Study ended.

The general aims of the committee's questionnaire were: (a) To discover tendencies in educational practice in work with immigrants by sending the questionnaire to States and cities where classes were known to be necessary. The full list of the cities and States responding is given at the end of the report. (Nearly 60 per cent of the 144 responded.)

(b) To compile the findings of the questionnaire and outline, with the replies to each question, the need for further development and increasing efficiency, noting achievements of special value.

The compilation covered two years of progress in night schools, industrial classes, and women's day classes.

CONTENTS

Community and independent organizations assisting public schools in extension of work.

The securing of pupils.

Terms and sessions for various types of day and evening classes.

Class work and methods: (1) Courses of study; (2) Grading; (3) Social activities; and (4) Home and neighborhood classes for women, with special attention to: (a) Recruiting and holding attendance; (b) Care of children; and (c) Special types of subject-matter.

Teachers: Special training.

Salaries: Basis by session, month, year, and amount.

Type of position: (1) Part-time teacher; (2) Full-time specialist; and (3) Director of special work.

Supervision:

Department or official.

Qualifications and training.

Conferences with teachers: frequency; nature of.

General recommendations for solving difficulties confronting the work. A few conclusions based on the questionnaire.

A collection of special articles from States and cities where developments of unusual value were discovered makes up fully half of the report. No attempt was made, however, to include in these special reports work already published in book or pamphlet form.

A recently compiled bibliography on immigrant education may accompany the publication.

The report is illustrated by seven pictures showing typical classes in various localities and groups throughout the United States.

In consultation with MRS. MARGARET S. McNAUGHT, *Chairman of Commission*, DR. PAYSON SMITH, and MISS OLIVE M. JONES.

OUTLINE OF REPORT ON EDUCATION OF THE JUVENILE DELINQUENT

OLIVE M. JONES, PRINCIPAL OF PUBLIC SCHOOL NO. 120, NEW YORK CITY

This report has twice been announced as completed, once in Atlantic City at the meeting of the Department of Superintendence, and again in Des Moines at the 1921 meeting of the National Education Association. On both occasions, while arrangements for publication were pending, new and very desirable matter came to hand. These experiences have resulted in an entire change of plan and may result in the issuance of the report in separate monographs prior to its publication as a complete report and its incorporation into the final report of the Commissioner.

The new matter includes reports of various individual efforts to solve the problem of the proper care of the juvenile delinquent, a mass of letters and clippings of articles evoked by the recent Nation-wide interest and alarm caused by the extreme youth of the criminals of today, reports of organizations recently roused to activity by the same causes, and certain publications of the Children's Bureau. It is felt that our report will be of little effect or value unless it includes recognition and comment concerning these later additions to the literature of delinquency.

The plan of our report, therefore, includes:

I. Accounts of individual types of work with the juvenile delinquent.

1. Day-time care, also known as the probationary school, by Olive M. Jones, Principal of P. S. 120, New York, the first successful attempt to handle the problem in this way. This report is completed and ready for publication. Excerpts have been distributed at meetings in Boston this year.

2. Twenty-four hour school, by Fred C. Nelles, who is conducting at Whittier, California, a most interesting experiment in preventive work. This report is completed and ready for publication.

3. Modern institutions for parental care of juvenile delinquents, by Hobart C. Todd, Superintendent of Industry, New York, where the institution constitutes a whole town of its own. This report is in preparation.

4. Modern bureaus of attendance and child welfare by members of the staff of the Bureau of Attendance and Child Welfare, New York City public schools. This report is in preparation.

II. A digest of the most important of the recently issued material concerning juvenile delinquency in its relation to our city schools. This new matter now in preparation will include an exhaustive inquiry into condi-

tions regarding juvenile delinquency made by Sara L. Rhodes for the Teachers' Council, New York City, a report by Dr. William Healy, of the Judge Baker Foundation, Boston, and the editorials and magazine articles already referred to.

III. Comment on both of the foregoing divisions of the report and resolutions to be presented for endorsement by the representative assembly, National Education Association. This is entirely new material suggested for addition to the report by Mrs. McNaught, Chairman of the Commission, after the original report was presented at Des Moines.

*REPORT OF THE COMMITTEE ON FINANCING DELEGATES TO THE REPRESENTATIVE ASSEMBLY*¹

CORNELIA S. ADAIR, TREASURER OF THE NATIONAL EDUCATION ASSOCIATION, WILLIAMSBURG, VIRGINIA

Since its appointment in October, 1920, your committee has been investigating the methods of financing delegates used by other National organizations, and making a systematic canvass of individual teachers and teachers' associations, affiliated and unaffiliated, for suggestions on the subject.

A Progress Report was submitted at the Des Moines meeting. In spite of the fact that few national organizations pay any part of their delegates' expenses the committee believes that the payment of some part of the expenses of both local and State delegates by the National Education Association is advisable.

The average expenses of a delegate is \$200. If the National Education Association should pay even so small a part as one quarter of the expenses of each member of a delegate body of 1000 persons, the cost would be \$50,000, or one fourth of the total revenue for 1921-22. To take such a sum from the running expenses at present is manifestly impossible.

At the Des Moines meeting, Mr. Reuben T. Shaw, of Philadelphia, introduced two resolutions looking toward raising dues either to \$2.50 or \$3.00. This was done in order that dues might be raised at the Boston meeting if the Delegate Body so desired.

The Committee, however, does not recommend the raising of dues for the following reasons:

First:—Such action would seriously cripple the Association in its membership drives.

Second:—In the last analysis the raising of dues is simply another method of asking the local associations to finance their own delegates.

The committee wishes therefore to make the following report:

1. That it is impossible for the National Education Association to pay any part of the delegates' expenses at present without raising dues.

2. That the Committee does not think it wise to raise dues at this time.

¹ In addition to the chairman, this committee includes the members listed on page 32.

3. That it is the opinion of this Committee that some plan for partially financing delegates should be adopted by the National Education Association as soon as it can arrange to do so.

Three plans have been suggested:

I. (a) For the payment of State Delegates' expenses:

1/3 to be paid by the National Education Association.

1/3 to be paid by the State Teachers' Association.

1/3 to be paid by the State Delegate.

(b) For payment of Local Delegates' expenses:

1/3 to be paid by the National Education Association.

1/3 to be paid by the Local Teachers' Association.

1/3 to be paid by the Local Delegate.

This plan should not be construed as opposed to the payment by a State or local association of both its own and its delegates' expenses.

II. That the National Association shall pay a per diem of not less than three dollars (\$3.00) for the actual number of days spent at the convention.

III. That the National Association shall pay one fourth ($\frac{1}{4}$) of the actual mileage of each delegate.

4. The Committee urgently requests that each State Director or Chairman shall discuss these suggestions with his Delegation and report their recommendations to the Chairman of this Committee at the earliest possible date. Two resolutions have been received from State delegations. It is the hope of this committee that every State and local group will take like action.

5. As a step toward attaining the end in view the committee urges that each local association adopt the National Education Budget System and pay its dues into the National Association as an organized group. This method should so minimize the expense of collecting dues that the National Education Association would in time be able to pay at least some part of the expenses of its delegates.

REPORT ON SOCIAL HYGIENE ¹

EDITH A. LATHROP, SPECIALIST IN RURAL EDUCATION, AND NINA C. VAN-
DEWALKER, SPECIALIST IN KINDERGARTEN EDUCATION, U. S.
BUREAU OF EDUCATION, WASHINGTON, D. C.

The Institute and Conference on Social Hygiene to which Miss Lathrop and myself were appointed delegates from the National Education Association, held a three-day session in Washington, October 4-6, 1921. This was conducted by four organizations: the District Department of Health, the U. S. Public Health Service, the District Social Hygiene Society, and the Women's Advisory Council to the U. S. Health Service.

¹ Report of the Delegates to the Conference on Social Hygiene for the Women of the District of Columbia and the Social Hygiene Council organized to continue its work during the year 1921-1922.

The sessions included an open meeting at the Central High School, four half-day sessions, three round tables followed by a joint session, and a luncheon. The speakers were the outstanding authorities on the different phases of social hygiene. Among these were Dr. Thomas W. Galloway, Dr. Rachel Yarros, Dr. B. C. Gruenberg, Dr. C. C. Pierce, Dr. Valeria Parker, Dr. H. H. Hazen, Dr. Kate Karpeles, Judge Kathryn Sellers, Mr. Alan Johnson, and Mrs. Mina C. Van Winkle.

At these meetings the subject of social hygiene was presented and discussed from the educational, medical, and legislative standpoints. The need of sex education was stressed; the necessity for medical treatment resulting from the ignorance of the facts of sex was shown; and the importance of legislation for the control of venereal diseases, and the repression of vice was pointed out. The speakers stated that many States had enacted laws of this kind but that the District of Columbia had not yet done so. At the last session the delegates met in three round tables for a further discussion of the three aspects of the subject, and later in joint session to draw up resolutions concerning the action needed to improve conditions in the District of Columbia. All the organizations represented were urged to work for the passage of two bills that have been introduced into Congress—the Venereal Disease Control Bill and the Vice Repressive Bill. A detailed report of the Conference was made to the President of the National Education Association soon after its close.

The efforts of the organizations represented in the Conference to improve the conditions in the District of Columbia did not end with the holding of the Conference. In accordance with one of the resolutions passed by the Conference, a Social Hygiene Council for the District of Columbia was organized in November in which all the coöperating organizations, over twenty in number, were represented. Among the purposes of this organization two were of special importance. The first was to make an intensive study of Social Hygiene problems, and the second to work with the existing Government agencies to improve the conditions in the District. The new organization elected officers and formulated its plan of work. This provided for meetings at stated times throughout the year. In order to carry out the first purpose the U. S. Health Service prepared a program of addresses by specialists on the several aspects of social hygiene—two for each month. This was accompanied by a detailed bibliography, so that those who wished to prepare themselves for leadership in social hygiene work might be enabled to do so. A certificate was offered to those who took the course and prepared an acceptable thesis of 1000 words upon one of a group of subjects named. The series of addresses is appended to this report.

Much practical work was done also in carrying out the Council's second purpose. The bills before Congress were thoroughly explained and their status reported upon as time passed. The Vice Repressive bill had already been introduced into the Senate and this had been presented to Mr. Focht, chairman of the District House Committee by the District Commissioners,

but no action had been taken. A committee was therefore appointed to call on Mr. Focht, asking that a similar bill be introduced into the House. Such a bill was introduced, and one hearing has been held, but the bill has not been reported out of the committee by either House or Senate.

The Disease Control bill, generally known as the Health bill, was also thoroughly discussed and several hearings have been held before both House and Senate District Committees. In order to meet some objections the original bill was superseded by another. This has been approved and is now on the calendar of the House. It is one of three measures whose passage is urged as essential, but it has been set aside by the debate on the tariff and other legislation.

Because there is a close relation between vice and feeble-mindedness the Council also worked for the passage of the bill for an institution for the feeble-minded in the District. To secure this and the selection of a suitable site the Council is coöperating with a committee of one hundred citizens. In all these efforts the Interdepartmental Social Hygiene Board, the District Social Hygiene Society, and the Women's Advisory Council to the U. S. Health Service gave valuable and efficient service. The last-named organization, which is composed of National chairmen of public health committees or other official representatives of the leading National women's organizations, held a two days' conference. The Social Hygiene Council also held a social hygiene exhibit lasting nearly a week. Five-minute addresses and moving-picture films were among its features. The Council was instrumental also in distributing much valuable literature and in carrying on some important lines of field work.

In our report of the Institute to Miss Williams, we recommended that the District branch of the National Education Association coöperate with the various organizations of the District in their efforts to carry out the suggestions embodied in the resolutions. It is clear that this was the logical recommendation to make since we represented an organization National in its scope and the Institute and Social Hygiene Council were concerned with social problems of the District.

Miss Williams replied that until the District National Education Association organization was perfected she would be pleased to have us follow up the work of the Council. In accordance with this request Miss Lathrop and I arranged to take turns in attending the lectures offered by the Social Hygiene Council of the District of Columbia. Together we attended five of eight lectures given. Each time we reported to each other the gist of the lecture scheduled as well as the business transacted at the Council. By this means we were both able to have a somewhat satisfactory notion of what the Council was doing. The pressure of work in the Bureau of Education made it impossible for us to prepare the theses.

No meeting of the District National Education Association was held until June, 1922. At this meeting President Ruediger called upon Miss Lathrop, who was present at the meeting, for an informal report of the work of the Council. The work of the year was reviewed briefly and the

suggestions offered that the District National Education Association should be represented at the Social Hygiene Council and that preferably these representatives should be chosen from among those whose specialities were concerned with social hygiene problems. At the close of the report the association moved that the Misses Vandewalker and Lathrop be the representatives until the annual meeting in October, 1922. 7

NATIONAL COUNCIL OF EDUCATION

SECRETARY'S MINUTES, CHICAGO MEETING

OFFICERS

President—HOMER H. SEERLEY, President State Teachers' College,
Cedar Falls, Iowa
Vice-President—JOSEPHINE CORLISS PRESTON, State Superintendent of
Public Instruction-----Olympia, Washington
Secretary—ADELAIDE S. BAYLOR, Federal Agent for Home Economics
Education-----Washington, D. C.

FIRST SESSION—MONDAY AFTERNOON, FEBRUARY 27, 1922

The meeting was called to order by the President at 2 o'clock in the Tiger Room of the Hotel Sherman.

The President spoke briefly on THE ELIMINATION OF EDUCATIONAL WASTE.

After roll call by the Secretary, Mr. John F. Sims, Chairman of the Committee on Rural Education, presented a semi-final report on the work of his Committee. Other committee reports were given as follows:

1. Final report of the COMMITTEE ON STATE ADMINISTRATION OF SCHOOLS by C. P. Cary, Chairman, Chicago, Ill.
2. Preliminary report of the COMMITTEE ON AMERICAN TEACHERS' COLLEGES by Charles McKenny, Chairman.

Addresses were made by Dr. John J. Tigert, U. S. Commissioner of Education, on RECENT EDUCATIONAL PROGRESS IN THE UNITED STATES, and by Miss Charl Ormond Williams, President of the National Education Association, on THE HOPE AND THE RESULT OF AMERICAN EDUCATION.

SECOND SESSION—TUESDAY AFTERNOON, FEBRUARY 28, 1922

The meeting was called to order by the President at 2 o'clock in the Tiger Room of the Hotel Sherman.

Lucy Page Gaston, Superintendent of the Clean Life Movement, was allowed time to speak on the CIGARETTE SITUATION and explain the Clean Life Pledge.

R. G. Jones, President of the Department of Superintendence, addressed the Council on GREAT EDUCATIONAL ACCOMPLISHMENTS.

Reports of Committees were presented as follows:

1. Sub-Committees' reports on REORGANIZATION OF SEVENTH, EIGHTH, AND NINTH GRADES, Charles H. Judd, Chairman, Chicago, Illinois.
 - a. The Junior High-school Program of Studies, James M. Glass, Harrisburg, Pa.
 - b. Junior High-school Buildings, J. H. Bentley, Duluth, Minn.

2. Semi-final report on CHANGES NEEDED IN THE ELEMENTARY SCHOOL COURSES, Katherine D. Blake, Chairman, New York City.

3. PARTICIPATION OF TEACHERS IN SCHOOL MANAGEMENT, Harlan Updegraff, Chairman, Philadelphia, Pa.

Following the last speaker, and supplementary to his report on Junior High-school Buildings, Mr. Bentley showed pictures of school buildings in Cleveland, Detroit, and Richmond, Indiana.

At the close of this session an informal conference on Teachers' Councils was held under the direction of Mr. Updegraff.

CONFERENCE OF THE SOCIAL HYGIENE SECTION OF THE HEALTH
COMMITTEE ON THE COMMUNITY AND THE CHARACTER
EDUCATION OF YOUTH

This conference was held in the Hotel Sherman and formed a section of the National Council of Education. The report is, therefore, herewith included in the proceedings of that body. The program is as follows:

The Nature of Character and the Manner of its Education—Otis W. Caldwell, New York City.

The Coördination of the Community Agencies in Effecting Character Education—Albert Shiels, New York City.

The Bearing of Social Hygiene Education upon Character—T. W. Galloway, New York City.

Discussions:

William B. Owen, President, Chicago Normal College, Chicago, Ill.

P. B. Stetson, Superintendent of Schools, Dayton, Ohio.

THIRD SESSION—TUESDAY EVENING, FEBRUARY 28, 1922

The meeting was called to order on the mezzanine floor of the Hotel Sherman at 8 o'clock by the President.

As the first part of the program of the evening was given over to reports of the Joint Health Committee, the President introduced Dr. Thomas D. Wood, Chairman of that committee, who took charge of the meeting. Dr. Wood spoke on JUSTICE AND EQUALITY FOR CHILD HEALTH and then introduced other speakers as follows:

Contribution of Physicians in Forty-two States to the Health Work in the Schools—John M. Dodson, Chicago, Ill.

What the Women are doing to Promote Health in Schools—Mrs. Ira Couch Wood, Chicago, Ill.

Response of the Teachers to the Health Challenge of the Physicians—William B. Owen, Chicago, Ill.

The latter part of the evening program was given over to the committee on THE TEACHING OF DEMOCRACY. A. Duncan Yocum, Chairman of this committee, spoke briefly on the TEN SUGGESTED ESSENTIALS OF DEMOCRACY and then introduced Mrs. Fannie Fern Andrews, Boston, and Walter Brown, Fairmont, W. Va., who presented respectively:

1. A General Discussion of the Ten Essentials.
2. English—Its Relation to the Ten Essentials.

FOURTH SESSION—WEDNESDAY AFTERNOON, MARCH 1, 1922

The meeting was called to order by the President at 2 o'clock in the Tiger Room of the Hotel Sherman.

The entire program was devoted to reports of progress of standing committees, as follows:

Vocational Education—Adelaide Steele Baylor, Chairman, Washington, D. C.

Graduate Education—Walter A. Jessup, Chairman, Iowa City, Iowa.

Educational Surveys—A. E. Winship, Chairman, Boston, Massachusetts.

Adult Illiteracy—Cora Wilson Stewart, Chairman, Frankfort, Kentucky.

Character Education—Milton Bennion, Chairman, Salt Lake City, Utah. Mrs. Mary D. Bradford, Wilmington, Del. A. Duncan Yocum, Philadelphia, Pa.

The Continuity of Education—J. M. Gwinn, Chairman, New Orleans, La.

The meeting adjourned.

THE ELIMINATION OF EDUCATIONAL WASTE

HOMER H. SEERLEY, PRESIDENT OF THE IOWA STATE TEACHERS COLLEGE,
CEDAR FALLS, IOWA

The main problem in administration of American education today is the wise use of the public income by a rigorous elimination of waste. The rapid enlargement of the program of studies; the constant development of the assumed extraordinary needs of American pupils and students, in variety and opportunity of education; the regular expansion of the budget of necessary expenditures to meet the actual emergencies that have arisen; the advancing ideals of the purposes and the functions of schools as a part of the progressive program of civilization, as shown in legislation, are all fundamental undertakings that demand the best equilibrated statesmanship of the age to interpret, to integrate, and to decide whereby the metes and the bounds of human efforts for the present and the future may be wisely determined.

It is time that serious work is in progress in every State of the Union to ascertain the qualities and the quantities of education that will give America the leadership of the world in intelligence and in masterfulness of capability in citizenship. It is true that very complimentary progress is being made in adjusting the many problems produced by the aims at universal education and training. It is true that publicists, promoters, and educators are notably investigating the experience of the world in develop-

ing national efficiency, power, and character. All these are recognized as important and essential amid the most complex conditions of society and citizenship that any nation has ever known, but it is also true that very little attention is given to conservation of resources obtainable for education, and less and less attention is given to the extraordinary and unusual waste that has accompanied these undertakings and enterprises.

What is necessary for the welfare and the perpetuity of society and of business and of National success is a kind of thrift and of economy that does not exist today in American transactions and expansion. Our leaders of public opinion and of important progress too generally overlook the fact that there is a sensible limit to what is necessary and absolute in educational expenditures. These expenses include (1) the overhead of buildings, equipments, organization, and administration; (2) the overhead of varieties of supervision, inspection, and direction that are preliminary activities to secure public aims, unclassified and uncontrolled; (3) the overhead of propaganda, political, social, intellectual, moral, and religious that dictate economic realities and possibilities. All of these preliminary expenditures are assumed to be absolutely necessary to be provided and to be adjusted before the actual efforts of education's instrumentalities can be applied to the training of children and youth. It must be evident then that the United States and every individual sovereign State must demand appropriate and expected educational returns for every dollar expended from the public treasury in order that educational waste may be avoided. In some way this vast overhead should be reduced and the public income should be spent more certainly upon the individuals to be improved and trained by the educational system.

To this should be added the great expenditures that have come from the vast array of organizations and societies that are official, professional, scholastic, social, and scientific, which are seeking the determination and the adjustment of public opinion. All these require time, effort, money, and thought that belong to society if they are to be maintained and perpetuated. Society has reached such a highly organized state that all occupations, undertakings, and aims of labor, business, industry, politics, and industries partake of types of professions, educational, social, and religious that their conclusions must always be reckoned with as factors in expense and in management that are extremely difficult to be realized by even the most thoughtful men and women of these times.

This summary of actual conditions should not be interpreted as the aims of an alarmist or as the thought of one who fears the results of democratic control and propaganda, because these interpretations must be accompanied by the highest confidence in republican principles of government and in the value of the dominance of public opinion. But this review of social and political phenomena is given to emphasize the urgent and imperative need for the elimination of all waste that can be rightly charged to the American system of public education.

Is it not evident that there is reason to conclude that the United States

of America should take an invoice of the public policies now practiced in order to seek to check much of the overhead expenses so that there might be more money for the actual applications of the popular education of the masses. It does seem that thrift, and thrift alone, is the only agency of management that can save the American people from extravagance and useless waste.

SEMI-FINAL REPORT OF THE COMMITTEE ON RURAL EDUCATION

JOHN F. SIMS, CHAIRMAN, PRESIDENT OF THE STATE NORMAL SCHOOL,
STEVENS POINT, WISCONSIN

A concise, clean-cut, comprehensive, and dynamic statement of our slogan for rural-school betterment is to be found in the resolutions adopted by the first representative assembly of the National Education Association at Des Moines, July, 1921: "We call attention to the failure to provide an adequate program of education for the children living in the rural areas of our country, and we urge that the educational opportunities provided for children in rural America be made equivalent to those offered to children in the most favored urban communities, and to this end we recommend that larger units of taxation and administration than the ordinary school district be adopted, such as the township or town and the county." Your committee on rural education will function in proportion as its findings will elevate the rural schools through purposeful activity of the people in rural districts—those who are to be the beneficiaries of betterment—to higher and higher levels until they approach the limit of efficiency.

We have a long distance to travel—"It's a long, long way to Tipperary, but our heart's right there." Every step forward and upward must be covered by the foot of toil. There is no royal road outside of hard conscientious work.

What are the elements involved in the solution of this problem so vital to the interest of our civilization and to the welfare of our people? Is the rural school equal to demands of the positive necessities of our twentieth-century civilization? Is our moral and financial support of it all that the gravity of the situation demands? Intelligence among all the people is the standing army that safeguards the liberty and promotes the progress of the Republic. Our liberties are to be preserved and extended by battling valiantly for a school system, constructively organized and sufficiently financed to send from its portals boys and girls approaching the threshold of manhood and womanhood, who possess intelligence and character of such degree as will make them good citizens—who are in possession of the tools of the civilization into which they are born and who by reason of their initiative, industry, and insight can and will improve that civilization.

For the rural schools this problem involves at least the following elements: The arousing of an intelligent and constructive interest among our rural people in the education of their own children at home. The rural

people find this opportunity elsewhere, but there should be no abridgment of opportunity at home. With clear vision of the purpose of education, with the proper and determined spirit governing the people, then and not till then will the proper means for rural education be supplied. Nor do the means to be furnished demand most attention; it is the willingness to make the utmost use of those at hand which must be cultivated, a willingness so purposeful and cordial that if those means are not adequate others will be supplied. This is the point of leverage. The voice of the rural people in their own largest interest is not heard in the halls of legislation, State or National. We need an evangelist to prepare the way—a modern John the Baptist—a new Horace Mann who will vitalize rural communities now intellectually stagnant, and who can inspire a healthful loyal sentiment which will give wholesome resultant direction to every educational movement of the community to achieve the purpose sought. Rural people must not be satisfied with inferior educational facilities—without such arousal and its dynamic reaction, little progress can be made.

Many rural communities cannot meet the expense of the schools they ought to maintain. The imperative need is for more money—more money for buildings and equipment, for school gardens and school farms, for teacherages, for salaries of teachers at work, and to keep highly trained and successful teachers in service. Education is not a local problem, for the integrity and perpetuity of the State and Nation are concerned in its solution. Therefore, there must be poured into the local treasury a stream of contributions from State and National reservoirs. Most of the States are now taking such contributions, and if the Towner-Sterling bill is enacted (and to secure its enactment into law every friend of education should wage battle, enthusiastically and coöperatively, until the will of the people becomes the law of the land), provision will be made for the apportionment annually among the States of \$15,000,000 for the preparation of rural teachers and of \$50,000,000 for the equalization of educational opportunity.

The localities which need the best efforts of leaders in the rural school line of work are too often the ones which can afford the smallest outlay, and consequently get the poorest service. Outside help must come to such places, and wealth, wherever it is, must, if we are to live up to our American ideals, be taxed for the education of children, the hope of the Nation, wherever they are found.

The cause of America is the cause of education which elevates the individual by reason of his activity of mind and conscience to higher and higher places until the summit of manhood is reached. We must gird our loins and fight for an elementary public-school system sufficiently financed to attract to the service of teaching the best and noblest of our young men and women. Thousands of teachers have left the profession in the last few years because the compensation received has been less than that of unskilled labor. The test of education is to be found in the kind of teacher employed, and until we feel this with the strength of irresistible conviction

and act in accordance with that feeling we fail in appreciation of those who train the citizenship of America—and surely we are neglecting the foundations. The influence of a good teacher cannot be overestimated.

The rural school includes more than teacher, pupils, texts, and apparatus. The good rural school is the creation of the best impulses and purest motives of the community. It is the intellectual center—an integral part of the people, organized in response to a healthy community of purpose. There are in the neighborhood of two hundred thousand one-room schools in this country, one third of which, due to poor roads, local jealousies, fear of increased taxation, and loyalty to the institution in which the voters themselves were schooled, will remain as one-room schools for many years.

Hopefully patrons of these schools are animated by the desire to make the one-room school the best that it can be made to develop in its product the qualities adequate to meet the demands and conditions of modern rural life.

God helps those who help themselves; yet the power of the single district to help itself is limited by the amount of taxable wealth in the district. So the larger unit contributes from larger sources of taxable wealth, making the basis for distribution the number of children between certain ages in the district—in Wisconsin, for example, those between four and twenty years. This is the basis most frequently used throughout the United States.

The need for better conditions must be felt in the local district, and progress will accelerate as the people of that locality will tax themselves to secure better conditions, although State aid in initiating the movement will prove to be a wholesome stimulant.

In this Nation there is evidence among rural people themselves that the one-room school does not give its pupils a hunger and thirst for the good things of life. They are groping for improvement. This improvement will come partly as a spiritual process, partly as a matter of study and investigation, and very much as a matter of resolution and initiative.

Therefore, the rapid progress of a movement involving the abandonment of the small schools in favor of associate schools, union schools, partially consolidated, and completely consolidated schools—all looking toward the creation of better educational facilities *at home*, extending the educational horizon and enlarging the circle of local effort. Said Lincoln: "It is the heritage of all the youth of America that they shall have an unfettered start and be given a fair chance in the race of life."

So comes the impetus of consolidation—a dynamic movement, the most highly consequential movement now under way to bring the rural youth into their educational heritage. Witness its marvelous growth in Ohio, Indiana, Iowa, New England, in the South, and in the far West, wherever the larger administrative and taxing unit has obtained its growth it has flourished most completely.

Axiomatically desirable educational activities should be stimulated and the burden of taxation should be equalized. America is wealthy. There is money enough for public elementary and secondary schools of highest

efficiency if the available funds are justly and wisely distributed. It is a problem of finance.

Consolidation may or may not cost more money, and decision will never be made on the basis of the financial aspects of the problem alone. Consolidation must justify itself by its demonstrated superiority over the time-honored district system, or it will not generally obtain.

The consolidated school is a rural-life institution giving greater service in the way of a longer school year, better equipment, increased regularity of attendance, a more scientifically organized curriculum, a higher quality of teaching force, and more purposeful opportunity for mental and moral growth through self-activity than is possible under the district system. The supreme question is will it produce a higher product of citizenship? All other considerations must sink into insignificance. It is the judgment of your committee that consolidation is the true solution of the problem which seeks to give the rural youth a secondary education at home. He surely is as deserving as the youth in the most favored urban community.

The teacher is the soul of the school. All instruction must minister to the development of the child mentally, morally, and physically, and growth comes only through the exercise of mind, conscience, and body, making for right behavior and right thinking. They are not parallel forces, but each carries its own burden in the stages of development, bringing him to manhood with a fund of knowledge—a capital of skills and character strengthened by wholesome discipline.

Ours is the duty to take up the task and make for a nearer approach to equality of educational opportunity through the better training of teachers for the rural schools. School is not mere school, nor a preparation for living. School is a section of life, an extremely valuable section of it, and must be so considered if we are to cultivate the child for his own needs, so that he gains power to meet the future by faithfully discharging the duties of the present.

The active agencies for the preparation of rural teachers are the training courses in high schools, the county training schools, and the normal schools. The university will some day have a vision of this function and do its share. The function of education is to construct the man, and the means employed in the training of teachers must harmonize to that end.

The content of courses in the training of teachers may be classified as professional, academic, and environmental. The professional makes for the development on the part of the teachers, of social amenities, appreciations, ideals, and skill; the academic for the scholarship which gives the teacher confidence in himself and inspires the pupils' confidence in him, while the environmental enables him to use the rich, suggestive material which lies in close proximity in such a way as to make it dynamic in the mental and moral growth of the child. We have not begun to realize the educational stimulus of bringing the learner into close and sympathetic touch with the real things of the rural community, cultivating his powers of observation, imagination, construction, and judgment and enabling him

to express himself in active work, keep eyes open, and hands at work even in the school.

The establishment by law of these teacher-training institutions is a recognition of the rural school as an entity in itself. Their product will render service in the schools for which they were prepared and will exert a powerful influence in checking the action of school boards, who too often assume that the numerically small enrolment and low attainments of the pupils are a proper measure of the qualifications of a teacher and who therefore employ an untrained novice, because of willingness to accept a small remuneration. There is nothing stimulating in the work of a teacher whose qualifications are dependent upon the lack of scholarship in the school taught. Good teaching demands scholarship, skill, and the adaptation of the curriculum to the grade of the pupil taught and the lower the grade the greater the necessity of the trained teacher.

"What is the minimum"? is asked. I shall say that within the next three years we demand high-school graduation, plus one year of professional training; within five years, two years of professional training; within seven years, three years of professional training, and by the year of our Lord 1932, four years of professional training.

All institutions for the training of such teachers should maintain and operate observation and demonstration schools of the highest degree of efficiency, in order that students may observe skillful work of exactly the same kind as obtains in those in which they themselves will function as teachers. Following observation they will practice in them or act as assistants to expert rural teachers in other districts. None but the best qualified teachers, and those who have a thorough and sympathetic knowledge of country life, should be engaged as teachers in the observation and demonstration schools.

The rural teacher wielding the baton of authority must endow himself, under guidance, with the qualities of leadership, for after all, it is his fight. He must cultivate himself and "carry on."

Briefly the elements of leadership are good health, adequate scholarship, clear vision, and open as well as an optimistic mind, initiative, indomitable will power, and coöperative spirit—all leading to mastery of the situation. The leader includes the opinions of others and extends beyond them, pointing the way to what must next be done for betterment. He must be tactful, alert, aggressive, willing to lead, be imbued with courage and altruistic purpose, and possess an unconquerable desire to serve others. His responsibility is commensurate with his degree of leadership, and in these trying times when Bolshevism is rampant this leadership is responsible for immersing the great masses of the people in the spirit of a truly democratic government, making them realize that this is their government and that it is their solemn duty to understand it, appreciate it, and take an active part in it in order that they may preserve, improve, and perpetuate it. This leadership will assert itself in community-center work.

In the ordinance of 1787, enacted by the Congress of the U. S. under

the Articles of Confederation organizing the Northwest Territory, is found a sentence which should be written in letters of living light: "Religion, morality, and knowledge being necessary to good government and the happiness of mankind, schools and the means of education shall be forever encouraged." These words specifically applying to the Northwest Territory are true Nationwide, and are as dynamic today as when they were written. Too great pains cannot be taken, no cost is too high to carry out the duty enjoined in this ordinance, and later incorporated in the constitutions of the several States, and implied in the Federal Constitution—that wisdom and knowledge be generally diffused among the people, obeying the law of radiation and not the law of concentration.

In harmony with this principle the school is not now regarded as an agency of the community, but an integral and sympathetic part of the community. It extends beyond the four walls of the school and makes its blessed influence felt in the humblest home, giving life and inspiration to adult as well as pupil. It is a community center ministering to the needs of all, commanding all to continue their education from day to day, from youth to old age.

The rural school, then, whether the one-room school, the consolidated schools, or the rural high school, enlarges its efforts to function as a community center of recreation, music, art, debate, oratory, and the study of community and National problems, for the development among children and adults of a type of culture, distinctly rural in character, yet not inferior to urban culture, in making for the enduring satisfactions of life.

The objectives of your committee then may be formulated as follows:

1. America must have first-class schools in every community, rural as well as urban. Equality of educational opportunity must not be a vision, but a reality.

2. Half-way, pitiable, temporary measures will not answer. Let us organize a five or a ten-year program, at the end of which period every rural teacher will have a minimum of four years of professional training beyond high-school graduation.

3. Multiply the number of consolidated and rural high schools.

4. Secure such legislation as will finance rural schools more liberally through adequate State and Federal aid, yet not to the extent of weakening local initiative. America has wealth enough if it is wisely and scientifically distributed.

5. Education surpasses in importance all other governmental activities and is the very life blood of the Nation.

6. Education is an investment and not an expenditure. No field of human endeavor calls so loudly for dynamic leadership as does the rural school. Let us keep the faith and fight a good fight to change it from what it is to what it ought to be.

*FINAL REPORT OF THE COMMITTEE ON STATE
ADMINISTRATION OF SCHOOLS*

C. P. CARY, MADISON, WISCONSIN

The student of educational administration is familiar with the fact that there has been for years a tendency toward more and more centralization in public-school administration. This, being interpreted, means making education more and more a State function, and thus to some extent relatively minimizing local autonomy in school administration. The advocates of centralization believe that this is the only way to secure efficiency, especially in backward communities.

There is a counter tendency, almost as clearly marked, to oppose further centralization. Those who oppose centralization do so on the ground that centralization breeds bureaucracy, tends toward stagnation and loss of educational interest in local communities. Again, there are certain private and parochial school interests that oppose more or less openly any increase in public-school costs and in efficiency due to improved organization.

There are also those who express the doctrines that the State has no right to maintain itself in its present form of organization through indoctrinating the young, as they claim the State does do, when it directs what shall be taught in the schools. Anarchists, for example, are not great friends of State-controlled education.

Upon the whole, however, the process of centralization goes on. This means, for one thing, the gradual strengthening of State departments of education. It means abler men at the head of such departments, greater authority, larger appropriations for such departments, more and better trained members of the staff, longer tenure in the office of State superintendent, or commissioner of education. The change in this direction is already well marked, and is, in the opinion of the committee, bound to continue until it reaches its proper degree of efficiency. At the present time in most States, if not all, it falls short of this efficiency. In some the State machinery is still absurdly inadequate compared with the function it should perform. In some States there is on the part of the political forces an apparent attempt to make public education inefficient and to bring educational organization into confusion, if not disruption, by multiplying educational machinery.

The chairman of the committee asserts that in his own State, Wisconsin, a very marked movement of this sort has been going on for several years. If the multiplicity of boards is not intended to confuse and demoralize public education, it is blind and stupid blundering that has created an independent board of vocational education and a State board of education, the latter with no proper function to perform, but with power sufficient to be meddlesome and officious.

This legislation was primarily the work of politicians who wanted to get control, but could not under the old order; and of certain manufacturers who wanted to use the schools to secure an abundance of cheap labor,

partly trained at the expense of the State. At least this is the only reasonable explanation for the action, and some frankly admitted that such was the object. There is developing a tendency for various industrial, political, and social and religious organizations to try to control or to hamper public education. Naturally this varies in different States, but those who have not sensed this are not of the observing type. Labor unions, non-partisan leagues, manufacturers, socialists, anarchists, and so on to the end of the list, are coming to believe that they could carry on their propaganda much faster if they could control the instruction of the young.

Within a year, the chairman says, he has been told by different persons that the public schools must teach trade-union principles; principles of socialism; religion; trades; non-partisan principles; and he knows not how many more. These persons were not all leaders of their sect or party, but it indicates how the wind blows. Your typical average politician has been so frightened by these rumblings that he hastens to assure these agitators that he is "with them," each and all. But it is impossible to get him to take any stand when it comes to the test.

Under such difficult and adverse conditions, what is the best form of State educational administration? There is absolutely no way in the opinion of our closest observers and best thinkers of getting an organization that will not suffer at times from the evils of politics. The consensus of opinion seems to be in favor of a State board of education composed of members elected by the people without reference to any political party or any social, industrial, or occupational qualification. One rock on which we are likely to wreck ourselves is that of trying to secure harmony by means of getting every cantankerous and belligerent element represented on boards. When this comes about we shall have forgotten all about the boys and girls to be educated and shall proceed to stage an endless fight as to who shall control. Sometimes it will be one element and sometimes another, with consequent educational chaos.

The board at best is unsatisfactory, for it is sure to be mediocre in its action, no matter how able individual members are. Whatever is done has to be a "consensus of opinion" and this is not wisdom but compromise and adjustment of opinions, an elimination of the most progressive measures. But American opinion just now is such that we can scarcely expect legislatures to grant one man the authority that is necessary to carry forward the educational work of the State in an efficient manner. The public would rather trust its affairs to a mediocre board than to put them into the hands of a single executive and leader, though the latter might easily prove ten times as effective. The worst thing that can be said about democracy is that in its practical workings it does not seek, or even welcome, efficiency in its public affairs. To muddle along in a "so-so" fashion is the actual practice, and it must be cheap as well as inefficient.

Where such a board exists, it should choose the chief educational officer. But the person so selected will vary owing to the conditions from a political Jack-in-the-box type of secretary up to a high-class, high-minded man

worthy to be commissioner of education in a great State. It will depend upon the ideals of the State and the status of practical politics. Such chance, it seems, we must take and make the best of it.

After this preamble, let us formulate briefly answers to certain fundamental questions:

What is the function of a State Department of Education?—Judging by the answers received from many of our leading educators in various types of educational activity from all over the country, there is a consensus of opinion that the State should have a head to its educational system and that this head should be the State department of education. This department should direct public-school effort throughout the State, at least it should have a large share in directing it. A State requires official leadership as much as a debating society needs a chairman, or an army a commanding officer. One great purpose is to secure teamwork in educational affairs. This leadership is not merely formal, like the chairmanship of a meeting. It must be vital leadership, and worthy leadership, not autocratic or dictatorial. If the leader is leader in name only—that is, by virtue of the fact that by some hook or crook he has been elevated to high position without a sufficient background of training and experience and without sufficient native ability, including adjustability, the outcome must inevitably be deplorable.

The following statements as to the function of such a department are chosen from letters sent to the committee, and quoted with approval: (1) To interpret the educational statutes and act as an executive agency for the carrying out of existing education statutes; (2) to exercise leadership throughout the school system of the State; to unify, guide, and inspire; to give publicity and to study the educational problems of the State scientifically; (3) to develop an adequate program of public education through the securing of suitable legislation; (4) to focus the attention of the public on the educational problems of the State; to secure coöperation of organizations other than educational; to shape public opinion along lines of progressive education; (5) to collect, interpret, and give publicity to statistical data of an educational sort, and to make surveys where needed in the State; (6) to serve (referring to the head of the department) as member of the various educational boards, such as university and normal regents.

(Such membership should not exhaust the duties and responsibilities of the chief educational officer in his relationship to the institutions.)

Why do not such departments function better than they ordinarily function in practice?—There is beyond question a belief among our leading educators that such departments do not function as they should. It is questionable whether such departments, taken by and large, reach an efficiency of more than 25 on a scale of 100. Why is it? Here are some of the answers that were sent to the committee: (1) Lack of money; (2) lack of a competent chief, or head, including lack of vision, training, experience, force, and executive ability; (3) lack of legal authority; (4) lack of public coöperation; (5) lack of educational ideals in selecting assistants;

(6) interference by the political forces of the State; (7) jealousy on the part of petty schoolmen, readiness to throw sand in the gearing whenever possible (There is much educational sabotage of this sort in many of our States); interference by private school interests of one kind or other (The more success the public schools meet with the harder for private schools to exist); (9) interference by conflicting or rival organizations; and (10) interference on the part of the industrial and the farming interests.

What should be the size of a department in a State having approximately a population of 2,500,000 in order to function properly?—The opinion seems to be fairly general that in such a State, indeed in any State, the minimum number of members should be about forty. Eight or ten of these, at least, should be persons who could in the general educational market command a salary of from \$6000 to \$7500 a year. These experienced, highly-trained, and capable persons would constitute the heads of departments, and the number of such heads will depend on the types of activity to be supervised and guided.

It would certainly include: (a) Teacher training; (b) high schools; (c) graded elementary; (d) ungraded, semi-graded, and rural; (e) sub-normal; (f) school buildings and grounds; (g) physical training and in the broader sense, health; (h) libraries and library reading; (i) statistics and their interpretation. This list is not exhaustive, but some of these may at times be combined.

A word of caution. A department should not be pigeon-holed off to such an extent that it becomes narrow and isolated. All departments, or divisions within the general department, should be parts of the orchestra, or, if you prefer, team workers like the properly trained foot-ball team.

The salaries paid to the remaining members of the staff should be at least three times the amount paid in the average city grades. There should be about a dozen stenographers and persons filling clerical positions. It is not assumed in this statement that the department will undertake any activities other than those directly connected with the supervision and leadership in public schools. The sort of activities that are grouped together in the State of New York we are not here considering.

What should be the relation of the head of the department to the higher institutions of learning?—The answer is that he should be a member of all boards having to do with public education such as the State university and State normal schools, and that in addition to his function as a board member he should be expected to have great influence in shaping courses of study for the training of teachers and should determine all matters of accrediting high-school graduates to the higher institutions of learning. For universities to determine the qualifications of high-school graduates for entrance to such institutions is illogical, for it has a constant tendency to divert high-school training into mere preparation for college.

There is a general desire among thoughtful friends of public schools to put education on a basis of organization and finances, commensurate with its importance to the State. But this can only be done by creating some

such department as has just been indicated. We could expect real educational leaders from such a group, provided they were not harassed by petty schoolmen and petty politicians—a pretty large proviso.

Shall we have men and women of the highest training and ideals managing our State educational affairs, or shall it be confusion worse compounded by having mediocre men and women scrap it out owing to the claims of various “isms,” critics, financial interests, and occupations? While we hope for the best it is most certain that we shall have to fight from now on to preserve and to make more efficient our school systems. Good people are so incredulous about the evil intentions or stupidity of anyone that they may not wake up to lock the barn until after the horse is stolen.

Finally, the head of the school system—State superintendent, commissioner of education, by whatever name known, should be the executive officer of the board, and the brains of the board as well, in everything that pertains to the professional side of the work of the department. Again, this can be true only when the man is worthy to assume such leadership. Such a leader will bide his time when cocky and opinionated members grow too officious. He will not foolishly take offense and openly resent the ebullition of self-important mediocrity.

REPORT OF THE COMMITTEE ON AMERICAN TEACHERS' COLLEGES

CHARLES MC KENNY, PRESIDENT OF MICHIGAN STATE NORMAL COLLEGE,
YPSILANTI, MICHIGAN

The committee which is making this report was created at the February meeting of the Council one year ago but its personnel was not fully made up till some weeks later, and it was unable to get together until the meeting of the N. E. A. at Des Moines last July. At the Des Moines meeting the chairman was authorized to prepare a plan for carrying on the proposed investigation and submit the same by mail to the members of the committee. This he did in the early fall. The several members of the committee offered suggestions which were incorporated in the final draft of the plan. Necessarily the investigation had to be made by means of the much execrated, much used and absolutely necessary questionnaire. In behalf of the committee I here and now heartily thank the presidents of normal schools and colleges who through their coöperation made this study possible. Reports were received from every State and the committee has reason to believe that the data herewith presented faithfully represents the present situation in the various items reported upon.

The purpose of the study—The study had two main objectives—

1. To discover the scope of the teachers' college movement, i. e., to what extent normal schools are advancing in rank to teachers' colleges.
2. To gather data which would reveal the practices and standards obtaining in teachers' colleges and their relations to practices and standards generally accepted in college and university circles.

It was thought such a study might serve a double purpose—first, as a record of conditions in the year 1922, which might be of value for comparison in future investigations, and second, it might aid in the important work of standardization of the normal school and teachers' college.

No financial aid was given the committee, which accounts for the fact that the data are not elaborated into tables and graphs. The committee hopes that the report will be of interest and value to those at least who are working in the teacher-training field.

The growth of the teachers' college—During the last two decades and more particularly during the last five years a new type of educational institution has come into existence—namely, the State teachers' college, which is a professional school for the training of teachers, with a four-year curriculum, requiring high-school graduation for entrance and granting the bachelor's degree. It is true that a few individual institutions of this sort had existed for a longer period and established themselves firmly in the educational world, but the number was relatively small. Up to 1916 there were but fifteen teachers' colleges among the sixty institutions included in this report. Since that date forty-five have established four-year curricula beyond the high school. In other words forty-five of the sixty institutions reporting extended their curricula to four years above the high school during the last five years, and nineteen in 1921. Today, fifty-one of the sixty institutions confer the bachelor's degree. These institutions are to be found in twenty-three different States representing every section of the country, east, west, north, south. Institutions in three other States offer four-year courses but do not offer degrees.

Extent of the teachers' college movement—The committee is indebted to President J. O. Eyjen, of Mayville, North Dakota, for the following data:

"There are 167 normal schools in the United States. One year ago 62 of them were giving four years of college work. Today there are 91 doing this work, showing an increase of 47 per cent in one year. The normal schools doing four years of work beyond high school constitute 45 per cent of the total number of normal schools in our country.

"Of the State normal schools offering three-year college courses there are 24 in number, or 14.4 per cent of the total.

"The State normal schools giving two-year courses above high school number 52, or 31.1 per cent of the total.

"This means that two thirds of the State normal schools are offering work beyond two-year courses for high-school graduates, and that only one third are of the conservative order.

"To recapitulate, there are 91 States normal schools with four years, 24 with three years, and 52 with two years of college work."

Causes leading to the establishment of teachers' colleges—The history of the normal schools is well known. The first normal schools were established in Massachusetts. Colleges had long been in the field, were well established and were furnishing teachers for the secondary schools. The schools that especially needed assistance were the elementary schools, and

the normal schools were created with the definite purpose of furnishing teachers for the common schools.

The normal schools of the Middle West have a somewhat different history. They were organized practically at the same time as the State universities and colleges, and consequently did not find their field of service limited. While unquestionably it was conceived that their function primarily was to serve the elementary schools, the situation in which they found themselves drew them into a broader line of activity. The colleges and universities were not meeting the need for trained teachers for the high schools, and the normal schools were called upon to supply the demand; consequently, without any predetermination on their part they extended their curricula of training into the secondary field, and as a result in the Middle West the normal schools from their beginning have trained a fair percentage of the teachers who have gone into the secondary schools. What has been true of the Middle West has been true largely of the West and South.

At first the high schools did not demand college graduation on the part of their teachers and even today outside of a few favored States the smaller high schools are quite barren of college graduates. But the standards gradually have become more exacting, and the tendency on the part of normal schools has been to expand into teachers' colleges to meet the changing situation.

But this report would not accurately record the real facts if it represented that the normal schools have been passive and disinterested toward the proposition of their expansion into teachers' colleges. Quite the contrary. For a quarter of a century the conviction has been gaining strength throughout normal-school circles that the best interests of American education demanded that as far as is possible and practical, normal schools should extend their curricula into the senior college field. This conviction rests on the following reasons:

The schools of the future should demand on the part of the grade teacher more than two years of preparation beyond high school. The modern elementary curriculum is rich in intellectual, social, and cultural material and cannot be administered as it should be by one who has not had broad and generous preparation. The normal schools are finding it impossible to give in two years the solidity and breadth of training which the elementary teacher needs. It is not expected that all elementary-school teachers, even in the best schools, will be college graduates, but it is believed that by holding up college graduation as an ideal more will be induced to keep up their growth after entering the profession and the teaching staff of our elementary schools will more and more be stimulated by the presence of college-trained teachers. Through summer schools and extension courses teachers in service may without loss of time and with reasonable expense continue their study, and a college degree offers a stimulating goal. The policy already established in some school systems of giving equal pay for equal preparation, no matter what department the teacher may be in,

will stimulate the elementary teachers to complete a college course. The normal schools must extend their programs of study if they are to be factors in the movement for college-trained teachers throughout the entire public-school system.

Another reason is the economic. A study of the teaching profession by Coffman put into definite form what everybody knew—that teachers are drawn largely from homes of limited economic resources. The present study reveals the fact that in the sixty-one institutions reporting about fifty per cent of the students are self-supporting wholly or to a great degree. It also indicates that, as a rule, a year of instruction in a normal school costs not more than sixty per cent as much as a year of instruction at the university of the State in which the normal school is located. If America is to have adequately trained teachers in her schools she must make it possible for the young men and women who are dependent on themselves for an education to get that education at a cost which they feel that they can meet.

Again, the normal schools find it difficult, if not quite impossible, to sustain a faculty of a high degree of educational and professional attainment with a course limited to two years. The universities have justly commented on the lack of productive scholarship in the normal schools. One reason for the condition is that the grade of work done in a normal school has not been tempting to men of scholarship. The courses are too limited both in time and character. Moreover, the hours of teaching have been many. The extension of their curriculum to four years and the accepting of college standards relative to the length of the school year and the hours of teaching would make it easier for the normal schools to attract to their faculties men and women of broad and productive scholarship.

Then, too, the normal schools have felt the lack on the campus of what in college circles are called upper-classmen. Not all the benefit a student gets in college comes from teacher and classroom. There is an invaluable contribution made to the expanding mind and character of the college youth through social contact with his fellows and there is also the subtle but potent influence of what we term atmosphere and tradition. An institution that keeps its students but two years, one half of whom are every year new to the campus, cannot develop the traditions, customs, and atmosphere which many of us prize as the most helpful and educative and lasting influences of college life.

Many educators, some connected with normal schools and some not, have maintained that it is not good educational policy to turn over to colleges and universities exclusively the function of training high-school teachers. Monopoly tends to breed stagnation. Competition is the life of trade. University inspectors of high schools have carried back to their institution stimulating suggestions when they have found as they so often have done Normal graduates with less than four years of training doing better teaching than university graduates. The gospel of professional training has been preached up and down the land by the normal schools

just as the gospel of academic preparation has been preached by the universities. Each needs the stimulating influence of the other.

Never before in the memory of living men has the public been so aroused to the needs of its schools as it was during the war. The threatened breakdown of our educational system through the appalling lack of trained teachers was heralded over the land by daily press and periodical and from platform and pulpit. One of the fruits of that campaign is an awakening within the ranks of the teaching profession as well as without, which is demanding better teachers and more ample means for educating them.

Perhaps the greatest single influence in the establishment of so many teachers' colleges during the last five years is the tremendous increase in the number of graduates from our high schools and the consequent increase in attendance at our universities. A few years ago, the universities and the normal schools were to a certain extent competitors for students. That day apparently has gone by. The universities find themselves crowded and with no hope of increasing their capacity sufficiently to take care of the students who will knock annually at their doors. Consequently they are the more inclined to welcome the extension of the normal-school curriculum to four years, seeing in that measure a relief for their undergraduate work and a means of strengthening their graduate schools.

Enrolment—Graduates—It probably will be a surprise to many to learn that during the last ten years teachers' colleges in the group reporting have conferred 6440 bachelor degrees and during the past five years 4409, and in 1920-21 1228, and that in the current year there are enrolled 12,061 students in the four-year courses. The figures bear convincing testimony to the service that teachers' colleges are rendering in supplying college-trained teachers to the school systems of the States.

Entrance requirements—In reply to the question, "Are the entrance requirements to the curricula leading to the bachelor's degree the same as those demanded by the university of your State?", fifty-three, representing twenty-three States, replied in the affirmative; twelve, representing five States, did not reply; and four, representing four States, replied "practically the same." These replies reveal an encouraging situation and indicate that the teachers' colleges are squaring themselves with the highest standards as far as entrance requirements are concerned.

Relation of the shorter curricula to the four-year curricula—It has already been noted that teachers' colleges have developed from normal schools administering two-year courses by the addition of two years of work. Practically all the institutions retain their shorter curricula. Of the sixty reporting, forty have curricula one year in length, fifty-four two years in length, thirty-three three years in length. A license to teach is generally issued by the institution to a candidate finishing any of the curricula named. It is a significant fact that reveals the economic status of the student body of normal schools that from two thirds to nine tenths of those taking degrees withdraw from college to teach before the course is completed.

An interesting and significant consideration is the relation of these shorter curricula to the curricula leading to a degree.

To the question, "In what respect, if any, is the curriculum of studies pursued by those who remain in the institution four years different in sequence from that pursued by those who drop and teach after two years?" twenty-five replied "no difference;" thirty-one made no answer, which, perhaps may be interpreted as implying no difference, one reports some variation in subject matter, and one reports practice teaching as coming later in the four-year group. In forty-seven institutions students may pass from the junior college to the senior college without loss. In seven institutions a loss is sustained.

Degrees—In no respect is the law of individual difference as illustrated in teachers' colleges more clearly demonstrated than in the variety of bachelor's degrees conferred. Forty-one institutions reporting show the following: A. B., seven; A. B. and B. S., thirteen; A. B. in Ed., six; A. B. and B. S. in Ed., one; B. Ed., eight; one grants A. B. and B. S. in home economics and agriculture; one, A. B. in music; one, B. of Music; four (Greeley, Gunnison, Albany, and Rock Hill), grant the master's degree for work done; one D. Pd. and one M. Pd. as honorary.

The replies to the question why both the A. B. and B. S. degrees are granted bring out the fact that the traditional significance of these degrees is still recognized. The A. B. represents the humanities and the B. S., science. The custom obtains in some institutions of granting the B. S. on the completion of such special curricula as music, physical education, commercial and manual arts, which lack the accepted academic content usually represented by the A. B. and which consequently would not receive full university recognition. Thirty-three approve this policy, twenty do not. This bewildering variety of degrees might lead the uninformed to conclude that the teachers' colleges are sinners above all others in this respect, but American colleges and universities show quite a varied assortment. It would be well if our teacher-training institutions which grant degrees should recognize teaching as a distinct vocation and adopt a degree which would be significant and indicative.

Relation to the university—One of the battle grounds in American education often fought over and still the theater of conflict is the relation of the normal school to the university. There have been and are two points at issue: First, shall the normal schools confine their work to the training of elementary teachers?, and second, what credit shall the university give for studies taken in the normal school? In reality, the two reduce to one—the matter of credit.

For decades after the normal schools came into existence the number of high schools was small, and the normal schools were obliged to admit students with only grammar and district-school preparation. The normal schools were at the best little more than professional high schools and their work received scant consideration from the universities. In time, high schools multiplied in number, and the normal schools began to increase the entrance requirements in their diploma courses. By 1900 normal schools generally offered a course two years in length, based upon a complete standard high-school course, or its equivalent. To meet the needs

of students who were not high-school graduates longer courses were also maintained.

Also by 1900 or soon after the State universities in the Middle West and West had begun to give practically sixty hours or two years of credit for the two years of post high-school work done in the normal schools. In some, reductions were made where the credits were too largely in elementary subjects. The normal schools had consequently practically established themselves as junior colleges. But the pressure brought upon the normal schools in several States to prepare high-school teachers led a number of them to take on the work of the senior college and to grant the bachelor's degree and to ask full recognition of these degrees on the part of the universities. The discussion of the issue thus raised has been heated and sometimes lurid. As it usually is in such controversies, not all the truth and justice tented under either banner. The universities have a right to insist, and it is well for the teachers' colleges that they do insist that teachers' colleges square with college standards in respect to entrance requirements, scholarship, faculty, teacher's load, student's load, size of classes, content and equivalency of courses, and physical equipment. On the other hand, the teachers' colleges are justified in asking and expecting that when college standards in these respects are attained and maintained that recognition shall be speedily and cheerfully given. Lack of college ideals and standards has been the prevailing sin of the normal schools and nascent teachers' colleges and gross ignorance of what some teachers' colleges have really achieved and prejudice against them because of their lowly history and fear of them as rivals in training teachers for secondary schools have been the outstanding sins of the universities. It is reassuring to know that the men on the faculties of our universities who best know normal schools and teachers' colleges are their warmest friends. The last decade has witnessed a progressive tendency for universities and teachers' colleges to come into satisfactory working relationships. Twenty-five teachers' colleges in fifteen States report that the universities of their respective States recognize them as senior colleges and honor their degree. Forty-three institutions representing twelve States report that they are not fully recognized as of senior college rank.

Foreign language—Nineteen teachers' colleges require two years of foreign language for entrance; twenty-eight require none; twenty-five did not reply, which probably means that they have no policy in the matter. Very likely most of these so replying have not yet developed the four-year curriculum and consequently have not had to face the situation. Eleven do not require foreign language for graduation.

Here is a matter in which the policy of some teachers' colleges differs radically from that of the colleges. Universally, colleges require at least two years of foreign language, either for entrance or as a part of the college course. It is a debatable question whether it is just to require foreign language, of every one taking a bachelor's degree from a teachers' college. Many who seek a degree are mature in years, have no interest in foreign

language, and little ability in language study. To require a foreign language of them is to sacrifice them for the sake of a principle. But institutions which do not require foreign language for the bachelor's degree are out of step with the procession and very likely will find difficulty in establishing satisfactory relations with the graduate schools of universities.

Faculty—General preparation—The standard preparation of college teachers as set up by the North Central Association is a minimum of one year of graduate study. Certainly the standard is not too high, and the faculties of teachers' colleges should expect to be judged and evaluated by the accepted college standards. The present study shows that about nine per cent of the teachers in the fifty-four institutions reporting, exclusive of teachers of special subjects like drawing, music, physical education, and manual arts, hold an earned Ph. D., and about half of the remainder hold the master's degree, and about ten per cent hold the bachelor's degree. Judd and Parker, in 1916, found that seven per cent of normal-school teachers held the doctor's degree as against thirty-four per cent in colleges, and that thirty-one per cent of normal-school teachers held the master's degree as against sixty-one per cent in colleges. The present study indicates that the teachers' colleges ranked higher than the normal schools in 1916, but they are still much below the colleges in respect of the training of their teachers. There was a time when a normal school or a teachers' college could offer as a plausible and even a reasonable excuse for the lack of masters and doctors on its faculty that they were hard and even impossible to get, at least the type that had sympathy with normal-school ideals and work. But that day is past. Men and women of graduate scholarship and successful teaching experience and human qualities are to be had today for salaries which the normal schools are paying. They are teaching on the faculties of our denominational colleges for lower salaries than normal schools offer. If the normal schools and teachers' colleges do not recruit their faculties from this type of teacher in the future the reason for the failure will lie with themselves. It will be they and not the times that will be out of joint.

Shall teachers' colleges be simon-pure professional schools?—This is a controversial question. Many educators of candid and well-informed judgment maintain that teachers' colleges should interpret their name literally and be absolutely and unreservedly professional schools. The Carnegie report on the Missouri normal schools holds this point of view. This means that the teachers' college curricula should contain only such courses as would bear more or less directly on the business of public education. It means, moreover, and this is a significant fact, that the teachers' college should not invite the attendance of students who do not intend to teach. The teachers' college should stick to its peculiar knitting just as do the colleges of dentistry, law, and medicine. It is urged that the teachers' college has no right to enter into competition with liberal arts colleges and that to do so is to weaken its position both internally and externally as a professional school.

Opposed to this view is a group of equally candid and well-informed

men who hold that the teachers' college should serve its territory in the field of higher education; that it should invite to its campus the youth of its locality who want a college education, irrespective of what their profession or business in life is to be. Allen and Pearce, in their text, *Self-Surveys of Teacher-Training Schools*, advocate this point of view.

On the refinements of this debatable question this committee would probably show a division of opinion, but it is the unanimous belief that no teachers' college is justified in sacrificing professional *esprit de corps* and the atmosphere of intellectual and spiritual enthusiasm for teaching for the prestige of numbers.

Teachers' colleges are divided in their opinion relative to this matter. Twenty-four state that they encourage the attendance of students who do not expect to teach, and thirty-nine state they do not. Three encourage such attendance to a limited extent.

Teacher's load—It is a matter for favorable comment that the range of the teacher's load in only twenty-four of the fifty-five institutions reporting exceeds sixteen hours, and but eight reached twenty-four hours. One reported twenty-five hours. This committee is inclined to think that the condition shows a trend in the right direction. Of sixty-six schools reporting, twenty-four stated that their teachers taught forty or more weeks per year; seven had a school year of forty-two weeks; one, forty-three weeks; four, forty-four weeks; three, forty-five weeks; four, forty-six weeks; and four, forty-eight weeks. Forty schools pay their teachers extra for summer school work.

Correspondence—Extension work—The taking on of correspondence and extension work has complicated the question of the teacher's load. In twenty-two teachers' colleges this extra mural work is carried by the faculty in addition to their regular classroom work.

Student's load—The showing is even better regarding the student's load, but eleven schools reporting permitting their students to carry twenty hours or more of work requiring preparation.

Separation of junior and senior students in classes—The answers to the question, "What fraction of the work required for the bachelor's degree must be done in classes to which freshmen are not admitted?" show a wide variation in practice. Twenty-four made no answer which must be interpreted to mean no rule yet established. Three report all classes open to freshmen. Those colleges reporting a rule show a range from one fourth to three fourths, *i. e.*, freshmen are excluded from one fourth to three fourths of the classes designed for sophomores, juniors, and seniors. That this is an important matter goes without argument. It is reassuring that thirty-six colleges have recognized its significance.

Observations and conclusions—In the opinion of this committee the teachers' college movement is sound in policy. The normal schools began as secondary schools with a professional purpose. As public education progressed they advanced to the rank of junior colleges, and with the further progress of public education it is perfectly natural that they should develop into professional colleges. This development is in complete harmony with

the general advancement of organized education. Moreover, it is a necessity if we are to have a body of trained teachers with a professional attitude toward their work. Especially is it important that we should have teachers' colleges in view of the disposition of teachers in service to continue their education. Thousands of such teachers find the work offered by the teachers' colleges during the summer session their greatest single opportunity for academic and professional advancement.

The teachers' college movement is still in the experimental stage. While a few institutions have established themselves firmly in the college field and have received general recognition for their work, probably three fourths of the so-called teachers' colleges are just advancing to senior college rank. It will take a number of years for them to establish their courses, increase their attendance, and standardize their work on a college basis.

The movement should receive encouragement from all friends of public education. Legislatures which have been responsible for the legal enactments which have created these teachers' colleges should back them up financially and make it possible for them to develop a physical plant and the faculties necessary for the work which they have been authorized to undertake.

The universities should evince a coöperative spirit toward the teachers' college movement. In the great work of education there is room and glory for all. The universities will find their resources taxed to the limit to care for those who desire to enter their doors. Any spirit of rivalry or overzealous competition between the educational institutions of a State should cease. The university and the teachers' college should be colleagues and firm friends in advancing the interests of education within their respective States.

The normal schools which advance to the rank of teachers' colleges should take the name college. It is idle to ask what is in a name, for there is much in a name. In public thinking the term school is applied to an institution below college rank. The name college has an appeal which the name normal school does not have, and as soon as a normal school is authorized to take up senior college work it should take the name indicative of its rank.

The teachers' colleges should address themselves to the task of standardization. If they are to be colleges in name they should be colleges in fact. This means that for the entrance requirements, student's load, content of courses, academic preparation of faculty, faculty load, number of weeks' teaching per year, and the like, they should square with college standards. Teachers' colleges may never hope to have the respect and recognition of the colleges and universities and the public in general until this task of standardization is achieved.

As an aid to this standardization, the committee suggests that a more detailed study be made of the organization and administration of teachers' colleges and of the content of the course of study, such report to be made by the present committee or by some other committee authorized for that particular purpose.

RECENT EDUCATIONAL PROGRESS IN THE UNITED STATES

JOHN J. TIGERT, U. S. COMMISSIONER OF EDUCATION, WASHINGTON, D. C.

The World War very naturally affected human society. Consequently during the War and since the War we have witnessed a very unstable situation in business, in politics, in every realm of human relationship, including education. The general conditions attendant on the War brought to this country an unparalleled wave of material prosperity and an unprecedented spiritual awakening during the course of the struggle. These flood tides of material and spiritual forces quickly reacted at the termination of hostilities and left the country in a back-wash of business depression and in a revolt from the magnanimous spirit which marked our participation in the conflict. All this has had a profound influence upon educational progress. The situation has brought about a keener realization of our educational needs, a deep awakening to the importance of education, for a time a greatly increased outpouring of public money for the benefit of schools, but more recently a well-defined tendency in all parts of the country to retrench on expenditures for education. So far as I am able to say, this tendency toward reaction has had little actual result, though it has been clearly felt everywhere and our educational forces have been compelled to mobilize against it in practically all quarters. This is the general situation with reference to education in the Nation at the present time.

It will be impossible in the limited time allotted me to outline even in a cursory way all the progressive movements that we have witnessed during recent years, but I may sketch in contour some of the more important features of our progress.

Educational legislation—Nothing promotes progress in education more generally than improvement in the legislation affecting schools. The most outstanding piece of educational legislation in recent years was the passage during the War of the Vocational Education Act, commonly called the Smith-Hughes Act. This Act became law shortly before the United States entered the war and the Federal Board for Vocational Education was organized in August, 1917, to carry out its provisions. The Act was not a war measure as some have unfortunately supposed. It was intended primarily to stimulate vocational education throughout the States by means of Federal subsidies, with special reference to education in trades and industries, agriculture, home economics, and commerce for boys and girls of high-school age and for teacher training in the above mentioned subjects. The effect of the Act was immediate and general. Within a period of ten months every State in the Union had made formal acceptance of the proposal of the Federal Government and by appropriating money on a fifty-fifty basis had entered into a coöperative agreement with the Federal Government to promote vocational education in the public schools and to develop facilities for training vocational teachers. The use of the agencies thus set up for the rehabilitation of soldiers injured in the World

War for a time overshadowed the primary purposes of the Act, but with the recent transfer of soldier rehabilitation to a separate organization, we can hope for a steady progress in vocational education throughout the Nation. More recently also there has been added to the work of the Federal Board responsibility for rehabilitating those injured in industry. This work is just beginning to be developed. The Act provides for an annual increase in funds for all purposes reaching a maximum in the year 1925-26 and annually thereafter.

The total amount expended annually upon all types of vocational education and derived from Federal, State, and local sources increased from \$2,653,776.52 in 1917-18 to \$10,649,852.11 in 1920-21.

The total enrolment of the vocational schools which received Federal aid increased from 164,186 in 1917-18 to 323,028 in 1920-21.

The number of those enrolled in vocational teacher-training courses which received Federal aid increased from 6589 in 1917-18 to 15,358 in 1920-21.

The Federal Act for vocational education, therefore, is seen to have had a significant and universal effect upon the progress of vocational education.

In the States there has been much legislative reform in the past decade. Within the past twelve years, fourteen States have adopted school codes, thus bringing into a homogeneous whole all of the statutory provisions of these States relating to public education. This is much needed progress, because most collections of school laws, as published by State superintendents, contain many inconsistencies and some contradictions.

In 1919, Alabama, Georgia, New Hampshire, and West Virginia adopted codes. Delaware revised her code in 1919, 1920, and 1921.

There are now forty-two States which have State boards of education or like general administrative bodies, and the remaining six States have boards for specific purposes, such as for the administration of vocational education.

The usual board is appointed by the Governor and consists of seven members, this being the median number for forty-two States. Pennsylvania was the only State in which an important change in the State board was made in 1921. There the State board was replaced by a State council of education, whose powers are somewhat greater than those of the old board. This council is composed of the State superintendent, as an *ex officio* member, and nine members appointed by the Governor.

Legislation with reference to the State superintendency shows two definite tendencies, but rather slow progress in both directions. One is the tendency toward removal of this office from politics, and the other is toward a change of title of the chief State educational officer. Within the last three years, Delaware, Minnesota, and New Hampshire displaced appointment of the chief State officer by the Governor with appointment by the State Board of Education. In the same period, however, Massachusetts and Tennessee reversed this policy and quite recently Kentucky and Indiana voted down a proposition to make the office appointive instead of elective on a party ticket in a political campaign.

In the last few years, New Hampshire, Connecticut, Rhode Island, and Minnesota have changed the title of the chief State educational officer to Commissioner of Education.

There are now nine States which have enacted legislation which makes the county the unit of administration for rural education in a very pronounced way, while there are ten States which have enacted a semi-county unit law. Delaware, Arizona, Montana, Oregon, and Missouri have all passed legislation in the past year or two looking toward the county unit of administration, but the law has been held in abeyance in Missouri awaiting a referendum vote. Twelve States have now taken the office of county superintendent from politics. This was done in Arkansas in 1919 and in Kentucky in 1920. There has been a marked tendency of late toward more adequate assistance for county superintendents, but four fifths of them are still without any assistance whatsoever.

In the direction of increased support for the schools, there has been a strong tendency for more liberal support from State funds. Sixteen States have recently assumed a much larger share of the burden of financial support for their public schools.

One of the most marked features of recent legislative progress is in increasing the effectiveness of attendance laws. There has been a steady tendency to push the upper compulsory age limit from fourteen years up to sixteen years and, to a less degree, a tendency to push the lower age limit down to seven years. Thirty-five States now have an upper limit of sixteen years or more, eight of these having amended their laws in the last few years. Other phases of improvement of attendance are noticeable in the provision that attendance shall be for the full term instead of for a part of the term, for more attendance officers, and more definite fixing of responsibility for the enforcement of the law. Since 1918, seventeen States have increased the minimum length of the term from two to four months. Four of these States have now established nine months as a minimum. These provisions have resulted in a considerable increase in attendance in the last few years, for which complete and accurate figures are not yet available.

There are many other phases of progressive legislation which we must omit because of lack of space, such as laws pertaining to Americanization, eradication of illiteracy, physical education, improvement of rural schools, teacher training, and the like.

Rural education—We believe that our rural schools are the most important part of the school system now demanding the attention of progressive reform, and we wish to give some attention to the progress that we have achieved here of late.

While progress in rural education is marked by achievements in every phase of school work, the most notable growth in recent years is in three lines, namely, professional supervision of classroom instruction, consolidation of small schools, extension of high-school facilities.

Supervision—A remarkable awakening to the need and value of professional supervision for rural schools has taken place in the last five years. The old conception was that a county superintendent was chiefly an administrative and clerical officer; he discharged his obligations to the teacher and the school by paying one short visit a year. Progress is indicated by a general tendency to increase salaries of country superintendents, and by the increase in the number of professional supervisory assistants employed during the last few years. Educational qualifications are now exacted from candidates for the position of county superintendent in thirty-seven States and teaching experience in twenty-two States. The salaries of these officers have increased since 1916 from 25 to 100 per cent. The number of superintendents receiving over \$2400 per year has increased from 78 in 1916 to 782 in 1920, or from 5 to 20 per cent of the total number. The number receiving over \$3000 has increased from 32 to 232. The maximum salary has increased from \$7500 to \$9000 in the same period.

Over \$2,000,000 was spent in 1920-21 for employing professional supervisory assistants for rural schools. The number of such assistants has increased since 1916 from 479 to 994. The number of office assistants furnished county superintendents increased from 372 in 1916 to 1319 in 1920.

The idea of State supervision of rural schools has also grown. The number of State supervisors employed has increased from 46 in 1916 to 117 in 1920.

Consolidation—The movement toward consolidation is growing rapidly, the number of schools increasing in some States more in one year than in the preceding twenty years. In 1920 there were eighteen States which had no laws providing for consolidation. Now all States have such laws. Seventeen grant State aid to encourage consolidation, of which ten have provided the whole amount or increased the amount given in the last ten years.

Reports sent in to the Bureau of Education indicate that there are 13,000 consolidated schools, enrolling 750,000 children. The money spent on transportation has increased until it is now over \$14,000,000 annually, or about 2 per cent of all the money spent on schools in the United States. Indiana and Minnesota each spent over \$1,000,000 a year for transportation. Consolidation is beginning to mean not only good elementary school advantages, but a high school within reach of the children's homes.

Extension of high-school facilities—The movement to extend high-school facilities to children of rural communities is noticeable in three ways:

- (1) By the increase in the number of high schools;
- (2) By providing for the payment of tuition from public funds of all children living in non-high-school territory, as in California and Illinois;
- (3) By providing dormitories where children from isolated rural communities may board at reasonable cost.

Notable advances in one or more of these directions in the last two years have taken place in Mississippi, Tennessee, Illinois, California, and Montana.

Increase of teachers' salaries—The increase of salaries for those in school work has been very marked during the past few years, but during the same period increased remuneration for laborers, artisans, and other workers was very much greater in proportion. Until 1921, increases in salaries for teachers lagged a long way behind the increased cost of living and the increased price of food. Only recently have the increases provided put the teaching profession in an economic position as favorable as that which existed before the War. From an economic standpoint, however, the teaching profession has not yet received a benefit from increases in salary. In 1921-22, high-school teachers are working upon salaries which in dollars represent an increase of 52.7 per cent over what they received in 1918. In 1916, the average teacher's salary, high and elementary, was \$563 per annum; in 1918, it was \$635 per annum; for later years exact figures are not available, but it is estimated that the average is still not over \$900 per annum. It is obvious that the present efficiency of the schools cannot be maintained if the salaries are reduced, and it is probable that they will have to be increased still further, even in the face of decreases in the cost of living. The increase in teacher training and experience has not kept pace with the increased salaries. In fact, it has gone backward, and in some respects since 1918.

Teacher training—A study of high-school teachers recently completed by the Bureau of Education showed a loss in 1921 over 1918 in actual training preparation and experience of high-school teachers. We have at the present time teaching in our high schools fewer teachers of experience, fewer teachers who are college graduates, more non-graduates of colleges or normal schools, but more graduates of normal schools than were teaching in 1918.

We have some evidences, however, of progress in teacher training. First, is the tendency to raise State normal schools to the level of four-year "teacher colleges." Seven States have recently converted their normal schools into colleges, and in some of them authority is given to grant degrees. Secondly, teacher training in high schools represents a movement which has spread over the Nation. Twenty-four States, or one half of the States in the Union, have made specific legal provision for this sort of training. We should note also that there has been a tendency to establish or enlarge departments for the training of rural teachers. In at least six teachers' colleges or normal schools such departments have been established during the last year. The number of directors of rural education has increased since 1915 about 25 per cent. Presumably, "director" means that a department of rural education exists in the institution.

There has been much progress in many phases of public education which must be passed over with mere mention. Recent emphasis upon health, hygiene, and physical education; the use of mental tests as a basis of classification and promotion and for the discovery of exceptional children; the provision of special schools and classes for exceptional children; the enrichment of the traditional curriculum and a better adaptation of the course of

study to the practical needs of the children and their environment, especially in the junior high school; evening schools; continuation schools; the growth of kindergartens, and many other phases of recent progress in education cannot be discussed in this brief review.

THE HOPE AND THE RESULT OF AMERICAN EDUCATION

CHARL ORMOND WILLIAMS, SUPERINTENDENT OF SHELBY COUNTY
SCHOOLS, MEMPHIS, TENNESSEE

The democracy established by our fathers nearly a century and a half ago provided for equality of opportunity never reached by any other people before. They made America the synonym for freedom, justice, and opportunity and to our shores from that day have come teeming millions eagerly in search of the avenues for self-expression and self-développement which our form of government made possible.

Closely interwoven and intertwined in the very foundation stones of this scheme of government are the fibers and tendrils of our greatest National institution, the public school. The evolution of their educational purpose was slow and laborious, due to traditions brought from the Old World, distances, and difficulties of communication; however, as the democratic impulse beat stronger and stronger in the hearts of these people and confidence in the Republic grew from day to day, the educational outlook and purpose began to assume form and to develop in like proportions. It is a far cry from the early colonial school, discriminating between the needs of the poor and the rich to the present-day conception of public education with its equality of opportunity to all races and creeds alike and we have just cause for pride and glory in our achievements.

That we have not, however, reached the zenith of our possibilities in public education, indeed, that we have not properly safeguarded the life of our free institutions was brought home to us in telling force by the revelations of the Great World War. It was largely through the draft that our attention was focused upon the number of men who could neither read nor write, those who could not serve in the army overseas because of physical disabilities, and that other group of people, considerable in size, who though living under the protection of our Stars and Stripes had not been imbued with the spirit of our government and continually sought to handicap and thwart its plans in the hour of its greatest crisis.

We began to see very plainly what ought to have been obvious before, that our school system, though it might be free, was by no means universal. When we began to take stock of our educational advantages it was found that the school terms varied in length from twenty-two to thirty-six weeks in different States of the union, and that in spite of compulsory legislation on the statute books, school attendance was very poor. At the height of the war there developed such a shortage of teachers to fill the schoolhouses of the Nation that, for a time at least, it filled with alarm the hearts of our

people. It served to bring to mind very forcibly the lack of preparation for teaching which had prevailed in large areas of the country before the war. There are approximately 700,000 teachers in America today. Of this number 150,000 are under twenty-one years of age; 30,000 have had just eight years of elementary schooling; only 120,000 have had four years of high school followed by two years of normal or college work; 150,000 have taught only two years, while one half of them have taught less than four years.

The teacher-training institutions of the country are turning out about one fifth of the number of teachers annually required to place "a well-trained teacher in hearty accord with American ideals in every classroom in America." Larger and yet larger support must be given to these institutions else we shall be cutting off our stream of supply at its very source. We cannot face this situation in the future with any degree of confidence knowing that the average salary of our teachers is less than \$700 a year, these being the latest figures obtainable. In this year of financial stress the daily papers carry all too frequently accounts of the closing of schools throughout the country for lack of funds and many teachers of excellent training and experience in their work will receive this year less than this annual average salary, a situation that ought not to be permitted to arise and one that ought to be effectually dealt with when it does arise. Banks, merchants, farmers, and business of every kind which might have gone under for lack of financial support during this period of liquidation have been bolstered up and kept going, and yet the schools, the biggest business of any municipality, State, or Nation have been forced to suspend operations. When our people, as individuals and as a Nation, really understand that our schools are the bulwark of our liberties and the greatest protection offered to our free institutions, searching investigations will be made until we have arrived at a plan of adequate support of our schools for present needs and wise preparation for the exigencies of the immediate future.

There is not time nor is this the place to enter upon an evaluation of our course of study in the public schools—whether it is too full or too long drawn out is a fruitful source of discussion, the end of which is not yet in sight. Complete concord of opinion on this subject has not been reached by our educational experts, but I think we may not be challenged in saying that definite fundamentals in the preparation for life and citizenship should be given to every child, followed and supplemented by training most needed to fit him for his station in life, the choice to be made by himself after he has been acquainted with the various lines of endeavor open to him.

When one travels throughout the length and breadth of this great land of ours and sees our mighty forests dwindling away, our enormous water power going to waste, our broad rivers with undeveloped facilities for transportation, the millions of acres of arid lands in the West waiting for but the touch of human hands to blossom as the rose, millions more of acres in other sections whose fertility is exhausted by years of unscientific agriculture, when one views with alarm the enormous waste of human

life due to preventable diseases and lack of proper instruction in health and hygiene—one cannot but feel that systematic, scientific instruction must be given to all of our people if we are to conserve and develop our human and material resources to the desired end.

One has only to go to our great centers of population and observe the colonies of foreign people speaking the language of their native country, easy victims of spurious doctrines, the unrest prevalent among the workers breeding antagonism between employer and employed, the rottenness of our city governments, sore spots eating into the very vitals of our Nation, the cupidity, graft, and ignorance always on hand in our legislative halls, to arrive at the conclusion that education has only just begun to function in our country.

It has become a trite saying that the life and strength of a democracy is in direct ratio to the enlightenment of its citizenship, and it has never been challenged. When this simple truth finds lodgment in the hearts of all of our people, there will be given a force and a direction to the great American educational scheme that has never quickened it before. Having performed just one time the duties and responsibilities of a full-fledged citizen of the Republic, I am profoundly impressed with the enormousness of our task and the sacredness of our obligations. There rests upon the teaching profession in this country today a responsibility so serious in its very nature, so far reaching in its consequences that it staggers the imagination of our leaders and challenges the best efforts which the united profession can bring to bear upon it.

It is a task of sufficient magnitude alone to set out upon the mobilization of the mental, moral, and physical resources of this great country of ours—but that even is not the end. Whether we will it or not the hopes and aspirations of all of the nations of the earth are centered in us, the freest of all free people. We cannot regard this trust lightly. America is still the world's great leader in democracy, and we must so shape our affairs at home and direct our policies abroad that these yearnings of people everywhere may find satisfaction and peace and confidence in the leadership which we have given to them.

It is right and proper and a sign of hope that the great nations of the earth have sat down together to devise some plan for international arbitration and for the elimination of some of the causes of war. Whatever the scheme devised may be, now that the councils have disbanded and their work has been given to the world, the task has been only begun, for no plan will be stronger than the public sentiment and moral sense of humanity. If their work is to endure and is to be followed by greater steps toward world peace, then the great teaching agencies of the earth, the school, the press, the platform, and the pulpit must begin their work. The children of one country do not hate the children of another country unless they are taught to do so. The great mind and heart of the world cherish good-will and abhor war.

