I have succeeded in placing weighing scales with measuring rod in nearly all districts. Classroom weight records are kept in all rooms. All pupils are weighed in the fall term, and those requiring special attention are weighed every month. The pupils are encouraged to study their weight.

Most of my schools are equipped with first-aid cabinets and first-aid supplies of all kinds needed for emergencies.

I find a great many rural children are undernourished, generally because of a lack of knowledge of the fundamental principles of food and nutrition and not because of poverty. The State supervisor of malnutrition has visited my schools and given instructive lectures in high schools and grade schools. I outline diets for poorly nourished children, visit the homes, and question the mothers and make suggestions. These suggestions are well received in some homes and in others not so well. Hot dishes are served in several of the rural schools, consisting of hot chocolate, cocoa, asparagus or tomato soup to be eaten with the lunch which the children bring from home. The teachers report better and more efficient work done in the afternoon where these hot lunches are served. Milk and graham crackers are served at recess in the morning; this also seems to put more pep into the pupils.

We have several atypical children registered and while nothing definite has been done as yet we hope in the near future to have them in one building with a specially trained teacher to care for these unfortunates.

I want to tell you how much you can get for the asking. In answering various advertisements I obtained abundant supplies for use in the

rural work, such as soap, dental cream, talcum powder, large and attractive posters for wall space as well as small ones for individuals, first-aid booklets and numerous other things, all of which aided materially in carrying out the health program and at the same time served their purpose of advertising.

I cover thirteen school districts, including one-room, two-room, and four-room schools, with two schools having high-school departments—all distinctly rural and located within a radius of eight miles of the City of Schenectady. The greatest distance between my farthest schools is sixteen miles.

Thus, in 1915, from a few men with a vision in Schenectady County, New York, has developed a successful and effective rural school health service.

COMMUNITY COÖPERATION IN SCHOOL HEALTH WORK

COURTENAY DINWIDDIE, EXECUTIVE SECRETARY, NATIONAL CHILD HEALTH COUNCIL, WASHINGTON, D. C.

The problem of community coöperation in the school health program considered in its broadest sense is far from a simple and uncomplicated one. Its solution involves adjustment between both types of work and personalities not only in their relation to one another, but most important of all, in their relation to the child, who should be, but is not always, the central theme.

Have any of you watched a pond in the process of freezing? Beginning around the edge one sees little crystals shooting out, pioneering their way over the untouched surface of the water, often in attractive patterns. These crystals branch off on widely divergent lines. To conceive of their ever having a common direction or coherence is a strain upon the imagination. Gradually the patterns are woven closer and closer and presently they come together. If it is storming or there is sleet or hail a cloudy covering may form but it is apt to be full of holes or may even be broken up into a sort of mush that may have the name of being ice but has no strength or clarity. If it is a still, clear night there is a merging that leaves no trace of the apparently conflicting lines running in many directions. Instead we see a crystal clear surface which grows thicker and firmer as the process goes on, and at length will support the skater, the sleigh, or the ice-boat.

No simile is a perfect one, but we do see in this process something of how the varying branches of school and community health work, apparently running along totally different lines, may be integrated into a strong, clear plan. Such a result requires to a high degree the submerging of individualistic policies in the bigger, stronger, united plan in which nothing of genuine value in each separate development is lost.

Because we are human beings we cannot leave this necessary process to go on by itself as if it would be a natural sequence of events. It is essential

that someone see the health problem of the school child as a whole. Such a leader must have a vision that will not be limited to this or that pattern of work but will see a larger community plan which wisely regards the needs of the child in the school and the home and also the contribution that parent, teacher, physician, and health worker has to give to his welfare.

Leadership essential—Coöperation of the community in the school health program should be preceded by the coöperation of the various elements within the school which are contributing to this program. A prime requisite is genuine leadership. No amount of paper planning will accomplish anything without such leadership.

A principal of a junior high school, which was considered an excellent one, was asked his opinion as to the possibility of his teachers joining in working out a health program in its relation to the community. He said that he doubted how much they could contribute as a group; that they had nothing in common but the roof over their heads, as their subjects were so widely different. Fortunately, he is not typical of many of the real leaders in the school field today. On the other hand, the superintendent or principal is usually too busy to give to that type of leadership the time and attention it requires and some one else is needed.

The starting point, the teacher—It might not seem appropriate to the topic of community coöperation in school health work to discuss the qualifications and attitudes of the teacher. On the other hand, the teacher's part in the whole school health program is so basic that attempts at coöperation are largely nullified if the teacher is incapable of playing her part.

The boy or girl in school has a perfect right to say to the teacher who is telling him how to keep well "Physician, heal thyself!" The educator, if he is to be a real instructor in health, should know what health is in fact and must know what it is in spirit. Teachers working for such low salaries that they are below par physically and mentally, or those suffering from correctible physical defects, cannot give their best to the children and are not the inspirations to a healthful life that they should be. Furthermore, the teacher should have clearly in mind what the principles are that should underlie health education. These principles have been stated admirably by the Advisory Committee on Health Education of School Children of the National Child Health Council. The teacher also must have some fundamental health knowledge through familiarity with authoritative subject matter and through guidance of the specialist.

Teachers must be thoroughly acquainted with modern methods in teaching, particularly as related to health subjects. It is not necessary to a group of teachers to emphasize the importance of method in vitalizing the subject taught and in influencing conduct more or less permanently. It might be assumed that our normal schools would give the necessary training in methods but we all know that many of them do not do this as yet and that many teachers now at work, whether normal-school graduates or not, have not had practical training in methods, especially as related to health.

It is a large field for further work but somewhat outside of the scope of my topic.

In a recent observation of the actual teaching of a lesson in milk in a course of hygiene it was found that the chief impression given to the children was that milk was very apt to be a dangerous poison and therefore should presumably be avoided rather than sought as a part of the diet.

Correlation of health with other subjects—Assuming that we have a group of teachers trained and able to teach health we still have before us the extremely important problem of correlating this teaching with the various subjects taught in the schools. Since the Committee of the National Education Association on the Reorganization of Secondary Education took the position that no matter that could not be justified on the ground of its value in the realization of specific social objectives had any place in instruction, this point of view has been widely applied.

To avoid further crowding of an already over-crowded curriculum it is essential that there be correlation of the teaching of health with other subjects. Experience in a number of cities has shown that it is possible to do this without loss to the other subjects and with decided gain to the teaching of health. Just as in French the teacher no longer asks whether the pupil has seen the little house of the gardener's daughter, so in mathematics, for example, training in figures, instead of being in abstract problems, can be put to the practical use of education at the same time in social objectives. There are many opportunities to teach health lessons in this way. A course in Art, with its work of drawing and painting, gives an excellent chance to inspire children with health ideals.

Coördination of personnel and work—A more difficult question, for the solution of which there are none too many definite guide-posts, is the matter of coördination of personnel and of work of the grade teacher, special teachers, and the physicians, nurses, and others who may be serving the schools from the health standpoint.

Here again no paper program can possibly secure results unless there is some one with a sufficiently large vision and administrative ability to see the problems of each and to fit the activities of each into a whole, balanced program.

There is increasing evidence of the need for greater concentration of the specially trained person upon the problem of helping and guiding the grade teacher rather than upon directly instructing the pupils. It is upon the grade teachers, in the last analysis, that the main responsibility must fall. The specialist can greatly multiply his or her effectiveness by working through them. For example, in one school district the director of physical education had worked hard to build up the physical training of the children. When he was withdrawn it was found that the teachers almost completely ignored the subject because he had at no time given them any feeling of responsibility for it or a real opportunity to take part in it.

The contribution of the physician and the nurse in education—School physicians and nurses, in coöperation with the teachers, have an unusually

valuable opportunity to drive home vital lessons in health. If the physician is one who correctly understands the importance of the economic and sanitary conditions of the child's home and surroundings, in judging of the clinical symptoms, his diagnosis and recommendations give not only a scientific but at the same time a very practical basis for much of the work of teachers and nurses in improving standards of living. They help to translate abstract conceptions of health and health habits, into practical working motives. One illustration that the lack of sufficient sleep on the part of a particular child has resulted in a weakened and anæmic condition and the loss of a grade in school will be far more effective in stimulating habits that develop mental and physical vigor than any amount of theoretical discussion. This is especially true when the gains resulting from a change of habit or the correction of a defect become apparent.

The reliance placed by the parent and the teacher upon the soundness of statements by the physician and the nurse enables them to reinforce the lessons taught by the teachers. It also throws a heavy burden of responsibility upon them to stimulate teachers, parents, and children to think along lines that are wholesome and constructive rather than morbid in considering the correction of defects and the development of health habits.

Administration of school health work—On the question of the general administration of school health work there are widely divergent points of view, particularly the view of those who advocate the complete control of all parts of the health program in the schools by the school authorities and that of those who advocate complete control of this program by the health authorities. Far too much time has been spent in arguing questions of division or assignment of authority and far too little time has been spent upon joint agreement as to program and better methods of coöperation.

Educational questions should be under the jurisdiction of the Board of Education, especially in so far as they relate to the actual program of the schools. It is clear that the Board of Health should not relinquish its rights in the matter of control of communicable diseases even though it may delegate certain powers to others. Therefore, neither the school nor the health authorities should assume the complete administration of both educational and control measures as related to health, without thorough agreement. It is desirable that there should be one administrative head of health work in the schools who should operate under a definite written agreement subscribed to by both the school and health authorities, outlining the scope and jurisdiction of such health work.

The school and the community—When we come to consider the real problem of the relationship between the school and the community we find much that remains to be answered. Perhaps the most important first consideration is the question of interest and attitudes. It is essential that the teacher, whether a grade or special teacher, shall think of health in terms of life, of the actual daily habits of herself and her pupils, not only in so far as individual habits are concerned but as the individual is affected by community conditions. It is no less essential that the health officer, the nurse,

and the health worker generally shall think of health and welfare in terms of education. By this I do not mean the superficial methods of advertisement and sensational news that so often go for education. I mean, rather, the fundamental type of education which influences and molds human life.

An illustration of the importance of the teacher's thinking of health in terms of living occurred in a class where the teacher was actually grading the pupils in health habits. Repeatedly one of the children in answering the question whether or not he had slept with his windows open stated that he had not. The boy was much distressed to make this answer and the children in his row were annoyed by his bringing down their average health grading and did not fail to "rub it in." However, not until the supervisor happened to be present at a recurrence of this answer was it learned that the child was sleeping in a room without windows. He had persuaded his parents to leave the door open and to keep the window in the adjacent room open. He really was making, under adverse conditions, a more earnest effort to obey the rule than the other children who professed superiority. There was, of course, not only an opportunity for encouraging the child in his efforts but also for initiating measures to improve his home conditions.

The school work, particularly health work, that limits its considerations to the health of the pupils in the school is largely lost. The community effort that ignores the fundamental contribution that genuine education has to give to forming life habits and ideals is exceedingly superficial.

Persons versus principles—Some believe that the visiting teacher is the solution of our present lack of integration between health teaching and practice in the school and in the community, although in some instances the visiting teacher may not have any fundamental understanding of health problems. Some believe that the nurse, the nutrition worker, or other health worker must be the instructor in health in the public schools although she may be the veriest tyro in the elementary principles of pedagogy. There is too much dispute over terms and labels and jurisdiction in this whole matter and too little thoughtful consideration of principles.

After all, is it not the main thing that there shall be some one whose first consideration is the larger community problem of health, who sees the contribution which the educator and also the trained health person has to give to its solution, and who is devoting his or her efforts to weaving the activities of each together into a pattern that is part of the life of the whole community? Only in the most unusual cases can the superintendent of schools be the person to do this work. It will demand, in the great majority of instances, some one who is definitely on that particular job, whether in the rural area, the small town, or the city district.

System or chance—Because of the irregular development of our school activities, in one place this coördinating function may be performed in whole or in part by the visiting teacher, in another by the nurse, in another by the nutrition worker, in another by the school physician, and in another by the health officers. But we are rapidly approaching the time when we must

begin to develop more definitely a system which shall take this out of the realm of haphazard sequence. For instance, there are many possibilities, from the standpoint of health education in particular, in the movement for a district teaching supervisor, or helping teacher, for rural schools, as an assistant to the administrative head of the schools. Such a person should have training and knowledge in the fundamentals of health as well as of other subjects and should know her own limitations and when to draw upon the resources of specialists. Until there is a person who really has a broad vision and is giving main consideration to the correlation of each special educational program in a complete program, we shall find many of these difficult questions of adjustment, for instance between the physical educator, the nurse, the nutrition worker, the teacher, and the physician.

Supervisory health work in the schools needs this sort of coördination just as much as health education. Upon the ability of the coördinator depends the answer to the question whether one individual can at the same time coördinate both the work of health supervision and health education. It is a desirable combination if practicable.

Volunteer health associations—The great power for good or ill in the hands of voluntary health organizations must be taken into account in any educational program. Too often these organizations attempt merely to use the school system as a means to put over their propaganda. In too many instances is this propaganda directed toward temporary purposes. We cannot better this situation as teachers by decrying the activities of these organizations nor can we as health workers do so by condemning the narrow-mindedness of teachers toward receiving outside help. The health organizations must have a keener appreciation of the fundamental problems of education, which unfortunately they often lack. At the same time the teacher must realize that the field workers and specialists in these associations often have an intimacy and freshness of contact with the actual health problems of daily life which equip them to contribute a fund of information, sometimes even a new view of methods in education, which are valuable and of which full advantage should be taken.

School and community health inseparable—Perhaps the chief fault of much of our earlier work in the field of school health has been due to the fact that those in charge of it have not looked beyond the school door. Health cannot be put on and taken off like a cloak. It is a matter of habits of life, of attitudes of mind, running through every phase of human existence. Health education during the hours in school must be closely linked up with health education that runs through the child's family and social relationships.

Water can be made to rise above its level if sufficiently powerful pumps are used and much energy expended. But the education of the child in personal habits during a few hours of the school day, when every other waking hour is packed with influences tending to break down that of the school, is a well-nigh superhuman task. It is because the correction of the child's defects, the changing of his environment, and the shaping of his habits are

so largely a problem of the home and the community that the follow-up work of the nurse and the visiting teacher are recognized as essential. But in addition, fathers, mothers, sisters, and brothers must all contribute their share for good or for evil to the child's education. If our pedagogical principles are correct these adults must not only be given information but must have responsibilities and definite tasks to do if they themselves are to understand the importance of healthful living and the relation of health principles to their own lives as well as to the life of the child.

In short, the citizens of a community must be drawn into close and responsible relationship to the educational system. It is one thing to persuade individuals to have their children's defects corrected because we know that it should be done. It is another thing to have a community-wide discussion of the importance of correction of defects and an organized committee of citizens working hard in a campaign of general discussion and follow-up to secure such corrections because they know they are essential to the children's well being.

Our parent-teacher associations are a wholesome evidence that we are attempting to meet this need for closer relationship between the school and the citizens it serves. Community center committees and neighborhood associations which think of other things besides street paving and lighting are beginning to vitalize the relationship between the school and the community. The names of these organizations is not important but it is what they do and the real degree of responsibility that they have that counts. They should be widely inclusive in their membership. Their work and organization should be properly integrated with other work and organization in the community. Consider, for instance, the far-reaching educational opportunities of the physicians and clergymen of a neighborhood.

All of such special groups as well as citizens' committees should be part of the educational system if we are using the term in its broadest sense. However, it takes educational leaders of large vision to see the relationship of these groups to the larger community educational movement. Too often the educator attempts simply to compress them into the mold of a school system which is bound about by tradition and purely academic limitations.

District committees—District Committees which bring together all of the groups that can contribute to the solution of the school health problem will develop greater responsibility and understanding on the part of the community for the problems of the schools. They will also help to eliminate much of the wasteful lack of understanding and of genuine coöperation between the various types of community servants who are dealing with the problems of health, recreation, and education.

City-wide or county-wide civic associations, Councils of Social Agencies, Chambers of Commerce, improvement associations, are invaluable in dealing with these problems. However, they can never be a substitute for an intimate coming together of neighbors, who know one another and their own neighborhood problems, and who can all take off their coats and go to work in a mutual service. It is remarkable how frequently a difficult

problem of jurisdiction between two health associations, or between a private organization and the school staff will be ironed out by simple consideration of the needs of the children or their parents right on the spot. Not only do we find that the trouble-making youngster receives individual attention but the community is aroused to an organized effort for recreation when it is discovered that this boy's difficulties are due to lack of opportunities for play under wholesome conditions.

Such a type of community coöperation does not spring into being unless some one has had a vision. To bring it about takes a leader, whether the school principal or some one else, who sees the latent possibilities of the average citizen. The leadership which starts a recreational program or a movement for correction of defects and does not develop real responsibility will vanish with the individual. It is when our leaders see to it that the average citizen has a chance to play his part in our community programs, whether of school health work or any other kind, that we shall begin to develop a type of community coöperation that we conceive of as existing in our old New England town meetings.

IMPROVED MEDICAL INSPECTION OF SCHOOLS

LEROY A. WILKES, M. D., MEDICAL DIRECTOR, PUBLIC SCHOOLS,
TRENTON, NEW JERSEY

Where adequate salaries are paid and the engaging and discharge of medical inspectors, nurses, and dentists is placed in the hands of the Chief Medical Inspector without political interference, medical inspection can be made an instrument of great good to the school child. Personally, I prefer full-time and specially trained employees, and I should free the medical man from all work not specially requiring his professional training. In this way he can handle a large number of children—with adequate aid by the nurses and teachers. Where earnest, interested physicians are obtainable on part-time, this may prove satisfactory, but many corps I have seen have a considerable number of men who are holding the position for the small salary paid, only as long as they can do so without interference with their private practices. As they become more experienced in this work, and hence more valuable, the demands of their private practices are also growing, and they must begin to slight the work of one or the other—or choose definitely which work they shall continue. It is but natural that they will give preference to the work from which they derive the major portion of their income. With a large corps, we inevitably have some members who are "on the fence"—they need both incomes, but cannot give adequate attention to both types of work. In these cases the school work suffers as a matter of course, since the income derived therefrom is less than from their private practice.

Many medical inspectors are engaged to examine the pupils of a certain district, for a very small per capita cost. This plan results in a hasty

superficial examination, which to my mind is not so valuable as an examination which could be given by a nurse especially trained to do a more limited examination—especially since her examination (or the M. D.'s) is only a preliminary step to the examination by the family physician or dispensary doctor. I know that many of my colleagues will cry aloud at this, but ten years of observation of the actual work as done in the field has convinced me that this is not a radical suggestion. I have seen this plan work in Bridgeport, Connecticut, with success. Of course many State laws require an annual examination by a physician, and so this precludes such a plan under law, but laws can be changed at times. Insufficient appreciation and finances in the allotment of school funds prevents the development of the work to its full possibilities. The big health work of the schools, to my mind, is the educational feature of health work, and this is distinctly the work of the teacher. The teaching of health is primarily and essentially the establishment of the practices upon which the maintenance of health is founded. We call them "health-habits" or, as one organization puts it, "the rules of the game," and life is a game we all must play.

These rules should be formulated by the health experts—that is, doctors, nurses, sanitarians, and dentists—but the art of "putting over" these rules to the child most successfully requires the especial training of the teacher, with her understanding and technique of teaching.

Many of us fail to appreciate that teaching is an art and does not consist merely in having the content or material.

The teacher should carry the burden of maintaining the health of the child, by example and precept, and leave to the doctor, nurse, dentist, and others, the salvaging of those who have temporarily departed from the normal condition of health, the signs of which the teacher should daily study and recognize in each pupil under her care.

The attempt to have the nurse deliver the health talks I have abandoned, except when the teacher requests her to speak to the children upon some occasion. Perhaps her uniform may stimulate interest upon such occasions, but for the nurse to assume the responsibility for the regular teaching of health, is to limit her usefulness in her established field, where her burden is already a heavy one. To demand of her a technique in which she has never been trained tends to lower her efficiency and to overlook the teacher who could teach health if time and subject-matter are supplied to her.

In the physical examinations many things are mechanical tests—like vision, hearing, height, weight—and the doctor's time is or should be too valuable to make these tests or to do clerical work. The teacher's interest should be stimulated by her presence at the time of examination, and she can assist the doctor and nurse, especially with the clerical work, and she will become thereby conversant with the examination results upon each child. This enables the teacher to intelligently urge upon the parent the correction of any defects found. The effect upon the parent of the teacher's interest in the pupil's physical condition is great.

Much medical inspection data is never classified and studied; but is merely

collected and filed away—never to be used again. Such systems do not benefit by their mistakes, but repeat them yearly.

Careful statistical study should be made so that a general average for several years would show whether sufficient improvement is shown to warrant the expenditures made or whether additional finances, changed technique, or increase in personnel is necessary.

The question of nutrituion, now prominent in the discussion of the child's health, is one where the up-to-date physician can be of marked assistance in selecting the children who are to be helped. Height, weight, and age standards aid in limiting the pupils to be examined by the doctor.

The dental studies made in the Trenton schools have shown us that there is a distinct difference between clean teeth and healthy teeth. It is not strictly true that "A clean tooth never decays," or else we have not yet learned how to really clean the teeth.

Control of contagion—The endemic index of each school should be known for each of the common diseases of childhood, so that yearly curves would show how near to this index the contagion had been kept or what improvement is shown.

This index is determined by finding the average number of cases of each disease which had been found in pupils of the school each month for the past five years, or longer.

JONES SCHOOL—SCARLET FEVER

Sept.	Oct.	Nov.	Dec.	Jan.	Feb.	Mar.	Apr.	May	June
0	3	4	7	6	10	6	4	3	1
2	2	5	6	6	7	4	3	1	0
2	4	4	4	6	5	2	1	0	0
6	6	8	10	10	6	4	2	0	0
2	0	4	6	6	4	4	2	1	0
5) 12	15	25	33	34	32	20	12	5	1
2.4	3	5	6.6	6.8	6.4	4	2.4	1	.2

If scarlet fever then, in any year, in February did not greatly exceed six cases, we should not get greatly alarmed, but if in the next five years the index became less we should be encouraged.

Personally, I believe with Chapin, of Providence, that control of contagion is largely an educational problem, and that voluntary isolation—even less drastic than we now practice—of a large number of more persons is more valuable than strict isolation of a few, while many run about at large, undiscovered and unreported.

I would advocate special accommodation and equipment for exceptional children; with school programs in which the primary provision was made for their physical benefit and their education needs were met more definitely.

In crippled children the primary question is this—Is this condition a progressive disease, or is it arrested or improving? Children who are declining physically should not be made to carry a burdensome mental program.

Cardiac cases, anemic and malnourished, epileptic and other nervous conditions, partially or wholly blind and deaf cases, speech defect and tubercular contact cases—all require special attention, as definitely as the mental defectives, and provision must be made for them.

Summary—1. Restrict physician's work to purely medical work so that adequate remuneration can be paid and still be economical as a per capita cost.

2. Whole-time employees are most satisfactory, as they are regular in the time devoted, can follow definite schedules, and are especially trained in this work.

3. Nurses can be trained to do a larger share of examinations, but should not be the regular health teachers for classes. She should give individual health talks.

4. The teacher is the biggest factor in the maintenance of health, and should have time and subject-matter for health education prepared for her by health experts.

5. Contagious control can be accurately determined by use of "endemic index" for different diseases in each school.

6. To have healthy teeth is a better aim than to have clean teeth, though brushing of the teeth should be urged as part of oral hygiene advocated.

7. Special accommodations, equipment, and program for physically defectives.

8. Teacher should always be present and assist in physical examinations of her pupils to stimulate her interest in the child's physical condition.

9. Teacher should study daily the "normal" appearance of her individual pupils, so that she will readily detect the first signs of departure from "normal" by the pupil and refer him at once to the school doctor or nurse.