In the following, ringing editorial, the *Washington Post* has struck deep

into the heart of the great problem of international good-will and world peace, "Deeper than conferences, deeper than National policies of friendly intercourse, deeper than individual genius can reach or collective effort accomplish, lies the talisman that will abolish war. It is education—the abolition of ignorance. Until humanity is really educated it will not be free from plague, famine, slavery, or war. Ignorance is protean in its shapes and devilish in its unexpected appearances. It acts through all the base passions and lusts. There would be no war if ignorance were supplanted by education, for selfishness would be eliminated, prejudice and hatred diminished, and it would be perceived that no war, however materially successful, is profitable. The winners of the late war are as unfortunate as the losers. It is not true to assert that 'there never was a good war or a bad peace,' because a war for liberty is blessed, and peace that accepts brutal violation of natural right is shameful. But it is true that war is an indictment of the intelligence of man and conclusive proof of his ignorance."

That the peoples of the earth may develop to the limit of their possibilities, this development to be based upon a right and just and honorable understanding among them, is education's chief task and here lies America's golden opportunity. Education is the best possible preparation for war, if wars must come; it is the only sure preparation for universal brotherhood and world peace. Let us have faith that America will prove true to her trust and worthy of this vast responsibility which the nations of the earth by common consent have placed upon her—that she will emerge from her task untarnished, unscathed, a bright and shining example of the ability and determination of a free people to develop themselves.

GREAT EDUCATIONAL ACCOMPLISHMENTS

R. G. JONES, PRESIDENT OF THE DEPARTMENT OF SUPERINTENDENCE,
CLEVELAND, OHIO

All great accomplishments should be ahead of us, and this with profound respect for past accomplishments. One great accomplishment is to maintain National poise. This depends upon a distribution of labor and its fruits. The last few years have overtaxed the stabilizer; organization in society was broken; wealth was redistributed. Hence the great job ahead of everyone is to restore balance and to preserve balance by intelligently directed effort.

National improvement—The decrease of illiteracy between the years of 1910-20, as cited in the recent issue of the *Journal of the National Education Association*, for the United States is 1.7 per cent. A significant item is the decrease marked in the States south of the Mason and Dixon line. It will be further observed that the average for all the States is not the measure for guidance, but the unit of the measure is rather the individual sections of the country. To say we are a Nation of any given

average of intelligence is misleading aside from the technical requirements of statistics. For the purpose of improvement we are concerned with the sections of the country confronted by special problems which are fundamentally economic. In addition to the accomplishment already made where the percentage has been lowered by as much as 8 per cent within the last decade, it would be of prime importance to direct attention to the illiterate localities, discover the cause, which probably is economic, and enable the State to improve its own condition. A National subsidy would enervate a section of the country by giving outright financial assistance. The best possible help to the weak is to help them to help themselves.

Intelligent direction is the most powerful assistance that can be rendered. State universities may render such service by directing the development of a State's resources until the tax duplicate will warrant support for education. If a subsidy from whatever source derived is offered it should be for a temporary period pending economic development and then granted only upon the promise that economic rehabilitation shall be initiated with the granting of the subsidy. We are aware that either economic or educational advancement may be regarded as incident the one to the other.

In addition, we are not prepared to spend a subsidy. A recent industrial survey determined that inefficiency traces back to education. This phase would require too long to develop at this time, but permit the statement that it would seem wise to provide education for adults by such means as the Short Course in Agriculture to develop localities with the greatest possible dispatch. Transportation, for one item, should be adjusted to develop territory. This measure, it is readily appreciated, is to be remedied by those who are trained and in position to produce the change. Educating children in the hopeless districts usually educates them away from the district as is instanced in Southern Ohio. It would be a great accomplishment to enable illiterate districts to learn to help themselves. Their pride and ambition would be conserved and their manhood strengthened. A large portion of the problem is to educate the non-indigenous population, the colored, and the southern European peoples.

Economy in educational production—The schools and all training institutions will have a very large part in preparing minds to do close or sane thinking. The distribution of labor and service in occupations in New York State is, approximately, as follows: 40 per cent in manufacturing and industry; 13 per cent in trade; 13 per cent clerical; 11 per cent in domestic and personal service; 9 per cent in transportation; 7 per cent agriculture; 4 per cent professional, and 3 per cent public service.

The distribution of education and preparation will bear some relation to this order. There is need to know what this distribution is and what it should be. Many are interested to know the boundaries for general and special education and, furthermore, whether educational opportunity shall be differentiated for given types. If in the occupations, 4 per cent will be professional, 65 per cent skilled labor, 20 per cent semi-skilled, and 11 per cent unskilled, shall education give attention to special preparation for the several groups?

Let us examine a recent industrial report entitled "Waste in Industry" to determine whether the causes of waste in industry bear any relation to the training offered in schools. Waste in industry, in the study cited, is attributed to low production, due to: (1) Faulty management of materials, plant equipment, and men; (2) interrupted production, caused by idle men, idle materials, idle plants, idle equipment; (3) restricted production, caused by owners, management or labor, and (4) lost production, caused by ill health, physical defects, and industrial accidents.

If there be waste, there are two remedies, the one to increase taxes, the other to effect economies. Industry has charged its mistakes to the account of the ultimate consumer, an individual we have all learned to know as an intimate friend. Industry will be told to learn to economize by better management. It is evident that the simplest way out is to ask for more funds to bury our mistakes, but we know the better way is to learn to make the funds we have serve a better purpose. We cannot forever continue to go to our boards and the legislature asking for increased funds. If the system of taxation were revised, this would be more nearly possible, but that event is far off. Taxes to the ordinary individual are about 10 per cent of his income. We all agree that is large enough.

Is any of the responsibility for waste in the world's work our responsibility? Is there close or remote correlation between the operation of industry and the operation of schools? If so, possibly the first and foremost cause of waste in education is inefficient management, just as it is found in the industrial survey. Can this charge be sustained? Have we ways and means to measure the effectiveness of our management? Those charged with the responsibility for management are boards of education, superintendents, supervisors, and principals.

If there has not been made a satisfactory analysis of leadership in school work, this might well be analyzed and recommendations be made for improvement. This is fundamentally a matter of personnel.

The building of personnel—There is no more vital concern than building personnel in an organization. It seems trite to speak of this, but for the superintendent's self I can think of nothing so important as to build the men about him, so that they in turn will build others in the system. We cannot go on forever poaching on others' territory to get men. Someone must settle down to building them. What has this to do with the National Council? Just this.

There is need for a monograph on practical administration and supervision as applied to personnel. There is required a philosophy for the operation of a school system; the mechanics may be perfect, yet the whole thing will go straight for the ditch and get there too. I am particularly suggesting personnel because of some acute experience past and present in hiring young men. They want a million dollars a year to begin, and they want to reach the tip-top in about three weeks. Someone is getting some bad advice and, possibly, someone is giving it. Cannot there be a monograph on this subject written by the old practitioners, in Anglo-Saxon

words and spirit that will offset some of the nonsense about high-speed high salaries with short apprenticeship and small responsibility?

Has our attention been directed in our research service more largely to personnel, or to organization content and technique in instruction? Does the responsibility for search of this kind lie with the colleges of education engaged in independent research, or should some organized body, such as the Educational Council, or the Department of Superintendence, or the National Education Association enter upon an analysis of management in education under such direction that the research may become the common property of all.

So far as we are aware, there has not been a study made that fixes responsibility, much less recommends measures for improvement. If the report on industrial waste holds good for educational waste, I fear the charge, quite current, that unprepared teachers are the cause, will occasion thoughtful consideration on the part of us engaged with school management.

Equipment—The second item cited as cause for waste is idle equipment. No doubt our physical property and its equipment are closer to capacity operation than ever before. Our attention is forced to it, at least, and this matter may well have consideration. This is a period of building construction, and there is need for information in common on this subject. With the advent of the junior high school, many buildings are being rushed to erection with limited knowledge of plans and specifications. The type of construction, the distribution of areas for given purposes, are consequent upon a curriculum which is altogether uncertain. One item specifically requires attention; namely, the extent and character of shop construction for manual arts. Ventilation, fresh-air rooms, lighting, seating, and many other features are due for consideration.

The matter of reconstruction or rehabilitation of old buildings is as important as new construction. Old buildings, out of date and inadequate for school needs and inspiration, will not be razed. Communities will not permit it. Ways and means should be devised to show what can be done. A few sporadic examples may be found where extraordinary results have been obtained, but there is much yet to be done. Perhaps some city could be induced to set an example for the country. Perhaps this body could devise a plan for development of the old structure.

Restricted production—We have restricted production, but it is due to different causes. Restricted production in education is due to the curriculum in part. What shall enter into it? Is there an organization to determine its content? Is there a consideration of economy of time? Are we to continue to enrich education or to reduce it to essentials? Are we clear as to the framework before we undertake its enrichment? Shall we continue to load the curriculum and lengthen the day? Individuals in the field are "working out" the desired improvement and, no doubt, they represent the best of agencies, but the waste is colossal.

Industry is spurred by competition to discover improvements. The

larger cities even find it difficult to assign teachers, or even members of the staff, to curriculum building on a time scale that amounts to research work. This would involve book building, which is now done on borrowed time and borrowed health and under no comprehensive guidance, or the work is done by those who are not engaged in field work and the result smacks of theory. For example, the development of social science for the junior or senior high school is commanding attention. Who will write the book and what shall it displace? The introduction of a new subject involves the reconstruction of one or more other subjects, or even better, the improvement in teaching of the subjects. A social science for the middle years cannot be a larger work cut down. It is a distinctly new problem. No doubt, the book will be written by a teacher or professor of history, sociology, or economy. It will be a mechanical or form text, a book that will actually serve a practical need.

Almost every one who has the maturity, vision, and field experience to sense the proper plan is too busy to write books. Perhaps the Council could organize a body to direct such work in one or a few subjects to the end that economy of time and the effectiveness of instruction might serve a good end.

Health—Lost production, due to ill health, is a major factor which is most difficult of measurement, but none the less present and obviously true. The cost for substitute teachers for one year in Cleveland is in round numbers \$150,000. This item is, no doubt, multiplied beyond our belief in reduced service of those who struggle on with the day's work while their health and vigor are low in tone. It seems hardly worth while to enlarge upon this topic. It is possible to increase the percentage of our staff who will keep physically fit. It will require work to do it, and if each city goes about the task individually the resistance will be great. This body could set up a study that will demonstrate to the country at large that that which is good for the welfare of the school child, by the way of better instruction, is at once an insurance to the individual teacher of comfort in mind and body and length of life and service. What can be worse for pupil and teacher than dragging through an existence in physical discomfort?

All that has been done to measure accomplishment has served a good purpose. The checking process is well and good, but there is a need in the field for the test that directs, which will be of greater service than the test that checks alone.

The test is a great accomplishment. It will be much greater. It will aid in determining the scope as well as the intensity of accomplishment in school work. Many of the tests are seemingly prepared on the basis of current teaching. How much improved the test would be if it covered in scope the field of the given subject basing the questions upon the crucial points of the subject. Such tests might easily be graduated by years, grades, or any desired unit of subject matter.

The teacher in the school does not comprehend the real meaning of testing. The first impression is that it is a measure of the teacher's efficiency.

This attitude tends to awaken resistance rather than intelligent sympathy in field work.

There is need for a monograph on the process of test making and the purpose and especially the science and art of giving tests. These remarks are based upon the possibility that the National Council may have or may create an organization to direct and employ agencies that may work throughout the year to centralize thought on important subjects and provide for the publicity and distribution of the findings.

THE JUNIOR HIGH-SCHOOL PROGRAM OF STUDIES¹

JAMES M. GLASS, DIRECTOR JUNIOR HIGH SCHOOLS, DEPARTMENT PUBLIC INSTRUCTION, HARRISBURG, PENNSYLVANIA

The present need—This paper is a preliminary report of a sub-committee on the Program of Studies of the Junior High School, appointed by a general committee of the National Council of Education; the latter committee for the past year has been conducting a study on the general problem of "Reorganization of Seventh, Eighth, and Ninth Grades." The appointment of the sub-committee has been too recent to permit of any study beyond that possible to correspondence. This correspondence has consisted in part of the preparation and circulation of a questionnaire on the Program of Studies of the Junior High School.² Replies are still being returned. A tentative tabulation of these replies has been made. The consensus of opinion as represented in the tabulation will in general be accepted as the basis of this report. The sub-committee, with the general committee, recognizes the present imperative need and the timeliness of a discussion on this vital subject.

A decade of experience—There is now a background of a decade's experience in the actual operation of the junior high school. The rapidity of the expansion of the junior high-school movement is in some ways to be regretted, yet conditions over which there can be no control favor this rapid expansion. Building problems are the unavoidable products of the post-war period. These building problems almost universally demand a distribution of relief to congestion in the elementary and secondary schools. The junior high school provides this distribution of relief and is very generally adopted as the chief feature of building programs. The building need is accepted in most communities as the opportunity for inaugurating the educational reorganization offered by the junior high school. The history of the movement will doubtless reveal that the great majority of junior high-school organizations have had their origin in this twofold administrative objective of combining building program with a program for educational reorganization.

¹ In addition to the chairman, the committee includes C. R. Foster, Principal, Latimer Junior High School, Pittsburgh, Pa.; A. Laura McGregor, Vice-Principal, Washington Junior High School, Rochester, N. Y.; Helen S. Watson, Assistant Superintendent, Los Angeles, Calif.; Clarence D. Kingsley, Supervisor of Secondary Education, Commonwealth of Massachusetts; S. O. Rorem, Principal, East Junior High School, Sioux City, Iowa.

² See questionnaire at end of this article.

Report of sub-committee—To the end, therefore, of promoting as extensive a study and discussion as possible of the reorganized program of studies of grades 7, 8, and 9, the sub-committee undertakes a temporary report on this subject. The report is founded upon the experience of junior-high schools in actual operation for the whole or part of the past decade. To the experience of the committee's own membership will be added that of others who in reply to the questionnaire have contributed of their experience.

The report of the sub-committee will at present and in the immediate future include: (1) This paper as a preliminary report giving in brief some of the basic principles and guiding objectives of the junior high-school program of studies; (2) a tentative program of studies which will suggest the constants and electives, the initial stages of differentiated curricula, and definite time allotments to the several courses of study; and (3) a later report based upon a complete tabulation of the replies to the questionnaire.

The unit of transition—The junior high-school is the unit of transition in the public-school system. Its chief contribution to any school system must be the realization of its purpose to weld together the units making up that system. The most serious indictment against the 8-4 organization was the abruptness of transition between the eight-year elementary school and the four-year high school. The junior high school will bring infinite harm to the public schools if its organization results in the creation of two such stages of abrupt transition.

The junior high-school program of studies should be a resultant of several forces. It should be made up, in part, of a continuation of the elementary school curriculum, but a review of these courses, i. e., a new view through articulation of elementary and secondary courses; in part, a preview of secondary school courses of study, but a rearrangement of such courses in their "simpler aspects deferring the refinements" to later senior high-school grades; in part, a prevocational content from the industrial and commercial fields; and, finally, a liberal amount of social science materials and social and civic activities to the end of giving to the early adolescent a "self-conscious social adjustment." This transitional unit of the public-school system must preserve its contacts and become a composite product of the forces which precede and follow it.

At the same time the program of studies of the junior high school is a self-contained unit. The point of view of the elementary curriculum toward its pupils is *en masse* to the end that all may receive a usable knowledge of the common branches and a sympathetic understanding of the social and civic structure of our democratic society. Differentiation of pupils into groups, so far as program of studies is concerned, prevails in the senior high school to the end that the individuals of each group may receive training in the types of work for which they have aptitudes.

Individual needs—The junior high school "must help *each* child to discover his own aptitudes" in the transitional stage between the *en masse* organization of the elementary school and the group organization of the

senior high school. It is the finding, testing, and trying-out period of the public-school system. The point of view is, therefore, the individual. Exploration of individual differences, guidance of educational or vocational choice, and stimulation of educational advancement are its primary objectives. The identity of the junior high school is, therefore, established in its purpose to treat each pupil as an individual problem. Exploration and guidance permit of no other interpretation. The program of studies offers a maximum of subjects required of all pupils and a minimum of electives or variables. The required subjects provide exploration—the elective subjects demand guidance in choice. The identity of the junior high school is typified in this service to the individual pupil.

From the standpoint of the transitional unit the required subjects continue the integrating or unifying courses of the elementary school, but these courses are modified to serve the distinct purpose of the junior high school. The electives introduce the varied opportunities for different groups preparatory to the later training to be received in specialized curricula of the senior high school. In brief, the junior high school must accomplish two purposes at the same time and each equally well—create and maintain its identity and preserve close relationship with the elementary and senior high schools.

An educational reorganization—It is evident that no mere physical combination of grades 7 and 8 and first year high school can meet the demand. This type of organization has already caused almost irrevocable harm to the development of the junior high school. Such an organization can be a departmentalized intermediate grouping of grades 7, 8, and 9, but it is not a junior high school. It is an unassimilated federation of separate units; it is not a union of coördinated parts. It is an administrative expedient; it is not an educational re-organization. It can in no way be termed a resultant which is a new force for a distinct purpose created from other forces each of which as a separate source of energy has a distinct purpose. In another way, the junior high school is a “chemical product, not a physical combination.”

Four periods of development in program of studies—It is, therefore, the difficult mission of the junior high school to continue a program of studies carried through the six years of the elementary school, modify and enlarge this program for the realization of its own purposes, and in turn prepare for advanced types of curricula in the senior high school. It is plain that this can be done only through successive periods in the transitional process. Briefly, these periods are four in number.

1. Adjustment (Low Seventh)—A period of *adjustment* for the very young and immature adolescent of twelve years of age. He must be adjusted to a new school organization, and to a new type of school administration. It would seem wise, therefore, to subject him during the first semester to as little change as possible in his program of studies. Such change as is advisable should be restricted to the inevitable modification in the courses of study which are consequent to enlarged school facilities and depart-

mentalization. There should be no change in the program of studies occasioned by the introduction of electives. In fact the tabulated report of the questionnaire shows over a 50 per cent vote in favor of postponing electives to the eighth year. Present practice gives little support to any seventh-year elective.

2. Exploration and Preview, or Apperceptive basis of secondary courses (High Seventh and Low Eighth)—There should be a period of *exploration*, when there is a *pre-view* of the specialized secondary school courses which distinguish one high-school curriculum from another, and when prevocational try-out is provided for drop-outs. This first general view of secondary school subject matter is restricted to the "simpler aspects" of the whole subject field prior to any attempt to cross-section it into its parts. This general introductory course offers opportunity for exploration of aptitude for the whole subject field and for a preview or apperceptive basis for the cross-sections of the subject. Properly, therefore, junior high-school courses are designated as general mathematics, general science, world history and general social science, prevocational courses, junior business training, and the like.

In the latter half of the decade of actual operation of the junior high school, there has been a marked tendency to defer electives from the middle of the seventh year to the beginning and at present in a less degree to the middle of the eighth year. This tendency has been largely due, no doubt, to a growing appreciation of the fact that one predominant objective of the junior high school is the exploration of individual differences, and of the fact that discovery of aptitude must precede even provisional electives. Part of the time previously given to electives has gradually been surrendered to general courses for exploration and preview. It is pertinent to add that this development makes a very large contribution to the realization of the chief mission of the junior high school to the public school system as the unit of transition.

At the same time it will be conceded by any junior high school administrator of experience that exploration of aptitudes and guidance of provisional choice of electives present two most difficult problems to both the administrative and instructional staffs. Here enter intelligence tests and standards of educational measurement, which to the junior high school, in common with other units of the school system, are in the experimental stage. Another experimental field, upon which the junior high school must place a main reliance, is that of educational and vocational guidance. One very vital need in the junior high-school movement today is the psychologist who will give us a dependable and a generally usable compendium on adolescent psychology. There are, therefore, several present handicaps to the diagnosis of individual differences which must accompany efforts in exploration of aptitude and guidance in choice of electives. The hope of the situation lies in the earnestness of purpose and the progress in these fields of educational experimentation which accompany the experiment of the junior high school itself.

Exploratory courses should be required of all pupils. Each general course is to a degree an exploratory course. General mathematics reveals the branches of higher mathematics in their simpler aspects and at the same time provides a background of experience in determining aptitude for higher mathematics and an apperceptive basis for the later cross-sections of mathematics. General mathematics includes a gradually decreasing amount of arithmetic, decreasing from maximum to minimum, and a gradually increasing amount of secondary mathematics, increasing from minimum to maximum. General mathematics is a reorganized self-contained course of study, but, as a resultant, it preserves articulation with elementary and secondary mathematics. Thus it prevents abruptness of transition with the courses of mathematics in either the elementary school or the senior high school. It provides an opportunity to evaluate aptitude for higher mathematics; it becomes the source of an apperceptive basis for all branches of secondary mathematics; and by preserving life contacts in all phases of its development it offers an actual educational return to the junior high school drop-outs who will not profit from either its exploratory or preview values.

General science similarly reveals in a general survey the fields of science and aids in the discovery to many a junior high-school pupil of an inherent capacity for science. Further, general science, with its project method and its stress upon the "important immediate needs" of pupils, offers a very real educational return to all pupils.

Practical arts provide a prevocational try-out for those who have aptitudes for industrial, technical, or engineering courses. The exploratory course in practical arts is not restricted to the purely vocational group. It is through exploratory shop experience that many an ambition is aroused for technical and engineering training.

The fine arts can and will, no doubt, in a more advanced stage of the junior high-school movement make material contributions to the discovery of aptitudes. It must be conceded that aptitude for fine arts is as demonstrable as aptitudes for mathematics, science, language, industry, engineering, or commerce. Exploration in fine arts is already provided in the organized activities, *e. g.*, the club organizations—orchestra, glee and chorus clubs, musical appreciation club, drawing clubs, cartooning, designing, commercial art, and art appreciation clubs. Here, as elsewhere, the chief inhibitory cause preventing the extension of exploratory courses in the junior high-school is the lack of senior high-school training of a special curricular nature for such aptitudes when discovered.

Aptitude for a foreign language is partially determined by language ability as evaluated in the English class. At least there is no prevalent tendency to include a foreign language among exploratory courses. It is usually first offered as a provisional elective. There is, however, a possibility that there may be developed for the high seventh and low eighth period a general language course preparatory to any initial language choice. But both the desirability and the practicability of such a course have yet, even to a tentative degree, to be determined.

The course in Junior Business Training suggested for the low eighth term, in the second part of the subcommittee's report, surveys the field of commercial education and gives the pupil some comprehension of its educational extent and the wide range of its vocational opportunities. At the same time that this course provides opportunity for a discovery of aptitude for advanced commercial training, it also brings to all pupils who should be required to take junior business training some knowledge of the principles and practices prevailing in the business and commercial fields—a knowledge which should be the heritage of all pupils.

The evolution of former courses for the seventh, eighth, and ninth grades in U. S. history, civil government, and ancient history is rapidly being accomplished. There are now courses of United States history and community civics for the seventh and eighth years, and vocational and economic civics for the ninth year. In time the term, general social science, will be used as extensively as are today the terms, general science and general mathematics. The exploratory and preview values of this course will be co-extensive with the whole junior high-school period. Such a course will provide an apperceptive basis for advanced courses in the cross-sections of world history, economics, political science, and sociology. The discovery of interest and capacity is as probable in the field of social science as in the field of natural science. Furthermore, the discovery and stimulation of interest and capacity for social science are vital to the fields of public and social service.

Every exploratory course must fulfill a twofold purpose: first, to help *some* pupils to explore aptitude for the course, and second, to give *all* pupils an actual educational return. There is a similar dual nature in all the objectives of the junior high school by reason of the fact that there are two practically exclusive groups of pupils—first, those who will continue into senior high school and, secondly, those who will drop out during or at the end of the junior high-school period. For the former each exploratory course becomes the basis of choice of electives, and for the latter each exploratory course must contain a content of genuine educational value. For the drop-outs, therefore, every general course must preserve life contacts. Each course must become a unit course of definite educational value in each year of its development. As the Commission on the Reorganization of Secondary Education states it—"Each subject should be so organized that the first year of work will be of definite value to those who go no further; and this principle should be applied to the work of each year."

Each junior high-school general course of study, therefore, should establish itself as an identity, a self-contained unit, with definite continuity below and above and with a definite educational value independent of any course above. General courses, each covering the simpler aspects of the subject field, are giving assurance of fulfilling this twofold purpose.

3. Provisional choice of electives (High Eighth)—Following the period of exploration and preview there should be a period of *provisional choice*

of electives. During this period facility of cross-over between electives should be promoted by every administrative device possible to the end of guaranteeing that evidence of unfitness for an elective will be followed by effecting a change of electives. If this period of provisional choice does not extend beyond one semester, there would be justification for postponing promotion requirements in electives during this semester.

The periods of adjustment, exploration, and provisional choice cover the first two years of the junior high school. These are the stages in the transitional process which should prevent abruptness of transition between the elementary school and the junior high school, which should provide an enrichment of the single curriculum by the articulation of elementary and secondary courses of study; which should explore individual interests, capacities, and aptitudes; and which should finally test the tentative choice in the light of actual contact with provisional electives. In short, these three stages are the adjusting, finding, and testing periods to the end of developing a unit of transition between elementary and secondary education. They are the initial stage of the secondary school's program of studies, where the individual makes his adjustment between the *en masse* organization of the elementary school and the group organization of the senior high school.

It is evident, therefore, that guidance and educational placement become predominant objectives throughout the seventh and eighth years. The program of guidance would presumably be undertaken by a faculty serving primarily as counselors or advisers and not solely as "subject teachers seeking only to lead pupils to mastery of subject matter." A junior high-school faculty should not tolerate educational or vocational prejudice in its service to a pupil body which is seeking primarily during these two years to find and test individual aptitudes. Since junior high-school teachers are today almost wholly trained through service, it becomes a foremost administrative obligation to provide an educational program for the professional training of the teaching staff. This professional program is so vital to the clear vision of the primary function of guidance and educational placement and of other junior high-school objectives that a weekly period, partly within school time in a six-hour day, should be provided for professional meetings and discussions. The faculty conference period should become one of the organized activities of the school and to this extent part of the program of studies.

The junior high school's purpose to provide educational guidance involves not only a conscious interpretation of this objective by the instructional agencies, but equally a conscious interpretation of the contents, aims, and outlets of all differentiated curricula by the pupils themselves. Guidance classes should in time be accepted as an integral part of the junior high-school program of studies. Such guidance classes will promote the pupils' conscious interpretation of each channel of educational advancement. They serve to answer two instinctive questions of adolescence: Why should I remain in school, will it pay me to continue my studies in high school, 'tech-

nical school, continuation school, or evening school? Guidance classes as integral parts of the junior school program of studies will also provide a background of vocational information for present and future self-direction.

4. Stimulation (ninth year)—Finally, in the accomplishment of the purpose of the junior high school to serve as a transitional stage in the public school system, there must be a period of *stimulation* to facilitate transition to the senior high school. The ninth year of the junior high school is primarily for the purpose of making desirable in the estimation of each pupil advancement into the next higher type of school. The ninth year carries on the program selected after the experiment of the two previous grades. This stimulation is largely by the agency of the particular electives chosen during the periods of exploration and provisional choice.

There can be no close lines of demarcation drawn in time and extent between these four successive stages. Each stage has a natural coördination with the other three. There is an overlapping which should prevail throughout the three years of the junior high school. The designated purpose of each successive stage can not be fully realized in the brief period allotted to it. In fact some of the stages must extend into the senior high school. It is true that in each year of the whole six-year secondary period there must be adjustment, exploration, provisional choice, and stimulation.

But, at the same time, there is a stage when each of the objectives becomes preëminently important in the transitional process of the junior high school. It is important that there should be clear, intelligent perception of the consecutive stages when adjustment, exploration, provisional choice, and stimulation become each in turn the predominant and controlling objective. Experience has demonstrated that there is great risk of failure, even partly, to realize the objective at the needed period in the transitional process when definite plans are lacking for administrative and instructional emphasis upon the particular objective. The point is that the objective cannot be incidental during the particular period when it should predominate; it must be in the focus of attention. For this reason only does this report recognize four successive stages in the transitional period. At least they offer claims superior to the present largely prevailing practice of dividing the three years into annual periods with no other merit than that of cross-sectioning the junior high school into three convenient time divisions.

Summarizing, the junior high-school program of studies continues with modifications the single curriculum of the elementary school. Through its general courses of study it expands this single curriculum into an enriched and varied curriculum, which, in a gradually increasing degree, becomes the initial stage of all secondary school curricula. It becomes the source of an apperceptive basis of later secondary courses, "reveals higher types of activities, makes these both desired and to an extent possible" and, thus, increases the retentive power of the secondary schools. It offers some assurance of intelligent educational choice and of wise educational placement. It makes possible a tentative or provisional choice of electives. It takes its pupils part way through these specialized courses of the senior

high school, and thus increases the probability that the courses will be continued and the specialized curricula completed. For those of its pupils who will not continue it provides a valuable educational return. Finally, it must reduce to a minimum any abruptness of change between itself and the single curriculum of the elementary school or the multiple curricula of the senior high school. Thus can the junior high-school program of studies become a chief factor in the realization of the mission of the junior high school to serve as the unit of transition in the public-school system.

Special types of curricular offerings in program of studies—The discussion of the junior high-school program of studies thus far has concerned itself with those curricular tendencies which facilitate educational advancement. As the unit of transition it is logical that the predominating tendency of the junior high-school program of studies should promote retention in school. Yet there are several types of pupils who cannot be retained and who must inevitably become educational losses during or at the close of the junior high-school period. These over-aged, retarded and mentally unfortunate groups are peculiarly the responsibility of the junior high school. The latter must, therefore, unaided by the senior high school, offer special types of training to its own residuum of pupils for whom advancement is impossible or impracticable.

Particularly for these groups should there be in the program of studies a liberal amount of social-science materials and especially social and civic activities so that principles of social coöperation and citizenship may be translated into conduct in the educational period which immediately precedes the entrance of the junior high school drop-outs into society and active citizenship. If their civic-mindedness is not to be undermined by the blighting influence of becoming industrial misfits and consequently social and civic cynics, the junior high school must offer to these over-aged and backward groups occupational training sufficient in extent to assure initial vocational placement. The junior high school can at least serve as a school of prevocational try-out and thereby replace, to an extent, the shifting from job to job in correcting industrial misfits during employment. If the junior high school can serve, even to a small degree with its limited facilities, in the prevention of industrial misfits and the consequent undermining of civic-mindedness, it will earn a degree of public confidence not possible through any other single service.

Therefore, the program of studies, as the resultant of several forces, includes a prevocational content partly for occupational placement in the industrial and commercial fields. Commercial electives are offered with the two-fold objective of promoting advancement into the commercial curriculum of the senior high school and of offering some occupational training for junior commercial occupations. The program offers junior business training, elementary bookkeeping, commercial mathematics, business writing, business practice, in which some degree of proficiency may be attained by junior high-school pupils, and a limited amount of typewriting. Consensus of opinion as represented in the questionnaire is in favor of postponing stenography to the senior high school.

Industrial arts electives are also offered with the same twofold objective. First, these electives would attempt to convert an original vocational or trade decision into a determination to seek advanced vocational training in the senior high school or to seek technical training for the higher types of industrial opportunities or engineering open only to advanced educational qualifications. Secondly, these industrial arts electives would offer occupational training for vocational placement to those who must seek such placement from the junior high school. There should be, therefore, in schools of sufficient size, two types of shops—the general industrial arts shop where all pupils receive practical arts training as an integral and required part of the program of studies and the special trade type of shop where vocational groups may receive intensive occupational training for vocational placement.

Vocational curricula in the junior high school, either of a commercial or industrial nature, should not represent a forced growth. They must represent the actual conditions as they exist when the *final* alternative of leaving school or choosing vocational training is reached. Whenever it is definitely determined by the guidance agencies of the school that this alternative is unavoidable, pupils should be transferred to these occupational courses, irrespective of grade classification. Grade organization must give way to a greater purpose, that of adaptability of program of studies to individual need. Occupational courses are, therefore, matters almost wholly of individual adjustment. Arbitrary administrative regulations of promotion, classification, and organization should never be permitted to conflict with demonstrated individual needs. This statement does not set up an insurmountable administrative difficulty; it is a direct contradiction of an unwarranted administrative practice which is frequently permitted to supersede individual justice to pupils. The junior high-school program of studies must insist upon the adoption of this point of view, if it would promote equalization of educational opportunity.

In addition to occupational training offered by commercial and industrial arts electives to some exceptional types of pupils, it is also desirable that the junior high school offer coaching opportunities to the retarded group who represent the preventable but inevitable proportion of non-promotions. This group includes those who, by lack of application or interest, or positive dislike for the restricted opportunities of a single curriculum, are able, in the light of intelligence tests, to maintain a creditable record of achievement. The fact that these preventable cases of subject failure have been shown to amount to as high as 60 to 75 per cent of all conditioned or non-promoted pupils is one evidence of the superior reliability of intelligence tests in measuring at least potential achievement. Study coach and opportunity classes or other type of coaching retarded pupils have been demonstrated to be a very effective means of increasing the retentive power of the junior high school and of stabilizing subject promotion by either remedy or prevention of failure.

The whole problem of coaching is reduced to one of minimum essentials

in each course of study and still further to the particular essential which was the principal cause of failure in each case. Minimum essentials are a concern of the program of studies, the latter indicates the remedial or preventive measure which should be applied in each case by the coaching teacher. Failure is usually traceable to lack of understanding of some particular essential in the course of study and less frequently to failure in all essentials. Repetition of the whole course of study is, therefore, frequently a needless waste of time. The remedy consists, rather, in determining the particular cause of failure and remedying the important weakness. Hence, coaching is far more effective than repetition. Furthermore, by preventing subject repetition and its consequent expense, coaching is the more economical means to check subject non-promotion and to increase the retentive power of the junior high school. The desirability of organizing courses of study on the basis of minimum essentials is evidenced by an affirmative vote of approximately 90 per cent in the replies to the questionnaire on the program of studies.

Still another special group for whom the junior high school program of studies should make provision, is the group of high I. Q. There is an affirmative vote of over 60 per cent in favor of acceleration. At the same time 72 per cent of the replies favor enrichment in the program of studies for the high I. Q. group. There is, therefore, some difference of opinion as to whether it is not preferable as one member of the general committee states it: "To prolong the period of education and enrich the program of studies for those who are able to do their work more easily, instead of putting a premium upon shortening the time spent in school." The writer of this report is of the opinion that acceleration should be restricted to the elementary school. However, another type of study-coach organization may be organized for the super-normal group to effect acceleration where it has not already been achieved in the elementary grades; at the same time this opportunity class organization for the high I. Q. groups may be administered to provide extension course opportunities in an enriched program of studies.

Practically 100 per cent of the questionnaires favor classification of pupils by ability groups. This indicates a decided vote in favor of intelligence tests and other means of evaluating ability. Ability classification demands a recognition of individual differences and adapts curricular requirements to individual capacity. It avoids the discouragement of comparative incapacity and removes conditions tending to mental indolence. Since the point of view of the junior high school is the individual, it is as important to determine mental capacity through ability classification as it is to determine aptitude through exploratory courses. The program of studies, therefore, should provide for minimum, mean, and maximum abilities. However, it probably will remain the practice for some time to come to prepare courses of study for the average group. It will, then, still remain for adaptations to be made by the subject teachers. If pupils requiring minimum essentials and maximum opportunities in the program of studies,

are segregated with a special group of study coach or opportunity class teachers, the probability is materially increased that necessary adaptations of the general courses of study will be made and applied.

School activities for junior citizenship in program of studies—The final objective of the junior high-school program of studies must be to provide school socialization on a scale so extensive that adolescent youth may find in the school itself "the special field for their activities as (junior) citizens." It is vital to recognize that the organized activities of school socialization should be and are motivated by accepted educational objectives to an extent equal to the motivation of the subjects of study by such objectives. When this recognition is once given, school activities will be dignified by a place in the program of studies and by a definite time allotment consistent with their rich educational possibilities. They must be as definitely planned as any other administrative or instructional facilities for the attainment of the objectives of secondary education. They should be dignified in the respect of faculty, pupils, and community by recognition in the program of studies and a time allotment in the daily roster.

These activities will largely fail to contribute to the attainment of the objectives if they continue as incidental. They should, therefore, become integral parts of the program of studies. They deserve a higher recognition than that accorded by the designation extra-curricular. They are intra-curricular activities. The consensus of opinion as shown by the questionnaire gives an affirmative vote of over 70 per cent in favor of including school activities in the program of studies and a vote of 80 per cent in favor of including them as an integral part of school hours. The activities include coöperative pupil government, home room activities, weekly school assemblies, clubs, and other social, recreational, and civic organizations. As previously recommended they should also provide a weekly faculty activity period for professional study, discussion, and conference.

A suggested program of studies—The second part of the sub-committee's report includes a suggestive program of studies with constants and electives and a definite assignment of periods to each subject. The program of studies is based upon the majority vote as tabulated from the questionnaire. This vote was 75 per cent in favor of at least a six-hour day; approximately 60 per cent in favor of the 60 minute period; 85 per cent negative vote opposing undirected study in a study hall or elsewhere and an emphatic 100 per cent vote favoring directed or supervised study. The tabulated replies also give approximately a 65 per cent vote in favor of four periods of prepared work in a six-period day.

The program of studies, therefore, assumes a six-hour day and six one clock-hour periods; further it provides for each of the daily six periods some prepared class work with directed study,—or some unprepared class work in health education, guidance, and fine or practical arts,—or some organized and directed activity. The prepared work is grouped into the four major fields of study: (1) English and language, (2) mathematics, (3) natural science including geography, (4) social studies. The unpre-

pared work in health education, guidance, fine and practical arts, is the fifth main division of the program of studies. Directed school activities comprise the sixth division. In brief there are approximately four daily periods of prepared work (actually the total is less in each semester), one period of unprepared work, and one period of directed activity.

* Prepared work.

¹ This questionnaire was sent out under the direction of the Committee on Reorganization of Seventh, Eighth, and Ninth Grades, and the Sub-Committee on Program of Studies of Junior High School.

a. Including spelling and penmanship and one period a month for library instruction. One or two periods of time allotted to school activities could be used for spelling, penmanship, and library instruction. Until the school activities are fully in operation it is desirable that this additional time for English be so used.

b. See Report of National Committee on Mathematical Requirements, Secondary School Circular No. 6, Bureau of Education, Washington. In the high eighth and ninth year there is an option in mathematics but no option of mathematics. Either general mathematics or the mathematics of the commercial curriculum are required of all groups.

c. U. S. history, or U. S. history and community civics.

d. Community civics, or U. S. history and community civics.

e. Elementary science and geography as a unit course, or science one period and geography three periods approximately.

f. Unit-course, or science two periods and geography one period approximately.

g. Elementary science introductory to general science of ninth year.

h. All pupils, except those electing commercial courses, required to take vocational and economic civics or general social science. Commercial pupils required to take general science—their later commercial courses will contain much of economic civics. A minimum of science will be required in the academic curriculum of the senior high school; general science, therefore, should be postponed to the tenth year for the academic group. General social science should be required of all groups in the ninth year except as indicated for the commercial group.

i. Personal hygiene, gymnasium, directed games, etc.

j. General shop, with progressive course of wood-working and metal-working through three years. Agriculture optional with industrial arts for rural schools. Home economics, including sewing, cooking, textiles, laundry, millinery, dress-making, dress and home design, and home training.

k. All boys for one term given an actual trade shop experience in a special trade type of shop equipment. The vocational side of practical arts stressed for one term for both girls and boys. Hence increase of time to three periods.

l. Additional time for fine arts may be provided by electing special work in school activities, *e. g.*, orchestra and chorus clubs, design and art clubs, musical or art appreciation clubs, etc.

m. Classroom instruction in educational or curriculum guidance—both educational and vocational information for pupils *prior* to choice of electives.

n. Elementary business practices and principles common to all life careers and a brief survey of commercial education and of junior commercial occupations.

o. Weekly periods for (1) home room period, (2) coöperative pupil government, (3) school assembly, (4) clubs, (5) faculty activities for professional study—a faculty *esprit de corps* for the coöperative solution of junior high-school problems of both an administrative and instructional nature. Junior high-school teachers must be trained through service; the most favorable conditions should be established. Until the school activities program is in full operation, part of this daily allotment of time for activities should be diverted to English, practical arts, fine arts, or other curricular requirement.

p. Other electives than those listed may be provided in the club activities, *e. g.*, art, music, science, English, dramatic, practical arts, or social service clubs. The groups of electives indicate partially differentiated curricula. To facilitate cross-over between electives during this term, it is suggested that electives be made provisional, *i. e.*, that promotion requirements in electives be deferred to the middle of the ninth year.

q. Partially differentiated curricula continued with twenty periods devoted to constants, fine and practical arts, and activities; and with ten periods devoted to electives. There are four major lines of curriculum choice provided in this year, *viz.*, the academic, the commercial, the scientific or technical, and the vocational.

r. Optional choice of Latin or one modern language. Small schools should restrict choice to one foreign language. Eighth year course introductory—vocabulary building, social life of people, etc. Earlier choice of a foreign language for pupils of high I. Q. is a program adjustment for each school. This earlier start of a foreign language should be an extension course opportunity in an enriched curriculum for special or accelerant groups.

s. First year high-school course.

t. Two periods of each.

u. Forty minutes in junior business training; twenty minutes in business writing.

v. Forty minutes daily in typewriting; twenty minutes in commercial mathematics.

w. Forty minutes daily in bookkeeping; twenty minutes in business writing.

x. Four periods elective plus the two periods required in constants of this term give a total of six periods; five should be in special shops or advanced home training and one in drafting or design.

y. The third group of electives in the high eighth branches off into two curriculum choices in the ninth year, *viz.*, first, the scientific or technical curriculum paralleling the academic in preparation for higher institutions, and, second, the

vocational or trade curriculum. In the former general science in the ninth year replaces the practical arts elective of the high eighth, but practical arts is still continued for this and all other non-vocational groups to the extent of two periods as a required subject.

z. Smith-Hughes curriculum organized as a ninth year elective, but over-age pupils should be transferred to this curriculum during seventh and eighth years when *definitely* determined that alternatives of vocational curriculum or leaving school are unavoidable. All such transfers are problems of individual adjustment. The academic work should include English, social studies, and related mathematics for a weekly total of ten periods. These pupils should participate in school activities on an equal basis with all others.

JUNIOR HIGH SCHOOL BUILDINGS

J. H. BENTLEY, SUPERINTENDENT OF SCHOOLS, DULUTH, MINNESOTA

This paper is based largely on a study made preparatory to the planning of two junior high schools for a community of about 30,000 and deals only with buildings designed for schools organized on the 6-3-3 plan. While there is not yet agreement on what group of grades should constitute a junior high school the majority of the schools so far organized are on the 6-3-3 plan. So it seems safe to take this as typical of the junior high-school organization. So far there have been comparatively few buildings designed and built for junior high-school purposes. Most junior high schools are housed in buildings originally planned for elementary or high-school work. Accordingly the junior high-school building, as a type, does not exist.

A few of these more recent buildings have been selected as illustrative of features more or less peculiar to the junior high school and indicative of certain trends that are now apparent. The buildings shown are quite different in type and were in every case planned to meet the needs of a carefully worked out junior high-school program. There is little agreement on the kind of things that should be given major emphasis and any conclusions drawn in this report will have to be understood as personal to the writer and modified by his own bias in the matter.

A junior high-school building must conform of course in every way to the best known laws of safety and hygiene. Problems of fire-proof construction, light, heat, or ventilation are not peculiar to it. Toilet facilities should be adequate and in this type of school widely distributed over the building in as small units as economy will permit.

How then will the junior high school be different from the present day elementary or senior high school of good design?

The junior high school as an intermediate school is attempting to offer 7th, 8th, and 9th grade children a different type of education than was offered in the former 8-4 plan. Some of the differences are to be found in (a) an enriched curriculum, (b) departmental organization with a more informal and socialized classroom procedure, and (c) a different social organization within the school. In addition the junior high-school

building is to be a community center to a greater degree than either the high-school building or the elementary-school building has been. The enriched curriculum does not necessarily mean a wide variety of new subjects from which to choose. There seems to be a tendency to limit the range of elective subjects somewhat narrowly as compared with the senior high school. This has at once a decided effect on the question of the size of the building, for with a limited number of electives it is possible to operate a junior high school economically with a smaller enrolment than is required for a school with a wide range of choice in the program of studies. This makes it possible for us to have junior high schools of 700 to 1000 pupils with all the advantages that can come from a close acquaintance between faculty and students and among the students themselves. An additional factor making for the smaller junior high-school building is the age of the junior high-school children which makes it desirable that they go a shorter distance to school than the older pupils.

The enriched curriculum does mean, however, that we must provide in the junior high-school building for science rooms, shops for boys, household arts rooms for girls, music rooms, art rooms, gymnasiums, and outside large fields for organized athletics.

The science rooms are not taking the form of the rather elaborately equipped laboratory and amphitheatre lecture room but are large rooms with a rather simple equipment of tables and chairs and in some of them a wood-working bench and a lathe are installed in order that the making of simple forms of apparatus may be carried out. While some of the buildings recently erected have provided for highly specialized shop work there seems to be a tendency in some buildings to turn away from the multiplicity of special shops to the large general shop and to relate closely the mechanical drawing to the shop projects of the pupils. The experimental nature of the junior high school is nowhere better shown than in this evident "feeling around" by those planning junior high-school courses for the proper type of industrial work.

There seems to be better agreement in the girls' work and there is a decided tendency for the unit kitchen equipment with stock kitchen ranges and kitchen cabinets to take the place of the familiar horse-shoe type of domestic science laboratory. There is a definite attempt to get away from the laboratory idea and get the home kitchen atmosphere where a group of from five to six girls can prepare a complete meal in family-sized portions to serve to themselves or to take home for the "acid test" of home consumption. The model flat still persists in many of the buildings, though some are discarding it. Most of the men planning buildings regarded it as an expensive ornament rather than as a necessary or useful adjunct to the household art work due to the very limited use that was made of it in actual practice.

There is a decided tendency to install the lunch room in connection with the household arts work. Some schools plan to operate the lunch rooms as one phase of this department's program. In this connection an interest-

ing use of the school lunch-room as a sewing-room is made in some places. While this makes some problems in program-making; on the other hand, where it can be successfully carried out, it results in a great economy in building cost as ordinarily the lunch-room which will usually accommodate at least 200 children stands idle the most of the school day.

Nearly all of the new buildings include a swimming-pool and at least two gymnasiums, one for boys and one for girls. Some of the larger buildings have two smaller rooms for corrective gymnastics or special exercise work. This increased space devoted to physical education is due to the increased emphasis placed on health work in the junior high-school curriculum which generally makes gymnasium work compulsory for all pupils throughout the three years. Some of the schools are carrying out this idea still more completely in play fields adjoining the buildings so that large numbers of the pupils may take part in various kinds of sports.

The program of studies of many of the junior high schools make provision for some sort of auditorium work for all students. While all the schools studied have an auditorium as a necessary part of their plan they do not agree as to the number of pupils this room should accommodate relative to the capacity of the building as a whole. Most of the larger schools plan for an auditorium large enough to seat from about one third to one half the total capacity of the school. The smaller buildings plan for a room to seat the entire school. Where the capacity of the school is 2500 to 3000 it is clearly inadvisable to build an auditorium large enough to seat the school altogether. Such a room is expensive to build and to operate, has a limited use, and when filled with a group of 7th, 8th, and 9th grade children may become very difficult to administer. It is, however, an undeniable advantage to have the entire school together and since an auditorium seating from 800 to 1000 can be built and operated for much less than the larger room and is useful on many more occasions, the smaller schools are justified in building an auditorium to handle the capacity of the school. This to the writer's mind is a decided argument in favor of the smaller school. The stage of the auditorium is generally large enough for choruses of 200 or more and has some provision for the storage of scenery. There does not seem to be a tendency to equip the stage with flies or an elaborate arrangement of dressing rooms.

The departmental organization calls for carefully planned corridors so that the pupils may be shifted at each period of the day quickly and without confusion. Most of the plans of organization call for home-room teachers and some building plans keep the elementary school cloakroom instead of adopting the high-school plan of the individual locker for each child. The tendency is toward the locker plan, however. Few of the buildings are providing study halls. Some are using vacant classrooms for study under the direction of the teachers. Others have lengthened the periods and are trying some form of supervised study which means that all but a small fraction of the students are assigned to some teacher each period of the day for some kind of recitation and study. All of the buildings studied

are making a careful provision for library work, and many have evidently planned for an affiliation between their library and the public library of the city.

The space within the buildings studied falls naturally into two large groups,—one we may call general classrooms and the other special rooms. By general classrooms is meant the ordinary classrooms designed for recitation or study. By special room is meant all the others including science rooms, shops, auditorium, gymnasium, music rooms, and library. In estimating the capacity of the building it was assumed that all of these rooms were to be occupied by pupils all of the day. On this basis it was interesting to note that the capacity of the building is always nearly evenly divided between the special rooms and the general classrooms, but with the larger number in the special rooms. In fact, the special rooms had a rated capacity of from 50 to 65 per cent of the total capacity of the buildings. The general classrooms of the junior high-school buildings are in general much like those of the ordinary schoolroom of good type, but in size are half way between the elementary room and the senior high-school room. Most of the buildings studied have a room planned for a capacity of thirty-five pupils.

All of the buildings had rather carefully worked-out suites of rooms for administrative purposes. All provide rest rooms, clinics, and most of them provide work and conference rooms for the faculty.

That the junior high school is to be much more of a community center than our other school buildings have been is shown by the care that has been taken in planning the building to make it easy to use shop, gymnasium, pool, or auditorium by the public without interfering with other parts of the building. In addition, rooms for social activities for the pupils and the people of the community have been provided in some schools.

Generally speaking, the buildings are two or three stories in height with no basement rooms. By basement is meant a room partially or wholly below grade. There is evidence of a desire on the part of school architects to express in the exterior of the building something of the character of the school it is intending to house. The new program in the new school has seemed to set schoolmen and school architects free from following the more or less standardized exterior of flat-roof and block-house type and has encouraged them to give the building an individuality that sets it apart from the conventional type of public-school building. This is a good tendency, and if the junior high school will set us free from the barrack type of school buildings it will have well served the present and next generation. We are building durable and permanent buildings nowadays and if our older buildings of brick and wood have had a life of from thirty to fifty years surely these newer constructions of concrete and steel have a much longer life before them. Accordingly we should look with favor on any attempt to provide a building whose beauty will be as enduring as the material from which it is made.

The building features peculiar to the junior high school arise out of the

type of work this school is planned to do and the age and maturity of its pupils. The chief difference lies in the number and character of the rooms for so-called special activities, some brought into it from the senior high school though in simpler form and some that grow out of its own peculiar purpose. While there is still great diversity in the buildings so far built no other type of school architecture has been so carefully and scientifically studied and planned, and we shall soon arrive, not at uniformity of plan, but at what we can call the typical junior high school.

REPORT OF THE COMMITTEE ON PARTICIPATION OF TEACHERS IN SCHOOL MANAGEMENT

HARLAN UPDEGRAFF, CHAIRMAN, UNIVERSITY OF PENNSYLVANIA,
PHILADELPHIA, PENNSYLVANIA

MEMBERS OF THE COMMITTEE

Chairman, HARLAN UPDEGRAFF, University of Pennsylvania.....Philadelphia, Pennsylvania
 MRS. SUSAN M. DORSEY, Superintendent of Schools.....Los Angeles, California
 P. W. HORN, Superintendent of City Schools.....Los Angeles, California
 W. M. DAVIDSON, Superintendent of City Schools.....Pittsburgh, Pennsylvania
 ANNA LOUISE FORCE, 17th and Stout Streets, Century Building.....Denver, Colorado
 STELLA HERRON, City Normal School.....New Orleans, Louisiana
 CORNELIA S. ADAIR, City Schools.....Richmond, Virginia
 OLIVE M. JONES, 187 Broome Street.....New York City
 E. C. BROOME, Superintendent of Schools.....Philadelphia, Pennsylvania
 H. B. WILSON, Superintendent of Schools.....Berkeley, California

This is the fourth report that has been made to the National Council upon the subject of Participation of Teachers in Management. Since the committee was first appointed for this study the number of organizations, committees, councils, and clubs has steadily increased until now they may be found in city school systems of all sizes throughout the United States. It is evident that teachers participation in management has come to stay; it is just as clear, however, that there is not yet any special form of participation which is generally accepted as best adapted to any particular set of conditions.

From the beginning the purpose of the committee has been to study, with the aid of as full and as definite knowledge of the facts as could be obtained, the different forms of participation of teachers in management and the results of the operation of each. In the first years of the committee's activities it set forth those principles of management which made clear the necessity for some form of participation of workers in the conduct of enterprises of every kind, the objects that were to be gained by such activity, and the criteria by which the results were to be judged.

The committee also directed its attention to the making of a careful study of the chief form in which teacher participation had been manifested up to that time—namely, the part taken by teachers in the making of courses of study. The information was gathered through a questionnaire furnishing for the most part numerical statements of an objective nature. The

study was published in monograph form by the National Education Association as part of the Report of the Committee on Superintendents' Problems in 1918. It showed that the organs used for this participation were almost all the type that was called the "Temporary Committee," of which there were numerous forms ranging from those that were dominated by superintendents of schools to those in which the superintendent studiously avoided having anything to do with the committee in any stage of its work. From the opinions of ninety per cent of the superintendents, participation of teachers was a positive benefit to the schools, to the teachers, to the superintendents as well as in the making of the course of study and in the improvement of methods of teaching. In fact, it proved conclusively that teacher participation in the making of courses of study should be adopted by city school systems generally without regard to size of city. As to which form of committee was best, it was impossible, however, to obtain sufficient data to warrant a conclusion.

This study was made before teachers' councils came into prominence and was originally undertaken because it was believed that such study might be of positive benefit to school management. Regarding the more formal and permanent organ of teacher participation—the teachers' council—it was impossible to make a similar study until it had been in operation a sufficient length of time to furnish a body of facts upon which to base conclusions. The efforts of the committee were, therefore, confined at first to the statement of those administrative and social principles that should determine the purpose, the functions, and the structure of such an organ, taking into account, also, the varying sets of limiting conditions which might affect form and structure.

A year later it was possible to secure the constitutions of a sufficiently large number of such bodies, as had been given administrative sanction, in order to make a comparative study of their structure. The study of Mr. Orton presented last year before this body, has been supplemented by those of Mr. Seares, Mr. Cummings, and Miss Hebb, that of the first named being most valuable from this point of view, appeared in the *American School Board Journal* for October, 1921. These studies show a surprising variety in structure among such types of organization.

In this we have another example of that unique characteristic of our democratic form of government which is both our strength and weakness. Each locality has proceeded alone, or at least, has decided for itself the structure and the functions which its formal organ was to have, thus making it possible to carry on a vast amount of experimentation under varying conditions as pleased each locality. While each organ standing alone has not been so correct in its form as it would have been had the plans been determined by some central agency especially proficient in the theory and practice of such organization in educational and other fields, nevertheless this period of experimentation has made it possible to have in the future organs better adapted to existing conditions than could have been suggested by expert authority, *provided* we now gather up in systematic and careful fashion the results of those more or less isolated experiments.

It now seems to the committee that the time has come when a study of the functioning of these organizations, known in general as teachers' councils, can well be made. In the working out of this study there should be three controlling principles: First, conclusions must be based on facts stated as definitely and as accurately as possible; second, the structure of an organ must be determined primarily by the functions it is to perform; and third, structure although determined primarily by functions to be performed is affected to a marked degree by the environing conditions within which it must work.

The committee has prepared, therefore, a questionnaire which seeks to get the facts as to how efficiently the different structures have operated in the performance of their various functions under the particular environing conditions in so far as such facts can be ascertained by the questionnaire method. The facts obtained together with such supplementary information as may be gathered will be studied with the purpose of answering in as satisfactory a manner as possible the following questions: First, under what set of conditions, if any, is a permanently organized teacher-participation agency desirable and under what sets of conditions, if any, is it undesirable? While the principles presented by this committee have pointed to certain conclusions on this point, there is yet needed a confirmation, modification, or negation of them by the outcomes of actual experience. Only in such a way as this may theory and practice be found of the greatest possible benefit to each other. Second, when it is found desirable to have a permanent formal organ for the participation of teachers in management, what form of organization is best adapted to perform each specified function under each specified set of conditions?

From surface indications it seems that these organizations are not working as smoothly and as effectually as had been expected by their sponsors, nor are they performing the good that they ought. The reasons for this, it is reasonable to expect, may be in part, at least, because they have attempted to perform functions that could be better carried out by some agency other than a council, or that their forms of structure were such that they could not accomplish the purpose effectually. Frequently it has happened that in the formation of a teacher council, the primary purpose was to increase salaries; consequently, the structure was properly framed for securing the representation and participation of all groups of teachers. The organ thus created has since performed such varying functions as the improving of the course of study, or the arranging for courses of lectures for the benefit of teachers, the providing of club rooms and forms of social entertainment, or the working for passage of certain bills through the legislature. Some of these functions are an integral part of the operations of the school system, others are not; and some require one kind of ability, others another kind. On the face of things, it would seem that there must necessarily be a vast waste of energy and of imperfect accomplishments when the same organs are performing such varied activities. Moreover, it will probably be found that sometimes the reasons are not in the poor adaptation of structure to

functions, but in the poor adaptation of structure to the environing conditions, such as: The nature and structure of other teachers' organizations, and of the function performed by them, the authority conferred by the school board upon the superintendent, the intelligence and the ideals of the teaching corps, the ability and the quality of leadership exercised by the superintendent and by the principals, and the spirit of the personnel as a whole. These practical considerations are very important and at times dominant as far as practical results are concerned. They destroy the true perspective, or in other words, cause the superintendents or the teachers to look at the situation through colored glasses. In all probability, these local situations or personal views, prejudices shall we call them, producing in individuals or groups, selfish or low aims, often stand in the way of the real progress that would result if the organization as created were given a fair opportunity.

It may not be amiss to present in the final section of this report a brief review of the more important criteria that seem, on the basis of the science of management in business and of management in schools, in so far as this has been studied to determine the success or failure of organs for the participation of teachers in management.

First, any organ for the participation of teachers in management in any school system must produce a better realization of the aim set up by that particular school system for the education of its children. This means that teacher participation is not introduced primarily for the benefit of either the teachers or the superintendent, but it exists rather for the benefit of the children. Consequently, if it does not benefit the children, it ought not to exist.

The value of this criterion is more apparent in those school systems in which recognition is given to the principle of individual differences and where every possible effort under the limiting conditions is made to reach the needs of each individual child. This is undoubtedly the most important criterion to use in passing upon the value of any teacher-participation plan.

Second, a teacher participation organ should promote the efficiency of the teaching corps; meaning by this, that it should make teachers more competent in instruction, more responsive to leadership and more loyal to the schools. Since the importance of the teacher becomes more apparent in a scheme of instruction which recognizes the principle of individual differences, it will be seen that we must exert greater effort than heretofore to make of each teacher the best possible teacher. Fundamental in this is the recognition of the desire, innate in practically every individual teacher, to make the most of himself or herself; but recognition not for himself or herself primarily but for the sake of the pupils who by virtue of better teaching ability are to receive superior guidance and help.

Nevertheless, it seems to be true that some teachers believe in teacher participation not for the sake of the children but for the sake of themselves in order that they may obtain a position in the organization and enjoy the exercise of power and receive the honor and adulation of their fellow

teachers, or in some instances in order that they may satisfy some grudge held against the superintendent or the school board.

Third, as a corollary of these two, it follows that a teacher-participation organ should make it possible for the superintendent to accomplish more and better work.

There are some superintendents who would not accept these as proper criteria. Their own attitude of mind or experience leads them to believe that councils have different purposes or that the purposes given are unattainable through them. I personally believe that experience thus far proves they are both proper and attainable. At the same time, I think we must acknowledge that the experience of some superintendents with their teaching corps or of some fellow superintendent with his teachers, would naturally lead them to doubt their validity. There are many misconceptions that must be cleared up. Superintendents should not have any of their rightful authority diminished; nor, on the other hand, should they alone desire to dictate the procedure of the school. Teachers should regard the superintendent as the responsible leader of the school and give him loyal support; they should not expect to take over his functions. It is when misconceptions and selfish aims intervene that coöperative effort fails. What should be done under such circumstances, it is difficult to say. Personally, I am inclined to favor the side, when there is a side, whose attitude is right; that is, to deny to teachers who would misuse their power the right of a council, and to grant it to those teachers whose superintendent is not well disposed to them. Should both have the wrong attitude, an impossible situation would exist, and neither course should be followed. Surely it would be time in such a school system for another superintendent and for changes in the teaching corps. It will be the function of the committee to study such situations and test the validity of the foregoing conclusions.

In summarizing, we may say that teacher-participation organs seemingly have come to stay, that they are performing a great variety of functions, that they are variously constituted, and that undoubtedly many of them have a poor adaptation of structure to the functions performed, owing to the fact that we are in the "trial and error" period of the development of this new form of institution. We need, in many quarters of the country, a clearer understanding of the aims of teacher participation and also some pretty well-defined criteria as to when teacher participation is functioning properly and when it should be redirected, and, possibly in some instances, reformed or abolished altogether. The experiences that we are thus having in this initial stage of development should be gathered together as rapidly as conditions permit, studied carefully, and from them conclusions formulated in order that there may be the least waste and least delay in the advancement of education. This your committee is endeavoring to do with such facilities as are at its command. It desires your coöperation and such support as the work requires.

THE COÖRDINATION OF THE COMMUNITY AGENCIES IN EFFECTING CHARACTER EDUCATION

ALBERT SHIELS, COLUMBIA UNIVERSITY, NEW YORK CITY

Character is difficult to define because it includes so many things—all our ways of thinking, feeling, and doing. True, we may formulate a general definition of character; but it is to be questioned whether such general definitions are useful for our purpose. At the very beginning sanctions of conduct must in turn be defined, and we at once embark on a philosophic journey which, however delightful to the traveler, fails to help the teacher in the practical and immediate problem of developing the character of children.

When we discuss particular situations we rarely differ as to what is right or wrong. The practical judgment of the man on the street is probably as correct as that of the philosopher. We may consider the factors of education in developing the character of children in the same common-sense way. We know that character involves (1) high motives; (2) the intelligent interpretation of the best motive, and (3) the appropriate actions, the latter becoming habits for constant situations. Because these three things make up character, it does not follow that we must establish a formal order of sequence in teaching them. The child himself just bubbles up in his tendency to action; he begins to choose the motive that influences action soon enough, and he naturally selects that which is most pleasant or least difficult. This really is the way most adults react, with these two important differences: first, the things that are pleasant to men and women of character are those which yield finer kinds of satisfaction—that is, such people respond to higher motives; second, their reaction to the good motive is more intelligent—it is based on greater knowledge.

Our work in education, therefore, is threefold: (1) to afford the right situation for action; (2) to build up the better motive; (3) to impart the most useful knowledge. All these are *essential*, but one is *fundamental* to good character—the good motive. If a child seems to accept the motive we call “good” by giving the appropriate action only because of a sense of fear, we can go so far as to secure “good” behavior, and we may even establish “good” habits; but a sound character implies response to those right motives which a child accepts for himself so strongly and so profoundly that they will have a driving force. A child who associates in a group that accepts the right motives will, even without argument, fall in with his fellows, for he finds pleasure in winning their approval. Therefore, association with the agencies in the community that recognize good motives, adequate knowledge, and successful performance is a mode of education, whether the agency is the church, the home, or a wholesome organization of young people.

The emphasis on motive and action must not blind us to the importance of knowledge in the development of character. There are two extreme conceptions of knowledge—each a contribution to truth, yet each in itself

misleading. The first seems to attribute to knowledge an extraordinary efficiency. Modern educators protest against this conception; yet, unconsciously, educational practice tends to adopt it. For nearly a quarter of a century, for example, citizenship training has been a subject of discussion among educators. In the broader sense of the term it has come to mean character training, except that the religious sanction has usually been excluded. During this period, with only negligible exceptions, all the discussions concerning civic training or character development have been confined largely to new curricula, that is, to a mastery of knowledge.

On the other hand, the emphasis on behavior or action has sometimes obscured the large part which knowledge plays in character development. Statements to the effect that mere knowledge never made a citizen, or that moral maxims play little part in making men of character are familiar to us all, and they are true. Yet we know that so useful a thing as the taboo among savages is but a method of capitalizing the knowledge that certain foods are dangerous or that certain customs are harmful. Similarly, civilization affirms ethical adherence to certain laws and customs which are hygienic rather than moral. Wisdom in meeting situations honorably as well as advantageously is based on adequate information. It is evidence of good character that a man save his neighbor's water supply from the pollution of his sewage. The good intentions of such a man become effective only in proportion to his knowledge of the laws of sanitation.

This, however, is no justification for assuming that a man must be versed in all the sciences—even the social sciences—to become a good citizen, else, indeed, democracy would be in a bad way. For the citizen of a democracy certain minima of knowledge are essential, as, for example, that the technical operations of government should be in charge of experts. The danger in education is not that a child may learn too much, but that he may endeavor to learn what is beyond him, or what is of little worth in meeting the ordinary experiences that most citizens are bound to face. The desideratum is that he should be able to interpret intelligently and use wisely the knowledge he does possess. The use of knowledge demands the presence of "people" and "things" under the most "natural situations." The community agencies afford both the opportunity and the situation in a way the schools may find it difficult to do.

The discussion has implied that character is developed in a child in his group relations,—that is, that the kingdom of heaven is not a special individual possession, but rather that it is found as a man lives with his neighbors and as he acquits himself decently and honorably in that association. Individualism, as far as it means a virile sense of personal responsibility, is a splendid quality. Individualism that signifies a ruthless search for personal benefit is a contradiction of the social order. Democracy and such an individualism cannot survive together; one or the other must eventually disappear.

Community agencies for this discussion may be defined as any form of

organized effort in a locality which is devised to contribute to the welfare of a neighborhood. The school is one community agency; others are the home, the church, the library, the local board of trade, the community council—if there is one. To coördinate them would require at the beginning some discrimination as to their respective values and functions. These agencies may first be discriminated as they contribute to character; either as they impart knowledge or as they afford situations that call for a child's reactions—situations well within his power to meet, yet not requiring such extraordinary effort as to invite failure. Every agency in education does both of these things, but differs in and may be distinguished by the degree of emphasis on action or on knowledge.

A second principle of discrimination is the relative permanence of these agencies. Permanence is an essential quality. If we evolve a plan of coördination that includes one agency which may fail at a critical time merely because it lacks the stamina to continue, our whole program may go awry. Permanence depends on two important factors: one is an assurance of financial support whether by public funds or private enterprise; the other is a public consciousness of need, due not so much to public enthusiasm—for this may be but a passing humor—as to a profound public conviction.

Since our aim is character development, a community agency must be assured that the people who constitute its membership have a sufficient interest in it to give it sustained, consistent thought and effort. Otherwise it may fail to accomplish its purpose precisely as democracy itself may fail through lack of general interest and effort among its citizens. This is the weakness of a philanthropy in a community. It may be an excellent instrumentality for achieving a purpose other than citizenship training. If, however, it merely gives, if its affairs are conducted from above, if those attached to it are recipients only, it will afford but a poor contribution to the making of self-respecting, earnest citizens. This, it may be noted, is not a plea for the abolition of philanthropic enterprises, which would be a real calamity, but rather an argument that some of these enterprises might with wisdom reorganize their methods of administration.

The school occupies a unique place, not because it is always the most influential among the agencies that develop character, but because the teacher is in a special sense concerned in all education that aims at character development, whether the process is going on in the schoolhouse or any other place. Moreover, the school enjoys certain advantages; its continuance is assured, for it is supported by public sentiment and financed by public funds. Whether the school requires initiative, team work, and contribution to its welfare from its particular group of citizens—that is, its pupils—depends much upon the character of the school administrator himself.

Now a school presents situations to its pupils and requires that they be met. Nevertheless, through its very nature the school carries on the tradition of knowledge. Its excellence is not unusually measured by the

ability of its pupils to repeat the knowledge that has been imparted, as through examinations. The school is usually ready to coöperate with other community agencies that, like itself, are engaged in the work of giving information. Thus, the best schools coöperate with a neighboring library, and they frequently utilize newspapers, magazines, and supplementary texts. Nor should the value of such knowledge be in any way deprecated. Several questions, however, arise: Has the school in its development of character a too exclusive tendency to emphasize knowledge only? Does this knowledge develop certain desirable attitudes and interests? Are these as carefully considered as the possession of the knowledge itself? Is citizenship training or character development consciously a dominant aim in the work of the school, or is it taken for granted as a probable by-product? These are not rhetorical questions. Many schools are concerned in attitudes, interests, habits, and character. Such phrases as "the project method," and "socializing the recitation," reflect that ideal. Moreover, there is a steadily growing realization among school people that organization and administration are more than mere methods of facilitating the operation of the school machinery.

The principal and the teachers may find the solution of this problem in the establishment of a school city, a school senate, or a school council; or the method may express itself rather in the tone or attitude between teacher and pupils. For example, there are schools in which the sanctions for obedience and discipline are not the dicta of authority alone—there is public opinion in the making of which the pupils themselves have participated. Whatever the method, in one way or another, the fact is being recognized that the spirit and the method of administering the school are in themselves valuable modes for developing the character of pupils.

When, however, the school is called upon to coördinate its work with that of other community agencies that emphasize actions and habits rather than knowledge, there is less evidence of accomplishment save of the more obvious and superficial kind. This situation has a humorous aspect. We have a generation of children subjected outside of the school to a variety of organized influences, most of them unconscious of or indifferent to one another. The sum of these experiences constitutes the child's civic education or mode of character development. Yet, these agencies, however well-intentioned, may be quite inconsistent with one another. It is as if a child were now one person and now another, each at a different time being taught a different, even a contradictory, conception of good behavior and right action. Fortunately most children seem to have a sturdy power of emotional and intellectual digestion. The model boy in the classroom who is arrested for theft outside is not a typical case.

Now if we revert to our principles of discrimination, we find that we of the schools may make at least the beginning of a plan for coördination. Because the school is already so well endowed with facilities for imparting knowledge, it is not here necessary to emphasize the value of coöperation with the library or with civic functionaries. Most schools today provide

for visits to the fire station or the water works. We need only consider those other agencies which do emphasize action—that is, knowledge put to work. One class of these community organizations is created for children. They are fairly well supported; they provide for the association of their people in natural situations. When they are under proper guidance they require at every stage action, habits, and adjustment. Examples of such organizations are the Boy Scouts, the Girl Scouts, and the Camp Fire Girls.

I select the Boy Scouts because a recent study of their activities, which was the result of an investigation made after correspondence with more than a hundred school superintendents, presents illuminating facts. Almost every superintendent stated that he approved of the scout program as an effective force in civic training. With few exceptions there was no evidence that the school concerned itself in any direct fashion with the experience of the pupils under scout direction, though frequently a scout troop was permitted to use a classroom after school hours, with the acquiescence, paid or unpaid, of the school janitor. Some good reasons were given for this indifference, as that the scoutmaster was not properly trained, or that the local troop had been organized under the auspices of a sectarian group. Apparently, however, the fact was that the scouts were merely ignored because they were an “outside” organization. Yet, let us pause for a moment to consider some of the aims of school instruction. One is to develop leaders which, of course, implies not only an intelligent appreciation of the qualities of leadership in varying situations, but a corresponding obligation to accept such leadership. What more natural situations are there for such training than among a group of boys starting on a hike, or making camp, or taking a school census, or discharging the many duties a scout is called upon to perform? Examples could be multiplied.

Good schools endeavor to establish a public opinion—the social sanction for certain acts, praiseworthy or blamable. It would be a fortunate thing if the same opinion continued to operate after school hours. Now the scout organization is concerned with the same objective. It seems undeniable that if the school people knew the scout program and the scout principles, and if the scout people knew what the school was trying to do, and especially if the boys themselves realized their mutual appreciations, certainly such sanctions would tend to become permanent forces. It is extraordinary how a perusal of the scout manual reflects the same purposes in character development that school men and women are constantly affirming; the difference being only a difference in the situation and a difference in the time.

The teacher may wearily ask if this means added duties to the members of a profession already overweighted with responsibilities. It does not demand more time except as the teacher, like any citizen, may desire to give it; but it does ask for a wider outlook. The administrator will claim very properly that these outside organizations are often improperly equipped and, in a great many cases, poorly manned. This is true, and it will

remain true as long as we who are inside the school continue to ignore those who are outside until they react our conception of excellence.

Today Buffalo is training scoutmasters. Detroit is installing in its new schools offices for neighborhood organizations that will form the membership of local councils for the scout troop. Not a few towns have undertaken to assign part of the time of paid supervisors, especially trained, so they may direct their local boy scouts, permitting them to retain their integrity as scout troops although conducted under a group of citizens interested in the school.

We, here, are not especially concerned in the Boy Scouts, or the Girl Scouts, or the Camp Fire Girls except as they exemplify a general principle: Whenever in a locality there is an organization that has the experience, traditions, and program that will develop character, the school is concerned to work with it. What our young people need constantly as they associate is the "give and take" experiences that mean teamwork, the realization of community dependence, the fine sense of believing in and living for something outside of the self, yet in which the self has a significant place. As soon as our children realize the oneness of purpose existing in the school and in their association out of it, there follows a consistency of experience that makes character development the easier.

There is another kind of community agency—the adult organization that is or should be concerned in schools because it sometimes interests itself in some phase of character development. This agency includes several types: organizations of business men like boards of trade, chambers of commerce, and the like; the fast increasing number of women's organizations, and one special group which we call parents' associations. The number of these organizations forbids any detailed consideration of their functions, and only a few references are, therefore, permitted. Recently one of the most aggressive of our business men's associations engaged in an undertaking to "save the boys." It is curious how small a part the school people had in it, though teachers could have given suggestions and made programs that would have saved much wasted energy. Women's clubs have been more fortunate, especially in their legislative activities, which is probably due to the fact that so many of their members are teachers. If the school people have not always been active it may be that they too have been ignored; yet it is not to be denied that the professional teacher is always inclined to look with a certain disdain upon the amateur who undertakes some educational work. However, it may be repeated that since the school is vitally concerned [though it can make no pretense to supervise all education looking to the development of character] it should know what influences are working to supplement the work it is trying to do, and even at the risk of rebuff, it should offer from its fund of experience and its store of opportunity whatever may help others who are trying under different circumstances to do the same thing.

Concerning the parents' association it is easy to theorize. We have had a great many years of experience, a great deal of assumption, and not a

little eloquence. The mothers' associations have organized and pyramided themselves into city and county, State and National organizations, more or less elaborate. Yet in the immediate neighborhood the single school and its own parents' association—we have much to learn concerning the technique of procedure that will include more than occasional entertainments, appropriations for charitable purposes, visits to the classrooms, and personal conferences, excellent though these things are. One significant outcome of the parents' associations has been the reflex on the home itself in impressing a new consciousness of responsibility for the influences that tend to develop or warp the character of children.

The discussions among teachers and parents, and the interesting volume of texts on the subject are emphasizing the fact that the important experiences are not only those in the school and the home, but those which occur in that uncertain and sometimes unknown field that lies between school and home. It is not impossible to conceive that for this very reason the parents' associations will not in the future be so sharply divided from community organizations. Not only fathers and mothers and teachers, but shopkeepers and clerks, advertisers, and purveyors of amusements equally need a quickened sense that they "belong" to the community, whether the consciousness be accelerated by an awakened responsibility or by more prudential considerations. The school and the parents together are powerful factors in training children, but they are not the only ones: our communities sometimes suffer from well-intentioned efforts of self-elected groups to improve the rest of the people; and even a parents' association would not be less efficient if it could blossom into a more inclusive organization that numbered in its membership the butcher, the baker, the candlestick maker, and the person who owned the movie show, or the amusement park. Human beings are more sensitive to the judgments of a group when they belong to it.

If development of character depends on good motives, adequate knowledge, and experience in doing the right thing, then whatever facilitates any of them is desirable.

If sanctions to good conduct are effective as we identify them as judgments of the group in which we count ourselves members, then we are first concerned that children and grown people find satisfaction and an outlet for their interests in those groups which have high standards of judgments.

Finally, if the experiences of children and of grown folks are consistent and constant so far as they develop high motives and afford satisfaction in performance, then character tends to become permanent. It is possible to develop any sort of national or racial character—to make a people obsequious or tyrannical according to whether they have through centuries been victims of oppression or masters of slaves. One nation performed a miracle of education within half a century—of a race of quiet, earnest, philosophical, and even sentimental people was made a nation of self-centered, arrogant soldiers who shook their sabers in defiance of the world.

It was, from the standpoint of effective education, a complete job. The objective was clearly seen, the methods carefully studied, and every social instrument was enlisted until men, women, and children were marching the goose step to the time of the schoolmaster, who was in turn the servant of another master. We may not safely forget that lesson. We have an aim—to preserve a democracy which can survive as its members are trained each to find his advantage in the advantage of his group. That is citizenship training, and citizenship training is character—right action toward our fellows in the group relation. But do we vision the aim clearly; do some among us vision it at all?

Then follows the mobilization of experiences so far as we can co-ordinate them: the school working to one purpose; the home and the community to the same purpose—that these influences as the child experiences them may work consistently together. At best, any attempt to mobilize educational influences will be but a poor replica for German thoroughness, because our society, fortunately, is not based on a conception of unquestioning obedience and we are not a goose-step people. But that is not a reason for indifference to the constructive forces that exist, rather is it a reason why communities must learn for themselves to utilize the favorable forces that operate within their bounds, and utilize them on a democratic basis. These forces are the community agencies. We have, it is true, no uniformed coördinator to bring these agencies together; therefore, we make slow progress. But as we educate progress is sure. As a matter of education, therefore, we cannot escape the conclusion that it is the teacher who must lead.

THE BEARING OF SEX-EDUCATION UPON CHARACTER

T. W. GALLOWAY, ASSOCIATE DIRECTOR EDUCATIONAL ACTIVITIES, AMERICAN SOCIAL HYGIENE ASSOCIATION, NEW YORK CITY

We seem to be agreed in this conference that character should not be looked upon as a mystical, formless, supernaturally determined something. Much less is it to be thought of as a general or racial thing. Character is individual, and every individual has a different combination of its elements from any other known combination. Because this seems true we really dare not speak of "training character" as a whole, any more than we can speak of "educating the mind." We can educate particular aspects of mental functions and activities; equally we can educate and train the receptive, intellectual, emotional and behavioristic elements in attitude and character as these are applied to particular situations.

Notwithstanding this there has appeared here a very decided unwillingness to indicate what we mean by character. It appears to the speaker that we must not, even though we are not capable of a perfect solution, try to evade the issue of objectifying and analyzing character, so that we may in some degree approach the task of training some of the simpler functions and processes which are inevitably to be included in that which

we name character. On the other hand this is no place to enumerate, even if we could, *all* the ultimate traits, states, and attitudes of the individual which go to make up character.

When we speak of "character" as being an object of education, we are tacitly including some such modifier as "good" "sound," "acceptable" or "effective." These terms imply a social, or some other, objective evaluation, and must finally be defined as well as included. This definition of goodness, however, is not the main part of our present task.

At the outset we may admit that the bases of character are inherited as physical and chemical complexes, and yet that the major part of its final form seems to be individually acquired; that it has both unconscious and conscious elements; and that it has both a purely personal and a social content.

No real approach can be made to this task of objectifying and analyzing character without including two somewhat distinct points of view: (a) The pragmatic, behavioristic *outcome* of the inner character of the individual, which some scientists would have us believe is all there is to it; (b) the inner unconscious and conscious structural and functional elements or factors in the mixture, which accompany and determine the behavior.

For practical, or behavioristic, purposes, the character of an individual must be, and is, measured by the degree to which the total "mixture" of personal traits and qualities *adjusts the individual to the most persistent and significant phenomena of his existence*. No character can be regarded as satisfactory, no matter how powerful or interesting it may be in its individual elements, unless it does make an efficacious and discriminating adjustment of the individual to his own inner processes and to his surroundings, as well as to the conflicts between these. The adjustment, which we call character, is then as much a matter of social as of individual psychology.

These phenomena which are sufficiently significant to make a difference in the matter of adjustment, and thus of character, are:

1. The general external physical and chemical forces and conditions, as gravity, heat, water, and food. Adjustment to these has conditioned the basic structure of all organisms, and has resulted in nutrition, protection, comfort, and even in life itself. It has produced, and is ministered to by the senses, appetites, reflexes, and organic responses. These are adaptations back of the whole natural history of goodness.

2. The universe-order, as this operates in coexistences and sequences—including reality, space, time, cause and effect, and so forth. This adjustment shows itself in definite conceptions of truth, beauty, logic. It produces and is ministered to by curiosity, reasoning, judgment, discrimination, esthetic standards, and the like.

3. One's own internal changing temperamental and mental states as these are determined both by the inherited factors (as endocrines) and by experiences, such as conflicts among the urges of one's primary desires; or between a desire and the inhibitions growing out of experience. This adjustment is measured by the comfort which comes from solving inner tensions, dilemmas, and conflicts. The degree of adjustment may be expressed in such terms as

uncertainty, satisfaction or dissatisfaction, happiness, remorse, phobias, poise, and the like.

4. The social order and the relations with others of the same species. These adjustments are of every shade of intensity from those of mating and parental care to the completest indifference or the fiercest competitions; and of every shade of complexity from casual contact of two individuals to the most elaborate adaptation of the individual to the social, ethical, and esthetic standards, conventions, institutions, and controls of the group. On the part of the individual these adjustments are expressed in terms of conformity or unconformity, of acceptance or aversion, of imitation or rebellion.

It is quite clear that these character adjustments of the individual in a changing world are dynamic and relative, and not static or absolute in nature. They vary with individuals, groups, time, and racial experience. Therefore they cannot be cared for completely by instincts and habits. This is all the more true because it is not always possible to bring these four main areas of adjustment into harmony among themselves. One of the most important tasks of character is to effect a working discrimination of the various values among these conflicting adjustments. Ordinarily we attach, from the point of view of character, particular merit to the adjustments within fields 2, 3, and 4, given above.

From the structural or synthetic point of view, the character, which can effectively make such adjustments, must include the following, among other elements:

1. A suitable *sensitiveness* or *openness* or *receptiveness* to all the old and new forces to which adjustment may need to be made. This implies, in the face of the habituation which inevitably follows satisfying experiences, a consciously cultivated modifiability or adaptability, *through appreciation* of the value of adjustment to new conditions. This is not the adaptability of inexperience, but of acquired *purpose* in spite of habit formation.

2. *Knowledge, understanding, intelligence.* We have long recognized the place of this class of factors in personality and character; and partly because we can measure these more exactly than any other factors, we have greatly overestimated their relative importance in character.

3. *Desires* ("impulses," "tendencies," "instinctive" appetites) which operate unconsciously or consciously to furnish "*motives*" for conduct. These powerful drives in character have been left chiefly to the mystics largely because they are elusive of exact study and measurement. They are most important in character and must be analyzed and systematically trained.

4. *Habits and skills*—These relate not merely to muscles and behavior; but equally to appreciation and modifiability, satisfactions, thinking, and discrimination. Indeed as important as habit is, it is not so much an independent character trait as a state of development of all the various traits.

5. *Satisfactions* or *dissatisfactions*, which may relate to conditions growing out of external stimuli (*before* action), or to the *results* of action in responding to stimuli. As desires are the states of feeling which drive to

action, satisfactions are the states of feeling which reward or penalize a particular action after it is performed. As a matter of fact it is through just such comfort and discomfort that particular conditioned reflexes, reaction patterns, bonds, and habits are stamped in or out.

6. The *attitude and power of discriminating*, which is a kind of acquired sense of proportion that allows a comparison and the weighing of stimuli, desires, ideas, experiences, and satisfactions and enables one to detect and use their variations. One may remark in passing that human adjustments are imperfect and ineffective less because we lack knowledge or motives than because we lack power to distinguish important from trivial facts and values.

There is no purpose to imply that these factors in character are either simple or operate separately "in a vacuum." They combine into still more complex character-states to which we popularly give names. Indeed the simplest act of conscious adjustment may call for the play of all of them. While doubtless far from complete, the following suggestions will illustrate such combination of factors. *Ideals* represent a fusion of *desires* and *ideas*. Conscious *motives* are ordinarily made up of *desires* plus *intellectual* elements. *Receptiveness* coupled with *satisfactions* makes for *appreciation*. *Purposes* are delayed reaction motive-complexes consciously connected with the future. *Tastes* are *satisfactions* which have become standardized and habitual. *Discrimination* may be applied to all other factors, and mediates all the combinations mentioned above. It creates understanding out of knowledge and personal standards out of ideas, and is the basis of all choices and decisions in dilemmas.

While each of these six functional factors in character is complex, each of them is much more simple than *character conceived as a unit*. Furthermore, all human experience seems to show that all these factors are capable of modification. That is to say they are educable. This of course does not mean that we can educate satisfactions or desires or discrimination in the mass, any more than we can develop intelligence as an abstraction. It means that we can, just as we can increase knowledge about any particular situation, modify satisfactions, and secure comparison and discrimination in a particular situation. Furthermore, just as we can finally create a prejudice toward knowing in general, we can build a predilection toward classes of satisfactions or toward the exercise of discrimination, as a trait or mode of character-reaction.

It is obvious that our present need is to find methods of modifying these and other elements of character specifically, and of measuring the degree of such modification. It is clear also why there is no high correlation between knowledge and character. Similarly we see that character education is not a matter of "teaching" something. It is rather a matter of vital, social life-projects covering the whole range of the desired particular adjustments in detail, with the project details fully motivated at every step by desires suitable to the stage of emotional development, and rewarded by the most natural and convincing satisfactions, until each desired adjustment is by way of becoming habitual.

The particular function of this paper is to show that the phenomena of sex and reproduction and the educative use of these phenomena *must loom large in any character education which pretends to fit for a real, present life*. If there is anything of truth in the preceding discussion, there seems to be no need of extended argument that sex education belongs here, and for the following reasons:

1. Sex and reproductive development within the individual, connected as this development is with the endocrines of the sex glands and the other glands of internal secretion, modifies from within practically all the factors of character mentioned above. Receptiveness and appreciation, intellectual capacity, all the emotional and temperamental elements of desires and satisfactions and interests and tastes, are highly conditioned by the state of the sex development and of the endocrine balance which is so sensitive to sex and reproductive states. This is shown specifically by the emotional changes of adolescents. The sex phenomena highly animate or dull the most important elements in personal character and conduct.

2. On the social side, sex and reproduction make a species and a society possible. It is through the joint operation of these functions and impulses that the whole fourth group of adjustments mentioned above (the *social*) originate. That is to say, if there were no reproduction and sex there would be no society in the first place.

3. Furthermore, more than any other group of biological or psychological factors, sex and reproduction *organize* this society which they produce. The home and family, whatever its shortcomings, is unquestionably the most fruitful factor in social evolution and structure; and the family is motivated and organized about the joint impulses, behavior, satisfactions, and habits of sex and reproduction. That is to say, without the attractions and impulses of reproduction and sex the species, even if it were formed, would not have produced any such society as we know.

4. The spirit of non-competitive interest and mutual adjustment, and even of service and sacrifice, which is the new evolutionary social factor involved in the family, is purely the outcome of sex love and the production and care of offspring. In other words the family itself is primarily a sex-reproductive institution; and the spirit of the home is the direct product of the sex-reproductive complex of unconscious and conscious adjustments. Incidentally, the extension of this non-competitive spirit into the general social structure outside the home seems at the present moment the only hope of a human civilization worthy of the name.

5. Factors which are so momentous in the development and life both of every individual and of the society in which these individuals must function must be profoundly influential in moulding that total mass of qualities (character) by which the individual must adjust himself to society. Out of the joining of these impulses of sex and reproduction and from the agreement and the conflicts between the individual and social welfare we get the most rich and colorful dilemmas and adjustments known to organisms. As meeting dilemmas satisfactorily is the school of character, so the ability

to meet such situation discriminatingly is objectively the best measure we have of the essence of true character.

Certainly these sex phenomena are as important in education for life as they are for life itself. In the past, we have very largely undertaken to educate personal character into a capacity for social adjustment by endeavoring to expurgate sex and reproduction from the list of important internal factors and external adjustments; or, what is as bad, by holding that these elements, when used, could make only negative and degrading contributions to character. The claim of social hygiene educators is merely that we must put Hamlet back in the cast. We are convinced not only that the play is incomplete without the Dane, but more fundamentally that the most beautiful, sweeping, and constructive rôle in the play is his. We need character education; and we need it unexpurgated.

To supply this need is the core of the proposal for social hygiene and sex education. It is to develop all the qualities included in character and to relate these specifically and consciously by the widest use of the project method to the dilemmas of sex, so that sex behavior may be most wholesomely adjusted to the most significant needs and happiness both of the individual and of society.

JUSTICE AND EQUALITY FOR CHILD HEALTH

THOMAS D. WOOD, CHAIRMAN, JOINT COMMITTEE ON HEALTH PROBLEMS
IN EDUCATION, NATIONAL EDUCATION ASSOCIATION AND AMERICAN
MEDICAL ASSOCIATION, NEW YORK CITY

The improvement of child health is the duty of everybody; of every home, of every school; of every community; of every State; of every Nation. Economy, thrift, budget-making, wise investment, productive effort, prudent expenditure are at present sensible, timely slogans. Every intelligent, unselfish effort for child health is in full accord with the spirit and purpose of everyone of these watchwords.

Securing the best attainable health and welfare for every child by the community and the State is the expression of social wisdom, of civic justice, and sound Statesmanship.

The State cannot guarantee to its children equality of inheritance, equality of mental endowment, or ability. Nor can the State guarantee to children in later years, equality of success or prosperity or health or happiness. But the State *can* and *should* guarantee essential equality in the fundamental health necessities and provisions for all of the children. This was done for the soldiers in training for war. It can and should be done for the children and youth of the State and Nation in training for citizenship.

Does such equality in relation to child health exist at present? Far from it! The program of health care organized by human society for the child's growth and development is uneven and inconsistent. The most impressive and dramatic development in this field is the Science and Art of Infant

Care. As a result of the intensive health care developed for babies the death rate of infants under one year of age has been reduced in many cities and in some States from 50 to 75 per cent during the last twenty years. If a corresponding saving and betterment in life and health could be made throughout the periods of childhood and adolescence up to maturity, the results would be thrilling beyond expression.

But the splendid momentum of health care gained during the first year of life is sadly slackened in the pre-school and school periods. Thousands of lives saved by skill and devotion during infancy are heedlessly and needlessly crushed out by street, and other preventable accidents during the runabout and early school periods. This "juggernaut" destruction of children in our streets must somehow be stopped. And what are the schools doing for the health of children and youth from five to sixteen or eighteen? Something, but as yet not much, at least, for all the school children.

The gradual improvement during the last twenty years in the health work of the schools is encouraging but by no means satisfactory. A few city school systems are now spending annually from four to five dollars per pupil for health and physical education. This represents from 3 to 5 per cent of the annual school budget, a splendid approach to a complete and adequate program.

On the other hand a few cities in our proud Republic are spending nothing for health in the schools. City schools, on the average, are doing much more for the health of pupils than are the rural schools. Health examinations of nearly two millions of school children (evenly divided between rural and urban schools) in New York State directed by the State Department of Education during the last five years show that 72 per cent of the pupils in city schools and 87 per cent of pupils in rural schools have health defects. The same report shows that of the defects reported in city schools 36 per cent were treated and of the defects reported in rural schools only 22 ⁷/₁₀ per cent were treated. And New York is not the worst State in the Union by a good distance.

Governor Miller, of this same State of New York, in his message to the legislature in January, 1922, expressed his convictions emphatically as follows: "I deplore paternalistic tendencies which substitute dependence upon the State for self-dependence and self-reliance of the citizen, but it is one of the highest functions of the State to safeguard childhood and to protect the public health and the proper discharge of that function is not paternalistic. . . . No child in the State should be handicapped by a remediable physical defect."

No child in the 24,000,000 school children of the United States should be handicapped by a remediable health defect. And yet over 15,000,000 of them are today so handicapped.

With all the splendid start that has been made in some cities and in a few States in this campaign for school health work the surface of reasonably full accomplishment in this vital task of the Nation has as yet only been scratched. Malnutrition still stalks like an insidious specter through this

land of ours threatening one child in every four or five, not with early annihilation as in some countries in Europe, but with dangers just as real and oftentimes more far-reaching in lowered vitality, deficient development, and decreased resistance to many kinds of harm. Myriads of children are suffering from partial starvation in a land of plenty; suffering thus, not often from poverty alone, but most often from ignorance, from carelessness, from neglect, from the irresponsibility of those not only in home, but in school and community, in the State and the Nation. Who must attend to this business if the country is to remain solvent.

The insecure roof of a theatre collapses with tragic loss of life. But unnoticed by most, the neglected, the moral, mental, and physical health of the children of the Republic, jeopardizes the very foundations of our entire permanent National edifice. The great majority of the children even yet are seriously endangered by neglect of the teeth. Only a few of those with defective vision have been corrected so that they can really "see straight." A very small percentage only, of children throughout our broad land have had their injurious tonsils and adenoids removed. Fifty-one per cent of the freshmen of a great University have had their tonsils removed. Do not sniff at this and say "Just a fad! a luxury possible for the children of wealthy families." Some of us, who have paid with hard-earned money and much discomfort for the removal of pus-laden tonsils, know better.

The boon we beg for the army of twenty-four millions of children in our schools is freedom from all remediable handicapping defects and a fair chance to realize the positive power of which they are capable by a reasonable opportunity for play; for vigorous out-door action; for enough wholesome, strenuous living, to develop as much of Rooseveltian robustness of mind and body and character as will benefit their world and generation.

The school child in three cases out of four is in a situation relative to health (even if unconscious of it) which is well expressed by the words of the famous cartoonist—"When a feller needs a friend."

What are his friends? Here are a few of them: (a) A scale in every school so that every growing girl and boy may be weighed each month; (b) A place to play and develop out-doors—in safety—with joy; with responsibility, with hardihood; (c) Sufficient food of the right kind; at the right time; and (d) A practical growing body of health habits, health attitudes, health ideas which will make a lifetime more useful and more satisfying.

Who are the friends of every school child in his quest of health? (1) The parents—intelligent, devoted, sensible—eager to learn; keen to have the help of school and community in making the children of the home, into the healthiest and best citizens for the world; (2) The teacher—as much interested in the health and character of her pupils as in their mental development; and (3) The rest of the people—physical-education teacher, school nurse, school doctor, family physicians, and all others, who help every child in the land to make the best of himself.

CONTRIBUTION OF PHYSICIANS IN FORTY-TWO STATES TO THE HEALTH WORK IN THE SCHOOLS

JOHN M. DODSON, CHAIRMAN OF THE COÖPERATING COMMITTEE OF THE
AMERICAN MEDICAL ASSOCIATION, CHICAGO, ILLINOIS

The enormous advance in our knowledge of preventive medicine in the last half century is pregnant with great possibilities in the saving and prolongation of human lives and the increase of human efficiency. The demonstration of these possibilities in the sanitation of the Panama Canal Zone by the late General Gorgas, and in the experience of the great armies in the Russo-Japanese war and the World War, were striking and conclusive.

To secure the maximum possible benefits of preventive medicine three things are necessary: (1) Scientific research, to which we owe practically all we have gained, must go forward to the discovery of new facts, new methods, and new principles. Research, therefore, in pure science, quite as much as in its applications to medicine, must be encouraged and supported especially in the institutions for higher learning—colleges and universities. The children of the coming generation should be impressed with the significance and importance of original investigation and no effort should be spared to seek out from the students in these institutions those rare individuals possessing the aptitude and capacity for such work.

(2) The knowledge of sanitation, hygiene, and health, already gained, and that to be added to our store by future investigations must be as widely and effectively disseminated as possible among the people at large, and especially to the school children, the coming generations of men and women. It is in them that our hope of betterment almost wholly lies. It is in this line of activity that your joint committee has been working for the last decade, and with gratifying progress. By action of the House of Delegates of the American Medical Association at its meeting in New Orleans in May, 1920, the several State medical societies were urged to appoint similar committees on the health problems in education to coöperate with similar committees to be appointed by the State teachers' associations. Over forty of the State medical societies have already appointed committees. The earnest, continued support of every teacher in advancing this movement in her own State association is urged by this committee and by the National Education Association, which endorsed this movement at its meeting in Des Moines last July. With such a group of 400 or 500 teachers and physicians cordially coöperating in the several States to secure a betterment of health conditions in schools and in school children and a more effective program of health education, there is almost no limit to the possibilities of accomplishment.

3. Multiple organizations have been formed in this country seeking to promote health in various ways and along various lines. Much time, money, and energy are being wasted because of lack of proper coördination of these numerous agencies. It has been one of the chief activities of this

joint committee of the National Education Association and the American Medical Association to seek coöperation with other organizations having purposes more or less in common. It should be, likewise, a prominent item in the program of the joint committees of teachers and physicians in the several States, to seek coöperation with other associations and agencies whose purposes are the betterment of health conditions.

WHAT THE WOMEN ARE DOING TO PROMOTE HEALTH IN SCHOOLS

MRS. IRA COUCH WOOD, DIRECTOR OF THE ELIZABETH MC CORMICK
MEMORIAL FUND, CHICAGO, ILLINOIS

Before saying a word on a physical education program, it would seem to me that we need to agree on a definition of the term "physical education." Recently, a committee of experts sat all day long discussing the exact meaning of "nutrition" without coming to a conclusion. It might be equally difficult to come to a unanimous agreement as to a definition of "physical education." In some schools, physical education covers all physical training and activities, track athletics, physical examinations of children, health education and hygiene, and even the nutrition work, while in others physical education is confined solely to muscular exercise without reference to any other aspect of physical well-being or health.

Back of the movement for physical education, there was undoubtedly the ideal of the perfectly developed Greek athlete. Today in the common practice of physical training, we seem often to have forgotten that the Greek ideal included perfect health, perfection of form, beauty in itself as an end to be desired; it was never confined to muscular development alone which might, or might not, win the wreath of laurel or bay. Our conception has been narrowed instead of broadened until now, in general, physical education means work in the gymnasium or on the playground, with muscular activity as its chief end, instead of perfect health as the goal to be achieved.

Since the army examinations showed so many of our men unfit for service, the movement for physical training has been tremendously accelerated, but I believe that if it is to be an adequate cure for the conditions found, we must have a very much broader conception of what physical education should rightly include than we have at present. My own point of view has been reached by practical experience in promoting the health of children through the medium of the Elizabeth McCormick Memorial Fund of Chicago, a private foundation made by Mr. and Mrs. Cyrus Hall McCormick in memory of their only daughter, Elizabeth, who died in 1905. The Fund was created in 1908 on the broad and simple basis of "improving the conditions of child life in the United States." It has so far been devoted to promoting the health of children in various ways; at first, through infant welfare centers, then through open-air schools, and

at the present time, through various methods of health education in schools and nutrition classes for undernourished children. We have had on our staff physicians, nurses, teachers, dietitians, and physical educators, to gain as nearly as possible the different points of view in the development of this subject of child health which is of such paramount importance in our National life.

Within the last few years, a large number of investigations of the physical condition of school children have been made by various organizations, including the Elizabeth McCormick Memorial Fund. Some of the schools showing the greatest amount of malnutrition and physical defects among the pupils, have been schools where physical education has been carried on for years. Chicago schools have had some form of physical education since 1886, and yet in a careful study of 10,000 school children made from widely differing groups in the city, an average of forty per cent of the children were found to be seriously malnourished and handicapped by physical defects. Many of the schools that have had no physical training have had excellent health records for their children. It also seems true from the investigations that, while physical education in the generally accepted meaning of the term is good for well children, it may, if unintelligently directed, do as much harm as good to the groups who are not fitted to take advantage of it. In a number of schools, the underweight and defective children were being put through exactly the same course of physical training as up-to-weight children, with the result that the malnourished pupils go steadily downhill on this program.

It has been found in several schools that as many as four per cent of the children had bad hearts, but that they were going through the same exercises as those children who were physically equipped for muscular exertion. It would seem to be a fundamental principle that careful physical examination, including heart and lungs, should be given to every child before he is admitted to gymnasium or to general physical exercise, as well as to any track athletics, but this is rarely done in practice. Recently, in a very progressive high school which had an excellent record for its basketball teams it was found that certain large boys were put in the sweat box for three hours at a time, until they came out at the point of exhaustion, so that they might reduce their weight to make a certain team for which a weight limit had been set. In a large school system in the Middle West where excellent health education has been carried on it was found that preliminary to the famous inter-school athletic meet of the spring, a large group of children did everything possible to lose weight so that they might get into classifications that would give them a better chance of winning in the competitions. This obvious lack of team work in the different departments of the school system has now been noted, and it is promised that no child underweight for height, or physically defective, will be admitted to athletic contests.

In every school attempting physical training, there should be a set of standards for the different groups of children, so that the exercises will be

given only to those whom it will benefit and in no way result in harm. In one of the high schools where a very large number of boys and girls were seriously underweight they were placed, at their own request in nutrition classes, but the director of physical education was utterly unsympathetic to the whole movement and would not excuse the boys and girls from gymnasium and playground work. After some months, however, when this director had watched the good effect on the few children who were given the extra rests, he reversed his decision and agreed to excuse all the underweight boys and girls from exercise upon condition they should rest during that period. The results were so astonishing in gains to the young people that I trust he is now a permanent convert to the fact that rest and relaxation have quite as important a place in a physical education program as have muscular development and athletic competition.

High schools and many grade schools are, of course, run on the credit system, and if we can get our physical educators giving the same credit for *rest* to the underweight and physically handicapped group that is given to the physically perfect children for athletics and physical training, we shall take a long step forward in the physical education program. Such credit was given in a high school where the coöperation of the health education and physical training departments was assured, and the results in inducing the young people to take the prescribed rests were most satisfactory. It would seem obvious that any school system progressive enough to have a physical-training department would arrange to have all the forces work for health and physical development in perfect accord. So far is this from being true, however, that frequently the chief opponent to the teaching of health and the training in health habits in the schoolrooms has been the physical director, who has often failed also to see how the teaching in food values directly affects the children in his care, and has remained unwilling to coöperate with the other school departments working towards his same end by different means. In one State, the chief opponent to the spread of nutrition service in the schools was the State Director of Physical Education.

Dartmouth College has, I believe, set some standards to which their young men must measure up if they expect to be admitted to any form of athletics; a number of high schools and elementary schools are making similar standards and not admitting any underweight or physically handicapped child to athletic contests, a most encouraging mark of progress. It is becoming more generally recognized, moreover, that the over-specialization of today in training young men and women for athletic sports has not always produced the finest physical specimens. The Greek ideal has indeed been lost sight of when a large number of football and baseball players and track athletes break down with tuberculosis during or shortly after their training period. I have been impressed with the fact that physical educators seem largely oblivious to the needs for fresh air, to the advantages of having the young people exercise out of doors wherever possible, and to the necessity for having the air in the gymnasium at all

times cool and fresh. In any number of schools, I have seen the students exercising violently in the gymnasium where the thermometer was over seventy degrees and the windows never opened, no provision afterwards being made for shower baths or change of clothes, the children returning to their schoolrooms with great possibility of chill from wet clothing.

Since the weighing and measuring tests of the Children's Year followed by investigations into the health conditions of school children all over this country, it has been amply proved that this question of physical unfitness is not a question of poverty, but of ignorance, as many children in the well-to-do districts and in schools in the prosperous neighborhoods are as seriously underweight as are those in the crowded districts of our city tenements and in our neglected rural schools. Therefore, our remedy for such a condition must be through education and not through an economic revolution or an extension of private charities as had previously been supposed. For example, in two of the finest private schools in the Middle West, one in a city and one in a suburban community, where the physical education department was of the finest, twenty-eight and twenty-six per cent respectively of the children were seriously underweight for their height and in need of special care. Even in these two leading schools which recognized the need for nutrition work and for health education among the children, it was with the greatest difficulty that the physical education department was induced to coöperate with the health education program and modify the exercises of the children to meet the needs of the underweight group.

It is sometimes necessary not only to convince the physical educators but the parents as well that a child should be given rest instead of added exercise or stimulus. We have had numberless examples of this in our work. One boy who was carrying a heavy high-school load was forced by his mother to take a newspaper route, because she feared that he would grow up without business instincts, if he did not begin early his commercial career. The boy steadily declined, and the parent could not be persuaded that it was the extra exertion that was bad for the boy. She insisted he had some inherent physical defect which had not been discovered. The family, in the meantime, was quarantined for three or four weeks and the boy could not carry his newspaper route, with the result that he showed a gain of an almost incredible number of pounds.

Mrs. S. came to us about a year ago for advice regarding eleven-year old Virginia, who was 12 pounds, or fifteen per cent, underweight. Virginia had always received the best of medical care and was free of physical defects. She went to bed every night at seven-thirty and was eating a suitable and adequate diet. In spite of all this care, she was so thin that her mother was worried and most anxious to "build her up." Further questioning revealed that besides attending a high-grade private school, the curriculum of which included strenuous gymnasium work, Virginia was taking lessons in Russian dancing and music. The dancing lessons were stopped at once and the gymnasium and music practice curtailed. During

the year from January 22, 1921, to January 12, 1922, Virginia grew $2\frac{1}{2}$ inches, although she was above the average height for a girl of her age and she increased in weight $19\frac{1}{4}$ pounds,—that is from $66\frac{1}{2}$ to $85\frac{3}{4}$ pounds, and reduced her underweight from 15 to 3 per cent.

Eva S., a member of one of our high-school classes, was excused from gymnasium work and permitted to take rest periods instead because the physician on examining her discovered a slight heart lesion. During the four previous weeks, although on the same routine, she had gained only a half pound. After leaving the gymnasium class, she started to make regular weekly gains and increased in weight from 89 pounds on March 10 to $96\frac{3}{4}$ on June 2. Many similar cases could be cited.

I am not in any sense deprecating the need for physical education in our schools, but I am trying to make a plea for a broader comprehension of what physical development and perfect health really involves. If the whole health program is to be placed in the physical education department, including the training in health habits, personal hygiene, and the like, then we must have better trained people to direct this department—occupying so vital a part of all education. If physical training is to come into its own in the broadest sense of the word, the preparation of the students in the schools for physical education must be broadened to include a greater knowledge of physical defects to which children are subject, the results of such defects if uncorrected, a greater knowledge of values of social environment and the effects of home conditions upon children, the result of exercise upon certain underweight and defective children, and a much larger conception of the development of positive health as an end in itself. So far as the training for group games, playground work, track athletics, gymnasium work, the courses in these schools would seem to be adequate, but more should be taught of food values, nutrition, and the meaning of physical defects, if our leaders of physical education are to develop the all-around health program and courses in health education which should accompany the physical training. If physical education is, however, to be limited to the development of the muscular activities of the child, as it largely is today, then we must have a much closer coöperation between doctors, nurses, physical educators, teachers, dietitians, and nutrition workers as to the place muscular activity should play in the health program of the child. With a broadened scope for physical education and with this coöperation in our schools and all the leaders of these different departments working together for the good of the child, we may then realize, I believe, the ideal which we all have in view—perfect health for every child in every school in the land.

REPORT OF THE COMMITTEE ON TEACHING OF DEMOCRACY

A. DUNCAN YOCUM, PROFESSOR OF EDUCATIONAL RESEARCH AND PRACTICE,
UNIVERSITY OF PENNSYLVANIA, PHILADELPHIA, PENNSYLVANIA

It is proper that the time consumed by the chairman of a committee—whether a standing one or one like our own with a continuing function, should be just enough to outline what is new in its achievements, and what the new issues and problems are which justify its continued existence. Any detailing of achievements should be left, as they will be left tonight, to the report itself as filed with the Council's Secretary for printing in the annual proceedings, and to supplementary reports by Committee members or sub-committee chairmen who have done some timely piece of work of unusual interest to the Council.

Current issues of peculiar concern to democracy—Since current issues serve to justify some of the new achievements of the Committee, they will be presented first. Among the current issues before the country and affecting education, which are of concern to democracy, there are three so outstanding and menacing that conspicuous attention should be called to them through the National Council. The first is the tendency upon the part of certain social or National groups to use education for group purposes. The second is the danger of American participation in world betterment becoming a partisan issue. The third, is the individual enthusiasm and possibly the foreign propaganda which seek to create American sentiment for an exaggerated individualism as apposed to democratic education.

American schools not to teach group propaganda opposed to the common welfare—The first danger is the most immediate. No American school either public, recognized as legally equivalent to public, or allowed to exist as not violating law, can be permitted to teach group propaganda opposed to the common welfare. It is eminently proper and American that the Knights of Columbus should interest themselves in improving the quality of textbooks in American history, and even that they should seek to have emphasized, as they may not intend to do, such conspicuous Catholic contributions to democracy as the freedom of worship given to Protestants in Maryland, or the patriotic self-sacrifice of the French Jesuit father who when asked by the Governor-General of Canada to go to the Iroquois villages to urge them not to attack the Canadian settlements, replied "*Ibo non redibo*," "I go but I will not return." It would be democratic for them and for other national bodies to join the friends of Ireland in seeking to eliminate exaggerated or ill-founded praise of Great Britain or to hinder an obvious effort to omit all colonial tyrannies or post-Revolutionary offenses. But especially at a time when Great Britain and America are moving together in the interest of world peace and world democracy, it would be undemocratic and treasonable for any American textbook to include all facts showing the unfriendliness of Great Britain; and to fail to teach that American liberty had loyal friends in England and that the

American Revolution itself was part of an older—and in some respects—slower movement toward democracy in England, which even now is becoming more complete not only in a willingness to give all freedom to Ireland which does not threaten the safety of the British Empire, but in a growing democracy in the British official attitude toward both home and world education.

Just as it is democratic for congressmen from agricultural sections to organize an "agricultural bloc," if in urging agricultural interests it does nothing to prevent or postpone legislation essential to the common welfare; so is it democratic for labor organizations to organize a school for the training of labor leaders, if in teaching them how to more intelligently serve the interests of labor, it also teaches them that no strike is democratic which interferes with the common welfare of all social groups, or no increase in pay or shortening of hours of labor is democratic which gives one industrial or vocational group proportionately more in return for its labor training and skill than it gives to all other industrial or vocational groups in common return for their labor training and skill.

In short, whenever a social group enters the educational field to further its group or class interests, it assumes the grave responsibility of effectively teaching that while its group or class interests may be furthered at the expense of other groups or classes, it is undemocratic that they shall be furthered at the expense of all groups and classes in common.

Preventing world betterment from becoming a partisan issue—The second current danger to democracy is an existing tendency to make a partisan issue of American participation in world betterment. When President Harding made Mr. Underwood a minority representative in the American delegation to the Disarmament Conference, he meant to make its deliberations all-American and non-partisan. When will certain gentlemen in the National Congress learn that there are some world issues on which the vast majority of the American people do not wish to be "reserved"! And some outcomes so momentous that they must not be delayed by a petty safeguarding of accepted and world recognized institutions and policies! Our participation in world affairs in so far as it concerns the common welfare of all nations, will continue to be non-partisan and will grow increasingly democratic, if every educational agency in America teaches: That while America will ever firmly stand for the interests of America and of Americans as against those of any other nation or nationals, America stands willing to sacrifice any national interest which conflicts with the welfare of all peoples in common, and will stand alone or with others against any act or policy of other nations which threatens our own democracy or the continued existence and growth of a world democracy which is the only certain guarantee of the continued existence of our own. This is the preparedness which Mr. Harding would have accompany reduced armament—"a better preparedness in a public mind and world opinion made ready to grant justice precisely as it exacts it."

Educational safeguard against the individual enthusiasm or foreign propaganda for individual as opposed to democratic education—The third cur-

rent menace to democracy is the favorable conditions for undemocratic propaganda presented by the spread of "parlor Bolshevism" or a certain willingness on the part of some Americans to admit that they are "intellectuals"; combined with the campaign for personal liberty waged by the liquor interests and persons individually interested in the unhampered drinking of liquor; and with even so seemingly different a thing as the useful educational experiment which sometimes exaggerates "individualism" in our so-called "progressive schools" or "schools of tomorrow." A recent editorial in the *International Review of Education*, published for the German League of Nations Society, and more or less widely circulated in America, makes the extraordinary statement that "true education, if not meant as a training, but as a service of life itself, must not be 'for' any aim, not even the most ideal. Wherever education is entirely free from coercion, wherever it is a living process in the true sense of that word, a growth, a promoting of growth, a development, it will not look upon some final aim, set and specified but on life itself stimulated from within, bearing within itself its own perfection, its individuality and completeness." Here is an educational ideal which out-individualizes the individualism of Rousseau himself. Rousseau would have *taught* social *ideals*, but without the individual's knowing that they are being imposed upon him, and through his individually accepting them as he personally experiences their wisdom. But here it is proposed to abolish the teaching of the aims and ideals most fundamental to civilization and democracy, on the ground that the individual, if allowed to grow, will freely develop into what is best. It is an educational *supermanism* which applies from the cradle the same Nietzschean doctrine which justified to German thinkers the abolition of old moral standards and the unhampered development of nationalism which sacrificed the "nearest" weak to the "farthest" strong. It praises Tagore and his "school of peace" and in the same breath waxes enthusiastic over the schools of the Soviet, with their revival of the individualism of Tolstoi's old peasant school.

In schools of such a type democracy *cannot* be taught, and Prussianism or Bolshevism *need* not be. One or the other is certain to emerge and it little matters which. It is quite likely through mere personal impulse that Tagore and the children of Tolstoi have been visiting America. The German League of Nations Society may be equally spontaneous and sincere as it publishes its English edition. But whether such doctrine as this is being sown broadcast through individual enthusiasm or through foreign propaganda, American "intellectualism" and the literature which ministers to it, it finds too fertile a field for the growth of undemocracies in widespread insistence upon personal liberty in social tastes and amusements, and childhood made free through individual impulse rather than a knowing of the "truth." If America is to stay American, every school which emphasizes education through free activities and through individual response to personal "situations," must teach with equal emphasis respect for superior knowledge and justly constituted authority, and see that as the individual

grows through his own spontaneity, he grows into democratic ideals and habits without which in children grown old individualism cannot but become either that of the War Lord or of the Soviet.

The ordinary American capable of being educated into the intelligence and idealism essential to democracy—In a previous report attention has been called to the curious contrast presented by this Montessorian-like belief that every child unfolds into civilization and democracy like a rose if given a right environment in which to unfold; and the interpretation so widely put upon the results of the Army Intelligence Tests, to the effect that almost half the native and foreign born white men of draft age—rising to 60 per cent or 70 per cent in certain races and nationalities, are with their children and children's children incapable of acquiring the degree of intelligence necessary to deciding such questions as democracy submits to popular vote. When there is added to this, the equally plausible assumption that civilized men and women are after all but little removed in their natural instincts from the savage, and incapable of attaining the higher moral standards essential to a growing democracy, democracy through education is made to seem as unattainable, as democracy through unhampered natural development in the absence of standards always must be.

As to the intelligence tests, it is not necessary to assume with a brilliant writer in the *Atlantic Monthly* who discusses "American misgivings," that the only remedy for the unintelligent 48 per cent is intelligence tests as condition to immigration, a longer period preliminary to naturalization with higher standards to be met before the final papers are granted, and education of the 48 per cent—themselves too unintelligent to rule—in the choosing of truly democratic *representatives* to rule for them. As surely as the Army Intelligence Tests did not show an unintelligence so great that the ordinary American cannot be taught "to discriminate between the politician who gives him a turkey or a ton of coal and the politician who gives him clean streets, hygienic surroundings and an honest expenditure of what he pays in taxes;" they did not measure his ability to judge, nor show any lack of capacity for being controlled by democratic attitudes and standards, for multiplying the vocabulary which can make experience democratically selective, or for acquiring democratic habits. More than this—it is biologically true that comparative unintelligence in the sense of having few ideas and few associations for them, can be transformed by the multiplication of axis cylinder processes and corresponding associations, to a higher degree of intelligence, and to a high *enough* degree of intelligence.

On the other hand, no better answer has been given to the scratch-a-Russian-and-you-find-a-Tartar attitude toward human betterment, than Mr. Bullard's insistence in the January *Harpers'* that the popular conception of the common welfare *has* steadily advanced with civilization, and that man has in each succeeding age shown his capacity for readjusting himself to new standards, and by process of "sublimation," for recentering unchanged natural instincts upon progressively higher ideals. It is not good for industrial, political, or educational leadership to assume that any

American who is not an idiot is incapable of an education which will make democracy controlling in his dispositions and personal and social decisions. It is still the most immediate national need that every institution and organized activity which can reach any American social group shall be aroused to its responsibility for teaching every essential element in the democracy which has made us what we are, and which alone can make us rise to continually higher democratic levels.

The chief work of the Committee during the year has been the submission of a tentative specification of the Ten Essential Elements in Democracy, to a list of distinguished Americans personally or officially representing, in a conspicuously important way, some group, movement, or attitude determining for democracy. The main body of this report is devoted to their replies, and discussion of their comments upon the Ten Essentials. It will also be necessary to include the Specification itself, with a list of the representative Americans who made the comments, in order to partly fill in the gap caused by the omission of the entire Report of the Democracy Committee from the Des Moines Proceedings. Members of Council who are interested in examining the Des Moines Report in further detail will find it in the files of "School Life" for September, 1921. It contained in addition to other material, definition of the work of the Democracy Committee in distinction from that of the new Committee on Character Education; an account of the circumstances which led to the formulation of the Ten Democracy Essentials; and the outline of a plan for an organized movement on the part of all the Churches of America in coöperation with the schools for a more definite furtherance of democracy, along the lines laid down in the resolution adopted by Council at its Atlantic City meeting.

The organized effort looking toward the coöperation of the Churches, has been postponed by the Division on the Furtherance of Democracy Through Religion, owing to the reorganization now under way of the International Sunday School Association and of the Sunday School Council of Evangelical Denominations. The resolutions adopted by the temporary Education Committee of these two bodies which substitutes coöperation between churches and public schools for insistence upon religious education in public schools, and the Americanization work now independently carried on by the Catholic Church, show the timeliness of this movement toward completer coöperation.

The Report to be presented tonight by Mr. Walter Barnes, as chairman of the English Division of the Committee, is an effort to definitely indicate how the Ten Essentials of Democracy can be furthered through the teaching of English. The Committee expresses the hope that the three other admirable papers of Mr. Barnes, written with the same general end in view, may soon be published in collected form.

Dr. G. D. Hadzsits, of the Latin Department of the University of Pennsylvania, who has succeeded in raising an endowment for the publication of a journal devoted to a more democratic teaching of the classics,

has consented to serve as Chairman of a Latin Division of the Democracy Committee. This is especially timely at the moment when the Classical League has under way the most inclusive survey of instruction yet made with a view to the betterment of the teaching of an academic branch, and following upon the well-grounded suspicion that Nietzschean supermanism in the case of Gymnasium-educated German thinkers and leaders, was as firmly grounded upon the supermanism of ancient Greece and of Greek philosophical states and the imperialism of Cæsars after whom the Kaisers were named, as democracy can just as surely be grounded upon many of the institutions of both Greece and Rome.

Serious attention has been directed to the dangers of exaggerated individualism in the field of elementary education, both in a talk by the Chairman, printed in the Proceedings of the symposium on progressive education, to which the last meeting of the Harvard Teachers' Association was devoted; and in another given during the current week at a public meeting in St. Louis held under the auspices of the St. Louis Country Day School.

The proposed publication and national distribution by the United States Bureau of Education, of the Democracy Questionnaire sent out to a hundred cities during the War, has been abandoned owing to the reorganization of the Bureau and the discontinuance of the agencies for the correlation of educational research. Council will recall Dr. Winship's philippic directed against the questionnaire, partly on the ground that Council was itself too aristocratic to issue it, but more largely because he conceived the questionnaire itself to be intended as a standard by which the democracy or undemocracy of school systems was to be judged and measured. This same assumption was responsible for a number of constructive criticisms made of the amended questionnaire by experts in the various university research bureaus to which the United States Bureau submitted it. All of these objections are answered when the purpose of the questionnaire is understood to have been the *dissemination and popularizing* of such modes of aiding the growth of democracy, as the Committee has been able to assemble, and the discovery of agencies already existing but unknown to the Committee. Even with the limited circulation of the questionnaire which was attempted, each of these ends was largely served. Many courses of study have directly or indirectly used questionnaire suggestions, while remarkable local contributions were unearthed which deserve National attention.

What the questionnaire, perhaps presumptuously attempted, will be more effectively performed by the general circulation of the Ten Essential Elements in Democracy, and the further specification by and for particular agencies of the definite educational objectives which will be assembled under each of its heads and sub-heads. In place of suggesting material, activities and methods, this *educational* specification of the Ten Essentials will analyze logical sub-heads into the realizations, attitudes, standards, motives, words, suggestive associations, habits, etc., through which its *control of individual and social conduct* can be made certain or probable.

A number of research students are now at work on this follow-up of the Specification. From the sum-total of definite education objectives thus assembled under each specified democracy element, experts representing each local agency, branch of knowledge, phase of school work, period of educational development, type of institution or social organization, by a consensus such as that now being experimented with by Dr. Charters, can select what will have the greatest range, recurrence, and probability of development, for particular groups to be educated and in particular social environments. It is this specialized form of the Ten Essentials circulated through educational journals in general and the organs of particular social and educational agencies, that the function originally planned for the Democracy Questionnaire will be more effectively and economically performed.

As Council was informed at the Des Moines meeting, in the Report omitted from the Proceedings, this specification of Democracy Elements was undertaken at the request of the Kindergarten Division of the Democracy Committee under the Chairmanship of Miss Lucy Wheelock, and later approved by unofficial representatives of a number of National and State social organizations, who met in conference at the Atlantic City meeting under the Chairmanship of Mrs. Fannie Fern Andrews.

Preliminary to their submission to representative Americans, they were made the basis of a correlated attempt to teach democracy through American history and literature by Miss Conner and Miss Davies, teachers in the High School, Scranton, Pennsylvania; and are now in part embodied in the program of the League of Women Voters of Luzerne County, Pennsylvania.

Mr. Barnes' paper this evening is the first step toward making the logical heads of the Ten Essentials suggestive for the teaching of English; and Mrs. Andrews', toward embodying them in a program for the American School Citizenship League and its component bodies.

The specification of the Ten Democracy Essentials which follows is accompanied by a condensed formulation intended to aid in the retention and ready recall of each group of essential elements. The arabic numerals placed in parentheses after the various items indicate the Ten Essentials in the order in which they occur in the original specification, and make it possible to properly locate the comments which follow, as made by representative Americans.

THE TEN DEMOCRACY ESSENTIALS ARRANGED WITH A VIEW TO THEIR READY MEMORIZING

[Mnemonic key-word: A-M-E-R-I-C-A, used to recall five memorizing units or "suggesters."]

A *Acid test of democracy*, suggesting through the two A's in the key-word:

Assurance in rights not conflicting with a continually enlarging common welfare.

- Annulment* of rights proved to conflict with a continually enlarging common welfare (7).
- M *Majority rule* for the common welfare (6).
- E *Equality*, suggesting:
- Equality of *rights* and *opportunities* as opposed to abilities and achievements (2).
 - Equality of the *higher levels* (8).
 - Equality of higher levels through *self-effort* (9).
 - Equality in achievements through *highest effort* (5).
- R *Responsibility of the individual* for all essential democracies (3), suggesting:
- Responsibility for *compensating duty* in return for every right or privilege (4).
 - Responsibility for *compulsion* of all essential democracies not self-attained (10).
- I *Individual strength* expressed in assertive citizenship (1).
- C *Coöperation* for the common welfare.
- A *Acid test*, suggesting with the first A that it has *two* phases—*assurance* and *annulment*.

THE TEN MOST SUGGESTIVE ESSENTIALS OF DEMOCRACY

Definitely Formulated as a Basis for Their Being Presented in a Different Form of Statement to Each Educational Agency and Organization in America.

1. *Democratic self-assertiveness*—The most fundamental factor in the democratic control of individual conduct is the accustoming of every individual to self-assertiveness in rights, in duties, and in opportunities, limited by common rights, by social coöperation and by the surrender of petty and non-essential forms of assertiveness which are socially unpleasant or offensive.

Most of the essentials of democracy are positive and not negative virtues, and their control of social through individual conduct is ensured through an individual sense of responsibility backed by an indomitable individual assertiveness of all that makes for the common welfare, "both alone and with others." Repeated and unnecessary individual failure in school, unfitness in vocation through lack of educational guidance, and social backwardness through the absence of training for unembarrassed social intercourse, create an individual sense of incompetence and impotence which make a truly democratic citizenship impossible. If the "Let's go!" of the trenches is not carried over to all that makes for political and social advancement, our National problems cannot be given a democratic solution.

2. *Equal rights and opportunities as distinguished from equal abilities and achievements*—If there is to be a saving popular faith in democracy, each individual must be taught to sharply distinguish between equality in the sense of rights and opportunities, and equality in the sense of natural abilities and individual achievements. Many Americans scoff at democracy,

because they assume that the Declaration contemplated an equality made impossible by heredity; or believe in it, because they confuse it with a communism which gives each individual an equal share in all things whether he earns it or not.

3. *A sense of personal responsibility for the rights, opportunities, and duties of both self and others*—Since but a small part of what concerns the common welfare is compelled by law, a democratic training must develop in each individual a strong sense of personal responsibility for securing the performance by himself and by all others, of every action guaranteed to each or exacted of each for the benefit of all. Democratic rights and benefits are not only conferred for the sake of the individual, but for the sake of society. The acceptance of them is a personal duty owed by each to all. Insistence upon their acceptance by others is often the only way of making effective their acceptance by one's self.

4. *Equivalent compensating service*—Each democratic right and privilege carries with it the compensating duty of giving some equivalent in return. The idea of "something for nothing" is undemocratic. Especially in the case of foreign-born Americans attracted to the United States by democracy in the sense of freedom and opportunity, education must emphasize the fact that free schools, free hospitals, free religion, and all other forms of freedom, are free to all only in the sense of being common to all, and ought to be paid for by each through taxation, contributions, or service to others, equal for all individuals or proportionate to individual ability.

5. *Equality through highest effort and the chance to exercise it*—Equality in the achievements of individuals is attainable only in the sense of highest individual effort. Whether in the attainment of rights, the realization of opportunities, or the consummation of service, the least fit individual is equal to the most efficient and the weakest to the strongest, when each has done his best. Even opportunities are equal only when each individual is given the fullest possible chance to do his best in what he is best fitted for or most interested in. The chief essential of democratic industry is highest effort at needed production or service by each individual and in every vocation, as the only fair equivalent in return for highest effort at needed production or service by other individuals or in other vocations.

6. *Majority rule for the common welfare*—Majority rule is democratic only when it seeks to secure the common welfare. Determination of the common welfare which majority rule must seek to secure is conditioned by: Expert commissions for the study of the common welfare, popular patience in awaiting their verdict and popular confidence in its findings, popular education including training in democracy, the impartial dissemination of facts by a free public press, fair elections, the check upon local partiality and popular prejudice provided through the mode of electing representatives and senators, and the power of amending even the Constitution itself. Any influence or activity subversive of any one of these conditions tends to make majority rule betray the common welfare to individual, group, or sectional interests.

7. *The surrender of individual rights conflicting with the common welfare, and the safe-guarding of individual rights which do not conflict*—Personal liberty and special privilege find their limit in the common welfare, but *only* in the common welfare. These two propositions taken together constitute the acid-test of democracy. *Less* limitation of individual rights than is necessary to the common welfare tends to Prussianism or Bolshevism; more limitation of individual rights than is necessary to the common welfare tends to communism and other extremer forms of socialism.

8. *Equality of the higher levels*—Any stable social equality must result from a leveling up and not from a leveling down. The spiritual side of man can never be satisfied on lower levels, and no form of government can permanently endure which denies to individuals the opportunity to lead the way to higher levels, and which fails to create conditions which encourage all to rise. This applies to the stabilization of industry, as well as to that of society in the broader sense. Personnel departments in the various industries with related schemes for progressive steps in training and promotion, public vocational education, educational guidance, and public continuation schools—all are favorable conditions to a higher material level. But since the chief stimulus to labor is the betterment of the social condition of one's self and family, unembarrassed participation in the higher forms of social intercourse is the necessary complement to industrial betterment.

9. *Self-effort essential to many elements in equality*—An essential condition to social stability and therefore to political safety is the realization on the part of all individuals, but especially on the part of individuals or racial groups which seek social equality and access through law, that unembarrassed participation in every social group must be self-earned. With this end in view unembarrassed social participation should be used as the justification for a new emphasis in every stage of education, of habitual correctness of speech, good manners, skill in a variety of games and amusements, an appreciation of the fine arts, and familiarity with the few essential general ideas through which otherwise isolated individual experiences are made common and social.

10. *Democratic compulsion*—The democratic control of social conduct requires the accustoming of every individual to the compulsion in himself and others, both through public sentiment and law, of every essential democracy which is not self-acquired.

As the essential complement to a stronger individuality or self-assertiveness, every individual should be accustomed from the earliest childhood, to cheerful submission to superior wisdom and authority, to ready acquiescence in community standards more exacting than his own, and to their inexorable enforcement in so far as it is necessary to the common welfare. An early education which, like that urged by Rousseau and Tolstoi, makes children unconscious of any more authoritative will than their own, is better preparation for a Prussian supermanism or "direct action," than for a democracy which is to endure and become more complete.

LIST OF THE REPRESENTATIVE AMERICANS WHO MADE COMMENTS
UPON THE TEN ESSENTIALS

- Hon. Henry Allen, Jr., Governor of Kansas, Topeka, Kans.
 Mrs. Fannie Fern Andrews, Secretary, American School Citizenship League,
 Boston, Mass.
 Dr. Nicholas Murray Butler, President, Columbia University, New York City.
 Dr. Lotus D. Coffman, President, University of Minnesota, Minneapolis, Minn.
 Dr. Russell H. Conwell, President, Temple University, Philadelphia, Pa.
 Hon. Calvin Coolidge, Vice-President of the United States, Washington, D. C.
 Dr. Harry A. Garfield, President, Williams College, Williamstown, Mass.
 Dr. Albert Bushnell Hart, Harvard University, Cambridge, Mass.
 Dr. Clyde L. King, University of Pennsylvania, Philadelphia, Pa.
 Dr. David Starr Jordan, Stanford University, Calif.
 Walter Lippmann, Associate Editor of the *New Republic*, New York City.
 Dr. James E. Lichenberger, University of Pennsylvania, Philadelphia, Pa.
 Dr. Charles R. Mann, Chairman, Advisory Board, War Plans Division, U. S. A.
 General John J. Pershing, General of the Armies of the United States, Wash-
 ington, D. C.
 Dr. Leo S. Rowe, Director, Bureau of American Republics, Washington, D. C.
 Booth Tarkington, Indianapolis, Ind.
 Frank A. Vanderlip, Scarborough, N. Y.
 Mrs. Thomas G. Winter, President of National Federation of Women's Clubs,
 Minneapolis, Minn.

University of Pennsylvania
 Philadelphia

June 29, 1921

MY DEAR DR. ROWE:

Believing that if existing National and international problems are to be given democratic solution, there must be a more definite and universal realization of just what democracy is, the Committee on the Teaching of Democracy of the National Council of Education has been attempting to gather together the factors or elements in the absence of which democracy is fundamentally defective or incomplete. When these elements have been authoritatively assembled, they will be effectively taught not only through a multitude of school systems already interested in our movement, but through the existing machinery of a great variety of State and National organizations which collectively reach the whole American people. To ensure their authoritative formulation, the accompanying list of democratic elements is being submitted to a group of men and women eminently representative of the several types of leadership which mold public opinion and of the activities which must be democratically directed and controlled. A tentative list of this group accompanies the summary of democratic elements.

It is believed by the Democracy Committee that busy as you personally are, the tremendous and imminent nature of the issue involved will lead you to take the time necessary to *state your agreement or disagreement with the essentiality of each of the ten democracy elements, and to add any element not included, which you regard as essential*. If in so doing you express the wish that your reply shall not be made public, it will be held in the strictest confidence.

If the replies to this inquiry are promptly received, the elements of democracy agreed upon will be presented at the annual meeting of the National Education Association early in July, and promptly translated into words suitable for each grade of instruction and for the social group reached by each coöperating organization.

Surely the most important political function of the school and of National leader-

ship is to teach all Americans to discriminate between those personal liberties which can be exercised without menace to the common good and those which cannot.

Yours very sincerely,

A. DUNCAN YOCUM,
Chairman.

COMMENTS ON THE TEN SUGGESTED ESSENTIALS OF DEMOCRACY

The most encouraging fact in the comments of distinguished Americans upon the Ten Suggested Essentials of Democracy is that no one urged the omission of any, or added others. This does not mean that others should not be added. Democracy is a personal and social growth, not a governmental form or a traditional state of being. This viewpoint President Garfield, of Williams College, was especially anxious to emphasize. "In general," he writes, "I assent to the statements made, but with this important qualifications . . . Is it wise to attempt to formulate a statement of these elements? As our own civilization advances it may easily be true that new elements will appear, and the formulation of a statement at the present time is as little likely to satisfy an inquiring mind a hundred years hence as do the creedal statements formulated long ago." If, however, we of the present fail to become familiar with what we can agree upon as representing present-day democracy in its essential elements, and if we are not so taught that each one of them becomes as controlling as possible in our lives and aspirations, the growth of democracy will be arrested, and through the weakening or destruction of the incomplete democracy of the present, democratic institutions may themselves be overthrown and the democracy of the future have no chance of becoming more complete.

Dr. C. R. Mann, Chairman of the Advisory Board in charge of education in the U. S. Army, regrets that he cannot endorse the suggested essentials "unequivocally." His main objection is that what is needed in a democracy is not intellectual appreciation only, but also an emotional desire or impulse to act in the right direction. It is, therefore, hard for me to understand how much good would come by translating these various ideas into words suitable for each grade of instruction as suggested in your letter. The things that seem to me to be essential in democracy cannot be taught by words alone, but by actions; and actions result from motor impulse and are guided by such information as you suggest." He carries his objections somewhat farther under one or two of the suggested essentials, and suggests as a substitute, the simpler headings "civic capacities, civic intelligence, and civic attitudes," under which are grouped the various items introduced in education for citizenship as carried on in the U. S. Army. Of course, Dr. Mann, like President Garfield, is right, except in his dependence upon general civic intelligence and common capacities and moralities, as a substitute for specific democracies. Democracy must not only be a growth, but because it *is* a growth, must be no mere memorized code, however authoritative and inclusive, but rather an *education* which ensures the democratic control of individual and social conduct through: Democratic realizations, attitudes, standards, and motives, strong enough to *be* controlling;

a democratic vocabulary which ensures the retention and recall of democratic experience; democratically suggestive associations so wide in their range, that they make every element in democracy suggest everyday experience and everyday experiences suggest democracy; the democratic habits and skills necessary to democracy in every phase of life; and, above all, the conditions favorable to our keeping democratic in the face of difficulties and becoming increasingly democratic in the face of new situations. But boys turned out from the great training school of the Army may have everything which their present training for citizenship includes, and lack the controlling force of every one of the elements suggested as specifically essential to democracy.

A number of distinguished Americans are satisfied to give the suggested elements a general endorsement, regretting that they have not time for detailed criticism. Russell Conwell "approves and applauds the great desire to get such a statement before the people, and in a shape which can be used by the teachers in our public-school system." Governor Allen fully approves. Frank A. Vanderlip calls them "admirable, several of them particularly so." "With the teaching staffs of public schools," he goes on to say, "averaging what they do I see difficulty in giving such instruction to the pupils. If you can work out a method of doing that, you will have accomplished a National service." Vice-President Calvin Coolidge writes: "They seem to me to be essentially sound and accurate. It is very possible that I might phrase some of them a little differently, but if you are able to secure the attention of people and set them to thinking along the lines you have suggested, you will certainly perform a most commendable service. I wish you every success in your efforts." Mr. Coolidge's courteous suggestion of different phrasing is naturally put still more strongly by Booth Tarkington: "If I have a suggestion to offer, it is only that possibly the phrasing might here and there be simplified; though I confess that I myself am not quite sure that this could be done with a preservation of the full meaning." This simplification of phrasing must and will be brought about. Committees authoritatively representing every form of education from the kindergarten to the university, either are already at work or will soon be put to work upon reformulations which will translate the essentials of democracy into the language of every group in American life, and into activities familiar to the experience of every American individual. For example, one of the best known State directors of Americanization work among immigrant women, not long ago exclaimed: "This must be translated into words that can be understood by four-year-old children, and applied to experiences customary in everyday jobs and routines."

Fannie Fern Andrews, speaking as the Secretary of the American School Citizenship League, writes: "It seems to me that these cover all the essentials of democracy and I think the majority of people who have given attention to the matter will agree to this. With your permission, I should like to send this out to the officers of the American School Citizenship League, telling them that this is your suggestion for a basis of work for

the Committee on Democracy. I should like to ask them,—that is, if you agree,—to offer suggestions as to the best way of putting these ideas before the teachers of the country. I suggest this plan with the understanding that the American School Citizenship League, as one of the coöperating organizations of your Committee, is supposed to concern itself with the teaching of democracy in the schools; as, for example, the Chambers of Commerce will concern themselves in getting the idea over to the business men of the country, and the womens' organizations in getting the ideas over to the women in their organized activities. For the schools, I should suggest making ten Type Studies similar to the Type Studies in 'An American Citizenship Course in U. S. History,' published by the American Citizenship League. I think, if you would consider it proper, I could get someone to collaborate with me in making out these ten Type Studies, which could be put directly into the teachers' hands." Mrs. Andrews' suggestion indicates one of the many ways in which the difficulty foreseen by Mr. Vanderlip, will be met. I must add the comment of Alice Ames Winter, President of the General Federation of Women's Clubs: "The immediate impression is that they are of very great value. Under a Committee on American Citizenship, the General Federation is making special effort to induce the club women of the country to study all sides of public affairs. I am going to take the liberty of sending your ten points to the Chairman of that Committee. May I ask whether you are taking any steps toward a distribution of this material among groups who are not strictly in academic circles?"

Finally, I cannot resist the temptation to quote from David Starr Jordan: "I have read your syllabus with interest and sympathy. I agree with every point, adding hereby only a note or two: a democratic solution—in default of that we have no solution at all, for all other systems in which force comes from the outside, fail to solve, force must radiate from within."

Others who have written expressing agreement are: H. W. Dodd, Secretary of the National Municipal League; Dr. Leo Rowe, Director General of the Pan-American Union and President of the American Academy of Political and Social Science; Walter Lippmann; and General John J. Pershing. The opinions expressed by some of them can be more effectively quoted under the head of democracy elements which they believe should be given greater emphasis.

Under the first of the ten—democratic self-assertiveness, Dr. Mann, of the Army Advisory Board, perhaps, rightly urges: "Self-assertiveness does not strike me as a good statement of the point you bring out in the context." A member of the Board of Publication of one of the great religious denominations makes a similar criticism: "Self-assertiveness," he says in substance, "Is what we are attempting as Christians to check." What I have in mind is self-assertive citizenship, as opposed to "going along" in politics and passive submission to civic wrongs. If anything further were necessary to convince me of the wisdom of substituting, self-assertive citizenship for democratic self-assertiveness, it would be the statement of Dr. Rowe. After

stating that every citizen owes a debt of obligation to the Committee and the fact that he wishes to heartily subscribe to the principles laid down, he suggests that "in principle No. 1, greater emphasis be made on community welfare and on the social consequences of individual action. My own personal view is that in our American education we do not require emphasis on the importance of individual assertiveness. This is instilled into the child in the home, and one of the greatest functions of the school is to soften the extreme individualism which is developed in the usual family environment."

Dr. Mann "also objects to the title equal rights and *equality*." So do we all object when the familiar expression is unqualified. But because it is a familiar expression, it is too often on the lips of Americans not to need qualification. Equal rights and opportunities are democratic. Equal abilities and achievements are impossible.

It is under the fourth element, equivalent compensating service, that General Pershing makes his comment: "I am inclined to think that a little more emphasis should be given to that phase of the essentials of democracy which involves the question of duties in contrast to the rights of individuals. This is covered briefly in the last three lines of the first sub-paragraph of Democratic Self-Assertiveness. It is also referred to in other paragraphs, but I have noticed such a frequent lack among our people of an appreciation of the duties of citizenship, particularly when they are insisting on certain rights as citizens, that I believe this requires special emphasis."

The last element that provoked special comment is the sixth—majority rule for the common welfare. Concerning it Mr. Walter Lippmann writes: "I agree entirely, except as to emphasis. In my judgment No. 6 is more fundamental than any of the others, taking No. 6 to mean the duty of seeking an unbiased view of the facts. Men can be ever so righteous and dutiful; if they do not know the circumstances where duty and righteousness are operative, they will as often go wrong as go right." Mr. Lippmann here points out the difficulty of teaching an individual to know what the common welfare is. As he puts it: "You do not in my opinion lay sharp enough emphasis on the intellectual basis of moral." Mr. H. W. Dodds, of the National Municipal League, writes: "I particularly like paragraph 6 which states the majority rule is democratic only when it seeks the common welfare. There is abroad in this country a belief that anything which the majority wants is right—which is the most subversive tendency I see. Minorities need protection and freedom now as much as ever."

David Starr Jordan gives several epigrams from his book, "Democracy and World Relations": as to compensating service—"There is no deadhead on the road to freedom"; and on assertive citizenship—"Danger comes from weakness of the weak rather than from strength of the strong." Such phrasings as these may in the end carry out Mr. Tarkington's suggestion. Nicholas Murray Butler on his after-war trip to Europe took time to write "the various questions to which you refer, have been publicly discussed by me with more or less fullness for many years past, and are to be found in my several published volumes, particularly in those entitled, 'True and

False Democracy,' 'Why Should We Change Our Form of Government,' and 'Is America Worth Saving'." A most useful criticism of phrasings was received from Dr. Clyde L. King, of the University of Pennsylvania. His main criticism lay with Essential 10, in which he would change democratic "compulsion" to "compliance and expression"; "submission" to "conformity"; and "acquiescence" to "compliance." "I would have a much wider place," he goes on to say, "than you have indicated for voluntary organizations of people into economic, social or opinion-making groups. It seems to me the real essential of democracy lies in mobility in organizing individuals into groups for the expression of opinions, and for the gaining of ends. In other words, the creative part of democracy is, by all odds, of as great importance as the constraining part, and I feel the creative processes should be given an emphasis I do not find in any of your ten points." This balancing of the creative and the constraining parts of democracy is what makes Essential 7 the Acid-Test. Emphasis of individual and group activity is of course a fundamental *means* to all the ends included in the Ten Essentials. As an *aim*, it will be more definitely included in the revised essentials under the head of "*individual strength*" expressed in "assertive citizenship" as a substitute for "democratic self-assertiveness." Albert Bushnell Hart takes much the same view—"Your categories nearly all are based upon the conception of the human unit and the desirability of securing personal action. I think you take too little account of the necessity of mass action and of the inherent restraint of individual effort by the interests of the whole." Various specific suggestions of great value which he makes along this line, will be incorporated in the forthcoming *Educational Analysis of the Ten Essentials*. Professor Hart's introductory comment: "To reduce to ten rubrics the essentials of democracy is a task upon which I should not like to enter lightly," well expresses the feeling with which the Committee began its effort at specification, and even more fully expresses the spirit in which it submits its report. We should not like to lightly regard the specification as complete. But, it may perhaps serve, like any other group of fundamental principles, as a more definite, inclusive, and authoritative basis both for the formulation of education for democracy, than has previously existed, and for the immediate campaign for democracy for which it is meant to prepare the way.

The report can well close with the final paragraph of President Garfield's comments, which he quotes from his own opening address to the distinguished delegates assembled from all over the world for his "Institute of Politics": "We are passing from the old covenant to the new. 'Thou shalt not' is giving place to, but is not displaced by, 'Thou shalt.' The maxim of equity '*Sic utere tuo ut alienum non laedas*,' applies as truly to nations as to individuals. Formerly it was necessary, indeed very necessary, that we should so use our own as not to do injury to the things of another. It was necessary that States avoid contact less contact lead to conflict. The world was not then prepared to go farther. But henceforth we must add to the maxim this: 'and so use thine own as to enable others likewise to use that which is theirs'."

THE TEACHING OF DEMOCRACY

FANNIE FERN ANDREWS, SECRETARY OF THE AMERICAN SCHOOL
CITIZENSHIP LEAGUE, BOSTON, MASSACHUSETTS

We are very greatly indebted to Dr. Yocum for this comprehensive report on Democracy and Education. In his statement on "The Ten Most Suggestive Essentials of Democracy," he has included, I believe, every element which should be considered. This comes at a time when democracy needs to be defined. If this report is accepted, this Council goes on record against socialism, communism, Sovietism, and every other form of government which is inconsistent with democracy.

Dr. Yocum has been far-sighted in getting the opinions of many representative Americans on his statement of the essentials of democracy. Some of the answers which he has received are worthy of notice. Some at once call forth a challenge. I can hardly agree, for example, with the viewpoint of President Garfield, of Williams College, who writes that he assents to the statements, but makes the query: "Is it wise to attempt to formulate a statement of these elements? As our own civilization advances it may easily be true that new elements will appear, and the formulation of a statement at the present time is as little likely to satisfy an inquiring mind a hundred years ago hence as do the creedal statements formulated long ago." Dr. Yocum has answered this query most satisfactorily. He says: "If we of the present fail to become familiar with what we can agree upon as representing present day democracy in its essential elements, and if we are not so taught that each one of them becomes as controlling as possible in our lives and aspirations, the growth of democracy will be arrested, and through the weakening or destruction of the incomplete democracy of the present, democratic institutions may themselves be overthrown and the democracy of the future have no chance of becoming more complete." This statement of Dr. Yocum, I think, must convince everyone that an understanding of the elements of democracy is a potent factor in the development of democracy itself.

Dr. C. R. Mann's comments on the statement, by which he says that democracy is not an intellectual appreciation only, but also an emotional desire and impulse to act in the right direction, calls forth another important statement from Dr. Yocum. "Democracy," he says, "must not only be a growth, but because it is a growth, must be no mere memorized code, however authoritative and inclusive, but rather an education which insures the democratic control of individual and social conduct through democratic realizations, attitudes, standards, and motives, strong enough to be controlling; a democratic vocabulary which ensures the retention and recall of democratic experience; democratically suggestive associations so wide in their range that they make every element in democracy suggest everyday experience and everyday experiences suggest democracy; the democratic habits and skills necessary to democracy in every phase of life; and, above all, the conditions favorable to our keeping democratic in the face of dif-

faculties and becoming increasingly democratic in the face of new situations."

Vice-President Calvin Coolidge is especially appreciative of Dr. Yocum's efforts. He writes: "They seem to me to be essentially sound and accurate. If you are able to secure the attention of people and set them to thinking along the lines you have suggested, you will certainly perform a most commendable service. I wish you every success in your efforts."

Dr. Leo S. Rowe, Director-General of the Pan-American Union, expresses his opinion that every citizen owes a debt of obligation to the Committee, and states that he wishes to subscribe heartily to the principles laid down. The detailed suggestions which Dr. Rowe and other distinguished Americans make shows a vital interest in the subject of democracy.

It is gratifying to note also the general interest in education which many of these responses indicate. Russell Conwell writes that he approves and applauds the great desire to get such a statement before the people and in a shape which can be used by the teachers of our public-school systems.

Frank A. Vanderlip calls the essentials "admirable, several of them particularly so, but," he adds, "with the teaching staffs of public schools averaging what they do, I see difficulties in giving such instruction to the pupils. If you can work out a method of doing that, you will have accomplished a National service."

The practical suggestions of Mr. Conwell and Mr. Vanderlip bring us to the next step as to the use which should be made of "The Ten Most Suggestive Essentials of Democracy." There are two objectives. First, they should be got over to the people; and, second, they should be introduced into the schools. To accomplish the first object, I have suggested that Dr. Yocum write a handbook on democracy, which shall contain these principles illustrated by experience, written in a popular style. Dr. Yocum could perform no greater public service than to prepare such a book. Moreover, through the various National organizations whose coöperation he has secured, he has the most effective means of putting this book before the people. His method in this, as well as his statement of principle, is indeed democratic.

As to the second object, these ten points lend themselves admirably to the Type Study method of teaching, adopted by the American School Citizenship League in "An American Citizenship Course in United States History," published by the League. The plan could be practically worked out by the preparation of ten type studies covering each of the Ten Essentials. There should be a graded series of type studies, one for the high school, another for the junior high or the higher elementary grades, and a third for the lower grades. These principles can be understood by the child as well as by the grown person. The American School Citizenship League would undoubtedly be very glad to coöperate with the Council in the preparation of such type studies.

ENGLISH—ITS RELATION TO THE "TEN ESSENTIALS"

WALTER BARNES, HEAD OF ENGLISH DEPARTMENT, STATE NORMAL SCHOOL,
FAIRMONT, WEST VIRGINIA

The chief purpose of a State school system in a democracy is the preparation of each individual of the democracy for social efficiency within the democracy. Therefore the value of each subject and activity in the democratic school is measured by the nature and amount of the contribution it makes, directly and indirectly, toward the preparation of each pupil for democratic social efficiency.

This is the test to which the various branches of English must be subjected. What are the democratic elements inherent in English, in its subject matter and in the intellectual activity necessary to the mastery of the subject matter? In English those knowledges, those arts and habits, those acts and activities which minister, which contribute to democratic social effectiveness—these and nothing else are of value in English.

Now, the English subjects, more, perhaps, than other subjects, may make large and important contributions to education for democratic life, or they may make scanty and meager contributions to it. English comprises such a vast territory, can be approached from so many angles, can be used for so many different purposes, has so many different meanings that it, above all subjects, must be examined closely and organized carefully, in order that it may be made to yield the utmost possible contribution to a democratic education. Let us then determine what are those standards and ideals, those arts and skills and habits and knowledges which are most useful because most used in a democracy; then let us discover and teach those elements and activities inherent in English which may reasonably be expected to further our major aims.

Of course, no one knows precisely what are the desirable and vital elements in democratic life. The ten "essentials" set forth by Dr. A. Duncan Yocum in *School Life* for September, 1921, are so very suggestive and constructive that they furnish the best basis for all future discussions. Their acceptance is implied herein.

The work in English language and composition (and it is to this phase of English that I am limiting my discussion today) may be so planned and carried out as to make a unique and valuable contribution to each of the ten essentials. If the activities of the class are thoroughly and genuinely socialized, if the members of the group are encouraged and guided in the solution of individual and social problems, problems of school and community life; if a succession of natural, educative, varied activities is taken up day after day and month after month, thus allowing each member of the group to find his level as leader or follower, each member emerging into temporary leadership and expert authority by virtue of his superior knowledge or skill in the particular activity engaged in; if the teacher acts as mentor and monitor, discovering and suggesting new themes and activities as they come to light from time to time, using each assign-

ment as a means of doing well the particular job, of solving correctly the particular problem, or planning adequately the particular procedure or making wisely the particular decision, and at the same time utilizing each assignment as a means of teaching how to do better that particular thing the next time; if the class is conceived of as a social group or informal organization, working through committees and special assignments, calling upon each person to do what he can do best, providing for the exchange and interchange, the social pooling of experience, opinion, skill, knowledge of each member of the group, which is the very essence of socialization—I say, if all this is done progressively and cumulatively throughout the years of the school, the work of the English classroom will make a real contribution to each of the ten essentials of democracy: to democratic self-assertiveness, to equal rights and opportunities, to a sense of personal responsibility, to equivalent compensating service, and to all the others.

And this is an entirely feasible and reasonable procedure, indeed, it is the only possible means of teaching and learning the English language. Sometimes we say that every lesson is a language lesson. As a matter of fact, no lesson is a language lesson unless genuine social language is employed. And no language is genuine social language unless it is used for a social purpose, to accomplish some social objective: to entertain, inform, arrive at a decision, mold public opinion, to plan a work or work a plan. We must come to realize that language is never an end in itself, it is a means—the most natural and convenient and economical means of accomplishing a social end. And moreover, it is a means of accomplishing present ends, not remote ones. The problem, the task, the plan, the decision, the activity must be one that calls for direct and immediate attention and action. We talk of preparation: let us begin to talk of participation. We argue for team work: let us first find work for the team to perform. We long for coöperation: let us first bring about some operation. I never have been able to see how we are going to train children to guide a boat or a bicycle or a machine or a business *that isn't moving*.

If we are to prepare children for democratic life and citizenship through English, we must in school engage them in situations analogous to situations in life, we must train them in those forms and activities of language expression most usual and most useful in democratic life. Conversation, discussion, informal argument, explanation, the telling of anecdotes and personal experiences, letters—these must supplant the time-honored types of discourse: of narration, description, exposition, and argumentation. Spoken language must predominate over written, informal social expression must take the place of formal semi-literary expression.

Language, used in social ways and for social purposes is the readiest, easiest, and most natural mode of welding a democratic society together, of providing for exchange of ideas, of modifying and rectifying and unifying the various sections and segments of society. Language, a common language employed with force and facility by all, is the greatest interpenetrating and integrating agency at our disposal. A democracy is not con-

ceivable unless every citizen is trained in the use of his mother tongue. No one is in possession of his full rights and powers until he can express himself and make himself felt. He has no *voice* in affairs until his voice is trained. Here then is the great and gracious task of the teacher of English: to equip for democratic life and citizenship by training each individual in those types and forms of language most useful and desirable in carrying on the work and carrying out the destiny of democracy.

Here I would stop except that what I have said is futile unless I say one thing more: not only must the types of language and the methods of language teaching be democratized: the language itself must be democratized. Our English teaching has been inadequate largely because the English teacher's view of the English language has been ludicrously erroneous. He has thought of and taught the language as a fine art instead of as a useful art, as a musical instrument instead of as a practical implement, as an aid to the enjoyments of literature instead of to the employments of life.

I do not disparage literature. It is one of the finest and most profitable means of spending leisure time; it has its great and beneficent mission to the heart of man; and it too can be a powerful democratizing factor. But the English of literature is but one mode or type of language, but one dialect, so to speak; the English of common daily democratic life is another and a different dialect—not superior, not inferior, but different. And never shall we be able to utilize language as a democratic and democratizing agency so long as that language is itself undemocratic, aristocratic, classical.

The effective language of social democratic life abounds in force, picturesqueness, expressiveness, naturalness, spontaneity. It delights in short-cuts, in figures of speech, in humorous phrases, in familiar, free-and-easy expressions. It cannot dispense with colloquialisms, idioms, the turns and quirks of the vernacular, and it is voiceless, it is dumb and impotent without *slang*. Yet "they say" slang is not proper! Not proper? What is proper but appropriate? And when slang is appropriate—as it is in nearly all the social situations of everyday life—slang is not only proper but indeed a most effective mode of expression.

Do you wish to know why English teachers are failing to teach English that gets across and carries over into life, that acts as a cementing and solidifying element in our democracy? It is partly because they preach and teach impossible ideals of a pure-bred and a blue-blooded language, of a high-brow and 'hifalutin' speech, patrician English, nasty-nice, top-lofty, schoolroom English. If we are to be common-minded, we must have a common speech—and that will never be the speech of scholars and pedants and prudes-and-prismy-y rhetoricians. It must be a robust, vigorous American speech, full of snap and sparkle, of warmth and color, close to life, rooted in the soil. The reason the classical idea—in English or in any other subject—is undemocratic is because it is a class idea.

Obviously, much remains to be said, but—also obviously—no time remains in which to say it. The English language has tremendous impor-

tance and import in the democratizing of education and in the education of a democracy. Here is an implement, ideal for performing a democratic work, an implement fitted to our hands; all that is required of us is to perceive it, grasp it, and use it.

REPORT OF PROGRESS OF THE COMMITTEE ON VOCATIONAL EDUCATION

ADELAIDE S. BAYLOR, CHAIRMAN, FEDERAL AGENT FOR HOME ECONOMICS,
WASHINGTON, D. C.

The Committee on Vocational Education consists of ten members, who were nominated at the Des Moines meeting (July, 1921) of the National Council of Education. Acceptances to these appointments have come from all members of the committee, but responses as to plans of work have been slow in reaching the chairman. A meeting of the committee was called for Tuesday afternoon, February 28, and although a small number of members were present the following tentative plans were developed as to the work of the committee:

1. To use, at least for the present, the definitions and analyses furnished by the report of the National Education Association committee on Vocational Secondary Education, published in 1916.

2. To limit the investigation at this or any other stage to certain phases of vocational education.

3. To take up for the initial study *Part-time Vocational Education* for the following reasons:

(a) Twenty-three States have on their statutes compulsory part-time laws. All of these, with the exception of two, have been enacted since 1917, and school officials are confronted with the problems of administering these laws; (b) part-time vocational education deals with youths and adults outside the full-time schools, who cannot be reached by generally accepted full-time school programs and methods; (c) since part-time education is usually carried on during hours of employment, the coöperation of employers and parents as well as pupils is needed; (d) the value of part-time vocational education is not clearly estimated and the public needs enlightenment on this type of education; (e) in programing part-time education, two important problems arise, i. e., that of the minor who must attend because of legal compulsion, and that of the youth above part-time compulsory age who may attend voluntarily; and (f) the large numbers of young people in the country who have limited education and training and to whom the part-time school seems the best agency to render educational service.

Different viewpoints from which a study of part-time education might be made were taken up for consideration.

1. Types of schools as to groups to be reached:

(a) Vocational extension—Classes giving instruction supplementary to the employment; (b) vocational preparatory—Classes giving instruction preparatory for entrance into a given employment; (c) the General Continuation School, which aims to serve a two-fold function: (1) To continue the general education upon a selective basis; and (2) to serve as a finding course where the individual is given every opportunity to discover the particular employment for which he or she is best fitted.

2. Types of schools as to underlying vocational purpose:

(a) Part-time Agricultural; (b) Part-time Trade and Industrial; (c) Part-time Commercial; and (d) Part-time Homemaking.

3. Isolated topics pressing for immediate attention, that would necessarily be developed by a study from the viewpoint of 1 or 2 above, but would not stand out so prominently as if dealt with alone: (a) Place of part-time vocational education in a public-school program; (b) financing a public-school program of part-time education; (c) methods of developing curricula for part-time schools and classes with suggestive short units outlined; (d) part-time education in various types of communities, as rural, village, town, or city; and (e) plant and equipment for part-time schools and classes: (1) Scattered vs. central; (2) school vs. employment plant.

After some discussion it was agreed to take up the study of part-time vocational education with a view to ascertaining:

1. The needs for these types of schools as shown by: (a) Numbers of young people eligible for the instruction; and (b) the desire, particularly of those in the upper age groups for further education as shown by the large numbers enrolled in correspondence schools, private schools, and the like.

2. Valuable contributions that have already been made by part-time schools.

3. Financing part-time schools:

(a) As to distribution of present school financial resources in States and communities; and (b) as to additional resources for part-time schools.

The development of a report along these lines will involve an investigation of present-day programs in part-time vocational education and their relation to full-time school programs, and the outlook for the schools and classes, with recommendations.

It is proposed by the Committee to have at least a preliminary report—it may be a complete report—ready for the Boston meeting of the National Council of Education.

REPORT OF COMMITTEE ON ADULT ILLITERACY

MRS. CORA WILSON STEWART, CHAIRMAN, FRANKFORT, KENTUCKY

MEMBERS OF THE COMMISSION

<i>Chairman</i> , CORA WILSON STEWART.....	Frankfort, Kentucky
MARY C. C. BRADFORD, 1735 Bellaire Street.....	Denver, Colorado
M. L. BRITTAIN, State Superintendent of Public Instruction.....	Atlanta, Georgia
ARTHUR H. CHAMBERLAIN, Editor of the <i>Sierra Educational News</i>	San Francisco, California
JOHN V. CONWAY, State Superintendent of Public Instruction.....	Santa Fe, New Mexico
THOMAS E. FINEGAN, State Superintendent of Public Instruction....	Harrisburg, Pennsylvania
JOHN H. FINLEY, <i>New York Times</i>	New York City
WIL LOU GRAY, Supervisor of Adult Schools.....	Columbus, South Carolina
THOMAS E. JOHNSON, State Superintendent of Public Instruction.....	Lansing, Michigan
MINNIE J. NIELSON, State Superintendent of Public Instruction.....	Bismarck, North Dakota
JOSEPHINE C. PRESTON, State Superintendent of Public Instruction....	Olympia, Washington
AUGUSTUS O. THOMAS, State Superintendent of Public Instruction.....	Augusta, Maine

The personnel of the Committee on Adult Illiteracy is not wholly made up, and only one or two of the members who have accepted have expressed their views; therefore, this progress report can be but little more than the expression of the ideals of the Chairman and a declaration of some of the principles and plans which will be submitted to the Committee at the Boston meeting for its consideration.

The National Council of Education being composed, presumably, of only trained and seasoned members of the National Education Association, and with a membership necessarily limited and very select, its committees should be composed of the greatest experts in their line and the reports submitted to this body should bear the stamp of searching investigation, clear and careful thought, keen analysis, and sound judgment. If in other organizations, illiteracy committees have been chosen because of their high official position, geographical location, or desire to enlist their interest, the Committee on Adult Illiteracy of the National Council of Education should be chosen for reasons manifestly different from these. This Committee should be made up of a body of experts on adult illiteracy, if such a thing as a group of experts on a subject, yet new to the Nation, can be assembled.

Let us admit in the outset that the Committee as made up, is not in conformity with this ideal. The members were chosen some months ago when our ideals as to the personnel were less definite and our vision of the functions of the Committee was less clear. This statement should not be construed to mean that there is dissatisfaction with the Committee or criticism of its members. It simply indicates that the appointments made in future will conform to this plan and that possibly some of this Committee, who represent the general field of Education, may be exchanged with the Illiteracy Commission of the National Education Association, giving us the benefit of the experts on that Commission, and giving that Commission the influence of the members so transferred, thus strengthening the personnel and the functions of both. A small committee of such experts, if only five or six, would be of more service than dozens gathered from the field of education at large.

The functions of the Illiteracy Commission of the National Education Association, the Illiteracy Committee of the General Federation of Women's Clubs, and the Illiteracy Commission of the W. C. T. U. are largely those of propaganda and the stimulation of activity in the field of education of adult illiterates. It is not the function of this Committee, as your Chairman sees it, to engage in endeavors of this kind, but rather to aid in standardizing plans, methods, and institutions engaged in combating adult illiteracy, to investigate and report on laws pertaining to illiterate adults, to define objectives, to fix the standards of literacy, and to investigate and announce accurate statistics. To sort and sift the good from the bad in plans, methods, tactics, phraseology, slogans, and all that pertains to illiteracy campaigns does not seem a program too ambitious, and for this Committee to translate the activities of others into terms that will be panoramic in scope, seems a service that would be both useful and desirable. It is a field that is in no wise covered by any other committee or organization and would be a duplication of nobody's efforts or aims.

That there is need of such committee of experts on adult illiteracy is clearly evident. While public education, as far as the child is concerned, is under a regularly created Department of Education in all of the forty-eight States, the campaign to eradicate illiteracy is being waged under various auspices, ranging from a State Illiteracy Commission as in Arkansas, Washington, Mississippi, and others to the Extension Department of the State University—as two of the States are conducting their campaigns.

In 1910 there was not a line on any statute book of any State referring to adult illiterates; today there are laws providing for school doors to be opened to them, laws compelling them up to certain ages to attend, laws creating State school officers to direct their education, laws compensating teachers for teaching adult illiterates, laws providing for the training of teachers to teach them, laws requiring teachers to go and teach them in their homes, and laws requiring the establishment of classes for them in factories and mills.