10. Closer coöperation between health and educational work is often obtained by placing medical inspection under the Board of Education instead of under the Department of Health.

11. All data collected from adequate records kept should be regularly classified and studied for improvement of work.

HOW TO REDUCE THE MORBIDITY FROM COMMUNICABLE DISEASES IN SCHOOLS

EDWARD S. GODFREY, JR., M. D., DIRECTOR OF THE DIVISION OF COMMUNICABLE DISEASES, STATE DEPARTMENT OF HEALTH,
ALBANY, NEW YORK

Much has been written on how to prevent communicable diseases in schools, most of it perfectly sound in theory and some of it sound in practice. By sound in theory I mean that according to our present knowledge a given method should prevent a given disease. By sound in practice I mean that certain measures have been found to be feasible both from the standpoint of general applicability and from the standpoint of results. A method,

sound in theory, may be so cumbersome or so dependent upon constant attention to minute details that it cannot be generally applied or if applied it reduces the incidence of disease at what may be an unwarranted cost in effort, in money, or in loss of school time. Since different diseases are preventable in different ways, it will make my meaning clearer if the diseases are discussed separately or in groups presenting a common problem.

Ordinarily, epidemiologists divide the communicable diseases according to their modes of transmission into—(a) Those transmitted by insects; (b) those transmitted by the alimentary tract; and (c) those transmitted by the respiratory tract.

Diseases in the first group are not peculiar to children and in the United States our interest is ordinarily limited to malaria. While the school should serve as a center of instruction and stand as an example in anti-malaria campaigns, the problem of eliminating this disease is essentially that of eliminating the mosquito and *as such* is a community problem largely of an engineering nature. This is not to say that in sections where malaria exists the school may not be of use nor that it should be indifferent; but since malaria is limited in its distribution to certain sections only, we can here discuss more profitably diseases of general distribution.

Of the diseases transmitted through the alimentary tract, typhoid fever, dysentery, and diarrhea may be mentioned. It goes without saying that every school should have a safe water supply and a safe method of excreta disposal. These two fundamentals of sanitation are by no means universal though there has been great improvement both in city and country in the last twenty years. This improvement is reflected in the declining typhoid rates of the entire country. There is, however, one point in this connection to which your attention should be directed. The growing practice of providing lunches for school children increases the chances for mass infection by diseases of this type. From a communicable disease standpoint the only safe milk is pasteurized milk and this point is being too frequently overlooked or perhaps disregarded because of real or imagined deficiencies in such milk. Again, the personnel engaged in handling school food supplies should be carefully questioned, before employment, as to their previous experience with typhoid fever—that is, whether they have had it themselves or not and whether or not it has developed in members of their families, families for which they have worked, or other persons whose food they have previously handled. Persons giving such histories should be required either to submit proper specimens for laboratory examination or refused employment. It is a question indeed whether all food handlers in schools should not submit such specimens, regardless of their histories. On the other hand, the history should always be taken and if it shows that the applicant has been associated with a number of typhoid cases he should be refused employment in such a capacity, regardless of the results of laboratory examinations.

Perhaps there should be classed among the alimentary infections, so-called epidemic jaundice. This disease was quite prevalent in New York

State last fall and winter and seemed to show a predilection for country school children. Instance after instance was encountered where the disease attacked almost every child in a country school, the school seemingly acting as the focus of distribution. We are uncertain as yet as to the cause of epidemic jaundice and its mode of transmission, though it seems quite certain that contact is the usual method.

When we come to the third group of diseases we reach our principal difficulties. The diseases of the respiratory group are almost always with us. They comprise the diseases commonly called contagious since they are spread almost entirely by human contact, they tend to epidemicity, they cause much loss of school time, some deaths, and many misunderstandings.

At the outset we are beset with the difficulty that these diseases occur only among human beings and that they are transmitted almost entirely from one human being directly to another. Changes of environmental conditions, the improvement of our inanimate surroundings therefore, are of infinitesimal effect on their prevalence. Even such an important improvement as abolishing the common drinking cup has had no measurable effect. Perhaps we can understand why when we observe how many people still cough and sneeze, openly and unashamed, with all the gusto and aplomb at their command. For every drop of infected salivary secretion that was ever drained from a drinking cup, a million from a more dangerous corner of the human anatomy are showered on sneezers' and coughers' neighbors. Let it also be borne in mind that sneezers and coughers are more apt to carry pathogenic organisms than the casual users of the drinking fountain. They may be mild or atypical or incipient cases or they may be carriers. If they be any of these the non-immunes or susceptibles in their vicinity stand a fair chance of contracting the disease.

Our problem in the prevention of this class of diseases consists in keeping the human cases and human carriers of communicable disease away from those who are susceptible. We must do one of two things—either find all the cases and carriers or make all the susceptibles immune. In practice we follow both methods about as far as public opinion will let us.

Smallpox is a disease in the prevention of which we rely most upon making the susceptible immune. We consider as susceptible all persons, of whatever age, who have not had smallpox or who have not recently been vaccinated. Where the vaccination of school children is enforced we do not have smallpox among them, where it is not, we do—sooner or later and the larger the community, generally speaking, the sooner. The favorable showing of New York State in its smallpox morbidity is hardly to be accounted for on any other ground than the well vaccinated school children of the first and second class cities. This not only prevents the disease in those cities but so reduces the chances of visitors becoming infected in them that the disease is rare even in the rural districts and smaller cities. It is true that we do isolate the sick and the contacts but unless we also vaccinate smallpox is quite certain to spread. Of course as long as there are buyers for wild-cat stocks and followers of wild-eyed reformers we can expect

disbelief and even opposition to vaccination, but such opposition seldom handicaps a properly conducted campaign. It may not be amiss, however, to give a word of warning. Every physician who vaccinates should know how to vaccinate properly. This is especially true of public vaccinators. Many physicians seem quite shocked to learn that scarifying and cross hatching are not good practice and many fail to appreciate the importance of giving instruction on the after care of the lesion.

Scarlet fever, as contrasted with smallpox, is susceptible of control by careful school inspection, by the exclusion and isolation of cases, by tracing the sources of infection and the supervision of contacts. Its amenability to control by these methods is due to its being much less contagious than smallpox—fortunately since there is no proven means of acquiring immunity except by having had the disease. In New York we have a rule requiring susceptible contacts, that is contacts who have not had the disease, to be excluded for seven days after last exposure. A doubt as to the need of this has recently been raised by the health officer of one of our cities who found that among 135 such susceptible contacts not a single case developed. This means that 675 school days were lost on the chance that a case might develop and spread infection before it could be detected. This looks like a very high premium for the risk and suggests the possibility of maintaining equally effective control through special observation of such contacts by the parents, the teachers, the nurse, and the school physician.

Diphtheria has in the past been combated entirely on the theory that by culturing schools we could discover and exclude and isolate all the cases and carriers of this disease (and its organism) and thereby eliminate the sources of infection. Generally speaking this theory is sound and it will work out in practice in small communities, and at times or even for a time in large ones. Perhaps with proper enthusiasm and support, financial, legal, and moral, it can be made to work in a large community continuously. But it requires constant attention, a properly equipped and immediately available laboratory, adequate personnel and an enthusiastic, careful, and persuasive school physician to make it work effectively and without friction.

Defects of this method—1. The disruption caused by culturing an entire school is not considerable, and this is usually deemed necessary when an outbreak has to be suppressed. This is especially apt to be true if the cases come from different grades and if the outbreak refuses to be suppressed following the culturing of abnormal throats and noses.

2. There is a likelihood that the procedure will have to be repeated at intervals in order to check errors and to discover new carriers.

3. The method is susceptible of error at practically every stage—in taking the cultures, in their handling, in their examination, and in the reports upon the examination. These are avoidable errors it is true, yet it is remarkable how frequently they do occur. They are apt to be especially numerous in the presence of an outbreak when everyone is working under pressure.

4. A certain percentage of carriers are sure to be found. The number is usually estimated to be about four or five carriers for every case, but this varies greatly. It depends largely, I think, on what the laboratory considers a diphtheria bacillus. These carriers must be excluded until they have cleared up or until a test shall have shown them to be non-virulent. This may be as little as five days or a week—though it *can* be less—or as much as several months. The loss of school time on account of carriers is apt to be greater than on account of cases.

5. The culturing of cases for release involves numerous domiciliary visits, consuming much time and causing not a little annoyance. This is quite apt to arouse public opposition, thereby increasing the difficulty of controlling not only the carriers but the cases as well.

I cite these objections not for the purpose of utterly condemning the method, but in order to show how unsatisfactory it is and how important it is that we seek something better.

Let us now consider measles for a moment. This disease annually causes about half as many deaths as diphtheria and about twice as many as scarlet fever. But mark this: Sixty per cent of the deaths are in children under school age. While it is a very fatal disease during the first three years of life and in orphanages and infant asylums, the general mortality between 5 and 9 is less than 0.5 per cent of the reported cases at that age. On the other hand about two thirds of the cases occur after school life begins and unless they have had it previously adults are just as susceptible as children. This is a matter of some importance since an attack in adult life means a greater economic loss than does the loss of school time. Furthermore, in time of war, a large number of non-immunes among the troops is quite certain to result in high mortality and a considerable disruption of military routine.

Except in the rural districts of our more sparsely settled States practically everyone is certain to acquire the disease before reaching adult life. Disease censuses taken in two New York counties this past year showed this to be true of from 90 to 95 per cent of rural-school pupils.

Measles is spread for the most part by cases in the incipient stage and it can only be prevented by isolating cases at the very commencement of this stage or before—that is, isolating contacts during the period of incubation. The disease can be detected early enough to prevent its spread by means of the clinical thermometer. This entails, however, a great deal of work and not a little disturbance of the school routine since the temperature must be taken of every susceptible exposure every day for a period of from five to fourteen days. The isolation of contacts is sometimes successful in small communities, provided one learns of the first case promptly and is successful in discovering all the contacts. The method bears a very striking resemblance of the well-known method of catching a bird by putting salt on its tail. It involves a considerable loss of school time, and the chances are excellent that instead of preventing measles, one is simply postponing it. All of which leads to the question, "Would it not be better

to expend the effort demanded to prevent measles in school children, to preventing it among children under three and among those who are in poor physical condition, and to seeing that when children are attacked they receive proper care?

Whooping cough also is a disease peculiarly fatal during the first three years of life and causes about the same number of deaths as measles. It has a long incubation period and is difficult to recognize until after many have been exposed. It is not, however, so peculiarly a school child disease as measles, since it is most common among pre-school children. Furthermore, most adults appear to be immune even though they may not have had the disease. It is quite possible that in most older children and adults the disease is so modified as to pass undiagnosed. The vaccine for the prevention of whooping cough is lauded by some and condemned by others. At best its reliability remains to be proved. There is perhaps better reason for a serious attempt to prevent whooping cough in school children than for measles since its usual course is from five to ten times longer.

Mumps, German measles, and chickenpox are non-fatal illnesses whose control is seldom seriously attempted outside the school. In children they are rarely attended by any serious consequences, although mumps after puberty may be a serious matter. German measles and chickenpox are of interest because mild scarlet fever is frequently mistaken for German measles and mild smallpox for chickenpox. Many school days are lost on account of these diseases and on account of exposure to them, and this constitutes practically the sole reason for attempting their suppression.

We do not know, however, and nobody seems to be trying to find out whether we decrease or increase the amount of absenteeism by efforts at prevention. Consider: German measles has a maximum incubation period of three weeks. The minimum for the sake of clearness is, we will say, one week. Exposures or contacts therefore must be excluded at least two weeks each unless they develop the disease promptly. Cases themselves may return a week after outset.

All of which brings me to the point toward which I have been gradually working. We need to collect, classify, and tabulate *useful* statistics on the incidence of communicable disease in schools. So far as I know no comprehensive scheme of this kind is anywhere in vogue. While it is true that here and there we have reports of intensive campaigns it is manifest that reports of this kind are quite apt to be colored and that they usually substitute generalities for definite figures. In any event they merely represent isolated instances and cover comparatively short periods.