In the creation of so many laws out of such meager experience and in such a brief space of time, it naturally follows that many of these laws are defective or inadequate. Some States have created a system of night schools and thus have provided an opportunity for illiterate adults, but have made no campaign to arouse public sentiment or to inform the illiterate that his opportunity has come. Some States have organized campaigns against illiteracy, have aroused the public and awakened the illiterates but have made no permanent provision for them to be taught, leaving their fate altogether dependent on the efforts of volunteers. The compilation of all the laws pertaining to adult illiterates with a classification and analysis would be of incalculable benefit. The comparison of these laws and the final judgment of some committee on such legislation is a need that has been frequently expressed and has probably as yet not even been partially met. May we not hope that the Committee will render to the cause of adult education a distinct service in this particular field.

The standards of literacy in this country are indefinite and variable. The United States Census Bureau defines literacy as the ability to write, assuming that one who can write can also read—and the test is the declaration of the individual as to his literacy or illiteracy. The Kentucky Court of Appeals has fixed the line between literacy and illiteracy as that which separates the second grade from the third, and has declared that one who can write and express himself, regardless of spelling correctly, and who can read an ordinary newspaper item, is out of the illiterate class. One of the States has fixed the standard of literacy, if we have properly interpreted its law, as the completion of the sixth grade. Some define illiteracy as the inability to read, write, and speak the English language—a test which had it been adopted by France before President Wilson's visit to that country, would have put him in the illiterate class while there because he could not read, write, or speak its native tongue. To aid in fixing a sane and definite standard of literacy, high enough and yet attainable, seems a necessary part of the program of this Committee. What the standard may be cannot at this moment be announced. That it will not be the mere ability to write one's name may be stated with assurance, for none who are fighting illiteracy intelligently have ever assumed that the ability to write one's name took him out of the illiterate class, or that if every illiterate in a State should learn to write his name, it would remove the blot of illiteracy from the State. The standard may not be so high as the completion of the sixth grade, for to place it at that elevation would leave many intelligent American people in the illiterate class. It should be the purpose of this Committee to find a happy medium—the same intelligent standard which would not leave a man really illiterate even though pronounced a cure and yet should be one low enough that it would not discourage the great mass of illiterates from undertaking to climb out of the dungeon of illiteracy, in which they are imprisoned, or discourage their rescuers from undertaking to aid them.

Illiteracy statistics are as yet puzzling and unfamiliar things. Only in recent years has any attempt at classifying them or any scrutiny of them been made. At last the counties and local communities, as well as the State and Nation are being brought face to face with their statistics on illiteracy. This is being done through the Illiteracy Commission of the National Education Association. There is an indictment in such statistics and when brought close to home they challenge the educated citizenry to action. Your Committee should in no wise duplicate the preparation and circulation of these statistics, but it has a statistical function equally as important and that is to investigate the floating terms of illiteracy statistics which vary so widely when quoted by different educators and to fix upon the accurate terms in each case. Within the past few weeks, the illiteracy of the United States has been quoted by educators all the way from three million to ten million in numbers. Educators of reputed and accustomed accuracy have recently been heard to quote the illiteracy statistics of the Army as being "only one out of every four recruits *able* to read and write" when as a

matter of fact, the Surgeon General's office which made the investigation, and, therefore, is the only authority on this subject, reported that "one out of every four was *unable* to read and write. The presentation of illiteracy statistics varying so widely from fact, and the quoting by educators of conflicting statistics on the same subject will tend to convince the laymen that educators are very careless or not altogether informed and will weaken the message that we are endeavoring to convey. If the Committee on Adult Illiteracy of the National Council could immediately investigate the sources of the illiteracy statistics now in popular use and could issue even a brief statement covering them, citing authority for same it would tend to clear up this matter and would steer educators and others toward the correct figures that, even when quoted accurately, are serious enough, more effective and not so likely to be challenged and disproved.

That this Committee is one with more than ordinary responsibility seems too evident to need reiteration. When its personnel is complete and its program is worked out, may its aims be high, its statements accurate, its decisions wise, its service both extensive and unselfish, and may God guide in all its deliberations and activities.

REPORT OF PROGRESS OF COMMITTEE ON EDUCATIONAL SURVEYS

A. E. WINSHIP, EDITOR OF THE JOURNAL OF EDUCATION,
BOSTON, MASSACHUSETTS

There is so much public and private money available for surveys and so many communities have some prominent persons or organizations with a private grudge that surveys are inevitable. No one can stop them if he wishes to, but the public has a right to think about *how surveys should survey*.

All would seem to be able to agree by this time that it is needless to go to any expense to tell a community about the weak spots in the schools. Anybody in any community can, without money and without price, find fault with the school administration, the police department, the fire department, and anything else in public service.

A sewer system was never established by studying sewage. Waterworks must be established before a sewer system is possible. It requires no intelligence and no trained nostrils to detect sewage, but it requires high engineering skill and great financiering to put in a water system.

The tests of efficiency of a survey are fourfold: *First*, For how much of the marvelous educational achievement of recent years are the surveys responsible? *Second*, What percentage of their recommendations have been adopted and put in action? *Third*, How many surveys have made recommendations based on their examinations rather than on preconceived notions of the master minds in the surveys? *Fourth*, Has the Survey been an inspiration to the community or an irritation? Each of these is capable of a direct demonstration.

As to the first, legislative action has paved the way for ennobling State normal schools into State teachers' colleges doing work for college degrees four hundred per cent in five years. How much of this is due to surveys? Attendance upon freshman or ninth-grade classes, which means retaining young people in school several years more than formerly, has increased more than one hundred per cent in five years. How much of this is due to surveys?

The increase in State requirement of fourteen years of age, or a sixth-grade education before going to work, is one hundred per cent in ten years; of sixteen years, or an eighth-grade education five hundred per cent in ten years; of eighteen years, or a high-school education one thousand per cent in five years. How much of this due to surveys? The enforcement of compulsory school laws has increased one thousand per cent in ten years. Adult illiterate education has increased one thousand per cent in ten years. The community influence of public schools has increased one hundred per cent in ten years. Improvement in thrift education has improved several hundred per cent in recent years. How much of this would probably not have come about but for the surveys?

As to the second, it would be interesting for every survey proposition to present a definite statement of the percentage of its recommendations that have been fully functioning three years after the survey report.

Third, it would be interesting to have all surveys surveyed and a report made upon the recommendations that had never been made in other surveys—that is, how many recommendations are based upon that survey rather than upon the known philosophy of the master minds in the survey?

Fourth, it is highly important that it should be known to what extent a survey merely stirs up sewage instead of establishing waterworks, to what extent the survey is a source of irritation rather than inspiration.

REPORT OF PROGRESS COMMITTEE ON CHARACTER EDUCATION—THE SANCTIONS OF MORALITY

MILTON BENNION, DEAN OF THE SCHOOL OF EDUCATION, UNIVERSITY
OF UTAH, SALT LAKE CITY, UTAH

The individual finds the sanctions of his moral life in his own conscience. In the light of modern science it now seems almost self-evident that the individual is born with capacity for moral judgments, including conscience, but that the nature of these judgments and the kind of conscience that he ultimately acquires depend primarily upon the various influences brought to bear upon him. These influences are exerted by the home, the church, the school, and by the individual's recreational, vocational, and civic life and associations. The conscience thus developed may be founded upon religion or upon social-scientific considerations, or upon both. In some respects it may be neither, but simply a reaction from habitual attributes and modes of conduct. Whatever the reason, the factors that enter into the

determination of conscience are likely to be complex. Any plan of character education must take into account these factors and bring them under conscious control.

Since conscience is the individual's basis of moral self-determination, it is of supreme importance that this conscience be so enlightened that it shall be a definite, sure guide in conformity with established ideals and that it also be capable of impelling right actions under new circumstances.

May we not assume that the home and the church will be primarily responsible for development of the religious background of morality? May not the public school also give recognition to the idea of God as the embodiment of all that is good, as an ideal to be regarded with love and reverence. This ideal may be a power in the development of conscience—obedience to which may thus become a mandate of the religious life.

Whether or not the religious appeal is permitted in the public school, there can be no doubt about the necessity of appealing to the concept of humanity, a concept possible of attainment through study of the social sciences. A realization of the nature and development of civilization is one of the most fruitful sources of moral inspiration. It reveals to youth his social inheritance, the spiritual as well as the material product of the united labors of all mankind. This inheritance is to be used but also to be sacredly guarded and augmented by each succeeding generation. This concept can be made the basis of a feeling of obligation to humanity, and of an enthusiasm for race progress and human perfection. In this field, no less than in religion, the intellectual appeal must be powerfully supplemented by emotional elements.

The fundamental principles by which conscience is determined, in terms of religion are "love of God and love of fellow-men." Translated into purely secular terms, these may be stated as "recognition and love of the good and love of humanity." From these general concepts or axioms all the virtues and their opposites may be deduced. Thus respect for life, for the source of life, and for the development of life follow with logical necessity. These imply such virtues as chastity, honor, and justice—virtues that are primary because they cannot be turned to evil purpose, as may secondary virtues when not directed toward ideal ends.

While individual conscience enters into the determination of the nature of social life as a whole, society has developed sanctions of its own. These social sanctions are imposed upon individuals by legislation, court decisions, custom, and public opinion in general. These are powerful determining factors in moral training. While the school has its own specific problems in character education, it cannot succeed except in coöperation with all public agencies. The public school is but one phase of public education. It must seek the support of all other government agencies, general and local, and of every voluntary social agency that can have influence in the character training of childhood and youth. The school cannot be an isolated institution, if it would measure up to its responsibilities.

The Committee is agreed by unanimous vote of those present at the meeting on February 26, 1922, to the following recommendations:

1. That the course of study and activities of the school should be so organized as to realize in both theory and practice all the objectives of character education. Somewhere at some time in the school curriculum all the virtues should be taught. This calls for reconstruction of many courses and inclusion, somewhere before the end of the high-school period, of one or more courses dealing directly with the study of ethics.

2. That we recognize "Love of God and love of fellow-men" as an axiomatic basis of the moral life.

3. That all teachers should be as deliberately instructed in the fundamentals of ethics as they are in the fundamentals of their mother tongue.

THE CONTINUITY OF EDUCATION

J. M. GWINN, SUPERINTENDENT PUBLIC SCHOOLS, NEW
ORLEANS, LOUISIANA

The whole, in education, is not equal to the sum of the parts. Generally, the whole is considerably less, for the parts overlap and clash and sometimes fall as parts. Our educational system, so-called, is composed of magnificent parts but when put together the desired organism turns out a badly jointed aggregate as if some journeyman had made it and not made it well.

The program for the education of the American child and youth is so large and complex that it is difficult, if not impossible, to comprehend it as a whole from home and kindergarten to the college and university and the life beyond the school. We have had to divide in order to master this tremendous program and so, have attacked the parts—the kindergarten, the elementary, the junior high school, the high school, the college, the trade and professional schools. Committees have studied and reported on these parts and through the years great improvement has been made to each of the segments of the educational program but with no great success in the union of the segments.

Teachers and school administrators have been looking at education from the outside in while the child, the subject being educated, must look at it from the inside out. It is time to take the child's point of view and then, like Yankee Doodle, we may not be able to see the town for the houses—the educational system for the parts. To the child our method of educating him must appear kaleidoscopic and full of contradictions and inconsistencies. The child must feel that his education is built up much like the fabricated automobile which takes form, if not life, as it passes from worker to worker along the carrier. He must feel that the automobile receives better treatment than his education, for there each succeeding worker takes for granted that the preceding workers have done their work well and so does not do over again what has already been done but puts on his part with every connection ready for the next following part. The child passes from teacher to teacher, all different, usually two or three

a year in the beginning years and five or more a day in the later years, with exposure here to one subject and there to another subject, with conduct applauded in the kindergarten disapproved in the first grade, with ways of doing approved in the eighth grade found wrong in the high school, with each new group of teachers discounting if not condemning the work of the previous group and requiring repetition and relearning of what already is known, so that ten years are required to go an eight-year journey, and when four must start that one may get through to the end, or even ten must start that one may get to the end of a little more distant journey; for there are sunken roads across his way where part is supposed to join part and chasms by the side separating his way from life and these must be filled by the fallen comrades before he can pass on to the diploma station at the end of his way.

The Committee on Continuity of Education will seek to collect some facts and opinions, organize them, and if possible, point a way for a better coördination of the school with the home and the non-school part of life and the different parts of school education with others and contiguous parts to the end that the educational program may become more organic, at least with parts merging into the others that friction is brought to a minimum and chasms no longer exist. A part of our program concerns itself with the relationship of school education to the home, church, the out-of-school environment of the child; another with the integration of the parts within the school, the kindergarten, the elementary, the junior high, the trade and the senior high school, and a third will consider the relations of the college to the high school and professional and other higher schools to each other.

SECRETARY'S MINUTES

BOSTON MEETING

OFFICERS

President—HOMER H. SEERLEY, President State Teachers' College.....Cedar Falls, Iowa
Vice-President—JOSEPHINE CORLISS PRESTON, State Superintendent of Public Instruction.....
Olympia, Wash.
Secretary—ADELAIDE STEELE BAYLOR, Federal Agent for Home Economics..Washington, D. C.

FIRST SESSION—SATURDAY MORNING, JULY 1, 1922

The meeting was called to order by the President at 9:30 A. M. in the Assembly Hall of Wentworth Institute.

The Secretary presented a report on the personnel of the present membership of the National Council of Education, its distribution throughout the country, and changes in the past five years. This report brought out the information that since the last annual meeting of the council four members, Calvin N. Kendall, John H. Phillips, Lorenzo D. Harvey, and Frank A. Fitzpatrick, had been called by death. On motion of Charles

H. Keyes the following committee was appointed by the chairman to draft appropriate resolutions paying fitting tribute to the valuable service of these members, not only to the Council but to education in general: Charles H. Keyes, *Chairman*, John R. Kirk, A. J. Matthews, A. E. Winship, and Olive M. Jones.

The president gave a brief address on *THE OUTSTANDING ISSUE IN AMERICAN EDUCATION*.

John J. Tigert, U. S. Commissioner of Education, gave a survey of the *ACTIVITIES OF THE U. S. BUREAU OF EDUCATION*, during the year, and Charl O. Williams, president of the National Education Association, discussed *THE ACTUAL RESULTS OF THE YEAR*.

The president announced the organization of a Research Department in the National Education Association and appointed a Committee from the Council to meet with John K. Norton, newly appointed director of this Research Department, to determine plans for coöperation between the Council and the new department. The following were named on this Committee: *Chairman*, A. E. Winship, Mrs. Mary D. Bradford, John R. Kirk, Adelaide S. Baylor, H. Lester Smith, A. J. Matthews, and Cornelia S. Adair.

The final report of the Committee on Educational Surveys was presented by the Chairman, A. E. Winship.

SECOND SESSION—SATURDAY AFTERNOON, JULY 1, 1922

The meeting was called to order by the president at 2:30 P. M. in the Assembly Hall of Wentworth Institute.

The Secretary presented the following report for the Membership Committee, which was unanimously approved.

The Committee on Membership met at Wentworth Institute Saturday July 1, at 8:30 A. M. and 12:30 P. M., and submitted the following recommendations for supplying vacancies in office and in the membership of the Council:

OFFICERS:—(1) President—J. M. Gwinn, New Orleans, La., term expiring in 1925, to succeed Homer H. Seerley. (2) Vice-President—Ada Van Stone Harris, Pittsburgh, Pa., term expiring in 1925, to succeed Mrs. Josephine Corliss Preston.

EXECUTIVE COMMITTEE—David B. Corson, Newark, New Jersey, term expiring in 1925, to succeed J. M. Gwinn, president elect.

MEMBERSHIP COMMITTEE—(1) Olive M. Jones, term expiring in 1925 to succeed herself. (2) Mrs. Cora Wilson Stewart, term expiring in 1925, to succeed herself.

MEMBERSHIP—Class of 1916 with terms expiring in 1922, elected to succeed themselves with terms expiring in 1928: James H. Van Sickle, Springfield, Mass.; Minnie J. Nielson, Bismarck, North Dakota; Charles E. Chadsey, Urbana, Ill.; J. Stanley Brown, DeKalb, Ill.; W. A. Jessup, Iowa City, Iowa; Grace M. Shepherd, Maryville, Mo.; Robert J. Aley, Indianapolis, Ind.; E. M. Bainter, Kansas City, Mo.; Albert E. Winship, Boston, Mass.

Class of 1922 with terms expiring in 1928: M. G. Clark, Sioux City, Ia., to succeed L. R. Alderman, class of 1916 with term expiring in 1922.

The Committee was highly appreciative of the splendid service rendered by Dr. Seerley in his term of office as president and regretted that he felt it necessary to decline nomination for a second term.

The Committee recommends that, according to a plan to be devised by the

Council, honorary or active honorary members be requested by the Secretary to serve temporarily on committees or in other activities of the Council, in vacancies created by the death of members, such service to continue until the next annual meeting when membership vacancies are supplied.

Because of the close relation existing between the activities of the National Council of Education and certain officers of the National Education Association—as President, Secretary, Chairman of the Board of Trustees, Manager of Publications, and President of the Department of Superintendence—and because of the further fact that whether members of the Council or not the duties of these officers are such as to prohibit attendance at Council meetings, the Committee recommends that the incumbents of these offices be regarded as active *ex officio* members of the Council during their terms of office.

Because of the present importance and magnitude of the visual education movement especially in relation to education and the need of clarifying some situations with a view to appointing a Committee to study the question, Olive M. Jones was designated to discuss the matter before one of the sessions of the Council.

Homer H. Seerley, *Chairman ex officio*.

A. J. Matthews

Olive M. Jones

John R. Kirk

Adelaide S. Baylor, *Secretary ex officio*.

By vote of the Council, the absences of the following named persons, due reason for such absence having been presented previous to the meetings, were excused:

Chicago, 1922—A. J. Matthews, Tempe, Arizona; J. W. Carr, Frankfort, Kentucky; Elizabeth M. Sherman, Oakland, California; Frank L. McVey, Lexington, Kentucky; Margaret S. McNaught, Sacramento, California; Charles H. Judd, Chicago, Illinois; Caroline S. Woodruff, St. Johnsbury, Vermont; R. O. Stoops, York, Pennsylvania, and T. A. Mott, Seymour, Indiana.

Boston, 1922—Milton Bennion, Salt Lake City, Utah; Edward F. Buchner, Baltimore, Maryland; W. A. Brandenburg, Pittsburg, Kansas; Arthur Chamberlin, San Francisco, California; T. E. Johnson, Lansing, Michigan; Charles McKenny, Ypsilanti, Michigan; Margaret S. McNaught, Sacramento, California; Elizabeth M. Sherman, Oakland, California; Harlan Updegraff, Philadelphia, Pennsylvania; H. B. Wilson, Berkeley, California; Thomas D. Wood, New York City; Anna Wilson, Crawfordsville, Indiana, and Georgia Alexander, Indianapolis, Indiana.

The final report of the Committee on Rural Education was presented with John F. Sims, Chairman of the Committee, presiding.

After the Chairman had set forth briefly the results of the work of the Committee, the following speakers, either members of the Committee or coöperating rural experts, were heard: L. N. Hines on THE MOST EFFECTIVE ADMINISTRATION AND TAXING UNIT; George S. Dick on THE ENROUSEMENT OF INTEREST ON THE PART OF THE PEOPLE IN THEIR OWN SCHOOLS; Adelaide S. Baylor on CONSOLIDATION OF RURAL SCHOOLS; John C. Muerman on TRANSPORTATION OF SCHOOL CHILDREN AT PUBLIC EXPENSE; and Fred D. Cram on TESTS AND MEASUREMENTS IN RURAL SCHOOLS.

At the close of these addresses Dr. Sims gave a brief statement of what he proposed to present to the National Education Association at the Wednesday morning meeting, concerning the work of the Committee on Rural Education. He asked for an extension of time for his Committee in order to edit and publish the report. On motion the time was extended for one year.

THIRD SESSION—MONDAY AFTERNOON, JULY 3, 1922

The meeting was called to order by the President at 2 o'clock in the Assembly Hall of Wentworth Institute.

The report of the Executive Committee was made as follows and ordered, by the Chair, to be placed in the minutes:

The Executive Committee met just before the opening of the Council meeting Saturday afternoon.

The personnel of each of the present standing committees was informally discussed, but all changes were left to the pleasure of the respective Chairmen.

No new Committees were appointed but it was recommended that a Committee consisting of the president-elect of the Council, J. M. Gwinn, New Orleans, L. N. Hines, Terre Haute, and Ernest L. Crandall, New York City, be authorized to organize a Committee on Visual Education to report at the 1923 mid-winter meeting of the National Council of Education.

Homer H. Seerley, *Chairman ex officio*.

Anna Laura Force.

Adelaide S. Baylor, *Secretary ex officio*.

J. H. Beveridge, Omaha, Nebraska, President of the Department of Superintendence, addressed the Council on THE PHYSICAL WELFARE OF THE CHILD.

Reports of three Committees were then presented.

During the presentation of the report of the Committee on THE TEACHING OF DEMOCRACY, A. Duncan Yocum, Chairman of the Committee, presided, and after a brief discussion of the topic, introduced speakers who addressed the Council as follows:

The Relation of Judaism to Democracy—Dr. Louis L. Mann, Rabbi of Congregation Mishkan Israel, New Haven, Connecticut.

Protestantism and Democracy—Walter S. Athearn, Dean Boston University School of Religious Education and Social Service, Boston, Massachusetts.

Contributions of Catholicism to Democracy—Reverend Father Augustine F. Hickey, Director of Diocesan Catholic Parochial Schools, Boston, Massachusetts.

Katherine D. Blake, chairman of the Committee on CHANGES NEEDED IN THE ELEMENTARY SCHOOL COURSES, presided when the report of her Committee was given. She spoke briefly of the work accomplished and introduced topics and speakers as follows:

History—Mary McSkimmon, Brookline, Massachusetts.

Science—Howard R. Driggs, Salt Lake City, Utah.

Arithmetic—Theda Gildermeister, Winona, Minnesota.

Training for Parenthood—Elizabeth A. Woodward, New York City.

This was the final report of the Committee on CHANGES NEEDED IN THE ELEMENTARY SCHOOL COURSES. It was, therefore, adopted and a motion carried that the Council recommend to the Executive Committee of the National Education Association that said report be printed.

Charles H. Keyes, Acting Chairman of the joint committee on HEALTH PROBLEMS IN EDUCATION, presided during the presentation of the report of that Committee, and before introducing the speakers, gave a brief review of the history of the Committee. Speakers were then introduced by him with topics as follows:

The School's Part in the Conservation of Child Health—William H. Burnham, Clark University, Worcester, Massachusetts.

Health Project in the Elementary Classroom—Emma Dolfinger, Louisville Normal School, Louisville, Kentucky.

Charles H. Keyes, chairman of a committee to pay fitting tribute to members of the Council who were called by death since the last annual meeting, reported as follows:

The past year has been severe upon the personnel of the National Council of Education in the removal by death of four eminent educational leaders.

John Herbert Phillips who was with us, in apparent health, at Des Moines a year ago died in the Birmingham hospital soon after his return, July 21. Born in Covington, Kentucky, educated at Marietta College, with abundant graduate work in universities, he became superintendent of Birmingham schools when there was one school building and seven teachers, and in thirty-eight years he built up one of the most modern school systems of the country with forty school buildings and nine hundred teachers. He was eminently scholarly and a rare gentleman. He was one of the first members of the National Council of Education and constant in his attendance. His presidency was highly efficient.

On September 2, 1921 after a prolonged illness Calvin Noyes Kendall ceased his labors. Born in rural New York, he was twenty-four years of age when he graduated from college. He taught in private schools in the West until at twenty-seven years of age he became principal of the high school of Jackson, Michigan. Immediately his professional career went forward by leaps and bounds. He was superintendent of Jackson and Saginaw schools, put New Haven on the public-school map of New England, kept Indianapolis on the front rank among American cities, and as State Commissioner of New Jersey won for the State, in the Ayres Index, the honor of being the only State, east of the Mississippi, to be among the first ten in educational achievement. His was a captivating personality, genial and genuine. He was president of the National Council of Education in 1914-15 and of the Department of Superintendence in 1921.

Frank A. Fitzpatrick had a place in the hearts of the senior members of the Council quite unlike that held by any other. For a quarter of a century after he retired from professional activity as a Superintendent he had a commanding influence in the National Council of Education due to his rare professional and scholastic attainment and exceptional personality. He was one of the best read men among us, and one of the sanest professional thinkers. He knew Dr. William T. Harris better than did any other member of the Council. His presidency of the National Council of Education did much to promote its influence. Whoever had the friendship of Frank A. Fitzpatrick loved and admired him.

Lorenzo Dow Harvey was one of the brilliant and skilful leaders of the National Council of Education, of the Department of Superintendence of which he was president in 1900, and of the National Education Association of which he was president in 1909. He was a commanding figure in public-school affairs in Wisconsin for nearly fifty years. He was county superintendent, principal of the

largest State Normal School at Milwaukee, State superintendent and President of Stout Institute at Menomonie. A princely fellow, a leader among men of affairs, loyal in comradeship, of scholarly attainments, abounding in art and wisdom, an exquisite gentleman was L. D. Harvey.

Charles H. Keyes, *Chairman*, Saratoga Springs, N. Y.

John R. Kirk, Kirksville, Mo.

Olive M. Jones, New York City.

A. J. Matthews, Tempe, Arizona.

A. E. Winship, Boston, Mass.

On motion the Secretary was authorized to spread this report on the records of the Council and send a copy to each of the bereaved families.

An open forum of the Committee on PARTICIPATION OF TEACHERS IN SCHOOL MANAGEMENT was also held on the afternoon of July 3, in Room No. 9, Wentworth Institute. This forum was under the leadership of Cornelia S. Adair, Richmond, Va., acting chairman of the committee.

FOURTH SESSION—WEDNESDAY AFTERNOON, JULY 5, 1922

The meeting was called to order by the president in Room No. 9, Wentworth Institute.

David B. Felmley, president of Illinois State Normal University, reported for the Sub-Committee on the Course of Study in Teachers Colleges.

Adelaide S. Baylor, chairman of the Committee on Problems of Vocational Education, presided during the presentation of that report stating the personnel of the Committee, the steps thus far taken in organizing the work and that the first problem selected for study was Part-time Education.

Mrs. Susan M. Dorsey, superintendent of schools, Los Angeles, California, told of the contributions Part-time Education, in its less than two years of existence in that city, had made in training the youth.

Anna A. Kloss, State Supervisor of Teacher Training in home economics, Boston, Mass., reported what Part-Time Education in Massachusetts had done for employed girls and women.

Agnes E. Doherty, Department of Social Science, High Schools, St. Paul, Minnesota, and a member of the Sub-Committee on Contributions of Part-time Education, told what steps she was taking in the study of her division of the report, and her estimate of some of the needs in a part-time program of instruction.

The request of the Chairman of the Committee on Problems of Vocational Education that she be allowed to withdraw from the chairmanship and serve as a member of the Committee and that a school administrator in one of the States be appointed in her stead was granted with the proviso that she serve as executive secretary of the Committee.

Honorable Payson Smith, State Commissioner of Education in Massachusetts, was made Chairman.

The following reports of Committees were then made by the respective Chairmen:

Report of Committee on Racial Well-being, Helen C. Putnam, M. D.,

Providence, R. I.; Preliminary Report of Committee on the Status of the American Women Teachers, Anna Laura Force, Denver, Colorado; Preliminary Report of Committee on Teacher Welfare, John W. Carr, Frankfort, Kentucky.

At the close of the last report a committee consisting of John W. Carr and the Secretary was designated to confer with the Executive Committee of the National Education Association with a view to securing the support of that body in the organization of a Committee that would be representative and would develop a helpful report on teacher welfare. The plans outlined by Mr. Carr in his report were endorsed and he was continued as chairman of any new committee that might be organized.

Recommendations of the Executive Committee, on the organization of additional committees were submitted and endorsed as follows:

The Executive Committee recommends:

1. That the following named members of the Council constitute the nucleus of a Committee on Visual Education: *Chairman*, L. N. Hines, Mrs. Susan M. Dorsey, T. W. Butcher, Olive M. Jones, Mrs. Cora Wilson Stewart, William C. Bagley, and David B. Corson.

To this number and others to be determined upon by the preliminary committee of the President-elect, Chairman Hines, and Dr. Crandall, it is recommended that coöperating experts be added from a list compiled by L. N. Hines and Ernest L. Crandall, and that the latter be one of these coöperating members.

2. The President's annual message to the Council, this year, has certainly led to the conclusion that the hope of our elementary schools rests upon the training of teachers in service. Statistics and conditions constantly verify, in the minds of all of us, the truth of this statement. We are, therefore, recommending that a committee to study Training of Teachers in Service be organized in the National Council, and that Thomas W. Butcher, President State Normal School, Emporia, Kansas, be designated as chairman of this Committee. We further recommend that J. M. Gwinn, president elect of the Council, Anna Laura Force, member the Executive Committee and Thomas W. Butcher, Chairman elect, constitute a Committee of three to organize the new Committee for Training Teachers in Service.

H. H. Seerley, *Chairman ex officio*.

Anna Laura Force.

Adelaide S. Baylor, *Secretary ex officio*.

A letter from Dr. T. W. Bicknell, first president of the National Council of Education, was read, in which he extended greetings to the Council and explained that his absence from the meeting, which he was scheduled to address on Saturday, was due to confusion of dates in the first announcement of the meeting. The Secretary was authorized to acknowledge receipt of his letter and extend to him the felicitations of the National Council of Education.

H. Lester Smith, Bloomington, Indiana, reported for the Committee appointed at the first session to confer with John K. Norton, director of the new Research Department of the National Education Association, in order to develop a schedule of coöperation between the National Council of Education and the Research Department. This report which herewith follows was approved by the Council:

Your Committee met July 2, 2:00 P. M. in the Hotel Lenox and after extended discussion voted unanimously in favor of the following:

Having conferred with John K. Norton, Department of Research of the National Education Association, and having been informed by him that the purpose of this bureau is to coöperate whenever possible in the collection, tabulation, and dissemination of educational data, your committee recommends to the council the acceptance of the offer of the Department of Research of the National Education Association to be of service to the Council through its investigating Committees, whenever these committees desire such assistance and we further recommend that the various committees of the Council freely avail themselves of the proffered service.

Respectfully submitted,

A. E. Winship, *Chairman*
Cornelia Adair
Mrs. Mary D. Bradford
Adelaide Steele Baylor
John R. Kirk
A. J. Matthews
H. Lester Smith.

Appreciation of the very great service rendered the Council by the retiring president, during his term of office, was expressed both by word and applause just before he announced the adjournment of the last session of the Council under his administration. Adjourned.

NATIONAL COUNCIL OF EDUCATION

OFFICERS FOR 1922-23

OFFICERS, STANDING COMMITTEES, MEMBERS

J. M. GWINN, <i>Superintendent of Schools</i>	New Orleans, La...	<i>President</i>	Term expiring in 1925
ADA VAN STONE HARRIS, <i>Director of Primary Instruction and Elementary Practice Teaching</i>	Pittsburgh, Pa.....	<i>Vice-President</i> ..	Term expiring in 1925
ADELAIDE STEELE BAYLOR, <i>Federal Agent for Home Economics</i>	Washington, D. C...	<i>Secretary</i>	Term expiring in 1923

EXECUTIVE COMMITTEE

THE PRESIDENT, *ex officio*, chairman

ANNA LAURA FORCE.....	Denver, Colo.....	Term expiring in 1924
DAVID B. CORSON, <i>Superintendent of Schools</i> ..	Newark, N. J.....	Term expiring in 1925
A. J. MATTHEWS, <i>President, State Normal School</i>	Tempe, Ariz.....	Term expiring in 1923

COMMITTEE ON MEMBERSHIP

THE PRESIDENT, *ex officio*, chairman

JOHN M. KIRK, <i>President State Teachers College</i>	Kirksville, Mo.....	Term expiring in 1923
WILLIAM B. OWEN, <i>President of the Chicago Normal College</i>	Chicago, Ill.....	Term expiring in 1923
CARROLL G. PEARSE, <i>President State Normal School</i>	Milwaukee, Wis.....	Term expiring in 1924
J. STANLEY BROWN, <i>President State Normal School</i>	De Kalb, Ill.....	Term expiring in 1924
CORA WILSON STEWART, <i>Chairman National Illiteracy Commission</i>	Frankfort, Ky.....	Term expiring in 1925
OLIVE M. JONES, <i>Principal of Public School No. 120</i>	New York, N. Y.....	Term expiring in 1925

MEMBERS

TERMS TO EXPIRE IN 1923

Elected by the Association

- R. G. JONES, *Superintendent of Schools*, Cleveland, Ohio.
 WILLIAM B. OWEN, *President*, Chicago Normal College, Chicago, Ill.
 M. E. PEARSON, *Superintendent of Schools*, Kansas City, Kans.
 UEL W. LAMKIN, *President*, Northwestern Missouri Teachers College, Maryville, Mo.
 A. J. MATTHEWS, *President*, State Normal School, Tempe, Ariz.
 SAMUEL A. BAKER, *State Superintendent of Public Instruction*, Jefferson City, Mo.
 WILLIAM P. BURRIS, *University of Cincinnati*, Ohio.
 J. G. CRABBE, *President*, State Teachers College, Greeley, Colo.
 MARGARET S. McNAUGHT, *State Commissioner of Elementary Schools*, Sacramento, Calif.
 MARY McSKIMMON, *Principal*, Pierce School, Brookline, Mass.

Elected by the Council

- ADA VAN STONE HARRIS, *Director of Primary Education*, City Training School for Teachers, Pittsburgh, Pa.
 JOSEPH SWAIN, *State Department of Public Instruction*, Harrisburg, Pa.
 MRS. SUSAN M. DORSEY, *Superintendent of Schools*, Los Angeles, Calif.
 E. E. BASS, *Superintendent of Schools*, Greenville, Miss.
 FREDERIC E. FARRINGTON, *Chevy Chase School*, Washington, D. C.
 G. W. A. LUCKEY, *U. S. Bureau of Education*, Washington, D. C.
 GEORGE L. TOWNE, *University Publishing Co.*, Lincoln, Nebr.
 THOMAS W. PALMER, *President*, Alabama College for Women, Montevallo, Ala.
 T. E. JOHNSON, *State Superintendent of Public Instruction*, Lansing, Mich.
 J. A. C. CHANDLER, *President*, College of William and Mary, Williamsburg, Va.

TERMS TO EXPIRE IN 1924

Elected by the Association

- THOMAS A. MOTT, *Superintendent of Schools*, Seymour, Ind.
 C. B. GLENN, *Superintendent of Schools*, Birmingham, Ala.
 FRANCIS G. BLAIR, *State Superintendent of Public Instruction*, Springfield, Ill.
 E. W. BUTTERFIELD, *State Commissioner of Education*, Concord, N. H.
 M. C. BRITTAIN, *State Superintendent of Public Instruction*, Atlanta, Ga.
 CHARLES S. MEEK, *Superintendent of Schools*, Toledo, Ohio.
 I. N. HINES, *President*, State Normal School, Terre Haute, Ind.
 H. W. FOGHT, *President*, Northern Normal and Industrial School, Aberdeen, S. Dak.
 C. E. BEACH, *Superintendent of Schools*, Enumclaw, Wash.
 HELEN C. PUTNAM, M. D., *American Academy of Medicine*, Providence, R. I.

Elected by the Council

- SARAH LOUISE ARNOLD, *Riverbank Court*, Cambridge, Mass.
 EDWIN S. MONROE, *Superintendent of Schools*, Hammond, Ind.
 P. E. McCLENAHAN, *State Superintendent of Public Instruction*, Des Moines, Iowa.
 J. W. K. DWYER, *Superintendent of Schools*, Anaconda, Mont.
 GRACE C. STRACHAN FORSYTH, 20 West 72d Street, New York, N. Y.
 ADELAIDE S. BAYLOR, *Federal Agent for Home Economics*, Washington, D. C.
 CARLETON B. GIBSON, *Superintendent of Schools*, Savannah, Ga.
 CORNELIA S. ADAIR, *Treasurer of the National Education Association*, Richmond, Va.
 OSCAR T. CORSON, R. D. No. 2, Oxford, Ohio.
 JOHN W. CARR, *Educational Department*, Capitol, Frankfort, Ky.

TERMS EXPIRE IN 1925

Elected by the Association

- THOMAS E. FINEGAN, *State Superintendent of Public Instruction*, Harrisburg, Pa.
 MARY D. BRADFORD, 2603 Franklin Street, Wilmington, Del.
 MARIE GUGLE, *Assistant Superintendent of Schools*, Columbus, Ohio.
 JESSE H. NEWLON, *Superintendent of Schools*, Denver, Colo.
 GEORGE H. REAVIS, *University of Pittsburgh*, Pittsburgh, Pa.

Elected by the Council

- MRS. FANNIE FERN ANDREWS, 405 Marlborough Street, Boston, Mass.
 ANNA WILLSON, *Superintendent of Schools*, Crawfordsville, Ind.
 CHARLES H. KEYES, *President*, Skidmore College, Saratoga Springs, N. Y.
 J. F. SIMS, *President*, State Normal School, Stevens Point, Wis.
 CHARLES H. JUDD, *University of Chicago*, Chicago, Ill.

TERMS EXPIRE IN 1925 (Continued)

Elected by the Association

- J. G. COLLICOTT, *Superintendent of Schools*, Columbus, Ohio.
 GEORGE N. CHILD, *Superintendent of Schools*, Salt Lake City, Utah.
 PAYSON SMITH, *State Commissioner of Education*, Boston, Mass.
 FRED M. HUNTER, *Superintendent of Schools*, Oakland, Calif.
 CHARL ORMOND WILLIAMS, *County Superintendent of Schools*, Memphis, Tenn.

Elected by the Council

- R. O. STOOBS, 515 West 121st Street, New York, N. Y.
 A. DUNCAN YOCUM, *Professor of Educational Research and Practice*, University of Pennsylvania, Philadelphia, Pa.
 JOSEPHINE C. PRESTON, *State Superintendent of Public Instruction*, Olympia, Wash.
 THOMAS D. WOOD, *Columbia University*, New York, N. Y.
 E. C. BROOKS, *State Superintendent of Public Instruction*, Raleigh, N. C.

TERMS EXPIRE IN 1926

Elected by the Association

- CHARLES MCKENNY, *President, State Normal College*, Ypsilanti, Mich.
 DAVID B. FELMLEY, *President, State Normal College*, Normal, Ill.
 JOHN R. KIRK, *President, State Teachers College*, Kirksville, Mo.
 DAVID B. JOHNSON, *President, Winthrop Normal and Industrial College*, Rock Hill, S. C.
 ELIZABETH HALL, *Assistant Superintendent of Schools*, Minneapolis, Minn.
 MARY C. C. BRADFORD, 1735 Bellaire Street, Denver, Colo.
 ARTHUR H. CHAMBERLAIN, *Editor Sierra Educational News*, San Francisco, Calif.
 P. W. HORN, 130 Arquitectos, Mexico City, D. F., Mexico.
 H. LESTER SMITH, *Indiana University*, Bloomington, Ind.
 J. W. CRABTREE, *Secretary, National Education Association*, Washington, D. C.

Elected by the Council

- W. M. DAVIDSON, *Superintendent of Schools*, Pittsburgh, Pa.
 EDWARD BUCHNER, *Johns Hopkins University*, Baltimore, Md.
 FRANK B. GILBERT, *State Education Building*, Albany, N. Y.
 HARLAN UPDEGRAFF, *Professor of Educational Administration, University of Pennsylvania*, Philadelphia, Pa.
 CORA WILSON STEWART, *Chairman, Illiteracy Commission*, Frankfort, Ky.
 KATHERINE D. BLAKE, 101 West 85th Street, New York, N. Y.
 OLIVE M. JONES, *Principal Public School No. 120*, New York, N. Y.
 CAROLINE WOODRUFFE, *Principal Vermont State Teachers' Course*, St. Johnsbury, Vt.
 C. P. CARY, *Madison, Wis.*
 H. H. SEERLEY, *President, State Teachers College*, Cedar Falls, Iowa.

TERMS EXPIRE IN 1927

Elected by the Association

- J. W. SEARSON, *State University*, Lincoln, Nebr.
 H. B. WILSON, *Superintendent of Schools*, Berkeley, Calif.
 AGNES E. DOHERTY, 2078 Summit Avenue, St. Paul, Minn.
 MILTON BENNION, *University of Utah*, Salt Lake City, Utah.
 ROBERT H. WRIGHT, *President East Carolina Teachers' College*, Greenville, N. C.
 ANNA LAURA FORCE, *Principal of the Lincoln School*, Denver, Colo.
 WALTER R. SIDERS, *Superintendent of Schools*, Pocatello, Idaho.
 L. H. MINKEL, *Superintendent of Schools*, Fort Dodge, Iowa.
 F. L. MCVEY, *President, University of Kentucky*, Lexington, Ky.
 W. C. BAGLEY, *Teachers College, Columbia University*, New York, N. Y.

Elected by the Council

- MAY TRUMPER, *State Superintendent of Public Instruction*, Helena, Mont.
 GEORGIA ALEXANDER, 520 N. Audubon Road, Indianapolis, Ind.
 W. A. LEWIS, *President, State Normal School*, Hays, Kans.
 D. B. WALDO, *President, State Normal School*, Bellingham, Wash.
 J. H. WAGNER, *President, State Normal School*, Las Vegas, N. Mex.
 DAVID B. CORSON, *Superintendent of Schools*, Newark, N. J.
 I. I. CAMMACK, *Superintendent of Schools*, Kansas City, Mo.
 NEIL C. McDONALD, *New York, N. Y.*
 ANNIE WEBB BLANTON, *State Superintendent of Public Instruction*, Austin, Tex.
 J. E. BURKE, *Superintendent of Schools*, Boston, Mass.

TERMS EXPIRE IN 1928

Elected by the Association

- J. M. GWINN, *Superintendent of Schools*,
New Orleans, La.
CARROLL G. PEARSE, *President, State Normal School*, Milwaukee, Wis.
E. E. OBERHOLTZER, *Superintendent of Schools*, Tulsa, Okla.
THOMAS W. BUTCHER, *President Kansas State Normal School*, Emporia, Kans.
GEORGE D. STRAYER, *Teachers College*, Columbia University, New York, N. Y.
W. A. BRANDENBURG, *President, Manual Training Normal School*, Pittsburg, Kans.
E. G. DOUDNA, *Superintendent of Schools*, Wisconsin Rapids, Wis.
JOHN CALLAHAN, *State Superintendent of Public Schools*, Madison, Wis.
MAY WADE, *Elementary Teacher*, Berkeley, Calif.
S. B. UNDERWOOD, *Superintendent of Schools*, Raleigh, N. C.

Elected by the Council

- MELVIN G. CLARK, *Superintendent of Schools*, Sioux City, Iowa.
W. A. JESSUP, *President, State University of Iowa*, Iowa City, Iowa.
JAMES J. VAN SICKLE, *Superintendent of Schools*, Springfield, Mass.
GRACE M. SHEPHERD, *Northeastern State Teachers College*, Maryville, Mo.
MINNIE J. NIELSON, *State Superintendent of Public Instruction*, Bismarck, N. D.
ROBERT J. ALEY, *President, Butler College*, Indianapolis, Ind.
CHARLES E. CHADSEY, *Dean of School of Education, State University*, Urbana, Ill.
E. M. BAINTER, *Junior College*, Kansas City, Mo.
J. STANLEY BROWN, *President, State Normal School*, De Kalb, Ill.
ALBERT E. WINSHIP, *Editor, Journal of Education*, 6 Beacon Street, Boston, Mass.

ANNUAL REPORT OF THE SECRETARY

ADELAIDE STEELE BAYLOR, FEDERAL AGENT FOR HOME ECONOMICS,
WASHINGTON, D. C.

In offering a report as Secretary of the National Council of Education it has occurred to me that you, as members, might be interested in a somewhat informal and brief statement of the personnel of the Council, rather than one dealing with an analysis of the educational work of this body, with which you are all familiar and which has been so well brought out by the present Chairman in his annual address and in his organization of work for the Council. A brief résumé of the history and growth of the National Council of Education furnished by the Secretary on request, was published in the March, 1922, number of the *Journal of the National Educational Association*.

Of the 120 members constituting the National Council of Education at the close of the last annual meeting, 53 held administrative positions in public-school education; 14 State superintendents, 27 city superintendents, 7 assistant superintendents or supervising principals, one county superintendent of schools, and 4 principals of elementary schools. Twenty-nine were heads of universities, colleges, normal schools and technical schools—16 being heads of State normal schools, 3 of universities, 3 of colleges, one of a junior college, 2 of city normal schools and 4 of technical schools; fifteen were on the staff of universities or colleges, 7 of these being deans in the institutions they represent. One is a member of a high-school staff, while the remaining 22 may be listed as miscellaneous or an unclassified group, largely because each one is in a class by himself doing an important piece of educational work.

Since the last annual meeting of the Council, three members have been called by death: John H. Phillips, Superintendent of Schools, Birmingham, Alabama; Calvin N. Kendall, Commissioner of Education, New Jersey, and Lorenzo D. Harvey, President Stout Institute, Menomonie, Wisconsin. All were outstanding figures in the educational world and able members of the Council.

Forty-one States are represented in the present membership of 118; 18 States with 1 member each, 8 States with 2 members each, 2 with 3 members each, 3 with 4 members each, 3 with 5 members each, 3 with 6 members each, 2 with 7 each, 1 with 8, and 1 with 10. Article I of the Constitution of the National Council of Education relates to membership and reads at one point: "No State shall be represented in the Council by more than 7 members." It is not possible always to observe this ruling inasmuch as educators are migratory and the members of the Council may move into a State where the quota is already full and no ruling has ever been made so far as the Secretary is aware covering this emergency. This explains why New York has ten members at the present time and California, 8. It means, however, that in supplying vacancies at this meeting no one is eligible from either of those States and no one from Indiana or Pennsylvania, each of which now has seven members.

Mexico has a member of the Council in the person of P. W. Horn, former superintendent of schools, Houston, Texas, and now in charge of a school for Americans in Mexico City, Mexico.

At the last annual meeting of the Council a special type of membership was created to be known as Active Ex-officio Membership and applicable to the United States Commissioner of Education. An honorary active membership has also been created, and six names were placed on the list: P. P. Claxton, Thomas C. Miller, W. H. Elson, Frank A. Fitzpatrick, John W. Cook, and J. Y. Joyner. Of these six members Frank A. Fitzpatrick and John W. Cook have been called by death since the last annual meeting.

Since 1915-16, sixteen active memberships have lapsed by death; G. B. Cook, Bettie A. Dutton, E. T. Fairchild, H. A. Gass, J. N. Greenwood, F. L. Keeler, John McDonald, G. N. Phillips, Nathan Schaeffer, Z. X. Snyder, W. E. Scribner, Mrs. Ella Flagg Young, Ben Blewett, Calvin N. Kendall, John H. Phillips, and Lorenzo D. Harvey. Recently four members of the honorary list have been reelected to active membership: Sarah Louise Arnold, H. W. Foght, Charles McKenny, and Payson Smith.

The honorary list as it now stands numbers 112. Sixteen honorary members whose names were on the list in 1917 when the present incumbent first assumed the duties of secretaryship, are not now living: H. B. Brown, Nebraska Cropsey, Aaron Gove, W. N. Hailman, Lewis H. Jones, Geo. H. Martin, J. L. Snyder, W. H. Maxwell, Jesse F. Millspaugh, Warren D. Parker, Irwin Shepard, Oliver S. Westcott, Delia L. Williams, H. B. Frissell, R. B. Fulton, and L. L. Wright.

Geographically, 86 of the present membership is located east of the

Mississippi River and 32 West. While only approximately 25 per cent of the members are women, yet a little over 40 per cent of them hold important offices in the Council.

Recently your Secretary undertook to check up the honorary list, on which were the names of several people unknown to her personally. Even the records of the National Education Association could not tell the story and personal letters were sent, bringing information in four or five instances of deaths of members whose names were still on the honorary list and on the records of the Secretary of the N. E. A. It is probably safe to assume that the list is now practically correct.

By a ruling of the Council, absence from four consecutive meetings causes membership to lapse, and by a recent ruling, attendance is interpreted to mean that members shall be present for at least one session of the meeting. The keeping of the records and checking up of attendance is one of the arduous duties of the Secretary. With open meetings of the Council it is often difficult to detect the presence of all who are members and therefore in order to check up attendance it is occasionally necessary to write members to verify the Secretary's records covering presence or absence. In practically all instances of such inquiry the responses that have come from the members have been prompt and courteous and the Secretary desires to take this occasion to express her appreciation of this aid.

By an unwritten ruling, so far as the Secretary is informed, absences have been excused when due notice of such absence has been filed with the Secretary. At the summer meeting in Des Moines, such absence was acted upon by the Council, and fifteen members were excused. At the Chicago meeting in the winter, eleven such excuses were received. These were not presented to the Council for action at that meeting and should be taken up at this time with others now in the hands of the Secretary.

Although for many years actively identified with the N. E. A. with a large acquaintance among its members and also a member of the National Council for several years, the Secretary is forced to confess that on first assuming the duties of her office, there were many unfamiliar faces in the group before her. Now she is pretty well acquainted with the entire membership and this has been made possible because members have come to the desk and thus made themselves and their presence at the meeting known to the Secretary. We hope this will continue.

While the Secretary feels privileged to serve so important a body in the N. E. A. she also offers apology for the many shortcomings in a service for which an already full schedule of work leaves little time and energy. As Federal Agent for Home Economics, the Secretary's duties take her into twenty-four States. On these occasions when time and opportunity permit, she endeavors to get in touch with the members of the Council, if only to exchange a word of greeting, either in person or over the phone. In the past two years approximately thirty members of the Council have been reached on these field trips. It so happens in a few instances, because of their administrative positions, members are met by the Secretary on official business relating to her work as Federal Agent.

The Secretary desires to hold herself ready at all times to serve not only the Council as a body, but the individual members so far as the limits of her time will permit, and trusts they will feel free to take up with her any points that need clarifying, either as they concern the organization and membership of the Council or its educational program.

THE OUTSTANDING ISSUE IN AMERICAN EDUCATION

HOMER H. SEERLEY, PRESIDENT OF IOWA STATE TEACHERS
COLLEGE, CEDAR FALLS, IOWA

American education has a great shortage in the rank and file of elementary teachers in the public schools due to the undesirableness of the kind of service expected and due to the impossibility of any betterment of condition likely to occur in the future of said service. The rank and file of these teachers are deficient in scholarship and training and their successors are not being trained because the students being educated do not want to enter the vocation and hence are not making preparation for efficiency in these undesirable lines. The great issue of today is that of adjusting elementary school work so as to make the improvement of the service an actual possibility.

There is today no certain chance of promotion in acceptability and in income of such teachers because the expenditures now required are as large as the public system of taxation can grant and the kind of work assigned has neither the attractiveness of future development or of personal progress that professionalism requires. On this account it is impossible to make such duties appeal to young people, as the narrowness of the service required is depressing and discouraging. There being no real specialization in the treadmill work required and there being no remarkable information or development expected, the making of such teachers professional is not yet a certainty, as the work expected and assigned is more of a trade than a learned vocation.

In the meantime education in higher lines has become practically special rather than general, and hence all colleges and universities are offering special training in all lines of service rather than the general scholarship that this kind of teaching requires. This is done not at the initiative of the faculties or administrators, but to meet the demand of patrons and students. Expertism and specialization give the trend to modern education and the pride of the output depends upon the notable experts that are produced. There is no remedy to this as the choice of courses has given opportunities for all kinds of specialization that persons in preparation for life demand. Hence there is no opportunity for training volunteer students for such public service as the common schools desire to have.

The work of the world must always be done by the so-called common people. Hence our educational system fails to reach this standard since

all education as now conducted seeks uplift, advancement, and larger possibilities than the masses require to do the service of labor and of co-operation that the greater number of people have thus far filled. If the elementary schools are to be stressed by attempting extraordinary improvement in the personnel of the teaching force in said service, the present attempts are not meeting the object sought in any particular.

The profession of law, medicine, theology, business, or education does not any longer receive in the colleges and the universities a training and a preparation for practice in the small city or town or country community, as the former lawyer, doctor, minister, and business man, as well as the teacher, have passed from these lines of general service into the class of specialists and experts, and hence the world is now a patron of many persons in many special fields rather than the patron of one in each line of intellectual and professional activity—all of these in the larger centers and none of them in the places where practice is general and special needs are not remunerative. This has made a great change in civilization and has made the problem of business of all kinds and of preparation of all kinds a different proposition.

The attempt to make teaching a profession has produced the tendency to expect experts even where actual expertness is not needed. The policies of rural education of fifty years ago have failed to function because of this trend of education and hence consolidation has become the new philosophy in order to increase centers of populations for the endeavor and this attempt has developed consolidated schools, large high schools, immense colleges and huge universities in order to have the opportunities for large variety of studies, for extensive organization of multitude of courses for such outcome and for vast opportunities to make experts of the highest order. This is not a possibility in the elementary school as it deals with fundamentals and with the tools of education rather than with any form of specialization whatsoever.

The outstanding educational problem of today in the United States is not to be found in the professional schools, the universities, the colleges or the high schools, however important these services are, but in the elementary schools, the centers for training the masses. Every attempt for their improvement has in mind the necessities of higher education more than the effective training of the children of the American people for real efficiency. This comes from the fact that elementary education is a much more difficult proposition to accomplish than all other educational efforts combined.

It is customary for this situation to be much talked about, much deplored, and much considered by legislators and by educators, but in the end nothing directive has ever been done and no plans now under consideration in any of the States of the American Union are more than tentative compromises with no positive hope of successful solution.

This situation of the elementary teachers demands a new system of education and of training them while in service as an addition to the system of training now offered as preliminary to entering the public service, as there must be a much changed status in the elementary teacher's oppor-

tunities and independence, to secure enough volunteers to give two or more years of preparation before being accepted in the educational system. To meet this exigency there are two agencies now in existence in some States that can be depended upon to give training to these teachers in service. These are the thoroughly organized summer school that is conducted on plans to meet this absolute need by educational institutions now existing and by the States opening summer schools in many more centers for the vacation period. For this purpose the State can secure public-school buildings of high-school standard that are uniformly closed during these weeks of the year. In addition it can offer instruction under an extension system that covers the entire State during the school year. It can organize classes in sufficient number for outside service hours to give these elementary teachers a rapid way of making up deficiencies in scholarship and of advancing professional qualifications and knowledge so that they may meet the standard in training adopted.

This new evolution in teacher training should be compulsory below certain qualifications and should finally relieve the teacher from the giving of much time to what is now camouflaged under the name of professional interest and development. This instruction and training should be provided free for all these teachers, as it is of sufficient importance for the welfare of the schools to make this investment. This system should continue in action until the emergencies that necessitate it no longer exist. By these combinations of effort and coöperation the elementary schools will come to standard by a few years of intensive development of the teachers in service.

THE ACTIVITIES OF THE UNITED STATES BUREAU OF EDUCATION

JOHN J. TIGERT, UNITED STATES COMMISSIONER OF EDUCATION,
WASHINGTON, D. C.

At the last meeting of the National Council on Education at Chicago, I undertook to set out some of the most conspicuous evidences of progress in education, dealing more particularly with educational legislation, rural education in its more significant phases, teachers' salaries, and teacher training. At that time I pointed out that there were many evidences of progress that could not be dealt with in the brief time allotted me. At this time it seemed wise to me to give the Council some conception of the activities of the Bureau of Education during the first year of my administration rather than to undertake to cover any of the phases of education that I omitted at Chicago. These latter are known to you more or less, but you must depend upon me for information with reference to what we are doing in the Bureau of Education.

I have been led to this conclusion likewise because when I addressed the Council a year ago at Des Moines I set out before you the plan of organization which I was putting into operation in the Bureau of Education and

I believe that you will be interested to know what results have accrued from the organization and the program which I have undertaken. I shall not take time here to review the plan of organization, but may say that it has been effective even beyond my expectations. The correlation of effort in the Bureau under a unified plan has worked well in each of the divisions established and has, in my opinion, significantly increased the general efficiency of the Bureau as a whole. The plan of bringing the various divisions together from time to time in conference and particularly the technical staff has been especially helpful and has brought about a better understanding of the mutual efforts of those working in the Bureau and a consequent increase in morale which has been evident to me, particularly during the last few months.

It will not be possible for me to review the manifold activities of the Bureau or to set out in detail the activities of any one division. It is my purpose to give you in a general way what has been accomplished in some of the more outstanding phases of our work.

Rural School Division—The work of the Rural School Division has been carried on in three ways, first, field work; second, research and investigation; third, the dissemination of information through bulletins, leaflets, circulars, and general correspondence. Perhaps the most novel feature of policy in the Rural Division is the plan of directly stimulating progress in rural education by reaching rural superintendents and supervisors with knowledge of the latest and most superior practices and with practical and definite suggestions. Formerly the Bureau undertook to furnish information only through bulletins and publications which were relatively large and therefore required considerable time for preparation. Such publications require from six months to a year for printing after they have been prepared. During the past year we have adopted the policy of getting out much material in leaflets, circulars, and mimeographed form which can be quickly prepared and quickly sent out.

We have completed printed leaflets on the following subjects: Consolidation and Rural Life; Transportation of Rural Pupils at Public Expense; Modern Equipment for a One-room School; Consolidation of Schools in Maine and Connecticut. Mimeographed circulars were completed on the following subjects: Rural Teachers' Library; What Is a Consolidated School?; Digest of State Laws on Transportation of Pupils; Consolidation of Schools and Transportation of Pupils; Salaries of Teachers in Rural Schools, 1922; Salaries of Superintendents and Supervisors.

The following leaflets are in course of preparation: States Whose Laws Encourage Consolidation by Means of State Aid; Summarization of the Essential Features of State Laws Concerning Transportation of Pupils; How Laws Providing for Distribution of State School Funds Affect Consolidation; The One-teacher School Building; Beneficial Results from a District Owned Teacher's Home; A Plan for the Organization of a County System of Agricultural Instruction in Elementary Rural Schools; Objectives in Elementary Rural School Agriculture; Directors of 250 Consolidated Schools; List of State Publications on Consolidation.

While inaugurating this policy of getting fresh information to those working in rural education we have not abandoned, of course, the publication of bulletins. We have completed during the year bulletins on: The Extent and Nature of Rural Supervision in the Forty-eight States; Homes for Teachers in the United States; these are now in the Government Printing Office. We have in course of preparation a bulletin on the History, Progress, and Extent of the Movement for School Consolidation in the United States, and three other bulletins on the subjects of Standardization of Rural Schools and Buildings, the Supervision of One-teacher Schools, and a type of problem-project in nature-study—agriculture suitable for use in formulating a course of study for elementary rural schools.

In the field members of the Rural Division have visited twenty-two different States for the purpose of investigating school conditions, holding and attending conferences on rural education, and addressing educational gatherings. This does not include duplication. In many instances more than one member of the staff visited the same State. Approximately seventy addresses were made; one educational survey of the rural schools of an entire State and one survey of a county were made by members of the staff. During the year thirty sets of slides have been prepared by the Rural Division for free distribution among school officials on the following subjects: 12 sets on school consolidation in the United States; 6 on transportation of school children; 6 sets on rural schools and grounds, and 6 sets on rural school activities. Two films of approximately 1500 feet each have been prepared, one showing consolidation in the different States and one showing supervision of rural schools in the United States.

Requests for information on school conditions and for recommendations concerning administration, organization, and practice in rural schools are received at the rate of from two hundred to five hundred a month.

Division of City School Systems—In general, the work of the Division of City School Systems is similar in plan to that of the Division of Rural Schools—namely, field work, research, and investigation, and dissemination of information. Bulletins were prepared during the year in the following subjects: Salaries of Administrative and Supervisory Officers in Cities of 25,000 or More Population; Administration of Schools in the Smaller Cities; Salaries of Elementary and Junior High School Teachers and Principals; Credit for Professional Improvement of Teachers; Major Projects in Elementary Schools (several projects given in detail); Statement for District of Columbia Senate Committee regarding teachers' salaries, Senate Document 3166, p. 23-37; A Kindergarten-Primary Course of Study; Housing and Equipment of Kindergartens; What They Think of Kindergartens; Bibliography on Education of Early Childhood.

The following bulletins are in course of preparation: Legislation regarding Kindergartens; Kindergarten Training Schools; Projects on Highway Transportation for Elementary Schools (Worked out with a fifth-grade class); Pamphlets on Platoon or Work-Study-Play Plan; Requirements for Promotion—First Grade; Work of Research Division of City Schools; Coöperative Studies—(a) The Social Sciences in High School; (b) Music

in City Schools; (c) Nature Study Through School Gardening; Health Education in the Kindergarten; Moving Picture Films on Kindergartens.

Circulars have been issued on the following subjects: Data Regarding Certain Phases of School Administration in the Smaller Cities; The Platoon or Work-Study-Play School; City High School Teachers' Salaries; Salaries of Elementary and Junior High School Teachers; A course for first-grade teachers advocating specific methods for specific ability.

The most important phase of field work of this Division is the surveys made of city school systems. During the year the following cities have been surveyed with reference to a whole or a part of school systems: Sparta, Wisconsin; Trenton, New Jersey; Shreveport, Louisiana; Washington, D. C.; Washington, North Carolina; Parkersburg, West Virginia; Greenfield, Ohio; and Wilmington, Delaware. A number of important conferences have been conducted and participated in, including a conference at Chicago during the meeting of the Department of Superintendence on the Work-Study-Play plan; the conference in coöperation with the National League of Women Voters during the Pan-American Conference at Baltimore; a conference on kindergarten education in connection with the Pan-Pacific Educational Conference, Honolulu, and others of equal importance. Members of the Division of City School Systems delivered in all sixty-seven addresses at educational gatherings in various parts of the country.

Division of Higher Education—The work of the Division of Higher Education is of three general types similar to those of the Divisions of Rural Education and City School Systems. During the year this Division has prepared bulletins or manuscripts as follows: Land-grant College Statistics for the Years 1919-21; Statistics on the Residence of Students in Higher Institutions, 1920-21; Current Statistics on Income and Enrollments at State Universities and Colleges; Accredited Higher Institutions; Accredited Secondary Schools; A Decennial Report on Land-grant College Education; Development of Educational Policies at Hampton Institute; Studies of the Negro Land-grant College Curricula; A Report on the Conference of Representatives from Junior Colleges, held in St. Louis, June 30 and July 1, 1920; Enrolment Statistics and the Status of the Teaching Staff at Engineering Schools and Colleges.

In the field work the Division has made surveys of 19 institutions including the following: Arkansas, State University; Arizona, State University; Oregon, 8 universities and colleges; Tennessee, 4 colleges; North Carolina College for Women. The field work has been completed in connection with the survey of 5 higher institutions in Kansas. This Division likewise has endeavored to promote the cause of higher education through addresses and educational conferences. Among the latter some of the most important were the conference on education in Negro Land-grant colleges held at Nashville, Tennessee, at which every Negro land-grant college in America was represented; and conferences on highway and highway engineering education in five States.

Service Division—The organization of the Technical Staff includes, in addition to the Divisions of Rural Schools, City School Systems, and

Higher Education, a number of miscellaneous specialists in divisions which serve definitely more than one of these fields. The Service Division includes specialists in health education, industrial education, home economics, commercial education, educational legislation, and foreign education.

In the field of health education the Bureau has maintained active co-operative relations with the U. S. Interdepartmental Social Hygiene Board, the Public Health Service, the Department of Superintendence and the Commission on Secondary Education of the National Education Association, the Child Health Organization, the American Red Cross, and other important agencies. More than 250,000 of a single health publication were sold during the year, which is a record for the largest number of copies of any government publication sold within the same length of time. Three important National conferences of teachers and others have been held with reference to health and physical education.

The Specialist in Industrial Education has conducted five conferences in industrial education with an aggregate attendance of 319 delegates representing twenty-seven States and the District of Columbia. The proceedings of four conferences have been published.

The Specialist in Home Economics held during the year ten regional conferences of teachers and supervisors, the attendance including representatives from thirty different States. These conferences resulted in formulating important conclusions and policies for the guidance of workers in home economics. Five numbers in a series of home economics circulars were issued and a bulletin prepared on "Reorganization of Home Economics in Secondary School Courses."

The investigation of home economics instruction showed that approximately 500,000 pupils are now studying this subject in 8000 high schools, and that it is compulsory in about two thirds of all the largest city school systems. Home economics is being introduced into about 600 new high schools each year, and departments are now maintained in more than 600 universities, colleges, and normal schools.

The Specialist in Commercial Education conducted ten regional conferences, the chief result of which has been an increasing number of colleges and universities allowing entrance credits in commercial subjects. This Department maintains coöperative relations with the U. S. Chamber of Commerce, National Foreign Trade Council, Association of Collegiate Schools of Business, National Commercial Teachers' Federation, National Federation of Business and Professional Women's Clubs, and other agencies. Six circulars on commercial education were issued and a bulletin on Training for Foreign Service.

The Specialist in Educational Legislation has issued a series of legislative circulars listing the more important laws by title and State, has made a formal digest of school laws biennially, and an interpretive review of legislation. Specific assistance has been rendered on a number of occasions in formulating legislation in various States.

The Foreign Education Section is called upon frequently for informa-

tion in regard to evaluation of elementary school, high school, and college credits from abroad in terms of corresponding school credits in the United States, and also in regard to requirements and opportunities for exchange of students and instructors. Data concerning school organization, legislation, revenues, curricula, and preparation and compensation of teachers in foreign countries have been collected and compiled.

Non-Technical Divisions of the Bureau—Aside from the technical staff there are a number of important divisions, among which are the Statistical Division, the Alaska Division, the Editorial Division, and the Library Division. Space will not permit a review of the work of these divisions at this time. I cannot pass over them, however, without a few words, particularly with reference to the important work in Alaska. After the purchase of Alaska from Russia it was given over to the charge of the Secretary of the Interior, who was made responsible, among other things, for the education, support, and medical relief of the natives of Alaska. These responsibilities were committed to the Commissioner of Education by the Secretary of the Interior. The Alaska Service of the Bureau of Education therefore falls into three general types—school service, medical service, and reindeer service.

At the present time there are 27,500 natives in Alaska scattered over an area of many thousands of miles. In 71 villages the Bureau has established schools with 145 teachers with an enrolment of about 4000 pupils. Each school is a social center. Many of them contain, in addition to recitation rooms, industrial shops, kitchens, laundries, baths, and teachers' quarters.

In its medical service the Bureau of Education maintains five hospitals in important centers of native population, employs nine physicians, and fourteen nurses. It sends medical supplies to all teachers in remote places.

The reindeer industry began with the administration of Dr. Harris as Commissioner of Education with the importation of 171 reindeer from Siberia in 1892. In ten years 1280 reindeer were brought over. There are at the present time in Alaska over 200,000 reindeer, two thirds of which are owned by the natives. In less than a generation the reindeer industry has brought Eskimos from the primitive to the pastoral state, from nomadic hunters to civilized men, having in their reindeer herds assured support and the opportunity to accumulate wealth.

During the past year two new schools have been established among the Eskimos in very remote places. During the winter just past, a herd of 1352 reindeer was driven by the Bureau of Education herders approximately 1000 miles from a point on the Bering Sea Coast to grazing grounds in the vicinity of the Government railway. This will provide means of transportation and a possibility for the exportation of reindeer meat which has hitherto been impossible. Fifty-four reindeer also were transported by a Coast Guard cutter from the Alaskan Peninsula to Kodiak Island, whose great grazing areas will provide support for numerous herds and from whose ice-free harbors reindeer meat can be exported at any time of the year.

An item of great expense in connection with the Alaskan work has been

the cost of transporting food and other supplies to the various stations of the Bureau of Education in that Territory. This has sometimes been almost prohibitive, especially to some of the more inaccessible parts of the country, and has long been a matter of grave concern to the Bureau. In order that this cost should be reduced to the minimum and the Bureau be made independent in the matter of getting supplies to where they are needed, the present Congress was asked for an appropriation to outfit the U. S. S. *Boxer*, a boat admirably fitted for the work and which had been offered to the Bureau by the Navy Department. Congress voted an appropriation of \$60,000 and the *Boxer* is now on her way to Seattle where she will be fitted with new engines and then put into the service. It is estimated that this boat will save the Bureau of Education \$40,000 a year in transportation costs and thus pay for itself in eighteen months.

The library of the Bureau of Education is the largest library composed exclusively of educational and pedagogical books and papers in the United States, containing about 200,000 volumes. During the past year there were 13,341 accessions made to the library, including books and periodicals.

The library service renders assistance not only to the staff of the Bureau, but has a large demand made upon it from the outside. Perhaps its bibliographies are the most important assistance which it gives to the educational world outside the Bureau.

During the year just closed the Editorial Division got out books and documents to the number of 101, including the Annual Report of the Commissioner of Education for 1921 and the Biennial Survey, 1916-18. During the year the Superintendent of Documents distributed publications of the Bureau of Education as follows: Annual Reports, 11,596; bulletins, 598,016; leaflets, circulars, and miscellaneous publications, 245,485, making a total of 855,097 books and documents distributed. 205,000 copies of School Life and index (5 numbers) were distributed. This makes a total distribution for the year of 1,060,097 pieces of material.

The Statistical Division gets out annually statistical bulletins covering the varied fields of education, such as State school systems, city school systems, universities, colleges, and professional schools, etc. During the past year a special study was made of high school teachers' salaries for 1918-1921. At the present time a special statistical study of foreign languages in secondary schools is being made. Some improvements have been made in our statistical work during the year, including a revision of the blanks for statistics of city school systems after conference with a committee of the Association of Business Officials of Public Schools and a committee of the Department of Superintendence. Blanks for the statistics of universities, colleges and professional schools under public control have been improved after conference with the State universities, land-grant colleges, and other organizations. Some slight changes have been made to improve blanks for the statistics of public high schools and of teachers' colleges and normal schools.

Among other activities of the Bureau which do not fall within any of the aforementioned classifications may be mentioned surveys. Although

no appropriation has ever been made for this purpose the Bureau has, since its inception, conducted 155 surveys, including nine State public school systems; seven State school systems for higher education; eighty-seven higher educational institutions; seventeen public school systems of cities; ten school buildings in cities; nine public school systems of counties; one survey of Negro education in the United States (twenty-six States and the District of Columbia); and fifteen miscellaneous surveys.

During the past year the Bureau has conducted forty-three surveys, including the public-school system of Arkansas; the institutions of higher learning in Kansas; nineteen higher educational institutions; eight city school systems; and five county school systems.

In the course of the year the Bureau received 128,100 letters; 34,013 library pieces, and 74,580 questionnaires and forms.

The Commissioner of Education traveled approximately 75,000 miles during the past year. He spent 196 days (including Sundays) in the field, and 137 days in the Bureau. He wrote and published twenty-two articles, and had more than 600 conferences in his office in Washington. He visited Seattle and spent four days in the Bureau of Education office in that city. He attended three meetings of the Federal Board for Vocational Educational and six meetings of its Standing Committee. He attended the formation meeting of the Federal Board for Maternity and Infant Hygiene; acted as chairman of four meetings of the Highway and Highway Transport Committee; and during the year made a total of 244 addresses before audiences aggregating 120,000.

The Commissioner conducted six National educational conferences; assisted in eight educational campaigns and conferences; addressed twenty National associations and four regional associations. He officially visited twenty-seven State education departments, and addressed twenty-five State educational associations. Beside speaking before numerous city and county educational associations and summer schools, the Commissioner addressed twenty-six institutions of higher learning; thirty-five business organizations; made four commencement addresses; three high school dedicatory addresses; and spoke at the inauguration exercises of President Aydelotte, at Swarthmore.

ACTUAL RESULTS OF THE YEAR

CHARL ORMOND WILLIAMS, PRESIDENT NATIONAL EDUCATION ASSOCIATION,
MEMPHIS, TENNESSEE

Material in statistical form showing the actual accomplishments of the past school year is not available at this time, but careful reading of educational publications with reports from almost every State in the Union shows clear and unmistakable signs of progress. Because the classroom teacher is the very heart of the public-school system of America, we will consider first of all the trend of the year as affecting our grade and high-school teachers.

As to the supply of men and women trained for the work, there is still a

lamentable shortage. To meet the actual needs of the Nation 100,000 new teachers are needed each year, the turnover alone being 75,000. All of the teachers' colleges and normal schools together graduate about 20,000 students a year, a shortage of approximately 20,000 trained teachers.

It goes without saying that in order to relieve this situation the profession must hold out inducements to the better class of students in our secondary schools equal to the inducements of other professions. The question of salary will from now on largely determine the number of desirable young people who decide to enter the teaching profession.

Not only must these young people look forward to reasonable remuneration for their labor in the schoolroom, but they must be helped through their years of training. It is not asking too much of the State or Nation to insist that young people who would be acceptable as teachers shall be prepared for their work without undue strain upon themselves or their families.

There is a disposition on the part of boards of education to hold salaries to the highest mark that has been reached, and in some instances to increase them; but as a whole, teachers' salaries stand low in the schedule of professional people and are not in proportion to the cost of living.

As a result of this condition, there is a heavy decrease in the number of college graduates now teaching in our high schools—a fact that cannot be passed over lightly. The adolescent youth of our country should not be left in the hands of immature teachers or those of restricted opportunity.

Teachers in the service show an increasing desire to take professional training. Many are taking extension courses at normal schools and colleges. Much professional reading is being done by groups of teachers in an organized way. The summer schools are crowded to their limits and are doing a great service to the Nation. In 410 summer schools in 1921, 253,111 students were enrolled. By the most conservative estimate one fourth of the Nation's teachers were in training last summer, and the enrolment in the summer schools of 1922 promises to be even greater.

There has been a marked increase in professional consciousness among our teachers. The seeds of professional organization which have been sown during the past few years are beginning to bear fruit. Codes of ethics for teachers are being worked out in various sections. Teachers are recognizing as never before the dignity of their calling and their obligations to the public and to themselves as leaders of the young. The teacher who is unwilling to get into line, who has not established this professional consciousness, is already being looked upon as behind the times and "out of the running."

Among the hopeful signs for the profession is the awakening of boards of education and the public to the necessity of stabilizing the profession by the pensioning of those who have given their best years to the service and by the wise regulation of tenure in service.

The fixing of a minimum salary sufficient to meet the needs of the young teacher, and increasing at such a rate as to retain fine young men and women in the service, is another hopeful sign. In a number of cities the minimum has been increased from \$1000 to \$1200, the increase meeting generally with public favor.

The single-salary schedule is appealing more and more to the people and to the teaching profession—the same salary to all men and women of equal training and equally successful experience, regardless of the grade or department in which the work is done. There are complex problems to be solved before this can become a Nation-wide policy, but it would be a democratic procedure and would do more to free the teachers in their choice of work than any move of recent years. It is thoroughly in line with the spirit of the new education—sound, sane, just.

An investigation recently made by the Research Department shows that thirty-two cities in seventeen States have adopted some form of single-salary schedule. They are as follows:

<i>States</i>	<i>Cities</i>	<i>States</i>	<i>Cities</i>
Alabama	Birmingham	Missouri	St. Joseph
Arkansas	Fort Smith		Kansas City
Colorado	Denver	Nebraska	Hastings
	Pueblo		Lincoln
Illinois	Chicago		Omaha
	Park Ridge	North Carolina.....	Raleigh
	Streator		Washington
Iowa	Des Moines	Ohio	Cleveland
	Sioux City		Cleveland Heights
Kansas	Fort Scott		Oberlin
	Lawrence	Oklahoma	Muskogee
Michigan	Adrian	Pennsylvania	Harrisburg
	Grand Rapids	Virginia	Roanoke
Minnesota	Duluth	Washington	Spokane
	Virginia	Wisconsin	Green Bay
	St. Cloud		
	Rochester		

It is largely in effect in Ohio and Wisconsin and is being worked out in Pennsylvania. However, length of tenure is still an item in salary schedules, but more and more we are coming to equal pay for equal service, and equal pay for equal preparation.

A movement most significant in its indications is the reorganization of the normal schools into teachers' colleges. New York took the lead by organizing the extension of two-year normal schools to three years, with a four-year requirement as the ultimate goal. Other States have followed, thus demonstrating the fact that standards may be raised even in the face of a serious shortage of teachers. The following States have placed their normals on a four-year teachers' college basis: Kentucky, California, Illinois, Wisconsin, Nebraska, Oklahoma, Rhode Island, and Massachusetts. Out of 167 State normal schools only seven were teachers' colleges two years ago. Now there are 92 of them and the movement is gathering momentum.

Professional organizations among teachers are becoming more and more business-like. State Teachers' Associations in nineteen States have employed secretaries on good yearly salaries. This means that instead of an inspirational get-together once a year, the associations will become organized factors in education for twelve months in the year. The membership of the State teachers' associations has shown a remarkable growth. Approximately 400,000 teachers were enrolled in State associations last year.

The rural schools are still in many sections laboring under the disadvantages of poor administration, untrained teachers, poor equipment, short

terms, and lack of supervision. The lack of supervision is perhaps the most immediate. For years to come the lack of trained teachers will be felt throughout the country and especially in the rural schools. To meet this lack of training on part of the teachers the classroom supervisor or helping teacher is the hope of the schools. As the public becomes used to the idea that supervisors are not luxuries but urgent necessities it will demand that the schools have the same provision for painstaking supervision as a modern hotel, department store, or factory. It rests with the superintendents and the supervisors to so establish and advertise the worth of classroom supervision that no question will be raised as to the expense of a supervisory force in any system of schools, rural or urban.

A general interest in the unit of administration in the rural schools of the country indicates that at no distant date the old district, or township, idea, will pass into history along with many other institutions of pioneer days. The county unit with its opportunities for better organization, expert supervision, and more business-like administration is interesting all parts of the country, and will no doubt be adopted in many sections.

There is a disposition to dignify the office of the county superintendent by the election of real leaders with adequate salaries and such tenure in office as to allow for the working out of educational ideals. When such leadership shall have been provided for rural America we shall have taken a long step toward the solution of one of our knottiest problems—the rural school.

During the war the building of schoolhouses throughout the Nation was seriously retarded, resulting in part-time attendance and overcrowded conditions for thousands of children. Reports from the field for last year, however, indicate a speeding-up of building programs, partly due to an appeal from Mr. Herbert Hoover to help find employment for the Nation's workers, but we are still woefully behind in many sections of the country.

The outstanding problem before educational officers today is that of adequately financing education. As a result of considerable agitation and discussion on part of the public and of noted groups of educators, the American Council on Education has appointed a commission composed of recognized specialists in education, taxation, and business, to conduct an inquiry into needs and costs and has placed \$170,000 at their disposal for the accomplishment of this great work. Under the leadership of Dr. Strayer, this commission will make a noteworthy contribution at a time when the need for such information is greater than at any other period in public-school administration.

Our National organization has had a great year. The membership has increased from 60,000 to more than 100,000, and the Association bids fair to be the largest professional teachers' association in the world. The National organization with its permanent home in the Capital City, its body of trained and consecrated office and field workers, and its close contact with the Nation's teachers through *The Journal*, is becoming more and more a great functioning body in the educational world.

The Journal—our official organ—has grown from sixteen pages at the beginning of the school year to a magazine of sixty-four pages. Not only

has it increased in size, but it has grown better in the quality and timeliness of the material published.

The field work of Mr. Magill has been specially significant and its influence upon the Association has been of the kind that cannot be easily measured. Coming into contact with thousands upon thousands of America's teachers, as he has in his many journeys across the continent, he has lifted the profession upon the highest plane of service, and has filled their hearts with inspiration and a longing to be more worthy of the place which they hold in it.

The president of the Association has visited twenty-one States and has addressed all classes of educational workers—students of normal schools and teachers' colleges, gatherings of teachers in county, city, and State associations, business men's clubs, women's clubs, and other civic organizations. She has visited schools in almost every section of the Union, from the largest city system to a remote rural school thirty-two miles from a railroad—on horseback—in the snow-capped peaks of the Cascade Mountains. Everywhere she has found an educational awakening—intelligent interest on part of the public, deep earnestness, and a spirit of service on part of the teachers.

Perhaps the profession has never realized so fully before that the schools belong to the people, and that the people can have the kind of schools they want; in consequence of this realization there is a widespread conviction that every movement for the betterment of education must be led by the educators themselves.

Abraham Lincoln said: "Public sentiment is everything. With public sentiment nothing can fail; without it, nothing can succeed. Consequently he who moulds public sentiment goes deeper than he who enacts statutes or pronounces decisions. He makes statutes or decisions possible or impossible to be executed."

The only condition of permanent social advance in a democracy is an interested citizenship, an informed citizenship.

Praiseworthy progress in this next big task of the educators can be credited to last year's record largely because better organized facilities for the spread of effective educational propaganda were at their disposal through local, State, and National associations. All of these things show that vital forces are at work and that the cause of education in the United States is in a state of healthy growth.

This educational awakening is not confined to our own country but it is world-wide. One hopeful sign of the day is the desire of the educational leaders in many parts of the world to come together for discussion of problems and interchange of ideas.

The Pan-American conference, which met in Honolulu in August, 1921, was called at the request of the Pan-Pacific Union, invitations being sent to individual educators, universities, and other educational institutions. Delegates and visitors from twenty-five Nations bordering on the Pacific Coast were in attendance, and the program included educational problems of common interest to these people. The object of the conference was to promote friendship and unity among the countries represented.

Dr. Finegan, an official delegate appointed by the United States Government, represented the National Education Association. He reported to the conference the action of the Representative Assembly of the National Education Association in passing a resolution to bring about the organization of an International Congress of Education to be held in the United States in 1923. Dr. Finegan emphasized the significance of this movement to internationalize the work of the National Education Association as a means of carrying on the splendid work begun in this conference. This proposal met with a hearty response by the newspapers and the public in general. Definite proposals for the world conference on education have been worked out by the Committee on Foreign Relations and will be submitted to a group of eminent educators during this Boston meeting. The Association has the assurance of President Harding that the administration will cooperate to make the movement a success.