We must find answers for such questions as these: Are our methods effective—is the amount of disease actually being reduced, and if so, is this reduction clearly attributable to the methods followed? Are our methods economical? Do they reduce disease incidence with the least expenditure of effort by the medical, nursing, and teaching staffs and with a minimum loss of school days?

I wish to stress this point, because for the true control of disease we must

have a statistical foundation. Unless we do have it we shall be continually guessing and we shall be continually misled by false deduction from insufficient premises. Few things are so patent in this work that they do not need to be stated numerically in order to be convincing. To insure progress, to insure success in this phase of public health work—which is also a phase of school administration—there must be cordial and intelligent coöperation between the health and the educational authorities. This coöperation should extend to the statistical field, to the field of research, as well as to the administrative activities of these two services. Working together we can tread the true path of progress and be able to distinguish it as we go. Working apart we shall but follow the beaten trails and never note that we are only following in the circle of our own footsteps. If I have seemed hypercritical in my statements, it has not been in a spirit of willful iconoclasm, but in order to stimulate the trial of methods that seem to promise better results, to promote research, to inspire thought.

THE MENTAL HYGIENE OF THE SCHOOL BEGINNER

WILLIAM H. BURNHAM, PROFESSOR OF PEDAGOGY AND SCHOOL HYGIENE,
CLARK UNIVERSITY, WORCESTER, MASSACHUSETTS

The child entering school has already had four years, more frequently six years, of pre-school training, in the home, on the street, the playground, or the like. Sometimes this has been good, sometimes bad. Usually it has been partly good and partly bad, from the point of view of mental hygiene, often seriously bad. Let us take a general survey of this period of pre-school training. To do this in detail would take a whole course of lectures. Dr. Gesell, of Yale, has prepared a book on the pre-school child which will, I hope, soon be published. The most that can be done in my brief survey is to note briefly a few outstanding points.

The child at birth is far more helpless than most vertebrate animals. It has little direct contact with the external world, except through the dermal senses of touch, temperature, and pain. It has duller senses than the adult. It is practically blind and deaf, the sense of taste is perhaps best developed, the sense of smell is relatively acute, but apparently has already begun to atrophy. The child is still anchored to the past; it reacts only to the more primitive sensations; it is capable of only the more rudimentary reactions. If with Edinger we call the brain cortex and its appendages, that part of the brain which in evolution began to develop with the serpents and the selachians, and has reached its wonderful development in the human cortex today, if we call this the new brain or neencephalon and the rest of the brain the old brain or paleencephalon, we may then say in a word that the child at birth is a paleencephalic organism.

Thus in the young child the connections between the brain cortex and the old brain have not yet been developed; and governed in its reactions by the lower levels of the brain, the child is a being less capable of co-

ordinated motor activity than the animal that has been deprived of its cerebrum. This is not a matter of mere inference. Some years ago the great German neurologist Edinger had the opportunity to study a child for three years that was born without the new brain. Where the neencephalon should have been was merely a cyst-like tissue, and for three years this child lived and was observed by Edinger and the child's mother. The report shows this little girl could not feed herself, could not learn to creep or walk, could not speak, could not even perform the most rudimentary activities, could only eat when food was placed in her mouth, and merely lay and made a monotonous sound. She was really incapable of learning as much in the way of motor coördination as a dog whose cerebrum has been removed. Such is the condition even of the normal infant at birth.

At birth, however, or before, the education of the child, or adjustment to the conditions of the external world, begins. The child has an innate impulse to activity, which is the matrix from which the more concrete instinctive reactions, so called, are differentiated. This impulse, or instinct if you please, to activity, together with the three fundamental emotions of fear, rage, and love, represent the primitive fundamental instinctive reactions of the child organism.

Again soon after birth the connection between the new brain and the old brain gradually develops, and with the development of the cortex the wonderful ability to make associations is developed. This appears first in the association of stimuli, in the production of conditioned reflexes in connection with food and the like. Even by observation one can note their beginnings in the early months of life. In the motor field they appear in the response, for example, of opening the mouth at sight of a spoon or cup from which the child has been fed, and perhaps in connection with the bath or the like.

Again in the field of emotion associated stimuli to the primitive emotions are soon developed. The child responds not merely to the primitive fundamental stimuli that produce fear, but also to varied stimuli that become associated with the primitive biologically adequate stimuli—first to loud noises, for example, then to any sensation perhaps that often occurs simultaneously with a loud noise.

Correlated with this physical and neural development, the general development of the mind and character has progressed so far by the time of school entrance that it is not strange the churchmen should have said that if they had the development of a child for the first six years they cared not who trained him afterward, or that Watson says that during the first three or four years of life he could make or mar a child irrevocably without violence or drastic methods.

Even with the few investigations already made, we have the following facts which are suggestive. Apparently at about the age of two years there is a great physiological epoch in the individual's development. By what seems to be a justifiable analogy between the development in the brain of the white rat and that of man, as a result of the careful studies

of Donaldson and his students, we find that at this age the child's nervous system should be capable of practically all the fundamental reactions the adult's is capable of. We find too, that before this age there is growth by cell division as well as by enlargement of the individual neurones; that after this period there is no further increase in the number of neurones; that at this period the brain weight is two and one half times what it was at birth, if not more; that somewhere between the age of sixteen months and two years the chemical constituents of the child's brain are similar to those in the adult; that at this period medullation has in a large degree been completed. When we correlate with this the psychic development observed and the fact that conditioned reflexes of great variety can be developed, we have a number of facts which indicate that this is a significant point, a nodal point perhaps we may say, in the development of the nervous system and the mental life.

At this period the fundamental habits of health, or the unfortunate habits which lead to physical and mental disorder, develop, especially in regard to food, digestion, sleep, movements of the bowels, and the like; and the fundamental reactions of fear and the other emotions are developing.

Even at this early period the reactions to the fundamental impulse or instinct to activity are developing, and while often neglected, these are significant. As Royce has pointed out, the child is constantly and continuously active, performing all sorts of rudimentary motor responses, doing the same thing over and over again merely for the sake of expending energy, for the sake of the motor activity itself. While the subject of little study, careful observers from Rousseau to the present have pointed out the advantage of leaving the child free to indulge at will in these spontaneous motor reactions in response to this fundamental instinct of activity.

Another side to all this is perhaps equally important, namely, the inhibitions of stimuli, the inhibitions of various forms of behavior, and inhibitions of more general character, good and bad, which develop during the early years. These come chiefly from associated stimuli, from associated emotional attitudes, and later from associated ideas which tend to inhibit other stimuli and other reactions.

Here, without entering into any controversy with regard to what is emphasized so much today, the subconscious or the unconscious, as the great reservoir of human character and human behavior, we may at least find the beginning of those fundamental but unconscious sets of the mind and emotional attitudes which survive in later life—unconscious, so far as the individual is concerned, but potent in determining the mental life.

Again the studies by Beik and Zigler indicate that about the age of six another nodal point in development occurs and naturally the mental development correlated with this is significant.

We cannot for a moment suppose that the child comes to school with mind and character a *tabula rasa*. Already on entering school the child is a bundle of conditioned reflexes, habits, sets of the mind, attitudes—appearing in whims, aversions, tendencies to certain forms of behavior—and already handicapped by a multitude of inhibitions.

Somatic hygiene without mental hygiene is inadequate, sometimes even dangerous. A splendid work has been done in recent years in caring for the proper feeding and nutrition of children. Many cases of malnutrition have been found among the well-to-do as well as among the poor, and the movement has accomplished a great work for the health of American children. To make this care for the proper nutrition of children as perfect as possible, it is desirable to keep in mind the great complexity of the whole problem of growth and development.

A dozen factors condition growth, as shown by a vast number of modern investigations. Among these are race, sex, individual type, the innate impulse to growth, relative primogeniture, the functioning of the endocrine glands, the environment in general as well as the food and nutrition provided, climate, the season of the year, exercise, disease or absence of disease, and general hygienic conditions.

Under the influence of these many factors naturally there are periods of accelerated and retarded growth, the most notable of which, after the early years of life, comes at the beginning of puberty; and many minor periodicities appear. Thus it is not strange that a child may be perfectly normal and yet for a period, perhaps of several months, grow very little or not at all. That, at least, is the natural inference; and observation by many parents and physicians has given evidence in many concrete instances. No standard is yet sufficiently perfected, no expert sufficiently wise to tell in case of an individual child just what the rate of growth at a given time should be. No height-weight quotient reliable by itself has yet been devised. A study of a group of children fed by the Quaker Commission in Europe showed no significant correlation between the findings by these quotients and those by clinical examination.

Thus obviously parents and teachers should not be too much disturbed when children apparently well do not grow at certain times according to the conventional norms. They should not say too much to the children about the need of growing at a certain rate, and should not make the stimuli for competition in growth too strong, lest perchance the children themselves acquire a morbid attitude and become worried because they do not grow as their playmates do. There is little danger of this, because children do not naturally worry about hygiene; but children of six years may develop morbid attitudes in regard to their own health or at least a complex of whims in regard to food and the like. Recent extended investigations by Hetherington in New York show that children are interested in matters of personal health at a much earlier age than most teachers imagine.

Normal digestion and nutrition are important for the mental health; but on the other hand, especially since Pavlov and others have shown that digestion waits on appetite and that an important condition of digestion is a mental attitude of serenity and cheerfulness, we see that even so admirable a form of somatic hygiene as the care for proper nutrition, may, with some children, carry its danger with it unless properly controlled by a normal mental hygiene. We have learned in recent years that even the best

balanced scientific diet does not save one from nutritional disease unless it contains those mysterious but vitally essential elements that, for lack of a better term, we call vitamins. In like manner what shall it profit a child if it have all the necessary elements and an ample diet if his mental attitude is abnormal, whether from the pedantry of his parents or the whims of the child itself?

While the general problem of hygiene is complex, the essentials of mental hygiene for the school beginner are simple. They are absolutely essential conditions also of mental health at all periods. They are the essentials too of sound education. Thus sound education and mental hygiene are inseparable. The *a, b, c* of both are the same. The minimal essentials are three—a task, a plan, and liberty. Worth-while activity in work or play, purposeful activity, freedom, and the stimulus of success either in accomplishment or the mere fact of doing, are the conditions of happiness and mental health everywhere. The child is always devising tasks of his own. If we give opportunity, in the early years, the problem will largely solve itself. Later more special training is needed. But the child's own activity is the very thing we are apt to neglect. We do not have time for this.

Again the hygienic value of a task comes from the fact that in the doing children both develop an interest and also learn to face reality. The educational value is as great as the health value. The health value is as significant as the educational value. But the health value as well as the educational value come from the child's doing it, not from the teacher's doing it.

Lest some may think I am giving the fussy vagaries of a mental hygiene expert, let me say that the Health Committee of the International Kindergarten Union has recognized this, and in a recent report it says of the interference of teachers with the tasks of the pupils:

"Nothing can be a greater nervous strain than to have some one continually at one's elbow to suggest or correct or to pick up one's work suddenly and set it right just as we were about to find a way ourselves. This nervous strain does not occur so much in the formal, dictatorial kindergarten where the children soon come to recognize that the teacher will do all the planning and they have little personal responsibility. It occurs more often in the kindergarten of a young teacher, whose ideal is to help the children develop initiative. She arouses their enthusiasm in a problem—and then cannot patiently let them think it out or work it out alone. Time is flying! The juggernaut of the program must go on its triumphant way regardless of how many slowly forming ideas it crushes, and the busy, busy teacher interferes. She interferes with the way Mary carries her chair—and sets it right; she interferes again when Mary's work is almost done—and with a deft touch spoils Mary's work by making it the teacher's. Is there not in this undue interference a nervous strain to the child which can be lessened without destroying his respect for order and organization?"

The beginning of school life should be a period of leisure, of self-adjust-

ment to the new social environment, of the spontaneous doing of tasks worthwhile, for which the school furnishes the opportunity. Mental hygiene forbids our making it a time of hurry, interference with the tasks of the children, and the development of inhibitions.

Some one may naturally ask if the child does it all, what is the teacher's business? The answer is, the teacher's business is to suggest, and guide, and give opportunity for the choosing of tasks worthwhile. The most important ways of giving suggestion are by example, and the force of concrete situations. This is the teaching of that master among the world's gardeners, Luther Burbank, who suggests that the best opportunities for tasks come from a rich natural environment out-of-doors. "Every child," he says, "should have mud pies, grasshoppers, water-bugs, tadpoles, frogs, mud-turtles, elderberries, wild strawberries, acorns, chestnuts, trees to climb, brooks to wade in, water-lilies, woodchucks, bats, bees, butterflies, various animals to pet, hay-fields, pine-cones, rocks to roll, sand, snakes, huckleberries, and hornets; and any child who has been deprived of these has been deprived of the best part of his education."

And if any note the danger in giving freedom, the problem is whether it be not more dangerous to prescribe.

The importance of the mental hygiene of the school beginner can not be adequately shown without a multitude of concrete details and examples. For this there is not time. A single illustration is given by the importance of detecting the inhibitions which children bring with them as a result of pre-school training. Some of these are important for health, some are definitely injurious. The most striking of them perhaps are those connected with a child's food and manner of eating and those which result from fear. Dr. Campbell has given many illustrations of the whims and inhibitions in regard to food. Every teacher can find examples of those from fear.

That the importance of mental hygiene for the school beginner has not in the past been emphasized, is due to the fact that so little of concrete fact has been available. Now, however, from the studies of repression and shock and the like in infancy made by the Freudians, and the knowledge of the lasting effects of unfortunate experience in childhood, with the concrete data furnished by the laboratory study of children by Krasnogorski in Russia, Dr. Mateer and Watson in this country, and our resulting knowledge of the conditioned reflexes and inhibitions developed in pre-school life, the unfortunate causes of conduct disorders and the obstacles to teaching and discipline that result from all these peculiarities and abnormalities, and finally, with the realization of the absurdity of the prevailing notion that mental hygiene is only for those who have no minds, especially the feeble-minded, we see the tremendous significance of applying the well established principles of mental hygiene, not only in the examination of the school beginner, but also in the adaptation of tasks to the ability of the children and the use of sound methods in instruction and training. Only thus can we avoid the twisting and thwarting of the pupils' characters, the development

of unwholesome attitudes, inhibitions, and nervousness by the work of the school, the sad record of failure and retardation, and the shame and disgrace of the public schools from the need of re-education of so many of their graduates in the hospital and the sanitarium, by the use of precisely the methods that the school aims to employ.

Thus the first six years of a child's life is a period of marvelous development, physical and mental. The completion of the sixth year usually marks the completion of many significant changes. As several studies have shown, it is in a sense an important nodal point, and while everything points to the fact that the first business of the child is growth and healthful development, it is apparent that care for the mental health as well as the physical health is necessary. The two cannot be separated. The one aim to which everything else is secondary, is health, physical and mental. For the mental health four things are of primary importance, and they are important conditions of healthful physical development as well.

(1) A rich and varied environment out-of-doors. A child's early training is in response to stimulation and the various natural objects in an ordinary country home are, so far as they go, the things needed. When this is meager a more varied and richer environment if possible should be provided. With such surroundings out-of-doors a child is provided with the best means of training.

(2) Freedom for spontaneous activity. The impulse to activity is universal and furnishes the necessary impulse in normal children. While parents and teachers should protect children from accident and the like, beyond that the special rule should be to let them alone so that they can make their own adjustments to natural situations. Parents usually are afraid to do this and feel that the least they can do is to interfere.

(3) Special training to remove the inhibitions which children bring to school with them from the home, the street, and the playground. Only a specialist in genetic psychology realizes how many and how serious are these inhibitions—inhibitions in regard to activity, in regard to food, clothing, in regard to play, and sometimes in regard to food, digestion, habits of secretion, in regard to sleep and many forms of behavior, perhaps in regard to a hundred things, varying according to the home and the playground surroundings.

(4) Non-interference. So little is known about normal mental development at this period that the only safe rule, where one does not know what to do, is to let children alone. This applies in regard to food, drink, sleep, activity, and many of the defects and disorders of childhood; and teachers as well as parents, as far as possible, may well allow children to choose their own task.

A COMPENSATORY MECHANISM IN STATUS THYMICO-LYMPHATICUS

WALTER TIMME, M. D., NEW YORK CITY

Preliminary to the presentation of this topic, it may be expedient to present my views regarding this constitutional state, so that our discussion may be around mutually understood terms. By a status thymico-lymphaticus, I understand a hypoplastic state, a condition in which important structures are smaller proportionately than the size of the individual calls for, with the sole exception of the lymphoid tissue of the body which is usually hypertrophic. The hypoplastic organs which are of importance are the heart, the blood vessel system, and some of the glands of internal secretion, notably the adrenals, the pituitary, the genitals, and frequently the thyroid. An enlarged thymus gland, which has been assumed to be the chief factor in this condition, is probably only one of the attendant or necessary ones and indeed, occasionally, though rarely, may not be demonstrable at all. Individuals, constitutionally hypoplastic, have precarious times during their life's course, not only on account of the blood vessels and cardiac conditions, but also by virtue of the small adrenals and underactive pituitary and thyroid glands, and by their altered and probably inadequate biochemical reactions. The extreme variety of symptoms produced by these basic disturbances will not have to be detailed by me for they are undoubtedly well known to such a group as this audience represents. The point of interest, however, to me is the question: while some of these patients die at critical times, such as, when under stress or strain, under narcosis, through fear and fright, yet why do the far greater number survive and gradually pass, presumably normal, from your observation? Indeed, many cases of status probably never see a physician for this trouble. In other words, there must exist an intrinsic mechanism in the individual which is automatically brought into action, which will counteract, overcome, and perhaps even cause to disappear, many of the inadequacies of his structure and his physiology. To get some light upon this mechanism, it is of course incumbent upon us to examine during their adolescent or even early adult years cases that give the physical signs of an early status thymico-lymphaticus.

Such adult cases when seen in large numbers, fall naturally into a few groups, but they all have some general characteristics. These are still the small blood vessels and heart, probably a thymic shadow, large upper central incisors and a maxillary torus, possibly hyperextension of the joints, notably of the phalanges and of the mandible, easily leading to subluxations. But when we look for evidences of a hypoplastic state in other directions, certain changes from the child's status are seen. In the first place, the blood chemistry has changed, the early relative lymphocytosis is not seen, the blood sugar is higher, the coagulation time is within normal limits. Evidences of better circulation are also noticed. The poor reaction to cold has been overcome, the skin does not get mottled on exposure, the hands and feet do not easily get blue and cold as before. The blood pressure

is normal and the individual has become much more able to overcome his difficulties. Evidently his glandular mechanism also has taken part in the general improvement.

Now, between these cases that die an early death, and those that become later apparently normal, there are the large number that only partially get out of this early difficulty, and as a result, we see them during this transition at some point at which their forces are unable to cope with the obstacles barring their way, usually in the guise of fatigue and headache, or fear or apprehension, frequently because of structural disturbances such as obesity, or overgrowth; occasionally because of lack of genital maturity, very often because of psychoneuroses. Many of the cases, because they show a common symptomatology have been grouped by investigators as follows: Neuræsthenia, migraine, Fröhlich's dystrophy, giantism, infantilism, neuro-circulatory asthenia, and a host of others. It has always been on a basis of symptom groups and not of pathogenesis that these conditions have been named. Let it be admitted right here also that some of these symptom groups may conceivably arise from causes other than in the course of a compensatory transitional status progress. Nevertheless, all these so-called "entities" (which they are not), may come about in the course of the attempt of the individual to compensate for an original status thymico-lymphaticus.

What are the main handicapping features of a status hypoplasticus from which the individual must free himself? First, the large thymus gland, then the inadequate blood sugar content, the low blood and pulse pressures, the low body temperature, the long blood coagulation time, the low general metabolism, and the low alkaline reserve. All of these attributes tend to make him of low resistance to fatigue, to infection, to shock; to produce in him inadequacies of personality and conduct with apprehensions and fears; a lack of initiative and tenacity, and hence a dislike of obstacles with a resultant automatic treading of the path of least resistance—a weakling in person and behavior.

However, practically all of these disabling qualities may be gradually overcome by an overactivity of certain glandular units. For instance, it has been shown that in lower forms of life the thymus may be made to involute rapidly by feeding thyroid gland. The coagulation time of the blood is most certainly hastened by both thyroid and suprarenal medication; body temperature is increased by thyroid and pituitary and suprarenal effort; blood sugar content is increased by the same three organs; blood and pulse pressures are considerably modified by the action of the suprarenal and pituitary glands; the metabolic rate likewise is heightened by thyroid and suprarenal substance. In short, there is within us an adequate mechanism to overcome the supreme disabilities of a status hypoplasticus. It is when the mechanism, or one of its component parts remains inadequate, that we see the partial effect upon the individual. This is the reason that status cases have usually been divided, by such observers as Emerson and Symmers, into two groups—namely, the one type with well-rounded

joints, fatty pads, and a general smoothness of contour, and the other type with slight and frail limbs, a sunken chest, and prominent joints. In reality, these represent only the extremes of many types varying in all degrees. The former class is that in which the pituitary is probably inefficient in its compensation, and the latter, that in which through lack of thyroid activity the thymus still exerts some influence in retarding development. The former, in extreme cases is really Fröhlich's dystrophy, most cases of which show a persistent thymus on X-ray examination. The latter is the type that gives us our effort syndrome cases—neuro-circulatory asthenias—with its low pressures, its disordered cardiac activities, its cold, blue, and clammy extremities. So that from the perfectly compensated cases with no symptomatology and only the physical signs of an early status, down to the lowest or feeblest compensatory cases with all the symptoms and physical signs of a persistent state, we have all intermediate grades.

Of interest is the individual in whom, secondly and probably compensatorily, the thyroid is overactive to such a degree in its effort that a true hyperthyroidism develops with goitre and at times exophthalmos. Indeed, Crile from his own experience, and citing others, states that 80 per cent of the goitre cases show a persistent thymus gland; and Crotti and others as well find that unless the thymus is removed at operation the goitre is apt to recur. This is also my own experience. These facts go far to support the theory that such hyperthyroidism is compensatory. Occasionally, it happens, as theoretically it should, that X-raying or removing the thymus alone produces a cessation of the hyperthyroidism.

Of interest is the series of changes that take place in the compensatory activity of the pituitary. As is usual in thymic states, the pituitary is small and the sella turcica small and largely enclosed. In such circumstances, if there is to be any hyperactivity of the gland, certain results will follow. In the first place, there will be the effect of the pressure exerted upon the walls of the sella turcica due to the engorgement or enlargement of the pituitary. This will determine in all but the few cases in which this fossa is ample in size, headache of varying degrees of intensity, from a simple "fulness of the head" to excruciating, boring headaches, intratemporal in situation. These headaches will come on at periodic intervals, and will be credited by the patient to any one of numerous causes—all of which may be effective in producing it in an individual of this type. Such causes are those largely that superinduce fatigue—overwork, worry, going too long without food, menstrual periods, and a host of others. After many years of such headaches, they usually spontaneously diminish or even cease. During the period of headaches, other signs in the individual become manifest. Thus, growth of the body in height and breadth is marked, fatigue usually becomes gradually lessened, the blood picture changes, in that the carbon dioxide tension is increased and the blood sugar increases, while the blood and pulse pressure increase. In other words, accompanying the headache periods, a general improvement of the individual on the vegetative level becomes manifest. With this heightened level, the mental

processes also seem to improve so that there is more initiative, more control over instinctive acts, less of flight in the presence of difficulties and obstacles, a greater power of attention, concentration, and application.