The Towner-Sterling bill is still in the hands of the Committees on Education of the Senate and the House. These committees await the President's recommendation on the reorganization of the Executive Departments, and while there is no direct assurance of favorable action, it is safe to say that the administration will recommend the creation of a Department of Education and Welfare, and that the extension of Federal aid for the promotion of certain phases of education will be conceded.

Taken as a whole the outlook for education for the coming year is most promising. While many thousands of teachers who left the profession have not returned, we are encouraged by the homecoming of many others, who show by their spirit and determination that they have reconsecrated themselves to the great task of training the Nation's children. They have found by wholesome experience that the compensations about which the profession has always boasted are not fictitious but happy realities.

Business conditions throughout the country are on the up-grade; the period of deflation is about over; industry has charged off its losses; the financial atmosphere is less charged with doubt and uncertainty, and the country is settling down to a period of hard constructive work in which education is bound to play a conspicuous part. I believe that the American people want education as never before and that our chief task is to crystallize this desire into concrete action, and to organize against and rout the forces of pessimism and reaction wherever they may happen to be in authority.

THE MOST EFFECTIVE ADMINISTRATION AND TAXING UNIT

Outline of Report to Committee on Rural Education of the National
Council of Education

LINNAEUS N. HINES, PRESIDENT STATE NORMAL SCHOOLS, TERRE HAUTE
AND MUNCIE, INDIANA

Scope of field—The problems involved in a discussion of the topic given above cover the entire Nation. There are practically no school corpora-

tions that are supplied with enough funds to do all the work they ought to do, and there are many thousands of school corporations that do not have adequate supervision and administration. Those who have given much thought to finance and administration agree that there is a wide field for improvement throughout the land. District and township administration should make way for county administration and, in some regards, county administration should make way for State administration. Further, there is a strong belief that the Nation should take a hand in the administration and financing, to some extent, of local school systems.

The questions at issue involve every phase of the welfare of the schools; where there is more money there can be better teachers, better buildings, better equipment, and better administration. These improvements, of course, involve questions as to the improving of every phase of school work from one end of the country to the other.

As to the importance of the topic, there can be no question whatever. Where tens of millions of dollars go into unimportant activities of the people only thousands go into the maintenance and development of the schools. If we are to cease being a Nation of sixth-graders, then heroic efforts in finance and administration must be made in order to get the improvements we ought to have.

Present conditions—The present taxing units range all the way from the school district to the State. There are no National taxes for education as such. In the vast majority of cases the taxing units are far too small. These units vary in their wealth all the way from a few scores of thousands of dollars to billions of dollars. There can be no uniformity of excellence of the schools under any such conditions.

The present administrative units vary as much in size and importance as do the taxing units. The most hopeless of these administrative units are the small independent districts where ignorant and provincial school officials in many cases control the local schools. Next to these district administrative units, we have the township unit with its sad record of inefficiency and low standards. The county unit follows next in order, a unit that is being urged in many States as an agency for curing the evils of the local schools. The county unit has its advantages and, if properly developed, can be of great service. Next to the county unit comes the State administration of schools. Few would advocate entire State control of local schools, but in many States laws need to be passed to give the State school governments greater power to help the local school corporations realize the best things possible. We have no real National administrative unit due to lack of legislation, funds, and high ideals.

The tendencies in this situation, so far as these tendencies can be observed, are toward enlarging the taxing and administrative units throughout the Nation. Every encouragement should be given to those legislators and school people that believe improvement lies in the direction of enlarging both the taxing and administrative units.

Unsatisfactory conditions—Unsatisfactory conditions are: (1) Insufficient income; (2) Provincial attitudes toward education; (3) Inadequate leadership; (4) Low school taxes; (5) Makeshift systems of raising school revenue; (6) Poor schools; (7) Lack of a National policy in regard to education; and (8) Inequalities of opportunity for education in State systems.

Measures recommended—We recommend the following measures: (1) National revenue for education; (2) Strong Federal Bureau of Education; (3) Most of local school revenue to come from State sources; (4) Strong county and State administration of education; and (5) Abolishing to a large extent, local control and financing of schools.

State and National legislation needed—(1) Necessity for greater interest in education on part of law-makers; (2) Providing added revenues as rewards or bonuses to those communities that make progress; (3) Extermination of weak and inefficient rural and village schools as well as city schools; (4) General bolstering-up of the whole system of education; and (5) Federal legislation along the lines of education so that the Nation can be of greater assistance to State and local systems.

THE AROUSAL OF INTEREST ON THE PART OF THE PEOPLE IN THEIR OWN SCHOOLS

GEORGE S. DICK, DEPARTMENT OF PUBLIC INSTRUCTION,
MADISON, WISCONSIN

In order that people be interested in anything they must see that it gives them profit or pleasure. The farmer is interested most in what yields greatest returns in profit and pleasure in proportion to expenditure of time, energy, and money. He has been shown that a pure-bred sire at the head of herd or flock, the careful culling to eliminate the boarder, the proper balanced ration, or the wise rotation of crops brings the desired greater returns. As a result his interest is aroused, his action is secured, and he willingly invests his hard earned money and follows directions that increased profits shall be his. These new but tested and proved ideas have been sold to him by the honest salesmen; he has bought and enjoys the rich return on the investment. The old unwise laborious way of doing things has no interest for him; only the best way, so far as he is able to pay for it, attracts him.

How has it been in the history of public education? It has been one experiment after another. Ideas have come, been praised, served for a time, and then condemned as detrimental to right educational processes. The people have followed along, each group putting time and effort in its own specialty, recognizing the principle of the division of labor. The authorship and management of public education has been left largely to those who by study, training, and profession are supposed to know what is best. But we have at times sold or allowed to be sold to the people things and ideas that have proved to be shoddy. People have trusted the sales-

man as he approves today and condemns tomorrow. Laws have been made at one session of the law-making body and repealed at the next. New organizations, plans of management, methods of instruction have arisen and passed on in short space of time, some of them costing much more than they were worth. Buildings erected, apparatus purchased under learned approval a few years ago must now be torn down or laid aside to make way for a later idea. Many of these try-outs have cost the people much hard earned money.

Even granted that most of the changes have been in line of improvement it has had an influence upon the people that causes them to ask, "What are we to have next, and what is it going to cost?" Even today we justify ourselves in allowing peddlers, armed with general letters of recommendation written by local so-called educators, to sell to the people school books and devices of no value, but for which comparatively large sums are paid. In nearly every rural or village schoolhouse can be found more or less of this worthless junk.

Would it not be better to give public support to our teacher-training institutions on the basis of the success of their output rather than on the basis of the number of immature girls that they can induce to enroll and remain for stated time, regardless of academic preparation, natural adaptability, personality, or sympathy for childhood. Should these people be licensed and sent out to draw public money for service they are not now nor never will be able to render? Finished does not always mean prepared. Would it not be as well to close some small schools where the teacher shortage occurs rather than to go through the form of pretending to have a school?

There are reasons why we must put forth an effort to interest the people in their own schools when they have met, and are meeting today a few things at least to disturb their faith and to cause them to question, "Why shall all these high taxes be paid for what we consider unnecessary or of no value?"

People must be shown. Through an educational campaign the people were taught to build and to use silos that now dot the farms far and wide. Years ago in the University of Wisconsin there was invented the Babcock milk tester. Through a campaign of instruction and inspiration people of the State became familiar with the value of this machine, now of international repute. The people's faith in and their use of these two inventions, the silo and the Babcock tester, put Wisconsin in her present rank as the "Cream Pitcher State" and enabled her to hold her financial equilibrium during the stress and storm of the immediate past and present.

Of course results from silos and milk testers are more tangible, more visible, than results from efforts to educate boys and girls. Nevertheless it is a worthy ambition to have Wisconsin hold a rank for her public schools equal to the rank she holds as a dairy State, a rank reached through an arousal of the people's interests to great possibilities and in leading them forward to results they have now accomplished.

In the language of today the right public education must be sold to the people, and it cannot be sold unless the people are induced to buy. How is this to be done? It is done by an educational campaign.

1. By showing the people a real school, its results and influences upon the children, young people, and communities.

2. By the changing of laws that may improve school organization, management, and instruction. To accomplish such results a county unit system, larger taxing unit, consolidation with rural high schools seem necessary.

3. By having the people come together to see the real work of the school, an exhibition of things accomplished.

4. Inspirational addresses in terms of the people's life and interests.

To tell what is done in one State may suggest a few ways of serving the people. The following lines of daily service are found in the Department of Public Instruction of the State of Wisconsin. Every member, twenty-two in number, not counting secretaries and other office force, gives service to the rural schools.

1. One person among other duties assisted by others supervises the thirty-two county training schools and twenty-four high-school training classes which are especially supported to train teachers for rural schools.

2. Three rural-school supervisors give their time to supervising and directing the 100 county supervising teachers who are assistants to seventy-two county superintendents of the State. These county supervising teachers are practically a part of the State department as their salaries and expenses are paid by the State; their selection must be approved by the State superintendent, and they must report directly to his office. These 100 people last year in addition to much other regular work served in 2395 community gatherings.

3. Two supervisors put in much of their time in meeting, conferring with, and addressing school board conventions.

The State law requires that once each year the members of the school boards of each district of a county shall meet in convention to consider the needs of the schools. "The clerk must attend and the others may." All attending receive a per diem of \$4, and three cents a mile going and coming. A representative of the department is present at the convention to report the policies, desires, suggestions of the State superintendent to discuss school laws, give an inspirational address and help in every way possible these board members, the business managers of the free public school, to successfully discharge their duty according to law and in the best interests of the children and the community. These members return home to carry new ideas, clearer ideas to the people of their school districts. Of the 23,000 school board members about three fourths of them with many teachers and others are met in these annual conventions.

3. Three men give entire time supervising the State graded schools, which are rural schools of special organization, receiving special State aid.

4. One supervisor of educational measurements has this year put about all of his time on rural children.

5. Two clinical psychologists, supervisors of special classes of exceptional children, serve the entire State, including rural as well as city people.

6. One person supervises the schools for the deaf and the blind.

7. Two supervise school libraries of entire State.

8. Three supervise high schools, serving the union free high schools (rural) as well as city and village high schools.

9. The Industrial Commission looks after the plans and directs the erection and care of school building and is in charge of the compulsory attendance law.

10. The State Board of Health and the seventy-two visiting county school nurses look after proper health conditions in all schools of the State. These last two named departments are closely associated with this department.

11. The State Superintendent of Schools covers the entire State, serving with as great if not a greater interest the rural child and community.

Through this well organized department the people receive help and inspiration which result in faith in their schools and a generous support. Some other channels through which this service flows freely to the people of the State are inspirational educational addresses to community meetings, fairs, picnics, farmers' meetings, parent-teachers' meetings, addresses to graduating class of rural, State graded, high schools, county training schools.

A well organized good school week rallying forces and helps from all over the State and touches all with a general uplift. Similar are the Better English Week and Better Health Week. Each one of these aims to touch every school, every child, every community, every home. They have proved very effective in interesting the people in their schools, and improved conditions have resulted.

Contests through competitive examinations in such subjects as arithmetic, spelling, and penmanship starting in each school district have ended in final contest at State Fair at Milwaukee. The advance in teachers' salaries is receiving general support. Fewer people call for cheap teachers, knowing that the lower salary means a poorer service from teacher to school. When our State Superintendent announced that there would be no more special licenses issued, although there were about 700 of these issued last year, the announcement met with almost unanimous approval.

The improvement in school attendance is gratifying. For the school year ending 1919 the rural schools show an average daily attendance of 70 per cent; the school year ending 1920, 72 per cent; the school year ending 1921, 77 per cent. Other schools have made equal advance in this line. We are hoping that reports for the year just closing will show a still better condition.

The State Department of Public Instruction has not done this work single-handed. It requires coöperation of all educational forces, State, county, and community, to achieve the best results. Our great State University, with one of the very best extension services in the country, carries help and inspiration to every community; the ten State normal schools, including Stout Institute at Menomonie, does the same; the many private educational institutions do their part. As a result, interest and faith in the people's schools increase; the service of this free public institution grows more and more effective and wins a more generous support, spiritual and financial.

REPORT OF SUB-COMMITTEE ON CONSOLIDATION OF RURAL SCHOOLS

ADELAIDE S. BAYLOR, CHAIRMAN OF THE COMMITTEE ON RURAL EDUCATION,
WASHINGTON, D. C.

In compliance with the request of the chairman, Dr. J. F. Sims, the following is submitted as the outline for the final report of the Sub-Committee on Consolidation of Rural Schools:

1. Purpose—To show the place and value of consolidation as a factor in rural education and offer recommendations as to how it may best be accomplished.

2. Scope—(a) The growth of consolidation in this country during the periods 1902-1912 and 1912-1918 with some estimate of its value in these periods, in the promotion of rural education.

This part of the report represents information received in 1912 and 1919 in response to questionnaires sent to each State in the United States. Summaries of these two studies have been presented to the council at previous meetings.

(b) Methods of organizing for consolidation in the various sections of the country. This material, tabulated from returns received from ten States representing various sections of the country, was presented at the summer meeting of the National Council of Education in 1921.

(c) Summary of the difficulties in the way of consolidation, and analysis of one of the major difficulties—transportation.

J. C. Muerman, specialist in Rural Education, U. S. Bureau of Education, coöperated in the preparation of the questionnaire on Transportation sent to the States for information and tabulated the returns. These tabulations, together with such materials as Mr. Muerman had already compiled in the U. S. Bureau of Education, are now embodied in a report prepared by him and just published by the U. S. Bureau of Education under the caption of Transportation of Pupils at Public Expense, Rural School Leaflet No. 2. This portion of the report—Transportation—has never been presented to the council, and I have asked Dr. Muerman to present it at this time.

3. Plan of Organization of the Report—The general organization of the report of the Sub-Committee on Consolidation will include: (a) Introduction; (b) body of the report, which will cover what has been enumerated under Scope (above); (c) notable achievements in the field of consolidation.

Requests for information on this point were sent out since April, 1922, to nine States, representing various sections of the country. To date information from four has been received. These four States recognize the following achievements in rural education as due to consolidation:

Iowa—The most notable event in connection with consolidation in Iowa has been the building of many splendid buildings of fire-proof construction,

with gymnasium, auditorium, and laboratories for manual training, domestic science, and agriculture.

Indiana—As far as the progress made in school consolidation in Indiana is concerned, the rapid growth of the high-school spirit is one of the outstanding features.

Another feature in the growth of these high schools in Indiana is the "six-year" high school. Many communities have found it much to their advantage to organize the seventh and eighth grades and the senior high school together. The idea has grown among patrons that the rural children are entitled to as good schools as are maintained for boys and girls in the cities. Supervised study has worked its way into many rural schools.

These changes are results of consolidation and would not have occurred under the old scheme of school organization.

Mississippi—It would be difficult to state the outstanding achievements within the last year or so because the progress made in consolidation is within itself an achievement of which to be proud. Along with this there are a great number of teachers' homes. The fact that plans and specifications for schoolhouses may be furnished has been a wonderful help in improving the type of these buildings.

Massachusetts—The abolition of the district system was, of course, absolutely essential before any widespread consolidation program could be carried out. This was accomplished through the stimulus of Horace Mann who recognized in the district system one of the greatest barriers to educational progress. The abolition of the district was not easily accomplished. It was first abolished in 1859, but the resentment on the part of many towns was so keen that it was speedily restored by the Legislature in the succeeding fall. In 1869 the district was again abolished, but virtually restored by the Act of 1870 which permitted any town to reestablish school districts by a two thirds vote. Twelve years later, 1882, the district control of the schools finally terminated. This act broke down both political and economical barriers that stood in the way of school consolidation.

Another very significant development in this field is the extent to which the one-teacher school has been eliminated. In 1838 when Horace Mann made his famous report on schoolhouses there were approximately 3000 school buildings in Massachusetts. Nearly all of these were of the one-room district type. In spite of the tremendous growth of population since that time we now have fewer school buildings in the State than in the days of Horace Mann, and the number of one-teacher schools has been reduced from nearly 3000 to 768; more than 97 per cent of our pupils are attending schools of two or more rooms.

4. Summary and recommendations on: (a) Methods of organizing to bring about consolidation; (b) Site, grounds, buildings, equipment; (c) Teachers; and (d) General.

5. Bibliography.

TRANSPORTATION OF SCHOOL CHILDREN AT PUBLIC EXPENSE

J. C. MUERMAN, U. S. BUREAU OF EDUCATION, WASHINGTON, D. C.

To secure definite and reliable data a questionnaire was sent to the forty-eight State departments of public instruction. Courteous replies were received from each, but unfortunately over one half of the States did not have the information complete. It was unnecessary to consult State and county school reports, bulletins, etc., to present even an approximate average of conditions affecting the question of transportation.

The committee appreciates the kindness of the State departments in sending all the information they possibly could and especially do they feel gratified for the prompt replies received from each department.

Distance and time elements in transportation—The minimum distance children were transported one way varied from one half to two and one half miles. The average was a little over one mile. The maximum distance was from five to twenty, with an average of six miles. The maximum time varied from one hour and less to three hours.

From the reports the committee would recommend one hour as the maximum time limit one way for any child transported at public expense and a maximum distance of five miles by horse transportation and ten or twelve miles by auto, over good roads.

Relative costs of transportation according to types used—That auto transportation is fast displacing the horse-drawn is shown in the reports from every State. This means good roads. It was also noted that a majority of the reports stated that good roads brought about consolidation and transportation.

Examples were given to prove that the large auto-bus was cheaper than the horse-drawn van or wagon. When the roads are in excellent condition and where from fifty to eighty pupils can be transported this is undoubtedly true, but in parts of the country where the roads are not well improved the horse-drawn type is not only more certain but a trifle cheaper.

In Iowa where thirteen consolidated districts compared costs, the average cost per pupil per month was \$4.90 for the horse-drawn, and \$5.11 for the motor-driven types of transportation.

The argument in favor of the motor-driven type is not entirely based on cost, but in time-saving. The average distance travelled by the motor in a given time is fully twice that travelled by the horse. Children remain at home longer in the morning for work and are at home earlier in the evening.

In convenience and comfort the large auto-bus is usually superior to the horse-driven van. Relative cost of transportation varies from \$3 to \$6 a month per pupil. Twenty-three States—Alabama, Arkansas, Colorado, Connecticut, Florida, Georgia, Indiana, Iowa, Kansas, Kentucky, Louisiana, Maine, Massachusetts, Minnesota, Mississippi, Montana, Nebraska, New Jersey, North Carolina, Oregon, Tennessee, Texas, and Vermont—trans-

port 301,034 children at a cost of \$9,896,830. Transportation in every State except eleven cost last school year \$16,000,000. The cost in States where the number of children was given was \$32 annually, or considering a school year to be nine months, \$3.55 a month per child. A fair estimate for the amount spent for transportation in the United States would be \$20,000,000 to transport five hundred thousand (500,000) children, many of them attending the twelve thousand (12,000) consolidated schools in the United States.

Relative cost of transportation according to methods of operation—Three methods were considered: The conveyance operated by owner; owned by school with paid driver; private contract.

A majority reported private contract was the method employed, but the most satisfactory was when the school owned the conveyance and paid a driver by the month. Where teachers were drivers the reports were satisfactory.

Driver's contract—Fifty different contracts were examined, all similar in nature as to demands and requirements of safeguards for the children. Laws in the various States are explicit and exacting and yet, during the past year, at least two horrible accidents have occurred. In both instances a little extra precaution could have prevented their occurrence. No matter how dense the fog may be any school boy with his ear on the steel rail for a second could tell if a train was approaching. These young lives are too precious to be thrown away without exhausting every known means in our power to protect them.

Someone must be made responsible for the enforcement of contracts or rules, and the principal or superintendent is the proper authority under powers granted him by the school board.

The following general information was gathered from the replies: Drivers are selected with care, but so often it is difficult to secure a good driver for the amount a district can afford to pay. The most common type of transportation is the horse-drawn conveyance. It was impossible to even estimate the number of conveyances of the different types in use at the present time.

Summary and conclusions—Care must be given any transportation. For auto-busses, Jordan Consolidated High School District, Utah, has a large garage built near the school building where the busses are cared for and repair work is done by the classes in auto-mechanics under the direction of a competent mechanic. There are other schools doing the same.

The average life of an auto-bus is from seven to ten years, with fully one hundred thousand (100,000) miles of travel. This means the deterioration is about 10 per cent annually. Proper care of the bus during the vacation time adds to the length of service as well as to the efficiency of the service. Transportation is an expensive item, and is a difficulty that must be overcome in forming any consolidation. Light, cheap conveyances are not recommended. The best is the cheapest in the end.

The advantages are so well stated by the State Superintendent of Washington that the committee begs to close the report with a quotation which

gives their advantages as follows: (1) Pupils are not exposed to rain and weather on their way to school. They do not sit all day in school with damp garments. (2) They arrive at school fresh and ready for work, not tired out by a long tramp. (3) They do not have to leave home as early in the morning. (4) They are under proper chaperonage while going to and from school—the time when immoral influences would otherwise have an opportunity to make an impression. (5) The attendance of the district is improved. The teacher does not spend her time with a mere handful of pupils. (6) Pupils who could not otherwise come to school, are enabled to attend. (7) Regularly enrolled pupils are enabled to attend under weather conditions which would otherwise keep them at home. (8) Consolidation is made possible.

TESTS AND MEASUREMENTS IN RURAL SCHOOLS

FRED D. CRAM, EXTENSION PROFESSOR, IOWA STATE TEACHERS COLLEGE,
CEDAR FALLS, IOWA

In undertaking this testing campaign for the National Council of Education we were confronted by a number of possibilities. We could use the United States as our field and get coöperation from as many sources as possible, we could limit the field to the State of Iowa, or we could make a still greater limitation, covering so small an area that the work could be personally conducted. We finally decided on the last course. The principal reason why we did not attempt to cover the whole field in the State was that there are very few people really capable of administering tests in rural schools, another being that the University of Iowa was covering the State with a special campaign with which we did not desire to interfere. Therefore, the campaign was carried out in Blackhawk County and here and there in other places over the State under the personal direction of the speaker.

In this campaign we had the hearty coöperation of the Iowa State Teachers College and of the County Superintendent of Blackhawk County, Mr. H. C. Moeller, who furnished the transportation, which relieved the council of the necessity of this expense. The State Teachers College furnished the material and the time of the examiner.

The plan was to go from building to building giving one test, usually, at a visit. These papers were scored by clerks at the college, after which graphs were made to show the conditions in the county. Teachers were then met in study centers. The graphs were presented and recommendations made either orally or by mimeographed or printed reports of outlines. The test was sometimes administered to the teachers themselves. After this meeting all those who had not been reached by the examiner secured the material and finished the program on that one particular test. The examiner and the county superintendent then took up a new test and went through the same operation.

You will be interested in knowing that there was no great deviation in results between the work of the specialists and of the rural teachers of the county. Whenever there was any striking difference, the papers were thrown out. The results, therefore, have only to do with the authentic reports turned in by teachers who made an attempt to give the tests scientifically. The teachers' results usually show a slightly higher percentage than those of the specialists. This is partly due to the fact that they administered the tests some two to six weeks after the examiner administered them. It seems, however, that the average classroom teacher cannot be entrusted with the test which takes from 30 seconds up to 120 seconds of time. After that amount, however, teachers without any particular training can keep fairly accurate time on their students.

In presenting our results in the published report we gave only the data which would be of interest to the average person interested in tests and measurements. We have limited our statistical tables to medians and averages, and in one or two cases we have gone into the matter of deviations. Anyone who is interested can take the tables and work out the advanced mathematical formulas for himself. I wish to call particular attention to the fact that we are making no great claims for this testing program and its results beyond the bare facts indicated. As a matter of fact, it is too soon to claim, as some people suppose, that the test and measurement program will solve all the intricate problems of the educational world.

We therefore repeat that the report perhaps indicates nothing but certain tendencies. For instance, we discovered in a certain neighborhood just west of Cedar Falls, where a new consolidated school district has been formed, but not yet centralized in a building, that the Danish children of that neighborhood have, on the whole, a higher intelligence as revealed by the National Intelligence Tests than the children not Scandinavian. Now, while our results show this, it would be necessary to experiment in individual cases to discover whether or not Scandinavian children are usually of a higher type of mentality than the pupils other than Scandinavian, which we would call American. Another thing indicated by going through our material is that girls are brighter in their studies than boys. We have no right to say that this is general, though, until we have examined a large number of these cases. Another thing is that, within a certain limit, the younger a child is in a given grade the better work he will do. Of course, it will not do to say that a seven-year-old child could do better work in the fifth grade than a twelve-year-old, but it is safe to say that usually an eight-year-old child in the fifth grade will be among the stars in his class and will probably be doing very much better work than the thirteen or fourteen-year-old in the same group.

On account of these tentative conclusions, therefore, I recommend to you, Mr. Chairman, that these studies be continued if our committee is permitted to live another year as a committee, and that some attempt be made to carry out investigations which will support or disprove some of these tentative conclusions.

*EVIDENCES OF PROGRESS IN EDUCATION AS INDICATED
IN BETTER PROVISION FOR THE PHYSICAL
WELFARE OF THE CHILD*

J. H. BEVERIDGE, SUPERINTENDENT OF SCHOOLS, OMAHA, NEBRASKA

There are many distinct lines in which progress has been made in behalf of the child's physical welfare. We shall briefly consider four: (1) Physical training; (2) Play grounds; (3) Health supervision; and (4) Better school buildings.

Physical training—When one learns that almost two per cent of the total population of the United States dies yearly and is told that two fifths of those deaths could be postponed; when one learns that three million persons are on the sick list constantly, that the economic loss to society through deaths which might be postponed is more than one billion dollars per year, the necessity for attention to physical education is unquestioned.

We seem to have had some theories in regard to this matter but very little effective practice until within the last few years. Proper physical training will enable people to have better resistance to disease and to improve bodily health—a responsibility which rests upon the school for education in hygiene, physiology, and physical training. True, advancement has been made in the last quarter of a century in preventive medicine, in the dissemination of health knowledge, and in the development of health habits, but we are just beginning to see the importance of having the community coöperate in hygiene and sanitation.

State legislatures are assuming their responsibility. The importance of physical training is emphasized through certain changes in American life which have tended to diminish the stimuli for physical training. Among these we find a tendency toward city life and the introduction of machinery on the farm that lessens the opportunity for physical activity. There are, also, more sedentary occupations than formerly.

Let us state some evidences of progress that have been made. Previous to 1915 there were only three States that had had any active legislation relative to physical education. These were North Dakota in 1899, Ohio in 1904, and Idaho in 1913. Since 1915 twenty-five States have enacted legislation on physical education. Stimulus was given to this department by an initial interest taken in military preparedness for high school boys by eight States. The seventeen States that have followed the lead of the eight, however, have enacted legislation that conforms better with our modern conception of physical education. People have differed somewhat in the meaning which they have attached to physical education. Some have considered it identical with the hygiene of childhood and youth. "Others would limit it to more or less systematic exercise of the neuro-muscular apparatus in order to promote and conserve the perfect functioning of the entire human mechanism . . . and to develop correct motor habits." Still others strive to insure bodily health and the right kind and amount of motor activity as an avenue through which the whole individual may be influenced for good in mind and character.

President Thompson, of Ohio University, regards physical exercise of four different types: (1) hygienic; (2) corrective; (3) educational; (4) recreative. These he defines as follows: The first he defines as designed to develop the larger muscles of the body, to induce a large intake of oxygen, and in general, to tone up the respiratory, circulatory, and digestive systems. The second, corrective exercise, is designed to "rectify defects such as round shoulders, a flat chest, curved spine, and the like."

Recreative exercises utilize the play instinct—the instinct through whose agency children are prepared for work.

Recreative exercises utilize the play instinct, and this is the instinct through such exercises ease and skill in handling the body are acquired.

If one analyzes the purpose and the scope of physical education through a study of the laws made in the twenty-five States he finds that the last seven or eight years have made a distinct contribution to the progress of physical education in this country. Insofar as legislative enactment is concerned an attempt is being made in most of these States to carry into effective practice the fundamental principles of physical education. In order to get some idea of the purpose of physical education let us quote some of the laws that have been passed and are now in operation.

The California law gives the purpose as follows:

To provide for the organization and supervision of courses in physical education in the elementary, secondary, and normal schools of the State. The aims and purposes of the courses of physical education established under the provisions of this act shall be as follows: (1) To develop organic vigor, provide neuromuscular training, promote bodily and mental poise, correct postural defects, secure the more advanced forms of coordination, strength, and endurance, and to promote such desirable moral and social qualities, as appreciation of the value of co-operation, self-subordination, and obedience to authority, and higher ideals, self-courage, and wholesome interest in truly recreational activities; (3) to promote a hygienic school and home life, secure scientific sanitation of school buildings, playgrounds, and athletic fields, and the equipment thereof.

In addition to the purposes indicated in the California law Indiana suggests that the course in physical education may likewise include "suitable instruction in personal and community health and safety; the privileges and responsibilities of citizenship as they are related to community and National welfare." Missouri, among other things, adds "to promote the general welfare; and to secure proper control of competitive school athletics."

Many of the States have no law concerning physical education but have organizations in the several States looking to a better control of competitive school athletics. This is commendable, but no doubt some legal enactment would aid interested educators in carrying out the sentiment expressed in the above statement.

New York and New Jersey have provided effective laws for physical training. An interesting statement from the New York law is that such training shall be given "in order to more thoroughly and comprehensively prepare boys of elementary and secondary schools for the duties and obligations of citizenship." One purpose as indicated in the Rhode Island law is found in the definition; "Physical education may be defined as in-

cluding healthful, sanitary environment; medical inspection; instruction in physiology and hygiene; and exercise in the form of such motor activities as marching, gymnastics, dancing, supervised play, and athletics."

The three most important things which appeal to the writer in the study of these laws are that they emphasize citizenship, social efficiency, and social adjustment.

While in some of these States pupils are excused from physical training on account of physical disability, yet for the most part one may say that in most States all pupils of all grades are required to take physical training. Connecticut includes not only those in all public schools in the State but also those who attend normal school. Indiana requires all pupils in elementary and high schools to take physical training. In Missouri the pupils in all public schools and State supported higher institutions are required to take physical training. In some States, California for example, completion of the course is required for graduation. In Indiana credit is given for physical training toward promotion and graduation. In Washington it is required as a part of the prescribed curriculum.

The time requirement differs in different States. Some require in elementary schools twenty minutes per day. Two hours per week are required in many secondary schools. Connecticut requires not less than two and one half hours per week.

One of the problems that is difficult to overcome in meeting the physical education requirement is the lack of well-trained teachers to carry on this work effectively and to view physical training from a broad standpoint—not only giving muscular activity but doing corrective work and instilling into the minds the importance of observation of the fundamental principles of health and hygiene when outside the school.

Evidence of progress that we must not overlook is the wider extension of physical education and athletics in the public schools. People are interested in this phase of school work and are realizing the necessity of providing more different types of games and more people to participate in the various types of athletic activity.

Previously we thought that any secondary school would do well to train eleven men with a few substitutes for football. In many of the high schools we now have several times that number out for practice. If baseball is good for nine men it ought to be satisfactory for ninety-nine. If basketball is good for five boys, fifty-five in the ordinary high school should have the practice.

In our own city a short time ago we had a Field Day for the elementary schools. Boys and girls both participated, the thought being that if the exercise is good for boys why not for girls. There were over ten thousand people in attendance. The children were enthusiastic and as well-behaved as you would find them in the ordinary schoolroom.

How far we have progressed from the former type of mere physical exercise in way of calisthenics in the closed schoolroom everyone knows. I should not be surprised to see, in the next decade, more than half of the physical training for high-school pupils being carried forward in the open

air. At the present time several schools have established open-air gymnasiums as well as open-air schoolrooms.

We see then evidences of progress in physical training through legislative enactment, in the attitude of community and State toward such training, in the broader idea toward its purpose in making it a part of the regular school program, in requiring better trained teachers for instruction in, and in supervision of, physical training.

Playgrounds and play—As a nation we are criticised for not giving enough attention to play and recreation. This was brought forcibly to the mind of the speaker a few weeks ago at a luncheon when an Englishman said to him, "You Americans are too busy with business. You work too much and play too little." He then proceeded to elaborate on the significance of the play element in adult life in England as compared with America.

Play is still more important in the life of the child than of the adult. A high degree of motor skill cannot be acquired unless muscular coördination is made during the period of growth. It is in the adolescent stage that one must practice to make a good ball player. The caddie makes the future golfer.

At the beginning of the war we were spending about ten cents per capita for play and recreation for our children. During the war we spent about fifty dollars per capita for the recreation of our soldiers. If this was important in war why not in peace? The people are coming to realize the importance of a peace-time program in healthful recreation and wholesome play.

Since 1916 some twenty-eight States have passed laws putting organized play and athletics into the program of the public schools. Such bills are pending in other States. Most of these State laws resulted from a meeting of physical training directors of the National Education Association. They provide for physical examination of all children with suggestion for the removal of physical defects, corrective exercises, and some follow-up system by the school nurse. In Iowa children may be sent to the State University Hospital for operations necessary to correct serious physical defects and be maintained there at the expense of the State. In the State of New York a mark on posture is recorded on the monthly report card.

Other evidences of progress are found in the demand of more space for play on our school playgrounds. In many cities and States minimum standards are being established. The minimum earlier established is being increased. London has thirty square feet of playground for each child. Then came a standard of one hundred square feet in this country. Now the call is for two hundred square feet for each child. The Delaware Board of Education passed the following rule regarding the size of school sites: "For a one-room school there shall be not less than two acres; for a two-room school not less than three acres; for a three and a four-room school not less than four acres."

In some secondary schools forty acres have been provided for play ground and athletic field. We are coming to see that play is as important as work.

"If the battle of Waterloo was won on the football fields of Eaton" may not Chateau Thierry and Argonne have been won on the baseball fields of America?

Health supervision—It is at least interesting to know that we are today discussing the physical welfare of the child in the city that was first in America to establish medical inspection. This was only twenty-eight years ago. Seventeen years after medical inspection was introduced into Boston, of 1046 school systems, examined by Leonard Ayres, 443 or 43 per cent had medical inspection of school children and 354 of these cities had school physicians. True, much of this work was not efficiently done, but it gave a stimulus to the study of health problems. These cities were experimental laboratories in the study of health problems that have enabled other cities to profit by their experience and develop efficient systems of medical inspection, dental clinic service, and health supervision.

In 1917 medical inspection laws were in force in nineteen States and the District of Columbia. In seventeen States the administration of the law is in the hands of boards of education. This is significant, for originally medical inspection in American cities was in the hands of boards of health. This change of attitude is an evidence of progress. The board of health should control contagious disease, but the board of education should have charge of health supervision.

Health supervision is educational in its outlook. Its purpose is to prevent as much as to cure—even more. Its object is to develop the child into a healthy, clean-living citizen, to make the school run smoother through elimination of absence and retardation caused by sickness.

So far as the writer knows the first State-wide mandatory school medical inspection measure in this country was passed by the State of New York in 1913, less than ten years ago. This law does not apply to the three largest cities in the State, but there are under its provisions about 700,000 school children, 37,000 teachers, and 11,000 school buildings. Because no funds were available for enforcing the law it did not really become operative until February 1, 1915. What are some of the things accomplished under this law?

1. Over 1500 physicians have been appointed as medical inspectors.
2. In four years 1,753,430 physical examinations were made and health certificates were issued.
3. Some 42,377 more corrections were made during 1919-20 than in the previous year.
4. A bulletin giving simple rules for the care and use of the eyes has been printed in suitable form to paste in the inside of the front cover of every pupil's textbook.
5. Of all children examined in cities and villages, 72 per cent had some defect. In rural schools 87 per cent were defective. More than 400,000 defects were corrected.
6. Number of children treated for—

Defects of skin and scalp.....	44,849
Defective vision	54,461
Defective hearing	7,180
Defective nasal breathing.....	20,644
Diseased tonsils	38,779
Dental defects	180,638
Defective lungs	2,903

Defective heart	4,984
Nutrition	17,788
Posture conditions	6,637

These are some of the more important things that have been accomplished so far as the correction of physical defects is concerned. The educational influence that has resulted from this type of work will have a marked influence on the whole State.

Under the provisions of the law a department of mental hygiene and diagnosis has been established. This department gives psychiatric and psychologic examinations and coöperates very closely with the Division of Educational Measurements. This department has organized special classes for children who are backward and mentally deficient. Over 6000 children are being instructed in such special classes. The sociological effect of such work will be far-reaching.

I have referred to the State of New York. May I tell you what our own city, Omaha, Nebraska, accomplished in way of physical examination and correction from September 10, 1921, to June 17, 1922. Total number of physical examinations made, 19,046.

Number found to have defects:

Decayed teeth	7,015
Diseased tonsils	3,133
Enlarged glands	476
Nasal obstruction	549
Defective hearing	150
Defective vision	1,415
Anemia	82
Scoliosis	13
Malnutrition	215
Chorea	6
Orthopædic	46
Discharging ear	78
Goitre	33
Others	175
	12,820

Number of defects corrected:

Teeth	2,217
Tonsils	858
Glands	124
Nasal obstruction	242
Hearing	27
Vision	452
Anemia	0
Scoliosis	0
Nutrition	19
Chorea	0
Orthopædic	9
Discharging ear	7
Goitre	0
Others	24
	3,920

In general, it may be said that the first inception of so-called "medical inspection of schools" was brought about by frequent occurrences of epi-

demics of contagious diseases among school children, which caused great loss of life. Attention was called to this fact about the year of 1894 and large staffs of physicians were employed in a few large cities to inspect the school children.

These physicians who began this early inspection for contagious diseases found that not only was the school a breeding place for contagious diseases, but also they were appalled with the imminent physical defects of school children who were considered *well* and expected to make a fair run in the school race. Much time and energy was given over to the examination of school children for the physical defects of childhood which tend to make them more susceptible to contagious diseases and which impede their mental and physical progress. While this work went along for a few years, it was not satisfactory because merely the examination of school children without a "follow-up" touch to the work seemed fruitless. The second thought seemed to be a nurse who might get into the homes and talk to the parents regarding the correction of these physical defects.

As time has passed, we have watched staffs of nurses steadily increase and the whole vision of public health work has taken a turn. People in education, as well as the health group, are fast beginning to realize that physical defects and contagious diseases are the results of wrong living and that the root of all health work lies in the fixation of health habits in the lives of our young Americans. Dr. Winslow tells us that 75 per cent of all children who enter school are inevitably candidates for contagious diseases and physical defects. Our school health workers thoroughly appreciate the statement that "Childhood is the golden age of opportunity for health work, and the public school, the greatest child agency in the world, is the most strategic field for health service."

With the foregoing thought in mind, the Omaha Public Schools have planned a course of study which will have as its aim the fixation of definite health habits and a knowledge of domestic and community hygiene. This will be taught from the Kindergarten through the elementary grades by the teachers and will be supervised, demonstrated, and vitalized by the staff of public-school nurses.

REPORT OF THE COMMITTEE ON THE TEACHING OF DEMOCRACY

A. DUNCAN YOCUM, CHAIRMAN, PHILADELPHIA, PENNSYLVANIA

Since it was in Boston that almost a century ago the first reluctant steps were taken for a separation between the education of the Church and the education of the State it is significant and even dramatic that it is at Boston that the representatives of great historic creeds should meet together to discuss the contributions of religion to democracy, on the invitation of a Council which peculiarly represents public education in America. And it is not only dramatic but prophetic and epoch-making that the outcome planned for the discussion is to make the *separation* of church education and

State education more complete by bringing about a more complete *correlation* between the religious instruction of church schools and such academic work in secular schools as can be given religious bearing in church schools, and between the training in morality and democracy given by secular schools, and such church school work as can be made contributory to it.

It is almost a century since the time of Horace Mann. He took his stand for the elimination of religious instruction from schools which were just beginning to be truly public and common, in a period when immigration and industrial development had begun to make the population of Boston the democratic composite of nationalities and creeds which it is today. He was bitterly attacked by the ministry of the old New England sects, which up to that time had looked upon the study of the New England primer and the Scriptures as quite as much a matter of course for New England schools as were morning and evening prayers for New England homes. One fiery sermon called down upon him the lightning of heaven, because, with the same good intentions as Uzzah, he had put his hand upon the ark of the Lord "in a new cart."

Protestantism soon reconciled itself to the change through the coming of the Sunday school, except for the occasional efforts of individuals or groups to have the Bible read in the public schools. Catholicism, with its historic insistence upon an education wholly religious and Catholic, so far as possible provided its own parish schools—all the more readily perhaps from the justification that public schools were "godless," than if they had remained Protestant; and has had at least some responsibility for the opposition to legislation which requires Bible reading in the public schools and the support of legislation which forbade it. Judaism, except for an occasional group or individual protest against school exercises and celebrations which were too conspicuously Christian, has freely used the public schools for secular education and depends upon the home and synagogue schools for religious instruction.

The increasing sense of responsibility on the part of Protestantism for religious education—At the present time the National situation as regards State and Church is more critical than it has been since the time of Horace Mann. Protestantism has at last become aroused, on the one hand, to the general abandonment of religious instruction in the home on the ground that it is being looked after in the Sunday school; and on the other, to the inefficiency of Sunday-school instruction as the result of too little school time, too irregular attendance, insufficient financial support, and an untrained teaching force. As a result the complete reorganization of Protestant religious education is under way. The International Sunday School Association and the Sunday School Council of Evangelical Denominations have been merged in the International Sunday School Council of Religious Education, with an education committee which is setting up new standards for every phase of religious education. A movement is rapidly gaining force for week-day church schools, which will meet for two or three hours two or three days a week and have a trained teaching force and a scientifically organized course of study. The resulting demand in many sections and

localities that such religious instruction shall be given children during school hours at some appointed place outside of the school and with school credit for work which is proved to be of equal grade to that given in the public school itself comes at a time when the sharp opposition to the Towner-Sterling bill by the Knights of Columbus and other Catholic agencies and the equally enthusiastic support of it by a newly organized Protestantism threatens to increase existing religious prejudices to an extent which will operate against a unified furtherance of democracy by all creeds, a diversified teaching by all creeds of the religion basal for democracy, and the common teaching by all creeds of respect for what others reverence, if religion is to present a united front to a radicalism which is attacking both religion and democracy.

The probable effect of Protestantism's request for public-school time and credit for week-day religious instruction—This issue of whether religious instruction shall be given outside of the school in school time and with school credit is a matter for local determination and is being differently decided and will continue to be so in different sections and localities. It might be avoided were it not for the fact that Protestantism and Catholicism appear to be compelled by force of circumstance to take different sides as to school credit for work done outside. The issue of allotting school time to outside work seems less sectarian. Protestantism cannot adequately give religious instruction in extra school periods when children are fatigued. But if religious instruction adequate to Judaism and Protestantism can be given and is given while children continue to have their secular education carried on in public schools, Catholicism may have to face on the part of public sentiment the question as to why its own secular instruction cannot be similarly given. It may well seem to the Hierarchy simpler and safer to oppose the giving of public-school time and public-school credit for outside religious instruction which is making "godlessness" an untenable charge against the public-school system than to justify to Catholics the continued burden of "double taxation" involved in the support of a separate system of parish schools upon the sole argument that all instruction for Catholic children should be given by teachers trained in the Catholic faith. This ground for opposition to the week-day school movement may be reduced to a matter of expediency, but the recognition of religious work done in week-day schools for public-school credit is more far-reaching. The request for credit is based upon the assumption that the quality of religious instruction is on a level with that of other public-school work, and consequently implies public school measurement or supervision of religious instruction. Since the danger of National supervision of parish schools may be the most serious ground for Catholic opposition to the Towner-Sterling bill, Catholicism would naturally oppose a giving of credit to Protestant church school instruction, which would put parish school children at a disadvantage on returning to public school, if similar credit and therefore similar supervision were not given to parish schools.

The policy of the Committee on Democracy as concerning religious education—The Committee on the Teaching of Democracy has no present con-

cern with this issue, aside from welcoming the growing realization by Protestants, Catholics, and Jews alike that with the complete elimination of religious education from public schools in the name of religious freedom, the various churches collectively assume the responsibility of seeing that every individual in the State is adequately trained in some form of religion outside the public school. The Committee, however, wishes to raise the question whether with collective responsibility there may not be a need for coördinated action.

In presenting this afternoon's program it has the further hope that, whatever the method by which each creed lives up to this responsibility, non-interference of the State with church education will be accompanied by a lessened spirit of sectarianism in all matters affecting public policy; that a growing respect by believers in any creed for what all other creeds reverence shall prevent religion itself from increasing the growing contempt for all religion and democracy shown by various radical groups; that to the teaching of religion which in itself is fundamental for democracy the various churches and denominations shall add a conscious and effective emphasis of everything in their organization, creed, and activities which can be made to definitely teach democracy; and that they shall in return ask the public school to emphasize and themselves systematically plan to relate to their own religious instruction everything in the teaching of school branches and in school activities which, although not in itself religious, can be helpfully related to religious instruction.

*The historic contributions of the various creeds and denominations to democracy should be supplemented by coöperative effort to increase it—*These policies can in part be furthered by a program such as the talks to be given this afternoon, which will naturally emphasize the historic contributions of the great religious creeds to democracy and touch upon their present contributions while studiously avoiding all matters at issue.

The emphasis of fundamental democracies in church school instruction and the relating of religious instruction to academic facts and social activities emphasized in public schools can be *separately* acted upon by different churches and indeed are already being so acted upon. They were approved by the Council itself at the Atlantic City meeting, and the Education Committee of the new International Sunday School Council of Religious Education has included them in its declaration of policies. Action upon *them* can be taken by the Catholic and Jewish Church, either separately or in coöperation with Protestantism.

But the other propositions require a formal *coöperation* to which this program is meant to be a first step.

*The conflicting alignment of Protestantism and Catholicism on the Towner-Sterling bill a menace to the growth of democracy and a disaster to be averted—*Is it too much to expect that a conference of religious leaders officially representing Judaism, Catholicism, and Protestantism may not avert a conflicting sectarian alignment on the Towner-Sterling bill which is beginning to involve the National Education Association and the public school organization in general in sectarian controversy?

For the first time in American history the Hierarchy of the Catholic Church in so far as it is represented by the Knights of Columbus and parish priests in all parts of the country has come out in declared opposition to a movement which the vast majority of public-school people, including the National Education Association itself, believe to be to the best interest of public education. For the first time Protestantism as an organized and solidified institution has come to the support of such a movement. The fight on this issue is only beginning. Before it becomes too fierce could there not be some official or semi-official effort at understanding and reconciliation, at least as to the question of school time and school credit for religious instruction and the safeguarding of religious instruction from all suspicion of State supervision. United opposition or support from a sect must have some common and definite reason which may be sufficiently met before sectarian conflict is permitted to multiply sectarian prejudice.

Coöperation of sects helpful to the lessening of racial and group prejudice as well as sectarian spirit—All sects should coöperate not only in a determined effort to avoid new grounds for sectarian spirit and to develop respect for what others reverence or worship, but in furtherance of the activities now deliberately carried on by certain sects or social groups to remove existing prejudices and the grounds for existing prejudices, which operate against them. The campaign of the Jews through literature, music, the stage, and moving pictures to counteract the anti-Semitic attitude in so far as it is based upon misconceptions of the Jewish character, together with the self-study suggested by the Education Committee of the National Council of Jewish Women in considering the question of restrictions placed upon the attendance of Jewish girls in some of the best private schools, should receive serious and helpful consideration from Catholic and Protestant educational agencies. The well organized attempt of the Knights of Columbus to emphasize in the teaching of United States history the loyal service rendered by Catholics to America and the contributions made to democracy by Catholics and Catholicism should be furthered by Protestant and Jewish educational agencies.

But still more important and more fundamental in the absence of reverence for what others reverence is the universal teaching of a common respect for what others reverence. If there is not sectarian coöperation along all lines of effort such as these the result is likely to be stronger group consciousness of a sort which may not lessen group prejudices. At least group coöperation along such lines is the most direct road to the arousal of a group understanding and sympathy in the presence of which group prejudices will disappear. How can Jews, Catholics, and Protestants expect respect for religion from radicals who have no religious belief whatever if they fail to show respect for the beliefs of one another?

Coöperation between church schools and public schools already begun should be given conspicuous publicity—The Committee would also like to bring into National and local prominence each existing effort on the part of any creed or sect to coöperate with the public-school system. In most localities Catholic and Jewish children are excused from school without loss

of school standing for necessary religious activities and ceremonies. In certain localities pupils in attendance at Catholic schools do part of their academic work or manual or industrial training in public schools. The Americanization work which is carried on with a peculiar efficiency by the Catholic Church in many sections among foreign-born Catholics and the National system of welfare work so strongly organized by the Hierarchy should not take the form in the minds of Catholics or non-Catholics of opposition to the Americanization work or welfare activities carried on by the public-school system, but while kept distinct in its organization, support, and control should be correlated with it.

The visit of Dr. Knox, then Educational Secretary of the International Sunday School Association, to the Atlantic City meeting of Council to ask its coöperation in determining the relationship of the week-day church school movement to the public-school system marked the first official step toward a coöperation and has been followed by the adoption by the International Sunday School Council of Religious Education and the approval by the quadrennial convention of the International Sunday School Association—now merged in that body—of a plan of coöperation along the lines suggested by the resolution then adopted by the National Council. (See Section III of the Report of the Committee on Education of the International Sunday School Council of Religious Education, Kansas City, Missouri, January 21-27, 1922.)

Representatives of the great creeds in the present program—It was for purposes such as this that it was planned to bring official representatives of the great historic creeds together in the present program, with the result that assurances have been made which promise much. Rabbi Mann, of New Haven, Connecticut, has been designated by the Central Council of Jewish Rabbis to represent Judaism. Dr. Walter S. Athearn, of Boston University, Chairman of the new Education Committee of the International Sunday School Council of Religious Education, represents Protestantism. Father Burke, of the National Catholic Welfare Association, who kindly wrote President Seerley and myself offering to provide the Catholic representative, and was urged in return to himself perform the service, found at the last moment that he was unable to come and has not notified the Committee of any action on his part in response to its request to designate some Boston representative. (This gap in the program was later filled by Father Hickey, of the Parochial School System of Boston, who happened to be present at the Council session and, on the invitation of the chairman, although handicapped by the suddenness of the call, unofficially represented Catholicism.)

The lessening of sectarianism through each sect and denomination studying additional ways of contributing to democracy—Whether or not the three great historic creeds officially get together in an effort to lessen sectarian prejudice, avoid sectarian conflict, and promote a common respect for what is revered by others the organized and official study of additional ways of contributing to democracy already promised by Protestantism, and which in all probability will be similarly acted upon by Judaism is in itself

the most fundamental means to removing every undemocratic element from sectarianism. The Catholic Church not only through the Hierarchy itself but through the National Welfare Association and the Knights of Columbus is furthering democracy in a variety of ways. The immediate future will show whether it prefers to do this wholly in its own way or through such forms of coöperation as have been suggested. The most essential service which the Committee in any event aims to perform and, after all, quite distinct from its effort to bring the great creeds into as common as possible a democratic program, is to present to the educational agencies of every sect and denomination its specification of democracy elements in the belief that each will do what it can to discover ways in which it can aid in our effort to bring about through every type of school and social organization the complete teaching of a complete democracy.

THE RELATION OF JUDAISM TO DEMOCRACY

RABBI LOUIS L. MANN, PH. D., NEW HAVEN, CONNECTICUT

Catholic, Protestant, and Jew are united in their faith in democracy. The program of the afternoon is symbolic not only of the contributions that each of the historic faiths has made, and is making, but also and more especially of their coöperative efforts without which democracy becomes an empty word, void of significance. For convenience I shall divide my message into three parts: *first*, the theory of Jewish life as a contribution to democracy; *second*, Jewish experience, endeavors, and achievements for democracy; and *third*, the Jewish vision.

1. *Theory*—The relation between religion and democracy might be traced back historically to the theocracy of the Hebrew Bible. This theocracy taught that God is Ruler, that all men are His subjects, that leaders should rule for the welfare of all men and remember that they are responsible to God for their actions. Would it then be too much to say that a democracy without an implied theocracy cannot stand? What in the domain of politics is called democracy, in the realm of religion is called brotherhood. It is the practical, willing, thorough-going and unselfish devotion of a person for a common social cause. It is the desire and the determination to serve without distinction of race, creed, color, station, birth, and other arbitrary, artificial, and man-made lines of demarcation that all too frequently obliterate the God-made resemblances between man and man. Faith, coöperation, mutual helpfulness, unselfish service, the idea that each human being has infinite worth, if not because of his attainments and achievements, at least for his potentialities, these form the basis of both democracy and religion. To hold a mirror to men's better selves and to give them a chance to visualize the unexpected and neglected goodness within them, to "convict people of unexpected virtues" as someone said of Browning, these ideas are common to religion and democracy. It is not enough to give toiling, struggling, suffering, burdened, oppressed, and persecuted men comfort and resignation, but to give every man the fullest measure of physical

comfort, spiritual aspiration, and intellectual endeavor of which he is capable. The realization and the exercise not only of all his capacities but also of all his potentialities for service must find a place in democracy.

The Biblical legend of a common ancestor, according to Jewish commentators, was indicative of our common humanity, with no aristocracy other than that of moral worth. According to another ancient legend in the Talmud, the different parts of the body of this common ancestor came from all the countries of the then-known world, to further emphasize that there is no "chosen people" save as it is self-chosen, as it chooses to dedicate itself to the service of humanity.

The contribution of the Jew to democracy is manifest also in the fact that the Pilgrim fathers used the Old Testament as their Civil Constitution; the first Constitution of Connecticut followed the Scriptures, literally. Mr. Oscar Strauss, in his splendid volume "The Origin of Republican Form of Government" has traced the origins of our government to the Old Testament. Abraham Lincoln, in whom our conception of democracy found its most perfect embodiment, was guided, as few men are, by the Scriptures.

The democratic sentiment runs through all Jewish literature. According to a significant story in the Talmud, there were three men in a boat, none of whom could swim. When they were out in midstream one of them took an auger and began to bore a hole beneath his own seat. "What are you doing?" cried the other two, frantically. "Attend to your own business," said he; "I am boring a hole beneath my seat only, not beneath yours." "But," said they, "the water will come in and drown us as well as you. We are all in the same boat." This story, though illustrating the negative aspect of democracy, yet affirms that there is no such thing as a self-affecting action, that we *are* our brother's keeper whether we will or no,

If we strive not for his winning,
Sharers we in all his sinning.

The Bible tells (Deut. 21) of an old custom that when a man was found slain in the field and no one knew who slew him, the elders of the city near by and the priests with elaborate ceremony had to gather around the man and say, "Our hands have not shed this blood." The Jewish commentators asked: "Why should the *best* men in the city be forced to take such a vow rather than the *worst*, who are likely to have a hand in it?" And their answer was that the *best* in every community are responsible for its shortcomings, making of democracy not a levelling-down process, but on the contrary, a levelling-up process. *Noblesse oblige*. Additional privilege means additional responsibility.

While much must be omitted in a brief survey, yet one would do violence to the democratic outlook of the Jew were he not to mention respect for authority, reverent obedience of the law, and the belief that personal liberty—so frequently misunderstood—is possible only *through* the law. "If liberty through the law may be compared to a fire in the hearth, liberty without law is comparable to a fire on the floor."

Law is the expression of a people's social conscience, and inasmuch as it is usually formulated by the wisest and best, it also creates a standard through which the majority, who naturally lack imagination and vision, learn to appreciate its value through enforced practice. While it has often been said that a person cannot "lift himself by his own boot-straps," this is precisely what happens in an ethical and democratic sense when a community formulates a higher standard of life through the law.

Democracy insists upon equality before the law. The unity of God, which occupies the central position in Jewish thought, and which has as its corollary the unity of mankind, demands the single standard of morality. "One law shall there be for the stranger and the native-born" (Ex. 12: 49). *One*, also, for man and woman, for individual and nation. Why should society permit man to degrade himself and yet welcome him into the best of homes? Judaism demands not that woman should sink to man's level, but that man should rise and that there should be a levelling-up process to the standard which all civilized nations demand of their women.

In like manner there should be but one standard for individual and nation. If "thou shalt not kill" and "thou shalt not steal" are correct for individuals they must also hold for nations, and as such, form a mighty protest against war, especially war for territorial expansion and war for commercial aggrandizement, which violate both of these commandments.

The single standard of morality not only helps democracy within a nation, but also paves the way for a democracy of nations and does away with the idea of "my country right or wrong." It gives a new evaluation of patriotism, a patriotism which is love for one's country, but expressed not so much in a willingness to die for it, but to live for it—to live not only for one's country, but also and more especially for one's countrymen, nay more, for humanity, by having one's own country contribute that for which it is best fitted mentally, physically, morally, materially, geographically, and spiritually to the welfare of all men—a patriotism so blind that it cannot see beyond the artificial, arbitrary, man-made boundaries between country and country, for the God-made resemblances between man and man, is unworthy of the name. William G. Sumner, that truly patriotic American, said: "Not that I love my country less, but humanity more, do I now and here plead the cause of a higher, a truer patriotism. I cannot forget that we are men by a more sacred vow than we are citizens—that we are children of a common Father more than we are Americans."

2. *Experience, endeavors, and achievements*—If experience is the best teacher, history is the best textbook. I firmly believe that the experience of the Jew forms a contribution, a Jewish contribution to democracy. There is a cruel and barbarous practice which consists of making nightingales blind in order that they might sing the more sweetly. For two thousand years the Jew has been the blinded nightingale, oppressed, persecuted, and abused beyond description, the victim of the most tyrannical, inhuman, and undemocratic treatment. As a result he has longed for democracy, he has dreamed dreams and seen visions of democracy. That experience has been a great contribution. The world remembers that one Jew was crucified;

it forgets that a million others were crucified as well. As a thirsty wanderer in the desert lies down to sleep and dreams of a cool, refreshing water-brook, so the Jew, buffeted about in the desert of undemocratic treatment, has longed, dreamed, prayed, and striven for democracy with a fervor that only martyrs possess, and with an intensity that only suffering can create. Time will not permit a catalogue of the thousands, literally speaking, thousands of disabilities placed against the Jews throughout the ages. They were denied citizenship, representation, and the right of holding office. They were prohibited from possessing real estate, from owning soil, and from tilling it. Money due them was declared uncollectable. They were required to wear special garbs. They were excluded from universities, schools, and places of amusement. They were subjected to special taxes, prohibited from legally entering into matrimony, excluded from most of the professions. Macaulay once said that if all the red-haired people in the world had been treated in like manner, they, too, would now exhibit most of the peculiarities of the persecuted Jews. That these peculiarities tend to disappear in America is due to the fact that democracy is an untold blessing.

Sad to relate, the anti-Semitism of Europe that made such deplorable conditions possible has now taken root in America. The malicious campaign of Henry Ford is but a symptom. The revival of the Ku Klux Klan, which is anti-Catholic, anti-Jew, and anti-Negro, which divides man against man, as democracy attempts to unite them, which fosters hatred, malice, and ill-will, is another symptom. Traitorous beyond description is the Ku Klux Klan's use of the American flag to cover up and to cover over its anti-American and its anti-democratic policy, which denies, defies, and belies all that the flag stands for.

Here, almost within the hearing of my voice, is Harvard University, for almost three centuries the great, noble, and liberal university of America, which recently attempted to bar Jews as Jews. That the press, public opinion, and the alumni of Harvard would not support this policy is as great a tribute to the soundness of American democracy as it is to the eternal shame of Harvard for attempting it. If limitation of numbers is necessary the qualifications whether mental, moral, physical, social, spiritual, or scholastic should be equally applicable to Protestant, Catholic, and Jew.

Why are some Jews uncouth and undesirable? Because they are the product of Russian persecution, because the Czars of Russia persecuted and oppressed them in ways that beggar description, in addition to barring them from schools and universities. These people left Russia that their children might have the privileges of which they themselves were deprived. They were Americans at heart and democratic in the full sense of the word, before they came here. Woodrow Wilson, while President, said that some of our foreigners are more genuinely American than some of those who are here by the mere accident of birth. Harvard's attempt to imitate the Czars of Russia would create for coming generations the same problem that the old Russia during the last fifty years created for this generation. Evidently Hegel was right, that "the only thing men learn from history is that men learn nothing from history."

The chairman specifically requested an account of the practical efforts for democracy among Jews. *The Central Conference of American Rabbis*, through its Social Justice Commission, has insisted upon *industrial democracy* and has striven for:

1. A more equitable distribution of the profits of industry.
2. A minimum wage which will insure for all workers a fair standard of living.
3. The legal enactment of an eight-hour day as a maximum for all industrial workers.
4. A compulsory one day of rest in seven for all workers.
5. Regulation of industrial conditions to give all workers a safe and sanitary working environment, with particular reference to the special needs of women.
6. Abolition of child labor and raising the standard of age wherever the legal age limit is lower than is consistent with moral and physical health.
7. Adequate workmen's compensation for industrial accidents and occupational diseases.
8. Legislative provision for universal workmen's health insurance and careful study of social insurance methods for meeting the contingencies of unemployment and old age.
9. An adequate, permanent National system of public employment bureaus to make possible the proper distribution of the labor forces of America.
10. Recognition of the right of labor to organize and to bargain collectively.
11. The application of the principles of mediation, conciliation, and arbitration to industrial dispute.
12. Proper housing for working people, secured through Government regulation when necessary.
13. The preservation and integrity of the home by a system of mothers' pensions.
14. Constructive care of dependents, defectives, and criminals, with the aim of restoring them to normal life, wherever possible.

It has protested against the violation of law and defiance of constituted authority, against lynching, child labor, breaking down of industrial standards, and many others.

In coöperation with other national organizations, it helped to make the Washington Conference on Disarmament a success by pledging each of its members to help create an atmosphere, a nation-sentiment that demanded that something tangible be done. Within the last few weeks it coöperated with the Federal Council of Churches and the National Catholic Welfare Council in demanding that the President of the United States take immediate steps toward ending the coal strike, hoping to prevent the untold hardships and misery which are almost sure to result during the coming winter. It is always willing and ready to coöperate with any cause that makes for a nobler America or a better humanity. Owing to the fact that many so-called "Rabbis" have misused the government privilege for "sacramental wine," it has asked the Government to rescind that privilege for Jews, though granting it to other faiths. It felt that there is nothing more "sacramental" than obedience to constituted authority.

The Council of Jewish Women, with sections in practically every city of the country, does a tremendous amount of work along democratic lines. It has coöperated at all times with other religious, social, and educational agencies—civic, State, National, and international. It has a definite program for Americanization, including night schools and courses of instruction for citizenship, following up immigrants for from two to five years after they come to this country. In almost all of its work, whether among

the immigrant, the blind, or the deaf, its efforts are not confined to Jews alone. It aids immigrants when they come here and assists them as emigrants before they leave their country at the point of embarkation. Its work of education at these points includes the fundamentals of American history, the significance of American holidays, its patriotic songs, and its pledge to the flag, making of these immigrants half citizens, as it were, before they arrive. After they come here, those who work on farms are encouraged to do the right kind of reading for citizenship. A circulating library is placed at their disposal, and community centers are opened for them where they might mingle with the native-born.

The Hebrew Immigrant Aid and Sheltering Society of America aims to keep the families together, believing that the family is the basis and unit of democracy. It gives helpful information to emigrants at points of embarkation and attempts to distribute these immigrants when they arrive, so as to avoid transplanting people who come from the congested districts of the old world to similarly congested districts in the new, so that their dreams of the new land might not be shattered and their hopes blasted.

The Independent Order of B'nai B'rith has been a great factor in Americanizing and democratizing foreigners. Its work along educational lines makes for good citizenship and its disinterested service to help the less fortunate to help themselves have been noteworthy.

The *Y. W. H. A.* and the *Y. M. H. A.* which recently combined with the *Jewish Welfare Board* have promoted the *Jewish Center* movement throughout the country. These centers furnish both a place and facilities for educational and recreational activities, physical training, vocational guidance, open forums, a clearing-house for ideas and especially for the Americanization and socialization of foreigners. These centers have the opportunity of interpreting to their constituency the historic government and ideals of America.

The National Farm School of America has successfully taken many immigrants who might have been in the congested districts in our large cities and by a scientific education in agriculture has made of them happy American farmers, producers, and workers.

3. *The vision of the Jew*—Every service at the Synagogue contains the prayer:

May all created in Thine image recognize that they are brethren, so that they, one in spirit and one in fellowship, may be forever united before Thee. Then shall Thy Kingdom be established on earth.

The Messianic vision of the Jew is that of a kingdom of God on earth. According to the Talmud, "It is incompatible with social misery." It thrives on faith, brotherhood, mutual helpfulness, and unselfish service. It is not a mere passive attitude: "They also serve who only stand and wait," but one of protest against evil, poverty, and suffering, followed up by constructive endeavor, with the hope that democracy *within* a nation may lead toward the democracy *of* nations, a government of the world, by the world and for the world, realizing the beatific vision of the prophet who said: "Have we not all one Father; hath not one God created us all?"

PROTESTANTISM AND DEMOCRACY

WALTER SCOTT ATHEARN, DEAN OF BOSTON UNIVERSITY SCHOOL OF
RELIGIOUS EDUCATION AND SOCIAL SERVICE,
BOSTON, MASSACHUSETTS

Union of Protestantism and democracy—Protestantism and democracy were married in Geneva. Calvin performed the marriage ceremony. The Swiss Communes, the counterpart of the New England town meeting, were the earliest and purest manifestation of democracy in Europe. Geneva came to exemplify the liberal, commercial, cosmopolitan, democratic ideals of the Swiss Commune. Into this democratic center came Calvin as the pastor of the community. Calvin took to Geneva his ideals of a model Christian social community. Luther had been preaching the same ideals, but Luther's dream of a Christian community broke on the rock of special privileges of princes and cities. Rousseau was born in Geneva. He and his father were regular attendants upon both the political and religious meetings of this unique community. Morley and Carlisle agree that the political concepts of Rousseau's Social Contract, which so profoundly influenced the French revolutionists, can be traced to the religious and political influence of Geneva. Any study of Rousseau must take into account the Calvinistic background of his work. Ever since their first meeting in Geneva, democracy and Protestantism have constantly reacted upon each other, each finding in the other a congenial avenue for the expression of its ideals.

Significant tenets of Protestantism—There are certain significant tenets of Protestantism which have had a profound influence upon the political ideals of Protestant adherents. Chief among these tenets is the doctrine of the right of private judgment in all religious matters. In the early days at Wittenberg, Luther wrote, "What there is contrary to reason is certainly much more contrary to God. For how should that not be against divine truth which is against reason and human truth." Again he paid this glowing tribute to reason: "It is admitted that reason is the chief of all things, and among all that belongs to this life the best, yea, a something divine. She is the mistress and queen of all arts, of all wisdom, power, virtue, and honor which men possess in this life; that which distinguishes them from other creatures, a sun and as it were a god, which is set for the ruling of such things in this life." And at that dramatic crisis in his life, when he refused to recant unless refuted by Scriptures or clear proofs of reason, he placed the *Bible* and *reason* on an equal footing as being worth the sacrifice of all life. At this time Luther said: "It belongs to each and every Christian to know and judge of doctrine, and belongs in such wise that he is *anathema* who shall have diminished this right by a single hair." In the same spirit is this call to liberty of conscience. "Beloved, we are not baptized into the name of Kings, Princes, or Mobs, but into the name of Christ and God only; we are not called after Kings, Princes, or Mobs—we are called Christians. No one can or ought to command the soul except he who can show it the way to heaven. This no man can do but

God only. For belief is a free work; therefore no man can be compelled. It is a true proverb, Thoughts are toll free."

Both Luther and Calvin used the appeal to reason against authority; both urged the establishment of free schools as means of training individual judgments that men might find individual salvation through a personal interpretation of the Scriptures. The Reformation was not only an effectual assertion of human liberty but also a great triumph of the scientific spirit.

A movement which places so great emphasis on private judgment, individual liberty of thought, would of necessity profoundly affect the political ideals of its followers. The right of private judgment in religion carried over easily into a belief in the right of private judgment in politics. We are not surprised, therefore, to hear Calvinism say: "If the queen will not agree with you in the Lord, you are not bound to agree with her in the Devil." It thus came about that Protestantism aided in liberalizing politics and subjecting tyrants to laws made by the people.

The interaction of democracy and religion—The close relationship of Protestantism and the communistic government at Geneva reacted on the organization of the church itself. One is not surprised to hear the admonition at the Council of Chalcedon: "Let the organization of the church be modeled along civil and secular lines," or to note how the organizations of Protestant Communions have followed the lines of the American Government. The union of the Geneva republic with the congregational church-form has embodied certain democratic concepts and practices. Among them are: (a) The service of both church and state is to promote the welfare of both the individual and society. (b) The right of the church to appeal to the people through the sermon in influencing elections and the conduct of government. (c) The exaltation of the esteem and self-respect of the people by the church. (d) The granting to the congregation of the right to choose its pastor and to oppose or approve the policies of the pastor when appointed.

From the participation of the individual in forming policies of a church there is an easy step to the participation of the citizen in the determination of the form and conduct of civil government and vice versa. In this connection a summary of the writings of Beza, Calvin's disciple, is illuminating:

(a) The will of God is the only foundation of authority.

(b) God's government is founded on pure justice. (Here he identified the will of God with the law of nature, and taught that under this law of nature all men are equal.)

(c) The people are not created for the sake of the magistrate, but the magistrate is created for the people. (An early statement of the doctrine of governments of the people, by the people, and for the people.)

(d) Just resistance by force is not incompatible with Christianity.

(e) Everyone is in duty bound to oppose usurpers of power.

(f) The Estates or those chosen to put the bridle on the sovereigns can and should reprimand them when they become tyrants. (Here is an attempt to make government the dutiful and intelligent servant of the people.)

(g) The public good and the good of the nation is superior to the sovereign or any individual.

(h) The unjust usurper may become a legitimate magistrate if the people afterwards elect him.

The activity of Protestants in shaping the affairs of state as active citizens is reflected in the prayer which recognizes the achievement of religious freedom: "We thank Thee, Oh Lord, for the privilege and the right to worship Thee according to the dictates of our own conscience, none daring to molest us or make us afraid."

Persistent problems of Protestantism—There are, of course, many persistent problems of Protestantism. The abuse of great religious tenets may lead to autocratic as well as naturalistic and atheistic ends.

There is the periodic attempt to identify religion and democracy. A definition of religion as merely the recognition of and pursuit of social values, without a recognition of the relation of the individual to an objective, personal God, tends to develop a religion of humanity which would identify democracy with religion. We are just now in the midst of a revival of this doctrine.

A second danger which persists in Protestant communions is found in the tendency of the Protestant church to lose religious consciousness in the midst of the social, commercial, and political expression of the common religious ideals.

These are problems of Protestantism which concern democracy, but which cannot be discussed under the limitations of this paper.

Essentials of democracy—Professor A. Duncan Yocum has listed the following as the ten most suggestive essentials of democracy:

1. Democratic self-assertiveness in rights, duties, and opportunities.
2. Equal rights and opportunities as distinguished from equal abilities and achievements.
3. A sense of personal responsibility for the rights, opportunities, and duties of both self and others.
4. Equivalent compensating service. (The idea of "something for nothing" is undemocratic.)
5. Equality through highest effort and the chance to exercise it.
6. Majority rule for the common welfare.
7. The surrender of individual rights conflicting with the common welfare, and the safeguarding of individual rights which do not conflict with the common welfare.
8. A stable social equality must result from a leveling up and not from a leveling down.
9. Self-effort is essential to many elements in equality.
10. The democratic control of social conduct requires the accustoming of every individual to the compulsion in himself and others, both through public sentiment and law, of every essential democracy which is not self-acquired.

The historic doctrines of Protestantism on individual rights, personal duties and responsibilities, the relation of the individual to society, and the

like, contain the essential democracies enumerated above. In other words, the development of the ideals which characterize the chief elements of Protestant belief and practice would tend to further the essentials of democracy.

Separation of church and state—Protestant churches believe in the separation of church and state in the interests of political freedom and religious liberty. Their formula is "a free church within a free state." Protestantism recognizes its obligations and responsibility to the state as well as to the church. Patriotism, for Protestantism, comes to have a religious sanction.

Democracy and education—The perpetuity of democratic governments depends upon the intelligence and moral integrity of the people. Democracy presupposes the capacity of every citizen for self-control in the interests of the common welfare. Democracy cannot survive unless it can develop in the masses who constitute its electorate a high level of intelligence and a general desire to foster the common welfare. Social solidarity which is essential to democracy demands that certain common elements enter into the training of all citizens. People who are to live together with mutual understanding must speak a common language, possess certain common habits, attitudes, ideals and have at their command a body of common knowledge. When there can enter into the training of all the people of all the nations of the earth a common body of knowledge, skills, attitudes, and ideals there will be possible the social solidarity of the human race and the brotherhood of man.

Democracy thrives on intelligence; Protestantism likewise thrives on intelligence and seeks to foster the means of the wide dissemination of knowledge and the development of the powers of the human mind. In so far as Protestantism has fostered the education of the masses it has fostered the agency which enables democracy to endure.

Protestantism and the public schools—The free schools are the chief instrument by which a democracy develops in each individual the powers of self-direction. Universal education is essential to democratic government. To survive, the democratic state must establish schools in which all its citizens may learn the common elements essential to democratic citizenship.

The democratic state owes its free public schools to the Protestant reformation. Protestant churches of the present time are ardent supporters of the public schools. They depend upon them for the literacy of their own children. Because they believe in the free state they pay taxes to support the free schools; they send their children to the free schools to be indoctrinated in the common disciplines essential to participation in the life of the free state.

But the Protestant churches also believe in the free church. They therefore believe that religion should not be taught in the public schools. To introduce formal religious instruction into the public schools would give some parents a just right to withdraw their children from the public schools and thus deprive them of the training for democracy which the State demands. Instead of withdrawing their children from the public schools

and thus endangering the perpetuity of the state Protestantism withdraws formal religious training from the public schools and assumes the responsibility of the religious education of its children in religious schools operated in coöperation with the public schools but solely supported by the church. Protestantism will continue to support the free schools of the democratic state.

The International Sunday School Council of Religious Education—The Sunday school boards of twenty-six Protestant denominations and sixty-seven State and provincial interdenominational Sunday school associations have recently merged their efforts into a North American Protestant Christian education association to be known as the International Sunday School Council of Religious Education. In outlining a constructive program for the Protestant churches of North America which would include both Sunday schools and week-day religious schools, this new organization adopted the following resolutions:

"The International Sunday School Council of Religious Education:

"(a) Reaffirms its faith in the public schools and urges upon citizens of all creeds the necessity of extending and developing these schools in the interest of democracy and free institutions;

"(b) Reaffirms its faith in religious education as an indispensable means of preserving both the virtues of the citizens of the state and the spiritual ideals of the church;

"(c) Urges the churches to preserve inviolate the principle of the separation of church and state by the strict observance of all the laws and traditions that have been created to guard the freedom of church and state; and

"(d) Urges upon public school authorities the recognition of their obligations: (1) To rearrange public-school schedules and build public-school programs in sympathetic coöperation with religious schools of all faiths; (2) to grant, under approval safeguards, suitable academic credit to students carrying approved courses under church auspices; and (3) to provide optional courses in ethical and social training for students not enrolled in week-day schools of religion."

Protestantism's future contribution to democracy—In assuming full responsibility for the religious education of their own children and depending on the free schools for secular education Protestant churches take upon themselves the task of maintaining the unity of the educative process. They will seek such a close correlation of the work of the religious and secular schools as will enable the church schools to give a religious interpretation to the curriculum of the public schools without, in any way, interfering with the principle of the complete separation of church and state.

This dual system of schools will give to all children the proper balance of those disciplines which lead to conformity, obedience, docility, on the one hand, and to invention, discovery, and initiative on the other hand. It will give the common elements essential to the homogeneity of the citizenship of the state, and it will provide a universal spiritual undergirding of the virtues of all citizens and preserve the great ideals of the church. Protestantism will continue to foster and to spiritualize the ideals of democracy.

PRESENT CONTRIBUTIONS OF CATHOLICISM TO DEMOCRACY

REVEREND AUGUSTINE F. HICKEY, DIOCESAN SUPERVISOR OF SCHOOLS,
BOSTON, MASSACHUSETTS

I am frank to say that I appear before this group with much reluctance. After hearing the carefully prepared papers on the contributions of Judaism and Protestantism to democracy I realize that it is almost unfair for me to attempt to set forth extemporaneously and without preparation the tremendous service of the Catholic church down through the ages and in the present day to the cause of democracy.

It is a matter of regret that the distinguished Catholic clergyman invited to discuss this question from the Catholic viewpoint has been unable to appear. I hope you will bear with me while I attempt to pay tribute to the influence of the Catholic church in promoting the interests of all people in all time. My attempt will fall far short of the fulfillment of this task. The subject is worthy of careful and finished presentation, which present circumstances entirely forbid.

I would call your attention first of all to the fundamental principle of Catholic living. The child in the home is taught the divine truth that every man is made in the image and likeness of God. This fact is the basis of all human dignity. A realization of this truth must impress every individual with a profound respect for the rights of his fellow man. Democracy connotes equalization of rights and realization that individual rights must receive constant respect. This principle of the dignity of the individual is fundamentally a Catholic principle. Upon this we base all our philosophy of life and on this principle we guide and direct all our relationships with our fellow men.

Let me say, furthermore, that in every democracy each citizen must bring to his citizenship certain definite well-fixed qualities of mind and heart. If I dare to enumerate I shall consider briefly at least five. The citizen must have faith in his country, must hope in his country, must love his country, must be prepared to make sacrifice for the common good, and he must be ready to obey the laws under which his relations with his fellow men are regulated. Faith, hope, and love for country, self-denial and obedience—these are the things which the individual must bring if any democracy is to endure. The children of the Catholic church down through the centuries have maintained their enduring faith, hope, and love of God. On this definite basis rests their faith, hope, and love of native land. The spirit of self-sacrifice and the spirit of obedience to law are born of their love of God and their respect for His law.

Again, let me insist that the qualities for citizenship in a democracy arise naturally out of fundamental virtues of the Catholic life. The Catholic makes the perfect citizen in a democracy because of the virtues which Catholic living develop in his mind and will.

Concrete evidence of the working out of Catholic principle in the influence of the Catholic church in the rights of all peoples is clearly written

in the pages of history. Who was it who brought to the slaves of pagan times a realization of their personal dignity and their right to freedom and liberty? Have we not in our Catholic history the fact of the consecration of noble hearted men of Europe to the redemption of the slaves taken by the Turks. These holy men of the order of the Trinitarians gladly offered themselves as hostages that freedom might be restored to their brothers suffering under a slavery imposed by their Turkish conquerors.

What organization brought the message of personal dignity and personal rights to the barbarians of Northern Europe? It was the Catholic church which preached this truth and which lifted these nations to the high plane of Christian civilization and to an appreciation of human dignity and human worth. It was the Catholic church which lifted woman from the slave of pagan times and placed her upon that pedestal of honor and dignity upon which she accepts the respect of Christian society.

If you know the story of the struggles for the development of our own American democracy you see Catholics prominent at every turn of progress and development. From Charles Carroll, of Carrollton, down to our present day the names of American citizens of Catholic faith are conspicuous for their loyalty and devotion in every great project towards the realization of the ideals of American democracy. In the great World War fought within our own memory to make the world safe for democracy, the American Army and the American Navy enrolled citizens of Catholic faith in numbers far above what might be expected in the proportion of the citizen of Catholic faith with the entire citizenship of the United States. It can be said without exaggeration that practically forty per cent of the soldiers and sailors who fought under the flag of the United States in the great World War were American citizens who understand life's responsibilities and receive all life's inspiration through their membership in the Catholic church.

We Catholics thrill at the thought of democracy. The Catholic church has always insisted upon the realization of the rights of every man. The contribution of the Catholic church to the furtherance of democratic ideals stands clear in her principles and in the facts of human history.

I would ask your attention to a most unusual and unique contribution to American democracy which the Catholic church is making here in the United States at the present time. I refer to the work of the parochial school. American citizens of Catholic faith maintain schools where two millions of children receive the highest kind of preparation for citizenship in our great Republic. These schools exist because the Catholic citizens of this country believe that religion is an essential element in education. Religion is the child's most precious inheritance. Without religion we can solve no human problems whether they are problems of democracy or of any form of social relationship. It is absurd for me or for others to stand upon this platform and to attempt to suggest satisfactory remedies for world conditions. These remedies can be found only in the acceptance of the truths which God spoke through His Son. These revealed truths are the facts and principles by which men are enlightened to know the way

to walk courageously in the face of the besetting difficulties and trials of life.

How foolish to attempt to prepare young children for citizenship and to deny to them their great religious inheritance—the revealed and spoken word of God Himself. It is impossible to bring to the child a proper realization of any of his inheritances, literary or scientific, unless he is taught that in God, Who is truth, the source of all these wonders is found. What is history except the revelation of the providence of God working out the destiny of men and nations. What is geography but a study of the generosity of God in furnishing to His creatures an abundance of the things we need in human life. There is no complete comprehension possible of those inheritances which are the groundwork of education unless religion has its place in the curriculum.

We all realize that there must be more religion brought into the lives of American children. Doctor Athearn is right when he says that the Sunday school is not sufficient. Why do you not, then, acknowledge the efficiency of the Catholic method which brings into the classroom the definite influence of religion in the educational process? The Catholic classroom with its religious teacher, its religious symbols, its religious spirit develops true religious character. The study of religion has a place in our curriculum, but we look for the results not in the brief minutes given to this first and fundamental subject of the curriculum but in the spirit of the school which is entirely religious.

Citizens in a democracy must have proper respect for law. No education is complete without emphasis on morality. There can be no morality without religion, for there can be no effective law without a sanction. Religion is the only enduring sanction of the moral law, and until religion has its proper place in the education of young children we can never look for the high quality of Christian character which is essential to the life and permanence of our American democracy.