When we examine the sella turcica in such individuals after a few years of this compensatory process, we see that there is evidence of pressure in the walls of the cavity for there is decalcification in various parts, chiefly at the dorsum and posterior clinoids; erosion at other places, and occasionally even a direct break through the walls into the sphenoid sinus or middle fossa of the skull. An enlargement of the cavity is thus produced which may be fully adequate for all purposes, in which case the headaches cease and the individual improves. At times the pituitary mass encroaches laterally upon the cavernous sinus and then symptoms referable to pressure upon the sinus and its contents—the motor oculi nerves, the ophthalmic division of the fifth nerve and its lachrymal branch—are added to the headaches. Then we have oculo-motor palsies, with strabismus, ptosis, lachrimation, and attendant symptoms at the time of the headache. Pressure anteriorly will produce optic nerve disturbances with scotomata and other visual field contractions and disturbances; while pressure posteriorly may produce pyramidal tract symptoms. These symptoms, correctly interpreted, are now seen to be incidentals in the compensatory process as affecting the pituitary gland. Occasionally it becomes possible to examine the sellæ turcicæ in the same individual at yearly intervals during the process and the successive enlargements of the fossa are unmistakable. Also, occasionally, the first picture is taken after the sella has already become fairly normal in size, and then the radiographer will report a “normal sella.” As a matter of fact, even though the size of the sella is normal, irregularity in contour with decalcified areas and facetting due to pressure serve to distinguish this type from a really normal sella. The type of individual that results from the compensatory process is one of large frame, generally six feet or taller, with a past history of fatigue, with headaches, with perhaps some stigmata of an early status still present—such as invert type of genitals, feminine pubic hair, late development of mustache and beard and the teeth of combined thymic and pituitary individuals—large central incisors, broad and square teeth generally with spacing, and hyperextensibility of many joints.

Of any attempts of the suprarenal glands to take part in the compensatory process we know little. Occasionally a case will go to autopsy, showing still inadequate suprarenal glands. Giant Turner, mentioned and photographed by Cushing, was an excellent example. At the autopsy, he still showed thymic remains, a very large, eroded sella turcica, but small blood vessels and extremely small suprarenals. One case that came under my notice was that of a girl of twenty, who died a “thymic” death under chloroform narcosis and who showed an aorta as small as a little finger and extremely small adrenal glands. It is of course possible and perhaps probable that many cases that make good recoveries and that never see a physician, improve under the influence of hypertrophic suprarenal glands. Very often, according to Cannon, the adrenals become hypertrophic, due to

overstimulation of the thyroid, and by thyroid compensation in the course of a status progress such an object may be attained.

It is obvious that many cases come to us in a partially compensated state, and if we can read their symptoms aright, it is possible that we may assist them in their compensatory attempts. The main points for us to recognize are those of inadequacies on the part of the thyroid and pituitary glands combined with signs of an early status thymico-lymphaticus, and as the number of these combinations may be almost infinite, depending on the grades of inadequacy of the compensatory mechanism, so do we have an equally large number of types of partially compensated cases, varying between the two commonly described.

There is abundant evidence, therefore, that cases of status thymico-lymphaticus undergo a gradual change through one or two decades leading finally to a more or less adequate state which enables the individual to take his place as a competent unit among his fellows. The enabling mechanism is composed of several component glandular organs, chief among which are probably the thyroid and the pituitary glands. Anywhere in the course of the compensation, cessation of the process may take place, leaving the individual only partly efficient, giving signs and symptoms of the deficiency of the particular gland or glands involved. If this is properly recognized, a method of assisting the compensatory progress suggests itself. It is furthermore of the greatest importance to recognize the signs and symptoms of the overactivity of the compensatory mechanism so that they be not treated as pertaining to a disease process but to a defensive one.

TONSILS AND ADENOIDS IN CHILDREN

D. CROSBY GREENE, M. D., HARVARD MEDICAL COLLEGE,
CAMBRIDGE, MASSACHUSETTS

The subject of tonsils and adenoids is one which is familiar to everyone in these days. The number of operations for their removal has, in recent years, reached such an enormous figure that today, a large share of the community has been operated upon before reaching adult life. It is a difficult matter to get even approximate figures of the number of operations during a single year in a city like Boston. But a rough estimate may be made by reference to the reports of the leading public clinics where this work is done. The total number at seven of our largest clinics is over 12,000. The number of operations at the smaller clinics and in private practise, would at a conservative estimate, bring the total figure to over 25,000 operations in one year. I believe that an inquiry into the matter would show a similar proportion of operations in other large centers of population in this country.

This subject is, therefore, a vital one to those who are concerned in the upbringing of the young and it is worth while, at a meeting of this char-

acter, to consider briefly the nature of these structures, the harmful effects which they may produce and the indications of a diseased condition.

In the first place, it should be borne in mind that tonsils and adenoids are composed of the same sort of lymphoid tissue which is found in the normal individual in various parts of the alimentary tract in varying amounts. The exact function of this tissue has never been determined, though many theories have been advanced in explanation. The fact that the wholesale removal of the tonsils and adenoids has not developed any deterioration in the individuals operated upon, but on the contrary, has been followed in the large majority of cases by improved health and vitality, is in itself, evidence that no vital function is reposed in these structures.

The harmful effects are of two classes:—first, those which result from simple enlargement, and second, those which result from infectious inflammation. Simple enlargement produces obstruction of the respiratory tract which, in turn, causes retardation and distortion of physical development. But simple hypertrophy which may be visible, but is not of sufficient degree to cause obstruction to breathing, is not an indication for operation.

Of far greater importance, in most cases, are the effects produced by infection of the tonsil. The conditions, represented in this group, comprise recurring, acute inflammations of the nose and throat with secondary inflammation in the middle ear, and sometimes, the nasal sinuses; infections of the glands of the neck; and more remote, secondary inflammations in the joints and in the heart which are the result of infection, carried by the blood stream from infected tonsils.

The points to be stressed in determining the question of operation in these cases are, in the first place, whether the tonsils and adenoids are large enough to obstruct respiration, and, secondly and of greater importance, whether the tonsils show definite evidence of infection. In making the decision as to operation, it should be borne in mind first that the operation as performed nowadays by competent operators who remove the entire tonsil, is not a trivial affair unattended with danger. There are real risks of hemorrhage, of pneumonia, sometimes even of abscess of the lung—dangers which are sometimes, though rarely, encountered by operators of experience and skill, and more often by those who lack these qualifications. The surgeon who says that he has never had any misfortune in these operations is one who shows by his statement that he is lacking either in experience or in varacity.

I mention these risks, not as an argument against operation, but for the sake of emphasizing the importance, first of careful determination of the advisability of the operation, and secondly, of adequate training and skill of the operator. In every case one should be convinced that the risk in the long run is greater without than with operation. One should balance the risk of a crippling heart disease, or arthritis, or middle ear disease, or a stunted development from deficient breathing space, against the relatively slight risk of operation. If this were done in every case, it would diminish the number of unnecessary operations that are undoubtedly being performed today.

As I have already intimated the size of the tonsils is not of as great significance as the kind of tonsil. The chief indications for the operation for removal of tonsils and adenoids are first, a history of repeated attacks of acute tonsillitis; second, enlargement of the glands of the neck; third, attacks of acute arthritis, commonly called rheumatism, which can, in many cases, be associated with inflammation of the tonsils; fourth, often occurring with the above, is infectious disease of the lining membrane of the heart which we call endo-carditis; fifth, attacks of acute middle ear disease which are commonly due to extension of infections from the adenoids or tonsils, or both, by way of the Eustachian tube to the middle ear; sixth, evident facial deformity and deformity of the chest, due to obstruction of nasal respiration; seventh, lastly, the size and general appearance of the tonsil is, in some cases, indicative of gross enlargement or disease.

But too much reliance should not be placed on the appearance of the tonsils. Often those which, at one inspection, are normal in appearance will, at another time, show distinct abnormality. The history of the case is often of greater importance than the examination.

A word as to the results of operation, we find that, as a rule, there is a decided improvement in general health, as well as in the local condition of the throat. But this does not mean necessarily, freedom from colds or even from the diseases which I have mentioned. Children whose throats have been cleared of tonsils and adenoids may still be subject to colds or middle ear inflammations, but it may be truthfully said that the chances of serious complications are decidedly lessened as a result of the operation.

Climate and exposure to infection play a very important part in the whole problem. A case which strikingly illustrated this point was that of a girl of fourteen years whom I saw a few years ago. She was the child of American parents, born and raised on the Mexican plateau. During her life there she never had trouble with her nose and throat. She came to school in Cambridge at fourteen years of age, and throughout her first winter here, was subject to repeated colds and attacks of acute tonsillitis. Examination of her throat showed large, prominent, and obviously diseased tonsils and large adenoids, and yet, up to the age of fourteen, this child had enjoyed the best of health, and was a fine specimen of physical development. It is fair to assume that, if she had continued to live in Mexico, she would not have had to even consult a doctor about her throat. Whereas living here she became immediately subject to inflammations in her throat of which she was finally relieved by the removal of her tonsils and adenoids.

In conclusion, I would like once more, to sound a note of caution in regard to the present wholesale rate of tonsil operating. Tonsils that are moderately large should not be removed without further evidence of disease from the history of the case, or the examination. The decision to operate should only be made after careful weighing of the evidence for and against operation.

EARLY RECOGNITION AND PROPER CARE OF HEART DISEASE AMONG SCHOOL CHILDREN

ROBERT H. HALSEY, M. D., NEW YORK POST GRADUATE MEDICAL SCHOOL
AND HOSPITAL, NEW YORK CITY

For those responsible for the education of the children in our public schools, it is very important to know the mental and physical possibilities of the child, whether there is or is not a handicap.

It is of paramount importance therefore, that each child on admission to the school should be carefully and thoroughly examined for its physical condition. By such an inventory of its assets and liabilities, the greatest return may accrue to the child from its investment of time and the State's investment of funds. The parents or guardian of each child should be requested to relate the illnesses and diseases which the child has had in order that some clue may be discovered as to the time when, and the infection by which, the heart was damaged. It is important to search particularly throughout the past for throat and joint difficulties and learn if there is any relation between their incidence and that of the heart defect. This should be done not only to learn the present condition but to be prepared to understand in the future the development of some unheralded defect. This inquisition may be accomplished by a trained social service worker, not added to the pedagogical duties of the teacher.

The examination of the physical condition of the child should be done by a well-trained physician and to be done properly requires time and the removal of the clothes of the child. It is rare indeed in these days that parents object to a dignified physical examination. They have learned the value of disinterested public health advice. An examination by the physician should record the visible, gross abnormalities, clubbing of the fingers, vasomotor disturbances, as cyanosis or erythrosis, the condition of the teeth, throat, tonsils, adenoids, and cervical glands, the presence of focal infections, discharging ears, dyspnoea, palpitation. Many of these conditions may be observed by a teacher and when seen, should suggest the need of an expert review of the condition of the child. The physician should note the condition of the lungs and the evidence of abnormal function as well as the cardiac signs, whether due to organic or accidental conditions. The activity, or disproportion in the interaction, of the endocrine system, as well as the state of nutrition and stature should be recorded. Having noted the static physical defects, the child should be examined during and after completing an amount of work given to develop its mechanical ability and defects, such as breathlessness, vertigo, fatigue, or degree of exhaustion.

At the completion of the examination of each child, there should be data upon which to base a diagnosis composed of three parts: first, the probable cause of the condition and whether it is active or dormant; second, the anatomical defects; and lastly, it should be placed in the proper group of a functional classification similar to the classification adopted by the New York Association of Cardiac Clinics.

CLASSIFICATION OF PATIENTS ATTENDING A CARDIAC CLINIC

Class I—Patients with organic heart disease who are able to carry on their habitual physical activity.

Class II—Patients with organic heart disease who are able to carry on diminished physical activity. A. Slightly decreased. B. Greatly decreased.

Class III—Patients with organic heart disease who are unable to carry on any physical activity.

Class IV—Patients with possible heart disease. Patients who have abnormal physical signs in the heart, but in whom the general picture or the character of the physical signs leads us to believe that they do not originate from cardiac disease.

Class V—Patients with potential heart disease. Patients who do not have any suggestion of cardiac disease, but who are suffering from an infectious condition which may be accompanied by such disease; e. g., rheumatic fever, tonsillitis, chorea, or syphilis.

By this method, the child's ability to carry on is approximately stated so that the teacher, the social service worker, and the convalescent, summer or vacation home may be apprised of the limitation or necessary restrictions of the child's activity.

Not only does the physical examination discover and evaluate positive findings, but it excludes improperly diagnosed conditions which resemble but are not heart disease. Often groups will be found in which one half or three quarters may be free from the heart defects which are charged against them. This error is not only unfair to the normal child, but it is detrimental to the child with an actually damaged heart, since such a child is often competing with normal children who are designated as heart cases and able to do, without injury, things which are too severe to require of a damaged heart and, if done, ultimately increase the degree of damage.

After recognition and classification, the care of the child depends upon the coöperation of a number of individuals—doctor, nurse, teacher, parents, child—who should be fully informed as to the nature of the handicap in order that the knowledge may bring the best return to the child.

The knowledge of the discovery of a cardiac defect should not be withheld, in accordance with old-time custom, from the child, as if it were a kind of mental explosive bomb too dangerous to be handled. Nor should the information be imparted in the subdued, stage-whisper tone of voice that is commonly reserved for the transmittal of news considered so serious that even its relation seems to imply a certain degree of danger.

The patients and parents, satisfied that the doctor knows the exact condition, are inspired with confidence and accept eagerly the advice given. So true is this that coöperation will increase rapidly from 25 per cent to a full 100 per cent as the results are observed.

A hopeful outlook is justified, for the child who knows the limitation of its heart will not readily undertake, or continue physical tasks which will be, or are, overtaxing. Knowing the necessity for the reasonable

restrictions imposed, the child becomes more contented with, or adjusts itself more cheerfully to, its environment. The acquirement of equanimity is the greatest aid to the plans of both teacher and doctor.

Any scheme devised has certain fundamentals which are interwoven and require the planning of doctor, teacher, and recreation or occupation director in their supervision from day to day. For the proper execution of such a scheme a social service nurse is essential. She it is who will look after the physical welfare of the child and see that the allotted time is spent as it should be. By her tact, common sense, and attention to details the children, parents, and teachers are kept informed of the individual needs or requirements. She keeps the child moving through the program.

In New York, two general plans are being followed as to supervision: the children are being followed by special clinics, one group attending the regular schools; another group, the children are segregated at some one central school. Segregation is not essential to proper care but does make possible rapid gathering of both facts and the other information possible from close association with large numbers of children handicapped with heart disease. There are eight clinics supervising the two groups of this type. In both groups executive supervision is carried on by a social worker whose duty it is to bring all the children back for periodic examination, whether ill or well; she follows up all absentees and has them examined at once if conditions warrant. Frequent re-examinations are necessary to learn the actual status of each individual: to advise and control the vocation, occupation, and re-adjustment to new conditions. Frequent examinations are valuable because they imbue in the individual and family the idea that prevention is more important than cure. Furthermore such repeated examinations teach both parents and children that sound knowledge of physical conditions is all-important in order that the mode of life may be controlled accordingly. A monthly talk to the mothers and fathers in the presence of the whole group is a great help to confidence, makes for better coöperation, and improves the esprit of the children. It gives an opportunity for the teachers to come in contact with the parents and convey the right point of view toward health advice.

The doctor, having frequent contact with patients and social workers, comes to know the personality and is in a better position to answer queries of the nurse, who is the means of contact with the family. She can discuss with the teacher the physical and occupational requirements, when this may be necessary, to determine preparation for the future. The larger number of children with damaged hearts may continue, without detriment, to attend the regular schools, but it is necessary that they be examined from time to time as well as follow certain restrictions. There is a group, a small per cent, who require considerable restriction as to exertion. For this group (II, A and B) it is necessary to have rest periods during the day and limit the duration and vigor of the walking. The diet of all the children should be supervised to insure its general wholesome character. Excess of sugar or candy should be avoided, although they are frequently

eaten in large quantities with or without the permission of parents. Meat need not be excluded though it should not be allowed in preponderating amount.

After even the simplest infections or diseases, the convalescence should be prolonged until the heart may have time in which to make a complete recovery. Tonsillitis, occurring in nearly 70 per cent of children with heart disease, or five times more often than in children without heart disease; rheumatism, occurring in approximately 50 per cent, and chorea, bone and joint pains should be considered as potentially serious diseases in children.

When there is neither fever nor active infection, a certain amount of graduated exercises, such as calisthenics, may be given under supervision. The individual endurance varies, so that all cannot take the same amount. These exercises improve the physical and mental alertness and functional activity of the heart and breathing as well as the posture of the child. Dancing, gardening, and quiet games may and should be used to develop interest. Instruction in various occupations should be given to the more seriously handicapped for its encouragement in sustaining individual endeavor to be productive. The digestive tract reacts to the exercise with more regularity, thus aiding the general condition of the child.

The supervising nurse can administer the simple medicines which may occasionally be required and when in doubt, appeal to the physician. Her duties, too, include obtaining the permission of the parents for necessary operations or special examinations; such as tonsillectomies, chronic otitis, serological, blood, or ophthalmic tests. Tonsillectomies can and should be done under ether anæsthesia to insure thorough removal.

The nurse should obtain and welcome all the various public health agencies—health departments, hospitals, out-patient departments of the various other hospital and convalescent or summer vacation homes where the child may be kept in the open sunshine and country life for weeks or months.

To summarize: the care of the child with heart disease in the public schools requires early recognition to prevent more damage. The child, who has had diseases which may, at sometime, initiate heart disease, should have special restrictions and care to prevent such an accident.

The proper care of the child with heart disease requires not only the individual and persistent supervision of doctor and nurse, but also the careful coöperation of the family together with that of the Department of Education, as well as the principals and teachers.

CONSERVATION OF THE EYES OF SCHOOL CHILDREN

GEORGE S. DERBY, M. D., ASSISTANT PROFESSOR OF OPHTHALMOLOGY,
HARVARD MEDICAL SCHOOL, CAMBRIDGE, MASSACHUSETTS

I have been asked by your secretary to talk to you on the conservation of the eyes in school children, with especial emphasis on the causes for

the wearing of glasses. After being in the practice of medicine for nearly twenty years and dealing with these problems every day it is a little difficult to talk in a non-technical way.

In the first place I regard the testing of vision in the schools as it is usually done at present as an extremely valuable measure. It is a good thing to have two or three charts and have them clean. There are a few precautions to take in carrying it out. The chart should be hung in a good light and the pupil should not face the light. The pupils should not have a chance to see the chart before being asked to read it. If I were a teacher I would tie up one eye with a patch while the pupil is reading from the other. If one eye is poor and the pupil is not watched he will often peep out of the good eye when it is supposedly covered. The pupil should not press the covered eye with his hand as the light will be blurred for a little time. Of course the test is not always carried out correctly and sometimes gives misleading results, but this is in a small percentage of cases; in my experience the information while limited is valuable and usually correct. We are only testing, however, the sight. Because a child has normal sight does not necessarily mean that he has normal eyes. I think a good rule to follow is this. If a child reads at least half the letters of the 20/20, or normal sight line, and has no symptoms which are referable to his eyes, I should pass him. If his vision falls below this he should be referred to the expert. If he is a backward child or shows symptoms which might be due to eyestrain, such as headache, red lids, pain in the eyes, etc., I should refer him to the expert whether his vision be normal or not. If his eyes turn either in or out he should be likewise referred to the expert.

Now when does a child need glasses? It is necessary to say a few words about the optical principles of the eye, but I will make them as few and as simple as possible. In order to see things distinctly the rays of light coming from objects into the eye must come to a focus on the retina.

The normal eye is so constructed that the light coming from objects 20 feet away and beyond are normally focussed in this manner. That is we see distinctly in the distance without making even an involuntary effort.

There are three different abnormal kinds of eyeball. There is the long eye (longer from front to back), the short eye, and the irregular or astigmatic eye.

The long eye is usually due to stretching of the eyeball, the condition known as myopia. The myopic eye has a short focus. The short-sighted eye sees well close to but does not see in the distance. This is a handicap and bars the myope from certain occupations, the more short-sighted the more handicap. It is well to control the development of the near-sight as well as it can be done by modern methods. In the old days when the causes of near-sight and its importance were none too well understood the Germans were a very near-sighted race. Too much use of the eyes, the book held too near the eyes, faulty posture, poor light, illegible script, and

lack of exercise promoting health are conditions the correction of which have largely done away with myopia in Germany. In the same way the Chinese scholar is near-sighted almost to a man. You will find usually moreover that the myopic child is inordinately devoted to his books. He cannot see in the distance, and it has no charms for him.

Now what are the methods of controlling the development of nearsightedness? Good light, good posture, good print, holding the book well away from the eyes, in serious cases, curtailing the use of the eyes. The wearing of glasses has a favorable influence on the progress of nearsightedness. In the first place it overcomes the handicap of poor distant vision, it restores the focus of the eye to the normal distance. It makes it easier for the pupil to hold the book at the proper distance from the eyes. All children with nearsightedness should wear glasses every moment that they use their eyes for near work. The only permissible time to take them off is when they are looking in the distance. This is extremely important during childhood and youth for that is the time when myopia is prone to increase. The eyeball may stretch, but it never shrinks back again. The myopic child is quickly shown up in the school examinations by his poor vision.

The second class, astigmatism, is not easy to explain; it is an irregularity of the front of the eye. The front of the eye should be a section of a sphere, in astigmatism it is a slice off the side of a lemon, some rays focus at one point, some at another; thus sight is more or less defective; there is difficulty in seeing and it produces strain. Such a child will not read perfectly, but he may read a few letters of the normal sight line, but in reading down he will have missed a number of letters on the lines above. If the astigmatism is sufficient in amount to cause symptoms he should have glasses which will make his sight normal. How much he must wear them depends on the amount of the astigmatism, the amount it is affecting his progress in school, and somewhat on the amount the sight is affected. Personally I believe glasses should not be worn constantly by people with slight astigmatism. I do not hold with the men who believe the very fine degrees of astigmatism are likely to cause symptoms.

The third class of what we call refractive errors are what we call the hypermetropes, or far-sighted people. This does not mean necessarily that they can see long distances but only that they see relatively better at the distance than they do close to. These are the people with congenitally flat or short eyes.

Now in youth the focusing power of the eye is very strong and the poor vision of the short eye can be corrected by focusing. The normal eye is focused for the distance so that it can see without making any effort. When we read we have to focus our eyes, but the muscles are so strong that we are able to focus them for long periods at a time without strain. The far-sighted child in order to see in the distance must often focus as much as we do when we read, otherwise objects around him look indistinct. Thus when he comes to read he must focus an extra amount. In individuals who

are not rugged this strain may give rise to various symptoms, such as aching eyes, headaches, early fatigue, etc., and for that reason glasses are usually necessary and often have to be worn constantly in the higher degrees of hypermetropia.

No set rule can be made for the prescribing and wearing of glasses in these anomalies of sight which I have described except in the higher degrees. Each case must be judged on its own merits and that is where the optician and optometrist who have no medical training usually fail. They can often measure the eyes for the right glasses, but they cannot judge in each particular case of the necessity for wearing which often takes a high order of judgment and intelligence.

One other thing, the focusing muscle is very active in the child and its power gradually weakens through life. In order to arrive at a clear understanding of the state of the eye, it is almost always desirable in children to use a drug to paralyze temporarily the focusing muscle. This drug is atropin or belladonna for younger children and homatropin, a weaker drug, for the older ones and for young adults. These drugs can do no harm and are practically essential for examining the eyes of the young.