The parochial school in the United States safeguards the highest interests of American democracy, for it places before the child a vision of the dignity and responsibility of citizenship in the light of his faith and his responsibility to God. Of no individual can it be said that he is educated unless he has been led to an appreciation of his fundamental relationship to his Creator. The Sunday school by itself cannot accomplish this result. Religion as part of the work of everyday in the classroom is the only satisfactory means for developing character. The fate of a democracy hangs upon the personal character of each individual citizen. In developing Christian character to an appreciation of religion and to a sense of moral responsibility the parochial school is making an essential contribution to the welfare of this country.

We have our parochial schools because we believe that there is no such thing as education without religion. We have these parochial schools, because we believe that the interests of God are the first interests in the educational process. We have these parochial schools, because as Americans we accept and put into practice the great warning of the father of this

country that religion and morality are the indispensable supports of our National Government and our National life. Our schools are American through and through. Our pupils love their native land and glory in the privileges of citizenship in this democracy. The pupils in these schools share all the common knowledge, common ideals, and common ambitions that enter into the background of real American citizenship. The glory of the Catholic method lies in this that this common knowledge and these common ideals are vitalized by religious truth and these common ambitions are motivated by a sense of religious responsibility.

Let me say as I close this extemporaneous, and therefore unworthy, presentation of the contribution of the Catholic church to democracy that I urge you most sincerely and earnestly to see the Catholic church on her altars, in her pulpits, and in her schools as the greatest bulwark of American democracy.

REPORT OF THE COMMITTEE OF THE NATIONAL COUNCIL ON CHANGES NEEDED IN THE ELEMENTARY SCHOOL COURSE

KATHERINE D. BLAKE, <i>Chairman</i> , Principal, Public School No. 6...	New York City
GEORGIA ALEXANDER, District Superintendent.....	Indianapolis, Ind.
ABBY LOUISE DAY, Professor of Education, State Normal School...	Lowell, Mass.
LIDA BELLE EARHART, Professor of Education, University of Nebraska.....	
.....	Lincoln, Nebr.
JOSEPH MARR GWINN, Superintendent of Schools.....	New Orleans, La.
FLORENCE HOLBROOK, Principal, Forestville School.....	Chicago, Ill.
CHARLES H. JUDD, Director, School of Education, University of Chicago.....	
.....	Chicago, Ill.
W. A. LEWIS, President, State Normal School.....	Hays, Kansas
HOMER H. SEERLEY, (Ex-Officio), President, Iowa State Teachers' College....	
.....	Cedar Falls, Iowa
JACQUES REDWAY, Geographer.....	Mount Vernon, N. Y.
ELIZABETH M. SHERMAN, Principal, Jefferson School.....	Oakland, Calif.
H. L. SMITH, Dean of School of Education, University of Indiana.....	Bloomington, Ind.
RICHARD O. STOOPS, Superintendent of Schools.....	Joliet, Ill.
JAMES H. VAN SICKLE, Superintendent of Schools.....	Springfield, Mass.
KATE VAN WAGENEN, Principal, Public School 53.....	New York City
ROBERT H. WRIGHT, President, East Carolina Teachers' College.....	Greenville, N. C.

In the last decade of the last century the National Education Association published the Report of the Committee of Ten and the Report of the Committee of Fifteen, and these two reports set the standards for the course of study in the elementary and in the high schools of America. Courses of study in most places have not materially wandered from the standards then set. Yet a generation has come to maturity since then; the world has learned to use the trolley, the automobile, wireless telegraphy, the airplane, the phonograph, moving pictures, the submarine, and poison gas; the World War has destroyed the old map of Europe and changed living conditions all over the world. The child of today faces a new world, and should not be tied to the course of study of the world of 1895.

The present elementary-school curriculum is determined largely in its content by the simpler conditions of life which prevailed two generations

ago. At that time the average child went to school only a few weeks in the year and never expected to make fluent or frequent use of the arts which he acquired in school. He lived during the larger part of the year in a simple rural environment where the conditions of life were open to the observation of everyone. The Commissioner of Education has given us a concrete picture of those early days by estimating that in 1800, the average schooling of an American citizen was eighty days; in 1840, two hundred and eight; in 1870, five hundred and eighty-two; in 1890, seven hundred and seventy; and in 1916, about twelve hundred.

During the last thirty or forty years conditions have rapidly changed in the social life of the States, as well as in the amount of schooling received by the average citizen. There has been some effort to enlarge the school program to meet these new conditions. There have been added courses in geography, nature study, history, and the constructive arts. The new courses thus added have, however, by no means kept pace with the needs of the times. We are beginning to be keenly aware of the necessity of a radical re-organization of school work so as to give pupils adequate preparation to take their places in the modern world.

No more striking example of the need of the enlargement of the elementary curriculum can be found than that which is brought out by the persistent demand of the times that we teach pupils about the community in which they live. The simple rural community of former times has disappeared. Even in the rural districts there are appliances of civilization, the telephone, the automobile, and the mail, which complicate life beyond the possibilities of direct observation. The modern child never sees the great majority of the people on whom he is dependent for the ordinary commodities used in his life. If he is to know anything about his personal relationships he must be taught to look beyond his observable environment.

The urgent need of expansion of the elementary curriculum becomes so apparent in the light of such considerations that it hardly seems necessary to argue further along these lines. It is, however, true that within the schools and in the community there are powerful conservative forces which make expansion slow. The parent wants his child taught as he was taught. Teachers and school officers are reluctant to abandon practices which long usage has made familiar. It is well, therefore, that organized effort be brought to bear on the problem with a view to bringing the schools a richer program, better suited to modern conditions.

ENGLISH

In most courses of study the literature read and studied in school is "classic." The real difficulty before the school is, that we are training children who face not *yesterday*, but *tomorrow*. Some of the best modern writing should be presented to the youth of America. In any event, the literature of the schools should lead away from the superstitions and folklore follies of the days when our ancestors painted themselves with woad,

and so feared strangers that anyone painted differently was killed as soon as seen.

No fairy story should be told to children unless it has a real ethical value. The old-fashioned allegory trains imagination quite as well as does the fairy story, and has a moral value that lasts through life. So also have the well-known myths which once were the religious beliefs of a people, and they have an historical value as well. Anyone with average intelligence and even a low order of imagination can tell fairy stories by the hour. Knowledge of life, reality, or verisimilitude are not required. That is why fairy story telling is so popular. But to invest with life and interest real people, who have moved the world, requires study and a high order of imagination as well as a certain dramatic ability. Yet such are the only stories worth telling to our children. Such are the tales that will kindle their imagination and lead them to higher levels, and will fit them to take up the burden of life, knowing that each must give his share of work and self-sacrifice in order that all may be happier.

Most of the Mother Goose rhymes were originally lampoons, political or personal; for instance, London Bridge was a lampoon of the time of Charles II. When their history is taught, those which have an historic value may be taught to advantage; the others might better be omitted, and simple songs with equal rhythmic value, written by our great authors, be substituted for them. It is absurd to teach to children six or seven years old the foolish rhymes that we older people learned in the nursery at the age of two or three.

The task before us in all English work is to try to make it vivid to the pupil. No child should ever be asked to write a composition on a subject which is not clear and distinct to him as a personal experience. Vague subjects and glittering generalities destroy a child's interest in the composition lesson. It is better for him to write bad English with a punch to it, than to write correct English that is dull.

Technical grammar should be omitted from the first six years in school. The grammar studied in the seventh and eighth years should be simple in character.

HISTORY

America thus far has been the greatest experiment in democracy that the world has seen. The children of today face a new world and must learn history in the light of present-day developments.

While world conditions of today must not be neglected, the best training for the child is a study of the laws and government of his own community, the things which he can readily understand.

History, as taught in the past, has focussed the pupils' attention upon military greatness. Democracy demands that the pupils of today shall study the progress of nations and races rather than the story of kings and generals. To this end periods of history should be chosen and the life of the people during these periods made real by means of research and project teaching, culminating in pageants. The life of the mass of

the people in each period should be studied and the causes for their advancement or retardation discussed and the far-reaching effect of *new discoveries, new inventions, and new ideas* should be shown.

Each period studied should be vividly contrasted with the every-day conditions of the present time. This will render interesting research into our own life and community conditions, and these should be carefully studied, defects noted, and the pupils taught that it is their duty to make the world better, and to bring nearer the brotherhood of men and the peace of the world.

Teachers should be leaders in their community, not followers. Sir Auckland Geddes, British Ambassador to the United States, in his address last November, before the Annual Convention of the Minnesota Education Association, stated that improved education would make future wars impossible and that the schoolroom is the hope of peace. He said "An ambassador's duty is to promote the cause of peace." How infinitely more it is the duty of the teacher! Continuing, "I have participated in two wars, and I have no desire to see another, nor for my children to see one. . . . You and your companions in the teaching profession have an almost absolute control over the mental bias of the citizens of the future. That knowledge emboldens me to say that if you are understandingly faithful to your trust there will be new hope for mankind and for the peace of the world."

ARITHMETIC

At the conference of the National Council of Education on July 5, 1920, after a discussion participated in by grade teachers, principals, normal-school instructors and presidents, and college professors and presidents, it was unanimously voted to omit entirely from the elementary course all the so-called higher arithmetic—all arithmetical conundrums, and to confine the work in arithmetic to those processes which are fundamental in character and are needed by the ninety per cent of the people in America who do not go to high school. Twenty-five years ago the N. E. A. urged the elimination of arithmetical conundrums, yet they are still present in most elementary school arithmetics.

Elementary school arithmetic (the first six years) should be confined to those processes with whole numbers, fractions, and decimals used in the everyday life of the great mass of our population outside of technical or special vocations. The substantial mastery of a certain number of often used abilities is better than half knowledge of twice that number.

The application of these processes should be confined to the problems that arise in the lives of the children and in the homes and communities of the average family. The work should be confined largely to the class period in which the teacher can see that proper habits of computation are formed, as well as that proper methods of attack in the study of a problem are developed. There is little value in out-of-class assignments before the fifth or sixth year.

All mathematical puzzles and conundrums should be eliminated; and

all problems, where in the real world the data of the problem are obtained from the answer, and all business, economic, and industrial problems (studied for social instead of vocational needs) should be left for the Junior High School.

This would eliminate the addition and subtraction of all fractions except those arising in the expression of units of one denomination in terms of a higher in our ordinary tables of measure. Such an elimination would render unnecessary methods of finding the least common multiple and the greatest common divisor. It would also greatly reduce the amount of complex work in multiplying fraction by fraction and dividing fraction by fraction.

Such a course would also revolutionize the teaching of decimals. Instead of teaching the pupils to express the remainders in long division as meaningless fractions with large terms, the division would be carried to tenths or hundredths as the nature of the problem required. These quotients could be added or subtracted as easily as dollars and cents. Thus the work in decimals would be confined to such use of a decimal in the division of whole numbers; to the addition and subtraction of decimals; and to multiplying or dividing a decimal by a whole number, all of which is paralleled in what he does in United States money when written with the decimal point and the dollar sign.

Multiplying and dividing decimals by decimals should be left until the latter part of the sixth year, and then lightly stressed.

Percentage should be taught as notation for hundredths and but the two problems of everyday life should be given—namely, finding the relation of two numbers and expressing it in per cent and finding the per cent of a number.

The reduction of compound denominate numbers as a separate topic independent of the usual work of multiplication and division should be eliminated, as well as the four fundamental processes in denominate numbers.

Mensuration should be confined to the simple needs of areas and volumes of the house.

This will not result, however, in a very great curtailment of time, but in giving a knowledge that will function in the uses to which the pupil will need arithmetic in later life rather than in the great inefficiency of today due to the awful waste in studying the non-essentials.

GEOGRAPHY

The airplane, wireless, telegraph, and telephone link the ends of the world in such close connection today that the people in the antipodes have become our neighbors. It therefore becomes imperative for us to know them intimately. As Dr. Wallace Walter Atwood, President of Clark University, has said:

"We have reached the stage in development when our further growth, perhaps our peaceful existence, depends upon our judgment in dealing with

the other peoples of the world." That is to say, the peaceful existence of nations lies in the hands of the geography teacher, who therefore must become the foremost factor in training humanity to the conscious knowledge which will bring about a peaceful brotherhood and solidarity of nations—their friendly characteristics rather than their objectionable differences.

Geography is fundamental to the history of the human race, for geographical features have controlled the development of nations. Physical and climatic conditions dominate human industries, and a study of geography, to be effective, must show how and why human industries are located as they are and why humanity is concentrated in specific regions which are either topographical or climatic.

The physical map of the continent should be the one continuously used, so that the geographical features may be firmly fixed in the mind of the pupil, who will thus learn to know why population is sparse in certain regions while others are crowded. The countries should be located approximately, in connection with their geographical features, rather than with accuracy, according to the calico-colored political maps which have hitherto been regarded as the more important. These last have their specific uses, and may be employed when necessary, particularly in the older classes.

The regions of production should be placed clearly before the children—the great coal and iron regions, making possible structural steel and intensive manufacturing; the grain areas of the world; the cotton districts; the fruit and timber regions; the roadways of commerce, tying cities together with waterways and railways, and ere long, with airways. Somewhere or other in the course, both the history and the geography of such trade routes as the Erie Canal and Mohawk Valley, the Santa Fé Trail, The Overland Mail, the Danube, the Khaibur Pass, the Suez Canal, the Panama Canal, the Berlin to Bagdad Railway, and other historic highways should be studied in detail. These are instances of the intense geographic control of human history.

Pictures on paper and screen, still and moving, cannot be too strongly emphasized; they naturally fall under these heads: physiographic scenery, social and industrial life, and transportation. Through pictures the child learns to know people on the other side of the world; their homes; igloos, tents, thatched dwellings, stone and wooden houses, palaces; their occupations; hunting, planting and harvesting, mining, manufacturing, and transportation.

The teacher should be the selector of her own pictures. Various side excursions may be taken through the use of pictures; for instance, the garb of the Bedouin nomad shows that cotton grown in Texas and woven into cloth in New England may be marketed in the Arabian desert.

As a rule, motion pictures are less useful than still life scenes. For illustration of plant and animal life development by the use of retarded motion, motion pictures are highly educative. They also illustrate manufacturing processes more interestingly than any other form of picture.

The chief advantage in the use of lantern slides is the fact that the whole class can see them simultaneously and discuss them.

And then there is the wonderful story of the world, round and whirling, going no one knows whither, through the starry universe that surrounds us.

The geography period should be the joy period of the day's work.

SPELLING

The N. E. A. should issue an authoritative list of the one thousand words which form the vocabulary of the average human being who has not had the benefit of a high-school education. This list should be made by a study of all the present lists of scientifically-chosen words, as well as those taught in good business schools. It could be published either by the N. E. A. or the U. S. Bureau of Education.

With this could be arranged a simple compendium of the rules required for punctuation in proof-reading.

TRAINING FOR PARENTHOOD

By scientific research and patient study we have learned the best methods of feeding and environment for plants and animals. The flowers are infinitely more beautiful, the fruits larger and more perfect, the farm animals more productive, than those of half a century ago. But during this half century we have done little to improve the human animal. The training and environment of children have been forgotten while human beings struggled for a livelihood. As a rule, the most wasted years of life are those from birth to school age. Nevertheless, the schools as a whole are not yet awake to their duty in preparing boys and girls for parenthood. This does not mean sex hygiene, but a continuous training in the ideals and joys of parenthood, and a knowledge of the self-sacrifice needed in order to win the crown of loving devotion that children give to wise and affectionate parents. Such training must not be left to the high schools but should be taught in the first six years of school life, for a majority of the school population leave school at the end of the elementary school course or earlier.

Humane education, care of babies, training for health of children of pre-school age, and the training of their powers of observation, and games that will help to develop either the body or the brain of the younger brother or sister, or the child that may come to their arms later in life—all these should be taught in the schools, to both boys and girls.

In our factory-built world of today thousands of children are acting as little mothers or little fathers to younger brothers and sisters. Untutored in the care of children and in the joy of training them aright, their little charges are merely heavy burdens borne in silence, or with grumbling, and sometimes with the abuse taught them by their illiterate parents. Such training as this would come to these little foster-parents as a revelation and a delight. It would help toward bringing to the schools in a short time better-trained kindergarten children, and, for the future, would mean an infinitely better generation.

SCIENCE AND MANUAL TRAINING

The world is calling for people who think, because the life of today is dependent on scientific research. Science, more than any other study, demands thought; it is therefore imperative that our children should study at an early age the beginnings of science, both organic and inorganic.

The child of today faces a world that is dominated by machines. Life is made easier for him by machines, and a great majority of the children will earn their living by caring for machines. It is well, therefore, that their training in the use of machines should begin early. There is a toy typewriter that is not expensive that would train for accuracy in spelling as no amount of written work will do, and there are simple arithmetical calculating machines that are interesting and helpful. There are similar little devices which can be used for "busy work," and will save the voice and the nerves of the teacher—and of the child—for the machine, like nature, is quietly inexorable.

Science work, in so far as it relates to machines, should be spread through the child's school life and not left for the last two years of school, as is frequently done in courses of study. In the city and on the farm, in its daily life, the child sees machines in use, and its toys frequently contain applications of the lever, pulley, wedge, and the like.

A seven-year old child can learn something of the force of gravitation when illustrated by its own bumps, and of adhesion, when it glues a picture to a piece of cardboard. As it progresses in school the child should learn to watch for examples of the power of gravitation, cohesion, capillary attraction, light, heat, combustion, electricity, magnetism, the lifting power of the screw, inclined planes, and other mechanical devices. Our great inventors did not postpone their work until they were ready for high school or college, but tinkered in their childhood, trying to find new ways of doing the things their parents did more slowly.

Just as inorganic science should be studied through the grades, so also should simple organic science. The fundamental difference between living organisms and inorganic matter should be taught with special emphasis on feeding, breeding, and growth. In large cities this study must perforce focus on plant life and human life, for dusty, dead specimens from a museum do not train a child in true nature study. Only in rural or semi-rural communities can the great panorama of nature really be studied. Nevertheless, school gardens, parks, and herbariums can do much for the city child, while corn clubs, calf clubs, and farm culture generally, will open the eyes of the rural child to the wonders possible of achievement in the plant and animal world through right feeding and environment. In all study of growth, the needs of plants and animals should be compared with those of growing children, and likenesses and differences studied to the end that the next generation may be better equipped for the struggle of life than the present one.

Shop work and cooking should not be confined to the seventh and eighth years, as at present because of expense, but should be taught throughout

the school life of the child, the younger children taking the place of helpers to the older girls and boys. All manual training, science, and art work should follow taste and ability lines, rather than sex lines. Boys should be free to learn cooking or sewing, and girls to do shop work; for in the industrial world today thousands of men are cooking and sewing, while in thousands of homes women are doing upholstery and carpentry work.

In ancient times education was transmitted from father to son by word of mouth. Today visual instruction is far more important than oral instruction. We appeal to the eye of the child through books and pictures, and the appeal to the eye is more powerful than that which is addressed to the ear. We all know the old saying, "In at one ear and out at the other," but no one has ever said, "In at one eye and out at the other," because things seen are best remembered. For this reason it is imperative for the up-to-date school to introduce visual instruction in all branches as far as possible. Stereoscopes are excellent, and moving pictures are still better. No town should be without the means of teaching its children through the medium of moving pictures. History, literature, and science can all three be illuminated in this way.

Unless our normal schools can teach the inspiration of the new century which lies before us, the course of study suggested in this report cannot be properly carried out. The normal schools of this country should be leaders of school thought and method, not followers of the course of study as already laid out.

No student should be permitted to receive a diploma from a normal school who has not specialized along some one line of study as well as accomplished the general course. Only a person who is too dull to make a competent teacher is unable to become a specialist in one or more of the subjects required in the elementary schools.

In closing the Chairman desires to thank the entire committee for their willing helpfulness, and especially the secretary, Dr. H. L. Smith, for his continuous assistance. Mr. Charles H. Judd, Superintendent Joseph M. Gwinn, and Dr. Jacques Redway have earned the gratitude of the Chairman by their prompt and efficient aid. This final report has the unanimous approval of the committee and was adopted as a whole by the National Council of Education on July 3, 1922.

TRAINING FOR PARENTHOOD

ELIZABETH A. WOODWARD, STATE SUPERVISOR OF CLASSES FOR IMMIGRANT
WOMEN, NEW YORK CITY

My topic relates to Parents' Helpers and would be understood at once if we discussed how to help the children in their capacity of mothers' assistants—both boys and girls. How to help them to administer these duties of "minding the baby" and "tending" the younger brothers and sisters so that our educational procedure shall be enriched by their duties is the

problem. At the same time these thousands of little children, parents' assistants I choose to call them, may also be teachers' assistants and society's assistants in the great work of social welfare.

In an age when despite all our educational efforts we are still a Nation of "sixth graders," we must plan to utilize all existing agencies for enrichment of elementary education. In our courses of study we must recognize facts. If less than seventy-five per cent of our elementary children advance beyond the sixth grade in our largest cities, where must we work?

The large families found in our congested districts, the economic conditions particularly among our immigrant groups, throw responsibility for the care of younger children on boys and girls below the junior high-school and the high-school age. For the adolescent in progressive higher schools, such agencies as Camp Fire Girls, Girl Scouts, Boy Scouts, and Junior Red Cross meet the needs and could have their programs on child-care enlarged and enriched. For the younger children who from seven to twelve years of age must regularly "mind" the little ones, the teachers of the first six grades as well as our courses of study must make provision in their regular school subjects for projects that will include helpful suggestions to these little parents' assistants.

Of course we have to educate the mothers, but few schools or agencies within the schools have attempted this beyond mothers' meetings or English classes for foreign-born. With her large family and needs for special adjustment to American life the foreign-born mother needs the help of her children. Even with our English-speaking mothers we say: "Maternity represents the most exacting individual responsibility known to society."

It is taxing, confining work for a little child to watch that no harm comes to the babies or younger children left in his charge. This care must be lightened and made joyous. New projects in the school work could include much that would be valuable as original work and not upset or enlarge the regular school curriculum. For instance, children in the cities need to be taught to play; they need imagination and creative power developed for the joy of the present and the good of the future.

Many little children are instinctive in their care-taking, old-fashioned in their responsibility, and autocratic in wielding their power over the younger ones. How many, on the other hand, are good-natured leaders in play with the little ones?

What a wonderful and joyful field of service this mothers' assistance work could be made if teachers knew the pupils' problems at home and helped to meet them? The teachers must do it. Even the mothers of a few children are frequently baffled. An advertisement like this was found in a paper not long ago: "Wanted, An intelligent person to assist for a few hours daily with answering questions of two children, aged three and five, to relieve parents of said children." Perhaps the answering of questions and the development of the linguistic powers of these coming citizens can be safely trusted to the school child in the modern city. But health training, handicrafts, games, finger-plays, lullabies and songs, stories and rhymes, nature-study facts, and the English language need a teacher's assistance.

Projects for the grades could easily include problems of caring for little children in groups during a mothers' meeting or an English class. Grade children can prepare real programs for younger and older groups, programs which would include handcrafts, such as clay work, bead stringing, playing with shells, spools, or buttons, making dolls of handkerchiefs, or vegetables, or nuts.

Above all things this child-caring work must be converted into play. It must be performed joyously. The children have a right to the pursuit of happiness. City children need to be taught how to play. Even the movies are destroying all thought of the individual's need for initiative. We need more life, more dramatic work, more interest in nature, more abundant activity, more joy in the achievements of children in our crowded tenements. Not more passivity, not more "minding the baby" listlessly, looking at movies, and "sitting around."

To summarize: (1) Frank recognition of the need of the education of parents' assistants, girls and boys under twelve years in the elementary grades. So long as large families exist and economic conditions remain unchanged the need exists. (2) Direct plans for meeting this need not only in health education but in almost all school subjects. These plans include: (a) The projects and problems so popular now in school work should make provision for these definite home needs. Children might be given credit in school, as the Camp Fire Girls and Girl and Boy Scouts do. (b) Introducing into normal school and kindergarten-training work problems and projects connected with the training of mothers' assistants. (c) Introducing into our courses of study suggestions for utilizing this great army of premature educators and guiding playfully and joyously these extra-school opportunities for service and nurture.

FINAL REPORT OF COMMITTEE ON HEALTH PROBLEMS IN EDUCATION

CHARLES H. KEYES, PRESIDENT OF SKIDMORE COLLEGE, SARATOGA SPRINGS,
NEW YORK, ACTING CHAIRMAN

The Committee on Health Problems in Education of the National Education Association with the continued cordial and effective coöperation of the corresponding committee of the American Medical Association has continued its work during the last year with a sustained interest in the Committee program and a steady demand for the reports which have been issued by the Joint Committee. Educational and health officials, Child Welfare organizations, Red Cross workers and other individuals and organizations in this and in other countries are looking to your Committee in increasing numbers for health standards and literature.

This Committee on Health Problems was created as a committee of the National Council of Education at the meeting in San Francisco in 1911 at the suggestion and request of the American Medical Association, which was in session at the same time in Los Angeles. At the meeting in

Des Moines, July, 1921, this Committee was formally adopted as a committee of the National Education Association.

After a careful survey of the general field the Committee decided to give attention first to the health problems of rural schools. The first report of the Committee was a valuable bulletin entitled "Country Schoolhouses," by Fletcher B. Dresslar, a member of our Committee. This report was printed and distributed in 1912 by the U. S. Bureau of Education. The Committee literature still being distributed in original or repeated editions includes the following:

1. *Minimum Health Requirements for Rural Schools.* Two editions of 800,000 copies of this report have been distributed. A third edition of 10,000 copies is now being distributed. Unprejudiced evidence from many places shows that this report has exerted great influence in the improvement in rural-school sanitation in the United States during the last eight years. Several States have adopted this report as the standard for rural schools.

2. *Health Essentials for Rural-School Children* was printed in 50,000 copies. This first edition was exhausted, and a second revised edition is now being distributed. Most of the copies of this report have been used as supplementary texts on health in the training of rural-school teachers in the normal schools, and as practical handbooks by rural-school teachers and supervisors.

3. *The Health Chart Report.* The first edition of 10,000 copies of the illustrated Health Chart pamphlet was soon exhausted, and a second edition of 10,000 is now being distributed. This pamphlet not only serves to illustrate and explain the health chart but is being extensively used for health instruction in both city and country schools and also as a guide in making health posters and scrapbooks.

4. *The Health Chart Set* comprises 58 charts, each 22 x 28 inches. Over 1000 complete sets of the health charts (including 58,000 charts) have been distributed in our own and in foreign countries. Many orders for individual charts have been received. One State department of health has recently ordered 2400 copies of individual charts.

The above-mentioned bulletins and the health charts are being sold by the Committee at the bare cost of printing.

5. *The Teacher's Part in Social Hygiene* was published last year with the coöperation of the American Social Hygiene Association and this co-operating Association presented the Joint Health Committee with 5000 copies of this valuable bulletin. The demand for this pamphlet report is rapidly increasing.

Constructive coöperation between organizations and committees is a prominent part of the policy of the Joint Health Committee.

6. *Health Improvement in Rural Schools* is a report which has been in careful process of preparation for several years. This is just coming from the press to complete for the time being the introductory plan of the Committee to promote the entire health program of the rural schools.

7. *Health Service in City Schools of the United States* is the report of a survey, conducted by our Committee this year, of the health work which

is being done in the city school systems of this country. Six hundred and twenty-two six-page questionnaires were sent to city superintendents of schools. Filled-out questionnaires containing much valuable information of current accomplishment have been received from 340 (54.6 per cent) of the superintendents.

Your Committee expresses here sincere appreciation of the splendid help and coöperation from the superintendents who responded so promptly. This report will be printed and ready for distribution within a few weeks.

8. *Daylight in the Schoolroom* is a valuable report on school lighting, prepared in 1921 by a sub-committee under the chairmanship of Dr. Edward Jackson, eminent ophthalmologist of Denver and a member of our Joint Committee. This report has been printed in several scientific and educational magazines.

9. A partial report on *Ventilation of School Buildings* has been prepared by a sub-committee of which Dr. R. W. Corwin, of Pueblo, Colorado, is chairman. Further work on this study is being conducted under the leadership of Mrs. Ira Couch Wood, of Chicago, another member of this sub-committee.

10. Appointment of Committees on Health Problems in Education in the several States. At the meeting of the House of Delegates of the American Medical Association in New Orleans in May, 1920, it was voted to urge upon each of the State medical societies that a committee of five physicians, members of the society, be appointed to coöperate with a similar committee of the State Teachers' Association as a joint committee on the Health Problems in Education in that State. It will be recalled that at the meeting of the National Education Association held in Des Moines, Iowa, in July, 1921, this action of the American Medical Association was heartily endorsed and each State Teachers' Association was urged to appoint such a committee in response to the request of the State Medical Society. All but five of the forty-nine State medical societies have appointed such State committees of physicians and have reported their personnel to the Secretary of the Council on Health and Public Instruction of the American Medical Association. Our Committee urgently requests every State Teachers' Association to appoint a like committee of teachers to coöperate with the medical committee.

While our Joint Health Committee of the National organizations of teachers and physicians can propose material and secure data of great value, and can recommend measures which would secure better health conditions in the public and other schools of the country, it is obvious that if such measures are to be generally adopted and put into practice it must be through the efforts of many groups dealing with these activities in the several States and communities. Our Committee will find one of its most effective fields of usefulness in serving as a medium of inter-communication and coördination of these several State committees.

The coöperating medical group of our Committee has initiated the custom of holding an annual conference at the time of meeting of the American Medical Association, of the members of the committees of the several State

medical societies. Our Committee recommends that a similar plan be instituted for the committees of the State teachers' associations and that our Committee be authorized to arrange for such a conference at each annual meeting of the National Education Association. The interchange of information regarding progress in the several States in solving the Health Problems in Education together with the opportunity for discussion and suggestion which such a conference would afford could not fail to be helpful in promoting this great movement.

The Joint Committee acknowledges with great appreciation the generous, substantial, and continued coöperation and support of the Elizabeth McCormick Memorial Fund of Chicago. Throughout the existence of our Committee the coöperation of the U. S. Bureau of Education has been of great value.

At the annual meeting of the Joint Health Committee on February 28 in Chicago unanimous support was given to a resolution that a committee should be appointed to prepare a Program of Health Education for Public Schools and Teacher Training Institutions of the country. This is by far the most extensive and important project which your Committee has yet undertaken.

So active was the interest manifested by the members of the Committee in this plan that on April 22 seven members of the Joint Committee met in Pittsburgh, entirely at their own expense, and spent two days in developing the plan for this Program of Health Education.

This wave of intense interest in, and intensive development of health work in the schools, accompanied by unprecedented stimulation of interest in health by voluntary organizations outside of the schools, and contribution to the schools of a fascinating and confusing mass of material and devices for health work and health teaching from many outside sources, makes it all the more desirable and necessary that the educational forces within the schools should study, interpret, and coördinate the materials and methods in the fields of health education so that the schools of the country may be provided with an educationally sound program of health teaching and training.

This program adopted by the Committee provides for sub-committees to grade the health teaching material for the kindergarten, elementary, and high schools; and also for the normal schools and other teacher-training institutions. These sub-committees further will provide technical groups to judge and organize material from the standpoint of teachers in the schools, physicians, educational psychologists, dentists, nutrition experts, teachers of physical education, biologists, and public health specialists.

This program of the Committee would involve the work of several years and during this period of thorough investigation and consideration of the multitude of problems involved our Joint Committee would plan to issue a preliminary report within a year or eighteen months to provide the best available guidance to the schools of the country relative to health teaching in the immediate future.

Extensive study and experiment by our Joint Committee, assisted by the

various technical committees referred to, would be necessary to solve some of the many problems in this field which are now pressing for answer.

In this new project the members of the Joint Committee have proposed for themselves and for their chairman a task of National scope and of great importance in the program of public education.

This Joint Committee seems peculiarly situated and constituted to attempt under distinctively favorable auspices this pressing educational task. This work can be confidently undertaken by your Committee, if the proper encouragement is given and if adequate financial support is provided.

If the preparation of a Program of Health Education—in scope and character like that briefly explained in this report—is to be carried out with reasonable efficiency an additional appropriation of \$5000 a year for at least three years is urgently needed to provide the secretarial and clerical aid required. Perhaps it is not necessary to add that no part of the appropriations here recommended is intended for any member of the Committee but simply for the secretarial and clerical work involved.

In addition to the committee program and reports already mentioned, we are working toward the following bulletins:

(a) Mental Hygiene for Normal Children: What Every Teacher Should Know About It.

(b) Standards of Health Norms and Defects of School Children.

(c) Making Athletic Games Safe and Healthful for School Children.

(d) Health and Efficiency for Teachers.

(e) Essentials in the Hygiene of Instruction and School Management.

To continue with reasonable efficiency the program already under way, and outside of the preparation of a Program of Health Education, the Health Committee respectfully asks for an appropriation of \$2000 for the coming year from the National Education Association. Your Committee, according to the custom of many years, confidently expects from the American Medical Association an appropriation equal to that which may be granted by the National Education Association.

THOMAS D. WOOD, *Chairman.*

HEALTH AND THE SCHOOL

WILLIAM H. BURNHAM, CLARK UNIVERSITY, WORCESTER, MASSACHUSETTS

After fifty years of modern scientific study of child hygiene it is now possible to state a few fundamental general truths in regard to the relation of the school to the child's health. For the sake of brevity these must be stated rather dogmatically. A few of the essential things are as follows:

(1) First of all the fundamental aims of education and of child hygiene are the same: normal healthful development and the acquisition of habits of healthful activity physical and mental.

For the early period of school life, in the kindergarten and the elementary grades at least, the primary aim of education should be health. The child's first business is to grow and to develop. Everything else can wait, but the

demands of health are imperative. At present there is no consensus among educators in regard to the aim of formal education. An eminent educator has frankly admitted that he does not know what the aim of education for the elementary period is. This is an amazing statement, but if pedagogy does not know the aim of education for this early period, then pedagogy should give place to hygiene, for hygiene does know the aim definitely—health, adjustment to a normal environment, and the acquisition of those habits of activity, physical and mental, that represent the alphabets of health for everyone.

(2) Physically and mentally the child is literally a different creature from the adult. Hence both our educational methods and hygienic training should be determined from the genetic point of view. This is obvious from what has already been said. In the early period the maximum of freedom for spontaneous motor activity out of doors is essential, in order that the child may make his own adjustments as a reacting organism to a natural environment. In the elementary grades the emphasis is naturally on the acquisition of the alphabets of learning and health and morals. In the high school the emphasis shifts and the aim is more on healthful adjustment to social environment, and so far as the individual is concerned, on self-discovery, self-adjustment, and mental as well as somatic hygiene.

(3) We now see clearly that organization of hygienic activities is necessary. The health interests of the members of a community, of the State, and of the Nation are all bound up together; and as regards pure food, pure water, pure milk, protection from infectious disease and the like, the health interests are common interests, and the health of the child is only the most important part of public health.

The opportunity of the school for public health is obvious from the fact that in the school all the children of the community are brought together; here conditions can be organized with regard to the health of the children directly and public health indirectly; and here too is the grand opportunity for prevention of disorder, physical and mental, since many of the most serious conditions that threaten the health of the young have not yet affected the children, and can be removed.

(4) Modern investigations and modern studies of education and hygiene have at least clearly shown that it is training in hygiene not mere instruction which really counts. However important instruction may be, it is secondary and subsidiary and is most effectively given on the basis of individual training. Hence the significance of the aim in the various child welfare societies actually to develop habits of health among school children.

(5) One of the greatest advances in child hygiene in recent years is the insight that mental hygiene is quite as important as somatic hygiene, and that objectively excellent methods in hygiene, important rules of health and significant teaching all avail nothing unless right mental attitudes and right habits of healthful mental activity are developed. Thus in connection with every school subject and even every lesson in child hygiene the dictates of common sense and the plain teachings of scientific mental hygiene are to be considered as well as those of physical hygiene.

(6) To the practical question, what can be done today, the answer is in the training of teachers. In matters of health, as in other things, school reform is always schoolmaster reform. For proper health training properly trained teachers are necessary. No textbooks, no rules for instruction and training, no code of health morals, no methods or devices, however clever, can take the place of good teachers. To insure good teachers they themselves must be trained in the essential habits of health, given the scientific attitude, a broad perspective, and the genetic point of view, so that lessons may be adapted to individual children and the concrete situations of the schoolroom.

This movement for training of teachers in child hygiene is of the greatest significance, but from the outset the instruction and training should be rigorously scientific.

The history of hygiene is instructive. Even in modern times children have suffered from the hands of the hygienists. The story is pathetic. They have been dosed with things vile of every description, from calomel and tobacco to human excretions. Even in modern times surgeons have advised slitting the gums, making the incision deep clear to the bone, in order to ease their teething.

Even the history of scientific child hygiene has not been free from error. The pathway is strewn with the fragments of exploded theories. To recount the errors even in regard to bad air and the ventilation of school-rooms would be a long story, at the core of which would be perhaps the gruesome warnings in regard to carbon dioxide as a deadly poison and schemes of ventilation based on this idea, although we know today that carbon dioxide in ordinary rooms is a harmless gas and in right proportions as essential for human health as oxygen itself.

The lesson is obvious. As others have fallen into error, so may we. No one, because he lives in the year of our Lord 1922, can claim immunity from error; and the teachers, lacking proper training and using textbooks that teach error, cannot be blamed. The only safety is the acceptance of no hygienic doctrines as true that cannot be verified by the scientific method.

Among the dangers to health in the schoolroom is the conscientious teacher of hygiene who lacks knowledge. The old physician Gazius who taught the danger of bathing, the teachers in the English school that punished their children for not smoking, those of a later age who condemned night air and the drinking of water, and the kindergartner of today who trains her children in songs beyond the compass of their voices, the teacher in the high school who forces the pubescent boy to sing when his voice is in the period of mutation, the dietician who is satisfied with calories without vitamins, and the hygienist who worries the children about malaria where there are no mosquitos—all alike are conscientious. Thus the success or failure of the hygienic training of teachers will depend upon whether this education is truly scientific or not.

While I would go further and make health the primary aim of all education in the early years, I wish to emphasize the need of the scientific attitude, of perspective, and of mental hygiene. More concretely, teachers

should learn that some children and some adults need most of all to forget their own health; that what is one child's food may be another child's poison; that while both instruction and training are necessary, instruction is especially for the teacher, training for the pupil; that while talk about hygiene may have flushed the cheeks of eager teachers, it never painted the cheeks of children; that only actual practice of health habits counts; that it is dangerous to teach what is not true, and that when in doubt the only safe rule is to let nature alone.

The service the school can render to the child's health and indirectly to public health is equalled only by the service of the home for the pre-school child. To the door of the schoolhouse the child brings not only the inheritance of the ages, but the result of six long years of training in the home and on the playground or the street. Not only the primitive emotions of fear, rage, love, and the fundamental instinct to activity, but associated fears, conditioned reflexes, attitudes, habits, some distinctly habits of health, some distinctly injurious. Thus the school beginner is by no means a *tabula rasa*.

(7) The strategic point of attack in school hygiene today is at the entrance of school life. Here a thoroughgoing health examination, physical and mental, is necessary. This is merely common sense, and it is imperative that teachers should know the character of the training children have received in the pre-school period. Just as at college entrance it is sound pedagogy and common sense to inquire into the mental ability and the high-school training of candidates for the college—and every institution finds this necessary—so it is perhaps even more important to know the associations, attitudes, inhibitions, and mental twists that children bring with them to school as the result of their six years of pre-school training, good or bad.

Only by a thoroughgoing examination of this kind at the beginning of school life can the necessary coöperation of teachers and parents be obtained. Only thus can the children needing special care be selected, the health of the normal children be preserved, retardation and failure prevented, and the teacher's time and strength conserved. The first months of school life amount to little for formal education, but are invaluable for health and should be devoted to this.

The failure to give such a competent examination at the entrance to school life and the ordinary plan of admitting all children, developed or undeveloped, normal or defective, at the chronological age of six has resulted in the admission of many children not sufficiently developed physically and mentally to do school work, the futile attempt to teach these children, the failure and retardation of many of them made inevitable from the outset, and a general attitude of hurry and waste and neglect of normal healthful development.

Next to ignorance and error the other great enemy of school hygiene is the scholastic ideal in its narrower form, the tendency to yield to the rush and hurry of the present time and the introduction of narrow efficiency ideals into the schools. With this ideal attention centers, not on the children but

on the school curriculum, the exigencies of grading, methods for beginning formal education at an earlier period, devices for acceleration, purely quantitative scales and standards, and in general emphasis, upon the scholastic product instead of the children to be educated. From the days of Comenius down there has always been this tendency to mechanism and haste. No one knows just when or how to begin the formal education of a child, but we feel that we must begin as soon as possible.

On the other hand child hygiene, somatic and mental, calls us back to a few fundamental things, and today with renewed emphasis it raises the old questions. With Watson, from the point of view of laboratory studies it asks if a child's mind be twisted and thwarted and handicapped by injurious conditioned reflexes and habits in the pre-school period, what can the education of the ordinary school accomplish? With Dr. Williams it asks what would it profit even if all our hygienic ideals were realized, if the children are not happy and attitudes of depression, failure, and the like, are developed? And again, with G. Stanley Hall, what shall it profit a child if he gain the whole world of knowledge and lose his own health, or what shall a child give in exchange for his health? Thus our brief survey ends as it began, with the insight that the aim is everywhere primarily health and normal development, physical and mental, that no other aim is educationally sane or hygienically sound.

HEALTH PROJECTS IN THE ELEMENTARY CLASSROOM

EMMA DOLFINGER, ASSOCIATE DIRECTOR CHILD HEALTH ORGANIZATION,
LOUISVILLE ELEMENTARY SCHOOLS, LOUISVILLE, KENTUCKY

I cannot resist a word, before speaking on the subject assigned me, about the Conference on Teacher Training, recently held at Lake Mohonk, under the joint auspices of the U. S. Bureau of Education and the Child Health Organization of America.

This was a conference of specialists in nutrition, of doctors, dentists, social workers, sanitarians, college professors, teachers, supervisory officers, and child-psychologists assembled to pool their special knowledge, their conception of needs and their ideals for health teaching in the hope that from this pooling would come some principles that all could use and adapt to their particular needs. One thing did come out paramount and shone through the resolutions finally adopted. It was this:

The young teacher must leave training school "*gloriously healthy*" herself, and enthusiastically eager to bring all her flock up to this standard. The normal school must give her such environment, such instruction, such method, but chiefly such *inspiration* through her own experience that she will never rest until all the boys and girls in her charge with *enthusiasm* and *intelligence* are headed for health.

How fine to see this point of view reflected in the courses of study of our training schools!

Now health, to the extent that it is controllable, is a matter of correct

habits, practices, and attitudes, and as we all know, habits are formed, and practices entrenched by *doing*, when children are interested in the results of the doing. To quote from a recent number of the *Journal of Educational Method*, "Children should be stimulated to initiate schemes and enterprises, helped to develop them, encouraged to evaluate the results. If the activity is their activity, they will develop habits; if the activity is such as real life offers, these habits will be useful acquisitions; if the result is satisfactory to them, the habits will tend to become firmly cemented. Education is the successful and satisfactory use of *movements* and *thoughts* necessary to present and later life."

Most strikingly is this true of health education. Rare is the child who is interested in health habits, in physiology or sanitation, as such. But if we can help this youngster to initiate schemes and enterprises, where acquiring health habits or health knowledge become his activities, or are such as real life offers, and where the results are satisfactory to him, then we get the release of that unquenchable energy of children, then children give themselves health-training that is the real thing.

In the school system from which I am about to describe an example, the returns in defects corrected, were not satisfactory to the supervisor of nurses and the director of health education. The plan was then devised of carrying to the children certain of the findings of the physical examination, those where it was thought that the child's spirit of coöperation would be helpful in getting corrections. Accordingly a classroom record sheet was made and on it placed the class roll with all points of health O. K.'ed, which in each child were up to the standard set. The symbol of this O. K. was a star of varying colors, and it was distinctly understood that the star was a symbol of a goal to be attained and not a reward or an inducement.

The children were at once interested in knowing why the particular points on the chart were chosen by nurse and doctor as pivotal health essentials. Discussion immediately centered about the relation of healthy tonsils, the adenoids, sound teeth, proper weight, vaccination, good sight, to vigor, and to your power to function successfully in your chosen field, be it music, athletics, drawing, or dancing.

The youngsters next were led to become enthusiastic about having a "100 per cent A-No. 1 bunch," as one sixth-grade boy put it. The teacher suggested this ideal, the children adopted it, with their own phraseology. Naturally, they, realizing the ideal, wanted to know how to get it and the plans developed by children, teacher, and nurse, working together, included: (1) Visits to dentists and dental clinics (more than had ever before been possible); (2) Hospital appointments; (3) Visits to oculists and opticians; (4) Planning of a health regime for all, with special attention to the over- and under-weights. This led in a 5-A 6-B grade to the best study of nutritive value of foods I have yet seen, because the children were ready to put into practice what they were learning in school. This study was arrived at, through experimentation determining the existence of certain easily demonstrable nutrients in common foods;

through study of the properties of various food groups; through making exhibits of suitable well-balanced meals; through reading government and other bulletins on food; and finally brought to a conclusion in the preparation in very simple but correct terms of "food books" for the younger children: posters and slogans by means of which the group tried to educate the younger children in the school.

In the sixth grade, dental defects were found to be so overwhelmingly the class problem, that the children eagerly pursued not only the corrective path, but also the preventive road, of reasons why—so that they might know what to do to keep their teeth in good shape after the defects, cleansings, etc. had been attended to. The relation of food to teeth from infancy to maturity proved to be of special interest. What little physiology and anatomy was here needed was learned with eagerness and accuracy. One test, was the quality of the reading slips, posters, and slogans, made by the class for the younger groups. In short, these groups, 5 ab and 6 ab, planned their own health lessons for two terms and they covered: (1) Interrelations between doing what one wants to do and the condition of one's body; (2) A plan of immediate corrective activities; (3) A definite list of topics on which information was sought; (4) A distinct recognition of use of information to regulate conduct, formulated as preventive activities, (diets, health habits.) The results of this work, started in September with its goal set for the following May, are suggested by the following report, made out by a committee of the 6-A class in one of two schools where similar activities were undertaken.

REPORT OF THE MARY D. HILL SCHOOL, GRADES 5-6

Our Improvement in the Health Race

Class	Original stars	Defects to be corrected	Added stars	Defects corrected	Percentage of improvement
5B.....	2	46	10	27	59
5A.....	5	45	17	42	93
6B.....	4	49	7	19	39
6A.....	3	31	11	23	74
	14	171	45	111	65

100 per cent in Dentist Race 5B, 5A, 6A

The Dentist's Race was to see how many classes could be 100 per cent in having gone to the dentist for corrections and prophylaxis before May 30. The work needed not to be complete by that time but must have been initiated.

In addition to these concrete returns, (1) Subject-matter studies were made on foods and health habits in relation to good nutrition; (2) Teeth; (3) Communicable disease (in answer to question, Why is vaccination necessary? These studies were handled between the two grades, not in both); (4) Health Books—the reference and supplementary readers were read intelligently for the first time; (5) Experiments were made and written up as English exercise; (6) The sale of milk in the lunchroom increased about threefold; (7) The sale of candy and other undesirables at the adjacent store decreased on the report of the proprietor; (8) The

extension of the interest of the 4th, 5th, 6th grades to the primary classes led to much improvement there, too, along similar lines.

It is not the purpose of so brief a paper as this necessarily must be, to describe critically the above class-work, but to show how great are the *health returns* when the teaching taps the flowing springs of the children's interest. Stars and banners then become, not paltry and artificial inducements, but mile posts on the happy road, or counters in the game.

Did time permit, I should like to tell how an eighth-grade class became the center for the marked sanitary improvement of its neighborhood, through its interest in a sanitation map of its school district, which a Woman's Club lent the school. Interested study in local ordinances and the sanitary science behind these, resulted in home and neighborhood reforms.

In another school, desire to have wash basins in the school, came through the gift of a new white lunchroom. The question of how to get clean hands led to interested study of why we want to get them, of the function of soaps in cleansing, not only hands, but the entire body; of the nature and functions of skin, of the value of such knowledge and practices. The concrete things, the scales, the lunchroom, the baths, the athletic contests, water supply in the school, these or their lack and the activities growing into, and out of them, are the valuable starting points; activity, reality, satisfaction, and joy, engendering enthusiasms for results, these are the indispensable accompaniments for and of a functional health program.

REPORT OF COMMITTEE ON PARTICIPATION OF TEACHERS IN SCHOOL MANAGEMENT

CORNELIA S. ADAIR, ACTING CHAIRMAN, RICHMOND, VA.

Teacher coöperation in administration has passed from the realm of the merely speculative into that of actualities so that we no longer say "Shall teachers coöperate in administration?" but "To what extent do they coöperate in administration?" It was with this idea in view that our chairman, Mr. Updegraff, sent out his questionnaire. So far the response has not been just what he wished. The subject is so far-reaching and the questionnaire seemed at times baffling, so that your acting chairman has deemed it best not to present the questionnaire itself to you for discussion, hoping thereby to gather more material for the final report of your chairman.

Before doing so it might be well to make a short review of the Teacher Participation or Teachers' Council Movement. Like many of our so-called new ideas it is an old friend under a new name or a general practice that has been dignified with a high-sounding title. If you will think back over your experience you will remember that teachers have always participated in school management to a greater or less degree. The fact that an activity was not the subject of general discussion does not presuppose its non-existence.

From the informal discussion between teacher and principal, teacher and teacher, persons interested in educational associations evolved the Teachers' Council idea.

The first form of organization of a Teachers' Council was in Waterbury, Connecticut, in 1908. The movement took hold slowly, and at the end of 1918 there were only 34 Teachers' Councils in existence. In 1919-20 a new impetus was felt and the number of councils more than doubled. Since then their growth has been steady. At a meeting of the Superintendence Conference in Chicago in 1920 a National Association of Teachers' Councils was formed, but little has been accomplished by that organization.

An increasingly long list of books on this subject shows the continuous interest in which it is held, and a list of well-known authors attests that that interest is spreading from coast to coast and from Canada to the Gulf of Mexico. A partial bibliography is attached to this report with a list (incomplete) of cities where teachers' councils are in operation.

An article in *School Life* for April, 1921, states:

Teachers' councils are generally constituted for some or all of the following purposes: (1) To raise the standard of the teaching profession; (2) to encourage professional improvement; (3) to foster a spirit of sympathetic good-will and helpfulness among teachers and a better understanding between teachers and officials; and (4) to democratize the school systems—that is, to give teachers a voice in shaping educational policies.

Work generally considered beneficial—School superintendents generally state that the work of teachers' councils has been reported: (1) Aided in securing a retirement law; (2) conducted successful campaign for school bonds; (3) formed loan fund for teachers; (4) procured general increase in salaries; (5) worked out a new course of study; (6) unified teachers by social gatherings; (7) held meetings for professional advancement; (8) conducted lecture courses; (9) secured use of school buildings for community purposes; (10) established coöperation between schools and private music teachers; (11) provided rest rooms for teachers; (12) organized parent-teacher associations; (13) equipped playgrounds.

General practice has shown that the best place for a teachers' council to originate is with the teachers themselves. Rarely does a council otherwise instituted serve its mission.

The National Council Committee was formed in 1920. The chairman hopes to get by means of questionnaires definite information concerning the functioning of these councils. We will therefore pass to the consideration of these questionnaires as our next order of business.

SUB-COMMITTEE REPORT ON THE COURSE OF STUDY

DAVID FELMLEY, PRESIDENT OF ILLINOIS STATE NORMAL UNIVERSITY,
NORMAL, ILLINOIS

Three factors contribute to the accomplished teacher—natural aptitude, training, experience. We still hear much of the born teacher, but in teaching, as in all other callings, native talent is developed by studies and perfected by experience. We commonly use the phrase teacher-training because we recognize that teaching is an art in which skill is to be acquired rather than science in which knowledge is to be gained. Yet all of us would rather use the broader term, the education of the teacher, which implies not an empirical art learned by imitation and with practice determined by habit, but a rational art resting upon scientific principles and with a larger play of individual initiative.

What should this education of the teacher include? As a basis there should be a liberal high-school education with chief emphasis laid upon English, the natural sciences, and the social sciences, with due attention to music, drawing, and handwork.

The program of the teachers' college should provide:

1. A preliminary survey of the school, of its aim and organization, of the work to be accomplished in the primary, intermediate, grammar grades, and high school, the characteristics of children at these different levels, the different types of teaching required and the qualifications of teachers that will enable them to meet the needs of the children.

The purpose of this course is to lead the young student to look upon the school from the standpoint of the teacher and to choose wisely the field of teaching for which he will prepare. Its method is inductive. The instruction in this course will make extensive use of the student's earlier school experience and of frequent visits of observation and comparison in the training school. This course is not yet to be found in a majority of our teachers' colleges.

2. A study of how children learn. In this the chief emphasis is laid upon the instinctive tendencies, the relation of sense-perception to imagination, to conception, and judgment, the relation of attention to interest, of interest to knowledge, the motor-tendency of ideas as revealed in imitation, the laws of habit-formation, the conditions of memory, association, and economy of learning, the feelings and sentiments as creating desire and moving the will. This course under the name of psychology is found early in the curriculums of all teachers' colleges.

3. A study of the principles of teaching, of classroom procedure as observed in superior teachers and justified by psychological laws.

Here we discuss the different types of classroom exercises, assignments, lesson plans, supervised and independent study, the project and problem method, the socialized recitation, the use of tests and scales, and other questions of instruction and class management.

4. A study of the school, its structure and administration as the organized instrument of education. This includes questions of classification and promotion, the school program, school discipline and incentives, ethical training within the organization, and school hygiene. It embraces also the relation of the school to other educational agencies, its relation to the State and problems of school finances.

5. An inquiry into educational aims and the function of the various studies, school exercises, appliances, and features of school life as factors in the development of the child and the realization of our school ideal. In this course are discussed definitions of education, the aims of education, educational values, controverted questions of educational theory, such as the doctrine of formal discipline, the doctrine of interest, so-called scientific measurements, the treatment of backward children, and the status of vocational education. This course is variously called *Principles of Education* or *Philosophy of Education*.

6. A study of the various systems of national education, the environmental factors that have determined their development, the work of educational reformers, the origin of the forms, maxims, methods, and studies that prevail in our schools, the historical development of the various conceptions of educational values, and the causes of the outstanding differences between American schools and those of foreign countries. The six courses thus far discussed may be called general courses in education, for they should appeal to all teachers.

7. A re-examination and re-organization of the various branches to be taught in the public schools from the standpoint of the developing interest and aptitudes of the child. In such subjects as geography, history, and nature study these courses will extend, clarify, and enrich the teacher's knowledge of subject matter as well as determine his method of instruction.

8. Further practice in the schoolroom arts—drawing, construction, writing, singing, reading, and public speaking, as well as the arts of good behavior and good health to improve the teacher's personal skill, to afford a better example for imitation, and to enable him the better to teach others.

9. Studies in sociology, economics, history, literature, and science—subjects for grown-ups that will minister to the deepening interests of the teacher's life and promote his insight into the aims and problems of education.

10. Observation and discussion of skillful teaching and increasing participation by the young teacher under sympathetic guidance with constructive criticism of his lesson-planning and of his conduct of the various types of recitation to the end that correct teaching habits may be formed. His voice, speech, position, manner, dress, should be, if necessary, objects of friendly criticism.

11. Personal contact with superior teachers, men and women of fine personality, of high character and consecration through whose inspiration and leadership the young teacher may be stimulated to a resolute endeavor to attain the highest possible excellence. In spite of all that may be done

to indoctrinate the young teacher with correct ideals and principles of action, so powerful is the principle of imitation that his schoolroom practice in each subject will be chiefly determined by the actual practice of the teacher of that subject.

That these elements should appear in the program of the teachers' college almost everyone will agree. We differ chiefly in the order in which they shall appear, in their relative importance, and in the amount of time that shall be allotted to each.

In the early days of State normal schools one curriculum was provided for all students, no matter whether they were to be primary teachers, grammar-school teachers, or to serve as principals. It was as if the opinion prevailed that teaching is an art that can be taught in the abstract, that there is a set of principles of didactics, which once mastered, can be applied to any subject or to pupils of any age. Just as the doctor was expected to prescribe for any sort of ailment, or the lawyer to handle any sort of case, the teacher was expected to function under all conditions. The liberal arts colleges, on the other hand, emphasized knowledge of subject matter, and insisted that if any one knew a subject he could teach it. They ridiculed "method in an empty head" for which the normal schools were supposed to stand.

The modern teachers' college recognizes that the verb to teach is followed by two nouns in the objective case. Mr. Smith teaches John arithmetic. This implies that the teacher must know John and must know arithmetic; furthermore he must know the art of teaching, that is, of presenting the material and organization of arithmetic to John in the way that will appear to his interests and aptitudes, and secure fruitful experiences in this subject.

We do not recede in any degree from our insistence upon a knowledge of the learning process and of the teaching process that ministers to it; but we have added an adequate appreciation of the importance of a knowledge of subject matter and of the special method of the subject. Our psychology now recognizes also the changes that take place in the interests and mental activities of the growing child.

Accordingly the teachers' college now provides different preparations for the different fields of teaching—for the primary school and kindergarten, for the intermediate grades, for the upper grades, for the various types of high-school teaching, for rural schools, art, music, home economics, agriculture, industrial education, commercial education, physical education, and for supervisors and superintendents. The specialization needed for fine performance in all arts and professions is needed in teaching also.

It is everywhere recognized that there is a large common element in the preparation of these different types of teachers. The variations are provided for in various ways. In some institutions there is a general curriculum with a few required studies to be taken at a definite time. Elective groups of subjects are added according to the proposed destination of the student.

Other institutions provide a minimum and maximum number of credits to be made in education. English, mathematics, the social sciences, home economics, etc., according to the kind of diploma desired, leaving the choice and sequence of courses largely at the disposal of the student.

Still others arrange distinct curriculums for the different levels and types of school work. Within these curriculums there is little freedom of choice. For large schools this is the best arrangement. It secures the proper sequence of courses and subjects and by segregating the students in each curriculum, it may give to each group even in the general subjects the special instruction of most value to that group.

Shall the general studies in education begin with the four-year teachers' college curriculum and continue throughout the course, or shall the earlier years be taken up with so-called academic studies and with the courses in special method?

The usual practice is to begin courses in education early. Most of the students enrolled in the teachers' colleges leave to teach at the end of the second year if not before. They should have the preliminary studies in psychology, the technique of teaching, class management, and practice teaching. This series must be begun in the first year.

For many years to come the vast majority of our students will teach with no more than two years of professional preparation. It will not pay the State to give, or the student to take, a longer course before beginning to teach in elementary schools. Our students are chiefly young women. Half of them will marry before they have taught six years and it should be so. Other students of both sexes will find teaching uncongenial or discover that they are ill-adapted for the work. Without further delay they should turn to other occupations. For such elementary teachers as at the age of twenty-five find themselves happy and successful in the work is the last two years of the teachers' college a really profitable investment for the State and for the individual. High-school teachers in the same manner who begin with the bachelor's degree may after the five years of journeyman service profitably seek the master's degree. But even if all our students were to continue through a four-year curriculum without interruption, we still at the very outset should introduce such courses as will develop the teacher-consciousness, and the teacher attitude, and will give to the life of the school the professional atmosphere that is so vital in the education of the teacher.

I shall now return to the eleven elements in the education of the teacher and examine the practice of teachers' colleges. Credits in our teachers' colleges are sometimes reckoned in semester hours, with from 120 to 128 hours required for graduation from the four-year course, sometimes in term-hours or quarter-hours, with 192 to 196 for graduation, sometimes in term-credits each equal to two and one-half semester hours, or to four term-hours. For the sake of uniformity I shall use the term-credit as the unit, each equaling one twelfth of a year's work or one forty-eighth of the entire curriculum.

1. The course entitled Introduction to Teaching is frequently a vocational guidance course of twenty or thirty lessons serving merely as a survey of the field, to enable the student to "orient" himself and decide what line of teaching he shall prepare for. Sometimes the course is given ampler scope. Just as the student of history, or economics, or science, should first take a general course that maps out the entire field within whose area later intensive courses shall lie, so there should be provided this general course dealing with the meaning of the school, the end to be accomplished, the qualifications of teachers, the chief problems of instruction and management. The course should deal with the earlier school experiences of the student and the material gained from observing good teaching in the training school.

This course should come in the first year and should develop at the outset the teacher-consciousness in the student.

2. Besides the term-credit in elementary psychology required in all teachers' colleges, in the first year, we find numerous electives in this subject usually in the third and fourth years. These elective courses usually deal with the psychology of young children, the special psychology of adolescents, the psychology of abnormal children, the psychology of the various branches of study. As many as six term-credits are offered in one institution.

3. A course in principles of teaching is required in all the institutions studied. Sometimes this study of classroom procedure is blended with the study of the aim of education and the educational values of the curriculum under the name of principles of education. Sometimes this study is taken up parallel to the practice teaching so that the difficult situations of the classroom shall give point and interest to the teaching devices discussed. The special study of intelligence tests and tests of educational progress is in most schools made a half-credit course in the third or fourth year.

4. School management in most teachers' colleges finds a place in the second year, sometimes as a half-credit subject studied in connection with the practice teaching, more often as a full credit, when a greater importance is given to school hygiene and to the moral training resulting from wise school management. School organization, classification and promotion, the school program, school discipline and incentives, coöperation with parents, the schoolroom, and the school playground are leading topics in this course.

5. School administration from the point of view of the superintendent and educational statesman occupies from one to three terms in the fourth year of most teachers' colleges.

That there should be an integrating course in education in which all the various elements of professional instruction and practice shall be brought into organic relation to the purpose of the school is recognized by most teachers' colleges. Since it undertakes to unify the entire body of educational doctrine this course has been called the Philosophy of Education, but of late years the tendency is to abandon this high-sounding title for the

less pretentious Principles of Education. Since the course involves an inquiry into educational values, the distinction between education for discipline and education for knowledge is discussed, and with it follows the inquiry, what knowledge is of most worth. To answer this question requires an investigation of modern society and of those social needs that the school must satisfy. Hence this course in some institutions is labeled Educational Sociology.

6. When the liberal arts colleges of the country began to recognize that education as a subject of study is worthwhile, they usually began with the History of Education. Teachers' colleges have frequently imitated them by introducing courses in this subject early in the curriculum. Such courses should come late for two good reasons. First, young people are not interested in the history of our institutions; they are interested in what our institutions are, and what to do with them. Second, one cannot read the history of education intelligently except in the light of educational theory. This study belongs in the senior year. Our teachers' colleges are giving from one to three terms of it. The period from Comenius to Herbert Spencer in European education and the development of American education receive chief attention.

This deferring the History of Education till the senior year does not mean that our freshmen shall never hear of Pestalozzi or Thomas Arnold, of Horace Mann or Mary Lyon. Some educational biography should find a place early in the curriculum.

7. The chief component of our curriculum is courses in the subjects to be taught. Sometimes these courses are labeled Method in Arithmetic, Method in Geography, and the like, as if the method of a subject can be learned apart from the subject matter. Huxley once remarked, "It is idle to practice with knife and fork without vittles on the plate." Much depends upon the teacher. If he has been bred in a good normal school, if he has been a student of education as well as of his special subject the method in his subject will appear. His own practice in teaching the subject will be more powerful in determining the practice of his students than any precepts he may give them.

8. The universities whose entrance requirements determine high-school curriculums have placed little value upon the so-called schoolroom arts. High schools maintain the accredited relation without giving any instruction in music, art, handicrafts, penmanship, or public speaking. Few colleges would exclude a freshman although notoriously deficient in all these arts. Yet they all contribute largely to the efficiency of the teacher. In the elementary school they should not be subjects for specialists. Yet few teachers' colleges are devoting to them the attention that their importance demands.

9. While the teachers' college is a professional school and while its work should be characterized by that vital interest and singleness of aim that gives zest, purpose, and reality to the work of a professional school, its students should not be cut off from those liberal studies that young

people of promise pursue for their own sake. There is an intellectual life that should be nourished without any regard to bread-and-butter returns. The so-called cultural studies in literature, science, history, politics, economics, and sociology that minister to the deeper interests of men and women should have ample space in the program.

10. Teachers' colleges differ widely in the prominence of practice teaching. In some the training-school is recognized as the central core of the whole system. In the training-school is tested the work of every classroom. Students look forward with eager anticipation to the day when their real work will begin. The instructors who have genuine fitness for teachers' college positions follow their students to their practice classes. They coöperate with the training-school in perfecting its course of study. They seek opportunities to observe the work and themselves to teach classes of children.

Shall the practice teaching consist of an hour a day extended through a year, or shall it be concentrated within a single term? For the first plan it is argued that the student who teaches but an hour a day can be held to his highest level of effort; that habits are more surely fixed by brief daily practice through many weeks than by extended daily practice through a few weeks; that the longer contact with the principles embodied in good practice insures their thorough mastery, and finally that the school program affords fewer difficulties when practice is spread throughout the year.

The advocates of the single term of concentrated work point out that this plan makes it possible to approximate real school conditions where the teacher is responsible for the forward movement of the entire grade in several subjects.

In this as in many other fields of thought and action we argue not to discover the truth, but to justify what we are doing. A small teachers' college with a large training school on its campus usually adopts the first plan. The teachers' colleges located in large cities, where training opportunities are provided in the city-school system are using the second. The large teachers' colleges usually neglect practice teaching because their facilities are inadequate. To afford really adequate facilities there should be three times as many pupils in the training school as there are student teachers to receive such training.

How much time may properly be assigned to each of these elements in the education of the teacher? Where the president and faculty of a teachers' college are college-bred men and women, the teachers' college is likely to approximate the traditional liberal arts college with undue emphasis upon foreign language and higher mathematics. Teachers trained in normal schools or with extensive public-school experience are in danger of overvaluing the so-called professional studies. Hence we find as low as four term credits in psychology and education with one in practice teaching out of forty-eight credits representing the requirement in education.

In the opinion of the writer, on the average twenty per cent of the teachers' college curriculums should be devoted to psychology, general educational courses, and practice teaching. For those intending to be supervisors and superintendents still more should be provided. The program for elementary teachers should contain many courses in special method, school-room arts, and cultural studies. High-school teachers and special teachers need curriculums well loaded with the subject matter and special method of their subjects. These only may profitably reduce their studies in education below the suggested twenty per cent.

In conclusion it may be said that while there doubtless is for each type of student a best division of his time among the different groups of preparatory studies, no one of us at present is ready to declare with confidence just what that best division is. For the present it may be just as well to have the variety in practice that now obtains until by reason and by experiment we shall be able to settle a few of the points in dispute.

Herbert Spencer tells us that in the progress toward truth there are three stages: the unanimity of the ignorant, the disagreement of the inquiring, the unanimity of the wise. In the composition of the teachers' college curriculum, we are plainly in the second stage.

REPORT OF PROGRESS OF COMMITTEE ON PROBLEMS OF VOCATIONAL EDUCATION

ADELAIDE STEELE BAYLOR, ACTING CHAIRMAN COMMITTEE ON VOCATIONAL
EDUCATION, WASHINGTON, D. C.

A committee to study problems of Vocational Education was designated at the Des Moines meeting of the National Council of Education, July, 1921, and the personnel determined as soon thereafter as possible. In naming the members of the committee two things were considered: (1) Their present relation to vocational programs of work; and (2) their location geographically to make a representative group. The last condition has placed them remote from each other and from the chairman, so the work has progressed slowly, as personal conferences among the members of the committee were practically impossible and replies to correspondence have been delayed.

A meeting of the committee was called during the sessions of the National Department of Superintendence in Chicago, February, 1922, but conflicting engagements or inability to attend the Department meeting brought together a very small group. It was decided, however, at the meeting and by correspondence prior and subsequent to the meeting, to take up first the study of part-time education, and a number of bases from which such a study might be made were considered.

It was the general opinion that no matter from what angle the study of part-time education was made there were certain objectives to keep in mind throughout the investigations:

(1) Place and purpose of Part-time Education in a public-school program.

(2) Optimum conditions under which to organize and maintain part-time schools and classes.

(3) Best program of work as to: (a) Curricula, (b) plant and equipment, (c) methods of instruction, (d) teachers, and (e) evaluating results.

It was further agreed to initiate the study of part-time education along the following lines: 1. Needs for part-time education; 2. Financing part-time education; and 3. Contributions of part-time education.

For the investigation of these problems three sub-committees from the membership of the full committee were created as follows:

Sub-committee I—*Needs for Part-time Education*. Members: J. G. Collicott, *Chairman*, Columbus, Ohio; H. Lester Smith, Bloomington, Indiana; Sarah Louise Arnold, Boston, Massachusetts; and R. G. Jones, Cleveland, Ohio.

Sub-committee II—*Financing Part-time Education*. Members: Frank B. Gilbert, *Chairman*, Albany, New York; E. C. Brooks, Raleigh, North Carolina; Payson Smith, Boston, Massachusetts; and Thomas E. Finegan, Harrisburg, Pennsylvania.

Sub-committee III—*Contributions of Part-time Education*. Members: Chairman (to be named); Mrs. Susan M. Dorsey, Los Angeles, California; Jonathan Wagner, Las Vegas, New Mexico; and Agnes E. Doherty, St. Paul, Minnesota.

Experts in part-time education were invited to coöperate with these sub-committees in the study of their problems. Those who have accepted and are now actively coöperating with the sub-committees are: G. A. McGarvey, Washington, D. C.; L. A. Wilson, Albany, New York; and Vierling Kersey, Los Angeles, California. While the chairman feels that important steps have been taken leading to the development of a valuable report, yet at this time only a report of organization and progress can be made.

In the absence of J. G. Collicott, Chairman of the Sub-committee on Needs for Part-time Education, I am submitting for him the following assignments and plan of work:

R. G. Jones, Cleveland, Ohio—(1) Need for reorganized courses for schools so as to meet individual differences; (2) Suggestive courses for general continuation and trade preparatory classes.

Sarah Louise Arnold, Boston, Massachusetts—(1) Part-time classes for girls and women in the home—(a) city, (b) town, and (c) rural; and (2) Part-time courses for employed girls and women above compulsory school age.

Lester Smith, Bloomington, Indiana—(1) Investigate the requirements of compulsory attendance laws in the different States as to (a) Age when pupils may leave school, (b) School grade completed, and (c) Other conditions for leaving; (2) Number out on working certificates; (3) Enrolment in private schools, correspondence schools, and evening classes.

G. A. McGarvey, Washington, D. C.—(1) Need for trade extension work for boys and men—(a) What employers are doing, (b) Preparation of workers, (c) Types of classes.

A note from Mr. McGarvey, who found it impossible to be present, gives the plan of study he has adopted for his assignment:

1. To make a comprehensive list of employers' associations that are giving any form of extension work for their employees. Such a list should include classes for apprentices covering a definite period of time, and classes covering short periods of training. We are not aware of any compilation of this kind having been made heretofore.

2. To prepare in outline form, the length of the course of instruction, admittance to classes, and character of training.

3. To list these classes under the headings of coöperative part-time, dull season part-time, or whatever other arrangement seems to predominate. A statement concerning the teacher and his training will be included.

Plans for development of other assignments on this sub-committee have not yet been submitted. It was anticipated that plans for the work of the sub-committee on Financing Part-time Education would be presented at this time either by the Chairman of the sub-committee or a duly authorized representative, but it has been impossible for anyone to be present for that purpose and no report was sent the Chairman of the full committee.

In the absence of a permanent Chairman for the sub-committee on Contributions of Part-time Education the work has not yet been thoroughly organized. As chairman of the full committee on Problems of Vocational Education, I assumed this responsibility until a permanent chairman could be appointed. In organizing a tentative program for this study, I asked members of the sub-committee to make local investigations as follows: In Los Angeles, Mrs. Susan M. Dorsey; in Pennsylvania or Massachusetts, J. H. Wagner; in Wisconsin, Agnes E. Doherty. The outline submitted to these members as a suggestive guide is as follows:

1. Length of time part-time program has been in operation.
2. Number of youths that have been reached by the program.
3. Number of youths returned to full-time schools who should unquestionably be there.
4. Number of youths to whose vocational advancement part-time education has contributed.
5. Number of those who have profited by the vocational guidance rendered through part-time schools.
6. Contributions of part-time education to the placement of youth in wage-earning pursuits.
7. Report of any studies made as to the contribution of part-time education to the lessening of juvenile delinquency.
8. Specific instances of better adjustment of youth to home life through part-time education.
9. Specific instances of better adjustment of youth to industry through part-time education.

10. Specific instances of better adjustment of youth to social and recreational life.

11. Number or per cent of youth who voluntarily remain in part-time schools after the age limit has been reached.

12. Contributions of part-time education in the public schools that could not be made by turning all of this work over to industry.

13. The value of productive work accomplished in the part-time school, that might be considered of money value.

14. Instances of leadership qualities of a higher type brought out and applied in a better way.

Vierling Kersey, director of part-time education, Los Angeles, is co-operating with Mrs. Dorsey in her part of the work.

Part-time education in the public schools, especially as a widespread national organization, is so new that a computation of returns as to its contributions, based on a definite scientific inquiry, is not yet available, but a number of localities including Los Angeles, in which the organization is only two years old, is endeavoring to keep in touch with the movements of the students enrolled and determine what contributions part-time education is making to the individual and to society in general. Mrs. Dorsey is present and will report on the preliminary study made for Los Angeles.

CONTRIBUTIONS OF PART-TIME EDUCATION IN LOS ANGELES

MRS. SUSAN M. DORSEY, SUPERINTENDENT OF SCHOOLS,
LOS ANGELES, CALIFORNIA

Los Angeles has been especially successful in interpreting the advantages of part-time education to parents and employers and in gaining their co-operative support. Of all the benefits that have come from this work, with the exception of the help to the individual student, none have exceeded the understanding gained by employers of the difficulties and perplexities of young children who are forced into business and industry; the importance of a sympathetic coöperation of the employer in helping to adjust the young employee to his task and the ultimate advantage to both employer and employee of the educational assistance given the latter in part-time work.

In order to secure the good-will of employers, a distinct effort has been made from the beginning to adjust the training, so far as it related to the particular business task of the individual employee, to his every-day practical needs. For instance, the arithmetic lesson given young girls employed in drygoods stores has been designed to meet the actual problems of the counter; materials have been carried to the classroom to explain textiles and fabrics; lessons have been given in business etiquette and morality, the latter being linked with civic morality as well; the care of the health has been emphasized with reference to the particular occupation, and similar

up-to-the-minute lesson aids have been adapted to the actual work of the student. Employers have sensed the benefits and reciprocated with sympathetic support of the part-time movement..

One great difficulty in Los Angeles is the vast extent of the school district which covers more than nine hundred square miles and a consequent diversity in schools ranging all the way from a one-room country school to a metropolitan high school with thousands of students. This situation makes necessary both a centralized and a de-centralized system, so that in the heart of the business district, where is found the largest number of students, they are grouped in one large centralized school; in a business suburb is located the Goodyear Rubber Factory, for which a single unit of instruction is provided in the plant itself, while in the remote San Fernando Valley fruit region are located isolated canneries and fruit-packing houses in each of which a student group is cared for either in the place of the industry itself or in some near-by room. Still another variation within the limits of the school district is the town where another part-time unit must be established; examples of this are San Pedro and Sawtelle.

In a study of 1673 part-time students, there has been in one year a 135 per cent of promotions ranging variously, 352 young people having received one promotion, and seventy-nine having received four or more promotions. These promotions have involved an advance to a higher grade of employment with more responsibility or an increase in salary on the original job.

One hundred eighty-five students have in one school year under the influence of individual attention and because of a new outlook on school life returned to school to complete the secondary course; 4 per cent, because of assistance received in the part-time classes, have remained in those classes after reaching the age when they were entitled to discontinue the work, even continuing to the age of twenty-one years.

Out of the above-mentioned 1673 students, 251 have received definite vocational guidance. Employers who are seeking young help are now turning to the part-time office for suggestions. One hundred twenty-five establishments employ all their junior help through the part-time department. Several of the students have been employed in the elementary schools for minor clerical positions.

The report shows that each instructor has made thirty-five home visits each month. This together with the extra work involved in making out lesson helps (the actual textbooks of the classes) makes the position of the part-time teacher no sinecure.

Great attention is given to instruction designed to help these young people make a wise use of their leisure time, in the cultivation of the power to discriminate between wholesome and dangerous diversions, in a word to create a desire for the best in recreation. The fact that a good degree of leisure time is coupled with the independence of earning one's own living creates a problem for young workers in cities. The leisure time of the young person who *earns* money, and thereby is able to control to a

degree his own expenditures, becomes a real menace unless the taste has been cultivated to appreciate the best in recreational diversions.

In order to cement the department and to create a feeling of comradeship among the students, there is issued a sort of school paper, containing information of value to students and employers.

It is a difficult matter to say how far part-time instruction prevents delinquency. It must, however, be conceded as more difficult for the young to go wrong when they have the daily restraining influence of an older teacher and friend whom they respect and when they are receiving constant assistance in their tasks so that work grows less discouraging and an honorable, self-respecting, and self-helping life becomes more attractive.

RECENT ACCOMPLISHMENTS IN THE CONTINUATION SCHOOLS IN MASSACHUSETTS

ANNA A. KLOSS, STATE AGENT TEACHER TRAINING IN HOUSEHOLD ARTS
SCHOOLS, BOSTON, MASSACHUSETTS

Continuation schools were made compulsory by referendum vote in November, 1919. The law requires the establishment of continuation schools in localities where two hundred minors, 14 to 16 years of age, are employed during the calendar year.

When employed, minors are required to attend school four hours per week between the hours of 8 and 5 on Monday to Friday inclusive. When unemployed, they are required to attend school for twenty hours during the week.

In September, 1920, forty-four localities opened these schools at a period when housing conditions were most difficult because of the retarded building program. In June, 1921, one of these schools was dropped and in September four were added, making a total during 1921-22 of forty-seven localities maintaining continuation schools.

From point of view of the girls' work, these schools may be classified under three types: the large schools requiring four or more full-time women teachers; the two-teacher school, in which one teacher is qualified for all phases of homemaking instruction and the other for academic teaching; and the one-teacher school, where one teacher—qualified preferably as a homemaking teacher—teaches also academic subjects. Approximately two thirds of the schools in the State are of types two and three.

The progress made in the continuation schools over this period is commendable when it is realized that it has been necessary to demonstrate the value of the training to the child, the home, the employer, and the community. This has been accomplished largely through the concerted efforts of the school authorities and teachers, working with the homes and employers in an effort to determine the girl's aptitudes, the vocational opportunities in the vicinity, with the resulting vocational training which in many

instances has raised the child in her position, or when advisable returned her to school.

Because of certain well-defined policies and features of the continuation schools this accomplishment has been facilitated. The continuation teacher aims to give individual attention to every girl, since the numbers in all classes are limited to fifteen, the teacher giving twenty hours of instruction and ten hours of follow-up work in the home and place of employment every week.

Well qualified teachers under thirty-five years of age (men for boys' classes and women for girls' classes) have been selected who have an interest in the child in industry, and have a vision and understanding with ability to guide children intelligently.

The project method of instruction is used largely. All work must be planned in short units so that every girl shall receive worthwhile, and in so far as possible, completed instruction every week, because of the fluctuating enrolment in continuation schools.

Definite attention has been given the recreational program so that in many communities achievement classes in worthwhile subjects have been organized and taught by competent instructors. Social clubs where girls are taught how to play, out-door clubs with interests in hiking, baseball, or basketball, have accomplished commendable results.

Speaking from the point of view of the girls' work, in every locality homemaking opportunities have been offered which include certain work in clothing, food, care of children, first aid and homenursing, care in management of the house, laundry work, and other problems; in certain communities commercial training, store service, power machine operating, and other training which a survey of the community shows to be advisable. The introduction of such a program in certain localities has had a noticeable effect on the training in the regular schools. This richer curriculum has interested for the most part every girl regardless of her attitude towards school when first she entered continuation work.

This practical instruction is given from fifty to seventy-five per cent of the time depending upon the need of the girls. During the remainder of the time training is given in citizenship, hygiene, English, arithmetic, and use of leisure time. Work in citizenship emphasizes her civic obligations which include the responsibility of an employee and employer. The hygiene is taught from the practical, personal standpoint of the girl, including such homely discussions as daily habits conducive to care of health. The English emphasizes oral expression, the appreciation of good literature, and lastly the written expression. A minimum of arithmetic is taught and only that which the girl will need. The use of leisure time is varied and influenced by the advantages of the locality.

The continuation schools, because of the merits of their work, are serving in certain localities as a source for juvenile employees. It often happens that an employer will call the school asking for a girl for a certain job. The school learns the nature of the job and then gives special

instruction to that girl preparatory to and in conjunction with the position.

The continuation school aims first to help the girl, then the home, then the employer. It is possible to accomplish this aim only through the constant study, through follow-up work by intelligent teachers, of the needs of the girl in her home and employment. The employers throughout the State have been most helpful and generous in their support of this work by their candid, sympathetic suggestions.

We feel that in Massachusetts we have made only a beginning in the training of the 14 to 16 year-old minors, but that these initial years have made a splendid foundation for further development of the work in part-time education.

REPORT OF THE COMMITTEE ON RACIAL WELL-BEING

HELEN C. PUTNAM, CHAIRMAN, PROVIDENCE, RHODE ISLAND

The committee reports the awarding of two honorariums and two honorable mentions to studies selected out of eleven made by groups being graduated for teaching, these resulting from its three announcements.

The first award, made in 1917, was \$100 to a group in a two-year normal school, Wisconsin State Normal School at Milwaukee, the work being done under the guidance of Miss Amelia McMinn, teacher of civics.

The second honorarium, \$250, was given in 1918 to a group in the department of psychology at the University of Wyoming, under the guidance of Dr. June E. Downey.

The honorable mentions were given to a class in education at the Massachusetts Agricultural College, Amherst; and to the senior class of La Crosse State Normal School, Wisconsin, both in 1917.

The judges have been Dr. Charles B. Davenport, of the Eugenics Record Office at Cold Spring Harbor, Long Island; Dr. H. E. Walter, of the department of biology at Brown University; Mrs. Henrietta W. Calvin, of the Federal Bureau of Education; William M. Davidson, Superintendent of Schools, Pittsburgh.

Dr. Davidson wrote in 1917: "I commend most heartily the plan of laboratory work your committee has instituted in connection with normal institutions, and congratulate you on the results. Each of the theses is not only highly creditable but is full of encouragement to all those who have faith to believe that the Normal School itself, as a great laboratory experiment in the preparation of teachers, is serving the public schools of the country efficiently and well."

Two other judges believe better studies should be produced.

The details of the work are given in the latest announcement (1920) which differs in no important point from the preceding two announcements except that the highest honorarium is \$1000, and the lowest \$250; and that it is made to all institutions preparing for teaching, instead of to specified

sections of the country. This announcement, reprinted from the *N. E. A. Bulletin*, April, 1917, reads as follows:

THE WELL-BORN

Four Thousand Dollars for Studies

It is as much the duty of educators to assure through educational procedures that individuals shall be well-born as that they shall be well-reared.

The Committee of the National Council of Education appointed by President Aley in 1916 to study methods of promoting the idea of racial well-being awarded honorariums offered in 21 States in 1917 and 1918. War demands so reduced senior classes that work was temporarily suspended. The committee now offers its final awards in all States as follows for 1921-1922:

The committee has been given a fund to be used to help place popular ideals of racial well-being above commercial ideals and above individualism. It offers six recognitions of merit to graduating classes of 1922 in State normal institutions; and in departments (or courses) of education (including psychology), of home economics and of biology, in colleges (including agricultural) and universities: (Group A) \$250 to each of three classes graduating in 1922 that have had a two-year normal course based on high-school graduation; (Group B) \$1000 to three classes graduating in 1922 that have had a four-year normal course based on high-school graduation; or classes graduating in 1922 from colleges or universities with courses four years in length, that have had at least two years in education (including psychology), or two years in home economics, or in biology (including zoology, etc.). These honorariums will be awarded for the best coöperative studies by classes, of the proposition, *It is as much the duty of educators to assure through educational procedures that individuals shall be well-born as that they shall be well-reared.*

Suggestions to two-year normal classes—What educational and social facts bear on the proposition? That individuals may be well-born, how can school affect physical condition of pupil, habits, intelligence, life-work, ideal of responsibility for inheritance passed on to the next generation? How can this ideal be impressed wisely in nature-studies, garden work, personal hygiene, school housekeeping, recreations, civics, history?

Suggestions to more advanced classes—What is the testimony of facts (and statistics) of history, wars, criminals, defectives, morbidity, mortality, birth rates, poverty, alcoholism, conservation and waste? How can the idea in the proposition be developed in primary, grammar, high, special, vocational schools, in continuation and extension instruction for adolescents and adults, so as to result in lessened rates of morbidity, of early mortality, of illegitimacy, of infanticide, and of life failures, as disclosed by the Federal census? Should this be one of the definite ideals to motivate public schools?

General suggestions—It is desired that all classes understand the elementary form of Mendel's theory of inheritance of unit characters with special reference to mental defectives. It is specially asked that each class submit a piece of original experimentation or investigation bearing on the proposition—for example, work with children in practice or other schools; study of a related social detail in village, county, ward, or city; critical analysis of curriculums, and the like. A study of a single family, especially one showing a well-marked trait, is a valuable educational exercise. Standard outlines for such can be had by writing to the chairman. An outline for "study of the self" which includes the above family outline can also be had. The outline for a proposed research may be sent to the chairman who will secure the advice of a specialist on the Advisory Committee of Specialists for the purpose of making it as useful as possible. It is recommended that sub-topics be assigned individuals or groups to work up, and that the long vacation be utilized. The final study must be composite, representing the class. A dissenting minority may present its reasons separately, not exceeding one thousand words.

Requirements—Notice of intention to make this study should be sent to the member of the committee from whom this invitation is received not later than January

15, 1921; length of manuscripts from two-year normals 4000 to 6000 words, from all others 5000 to 8000 words, tables not included; concise summary not exceeding 300 words; six typed copies; each copy strictly anonymous, but having in upper left corner of first page a pen name, name of the group to which it belongs, and number of students cooperating, e. g., "Progress," Group A, 21 cooperating. Each package is to hold a sealed envelope bearing the pen name and containing the address of the person to whom the honorarium may be sent. Manuscripts are to be with clerk of committee, Ida P. Greenman, 1022 Hospital Trust Building, Providence, R. I., not later than April 1, 1922.

Successful studies—Studies are rated as follows: Experimentation 40 points, research 20 points, accuracy, definiteness, cooperation of departments, and mechanical appearance each ten points. Awards and honorable mentions will be announced before commencement in 1918. The committee reserves the right to give none when no study is found of sufficient merit. Successful studies become the property of the committee and may be published. One copy of each of the others will be retained by the committee, the remaining five copies being returned to the sender when a request is accompanied by the necessary postage within three months after awards are announced.

HELEN C. PUTNAM, Providence, R. I., *Chairman*
SUSAN MILLER DORSEY, Los Angeles, Calif.
MARY C. C. BRADFORD, Denver, Colo.
FLETCHER B. DRESSLAR, Nashville, Tenn.
CARROLL G. PEARSE, Milwaukee, Wis.

The committee does not publish at this time the successful studies, there being but two. A larger variety is wanted since it is essentially desirable to secure more examples of independent original lines of reasoning and experimentation. The studies first published will have much influence in setting the pace for less enterprising recruits to the profession.

The committee was invited to send a delegate to the Second International Congress of Eugenics September, 1921, at New York, and did so, the chairman serving.

There is still available over \$3500 for honorariums. The committee therefore recommends that it be continued. It also recommends that the *Journal* of the Association be requested to publish the official announcement of the studies invited as promptly as possible after its receipt.

PRELIMINARY REPORT OF COMMITTEE ON THE STATUS OF THE AMERICAN WOMAN TEACHER

ANNA LAURA FORCE, CHAIRMAN, DENVER, COLORADO

A question and answer of vital interest to those concerned with public-school education is the status of the American woman teacher. Historically, the nineteenth century movement of the expansion of the economic and professional activities of women outside domestic limits coincided with the development and expansion of the public schools. Large numbers of women became teachers when they were needed because of social tradition of the relation of women and children and the fact that the service of women could be procured more cheaply than that of men. So the rapid increase of women teachers in elementary and secondary schools

may be ascribed to low standards of compensation. The theory of democracy would seem to demand a place for the woman teacher, but not for the exclusion of man.

Equal pay for equal work does not affect a few men teachers only. This is a question of economics wide, deep, and far-reaching. Woman has proved in the last generation that she is not inferior to man, just different. The laborer is worthy of his hire. Eventually, however, wage will be regulated by law of supply and demand.

In June the sweet girl graduate holds the center of the stage. She outnumbers the boys. While the poet is tuning his lyre, the statistician wants to know what becomes of maiden in cap and gown. It is claimed that 47 per cent marry at an average age of twenty-six years.

In the old days a well-bred and well-educated woman could teach, and she could do nothing else. Nowadays many professions are open to her. The professions bid fair to rival teaching, as there are few that are not undertaken by women. According to recent statistics the list of occupations followed by seniors of women's colleges are art, art-craft, journalism, science and research, library, music, drama, secretarial and social service, and foreign missions. Few professions or occupations today exclude women. Women are no longer hampered by sex. Efficiency of service rendered is more important than question of sex.

Owing to the large number of women employed in public-school teaching, the wide territory over which they are scattered, the inadequate preparation of most of them, and the short period of service that is characteristic of the professional life of a teacher, it is difficult to maintain a thoroughly well-organized professional consciousness expressing itself in recognition of professional ideals and in a code of professional ethics.

The fundamental conditions of professional service are found in the changing nature of educational problems. The chief work of the teacher today is to adjust to a constantly changing and growing human nature, and meet the needs of an evolving social life. The character of the profession must be progressive rather than traditional, thoughtful rather than habitual. To become mechanical is at once to cease to be professional.

The essence of professional practice lies in its artful concrete adjustment to constantly varying situations, problems, or crises requiring invention of new technique or modification of methods. Skill acquired through practical apprenticeship will not provide the required flexibility. There must be broader training in basal subjects that will interpret educational factors, and a study of the "philosophy of education that will emphasize assumptions, relations, and principles."

All educational work must be expert service. The teacher does not deal with knowledge and truth. She deals with the personal and social value of truth. Besides adequate scholarship, superior attitudes and ideals must be added. The former is transmitted by pedagogical technique, the latter by personal influence through unconscious methods.

Teaching has a social significance not attained by other kinds of work

with a consciousness focused on social welfare rather than personal profit. Teachers do more to earn, or fail to earn, their personal living. They incidentally and eventually affect large and fundamental matters, such as the state of civilization, morality of a generation, social potentialities of individuals taught.

Many of the women, also men, now teaching in the public schools of the United States have never had any professional training in preparation for teaching. Preparation required in most urban schools is two years beyond the high school; in rural communities frequently less than high-school education is accepted.

Because of the inadequate training of those who begin teaching and because those who succeed in any line of endeavor continue to be students of their field, a large part of the training is secured after they enter service.

The degree of training demanded of those who enter the profession will continue to increase. The improvement of those who supervise and direct the work of teachers must be regarded as of primary importance. In fact the responsibility of teacher training in service is the problem of the administrative officers and supervisors. When the leaders are adequately trained a higher degree of efficiency upon part of those supervised by them may be expected.

The rural teacher, with her inexperience and lack of preparation, is the real problem when the status of the American woman teacher is considered. Reorganization of State systems is the only means of bringing about better administration whereby schools may receive the same consideration as city schools. Educational legislation and revision of taxation laws seem to be the only remedy.

In this study of the Status of the American Woman Teacher it is the purpose of the committee to collect data through questionnaires sent to superintendent, director of rural schools, supervisor or director of normal schools, department of education in colleges, women's colleges, educational department of women's clubs, or a member of the medical fraternity.

Questionnaires will be prepared to consider the following conditions:

1. Preparation—

- (1) Number of years schooling.
- (2) Type of institution attended.
- (3) Major and minor subjects taken in college.
- (4) Degrees received.

2. Culture—

- (1) What she reads.
- (2) Whether she has traveled in this country or abroad.
- (3) What she does with her vacations.
- (4) Whether she belongs to any clubs other than teachers' clubs, any societies or associations other than teachers' associations.
- (5) Relation to civic affairs.
- (6) Spiritual life. Identification with some church.

3. Economic status.

- (1) Number of persons in family when she entered school.
- (2) When she graduated.
- (3) Estimate of the annual income of family during the time she was in school.
- (4) Number of persons that were wholly or partly dependent upon her.
- (5) Salary—
 - (a) Amount she is able to save.
 - (b) Actual living expenses.
 - (c) Amount put aside in investment and insurance.
 - (d) Annual increases in recognition of professional study.
 - (e) Retirement fund.
- (6) Conservation of teachers' health in observance of hygiene of teaching.

4. Professional status—

- (1) Study of revision of curricula.
- (2) Conferences of supervision council.
- (3) Participation in school-building program.
- (4) Nature of supervision and character of criticism.
- (5) Meetings attended and nature of discussions.
- (6) Teacher rating by whom, how?
 - (a) For what purpose?
- (7) More select group through vocational guidance.
- (8) Recognition in salary schedule of hours of credit for summer school and extension courses.

THE STATUS OF THE AMERICAN WOMEN TEACHERS

The attached questionnaire concerning the Status of the American Women Teachers was sent to superintendents in all of the cities of the United States above 100,000 in population. Twenty-four replies were received.

The replies were tabulated and the results set forth as indicated. In other words the twenty-four replies received give the average per cent of women teachers belonging to the group that has fallen behind in *professional training* as twenty-seven. The total number of teachers involved in these replies, and upon which the 27 per cent is based, is 9858. Of the total number of replies received, one answers "cynical," 13 "sympathetic," and 8 "indifferent," and so on through the questionnaire.

All superintendents agree that those teachers should be retained who were considered the best ten years ago, but now are far behind in formal preparation for meeting new demands. For those who have been long in the service some way should be found by which their services may be used. Provision of retirement funds should be made if there is no present established law.

Rehabilitation by means of constructive supervision and extension courses are recommended where ability and desire for improvement on part of teachers are shown. One superintendent however believes that teachers lose more by extension courses than by conserving all their energies for the work they are engaged in. Some think that indifference should be overcome by diplomacy, not coercion.

The replies of the superintendents who answered questionnaire concerning the ranking of types of teachers designated with respect to efficiency, indicated a diversity of opinion. The majority give preference to Type Two, "Women who are not conscious of a marriage motive but who expect to give their lives to the work of the school teacher. Type One, "Young women who hope or expect to terminate their teaching work by marriage in the course of a few years," receives second place in estimate of superintendents who answered questionnaire. Type Five, "Widows who have returned to the teaching profession with the intention of remaining in it," is given third place. A slight preference is given to the type of married women teachers who expect to remain in the profession a long time and do not have to support husband, children, or relatives. Responsibilities of those who have others to support divide interest, but not more perhaps than social engagements do of the unmarried. Widows are approved, provided they have not been out of teaching too long. They do not differ greatly from types one and two. Some superintendents believe that marriage has nothing to do with efficiency. They believe that teaching ability is more dependent upon inherent qualities than on accident of marriage. So much depends upon individual attitude. The marriage motive, conscious or unconscious, is practically universal. One superintendent believes that the ranking of such types is not a basis for discrimination.

Replies as to *social status of teacher* show that the teacher is becoming more of a factor in the social life of the community. Women's clubs as a rule welcome the teacher, but lack of common interest, hours of teachers' service, and for class reasons in some instances, teachers are unable to take part in the activities of women's clubs. However, in some places women's clubs boast of a large membership of teachers and solicit their support and cooperation.

It is gratifying to note that a very large per cent of the women teachers do take their work seriously, and it is the opinion of all who replied that there is an improvement over conditions of ten years ago.

QUESTIONNAIRE CONCERNING THE STATUS OF AMERICAN WOMEN TEACHERS

(Total number replies, 24)

To the City School Superintendents:

In recent years we have had such a rapid advance in teaching theories that much higher demands are now being made in the way of teacher qualifications. This movement has come on so suddenly that many teachers who were considered to be the best ten years ago are now far behind in

formal preparation for meeting the new demands. About what per cent of your women teachers belong to this group? 27 per cent. About how many teachers does this per cent represent? 9858.

Which of the following adjectives describes the attitude of these teachers as a group toward the higher qualification requirements which are being set up? Show by check.

- 1 answers "Cynical"
- 13 answer "Sympathetic"
- 8 answer "Indifferent."

By check indicate which of the following statements expresses your view as to what consideration should be shown this group in any school system.

1. They should be dismissed at once on the principle that they are too far behind to catch up in a reasonable time and the educational welfare of the pupils subordinates all other considerations. 0.

2. Because of services rendered in the past combined with what they are yet able to do, they should be retained even if they never catch up in professional training and scholarship. 6.

3. They should be retained only if they take advantage of opportunities through extension courses, summer schools, leaves of absence for study, etc., in order to meet present professional training demands. 13.

The following questions are submitted in an effort to get a collective opinion from superintendents concerning the professional spirit of women teachers in general:

1. Without reference to your local situation but inferred from your general observations about what per cent of the women teachers do not take their work seriously. 17 per cent.

2. Do you consider your answer to the above question to represent an improvement over the condition of ten years ago? No, 5. Yes, 18.

TYPES OF WOMEN TEACHERS

Designate by numerals (1, 2, 3, etc.) the ranking you would make of the following types of women teachers with respect to efficiency:

1. Young women who hope or expect to terminate their teaching work by marriage in the course of a few years.

- 8 give rating of 2
- 6 give rating of 3
- 1 gives rating of 4
- 2 give rating of 5

2. Women who are not conscious of a marriage motive, but who expect to give their lives to the work of the school teacher.

- 15 give rating of 1
- 1 gives rating of 3
- 1 gives rating of 5

3. Married women who expect to remain in the profession for a long time, but who do not have to support husbands or other relatives.

- 2 give rating of 1
- 4 give rating of 2
- 4 give rating of 3
- 1 gives rating of 4
- 4 give rating of 5

4. Married women who have husbands, children, or other relatives to support.

2 give rating of 1

3 give rating of 2

3 give rating of 3

4 give rating of 4

2 give rating of 5

5. Widows who have returned to the teaching profession with the intention of remaining in it.

7 give rating of 1

5 give rating of 2

5 give rating of 3

SOCIAL STATUS

About what per cent of your women teachers, would you estimate, take a part in the social life of the community to an extent equal to that taken by any other group of cultured women? 53 per cent.

Do you feel that, generally speaking, the women's clubs of the community do not welcome the teacher because of her financial status? Yes, 4. No, 17.

Do you feel that the woman teacher is becoming more of a factor in the social life of the community? 19. Less of a factor? 2.

June 19, 1922.

REPORT OF THE COMMITTEE ON THE STATUS OF THE CLASSROOM TEACHER, A SUB-COMMITTEE OF THE NATIONAL COUNCIL OF EDUCATION COMMITTEE ON THE STATUS OF TEACHERS

CORNELIA S. ADAIR, CHAIRMAN, RICHMOND, VIRGINIA

Since the question of the Status of the Classroom Teacher in the United States is such a broad one the chairman of this sub-committee has decided to treat the subject from one aspect only, that of the attitude of the teachers themselves toward their own status. To that end questionnaires were sent out to organized groups of classroom teachers, to individual teachers, and to superintendents with the request that they be given to classroom teachers. Three copies of the questionnaires were sent in each letter, to be filled out respectively by a teacher of two, ten, and more than ten years' experience. The request met with a generous response and answers are still coming in.

This is the questionnaire with such answers as admit of numerical tabulation. An interpretation follows:

QUESTIONNAIRE ON STATUS OF CLASSROOM TEACHER

A. Professional Status.

1. Is teaching in your part of the country ranked with other professions? State reasons.

1. By teachers themselves? Yes, 27; No, 29.

2. By members of other professions? Yes, 15; No, 26.

3. By other citizens? Yes, 14; No, 26.

4. What place has the teacher in your community—

(a) In civic life? Good, 23; Poor, 19.

(b) In social life? Good, 19; Poor, 22.

II. Are teachers loyal—

1. To each other? Yes, 37; No, 13.
2. To their own organized group? Yes, 38; No, 8.
3. To the system as a whole? Yes, 38; No, 4.
4. How may the spirit of loyalty be fostered?

III. 1. Is your organization such as to develop the "group spirit"? Yes, 30; No, 4.

2. How are the best ideas of the individual teacher made available to the group and to the system as a whole?

B. Teacher Training in Service.

I. How have you adapted your new salary scale to experienced teachers whose certificates do not meet present requirements?

II. How are teachers in service being trained?

1. By school authorities?
2. By teachers themselves?
3. How is the teacher's work rated?

C. Finance.

I. Has your salary scale been revised in 1921-22? If so, why?

II. Salary	Maximum	Minimum
1. Elementary School		
2. High School		

Remarks:

..... Years taught
 City State

Question A I will be interpreted from the negative point of view. The following reasons were assigned for the lack of professional rating: lack of tenure, no proper system of coöperation between branches of the service, tradition, lack of leadership among the teachers, faulty systems of supervision, the failure upon the part of the public to realize the high standard of education required of those entering the profession, lack of trained teachers, the factory idea.

Various reasons were given by the teachers for their belief, but all agreed that the teacher's own attitude toward her own profession was the most vital factor in influencing the attitude of others. A number of teachers regretted that more teachers did not take an active part in civic and social life. The common reason assigned was lack of time.

A II. A great majority of teachers felt that teachers were loyal to each other, their own organized group, and to the school system as a whole. All felt that teachers' organizations developed the "group spirit."

A III. Many interesting answers came to the question, "How may the spirit of loyalty be fostered?" All of these answers may be summarized in this statement, "Give teachers an opportunity to coöperate in the administration of school affairs. Let them help build up the system, and loyalty naturally follows. This can be done only through organization." Only through organization and coöperation in administration may the best ideas of the individual teacher be made available to the group and the system as a whole.

B I. Experience was the chief basis in the adoption of the new salary scales. Coupled with this was the statement that no new teachers would be employed who did not come up to the minimum educational requirements. Five cities proudly stated that they had no teachers who did not come up at least to the minimum requirements.

B II. With the increase in salaries came an obligation for better service. Many methods of teacher training in service are being used. Chief among these methods are: Extension classes, summer schools, lectures, professional reading, institutes, supervision. In many places increased pay beyond the maximum (a super-maximum) was based on college credit. Both teachers' organizations and school authorities favor teacher training in service.

B II 3. Everywhere the teachers were rated by the supervisors or the supervisors and principals. There was one interesting contribution. In Delaware teachers have a share in rating themselves.

C I. Only one city reported a revision decreasing salaries in 1921-22, as against seven that reported increases. Three cities, Denver, Colorado, Spokane, Washington, and St. Joseph, Missouri, reported a single-salary scale.

This report is in no sense final. The chairman wishes the privilege of continuing her study in order to report at a later date.

PRELIMINARY REPORT OF COMMITTEE ON TEACHER WELFARE

JOHN W. CARR, CHAIRMAN, FRANKFORT, KENTUCKY

At the Des Moines meeting of the National Council of Education, a chairman of a Committee on Teacher Welfare was appointed, and the President of the Council was authorized to appoint other members of the committee. There were no instructions given as to what this committee should do and no funds placed at its disposal. So far, three members of the committee have been appointed: Mary S. Mulligan, of Ohio; David B. Corson, of New Jersey; and John W. Carr, of Kentucky. It submits the following brief report and asks for further instruction.

Teacher Welfare is a broad and general expression, difficult to define. As ordinarily used it has to do with salaries, tenure, pensions, terms of employment, conditions under which teachers work at school, living conditions provided for them in the communities where they are employed, rewards other than money which they should receive, opportunities for growth and development, and a chance to achieve some of the highest and best things in life. Teacher welfare has to do with money, health, work, recreation, home life, creature comforts, and a number of other things which affect teachers as individuals and as a group.

We have asked ourselves two questions: (1) What specific thing do we wish to do? and (2) What means shall we employ to attain our objective?

The specific thing we wish to attain is the *actual betterment of the conditions of teachers* as individuals and as a group—betterment of as many teachers as possible in as many ways as possible and to the greatest extent possible. We wish to get things done for teachers which will promote their health, increase their bank accounts, give them sanitary and comfortable places in which to work, provide for them decent and homelike places in which to live—in a word make them more important folk in the community and as a result more efficient servants of the community.

There is already a number of committees at work on certain phases of teacher welfare, as for example, the committees on salaries, tenure, and pensions. The Committee on Teacher Welfare should not attempt to duplicate the work of any of these committees, but it should strive to find ways and means for carrying into operation the recommendations of such committees as those referred to above. The chief work of this committee would be to form organizations and to keep in touch with organizations whose chief aim is to promote the welfare of teachers.

If such work is undertaken, a large committee on teacher welfare should be appointed—a committee consisting of at least one member from each State. It would be necessary to appoint or to secure the appointment through State teachers' associations of State committees on teacher welfare. Local committees would be necessary also in the larger and more important communities. The particular work of these committees would be to promote the welfare of teachers in various ways. Sometimes this would be accomplished through legislation, more often through the action of boards of education, but ultimately through public opinion.

It would be necessary to have a program. This would change from time to time and be in different stages of development in different places. It is not necessary to attempt to outline such a program in detail, but it would have to do with better salaries, securer tenure, more adequate provisions for the care of the aged and incapacitated members of the profession; better living conditions for teachers—teacherages, suitable rooming and boarding places and such social privileges as men and women of character and refinement are entitled to receive; better working conditions relative to terms of employment, and care and sanitary condition of school buildings in which they work; means for protecting the rights of teachers—legal and professional; better code of professional ethics more generally observed. These and kindred topics might well be included in the program for teacher welfare.

If the committee is continued, it should not only be enlarged, but it should be made a standing committee with adequate funds to carry out its program. It is impossible for this committee to do much in a year or two, but worthwhile accomplishments can be made only by continuous work. The membership should change from time to time but the committee should be continued as long as it does effective work. Its reports should not be essays on professional topics, but a summary of actual achievements.

The committee should have necessary funds at its command to enable it to carry on its work. A large appropriation is not needed at first, may never be needed. Members of the committee should be expected to give their services free, but funds should be provided for clerical assistance and other necessary expenses.

This report is submitted with the recommendation that the Council give it such consideration and take such action as it deems proper.

Department of Business Education

SECRETARY'S MINUTES

OFFICERS

President—CLAY D. SLINKER, Director of Business Education.....Des Moines, Iowa
Secretary—G. F. KNIPPRATH, Head of the Bookkeeping and Accounting Department, Technical
High School.....Omaha, Nebraska
Chairman—RAYMOND G. LAIRD, Principal Roxbury High School.....Boston, Mass.

FIRST SESSION—MONDAY AFTERNOON, JULY 3, 1922

The Department of Business Education of the National Education Association convened in regular session on Monday afternoon, July 3, 1922, at 2:00 p. m., in Room 43 of Boston University, at 688 Boylston Street, Boston, Massachusetts. The meeting was called to order by Raymond G. Laird, chairman.

The following addresses were given:

TRAINING OF THE PENMANSHIP TEACHER OF THE NEXT DECADE—Bertha A. Connor, Director of Penmanship, Boston Public Schools, Boston, Mass.
COÖPERATION BETWEEN CIVIC ORGANIZATIONS AND SCHOOL AUTHORITIES—Karl F. Adams, Principal of Lincoln High School, Seattle, Wash.
PLACEMENT PROBLEMS—Eleanor J. O'Brien, Department of Vocational Guidance, Boston, Mass.
THE NEXT STEPS IN COMMERCIAL EDUCATION—Frederick G. Nichols, Director of Commercial Education, State Department of Public Instruction, Harrisburg, Pa.

SECOND SESSION—WEDNESDAY AFTERNOON, JULY 5, 1922

The meeting was called to order by Chairman Laird. The following addresses were given:

PUTTING THE SHORT IN SHORTHAND—Edina Campbell, Principal of the Hickox Shorthand School, Boston, Mass.
TRAINING FOR RETAIL STORE SERVICE—Isabel Craig Bacon, Special Agent for Retail Store Service, Federal Board for Vocational Education, Washington, D. C.
INTENSIVE TRAINING FOR BUSINESS—George L. Hoffacker, Head Instructor of Book-keeping, Boston Clerical School, Boston, Mass.
CORRELATION OF COMMERCIAL COURSE OF SECONDARY SCHOOLS WITH COURSES OFFERED IN COLLEGIATE SCHOOLS OF BUSINESS—Charles F. Rittenhouse, C. P. A., Boston, Mass.

The department now proceeded to the election of officers.

Moved by E. W. Barnhart that a committee of three be appointed to cast a unanimous ballot for the officers of this department after the place of the next meeting is known. Seconded. The purpose of the above motion was to secure officers in the locality of the next meeting, and thus be assured of their presence. After discussion as to its legality, the motion was withdrawn with the consent of the second. The following officers were nominated and elected from the floor:

President, E. W. Barnhart, Chief, Commercial Education, Federal Board for Vocational Education, Washington, D. C.
Secretary, Mrs. Luzetta Erickson, State Supervisor of Commercial Education, Boise, Idaho.

The meeting then adjourned upon motion.

G. F. KNIPPRATH, *Secretary*.

PLACEMENT PROBLEMS

ELEANOR J. O'BRIEN, DEPARTMENT OF VOCATIONAL GUIDANCE,
BOSTON, MASSACHUSETTS

The first problem of placement is one of organization, whether or not a central placement bureau is desirable or necessary in a public school system. In Boston that problem has been very much discussed for many years; it is generally conceded that such a system is necessary.

The Boston Placement Bureau was established under private auspices in 1912, with coöperation of the Boston School Board in the use of school buildings for meetings. That coöperation grew from year to year as the field of placement widened until in 1915 the Department of Vocational Guidance was organized, and in 1917 had assumed control of the Bureau. The department uses both titles because of the associations formed in the five years when the work was carried on under the Boston Placement Bureau.

The Department of Vocational Guidance is organized with a director, Miss Susan J. Ginn, and a staff of vocational assistants (women) and Vocational Instructors (men) appointed under a special certificate. In addition, each school—elementary, intermediate, and high—has at least one vocational counselor who is a teacher appointed by the Head Master of the school and who serves as a connecting link with the Department of Vocational Guidance.

It is difficult to outline the work of the vocational counselor in the schools because it is voluntary; as usual under such conditions definite standards cannot be set. The vocational counselor should interview all children who express an intention of leaving school, for the purpose of discovering means of retaining them. He or she should act as adviser in the 7th grade on the choice of a secondary school. The Vocational Guidance Department has just prepared a booklet "A Guide to the Choice of a Secondary School." Classes in English or civics should be conducted by counselors in which studies of occupations could be made. She should attend frequent conferences with the director and members of the Vocational Guidance Department in order to keep in touch with legal decisions on child labor, changes in business conditions, or other matters relating to children. There is great need on supervision of part-time employment of school children, and it is possible that this might be one of the duties of the counselor. On the other side, the counselor should unquestionably be allowed time for her duties and additional compensation.

When a child is obliged to leave school under sixteen years of age the counselor may recommend him to the placement bureau to secure his first job. Once secured, that child becomes the charge of the Continuation School until he is sixteen years of age, when he returns to the supervision of the placement bureau. If the child secures his first job himself, he may or may not be sent to the bureau. This is one problem for close coöperation between the Continuation School and the Placement Bureau if there

is to be an inclusive, school placement system, as it is very important, from the employer's point of view, to have all school placement agencies act through one junior placement clearing house. It is confusing and wasteful of time for an employer to be obliged to call one office for one class of workers, another for another, or worst of all several offices for the same class of workers. If he has been shown the advantage of hiring employees from a bureau that knows its young people, and has access to their school records and working experience, it seems inefficient and unbusinesslike to have placement work scattered among several school offices.

Another point is that the Continuation School is closed during the summer months.

In ten high schools the graduates are registered by personal interview before graduation by the vocational assistants and instructors of the Central Office, and are followed in their after experience at school, college, or work until they are twenty-one years of age. The only general high school outside of this plan is the Dorchester High School which up to this time has undertaken the placement of its own pupils through the office of the head of the Commercial Department. Now, steps are being taken at the request of the Head Master to bring the school into the central Vocational Guidance and Placement system.

The only remaining secondary schools are the two college preparatory schools, the Girls' Latin and the Boston Latin School, the High School of Commerce, High School of Practical Arts, Girls' Trade School, and the Boston Trade School, each of which has a specially appointed vocational assistant or instructor. The Vocational Instructor at the Boston Trade School is a member of the Vocational Guidance Department, assigned to that school. One other member of the staff is assigned to work in the intermediate school grades of the Hancock School.

While theoretically the Latin Schools and the other secondary schools mentioned are not registered nor followed by the Vocational Guidance Department, actually many students from all these schools are referred or come to the bureau each year for part-time, summer, or full-time work, particularly in the summer when the schools are closed.

Drop-outs from the high schools may be referred by the vocational counselor to the placement bureau, and here is the next problem of placement organization, to enlarge the Vocational Guidance Department to the point where it may be possible to take care of every drop-out who should be registered automatically just as the graduates are. That step is also being planned, as is the inclusion of the Dorchester High School. These steps are logical, first from the point of view of the child, that every Boston public school pupil is entitled to equal consideration, and secondly for the value to the system of complete and inclusive records and statistics.

Whether a school system should maintain a central placement department or not is a question which can only be settled by impartial scrutiny of the results of such a bureau operating over a span of years. Placement and placement alone is not of sufficient importance to justify the existence

of such a department. The schools have always done a certain amount of placement but without the follow-up work which checks results. Even now, many young people are placed before graduation, but reports are passed on to the Vocational Guidance Department for record and follow up. It is impossible for the teachers to do this work except in the most superficial way. They have not the time, nor the means at their command.

Vocational Guidance through the curriculum should prepare students by vocational information and advice for an intelligent selection of a vocation and after that selection has been made with the greatest possible freedom of individual choice, should stimulate students to seek the most advantageous field of development. Many people believe that a school which has done this has accomplished all its purpose. This implies a highly idealistic condition and supposes that the school adequately reflects real life—for our particular discussion the real life of the commercial and industrial world, for although the placement department follows all its registrants, it is most concerned with the large number whose next step after leaving school is entrance into occupational life.

No one knows better than the placement worker that the school does not adequately reflect real life, not yet. If every teacher in commercial education could spend just one year trying to place his young students, all, not just the upper ten per cent, he would probably return to teaching with a reorganized attitude toward his work, both as to content and method. The next best thing is for the placement department to send back to the schools frequent and carefully prepared reports from the field.

Until we have vocational guidance perfectly coördinated throughout the grades, there will always be need of a placement department, even in its narrowest sense. Broadly, for the value to the whole system which must come from careful follow-up work after placement there will always be need of a placement department. For follow-up is the only agency working to connect school with the real world for which it prepares. It is the medium through which the occupational world makes known its complicated, constantly-changing needs. It is also the medium through which it must always be the function of the school to send out to the business world high standards of working conditions, limitations of hours and burdens of work for minors, standards of loyalty and coöperation.

One of the most recent activities of organized industry is the compiling of vast amounts of occupational information. The Boston Placement Bureau collects and disseminates to vocational counselors, booklets, leaflets, and studies along this line on every available occupation. It also keeps a vocational information file at the central office, and catalogues of over two hundred schools and colleges for use of counselors and registrants.

In 1921 ten Boston High Schools graduated 688 boys and 997 girls. Each graduate was asked to indicate his or her vocational preference on the registration card at the time of the interview with the vocational assistants. The results were tabulated as follows:

	Boys		GIRLS	
	Number	Per cent	Number	Per cent
Agriculture	15	2.2	..	..
Manufacturing and Mechanical....	65	9.7	1	..
Mercantile trade	114	17.1	5	..
Public Service	2	..	..	..
Professional Service	304	45.5	179	18
Domestic and Personal service....	1	..	1	..
Clerical	41	6.1	712	71.4
			(509 stenography)	
Interest not stated.....	59	8.7	28	2.8

In Boston the Placement Bureau makes a detailed report to the Head Master of each high school of each individual graduate within a year of graduation. This information is obtained from the young people from personal interviews at the central office, from letters, by telephone, or by home visits. A detailed analysis was made of the results of follow-up work of the class of 1921 whose vocational preferences have been listed above.

	Boys		GIRLS	
	Number	Per cent	Number	Per cent
Agriculture	2	.6	..	..
Manufacturing and Mechanical....	63	18.18	12	2.
Transportation	17	5.1	..	..
Mercantile	108	32.2	41	6.8
Public Service	4	1.2	15	2.5
Professional Service	18	5.3	14	2.3
Domestic and Personal service....	12	3.5	9	1.5
Clerical	63	18.8	471	78.1
			(140 stenography)	
No information	14 }	14.5	12 }	6.8
Wanting work	34 }		29 }	

In the manufacturing and mechanical group where only one girl had expected to find work, 12 girls found employment.

In the mercantile group five girls hoped to find their openings but 41 were actually placed, 30 selling and 9 in stock or examining in department stores.

No girl had expressed her intention of entering any kind of public service, but 15 girls became telephone operators.

Of the 179 who preferred professional service, only 14 succeeded in finding opportunities, easily understood because one year is not sufficient time in which to prepare for professional work.

Nine girls were employed in domestic or personal service, hairdressing, mothers' helpers, or restaurant workers.

The widest variation was in the large group who elected the clerical occupations, 46 different types of work, corresponding very closely with a recent analysis of commercial occupations made by the Federal Board of Vocational Education, not yet published.

Stated simply, the available commercial occupations do not correspond either in kind or number of openings with the available candidates, according to the candidates' own stated preferences. Some adjustment has to be made, and it is perfectly obvious which side gives way. The pressure to

earn one's living is greater than the pressure to get a certain job done, and after much running about to employment offices, the young girl decides to accept that typing job, bitterly disappointed perhaps, and more than half sure that it is the fault of the placement worker that she does not secure a secretarial position. The latter has to face facts daily, not hopes nor opinions, and it is still her business to keep her relations with the disappointed young typist friendly, to try to get her to keep in touch with the office, either by coming in during her lunch hour or in the evening hour held twice a month for just such a purpose. The young girl, if alert and intelligent, studies her particular field, watches her opportunity, learns when a vacancy is coming, and prepares herself by taking evening dictation courses to be ready for the time when she may be advanced to the coveted stenographer's desk. Her daily practice in typewriting is very valuable when that time comes and finally all is well.

If the schools do not find material for study in two such reports, then the work of the Placement Bureau fails in one of its most important aims.

If more than half of the girls of our general high schools elect stenography as a vocation, it is, perhaps, not so much because of any particular fitness for the work as because they do not know what other openings modern business offers. A young girl of the class of 1921 came to us last July wanting stenography. She came with only a C record of achievement in preparation, but with absolute confidence of getting an A record of achievement in a stenographer's position as expressed on the payroll. It was impossible to place her as a stenographer but after a short time she accepted a temporary opening in the marking room in a department store. Four or five months later the vocational assistant who placed her visited that store and found the girl still employed and very happy. The head of the department said that the girl was "a wonder on the tagging machine" and had been placed in charge. A few weeks ago the head left to be married, and our young girl was promoted to the vacated position. She has the satisfaction of liking her work and doing it successfully.

The argument may be advanced that the young high-school graduates show commendable adaptability and that the record shows flexibility of commercial education. It must however be remembered that hundreds of precious hours of high school time were spent preparing for vocations which were not followed. That is not the aim of commercial education. There is no doubt that a report of the class at the end of five years will be of greater value as suggestive material to teachers in commercial education. That will demand the highest degree of coöperation between the employers and young people with the Department of Vocational Guidance. Nothing can be done to compel this coöperation; it must be voluntary and rest solely on mutual respect, interest, and understanding.

It is not the function of the Placement Department to settle any of the organization or administrative problems. It can only state the case and leave decisions with the departments empowered to make changes, furnish funds, or inaugurate policies.

If all the forces at the command of the school system could be combined to support a placement bureau, its work would be half accomplished. For example, we are just beginning to realize the value of the older graduates as employers, office managers, heads of departments, or wives of employers. We have not mobilized the parents of pupils, friends, and relatives of teachers into a compact employing group because we are still a young department in the school service, but each year adds new power, new friends, new strength to meet problems. We believe that time will show the value of the work.

PUTTING THE SHORT IN SHORTHAND

EDINA CAMPBELL, PRINCIPAL OF THE HICKOX SHORTHAND
SCHOOL, BOSTON, MASSACHUSETTS

In teaching shorthand the longest way round is likely to prove the shortest way home. Some one has truthfully said that the girl who learns shorthand in two months usually takes a post-graduate course of two years at her employer's expense. However the length of time it takes and the amount of effort intelligently expended or wasted upon this study depends largely upon the teacher. We must face the music; but we may face it with supreme confidence and courage, if we are imbued with the consciousness that if conditions are new and different that we must adopt new and original methods and drop forever the dead formalism of the past.

Our task is a big one: the tendency of the times is towards superficiality and general laxity in study, yet we find ourselves in an era when world conditions embracing all branches of study demand an extraordinarily minute analysis and a relentless probing into the source of things. Herbert Spencer said "Teach thoroughness, the first great essential of education." Not one of the ten commandments has ever been broken as that precept has been. Let us no longer be content with turning out students who write 100 words a minute, but push the standard up to 150. It can be done and in a reasonable time, but the seed must first take root in the mind, yes and in the heart of the teacher, for every true teacher should love her subject and particularly her pupil. We know the pupil justifies this attitude; surely the subject justifies it—it is as big as all the languages put together that we have taken all these years to perfect, as big as commerce, as big as the world. It makes no difference what phase of business it is, from the factory to the President's office, shorthand may come into play. A big subject demanding great big open minds to handle it!

The first question that presents itself in the technical side of teaching shorthand is the need for variety. This need is most acutely felt today when most boys and girls are subjected to the rapid, delirious excitement of the moving picture, the absurd over-attention to dress and the wild, free rhythm of jazz music. Well, these conditions are here; we are not going to quarrel with them; we will as far as possible offset them by putting a little jazz into our teaching.

In developing the attention faculty, which should be a preliminary step in undertaking the teaching of any subject, it is well to attack it by means of psychology. Try the old experiment of telling a story to the class, occupying perhaps a half a minute to a minute. Then ask them to give you the gist of what you have said—no two will tell it alike, and the wide divergence of opinion conclusively demonstrates that if they are to receive the impressions to which they are entitled, in order properly to concentrate, they must keep their mental decks cleared for action. You have told them nothing; they have just discovered it for themselves, and right there you touch on one of the most important principles in pedagogy—we do not educate by implanting ideas in the mind of the pupil, but by educating or drawing out.

In the interest of keeping this atmosphere of enthusiasm in the school-room I believe it is not advisable to give the drilling exercises day after day in exactly the same manner. For instance, after the class has taken the material in shorthand and it has been read by a pupil, the instructor re-dictates the letter beginning at the end and working backward. This may be followed by her dictating every second word, reading forward; and to permit the fastest writer to operate without that sense of boredom that comes from waiting for a slower member to "catch up" each pupil is required to write the outline as often as she can until the next word is spoken. The following day the instructor will change her tactics, and ask a pupil to re-read the matter while the rest of the class write it. Two purposes are thus served—the delight of variety, and the advantage of "taking" from another voice.

In learning the tiresome lists of word signs, which are an essential factor in every system of shorthand, I have had the best results from having the pupil take the words in groups of three, thus avoiding the automatic action of the mind that results from taking one or two words over and over again. The thing I would try to impress upon the instructor is that she keep her methods, her mind and, so far as possible, the mind of her pupil, like a running stream, constantly throwing off those elements that tend toward stagnation.

Walking amongst the pupils while they write is an important phase of the teaching. Thus will the instructor, even in a very large class, do individual work: she will ascertain the peculiar tendencies of each pupil and while insisting on the same technical perfection in the writing of all, she may make the personal appeal to each one in a different manner.

The girl with the developed or potential imitative faculty will be spurred on by your writing a few words for her personally, she will naturally copy the correct outlines; her phlegmatic neighbor, lolling sideways, head on arm, thoroughly bored with the whole business can perhaps best be moved by a telling bit of sarcasm, which may be given out to her individually and which would doubtless prove most destructive if administered to the class as a whole. Another fancy she has a handicap peculiar to her only, poor eyesight, left-handedness, or something of the sort, and here we may remind that the Creator very often selects those with just such

handicaps to do His biggest work—Edison is totally deaf, Milton was totally blind, Pope a physical weakling.

Then there is perhaps the most interesting and at once the most bothersome pupil of all, the analytical, questioning mind that fights every inch of the way. This one can only be satisfied with a clear logical answer. Now the skilful teacher can find a reason for everything in shorthand, and by this gauge you can about measure the size of your teacher. After all it is not teaching machines that are needed—but honest, enthusiastic students of education whose minds are so imbued with the bigness and beauty of the subject that they will run down right to its very lair every exception, every thought that seems to confuse and find out the reason why. In this connection it is important for the teacher to remember that the more the student's mind is exercised the less drill will be necessary; in other words, the more reasoning the less memorizing.

Now those of us who are expert writers and have been so for a number of years never heard the word rhythm in connection with our study of shorthand—we just hit upon it. No wonder that we wish to abandon the old-time methods, when we know today that the most important element in rapid writing is rhythm. Professor James has aptly said that we are bundles of habits; then on the first lesson in shorthand the pupil should be started on writing sentences from dictation, thus beginning at once, constantly under the eye of the teacher, the habit of rhythmical continuity. There should be no transition period between theory and practice; they go hand in hand.

The pupil should use all of the time in writing, not in jerkily slapping down a word and halting until the next word is spoken. The time will of course be changed, depending on the speed of the dictation, but this need never interfere with a perfect rhythm any more than the change of time in music would interfere with the rhythm. The outlines should be close together and the hand raised the least possible distance from the surface of the paper between words, thus making the whole operation as compact as possible. The rhythm in the writing will preclude the tendency to cramp the hand.

On the second lesson these sentences may be given over and over again, and behold after, say, twenty-four hours we have the pupil writing at sixty to seventy-five words a minute. Of course this speed in itself means nothing, for speed on matter so familiar is no speed, but it has the desired psychological effect of egging the pupil on while writing accurately, rapidly, and rhythmically at once.

In reading, the word should be pronounced phonetically aloud. It will speak itself. By phonetically I mean that if the outline be *gay* for instance, ask them to say *gay*, not *g*, etc. It is useless to sit staring at it as a whole or stabbing at it by guess.

It is an excellent plan to write on the board before the class and have them follow in their notebooks. They will instinctively drop into the instructor's method of correct writing. To vary this, have them cease

writing while you continue purposely making mistakes, and have them correct you.

Urge the pupils from the beginning to make small notes. The advantage of this can be quickly and interestingly demonstrated by having one set of pupils race another group in the making of two outlines. These outlines should be of about the same shape but one about twice the size of the other. All are convinced when the group with the small outline find that in a given time they have made twice as many outlines as the group with the larger outline.

Try to impress upon the pupil that she is not in a school but in an office with all the responsibility incident thereto. If it can possibly be arranged have the pupils write letters that are really going out. Insist that they have everything ready when the dictation begins—pointed pencils, open, dated note-books, and set a time limit when the letters must be mailed. This will sometimes result in a panic, but it is better to burn out all the panic energy in the school room than later when it may mean the loss of a job.

Now, we have discussed various methods for putting the short in shorthand, yet, paradoxical as it may seem, shorthand as such is to my mind the least important part of the teaching of shorthand. Would we think of attempting to make a historian out of a person whose knowledge is confined to history and who knows nothing of geography or ethnology, or an army officer by merely teaching the manual of arms, eliminating mathematics? Certainly not. No more should we attempt to make a shorthand writer out of a person who is not in command of a large working vocabulary of the English language. Before she attempts to learn the language short we should be sure that she knows it long.

It is a fact that the Yahgan Indians of Tierra-del-Fuego have a working vocabulary of forty thousand words, and it is also a fact, as nearly as it can be estimated, that the average American stenographer—I speak now of the great rank and file, mostly high-school graduates, not the product of university or college—has a vocabulary of between two and three thousand words.

What availeth it if she write the Hindustani language in shorthand if she cannot transcribe it except by the very precarious method of writing literally by sound. This method is particularly unsafe in transcribing the English language where the spelling of words exactly as they are pronounced is the exception rather than the rule and where words similarly pronounced have entirely different meanings.

In this connection, rather than giving long, formidable lists of words to memorize, it seems advisable to have selected reading in connection with the shorthand work. It can be worked out to advantage with the period of writing for demonstration on the board. This reading may be selected with the idea of covering important fields of knowledge, as well as having unusual words. During this period the pupil will have the privilege of not only having explained to her in full the formation of an outline, but

the meaning or spelling of a word, or the discussion of the subject matter. Placards may also be posted in the schoolrooms calling attention to this vocabulary shortage, one reading perhaps like this: "How many times a day do you use the words, *nice, splendid, awful, fierce, elegant?*" In casting about for substitutes they will probably visit the dictionary, and the vocabulary consequently become enlarged.

A knowledge of words and the technical knowledge of shorthand are not separable subjects. The student may learn words without shorthand, but she can never learn shorthand without words. From this standpoint they are essentially the same study.

If a dictated word be unfamiliar to the stenographer, she has to write it out laboriously every stroke, every vowel, missing perhaps several words during the process, and even then, it is fifty-fifty that she gets it wrong; whereas if the word be familiar to her she may write a small part of it, just enough to give the cue, and her dependable vocabulary will give her the remainder; obviously then the wider the general knowledge and greater the vocabulary the greater will be the technical speed of the shorthand writer.

Let us turn out not writers of shorthand, but shorthand writers, and I insist on a sharp distinction between the two. The one involves merely an automatic, machine-like record depending entirely on the dictator, where the shorthand writer means the development of an intelligent, useful human agent with the qualities that admit of progress.

INTENSIVE TRAINING FOR BUSINESS

GEORGE L. HOFFACKER, HEAD INSTRUCTOR, BOSTON CLERICAL SCHOOL,
BOSTON, MASSACHUSETTS

You may well ask the question, why should one have intensive training for business? Why make it intensive? We have our splendid school systems all over the country with their school organizations, buildings, and equipment, well-trained teachers, courses of study carefully planned out—the result of experience covering a good many years, and all this should satisfy the requirements of business men for office workers. At the same time, there are in every community two groups of young people who have taken advantage of the opportunities offered by the public-school system, who are not trained sufficiently to meet these requirements; the first group, those young people just out of elementary school who want to go to work as soon as possible, either because of necessity or because they do not like school, and the second group, those who have gone through high school but haven't acquired enough technical knowledge to satisfy the needs of business.

In different parts of the country attempts have been made to put some quick, rapid-fire, intensive courses in the first and second year of high school, with the hope of training boys and girls to fill positions in business

offices. Most of these courses have had subjects in them which should train a boy or girl for general clerical work. Some of them were so ambitious that they thought they could train pupils to be stenographers. If you think about it a little you can easily understand why most of these courses were failures. The pupil is too young, too immature to appreciate the things that the teacher is trying to teach him. He cannot absorb it, nor at that age be sufficiently benefited by it to go out into business, after a year of training, and do the work that a business man is willing to pay for. Business people pay the bills; they turn the money into the city treasury from which teachers are paid, and they expect the pupils to be properly trained for them.

A teacher has no right to be teaching unless he can do well the thing he is trying to teach. Teachers ought to go into the business world during vacations and get practical experience. It is quite possible, even in the dullest times. It has been our experience here in Boston that if a really earnest teacher desires to get a job in a business office, he can get it. Teachers have no right to teach shorthand unless they can hold a stenographic position. Bookkeeping teachers should be capable of keeping a set of books. If they cannot demonstrate before the class the pupils cannot have much confidence in them.

The second group I have divided into five sections. Give this group of pupils, who, after getting through elementary school feel that they want to do something, a chance to get into high school for two years, and keep them away from the commercial course if you can. Give them two years in high school—then they are fifteen years old perhaps, and are better able to decide whether they would like to train for office work or not, and you have a group who have a pretty fair foundation for commercial training. The second class is made up of those who have had two or three years in high school, but somehow or other have not derived much benefit from it. The third class is made up of high-school graduates who have taken partial business courses and desire to secure further training. The fourth class is made up of high-school graduates who have not had any commercial training at all. They have taken a college preparatory, normal, or general course, and decide that they do not want to go any further in that line. The fifth class is made up of those who have been employed and feel the need of further training to secure advancement.

These five groups seem lost somehow. There should be some way of taking care of them. They are not productive, and society gets no benefit from them except as consumers. Many of them might succeed in business. A graduate of an academic course in high school is the best kind of pupil to study shorthand, if adapted for it, on account of the good general education he has had.

The city of Boston has provided a special business training school for these various classes of pupils, in which an opportunity is given to girls to secure a business education, if they want it, and to qualify those not properly trained for better positions. It is really a free public business college and we believe the only one so organized in the country.

In the courses offered, the business course prepared for such positions as assistant bookkeeper and general clerical work. Pupils must have completed at least two years of high school with full credit to be admitted to this course.

The shorthand course prepares for stenographic work. At least three years of high school is required for admission to the course. When pupils have completed three years of high school they are very likely to finish the fourth year. For this reason, there are very few pupils studying shorthand who have had only three years of high school. Nearly all are graduates.

The secretarial course is a combination of the business and shorthand courses, with some additional features. A pupil must be at least a high-school graduate to enter this course.

A course in higher accounting is open to high-school graduates or girls who have finished the business course. It is still in the process of development.

These courses were planned with the business man in mind. He wants a person who is competent, who has had enough fundamental training. Why shouldn't we let everybody in? you may say. Because everybody isn't fitted to be a bookkeeper or stenographer. If we have a school for training people for stenographic service then only those people who are especially adapted to that work should be admitted. There is many a good cook trying to be a stenographer, and perhaps vice-versa.

As to the subject matter in these courses: in the business course are taught those same subjects that all of you are familiar with: bookkeeping, penmanship, business English, business arithmetic, rapid calculation, commercial law, spelling, and office practice. In teaching bookkeeping no attempt is made to over emphasize the subject. Just as much importance is attached to every other subject, and pupils are not taught to think that if they pass their bookkeeping easily they are practically through their course—they must pass all other subjects just as well. We lay great stress upon penmanship, rapid calculation, and business English. What has been said here today about English seemed to me splendid, and of course, all of you believe in it; but can you accomplish it? Do you have the co-operation of all the teachers in the school in stressing the importance of this vital subject? We have such coöperation in all of the subjects in this school. The aim in giving the course is to supplement what has been taught in the high school, to increase the vocabulary, to teach them the correct use of words, and how to punctuate. We make penmanship an educational subject, and we impress upon the pupils that good penmanship is just as important to them as anything else—but I imagine they look upon it as a nuisance. There is the key-note of success to the whole training of the young women in this school—making them believe that every subject is an educational subject. The habits of mind and body that are cultivated in studying penmanship are helpful in learning other things and in doing the daily work after being employed.

Pupils are classified in small groups, and in this way are permitted to

advance rapidly. The progress of the class is not determined by the speed of the slowest people in it. We have constant classes into which pupils come when they are ready for them, and are then promoted when they have done the work outlined in the various groups. If one girl is a little slower to learn she can take all the time in the class she needs, instead of being dragged along with the other girls whom nature has endowed with a little more ability or ambition. A brilliant girl is not held back with the class—she is given every opportunity to advance as fast as possible.

One 45-minute period each day is devoted to drill and instruction in most of the subjects. In bookkeeping, shorthand, and typewriting, at least two periods each day are given. When a pupil has finished a subject such as commercial law, or penmanship, or perhaps English, this period is added to the time for bookkeeping or shorthand, and larger assignments are made each day.

In the whole school, the plan is to drive just as hard as the pupils can stand, and give as long home lessons as possible without overworking the pupils. The teacher is able to observe each day just how every pupil is getting along; that is, oversight is exercised so that if a pupil is being worked too hard, she is sent to the school doctor.

In the shorthand course the same plan of small groups and drive, drive as hard as possible, is followed, and yet there is thoroughness in everything. In shorthand theory, a pupil must pass a test on every lesson before she can go on to the next. She must pass with a grade of ninety per cent. The test covers everything in the lesson that the pupil should know. When a pupil finishes the theory class, she goes into the 75-word a minute dictation class, where she must pass eight test letters—that is, several letters are dictated every day, and when the class goes to the typewriting room to transcribe, the number of the test letter is announced, and the letter is transcribed. There are a certain number of points taken off for every error, but if the pupil succeeds in getting ninety per cent on the letter, it is passed. When she gets eight of these, she enters the 100-class, where she must pass ten of these letters, and then the 125-class, where she must pass twelve of them. Office training consists of two or three months' work in a model office, where the pupil learns to use all kinds of office machines. Then she must pass a final test in shorthand, consisting of dictated matter at a speed of not less than 125 words a minute. After working two weeks in the school office, she is graduated. We think then, that perhaps she will be able to get a good position and hold it, and most of them have, in the seven years that the school has been in existence.

The requirements are high enough, so that we seldom find a failure among the girls. After they have completed their school work, the employment bureau secures a position for them and keeps in touch with them to follow their progress.

Other prominent features are lectures and talks given to the girls from time to time by graduates and by prominent business people in the city, who come to the school and explain the needs and requirements of business.

These talks are inspiring, and help to encourage the girls in their work to reach the highest point of efficiency. Many after securing employment continue at night school, in Boston University, until they get a college degree. Such girls succeed rapidly and are an important asset to the community.

CORRELATION OF COMMERCIAL COURSES OF SECONDARY SCHOOLS WITH COURSES OFFERED IN COLLEGIATE SCHOOLS OF BUSINESS

CHARLES F. RITTENHOUSE, C. P. A., BOSTON, MASSACHUSETTS

Not so many years ago, the commercial course given by our secondary schools was regarded as a finishing course; today we must look upon it more in the nature of a preparatory course. Business now receives general recognition as our newest profession. Collegiate schools of business have been organized as an important part of the work of the larger number of our colleges and universities. Students are flocking to such schools from all parts of the country to be trained for this new profession. A technical college course is thus provided for the young man who can spare the time necessary to obtain such a training. Collegiate courses in business should result in more definitely defining the scope and content of the secondary school course.

In view of the rapid spread of a professional training for business offered by our collegiate schools, the secondary schools should recognize the fact that they are less and less finishing schools for business and more preparatory schools for colleges and universities giving business courses. Rather, our secondary school course should accomplish a twofold purpose: (1) Provide an elementary training for business for those students who cannot continue their studies beyond the secondary school; and (2) Provide a thorough training in the preparatory branches of business for those students who expect to continue their work in a higher institution.

The question which naturally arises in your minds is whether both purposes can be accomplished by one and the same course of study. I believe strongly that they can. The business world has strong convictions about the training for office work which a young man or woman should possess upon leaving high school. Likewise our collegiate schools of business have definite standards by which to measure the preparatory training which their entering class has had. It happens that the entrance requirements of the business office on the one hand, and the entrance requirements of our collegiate schools of business on the other are closely parallel.

Excluding mental, moral, and personal characteristics, the business man expects the graduate of a commercial high school who comes to him for a position to be thoroughly trained in the clerical arts of business. If he is looking for a stenographer, he expects the high-school candidate to be able to take ordinary business dictation at a reasonable degree of speed

and to transcribe her notes easily and accurately; to write a neat, legible, and business-like hand; to be able to spell and to punctuate; and to have a sufficiently high regard for her mother tongue to enable her to express herself either in conversation or on paper in a clear, simple, and grammatical manner. If the business man is looking for a bookkeeper, he expects the candidate to possess a thorough understanding of bookkeeping theory and sufficient skill in the application of theory to enable her to keep a simple set of books in an accurate and intelligent manner; to handle ordinary banking matters and to understand the use and purpose of commercial paper; to be accurate in figures and thoroughly familiar with the ordinary processes in commercial arithmetic; to write rapidly, neatly, and legibly.

Everyone will readily admit that the secondary school fails of its purpose if it fails in any of the aforesaid respects. It is equally true that the college or university-giving courses in business sincerely hopes that it will be saved the necessity of teaching its students to spell and punctuate, to perform computations in arithmetic, to write a rapid, legible hand, and to use good English in speech and written discourse. In other words, the constant cry which is becoming almost a clamor both from the business office and collegiate schools of business is for emphasis on the fundamentals; for concentration of effort on the essentials of business. In this, there is no room for doubt. There is entire harmony between the collegiate school of business and the business office in expecting and insisting upon these fundamentals. The fact that business men and the deans of our collegiate schools of business have so much to say about the high-school product in these respects would seem to indicate that there is reasonable ground for criticism of the secondary-school course.

The fault cannot be wholly that the instruction is poor but that much needed time is "stolen" from these fundamental subjects and given to the higher branches of business which belong essentially to the technical schools of business. The training which the high-school student thus receives is too diluted and is spread thin over too wide a surface. The mistake is a pardonable one. Most progressive and scholarly teachers would prefer to teach money and banking rather than commercial arithmetic, salesmanship rather than penmanship, cost accounting rather than bookkeeping, economics rather than spelling and punctuation. It is natural for us to want to give all the tone and dignity which we can to the work in which we are engaged, but we must remember that, in the last analysis, our efforts are judged by the results which we obtain. If we fail to turn out a finished product which comes up to certain definite standards, we fail in everything.

Department of Child Hygiene

SECRETARY'S MINUTES

OFFICERS

President—O. B. NESBIT, M. D., School Health Commissioner.....Gary, Ind.
Vice-President—MAUDE A. BROWN, Supervisor of Hygiene.....Kansas City, Mo.
Secretary—WILLIAM A. HOWE, State Medical Inspector of Schools.....Albany, N. Y.

During the Boston meeting six sessions were held by the Department of Child Hygiene. The first on Monday afternoon, July 3, was largely devoted to health education and health training. In the absence of Dr. Nesbit, Dr. Howe presided. The following program was presented:

MONDAY AFTERNOON, JULY 3, 2:00 O'CLOCK

- THE TRAINING OF TEACHERS IN HYGIENE AND IN SANITATION—C. E. Turner, Assistant Professor of Biology and Public Health, Massachusetts Institute of Technology, Boston, Mass.
- THE PREVENTION AND CORRECTION OF SPEECH DEFECTS—Dr. Frederick Martin, Ithaca Conservatory of Music, Ithaca, N. Y. (With presentation of pupils.)
- TEACHING THE DEAF CHILD—Harry P. Cahill, M. D., Department of Medical Inspection, Public Schools, Boston, Mass. Mabel Ellery Adams, Principal of the Horace Mann School for Deaf Children, Boston, Mass.
- THE AWAKENING OF LATENT HEARING BY MEANS OF MUSICAL SOUNDS AND VIBRATIONS—Jennie M. Henderson, Assistant Principal, Horace Mann School for the Deaf, Boston, Mass.
- WILL INSTRUCTION IN HYGIENE AND PHYSICAL EDUCATION IN THE COLLEGE BE MADE WORTH-WHILE?—Eugene C. Howe, Department of Hygiene, Wellesley College, Wellesley, Mass.

THE IMPORTANCE OF SUBJECT CONTENT IN HEALTH EDUCATION—C. E. A. Winslow, M. D., Professor of Public Health, Yale University, New Haven, Conn.

The second session was held at eight o'clock on Tuesday morning. Dr. Charles H. Keene, of the Department of Public Instruction of Pennsylvania, was chairman. The following program was presented:

TUESDAY MORNING, JULY 4, 8:00 O'CLOCK

- PHYSICAL FITNESS FOR SCHOOL ADMISSION—C. N. Jensen, State Superintendent of Public Instruction, Salt Lake City, Utah. E. G. Gowans, State Director of Health Education, Salt Lake City, Utah.
- THE RESPONSIBILITY OF PUBLIC SCHOOLS IN HEALTH SUPERVISION—Charles H. Keene, M. D., Director of the Bureau of Health Education, Department of Public Instruction, Harrisburg, Pa.
- SANE INCLUSION OF SEX HYGIENE IN CHILD HYGIENE—T. W. Galloway, President of the American Social Hygiene Association, New York, N. Y.

On Wednesday morning, July 5, at 8 a. m. a session on nutrition was held. Miss Clyde B. Schuman, of Washington, D. C., was chairman. The following papers were presented:

WEDNESDAY MORNING, JULY 5, 8:00 O'CLOCK

- THE RELATION OF NUTRITION TO DENTAL CONDITIONS—Percy R. Howe, D. D. S., Chief of Research Department, Forsyth Dental Infirmary for Children, Boston, Mass.
- WHAT CAN THE SCIENCE OF NUTRITION CONTRIBUTE TO A HEALTH PROGRAM?—Alice F. Blood, M. D., Professor of Dietetics, Simmons College, Boston, Mass.
- A PRACTICAL SCHOOL PROGRAM IN NUTRITION—Mary G. McCormick, State Supervisor of Nutrition, State Education Department, Albany, N. Y.
- FRESH AIR, DIET, AND REST FOR SELECTED PUPILS—Carlisle Reed, M. D., and Miss Mary Callaghan, Public School Nurse, Boston, Mass.

DISCUSSION LED BY MARY E. MURPHY, of the Elizabeth McCormick Memorial Fund, Chicago, Ill.

On Wednesday afternoon, Dr. E. A. Peterson, of Cleveland, Ohio, presided over the session at which the following papers were presented:

WEDNESDAY AFTERNOON, JULY 5, 2:00 O'CLOCK

AN EFFECTIVE RURAL SCHOOL HEALTH SERVICE—Augusta C. Turnbull, Schenectady, N. Y.

COMMUNITY COÖPERATION IN SCHOOL HEALTH WORK—Courtenay Dinwiddie, Executive Secretary, National Child Health Council, Washington, D. C.

BETTER PHYSICAL EXAMINATIONS AND INSPECTION IN SCHOOLS—LeRoy A. Wilkes, M. D., Medical Director, Board of Education, Trenton, N. J.

HOW CAN SCHOOLS REDUCE MORBIDITY OF COMMUNICABLE DISEASES?—Edward S. Godfrey, Jr., M. D., Director of the Division of Communicable Diseases, New York State Department of Health, Albany, N. Y.

The session on Thursday afternoon, July 6, was devoted to mental hygiene. Dr. Frankwood E. Williams, of New York City, was chairman. The following program was presented:

THURSDAY AFTERNOON, JULY 6, 2:00 O'CLOCK

MENTAL HYGIENE FOR THE SCHOOL BEGINNER—William H. Burnham, Professor of Pedagogy and School Hygiene, Clark University, Worcester, Mass.

THE INAUGURATION OF A STATE-WIDE SCHOOL CLINIC IN MASSACHUSETTS—Walter E. Fernald, M. D., Superintendent of the Massachusetts School for the Feeble-minded, Waverly, Mass.

FATIGUE AS A FACTOR IN EDUCATION—Francis N. Maxfield, Director of the Bureau of Special Education, State Department of Public Instruction, Harrisburg, Pa.

SOME INTERNAL GLANDULAR INFLUENCES UPON CHILD MENTALITY—Walter Timme, M. D., New York, N. Y.

THE RELATION OF PHYSICAL TO MENTAL DEVELOPMENT—Frank P. Graves, State Commissioner of Education, Albany, N. Y.

The closing session was held on Friday afternoon at two o'clock. Dr. William H. Devine, School Medical Inspector of Boston, was chairman. The following program was given:

FRIDAY AFTERNOON, JULY 7, 2:00 O'CLOCK

TONSILS AND ADENOIDS AMONG SCHOOL CHILDREN—D. Crosby Greene, M. D., Harvard Medical College, Cambridge, Mass.

THE EARLY RECOGNITION AND PROPER CARE OF HEART DISEASE AMONG SCHOOL CHILDREN—Robert H. Halsey, M. D., New York Post-Graduate School and Hospital New York, N. Y.

CONSERVATION OF THE EYES OF SCHOOL CHILDREN—George S. Derby, M. D., Assistant Professor of Ophthalmology, Harvard Medical School, Cambridge, Mass.

OHIO'S EFFORT TO BRING CHILDREN UP TO A NORMAL HEALTH STANDARD—T. Howard Winters, State Department of Education, Columbus, Ohio.

THE SCHICK TEST AND DIPHTHERIA PREVENTION IN THE PUBLIC SCHOOLS IN NEW YORK CITY—Abraham Zingher, M. D., Director of Public Health, New York, N. Y.

Preceding the session on Friday afternoon the business session of the department was held. The following officers were elected for next year: *President*, Dr. William A. Howe, State medical inspector of schools, Albany, N. Y.; *vice-president*, Dr. E. A. Peterson, Cleveland, Ohio; *secretary and treasurer*, Dr. Charles H. Keene, director of the bureau of health education, department of public instruction, Harrisburg, Pa.

The following resolutions were unanimously adopted.

Resolved, That the officers of the Section on Child Hygiene be instructed to communicate with the officers of the section on Physical Education and to arrange with that section for as many joint sessions as may seem desirable and necessary to cover the common ground of interest to the people in both groups. Voted further that the officers of the section be instructed to so arrange the program of this section that there shall be no avoidable time conflict between its meetings and those of the Section on Physical Education or those of the Committee on Health Problems in Education.

THE PREPARATION OF TEACHERS IN HEALTH EDUCATION

C. E. TURNER, ASSISTANT PROFESSOR OF BIOLOGY AND PUBLIC HEALTH,
MASSACHUSETTS INSTITUTE OF TECHNOLOGY, BOSTON, MASSACHUSETTS

I shall deal with only the somewhat immediate problem of supplemental training for the teachers who are already in the field. May I take the liberty of telling you the opportunities for training which we are providing in Boston, first, for the general or grade teacher, and second, for the specialist? It is not vanity which prompts me to do this because we are not confident that we have ideal methods. It would, indeed, be much easier to escape criticism by outlining what one thinks would be ideal than by stating definitely what is actually being done. But this is a place where we profit from each other's experience, and I am asking permission to discuss our own work, first because it is typical of the sort of thing which can be done in any educational center, and secondly because it is definite and specific and therefore more readily provocative of criticism and discussion.

For teachers and school nurses we provide special summer courses, such as might be made available at any university where there is a department of public health. One course is offered in Methods of Teaching Hygiene and Public Health in the Public Schools. In this course we outline the nature of a sound and complete school health program, indicating the part taken by the various professional workers and the possibility of liaison between the various groups. Following this we discuss grade by grade the instruction program for the elementary schools indicating a variety of methods which may be adopted, providing for the student insofar as possible a complete list of teaching aids and sources of both information and inspiration. There is an exchange of experiences in the class and there are visitations to places where various kinds of child health work are being carried on in the vicinity of Boston. Such a course we believe gives the teacher a broader perspective and a stimulus for the development of her own initiative along various suggested lines.

In addition we are offering at the Institute this summer three courses in subject matter designed to present fundamental details in a form to be most useful to the teacher in elementary schools and avoiding much of the technical detail which is insisted upon in courses provided for the training of specialists in the field of public health. These courses are Personal Hygiene and Nutrition, Sanitary Science and Public Health, and Elementary Bacteriology.

The second phase of my discussion has to do with the training of special directors, supervisors, or teachers, who are to assume the responsibility of organizing and putting in operation the health instruction program for the municipal school system. Pennsylvania and Michigan are already working upon a four-year course of study which will take the student directly after high school and produce this particular kind of specialist. We are not offering this type of program in Boston because we are not well organ-

ized to do so. What we are doing, however, is to provide a supplemental course of study for those people who are already at work in this field. The student's previous training is taken into consideration and there is prescribed a program of study which will round out the fundamental training in physiology, hygiene, sanitation, teaching methods, and physical training.

We arranged last year in the School of Public Health a one-year course of study open to people of four types of preliminary training. They must all have had a high-school education and in addition to that their training may have consisted of (1) graduation from an approved school of Physical Education with teaching experience; (2) graduation from an approved college with specialization in health subjects or their fundamental sciences; (3) graduation from a normal school or teachers' college with teaching experience; or (4) training in public-health nursing with school nursing experience. We assumed that people who are to develop a program in health education should have a good grounding in, first, the subject matter of physiology, hygiene, sanitation, and public health; second, teaching methods; and third, the nature and place of physical activities in public schools. On this basis we accepted people well prepared in one or more of these fields, and provided a one-year program which would supplement their previous training where additional study was most needed. This course of study was offered under the coöperative arrangement through which the Harvard-Technology School of Public Health has been conducted and with the additional coöperation of the Graduate School of Education at Harvard which includes in its curriculum courses in physical education.

THE PREVENTION AND CORRECTION OF SPEECH DEFECTS

DR. FREDERICK MARTIN, DIRECTOR OF THE INSTITUTE FOR SPEECH DEFECTS,
ITHACA, NEW YORK

The prevention and correction of speech defects is a subject which should be understood by everyone but is often misunderstood by parents, teachers, and those in charge of the health of school children. The importance of speech correction has been emphasized during the past few years by the organization of special departments in the school systems of our largest cities. Fourteen cities have special supervisors of speech improvement and two States, directors. Wyoming was the first State to engage a special director of these activities. Pennsylvania, a year later, followed her example. Both of these directors received their training under the speaker in the New York City clinics. Several other States are now interested and have tentative plans for the institution of a similar department in their curriculums. To quote F. H. Bair, of the New York State Department of Education, "It is the business of the schools to see that the word is made articulate and that it speaks to men, inescapably, the thing it was sent into the world to say."

Water will not rise higher than its level, and before pupils can be taught to improve their speech the general level of articulative efficiency among teachers must be raised. The beginning should be made in the normal schools. No one should be permitted to take charge of a class without a thorough training in speech and without the ability to enunciate clearly.

The note of paramount importance, which we are trying to impress upon the social mind, is that of general speech improvement and the prevention of defects in their incipency. In making a resumé of statistics, it has been proved that most speech defects develop during the school age—that is, between the years of five and nine. They occur after the child has entered school. There are many psychological reasons for this. I do not attribute the fault to the teacher but rather to the course of study which has neglected to allot sufficient time to this most important subject.

We should develop better voices. You can obtain good voice production in almost any child, unless there is an organic defect or some lesion in the brain. The simplest mode to follow is the daily practice of vocal gymnastics, which will exercise the muscles controlling the vocal cords. If these are brought into play, continually and sufficiently, you will produce the proper voice and a speech which can be heard. The exercises are built upon the six fundamental sounds and may be obtained by applying to the Institute at Ithaca. In the production of audible speech, it must be remembered that it is necessary to properly deliver the vowels. When we bring out the vowels we make our words carry. This is a point I stress with public speakers, singers, and teachers. At the close of the day, when the teacher is tired, the tendency is to tighten the muscles of the face, to close the teeth, to raise the pitch and to force out the word. At such a time, if one will think of the vowels (opening the mouth to let them carry) and lower the pitch, the effect upon the class will be noticeable and the expenditure of nerve-power be diminished one third. In the New York City schools, with young children, our department instituted the practice of calling the vowels the "round tones" or "open-mouth sounds." This meant more to the child than the appellation "vowel." *The vowels or open-mouth sounds are the vehicles of our speech.* For example, take the word "vowel." If I say to you "vow-el" you can distinguish the word at a great distance, but, if I mouth the vowels (no matter how great the breath force expended), by the time the word reaches the rear of an audience, it may be interpreted as "owl," "foul," or many other analogous words.

Children, in the lower grades, who are permitted to continue day by day the practice of faulty articulation and mumbled speech, gradually develop defects which manifest themselves in the competition of later grades. To this add the complexities arising from speech conflict, consequent upon difficult studies, and we have our major disorders. *Correct habits of articulation and enunciation are based upon scientific principles of production.* With daily practice and application of vocal gymnastics and phonic drills, the teacher can soon produce a proper vowel resonance,

a clear enunciation and distinct pronunciation. Spoken language is the result of a process of imitation. The only way in which the pupil can attain a faultless enunciation is for the teacher to constitute herself a model from which he must pattern his speech. The proper development of voice and of the speech organs should precede reading because of the mental conflict in the visualization of thought. Stammering very often finds its inception in the schools in the pernicious practice of forcing children to articulate words before the areas controlling voice have been properly developed. The brain centers for the production of speech very often do not keep pace with the centers wherein we form mental images of words or of written language. The result is that the child will think faster than he can speak; speech conflict will ensue and stammering be engendered.

Great progress has been made in solving the functional difficulties of the voice. These defects we have divided into five major classifications—each of which I shall briefly describe under their respective headings.

Stammering and stuttering—More noticeable in its manifestations than other defects, because of its many acute phases, is stammering. Those suffering with this defect are probably the most neglected class of afflicted human beings in the world, having received until lately but little attention from either the pedagogic or medical profession.

Stammering, according to its universally accepted meaning in English, is a halting, defective utterance. The sufferer has difficulty in starting a word or in passing from one letter to another. It is a momentary lack of control of the muscles of articulation in the effort to speak. Often the stammerer will come to an absolute halt, being unable to produce voice. The defect is sometimes accompanied by irregular, spasmodic movements of the organs, often terminating in a partial or serious derangement of the articulate speech. One form of stammering is commonly known as "stuttering." It is the unnecessary repetition of a letter or a word before passing to the next, as "d-d-dog," or "they— they— they went— went out."

I am forced to epitomize my remarks upon this class of speech defects which itself constitutes an entire paper. I would refer those eager for an exposition of the subject to my pamphlet published by the Department of Health of the City of New York.

The cure of stammering is at once complex and delicate. The slightest mistake may interfere with an effective treatment. There must be developed an equilibrium of emotions, a precision of thought, and a new habit of speaking. The instructor must make a psychological study of every case, treating each as a personal equation. He must induce an attitude of mind on the part of the sufferer, which will increase determination and confidence. The habit of stammering is, in itself, sufficient to derange the nerve mechanism, producing a lack of confidence and excessive inhibition. The result is timidity and mental retardation. Stammering is abnormal and contrary to the proper functioning of the organs of speech, often terminating in an upset condition of the nervous system which can only be corrected by removing the cause, stammering. The stammerer is

inharmonious in his being. We must vitalize and harmonize his three elements—mind, body, and voice. There is an inability to respond to stimuli because of imperfect coördination. This sluggishness must be eliminated by quick, snappy response in all gymnastics whether mental, physical, or their combination in vocal effort. He must acquire control of his speech mechanism. That is a physiological cure just as control of thought mechanism is psychological. It is not by the laying of a cornerstone that a building is completed but rather by the careful placing of one stone upon another. So must constant exercise be given the stammerer until the larynx functions normally and the proper auditory images become fixed.

Lisping—Lisping is an imperfect production of sibilant sounds. A common form of this defect is the protruding of the tongue (lingual protrusion) when giving an “s” sound, saying “thith” for “this” or “thoo” for “zoo.” This usually is merely a habit and is corrected by rigid supervision on the part of the instructor. The lisper must be taught to discipline his unruly tongue. A system of tongue gymnastics and a manual for lispers, with daily lessons and drills, are employed with such cases when referred to our speech clinics. There are other more acute forms of lisping which need the attention of a specialist.

Most cases of lisping find their inception during the period of dentition. This must be corrected immediately by insisting upon an imitation of correct production, with the teacher or parent as a model.

Lalling and cognate defects—Lalling, as the word implies, signifies an acute sluggishness of the lingual muscles when speaking. This defect is rare in the high school but commonly encountered in the elementary grades, especially among subnormal children. Many of the cases of lalling are given the misnomer “tongue-tied.” However, out of an average of fifty cases brought to me as “tongue-tied,” I find that but one really is. This defect is usually caused by a lack of coördination of the muscles of the tongue and is corrected by tongue gymnastics and the development of a faster response to stimuli.

Associated with lalling we find many similar defects, such as nasality and nasal twang. Nasality is the emission of too much sound through the nose. You will find, as a rule, that this has been caused by hypertrophied tonsils. It may, in exceptional cases, be directly due to a paralysis of the palate or cleft palate, but usually is simply the result of improper usage of the palate, which is corrected by stimulation and the exercise of raising and lowering the uvula, as employed in the tongue gymnastics. Nasal twang is the emission of all the sound through the mouth. In order to have perfect speech the fundamental sounds should issue from the mouth, but these must be reënforced by the resonance of the nasal cavities. The child with adenoidal growths, deflected septum, or any interference in the nasal passages will not be able to use these different sounding boards and the result is a nasal twang. In such cases a specialist should be consulted.

Defective phonation—Defective phonation is the improper production of sounds, due to slovenly speech and the lack of sufficient training in the proper phonic values. We hear "dat" for "that," "lidle" for "little," "couldjer" for "could you," and Wich is Fit Avnoo?" instead of "Which is Fifth Avenue?" There is no organic cause for this. It is merely a habit, which may be easily corrected by drawing the child's attention to his imperfect production of these sounds. It is usually the result of environment.

Foreign accent—This is the largest class with which we have to deal in the public schools of our largest cities. It is the proper understanding of effectual methods for the elimination of this form of speech which will be a big factor in the present National movement for the Americanization of the foreigner. Continued use of the mother tongue causes a foreign articulation of the organs of speech and a different auditory conception of the vowel sounds. In developing a better habit of speech in these foreigners, we must always bear in mind sound production and tone variation.

From careful study, I have divided foreign accent into three classes:

- (1) The giving of improper or false value to our vowels, for example, "Harry" pronounced as though it were spelled "Hairy," "Morris" as "Mawrus," "out" as "aout," "peach" as "pitch," and "apple" as "epple";
- (2) Placing stress on the wrong syllable, as "cha rac' ter" instead of "char' ac ter," "car pen' ter" for "car' pen ter" and "tea cher'" for "teach' er";
- (3) The rising inflection at the end of every phrase and sentence. These various forms of foreign accent are corrected by developing a proper production of the vowel sounds, by a study of the phonic elements, and by a rehabilitation of pitch. I have prepared a syllabus upon the subject which is now used in our public schools and may be obtained upon application.

TEACHING THE DEAF CHILD

MABEL ELLERY ADAMS, PRINCIPAL, HORACE MANN SCHOOL FOR THE DEAF,
BOSTON, MASSACHUSETTS

There used to be problems in Symbolic Logic long ago in college in which one field would contain all A's and another all B's, and where the fields overlapped we said that within that overlapping space all A's were B's and all B's were A's. Now I conceive that in our particular discussion this afternoon the A's represent the otologists' problem consisting of the scientific treatment of deafness, and the B's represent the teachers' problem of adapting the processes of teaching to the mind of the deaf child so as to make it as nearly normal as possible. The common ground where all A's are B's and all B's are A's is the overlapping space where the otologists and the teachers meet in mutual helpfulness making a concerted effort to insure the proper placing of deaf children where they will have the best chance of an education. This concerted effort must include the education of public opinion, especially the opinion of parents and teachers and school

boards, so that they may become aware of the needs now so little understood outside the clinics and the schools for the deaf.

Of the otologists' problem I shall say nothing, both because my knowledge is of necessity empirical, and also because Dr. Cahill is here on purpose to discuss that side of the question.

My subject, then, narrows itself down within the limits of that part of the field where doctors and nurses and social workers on the one side and the educators of the deaf on the other must meet and exert their best powers to secure adequate service for the deaf child.

Let me pause for some limiting definitions. For the present purpose I use the adjective "deaf" as a general term to connote any degree of deafness, ranging from total down to the smallest amount liable to attract the attention of parents and teachers. Presently I shall use the term "totally deaf" and I wish this phrase to stand in your minds for "practically totally deaf," that is to say, too deaf to understand any spoken language. Then I shall use "hard-of-hearing" to denote the whole long range between practically total deafness and perfect hearing. I shall studiously avoid any use of technical terms from either your vocabulary or mine. I have a rooted belief that half the misunderstandings which arise between professional folk and the laity are occasioned by mysteries attached to professional lingo and that for most occasions in life it is quite possible to say everything in plain English if one is willing to take the time and the trouble.

I take for granted that the medical gentlemen here present are well content to leave to educators of the deaf the specific problem of so organizing and administering the education as to get the best results according to our different lights; and our lights are different, there is no use in denying it.

The eastern part of the country stands pretty solidly for oral teaching of the deaf and the western and southern States—in their State institutions at least—are pretty apt to hold to the Combined System which includes conventional signs and the manual alphabet with more or less of an admixture of oralism.

Then there is much difference of opinion as to the relative advantages of teaching the deaf in boarding institutions or in day schools. This question in the past has been most potent in provoking controversy.

But neither oralism, manualism, boarding institution, or day-school shall receive aid or comfort from me today, because of the character of my audience. You are here from all parts of our country. I dare say some of you at this very minute are thinking how flat and Bostonese my speech is and wondering how we can stand it to hear ourselves talk. Being from all parts of the country you naturally must solve your problem under existing conditions in your home-school systems, and argument as to how much better some other kind of school might be is quite valueless.

Granted, then, that you are working in a community which recognizes that deaf children have special school needs and stands ready to make suitable provision for them, what types of children should you, school physicians

and school nurses, turn over to the teachers of the deaf, and what types should you try to retain in the ordinary classes?

There is one type about which there can be no question, that is the totally deaf: the children who by reason of deafness, congenital or acquired in infancy, have never learned to talk. These are the so-called "deaf-mutes" or "deaf and dumb" children. The deafness may be total or there may be some perception of sound, but if a deaf child is apparently bright and has not learned to talk, that child belongs in a school for the deaf. He is dumb because he has never heard the speech of his kind, and for no other reason. All of us were born dumb. Spoken language is an acquired art, and those of us who have heard from birth acquired it gradually and naturally from the speaking world about us through our hearing, and have never realized that we did acquire it. We have always considered that we were born with speech, but we were not; we were only born with the speech apparatus and the inherited tendency to speak. The deaf child comes into the world with a normal speech equipment, but the correlative ability to hear is lacking; therefore he remains *dumb* instead of beginning to grow out of his dumbness while still a baby, that is to say, beginning to learn to talk. It would seem as though there could be no doubt whatever that such children, dumb because they have never heard spoken language to imitate, should be sent to a school for the deaf, and of course a majority of them are so sent; but many individual cases escape attention every year, and you will find typical deaf children scattered about in every school system sitting drearily through the session, doing a little writing and drawing, and sinking into an apathy closely resembling low-grade feeble-mindedness. The school nurses here in Boston under Miss Helen F. McCaffrey, supervising nurse, have recently conducted a campaign to round up all such cases. They actually found several in grades from the first to the third and applied themselves to the task of inducing the parents to send them to the school for the deaf. The nurses encountered opposition from the parents on two main grounds. The mother either refused to believe that the child was "deaf and dumb" because he heard certain sounds, or she was pinning her faith to the fact that some doctor had told her that the child would hear better when he was older. Often the removal of tonsils and adenoids had been recommended as a general health measure and a possible chance to improve the hearing and the mother was looking forward to some vague time in the future when an operation would bring back the hearing. Without venturing too far into the territory of the otologist, may I say right here that in over thirty years' experience in one school for the deaf I have never known the hearing of any one of its pupils to be sufficiently restored by any operation to warrant his being placed in a hearing school. This of course is probably because hopeful cases are ordinarily kept in the public schools during treatment and never reach us at all, anyway.

Congenitally deaf children have no language, no medium of thought, nothing but a few natural signs which they have built up for communica-

tion with their world. It is for the school to give them language by whatever method the authorities designate, and utilizing this language as they learn it, to teach the subject matter of the curriculum as far as it is practicable.

For the sake of getting on let us agree that the totally deaf, born so or become so in early childhood must go to a school for the deaf and that the otologist's clear duty is to direct the parent to the nearest school, taking care that some sympathetic kindly expression of his cannot be wrested into an excuse for waiting and putting off the day.

We have had apparently intelligent parents bring children of fourteen and fifteen to us utterly ignorant, needing to begin at the beginning, and the only excuse the assertion that the doctor said his hearing would probably come to him when he began to develop.

We now come to another type, about which there should be no doubt—the children suddenly deafened by accident or disease. These unspeakably pathetic cases should be hurried into school just as quickly as their health permits. The shock of sudden deafness is so terrible, the great silence that settles down is so oppressive, and the inconvenience and annoyance of not understanding what is said is so nerve-racking that no time should be lost in opening up the new method of communication by lip-reading, and surrounding the child with companions who regard the difficulties of his situation as quite commonplace and so unconsciously smooth his path for him. Lip-reading usually comes easily and quickly to these children. A good school makes provision to give just as much individual intensive teaching as the pupil's physical condition will allow, and in three months a working knowledge can often be acquired. Early placing in school also helps to keep voice and speech natural. In old times children who lost their hearing after learning to talk were often allowed to forget their speech and to lapse into dumbness, or if they kept their speech it usually became thick and somewhat unintelligible. Modern methods however are lessening these consequences every year. Again the otologist's duty seems to be clear for these cases, and he seems to have no choice but to recommend a school for the deaf and to use all his powers of persuasion to quicken the action of the dazed and sometimes reluctant parents. It is fair to presume that every doctor and every nurse in this room would refer children of the two types just discussed to the nearest school for the deaf tactfully, sympathetically, but promptly.

We come now to the hard-of-hearing, where there is ground for a difference of opinion. Doctors and teachers are not agreed upon the proper place for the hard-of-hearing. We will, if you please, leave out of account for the present the slightly hard-of-hearing, and direct our attention to those hard-of-hearing children who cannot make proper progress in an ordinary school. Let us begin with those having the least hearing. There are children who have enough hearing to learn to talk imperfectly. They get the principal words of a sentence, usually the nouns and verb-roots and adjectives, but they leave out connectives, prepositions, and inflections—in

short, they learn to talk baby-talk in a way that seems fairly normal. They hear pretty well at short range, and in homes where they are given great care they sometimes go on to almost normal speech. But where this care cannot be given their speech remains baby-talk. If they are bright, and are quick learners they sometimes get through the first two or three grades if they are given front seats, mastering the greater part of the subject matter and giving the impression that they are simply defective speech cases. They *are* defective speech cases, but their speech is defective because they do not hear the obscure sounds, the prefixes and suffixes and parts of the verb which we Americans slur over and indicate by a half-spoken syllable. If these cases go to the defective speech classes the teachers recognize and undertake to cure the specific defects, and having the children at close range they make some progress; but the trouble is too fundamental for mere speech correction to be effective. The mental aspect must be considered. Their whole mental life is blurred and hazy and defective, just as their speech is. The baby talk the child uses is probably a fair reflection of what he really hears and no correction of defective elements of speech is going to help him permanently unless his whole education is so arranged as to enable him to understand what is said to him and to give him constant practice in the use of correct English. An hour or two a week spent in improving his speech obviously cannot produce the desired effect. Not only must he have attention to his English but every subject of the curriculum—arithmetic, geography, or history—must be presented to him with a thoroughness and care for detail entirely unnecessary for children with perfect hearing. The speech-defect teacher soon discovers this, and in conference with the nurse proposes a school for the deaf where lip-reading and individual teaching will help out the faulty hearing; but the moment the question is mooted to the mother that lady is up in arms because she doesn't want her child to go to a "dummy school." She takes the child to the nearest clinic and upon the advice she receives there will depend the child's fate. If the doctor or the social worker happen to be of those who believe that lip-reading hurts the hearing, the mother may be advised to keep the child on in the regular school where he will fall farther behind year by year, spending two years in a grade, pushed up because he is over-age, struggling along until he is sixteen when the law allows him to go to work.

Without going into the psychology of the subject we all know that early childhood is the time to learn speech and language and that habits acquired then, whether good or bad, are pretty likely to stick. Now if you have a child so hard-of-hearing that it has not learned to use its mother-tongue like a normal six-year-old when it is six years of age, it should be put where it can learn as quickly as possible. I have the greatest sympathy with the mother who doesn't like the sound of deaf voices, but she can be told that if her child cannot hear well enough to learn to talk the deaf voices won't trouble *him*. I sympathize with her fear that he will learn to make signs, but if she is a Jewish or Italian mother or has French blood in her, as I

have, she often makes more gestures than our totally deaf older children, and if she never allows any gestures at home the danger is not great at least in a day school. But with her fear that the child's hearing will deteriorate if he learns lip-reading I have no sympathy whatever, because it has no foundation in fact. Lip-reading never hurt anybody's hearing and never will. The hard-of-hearing themselves who have achieved any degree of success in the art will tell you that it improves the hearing. Whether or not it can do that it certainly renders them more comfortable by relieving the misery of nervous tension which constant strain to hear engenders. I put the question to a convention of hard-of-hearing persons here in Boston last year, asking if they knew of any one who had ever suffered diminution of hearing as a consequence of learning to read the lips. I made sure that everyone understood the question, and there was not one affirmative answer!

On this subject of lip-reading being an injury to existing ability to hear, then, doctors and nurses ought so to inform themselves as to be able to assure anxious mothers that the danger does not exist. Besides, in any progressive school for the deaf daily lessons in the utilization and education of the hearing are given to those children who need it, so that the hard-of-hearing child's hearing will be much better cared for in the school than anywhere else. Miss Henderson is going to show you how she does it.

There are many hard-of-hearing children who have normal speech and whose education could proceed under normal teaching if they could only hear what was being said. Such children are usually given a front seat and so are able to hear what the teacher says; but they lose all that is said by their classmates and consequently fail to grasp what follows and so drift along with only half-knowledge from day to day. When we remember that modern pedagogy measures the success of a teacher by what she doesn't say, but leads the children to say, it becomes clear that the hard-of-hearing child down front stands a pretty poor show in the rapid give-and-take of an ordinary recitation.

Here again I have the greatest sympathy for the mother who does not want to take her perfectly normal appearing child from its normal surroundings and send it to a school for the deaf, and she ought not to be obliged to do it. But the child needs more attention than it can get in a hearing class and is actually better off in a school for the deaf than in a school for the hearing. An ideal solution of the problem under city conditions would be the establishment of a graded elementary school for the hard-of-hearing where the pupils could proceed from grade to grade in the usual way but where the classes would be small enough to put every pupil within hearing range of every other one, and skilful instruction in lip-reading would supplement the other teaching. A few such schools have been established in Europe and we ought to have them here. But in the country or small-town school-systems such a school for the hard-of-hearing probably would not be practicable as there would not be enough pupils to allow proper grading, and any plan which extracts the hard-of-hearing from

the grades and simply dumps them in small ungraded classes is most undesirable. As between two admittedly imperfect courses then, that is, keeping hard-of-hearing children where they are losing a good portion of the instruction or putting them into a school for the deaf it is natural that I should consider the school for the deaf the lesser evil, especially as such children are usually very happy with us; but a separate provision would be a much superior plan.

There remains for consideration one more type—the slightly hard-of-hearing who can get on fairly well in an ordinary school, but need lip-reading not only for present needs but for a future when their deafness may increase. These children should attend special classes in lip-reading and every community ought to furnish them with an opportunity. Our own Massachusetts city of Lynn was a pioneer in this work, and Boston has maintained such a class for two years.

All children who cannot hear any speech must go to a school for the deaf, and I believe that all children too hard-of-hearing to learn to talk naturally ought to. The lesser degrees of deafness must have special teaching somewhere. It is for doctors and nurses and social workers to see to it that the deaf children of our country get what they need, and my last word to you is: If any one tells you that lip-reading will injure the hearing, don't you believe it for it isn't so!

We should have been glad to have invited you all to the Horace Mann School for the Deaf to see the work as it is carried on there, but the rooms are so small we could not accommodate you. So we have brought to you here that part of our course of study which we thought would interest you most, and Miss Jennie M. Henderson, the assistant principal, will demonstrate it to you.

It has been a great privilege and a great pleasure to be allowed to address your department. I thank you for your attention, and if, in consequence of this paper, one deaf or hard-of-hearing child is placed where it belongs in some school system, the effort will have been well worthwhile.

THE AWAKENING OF LATENT HEARING BY MEANS OF MUSICAL SOUNDS AND VIBRATIONS

JENNIE M. HENDERSON, ASSISTANT PRINCIPAL, HORACE MANN SCHOOL
FOR THE DEAF, BOSTON, MASSACHUSETTS

The first period of our school day is divided among three groups of children: (1) Those who need more work in speech; (2) those who need special lessons in lip-reading; and (3) those who will be benefited by auricular training.

In my demonstration this afternoon, I shall attempt to show you what has been accomplished in a class which has been trained to listen. Some of these children have been classified as semi-deaf and others as totally deaf, but all have responded to systematic auditory stimulation. They have

made definite progress which has been encouraging and surprising. I base my whole success in this method upon the awakening of latent hearing by means of musical tones and vibrations.

Stimulation by means of musical instruments is necessarily passive because the child is making no conscious effort to hear. Different instruments are used with the hope that there will be a mental response on the child's part as to pitch, quality, and volume. As soon as the pupil's sense perception is awakened we aim to develop a mental response to a second sound. In this way we build up the child's hearing reaction to many sounds. The class is trained at first to tell the difference in pitch, whether it be high or low or middle, according to the part of the keyboard of the piano which is played.

I have found that the child will respond to a singing tone rather than to a spoken one. Beginning with the elementary vowel sound of ee which is prolonged and sung on the octave above middle d, the children are taught to recognize through the ear oo and ar. The pupils differentiate between these vowel sounds as I sing them interchangeably. When I first began work, I had to stand near the children, but I gradually increased the hearing distance, so that now I can stand a number of feet away from them, and they readily tell me the vowels sung. It is a harder test for the children to distinguish between the diphthongs.

You will see in this demonstration that I shall have to lessen the hearing distance for the spoken vowel, words, and sentences.

These children have become acquainted with a great many popular airs. They have been trained to feel the vibration, and to listen. At first, because I firmly believed that the singing voice would carry better than the spoken word, I myself, sang to them. Then I conceived the idea that I wanted them to take a more active part in the lesson. Accordingly I asked them all to try to sing with me. They were able to keep the time and rhythm because we had done a great deal of this work in our speech lessons. This seemed to stimulate the auditory mechanism to an increased degree.

When they had learned two songs I began to help the children to differentiate between them. We have added to our list of songs as you may readily see. At first it was necessary for me to sing the songs through, but the children now respond after I have sung a few measures.

Please remember that the children are not being trained to sing. All this work is given for the reaction it will have upon their hearing, making for better speech. It is done with the hope that they may go out into the world as hard-of-hearing pupils rather than deaf. They will undoubtedly approach nearer the type of the normal child.

A younger group of children are being trained along similar lines. Instead of community songs, they are becoming familiar with the Mother Goose songs. All the pupils have been stimulated by the music of the victrola. Many can tell whether they hear an orchestra or a band, or whether a song is sung by a man or a woman.

We use the Montessori Bells in testing for distance. The children tell whether the bells struck by the teacher are the "same" or "not the same." They are trained to match the tones and to note the relation one bell bears to another in pitch whether high or low. Some of the pupils can build up the scale with the bells. This is difficult and requires a keen sense of pitch.

The class has constant drill in recognizing vowels, syllables, words, phrases, and sentences. Some of the children have progressed so that they can understand a story spoken into the ear. One child who is here today thoroughly enjoys taking part in a little play. Her enjoyment is manifest by the inflection which she puts into her reading.

A teacher who works with children in this way must be optimistic and enthusiastic. She must never lose hope that time spent in auricular work will eventually give results.

THE IMPORTANCE OF SUBJECT CONTENT IN HEALTH EDUCATION

C. E. A. WINSLOW, PROFESSOR OF PUBLIC HEALTH, YALE SCHOOL OF MEDICINE, NEW HAVEN, CONNECTICUT

We progress in all human undertakings by oscillations between one extreme and the other, a principle which is admirably illustrated in the history of the teaching of hygiene. Ten years ago, where such teaching existed at all, it involved chiefly the memorizing of the names of the bones of the human body and similar mental gymnastics. Today we are in the flood of a wholesome reaction against the teaching of unimportant and disconnected anatomical facts. The motive of the time is habit formation, and largely through the stimulus of the Child Health Organization of America we have developed a whole host of devices for making health education vital and compelling. Conduct, as Matthew Arnold said, is three fourths of life; and the object of education is to modify conduct. The basis of our present attack is the height and weight chart with its direct appeal to the competitive instinct and grouped about this fundamental device we have a whole technique of health stories, health poems, health plays, health clowns, and health fairies to aid in seizing the imagination of the child and enlisting his interest in the new movement.

All this is admirable, but I suspect that we shall soon face a real danger of swinging the pendulum too far. Habit formation should no doubt be our first aim, but it is by no means our only aim. We must also lay a sound basis of knowledge if the child is to be something more than an automaton, if it is not only to learn certain tricks but it also to acquire intelligence which will enable it to modify its habits to meet the changing conditions of its after life. With every year health problems loom larger in our community life and if the citizen is to deal competently with such problems he must know something more than that he was taught in school to brush his hair in the morning, to operate the tooth brush with a rotary

motion, to eat carrots, and drink milk. It would seem unnecessary to emphasize the fact that a little fundamental knowledge may properly enter into health instruction if the very word "physiology" had not become taboo to the ultra-progressive educator. There is of course no necessary antagonism between the two viewpoints. We used to teach the structure and function of the body without applying our knowledge. Now that we have learned the importance of application shall we forget our knowledge and apply any chance hygienic fad that happens to dominate the passing moment? I believe we may advance as a fundamental postulate that a program of school hygiene should include not merely the formation of health habits immediately necessary to the child, but also the acquisition of a certain basic body of knowledge which will be necessary for the continuance of healthy living in the future. In the words of the committee on a school health program of the American Public Health Association: "The goals of health instruction are to establish health habits, to give the child the practical knowledge in the principles of healthful living, to develop health ideals, to arouse a sense of individual responsibility for the health of the community, and community responsibility for the health of the individual."

In the second place it seems clear that the inculcation of a necessary knowledge of the fundamental principles of healthy living requires a certain amount of systematic instruction in a classroom. I know that many members of this audience will rise up at once and tell me that the most effective teaching of hygiene is being accomplished today in certain schools where no textbooks are used and no formal period set aside for the study of this subject. Hygiene permeates the whole school curriculum as an intangible but ever-present influence, so that as a speaker remarked at the Lake Mohonk conference last week, "It is not a question of the place of health education in the curriculum, but of the place of the curriculum in health education." I acknowledge the fact that brilliantly successful health education is being accomplished in this way, but I deny that it is a fact upon which we may safely base general deductions. Professor Thorndike once remarked to me that all educational experiments succeed and it is perfectly obvious that in a dozen school systems in the United States geniuses have arisen who are accomplishing marvelous results by extra-curricular inspirational methods. I submit, however, that it is absolutely out of the question to expect that any large proportion of the vast numbers of teachers in the public schools of the United States can ever be transformed into inspired missionaries of health; nor can they be expected to become automatically equipped with the basic knowledge without which inspirational project teaching becomes a form of expert salesmanship, with no goods to sell. The Rules of the Game form an excellent peg on which to hang health teaching, but if they comprise the whole knowledge of physiology possessed by the teacher herself the ultimate results will not prove of high value. The average teacher in the average school will never achieve real results in health education except where there are hours set apart for the

subject, and until she is graded and promoted by her work in hygiene as in other subjects and until she is trained in hygiene in a normal school as she is trained in arithmetic or English grammar today. I would not give up one whit of what has been accomplished in emphasis on habit formation and in the development of extra-curricular methods of appealing to the imagination and the will of the child but in the long run such appeals will only have their maximum effect if they are correlated with definite classroom instruction in the biological principles which underlie the sound conduct of the individual life.

The exact stage of school life at which such classroom instruction should begin is still to some extent a debatable problem. Of fifteen States whose hygiene programs happen to be accessible to me as I write, seven provide for the use of textbooks in the fourth grade, four in the fifth grade, three in the sixth grade, and one in the eighth grade. The committee on school programs of the American Public Health association believes that "in the kindergarten and lower four grades, the chief effort should be to develop health habits mainly by inspections and special devices. In subsequent grades systematic instruction should attempt to crystallize and fix the health habits which have been taught heretofore, and to provide the pupil with necessary information concerning the physical basis for healthful living, principles of bacteriological cleanliness, and the sanitation of the community."

In the first three grades, and perhaps in the fourth grade, primary emphasis should be placed on habit formation but always with the accompaniment of sufficient information to make the reasons for the habit as clear as the child's age will allow. In the fourth or fifth grade there should be a change to a more fundamental biological emphasis. Subject content should still be closely correlated with habit formation but the habits should no longer be approached as isolated rules of conduct but as applications of a broad conception of the structure and functions of the living body. On this assumption I should like to outline what seem to me as a biologist a few of the broad and fundamental elements of knowledge which such instruction should inculcate.

First of all, and most important, is the basic conception of the body as a living machine, working in accordance with physical and chemical laws, and working as a coördinating whole with the health of each part depending on the normal functioning of the rest. It is essential that this conception should be grasped, not as a form of words, but as a solid and vital basis of all the student's thinking about health. If such a view were really held as a basic conviction by our adult citizenry it is probable that four fifths of the delusions and superstitions and quackeries that weigh upon the human race would vanish like a dream. The development of this fundamental viewpoint depends of course on other types of instruction than that given in hygiene. It is rooted and grounded in a knowledge of general biology. As President R. L. Wilbur, of Stanford University, wrote me a few weeks ago in connection with the program of this conference: "I

feel that there should be particular emphasis laid upon biological work—nature study, zoölogy, botany, and the like—as a basis for thinking in terms of life. Otherwise hygiene is too apt to be a series of more or less true so called ‘precepts.’ My feeling is that sound and universal training in biology for our college population would soon give us the teachers to handle hygiene in the schools and a proportion of citizens with an appreciation of hygiene in ordinary life. The teachers need to think biologically more than to put over rules.”

If we could really inculcate this conception of the living machine with all that it implies I should be almost satisfied with the accomplishment of the course in hygiene. It is impossible however to teach this general lesson—except as a form of words—without a sufficiently detailed exposition of physiology to make its meaning a vital element in intellectual experience; and there are a number of subordinate principles in the working of the living machine of sufficient moment to make their inclusion in our course essential to its adequacy. Among such I would call particular attention to the following, always remembering in the words of the outline recently issued by the Pennsylvania Department of Education that “only so much formal information should be given as will render possible good health in the parts described.”

(1) It is not important to know the number and the names of all the bones, but it is essential to know something of the structure and inter-relations of the parts of the bony system and to understand the structure and the general arrangement of the muscles if the child is to have an intelligent grasp of what is involved in correct posture, if it is to comprehend the real value of exercise and if in future life it is to respond intelligently to the professional advice of the orthopedist.

(2) A knowledge of the mechanics and the chemistry of digestion is vital to the continued maintenance of sound elementary habits and only a real knowledge of the elements of nutrition will make possible a judicious appraisalment of the dietary fads and fancies with which the citizen of the future is likely to be confronted in increasing degree. Under the general heading of the digestive system we may also mention the importance of some conception of the structure of the teeth and of the processes of dental disease which will facilitate a future utilization of the resources of dental hygiene.

(3) A clear comprehension of the physics of the circulation is basically important for any conception of the effects of the atmospheric envelope upon the body and for a rational control of the effects of this atmospheric envelope through ventilation and clothing.

(4) A knowledge of the ways in which wastes are eliminated from the body is fundamental in avoiding constipation and in maintaining the kidneys in a healthy condition. Here, as in circulation, it is through a real knowledge of the machinery involved that the individual will be disposed to take the fullest advantage of medical counsel bearing on the postponement of the degenerative diseases of later life.

(5) A vital conception of the structure of the nervous system furnishes the only sound basis for intelligent mental hygiene, for habit formation, rather than the learning of tricks like a pet dog, and for the adjustment of work and rest so as to insure a maximum of productive performance. The practical hygiene of the eye and ear requires an intelligent comprehension of the structure of these complex but frequently defective appendages of the central nervous system.

(6) Finally, under this general head of Physiology the pupil should be given an elementary view of the cyclical changes in the human body, of the ways in which developmental and degenerative diseases arise and of the possibilities of medical science as applied to the early detection and hygienic treatment of incipient disease.

In addition to these points which appear to me to constitute the most essential elements in a sound knowledge of Physiology, proper, the pupil should also be equipped with an equally basic comprehension of those fundamental relations between man and his microbic and other enemies which underlie the control of the environmental diseases. In this field again there are a half dozen outstanding points which deserve special mention.

(1) The expansion of everyday conceptions of cleanness, to include the vitally important sorts of cleanness can only be acquired through knowledge of the principles of bacteriology, best by actual demonstrations of cultures which the student can see and handle. Much of the inspirational health teaching of the present day shows that even the would-be teacher of hygiene has quite failed to grasp the essential distinction between dirt which is dangerous and dirt which is merely unsightly.

(2) In the second place the distinction between the harmful and the harmless bacteria should be made clear, with the fact that the dangerous types have their origin only in the human and animal body, so that a vague fear of dirt and disease in the abstract may be replaced by an intelligent sanitary conscience which will facilitate the isolation of disease in its early stages.

(3) Thirdly, the pupil should be given a conception of the way in which disease germs are transferred from one person to another by water and other articles of food and particularly by insects; and of the methods of preventing such transfer by measures of public sanitation. The control of the fly nuisance offers a peculiarly valuable direct contact with personal experience in this field.

(4) Next in importance is a comprehension of the nature of the struggle between the invading microbe and the human host with an intelligent grasp of the principles of vaccine and serum therapy, which promise to play an ever-increasing rôle in the control of communicable disease. With instruction of this sort the obstructive efforts of the anti-vaccinationist would lose their power and smallpox, typhoid, and diphtheria could be brought under complete control.

(5) In the higher grades the principles involved in the control of tuberculosis and infant mortality should find a place. In these and other fields an intelligent coöperation of the citizen is vital to success and that coöperation can only be secured in a community where the elementary principles involved are understood.

(6) If the citizen is to play his part in the broader community struggle against preventable disease he should understand something of the main objectives and the general activities of the health departments of city, State, and Nation. The health officer who operates in a community where any substantial proportion of the citizens have received a basic instruction of this kind would be able to accomplish results in the saving of lives of which we have scarcely dreamed in the philosophy of the past.

(7) Finally, we should recognize a growing and a very sound tendency to introduce into the school curriculum well planned instruction in regard to safety in the street and in the home. One half of the victims of automobile accidents are children, of whom over 500 are killed and 12,000 injured in New York City every year. The schools of St. Louis reduced fatal accidents of school children by more than 60 per cent through intensive safety teaching. The Safety Institute of America is planning to furnish next year a special information service for the teachers of New York City along this line.

Without the acquisition of such broad elements of knowledge as those outlined above, our scheme of health education will fall short of the attainment of its highest possibilities. Let us continue to emphasize the acquisition of health habits as the primary aim of such education, but let us base these habits and their modification in the coming years upon a sound knowledge of the underlying principles of physiology and hygiene. Let us utilize all the resources of correlation and extra-curricular inspirational technique, but let us provide also for such systematic classroom instruction as can alone insure for hygiene its definite and permanent place in our educational system.

PHYSICAL FITNESS FOR SCHOOL ADMISSION

C. N. JENSEN, STATE SUPERINTENDENT PUBLIC INSTRUCTION; E. G. GOWANS,
STATE DIRECTOR OF HEALTH, SALT LAKE CITY, UTAH

In Utah we have the same situation as elsewhere in the Nation—our educational program is in advance of our financial support. The past year we have been trying to hold on to what we have so far achieved, and it appears as if this procedure will absorb a good part of our interest and effort during the twelve months ahead of us. Our legislative program therefore will be mostly concerned with correcting minor defects in our present school laws.

Since this situation began to prevail, we have busied ourselves in advancing our educational program through such avenues as would call for no special legislation. This has been particularly true with our health work

and Americanization problem. Our efforts have resulted in the creation of a situation that will, we hope, in the near future, make it possible to enforce by law some of the things we are now doing without this valuable asset.

Our health program in Utah is enlarging itself to include children below school age as well as those who are already in school. You are familiar, we presume, with our activity among the school age group, so we shall add nothing at this time to this phase of our school work.

It is a sad reflection when we think of the great waste and injustice in this land, resulting from negligence and misdirected effort in the teaching of hygiene. Particularly is this true in teaching formation of health habits and the care of the pre-school child. We are firmly convinced that whatever is done by the educational system of our State in the interest of the physical welfare of children must take into consideration the pre-school age group. It is not doing justice nor is it fair play to take children from their homes at the age of six to enter upon the new phase of life incident to their entrance into the school. We feel we have not attached as much importance to this event in the life of the child as we should. As a matter of fact and ordinary observation, it is an important epoch of life. Prior to school entrance children quite generally enjoy great freedom in the home and the street. They are accustomed to a life in the open air and sunshine, coming and going largely as they please.

Now at school entrance we take them out of this environment of almost perfect freedom and subject them to the restraint of the ordinary school-room. They are subjected to a new set of stimuli. New inhibitions and forms of response are imposed upon them. This new experience with its physical restraints and its training in voluntary attention makes of the first years of school life a period of danger and difficulty.

The studies and observations of a number of careful workers have made clear to us that many children are admitted to school before they are fully fit to endure the trying experiences of beginning school life. The evidence of their unfitness consists in failure of promotion, repeating of grades of school work, physical breakdown, and the development of certain mental disorders. Dr. Burnham has so wisely said: "Our present haphazard method of taking in (to school) the sick and the well, the developed and the undeveloped, the normal and the feeble-minded, the defective and the sound, and of teaching them together at the outset is wasteful and absurd." And not only that; it is unfair to all types of children themselves. Dr. Burnham further says that "One of the reasons for retardation is the fact that children enter school prematurely or in such imperfect physical or mental condition that they cannot do the work of the school. Failure occurs from the first, and the pupil, handicapped both physically and mentally, is turned back at the close of the year to repeat the same dreary routine. The place to begin the prevention of retardation is at the entrance of school life."

Our law in Utah says that children may enter school at the age of six

years, and many parents have come to feel that if they do not get their children into school at that time they are in some way being cheated out of their lawful rights. If parents could come to understand that the successful doing of school work depends upon a number of other very vital things as well as upon chronological age it would be a good thing.

The past year, we have tried to point out as concretely and definitely as possible what is meant by fitness to enter upon school life in order that parents, mothers particularly, might know just what they should aim at in their work for the physical welfare of their pre-school children. Not far in the future, we hope to pass a law requiring of all children before they are permitted to begin school work to pass a carefully prepared physical and medical examination to find out whether or not they are fitted to undertake the new life.

The information we have sent broadcast throughout our State contains a statement of standards. The standards are not the result of our own work. We have taken the liberty of appropriating from such authorities as Dr. Burnham and those of the Children's Bureau at Washington, D. C. In our appropriation of this material, we have tried to be fair and give proper recognition to those from whom we use material. Very briefly stated, the standards we are encouraging the parents to adopt are: (1) The child should be six years old or over before entering school; (2) Should measure not less than 43 inches high; (3) Should weigh not less than 40 pounds; (4) Should not measure less than 21 inches around the chest; and (5) Should possess all four of the six-year molar teeth.

In passing, let us say that we try to impress upon parents the idea that standards are not to be followed blindly but that they are simply indices of the normal and desirable.

It is not sufficient to give a simple statement of standards, so we have consistently attempted to educate parents to the value, both to themselves and others, of what a knowledge derived from these examinations gives. The reasons for these examinations have been so well stated by the authorities mentioned that our State Health Directory has copied them verbatim. They are:

1. To prevent those children who are in ill health or not sufficiently developed physically and mentally from entering.
2. To provide the necessary data to enable teachers so to order the school work that it will not result in injury to health or check to development, as often happens in the first year of school life.
3. That proper grading and adaptation of school occupations to individual capacity may begin at the outset of school life.
4. To give school physicians the data necessary for safeguarding the health of children against contagious diseases and the like.
5. To give teachers proper knowledge of the new pupils and the right attitude toward them.
6. That children may begin and be saved from unnecessary failure and retardation or elimination in later grades.

7. To educate parents and foster a right attitude toward the school.
8. To save the money of taxpayers, now largely wasted, and so badly needed to provide for absolutely essential hygienic conditions."

We have encouraged parents to keep from school those children who fall under the following groups:

1. Children who have an infectious disease.
2. Children who have rickets, or the after-effects of rickets to the extent that they are in poor physical condition and liable to develop neurosis or some other defect from the influence of school work.
3. All children who have tuberculosis, unless there are outdoor schools in which they can be placed.
4. Children who are in a serious condition of anemia, unless again there are outdoor schools in which they can be placed.
5. Those who have any chronic disease which is liable to be aggravated by school attendance or would interfere with school work.
6. Those who are in a retarded state of physiologic development or mental development, where this would be improved probably by keeping them out of school, and where injury would be done by admission to school, or where it would interfere with school work.
7. Those who have serious sense defects.
8. Those who have any neuroses or the like which would be physically contagious, epilepsy, chorea, stuttering, and the like.
9. Children who have not been vaccinated.

While this information, together with much other material, has been put over in our State, you are probably anxious to know just how it has been done and what are the results. An effort was made in one of the forty school districts of Utah to organize a procedure that would not only secure some reliable data but would also make a demonstration of what could be done at reasonable expense.

The work was undertaken in the Jordan School District and in the Training School in connection with the School of Education at the State University.

The examining staff in the former case consisted of the superintendent of schools as psychologist, a worker from the State Department who happens to be a specialist in the field of eye, ear, nose, and throat, a nutrition specialist who volunteered his services for the experiment, the supervising nurse, and two assistant school nurses.

The examination given was extensive and accurate enough to entitle it to be called an expert examination, and with such an examination as a beginning the second examinations to be given annually or biennially thereafter might well be of the type that can be given by the teacher and a trained nurse.

This year we expect the same work to be carried on in other districts and continued in the present one.

We have made children of pre-school age the topic for discussion and study the past year in our Parent-Teachers Association. This association

is organized very similar to our educational system. State officers are elected yearly. They have general supervision of the forty school districts. Each school district has a set of supervising officers who work conjointly with the district school superintendent. They give general supervision to the local association. Thus, a local association will be working on local problems and at the same time, all local associations will be devoting part of their time to a State-wide general problem. Such organization makes it comparatively easy for the State to concentrate on problems of general interest.

We are disposed to feel that this year our efforts have yielded better results than we anticipated. Our greatest drawback has been that we have not had sufficient lecturers on dietetics and technical hygiene problems to cover the field as we would have wished. The University of Utah, the Utah Agricultural College, and physicians have come to our rescue and contributed much to make the plan a success.

We are happy over this beginning and we trust it shall finally end in each child on school entrance being physically fit.

THE RESPONSIBILITY OF PUBLIC SCHOOLS IN HEALTH SUPERVISION

CHARLES H. KEENE, M. D., DIRECTOR OF BUREAU OF HEALTH EDUCATION,
DEPARTMENT OF PUBLIC INSTRUCTION, HARRISBURG, PENNSYLVANIA

It is only recently that any considerable proportion of the schools of America have made real effort to carry out the Spencerian ideal of education. His definition, that "Education is training for complete living," has been a pretty thing to talk about, but there has been little real progress toward building up a child who was properly equipped for complete living. Too many educators have felt, and practiced, that the function of the school was merely to pour information into the little machines sent them by fond parents. Only within a very short time has it begun to sink into the consciousness of most of those engaged in public-school education that it was of little value to pour information into children unless at the same time there went on a steady building up of the health and physical side.

Today progressive educators believe, and many of them carry into their practice, the idea that it is not information which counts for success and happiness, not even knowledge, but doing. This is particularly apparent in the strenuous efforts made in many communities, and in some States, to get a type of physiology teaching which shall result not so much in information as in action. At the present time almost the whole effort in that particular phase of education is to build up proper habits in regard to health matters; in other words, we are changing this school subject from a dry, little-interesting, extraneous thing into a living, throbbing part of the daily life of the child.

The real function of the school, then, is training for complete living.

In other words, we need a training for citizenship which shall make children not only informed, but well and strong, physically as well as mentally, so that these growing boys and girls, possessing real citizenship, may become the bulwark of our civilization.

In health matters the duty of the school is three-fold—protection, correction, prevention—protection from acute and chronic infectious diseases, from the evils of poorly planned, poorly constructed, and poorly administered school buildings, and from the menace of the poorly trained teacher; correction of the defects which have arisen because of poor surroundings in the school, home, and community, lack of information on the part of parents and teachers, and as the sequelæ of acute infections; prevention in the nature of a marked improvement of habits of living, a vigorous up-building of physique through proper physical activities properly taught, through proper content and arrangement of the school program, and through the proper planning, construction, and sanitation of the school plant.

Educators must no longer be satisfied to put forth a program which does not injure pupils, but they must go further and put forth a program which will build up pupils, not only on the mental side, but on the physical. Proper content of school health activities, properly and vigorously carried on, will do this. If it is ever to function properly, this must be the real program of the schools for health. This program must have a definite content, which may be divided roughly into five parts.

First, that thing which most of us were brought up to speak of as physiology, but which we now conceive as a health training and instruction;

Second, that factor which was formerly spoken of as "physical culture," later developed into a more vigorous ideal spoken of as "physical training" and now conceived as a real, vital part of the education of the child—physical education.

Third, the hygienic management of the school program, covering not only the number of hours per day which pupils of different ages should attend school, but going into details regarding the proportion of different kinds of subjects which should be taught and the times of the day at which these may be taught, proper interspersing of these teaching periods with relief drills, and various other physical activities, and including within its content the consideration of the feeding of the child, particularly the noon hot school lunch.

Proper arrangement of the daily program will keep fatigue at a minimum and help to build strong, properly functioning bodies and minds. Roughly, this program would be as follows: Open school at such a time as to permit a proper amount of sleep for young children between one hour after dark in the evening and at least one hour preceding school time. The amount of sleep required at various ages is approximately, as follows: four to seven years, twelve hours; seven to ten years, eleven hours; ten to twelve years, ten hours; twelve to sixteen years, nine hours. This opening time on the average, therefore, should be between 8.30 and 9 A. M. standard time.

Certain times of day lend themselves best to certain types of work. Opening exercises followed by cleanliness and health habit inspection should begin every school day. Things which in themselves act least as a motive for accomplishment should come when the mind is freshest, probably immediately following the opening exercises. Abstract concepts of number such as the usual arithmetic fall in this class. Subjects having human interest, such as geography, history, or civics, should follow. The recess period should be placed at approximately the middle of the session. It should be at least fifteen to twenty minutes in length. Memory work such as spelling and formal grammar should follow a relaxation period such as the morning recess or noon intermission.

The period following the noon intermission is a highly efficient one if pupils have been properly fed. Here should come subjects requiring concentration of little less severity than abstract number work. These may be English composition, history, geography, or drawing. An afternoon as well as a morning recess is essential in all grades below the seventh. Subjects containing large social elements should end the classroom program. These may be art from its appreciation side, music, current events, health discussions, dramatizations, excursions, and the like.

The various activities of physical education should be so spaced as to provide the maximum of relief of fatigue, and for body building. Relaxation periods of from two to five minutes each should be placed between each two study or recitation periods. Windows should be opened and vigorous physical activities given. Recesses, weather permitting, should always be out of doors. The activities at this time should be so organized that every child has desire and opportunity for safe, vigorous play suited to his age and strength.

Hot school lunches should be provided for all pupils if they are unable easily to get home during the noon intermission. All children below the second grade should have opportunity for a lunch of milk or hot chocolate at morning recess. Whenever the financial condition of parents requires it this midmorning lunch should be provided at public expense.

The length of the school day should be graded to suit the age, and mental and physical resistance of the child. The question for boards of education to decide is not, "Can the child get a certain amount of information in a given time," but, "Is the length of the time decided upon within the limits of the child's fatigue resistance?" The process of accustoming a child to the routine and restrictions of the school must be a gradual one. Children of the kindergarten age, under six, should not be permitted to remain in school more than two and one half hours per day. During the first and second grades this time may be raised to not more than four and one half hours per day; in the third and fourth grades to five hours a day; in the fifth and sixth grades to five and one half hours; in the seventh and eighth grades to six hours per day.

Chronological age is not a proper qualification for entering the first grade. Pupils should be admitted only after successfully passing definite physical,

physiological, and psychological tests. In other words, the basis of admission and promotion should be physiological and psychological rather than chronological.

Time allotment, minutes per week, should approximate the following:

Grade	I	II	III	IV	V	VI	VII	VIII	IX	X-XII
Length of school day	1350	1350	1500	1500	1650	1650	1800	1800	1800	1800
Recess	150	150	150	150	150	150	75	75	75	
Physical Education	180	180	180	180	180	180	180	180	180	180
Hygiene and Physiology, (Health teaching)	60	60	60	60	60	60	60	60	60	45
Noon intermission ¹	375	375	375	375	375	375	375	375	375	150 ²

Fourth comes hygiene of the school plant, which includes insistence upon provision of proper facilities for heating, ventilating, air moistening, lighting, arrangement of blackboards, sanitary toilets, proper floor area, playground area and equipment, and proper cleaning methods.

Fifth is that part of the health program which is going through such a rapid development and transformation, particularly as this is seen to be more and more a vital part of the activities of the schools and of the responsibility of school officials. This activity which has evidenced its broadening by its changing name, rising from a primitive medical inspection concerning itself almost entirely with acute infectious diseases, to become a physical examination with some corrective activities, but now broadened into a real health examination and inquiry into all of the health factors surrounding the child, and adding efforts to improve these factors as well as to remove his physical defects, so that it has become what we may best term a real "health supervision."

This health supervision is an essential part of the school program and cannot be carried on successfully without taking into careful consideration its relation to health training and instruction, to physical education, to the hygienic management of the school program, and to the hygiene of the school plant. Insomuch as this interrelation is ignored, health supervision of school children is a failure. It cannot be a field of activity set aside by itself under the direction and control of any board or body outside the Board of Education. To advocate such a procedure shows a definite lack of vision as regards its possibilities in relation to health training and instruction, its responsibilities in physical education, its duties in the hygienic management of the daily school program, and its function in guiding and largely controlling the hygiene of the school plant.

Medical inspection was started abroad many years ago by certain boards of education for, first, the physical inspection and examination of children; second, for the examination of buildings. In the United States it was started by the local board of health in several of the larger cities, examina-

¹ Not included in the specified length of the school day.

² Luncheon.

tions being made by physicians primarily to find, isolate, and quarantine children having acute infectious diseases. It was hoped thereby to check the spread of those diseases. It was soon found that such an effort was pitifully inadequate as a real health measure. Only about four per cent of the pupils even at that time had such infections. At the present time the percentage usually runs less than two per cent per year. The field was gradually broadened to include the physical examination of all the pupils.

It was soon found that even this broadened activity was not fulfilling the need, so that its purpose gradually shifted and the concept became more and more prominent that, while checking contagious diseases was important, and while finding physical defects had a value for propaganda purposes, the finding of these defects had little value to the school or to community and no value to the child unless something was done about it. It became necessary then to add another factor to the personnel—the school nurse. The percentage of correction of physical defects thereafter rapidly doubled and often trebled.

It was then found that there were some communities, and some parts of almost every community, where it was impossible to get corrections because of lack of facilities or poverty of parents, so that it was necessary to add to the machinery different kinds of clinics, those for the care of the teeth, for the care of the eyes, and for the nose, mouth, and throat, being most common.

Even with our best efforts, and with all the above facilities, we find that there are certain groups of children whose physical defects may be corrected only very slowly or not at all. In the former group fall the mal-nourished and the tuberculous. In the latter group the semi-deaf and deaf, the semi-blind and blind, the crippled, and that very large group of mental defectives roughly covered by the terms "epileptic" and the "feeble-minded." It became necessary, therefore, to establish special classes for the care, protection, and education of these groups. These are so intimately woven into the general school machinery and so vitally affect the health and welfare of all the pupils in the schools, that it becomes more and more apparent that it is extremely unwise to have this health supervision carried on by other than school authority. The personnel for this work includes such factors as the regular school physicians and the specialists who work with them, the school nurses, the dentists, the dental hygienists, the teachers of special classes, and the regular classroom teachers, whose activity, properly directed, is becoming more and more a valuable asset in the health of childhood.

The ratio of personnel to the number of children enrolled is a most important factor. There should be approximately one school physician working three hours each school day for each 3500 to 4000 pupils enrolled, counting both the high-school and grade-school pupils. For small communities this works out roughly in the ratio of one hour per school day for each 1000 school pupils. The usually accepted standard for school nurses is one nurse for each 2000 pupils. In small, rural, scattered com-

munities it may be necessary to supply one school nurse for each 1000 pupils. The number of nurses and doctors above given presupposes that the nurse will work with the doctor while he is making the physical examination, keep most of the records, and make certain parts of the physical examination, such as measuring, weighing, testing sight and hearing, and otherwise expediting the work of the physician to the fullest extent. There should be one school dentist giving three hours' time each school day for each 16,000 pupils enrolled. This is presupposing that there are employed dental hygienists in the proportion of one full time dental hygienist for each 4000 pupils enrolled in the lower six grades. The number of pupils per teacher in the special classes varies according to the type of class, being from twenty to thirty pupils for the classes for tuberculosis and for nutrition classes, ten to twelve for deaf and semi-deaf, for the blind and semi-blind, twenty to twenty-five for classes for crippled children, and approximately fifteen for classes for the mentally subnormal.

Properly advised, directed, and coördinated by the superintendent of schools and the board of education all the above make a wonderful team for health. The closer the coördination of the health supervision with the health training and instruction, the physical education, the daily schedule and school sanitation on the one hand, and with the other school activities on the other, the better the results will be. There must be a definite working together of the doctors, nurses, dentists, clinics, special classes, of the special, physical education, and regular classroom teachers and of school time, after-school, and vocational activities if we are to get the worth of the money which is expended for this activity.

There must be a more definite coöperation than we have as yet succeeded in getting, except possibly in some rare instances. Most of the personnel used for health supervision has at times a definite function in health training and instruction, in physical education, in advising on the arrangement of the daily schedule, in supervising and correcting the sanitation of the school plant, in advising and building up the health of the teachers as a whole, and in training and building up community health ideals on the part of parents and public.

This health supervision must be given a definite type of organization. It should work subordinate to some individual who has the responsibility for the whole school health organization. In the smaller communities this may be the superintendent of schools or even the supervising principal. In the larger communities there should be a director of school health, under whom shall work specialists in physical education, in health training, and in instruction including the teaching of nutrition, psychologists, and a supervisor of health supervision. This supervisor must be a physician responsible for planning the work and coördinating the activities of school physicians, school nurses, school dentists, dental hygienists, school clinics, and health phases of the activities of the teachers of special classes, whose work so vitally affects the health and possibilities of the unfortunate group who must either temporarily or throughout their school career occupy such classes.

As to the definite place of control and authority for this work in health supervision, the weight of the argument seems to make certain that the only logical body to control is the board of education.

Those who favor board of health control have only two real arguments, and these are more superficial than fundamental. First, that because the control of contagious diseases is primarily one of the functions of the board of health and because the board of health only has the police power necessary for the enforcement of quarantine, it should have control of this school activity; and second, in order that this health work may be coördinated with the other health agencies of the community. In rebuttal, those arguing for board of education control maintain that whatever the power and authority, the school doctors and nurses in the field have to report contagious diseases to a central office and that oftentimes their diagnosis is confirmed by special investigation before quarantine is enforced, that neither time nor efficiency in the control of contagious disease is lost when these doctors and nurses in the schools are working under school authority, as even then they report communicable disease cases direct to the health department. It is, of course, accepted by all parties that the board of health shall make the necessary rules and regulations in regard to exclusion from school and quarantine. So far as coördination with other health agencies is concerned, school health work, outside of the attempted control of contagious disease, has little in common with the other health agencies of the community or State. The attention of the board of health is largely occupied by inspections of premises and enforcement of city ordinances regarding such factors of health as purity of food and milk supplies, sanitary disposal of refuse and sewage, guarding of water supplies, the correct handling of vital statistics, and numerous other things that *per se* have little direct relation to the activities of public schools.

Control of all school health activities by the board of education, however, seems advisable first, because they can do just as well and as efficiently as the board of health all those things relating directly to the health of the school child while in or about the school. There are strong additional arguments.

In the vast majority of communities the board of education machinery is much better developed than is the board of health machinery. The smaller the community the more this is true, because there is always a functioning board of education no matter how tiny the unit, whereas it is rare to find a board of health that does much in communities below the city class. The attitude of the teachers is necessarily better toward board of education control because the board of education has direct control over them.

Parents are much more coöperative toward the board of education. Their whole experience with the board of health usually has been disagreeable—a compulsion rather than a coöperation. On the other hand parents, throughout the school career of the pupils, are accustomed to dealing with board of education employees and to a large extent coöperating

with them. Under board of education control the whole activity is a leading and aiding, rather than a driving. Because the public has been accustomed for generations to accept various kinds of aid from the board of education, they will accept this additional aid on the health side just as naturally as they accept free paper and pencils and textbooks, and with just as total lack of feeling of charity or obligation. This direct aid coming from the board of health unfortunately often does have the charity taint.

Moreover, health supervision under board of education control can and will go farther in building up physical and mental health than it can possibly go under board of health control. This is due largely to the fundamental concept of the sphere of action of the two bodies, and to the fact that such a large proportion of the proper kind of health supervision work is totally and permanently beyond the power of control of the board of health or any other organization other than the board of education. Working under board of health control there can never be the intensive coordination and cooperation of the various factors of school health activities that there may be under board of education control. To name only two or three of these factors, consider how little the board of health could reach such problems as health instruction and training in the schools, or the control of the daily program of the schools, or any proper development of mental hygiene, the importance of which we are just beginning to realize.

Furthermore, it is a fundamental concept of the leading educators that all of the activities which go on in the schools must be controlled by school authorities. This is necessary not only for the best working out of these activities, but in order to prevent a chaotic disintegration of those activities already in the schools.

The health of children of school age is fundamentally a board of education problem. It has a definite relation mentally and physically to the growth and development of the pupils in the schools. The physical characteristics are largely fixed for life before the age of eighteen, and the school is the only organized agency which can materially affect these characteristics. The child spends more time in school than in any other place except the home.

The school is the nursery of the Nation, and anything which tends to disintegrate the unity of its authority is a distinct menace to our future. The school age is the habit-forming age, and the school teacher more than any other person, except the mother, is in a position to control and develop these habits. And, lastly, the standards of the home itself, particularly in such health matters as personal cleanliness, sleep, fresh air, and food, are often developed through the school child.

Then, too, the relative aims of the health department and the board of education are fundamentally different. The vision of the health department looks toward the detection and segregation of communicable diseases, the detection of physical defects, and the statistical bearing of these defects. The educational department has a more fundamental vision looking toward

prevention and up-building, working through such fundamental school problems as habit formation, exercise, cleanliness, healthful surroundings, ventilation, rest, recreation, nutrition, growth, protection, checking retardation, correction of physical defects, special education of those with such defects, hygienic program arrangement, and education through organized physical activities.

As regards the controlling authority of this health supervision, the present condition of affairs is interesting. In practically all foreign countries it rests in the national board of education, and always has so rested. In the United States, whereas the work was started as a board of health activity it has gradually become, because of its broadening scope and because of the better organization of those in control of the schools, a board of education function. So that at the present time the vast majority of the communities carry on this activity under the board of education. Of the twenty-three States whose superintendents report special health supervision laws, only 17 per cent of them place the control under the board of health, 26 per cent place it under the joint control of the board of health and of the board of education, and 57 per cent place it wholly under control of the board of education. Of those State superintendents replying to a questionnaire, only 15 per cent suggest the advisability of placing this activity under the board of health.

If this work of school health supervision is placed under the direct control of the boards of education it will not only do all that it could do under board of health control for the better health of school pupils, but it will bring about this closer coördination with all other school health activities which is essential for real progress. It will bring about a definite training for proper attitude toward social hygiene through classroom activities, particularly in such studies as biology, science, and nature study, rather than encouraging the most undesirable activities of the itinerant lecturer. The program of mental hygiene will be a program on the up-building side, an effort to create a proper attitude toward life on the part of all pupils, rather than a mere effort to segregate those who are mentally unsound.

This program will never function properly nor make any real progress unless all the health activities of the schools are coördinated and gathered together under one thoroughly trained head who, together with all of his subordinates, shall be employed by and responsible to the public school authorities, upon whom devolves the real responsibility for guiding and guarding our children through the formative years. Of these various health activities this health supervision is a real and fundamental part, and only by its being made an integral part of the school program, given the same standing and authority, and under the same control as other school subjects, will the schools be able to turn out products which are really educated—"for complete living"—and for citizenship.

THE RELATION OF NUTRITION TO DENTAL CONDITIONS

PERCY R. HOWE, CHIEF OF RESEARCH DEPARTMENT, FORSYTH DENTAL INFIRMARY FOR CHILDREN, BOSTON, MASSACHUSETTS

Decay of the teeth, the most common pathological condition, does not seem to have been arrested by modern treatment. Primitive races or races living on natural foods are free from it. The present theory that caries is wholly a local process, the result of the fermentation of carbohydrates, does not explain its periodic occurrence. The caries of childhood, adolescence, pregnancy, and of old age occurs in life when there is an especial demand for calcium or when the calcium is not properly used. Animal experimentation does not support the present theory, but it is when insufficient calcium is furnished animals or even when this is furnished, if an irregular use of the calcium is brought about, that caries occurs.

The teeth and bones are similar chemically, in the method in which the calcium is held in combination and in the process of calcification. In most bone diseases, an increase in the magnesium content is found. We have found that carious teeth have twice as much magnesium as sound teeth. Other evidences that the teeth change in structure may be seen when animals which are capable of showing effects similar to those that occur in man in respect to foods, are fed diets comparable to modern diets. Their teeth become badly affected. The guinea-pig or monkey shows caries and pyorrhea. Other pathological effects occur, such as joint trouble, eye trouble, reproduction may be stopped or abnormal young brought forth, and growth is affected. These effects were obtained principally by a long-continued deficiency in the antiscorbutic vitamins. They were accentuated by a deficiency in calcium.

Recent estimations have shown that children need more calcium than has been thought. For sound teeth, we recommend first mother's milk. Cow's milk must be modified so as to prevent dense curd formation and hence calcium loss by excretion. When milk is pasteurized, orange juice must supplement it. In older children, milk and green raw leafy vegetables, and citrous fruits in addition to their other foods, also whole grain products are to be recommended. The greatest harm from sugars is not their local action, but that they are so taken as to spoil the appetite for the foods which they need for tissue building.

The food requirements of children are not those of the adult. They have the growth factor to be considered. They are more active and the important thing is to see that their foods are not deficient in any known factor. Proteins, carbohydrates, inorganic salts, fats, vitamins, and roughage should be amply supplied. Tooth decay is to be regarded as a deficiency disease.

A PRACTICAL SCHOOL PROGRAM IN NUTRITION

MARY G. MC CORMICK, STATE SUPERVISOR OF NUTRITION, STATE EDUCATION
DEPARTMENT, ALBANY, NEW YORK

Experimental work in nutrition has followed two lines: 1. The attempt to discover the nutritive requirements in quantitative terms; 2. The study of the effect on laboratory animals of feeding diets known to be inadequate. While the first kind of experimental work is of supreme importance, the second kind, that of feeding insufficient diets to animals has led to such disastrous physiological results that a very widespread interest in nutrition has been stimulated. Most organizations devoted to child welfare are considering a nutrition program; some have already adopted one. One wonders how soon the schools will introduce a nutrition program.

It has been my experience during the past four years to work for the school authorities of New York State. I have found them most interested in child welfare and ready to adopt a nutrition program when an effective and practical one is presented to them.

What is a practical-nutrition program for the schools? School taxes are high and the nutrition program must not be inordinately expensive. The present school curriculum is a heavy one and the nutrition program must therefore be very simple. It must be admitted that our knowledge of the nutritive requirements of children has been much further developed than our knowledge of the best way in which to organize a nutrition program in the schools. From the standpoint of school administration, nutrition programs are in their initial experimental stage. The one who is guiding this new experiment in the school schedule must have the mind of the scientist; he must exercise a constant criticism of his own method and be ready to change or even abandon it when a better one has been developed. Probably the nutrition method which has attracted the most general attention is the nutrition class method. While the nutrition class is an effective means of arousing the interest and coöperation of the undernourished child and his mother, a school program devoted exclusively to the organization of nutrition classes is to my mind neither practical nor complete. It is not practical because of its cost; the number of persons needed to conduct such a program requires an expenditure of money for salaries which few boards of education would sanction. It is not complete because even if fully organized it reaches directly only the undernourished children—about twenty per cent of the school population.

The purpose of this paper is to present a nutrition program that does seem to be complete and practical and does not require an expensive budget. This plan has been adopted in two cities in New York State—namely, Auburn and Binghamton, and has been demonstrated to be successful. In Auburn a well-trained supervisor of nutrition was placed on the school faculty. This supervisor of nutrition met the teachers periodically and gave them lectures, the teachers in turn presented lessons in nutrition to the children in the light of the knowledge gained by these lectures. As a

result the percentage of malnutrition in Auburn has been reduced from twenty-three per cent to eleven per cent, only three nutrition classes have been organized. The emphasis has been placed in training the teachers in the principles of nutrition.

In Binghamton a well-trained supervisor of nutrition has also been placed on the school staff. She has given lectures to the teachers in the nutritive requirements of children. The teachers in turn have transmitted these lessons to children and have inspired the children to practice good food habits. The undernourished children in Binghamton have been reached by their grade teacher who has the consultation service of the nutrition supervisor. The prevailing percentage of undernourished children at the present time is eleven and five tenths per cent. Contrast the nutrition class method with the plan of having a supervisor of nutrition to train the teachers. The elementary-school population of Binghamton is 8481. The number of undernourished children would be one fifth or 1700 children. To organize all of these children into nutrition classes at once would require a staff of seventeen persons. Even then only the undernourished children would be reached directly. Under the other plan of having a Supervisor of Nutrition one person reaches 8481. The kind of nutrition program here presented—that of having a supervisor of nutrition on the school staff—has demonstrated in two cities in New York State that

1. Teachers can be made interested in the subject of nutrition.
2. The lessons presented by these teachers trained in nutrition are so effective that in about 18 months the percentage of children classed as undernourished has been reduced fifty per cent.

The success of such a program depends upon three essential conditions:

1. A well organized school system in which superintendent, principals, and teachers are vitally interested in nutrition.
2. A staff of school medical inspectors and school nurses for the correction of physical defects.
3. A well-trained supervisor of nutrition, one who is a graduate at least of a four-year college or university and who has specialized during her course, in physiology, biological chemistry and food chemistry, and nutrition. She should also have a knowledge of psychology and the principles of teaching.

FRESH AIR, DIET, AND REST FOR SELECTED PUPILS

CARLISLE REED, SCHOOL PHYSICIAN, BOSTON, MASSACHUSETTS

The open-air classes in the Washington District have been under my observation for the past six years. There are two classes, a second and third grade. These two grades have been selected because the great majority of children who can be benefited by open-air class treatment are to be found in this district, at least among the younger children. Some consideration has been given to establishing a first-grade class, but as yet it has not been found practicable to do so.

The object of these open-air classes of course is to improve the health of the children. There are many children whose physical condition is such that they are unable to perform the regular grade work in the ordinary classes. These children need special care and attention and an attempt is made in the open air to build them up physically so that they may be better able to benefit from their education and more nearly compete with their fellows.

The Washington district is located in the West End of Boston, a densely populated congested tenement district. The population of the school district is practically all of foreign birth. There are over 1800 children in the school district mainly Jewish and Italian, with a sprinkling of Poles and almost no native Americans.

Selection—A preliminary selection of children is made at the end of the school year to form the open-air classes for the succeeding year. In September, these children are carefully re-examined. The children of the regular second and third grades are examined as early as possible in the year, and the final selection of candidates for the open-air class is made. Thirty children make up a class where there is but one grade, twenty-four where there are two grades.

Examination—All examinations are made with the child completely stripped to the waist after being weighed and measured by the nurse. The importance of having the children stripped cannot be too greatly emphasized; many defects are readily apparent that might easily be overlooked if the examination were made through the clothing. The heart and lungs cannot be properly examined through clothing, nor can one accurately and rapidly detect such defects as slight curvatures of the spine, faulty posture, the milder cases of malnutrition, and the like, if the child's body is clothed.

All examinations are made in a special room devoted to the use of the doctor and the nurse. The examination is fairly comprehensive, including height, weight, general condition, examination of teeth, nose, throat, heart, lungs, spine, glands, orthopedic defects (posture), etc. All defects are recorded on the regular Physical Examination card which accompanies each child through his school career.

Type—The children selected are those who are physically below par; not sick enough to remain out of school for treatment, but still not strong enough physically to get along in the regular classrooms. These children on account of their debilitated condition frequently are unable to keep up in their regular classroom work and are obliged to repeat a grade.

Those chosen are the pretubercular, anemic, glandular, those with malnutrition, children who are weakened from some serious illness, occasionally some cardiac cases both functional and those with failing compensations, orthopedic cases, contact cases (i. e., children who have been exposed to active tuberculosis in their immediate family), a few with enlarged tonsils and adenoids where the child is underweight, and a few with nervous troubles.

Duration of stay—Once in the open-air class, the child is kept through the entire year. Many of those entering the second grade open-air class go into the third grade open-air class for the following year. The policy of keeping the children in these classes for the entire year or even longer is simply a policy of building for the future. It is not enough to simply get the child up to normal weight and then put the child back in the regular grade; the child's strength and resistance must be built up as well, so that he may hold the gain that he has made and continue to thrive. That this policy is sound is borne out by the results.

Before a child is placed in the class, a special home visit is made by the nurse to get the consent of the parents for the child to attend an open-air class and also to get their coöperation. The parents are greatly interested and there has never been any difficulty in obtaining this consent. Frequently parents come in and request that their children be allowed to join an open-air class.

The children are followed up closely by the nurse and all remediable defects noted during the physical examination are cared for as early in the year as possible. All children have their teeth in perfect condition quite early in the year. The nurse sees to it that all children go to their family physician or dentist or where there is none, to one of the hospitals for treatment. Many of them she takes herself. This early cleaning up of defects helps them to get the full benefits of their classes.

Fresh air—The value of fresh air in the treatment of the habitually delicate children, such as are chosen for a fresh-air class, has long been recognized. It is certainly readily apparent that children who droop and appear dull in the regular classrooms become bright and alert with increased evidence of mental and bodily vigor after a few weeks in the open-air class. Their eyes are brighter, their cheeks show color, and their minds become more alert. One thing is quite apparent; the children are very happy in these classes. Catarrhal conditions clear up rapidly and soon disappear. These children practically never have a cold, and are rarely sick. Contagious disease is practically unknown. Their attendance improves and children who, in the preceding year, showed absences of many school days, even weeks, have a perfect attendance record at the end of the year. In fact, the attendance for the two Washington Open-air Classes for the past year was over 99 per cent, a fine record. On account of their increased vitality they learn more rapidly, although less actual time is spent in instruction.

Granting all these benefits, the question then of how much open air is necessary arises; that is, must the school be entirely outdoors with only a roof for shelter, and perhaps a canvas wind-break on one side, or may it be held in a regular room with special window arrangement. Dr. River's private school in Boston, the Elizabeth McCormick School in Chicago, and many others have shown excellent results with the wholly out-door type of school. This is the extreme, but perhaps the only real type of open-air class, in the true meaning of the word. In a class of this kind, more

warm clothing is required and more and heartier food is necessary than in the in-door open-air class. This, of course, means greater expense which cannot always be readily met.

On the other hand, excellent results are also obtained in the type of room that is more widely used and which is open on one side only. A room of this variety was made use of in Providence, Rhode Island, in 1908, in the first open-air class in the United States. The first Boston open-air class was established a few months later in the same year. In the original Providence room one entire side was taken up by windows reaching from near the floor to the ceiling and hinged at the top. By means of pulleys on the lower ends of those windows, they can be raised to the ceiling. In the Washington School, the windows are divided in the middle like French windows, and have a device which locks each half of the windows open at any desired angle independent of the other half. There are other similar devices in use for utilizing the whole air space provided by the windows. In any event, the windows take up the whole of one side, so that the room is entirely open on one side. The exposure on the open side should be toward the south so that there may be an ample supply of sunshine.

In many cities a certain amount of heated air is admitted during the cold season. In New York the minimum temperature was fixed at 50 degrees F. in 1915; in Boston the temperature is kept as close to 55 degrees as possible. In a cold raw climate like Boston, with its east wind, a totally unheated room soon tends to become damp and cave-like, unless some heat is supplied.

Diet—On the question of feeding, there is a great variety of opinion. In the original open-air school at Charlottenburg, Germany, in 1904, the children were given five meals a day. In England, three meals were served. Many others have followed similar programs. The number of meals given varies from the five meal a day plan down to where no meals are furnished, but the pupils bring food from home which is consumed in the mid-morning. In a great many schools, a mid-morning lunch alone is provided.

In Boston, no food is provided by the city; instead, an attendant is furnished to prepare the meals which are paid for, at cost, by the children. The attendant also cleans up. The city provides a gas stove, an adequate supply of cooking utensils, enamel cups, spoons, etc., and facilities for preparing food, and cleaning and washing up. The cost varies in different districts. In the Washington School, two cents a day has been found adequate. With careful buying it has been found that this sum will purchase sufficient food for a proper lunch. Although it is a very poor district, there has been little difficulty in getting the children to bring in the money. No child is refused food for lack of money.

Just what is the best food to serve for mid-morning lunch has always been a question; various things have been tried and all have seemed to work well. One year it has been cocoa with crackers or cookies, another soups prepared in our own kitchen, another time milk and crackers. This

year we tried an innovation, serving cereals and milk with sometimes cocoa and crackers, and thick vegetable soup once a week. The soup provided contained one big potato, three fourths of a cup of milk for each child, and was seasoned with other vegetables. The cereals were greatly relished by the children who for the most part were not accustomed to them at home. Next year crackers are to be discontinued and rye bread substituted. The interesting point is that the children improved visibly on all the different diets. An ideal food from the standpoint of handling and cleanliness is a half pint of milk for each child served in its original bottle and taken through straws. The cost in this city is four cents a day. It has, however, the disadvantage of being cold food and in the winter months hot food has been found to be more acceptable. The question has often been raised whether or not some parents would not send their children to school without their breakfast if they knew that a morning lunch would be served. Careful inquiry has shown this not to be true. It has also been found that the school lunch in no way interferes with their regular noon meal. Consequently the children receive their three regular daily meals and in addition a hot lunch in the middle of the morning.

Rest—Rest has always been considered an important factor in treating debilitated children. Perhaps the best way to obtain it is to provide cots on which the children lie supine for a stated interval at a fixed time of the day. More often, cots are not available and steamer chairs are used. These are good, but do not provide the full relaxation that can be obtained on a cot. In some classes, the children simply lean forward in their chairs and rest their heads on their folded arms. This is the least desirable method as it constricts the abdominal organs and impedes the breathing. A fairly satisfactory method used in at least one class is to have the children spread their blankets on the floor and lie on them.

When it comes to the question of how much rest is required, by these children, there seems to be a considerable variation in opinion. This, doubtless, is due in a great measure to the difference in the physical condition of the children under treatment as well as to differences in the ideas of those who are caring for them. Markedly debilitated children require more rest, even up to two hours a day.

In the Washington School, although steamer chairs are provided, they are little used. The chairs are occasionally used in the early part of the year by individual members of the classes, but are never used by the classes as a whole. Although the Washington district is a densely populated crowded tenement district, populated chiefly by foreigners, we do not have many of the greatly debilitated children that one might expect. The children we select, although well under par, do not require complete rest.

Rest may be obtained in another way beside lying down and that is the method of obtaining it that our teachers follow. It is by frequently changing the occupation, made as soon as the class begins to show signs of restlessness. The teacher knows her class, and watching it closely, stops her period of instruction before she overtires them. A lesson period is followed

by a period of some form of quiet relaxation where the children are engaged in arranging card letters or colored sticks at their desks or some similar task where they rest quietly at their desks. Stories, games, and exercise are interspersed with the lessons. As the year goes on, the teaching periods can be lengthened. The point is that the children are never overtired at one task, but are rested by a frequent change of occupation.

In schools where the physical condition of the children is much lower, the periods of complete rest are doubtless necessary, but much rest can be obtained in the manner outlined. If complete rest is desired, it can best be obtained by lying down and should come in the middle of the session.

Results—The results of the open-air class treatment are truly encouraging. At the end of the year the pale, dejected, hollow-eyed youngsters have been transformed into bright-eyed, rosy-cheeked, alert, happy children. They have gained in weight and strength and have at the same time performed the regular work of the grade so that they return to the regular grade classes on an equal basis with their fellows.

This spring, in order to determine the results of the treatment, I made a special examination of all the children in the Washington District who had ever been in an open-air class. I wanted to know whether the gains made by the children were permanent or whether they slumped again after a year or so in the regular grades. There were only about 195 children available; the rest had either been discharged to go to work, indicating good physical condition, or had been transferred out of the district. The result of the investigation was extremely gratifying. The great majority of the children had not only held their gains, but had continued to improve; only a few had slumped, and in most cases, there was a special reason for this. Rated on general physical condition, roughly 57 per cent were in excellent shape, 33 per cent were fairly good, and about 10 per cent were poor. There were some splendid physical specimens among them.

The gains in weight were interesting. Taking as a basis the weight of the child on entering the open-air class, the average normal gain of weight for the period of two, three, or four years that the child had been out of the class was estimated. This estimated normal gain of weight was compared with the actual gain in weight. The children were then divided into six groups according to the number of years they had been out of the open-air class, and a comparison made between the actual gain in weight and the estimated normal gain in weight. In each group it was found that these children had gained more than the estimated normal gain. As examples, twenty-nine children one year out of the class averaged three fourths of a pound more than the normal gain. Thirty-seven children, two years out, one and three fourths pounds, while the greatest gain was in thirteen children, six years out, who averaged three and seven eighths pounds above normal.

Conclusions—(1) Good results may be obtained in a building with one side open as well as in a class entirely in the open; (2) Feeding more than a light mid-morning lunch in school is not necessary; (3) The amount of

rest required depends on the condition of the children. Much rest can be obtained by a change of pace; (4) The gain in physical health is permanent; and (5) Economically, open-air classes are a good investment, for they make healthy, self-supporting citizens out of children who otherwise on account of ill health would be a burden to the community. They also reduce expenses by reducing the number of children who have to repeat a grade with its added expense.

Recommendations—(1) There should be open-air classes in every school district; (2) Some provision should be made to care for the children in the higher grades where there are not enough children to form a class; (3) Open-air classes should be established in the first grade where there are many children who stand in need of its benefits and who now are obliged to repeat the grade on account of ill health.

Miss Callaghan, the school nurse of the Washington School, will read a report of the follow-up work of the 197 children who were in the open-air classes during the second or third grade. Twenty-seven of these children completed their elementary training and graduated June 22, 1922.

REPORT OF THE FOLLOW-UP WORK OF 197 OPEN-AIR CLASS CHILDREN IN THE WASHINGTON SCHOOL

MARY CALLAGHAN, PUBLIC SCHOOL NURSE, BOSTON, MASSACHUSETTS

We nurses are told time and time again that the physical condition is the foundation of education. Recognizing this, Mr. Hinds is always ready with his coöperation in the carrying out of every plan for bettering the health of the children in the Washington District. Along with the wonderful aid of our principal, there is the enthusiasm of his assistants who regard the working out of every health problem as an opportunity for helping the child. To help him grow well, doctor, nurse, and teacher work hand in hand with the parent for his physical and mental and moral development.

This report was prepared at the close of the school year, June 1, 1922. We will follow the order of the health card:

Classification—The school physician classified the open-air class children into three physical types. This classification was determined after a careful physical examination during May, 1922, of the 197 open-air class children now in our district.

Type I represents the best physical condition; Type II, not quite so good; and Type III, the lowest physical condition.

Physical Types	I	II	III
Number of Children.....	112	63	20

Nose and throat—One hundred and twenty-eight children, nose and throat negative; 53 children, adenoids and tonsils removed; 10 children, after leaving the open-air class, operation not deemed necessary; and 6 children, not yet followed advice.

Teeth—From the beginning of the open-air class in 1913 it has been our effort to have all the children's teeth put in perfect condition while in the open-air class. We have succeeded in accomplishing this, each year with every child, with the exception of seven who refused dental treatment. This year a special effort was made to complete the dental work of the 197 open-air class children. The result is that 190 have had all dental work completed, the same seven children refusing treatment. Through a special favor granted to us by Miss McCaffrey and Dr. Cross, who are always looking for an opportunity to promote enthusiasm in the care of the teeth, we have been able to accomplish this great piece of work in a few weeks this spring.

Cardiac disease—Sixteen children with organic heart disease. All are in school and their hearts are well compensated. These children are very carefully looked after. They are reëxamined by the school physician at different times during the year as physical indications require. With his advice, they are permitted to ride in the elevator and may be excused from manual training or exercise.

It is a rule of our department that the school nurse visit the home of each child who has organic heart disease at least once a year and oftener if medical treatment is advised by the school physician, to instruct the parent on the importance of having the child placed under treatment, and in following the doctor's advice.

There were nineteen children with functional heart disease before entering and during the time in the open-air class; after leaving the open-air class there were only four children who had functional heart disease.

Orthopedic defects—Seven children, lateral curvature of spine (all are receiving treatment at the Massachusetts General Hospital); 12 children, postural defects (special care and instruction given to them in the classroom and in the home); 4 children, pigeon-chested; 3 children, bow-legged; 3 children, deformed feet; 2 children, deformed arm; 1 child, deformed arm and foot; and 1 child, one hip smaller than the other.

Malnutrition—Fifty-eight children malnourished. There are 34 children once malnourished now normal. Every child in the open-air class is weighed and measured every year. The malnourished children throughout the district are weighed and measured every month while marked malnourished. Twenty-four children now malnourished.

School attendance—The 197 children are in grades as follows:

Grade	8	7	6	5	4	3	Present open-air class	
							3	2
No. children.....	27	13	29	17	39	14	30	30

One child, third grade, open-air class, in Westfield Sanatorium.

One child, second grade, open-air class, in Home for Incurables.

Ninety never repeated grade.

One hundred and seven repeated as follows:

Eighty-three before entering open-air class.

Twenty-four after leaving open-air class; 12 of these repeated before entering and after leaving.

Fifty-seven repeated grade once.

Thirty-four repeated grade twice.

Fourteen repeated three or more times.

A review of the illnesses of the open-air class children may account for some of the days out of school and for some of the repeating grades. It reveals that these children have lived through a great deal. If you should ask me how they compare with the other children in the school we would tell you, from experience gained from the children and their parents and in visiting the homes of all the children in the district since 1907, that these children have proportionally a far greater number of defects and have had more serious illnesses than the others.

We are interested to show the benefits of the open-air class in a practical way. Is the open-air child a special child, and should it receive special attention and for how long? Yes! As long as it is in our school and it needs attention, it demands attention, it loves attention!

AN EFFECTIVE RURAL-SCHOOL HEALTH SERVICE

AUGUSTA C. TURNBULL, HEALTH TEACHER IN THIRTEEN RURAL-SCHOOL DISTRICTS, SCHENECTADY COUNTY, NEW YORK

The school medical inspection law in New York State, which became effective August 1, 1913, made medical inspection compulsory in all the public schools of the State, including the rural schools. The optional provisions of the law were broad enough in scope to give the school authorities which were willing and could secure the appropriations ample authority to institute a complete system of medical inspection, but the mandatory provisions were few and relate largely to discovery of defects with little emphasis placed upon their corrections.

According to the provisions of the statute, the trustee or trustees of the rural-school districts are required to employ a doctor as school medical inspector whose duties are to examine the pupils of the school and make a record of such inspections for each pupil each year.

The trustees of several school units, or districts, could combine in the employment of a school medical inspector, but the general practice was for the trustee or trustees of each district to act individually. Contracts were made with the medical inspector to examine the pupils; some paid twenty-five cents or as much as one dollar per examination. He visited the school as he found opportunity, examined the pupils therein, and made the record on cards provided for the purpose. He then considered his duty performed and it was according to his contract. He then gave no more attention to the school for that year. The record cards of these inspections were left in the school and carefully stored away by the teacher.

Thus defects were discovered, but little attempt was made toward correcting these defects. In the Schenectady County schools of which I speak

only a few isolated cases were treated for correction during the first two and one half years under the operation of the law. During that time five thousand dollars or more was spent for inspection with little or no corrective results. The experience of these two and one half years showed very plainly that the results were far from what they should have been for the money expended.

Dr. Howe wishes me to tell you how rural-school health originated and became a successful reality in Schenectady County, New York. This is my field of work.

The trustees of several rural districts realizing that no results were being obtained in the matter of correcting defects and promoting health education generally complained to the district superintendent that they were wasting money and asked him to call a meeting with a view of securing a registered nurse who would devote full time to the school health work. The district superintendent called this meeting in December, 1915, and as a result of that meeting the trustees of eight school districts manifested a willingness to try the plan of having a nurse for follow-up work and prepared a contract, which was executed by these several school districts. The work for the remainder of that school year—five and one half months—was most gratifying to both the district superintendent and the trustees, so much so eleven school districts joined in engaging the nurse for the next school year.

In order to give some idea of the way in which our work was started I will read the present secretary's report.

ORGANIZATION OF THE ASSOCIATED SCHOOL BOARDS, SCHENECTADY COUNTY

This association was organized on October 8, 1917, at a meeting in response to a call from the district superintendent of schools in Schenectady County. Those joining together were the trustees in a number of districts outside the city interested in keeping up in their rural schools a standard of health inspection and supervision approaching that found in our best city schools. The number of districts represented has fluctuated between twelve and fourteen, but for the past two years has remained at thirteen.

The success of the organization in keeping together and promoting the health of our children in the schools, while largely due to the active interest of all the trustees in their schools is also greatly due, it is believed, to the informal nature of the association. It is not encumbered with anything in the nature of a complicated constitution and by-laws. A simple agreement signed by the members has been found sufficient, the following being the form now used:

"We, the undersigned trustees of schools in Schenectady County, agree to associate and coöperate for our several school districts in the employment of physician and nurse, and in carrying out any other work considered necessary in promoting the health of the children in our schools. We mutually contract to pay the expense of this service in proportion to the assessed valuation of property in our districts. Payments are to be made 25 per cent on October 15, and the remainder not later than January 1, next."

Necessary officers will be elected, a budget will be adopted and detailed procedure for carrying out the work within this budget will be determined by majority vote of those members present in any meeting of which notice has been given one week in advance, a quorum being present. A quorum will exist when a majority of the districts are represented."

The "necessary officers" have been found to be sufficiently covered by a president, now district superintendent of schools, and by a secretary-treasurer.

On the basis of the above agreement contracts have been made with the school physician and school nurse; the use of the City School Dental Clinic has been engaged; the services of the Day Nursery have been employed; and glasses have been fitted by an eye specialist. The needs of various schools have been pointed out and taken care of by the purchase of useful, or necessary, apparatus and equipment. The recommendations of the physician or nurse are usually complied with without question, a good indication of the respect in which their judgment and experience is held.

The advantages of the system over the old more or less perfunctory annual examinations by a physician, just to comply with the law, are too obvious to discuss. Among them may be mentioned insurance against the spread of epidemics; discovery of diseases, or defects in early stages, while the trouble may easily be corrected; proper instruction in hygiene, etc. None of us would willingly go back to the old system. It might also be mentioned that the subjects of discussion at our meetings are not necessarily confined to health work, but that much useful and instructive information along other branches of school work is gained by contact with other trustees having similar problems; and with the representatives of the State Department of Education.

The experience of the past five years has proven to us the value of an association of this nature and such an association is heartily recommended to any similar group of school districts.

A. C. FINNEY,
Secretary-Treasurer.

Schenectady, N. Y., June 23, 1922.

There are three essential factors in any effective system of school health work: (1) The doctor who examines the pupils and discovers defects; (2) the nurse to teach health habits, secure coöperation of the parents and teachers, and secure and devise ways and means whereby defects may be treated; and (3) facilities for doing corrective work with children.

We now had a nurse for this group of rural schools, but each district continued to employ its own school doctor for the purpose of making examination. In 1917 these rural districts combined to employ a school doctor in the same manner in which the nurse was employed. The doctor devoted as much time as was necessary to the school work. The results for that school year were still more gratifying, and more corrections were made. In the territory which I cover we have no facilities such as hospitals or clinics where children may be taken for corrective treatment. We, therefore, endeavored to secure this service from such institutions in the city of Schenectady.

We coöperate with the school department of the city of Schenectady and in that way secure dental service. We have access to a splendidly equipped day nursery, where pupils of parents who are unable or unwilling to pay for corrective treatment may be sent. In this institution we have access to the eye and ear clinic, general clinics, orthopedic work, and the use of the operating room with a registered nurse in charge. Capable physicians are in charge of this day nursery, and they give a great deal of time to this philanthropic work.

The eye and ear clinic is held two days a week with a specialist in charge who has done this work for many years and thoroughly understands the

handling of children. The eyes of such children as are unable to pay for treatment are examined free of charge, and if found defective a prescription is given to the nurse, who gets glasses at a greatly reduced rate, the combined school board providing the funds. Medicine is given free, with full directions for using.

When it becomes necessary to operate for tonsils, the child comes to the nursery at eight-thirty in the morning, is prepared by the nurse in charge, and after the operation is performed the child usually goes home about four-thirty of the same day unless they have to stay all night, when an extra nurse is secured for night duty. These children are always accompanied by one of the parents or an older sister.

The dental clinic for our rural pupils is held in the Educational Building in Schenectady every Saturday morning. These clinics are held each week day morning from nine to twelve. The price for this work is sixty-five cents a visit, and is paid by the combined school board representing all of the rural schools which I serve.

We have a great many Italian, Bohemian, and Polish children in the rural schools. These foreign people have large families and sometimes the father earns very small wages, so the children often are very poorly provided for, both in relation to food and clothing. I sometimes have to ask and receive help from the poor master of the town for food and clothing, especially shoes. I also get splendid help from the parent-teachers' associations and the better class of neighbors.