One other point which I meant to emphasize. Symptoms which we know as eyestrain are seen most often in connection with hypermetropia and astigmatism. They may often be relieved by glasses worn constantly or perhaps only for near work. The symptoms of eyestrain are seldom seen in myopia. Glasses are worn in this condition to improve distant vision and to control the progress of the myopia. A myopic person is much handicapped by his eyes in the normal relations of life. He cannot recognize his friends, he cannot see the blackboard, enjoy the movies or the theater.

Now a little about cross eyes, squint or strabismus as it is technically called. Whenever an eye turns in or out expert advice should be sought and the earlier the child sees the doctor the better. I like to begin work on these squint cases not later than two years of age. I shall only talk to you about the eyes that turn in. When a mother brings a child to you with a squint, you ask which eye turns in and she usually replies both. To have both eyes turn in at the same time is an exceedingly rare condition, usually either the right or the left turns while the other remains straight or they may alternate, first one turning and then the other. What are the causes?

In order for an eye to see distinctly it must be directed straight forward so that the rays of light from the object looked at will fall on the center of the retina. If the rays fall anywhere else sight is much reduced. Hold your fingers up to one side of the other while you hold your eye straight and see how much less distinct they are than when you hold them directly in front. Now in normal eyes there is a delicate interconnecting system of telegraph wires in the brain which so controls their movements that the image of the object looked at falls on the corresponding central point of each retina, these two pictures are superimposed and a single picture results which not only has length and breadth but the perception of depth or relief

or as we call it, stereoscopic vision. This perception of relief is very imperfect in one eye alone; with one eye alone the judgment of distance is very faulty. Now there is a great deal about the origin of squint which we do not know, but one of the commonest causes of it is a faulty development of this delicate nervous mechanism which joins the two eyes, the fusion sense we call it. The fusion sense is faulty, it may even be absent.

Let us suppose that an eye has at birth faulty sight, or acquires it as the result of accident or disease. Its owner has no longer sufficient incentive to use the two eyes together and one of them turns naturally either out or in for there is nothing to hold it straight. Such a squint can only be remedied by operation, and it may not stay straight even then. Next there is the eye with faulty sight through excessive far-sight, near-sight, or astigmatism. It may be possible to improve the sight greatly by glasses, and the squint that has developed may be corrected. Sometimes we tie up the good eye and make the child use the poor eye in order to develop its sight.

Another common cause is excessive hypermetropia. You know what focusing is. We focus in order to read. We must converge also in order to read. If you look at my eyes when I am regarding a near object you will see that they converge as they focus, the two things go hand in hand. In a high degree of far-sightedness, as I told you before, the vision must focus excessively in order to see. He therefore converges excessively and the image of objects no longer falls on the center of the back of the eye. In order to see distinctly one eye at least must be turned straight. He cannot straighten both, for to do that he would have to relax his focusing power and he is focusing in order to see properly. So what he does is to turn one eye straight and as a result the other eye turns inward.

Overcome the necessity for too excessive focusing by giving the child glasses and the eyes will often straighten without further treatment; thus it is inevitable that many cases of squint must wear glasses to correct faulty visual conditions. The wearing of glasses, assisting the development of the fusion sense by exercises, and sometimes the developing of the sight of a poor eye by covering the other are the essentials in treating squint. If they fail, then an operation on the muscles which govern the position of the eyes is necessary, but this is usually the last resort. Those measures should be taken early before the habits are too ingrained.

To sum up, therefore, we may say that glasses are most often prescribed (1) to control the development of myopia, (2) to improve faulty vision, (3) to relieve eyestrain, and (4) to assist in establishing normal relationships between the two eyes. A point which should be emphasized here is the necessity of the teacher's seeing that the glasses which have been ordered are worn. Too often the pupil's family goes to the expense and loss of time necessary to an examination and then the glasses are thrown aside by the child after a few days.

Attention to the eyes in childhood is of great importance. They should be cared for but not overcared for, as is sometimes the case. Condemning a child to glasses is a serious step and should be only taken after mature

consideration. Hardly a disease sign or symptom that the flesh is heir to that has not been laid at the door of defective eyes. Thus it is that Americans wear glasses to excess. Consider what is likely to happen if you go to the optician, a man without medical training, who tests your eyes and sells you the glasses. He makes his profit in the sale of glasses. His incentive to make a sale is certainly a strong one. Therefore a child or adult sent to the optician to have his eyes examined is practically certain to return with a pair of glasses. If these children cannot afford to pay for the attention of the medical specialist, then whenever possible send them to a reputable hospital clinic.

Now it is by no means certain that the child with symptoms apparently referable to the eyes really has anything the matter with those organs. We Americans are a nervous race, and we show many signs of nervous tension. Many children are brought to me each year that are purely nervous and have nothing the matter with their eyes. The commonest features they display is twitching, especially of the face, complaints of headache, sensitiveness to light, and a whole train of other signs. It is not infrequently that I see children who desire glasses just to imitate small friends who wear them.

The child who can see perfectly well but who simulates trouble with the eyes is not uncommon in my experience. The deceitfulness of these children is often seen only after several examinations. The motive sometimes becomes clear but occasionally is a mystery. The physician as well as the teacher has much use for psychology.

Another thing to remember is that a weakly child or one that is run down may show symptoms in any part of the body without local cause. This must be kept in mind by teacher, parent, and physician.

Now there are other children besides those we have been talking of, who need attention in school. Children whose eyes and lids are chronically red and inflamed need medical treatment and often glasses. The recognition of the early symptoms of pink eye or conjunctivitis is exceedingly important. This disease is a cold in the eye, is very contagious, and easily and quickly curable. The pupil with this disease should be quickly excluded from the classroom, as it spreads like wildfire.

I regret that my time does not allow me to talk to you about two very interesting and important diseases with unpronounceable names—phlyctenular keratitis, which bears a close relationship to tuberculosis, and interstitial keratitis, due to hereditary syphilis. Both these diseases furnish candidates for the defective eyesight classes, a subject which I should like to dwell on did my time allow.

OHIO'S EFFORT TO BRING CHILDREN UP TO A NORMAL HEALTH STANDARD

T. HOWARD WINTERS, STATE DEPARTMENT OF EDUCATION,
COLUMBUS, OHIO

I fear that those who have noticed the title of this paper have anticipated the statement of a definite program for bringing Ohio children up to a normal health standard—a program not only defined, but in practical operation throughout the State. Such, I regret to say, is not the present stage of our progress. As in many other things, and like many other States in this field, there are scattered, miscellaneous beginnings; the establishment of some such work in some places on a good basis, and a measure of State-wide interest with some phases of the work centrally promoted or provided for by legislation.

The work has lagged a good deal behind what we hoped for three years ago; first, because the bill providing for county health districts was seriously weakened before it was really in effect, and secondly, because the physical education bill failed to pass. The latter provided for physical education in all schools, it being required already in city districts, for the proper training of physical education teachers, and some training in that work for all teachers, for a State syllabus and State supervision. It connected physical education and health supervision only to the extent of providing that in the conduct of the former due notice should be taken of the health supervision, and in making it a duty of the State supervisor to promote coöperation with the State department of health and with local health authorities. If this bill had passed we feel that a great deal more could have been done. We especially feel the need of an expert in these lines on the staff of the State department of education.

The following is the draft of a bill prepared for introduction to the next legislature. This was prepared by a committee interested in physical education. The endorsements of persons and organizations concerned with school and child welfare are desired and also any criticisms or suggestions relating to the matter are invited.

A BILL

To amend section 7721 and to add supplemental sections 7721-1 to 7721-7 inclusive of the General Code, relating to physical education in the schools.

Be it enacted by the General Assembly of the State of Ohio:

SECTION 1. That section 7721 of the General Code be amended and that supplementary sections 7721-1 to 7721-7 inclusive be added to read as follows:

SEC. 7721. *All pupils in the elementary and secondary schools of the State shall receive as part of their instruction such physical education as may be prescribed or approved by the director of education, and the physical education provided shall occupy not less than one hundred minutes per school week. This time shall be in addition to that devoted to regular intermissions and to instruction in physiology and hygiene. Modified courses of instruction may be provided or approved by the director of education for pupils unable to take the courses provided for normal children. Credits and penalties shall be applied for success or failure in physical education courses as in other school subjects.*

SEC. 7721-1. The superintendents of schools of all city, exempted village and county school districts, shall submit before the fifteenth day of September annually, to the director of education, for his approval, the courses in physical education to be pursued by the schools under their supervision or shall indicate that the courses outlined by the director of education will be followed by the schools under their supervision. At the close of each school month a report of the amount of time devoted to physical education shall be included in the report of every school.

SEC. 7721-2. Boards of education shall, in the institution and conduct of physical education, take due knowledge of the health supervision of school children maintained by boards of health or by boards of education and shall provide for the proper coordination of such work with the work in physical education.

SEC. 7721-3. All institutions for the training of teachers in the State of Ohio shall include courses of study designed to prepare teachers to give instruction in physical education. No state-wide certificate shall be granted after June 1, 1924, to persons who have not had such work in physical education, in college or normal school as may be required by the director of education.

SEC. 7721-4. After September 1, 1926, no person shall be granted a certificate or employed to teach or supervise physical education as a special subject, who does not present satisfactory evidence of having creditably completed a special course in physical education of not less than two years, or its satisfactory equivalent, unless such person has served as a full-time teacher or supervisor of physical education prior to January 1, 1925. The holder of a physical education certificate may be employed to teach hygiene, which shall be included in the term physical education, used in other sections of law relating thereto.

SEC. 7721-5. The director of education shall publish a program and a syllabus covering the several subjects and activities required in physical education and these publications shall be distributed for the use of the teachers of the State.

SEC. 7721-6. The director of education shall appoint a supervisor of physical education to administer, supervise, and direct the varied program and activities of physical education and to promote the training of teachers of physical education, to promote cooperation with the State department of health, and with district boards of health, to advise with boards of education and to assist the director of education in the performance of the various duties devolving upon him in the execution of laws relating to physical education.

SEC. 7721-7. It shall be the duty of the boards of education or other officials in charge of all schools in the State to make provision for the establishment and maintenance in their schools of the courses in physical education prescribed by section 7721 of the General Code.

SECTION 2. That original section 7721 of the General Code be, and the same is hereby repealed.

The county health district bill, as first passed, provided a minimum staff in each county of a full-time physician, a nurse, and an office assistant. It abolished all local boards of health outside of cities of 25,000 or more. It provided that the staff in each county must be chosen on civil service rules. The budget made by the county health board became effective on approval of the county health advisory council. The State might aid up to \$2000 per year. In the law now in effect, State aid and the large district are retained, but the extent of the staff is made permissive and the budget is subject to the county budget commission. It is not even necessary that the physician be employed full time. The safeguard of civil service is not retained. The statement of many duties is changed from *shall* to *may*. Under such a law the efficiency of the county health office and the amount of service it gives in the county vary from almost nothing to very extensive and almost adequate health supervision.

Our laws provide that a board of education may appoint school physicians and trained nurses, or may delegate the duties of such to the board of

health. Now, we do not have county unit school districts (except for general school supervision); our counties are cut up into rural districts of six by six miles or smaller. These districts have seldom appointed school physicians or nurses. Besides, this law was enacted when there were the small village and township health boards, which hardly functioned except when there was a serious epidemic. The most of the health work, done in rural Ohio schools prior to 1919, was under a clause which enabled two or more districts to unite to employ a school physician or nurse. Several progressive county superintendents of schools prompted all boards in their respective counties or the boards of large sections of the counties to employ a physician, or physician and nurses. Sometimes the nurses did practically all of the work in the field, the physician (under whom alone they have the right to inspect school children) being nominally in employ, or remaining at the county seat and having doubtful or serious cases brought in to him for further examination. This system of inspection, when diligently promoted by the county superintendent of schools, having follow-up work and clinics, and securing general interest, proved very effective. Unfortunately it was not tried in many counties and not in all of those with the effort necessary to wide effectiveness.

Besides work so organized there was medical inspection in a good many districts by representatives of the county medical societies, often without pay. For eight years the State Medical Society has urged inspection of all children, and has urged upon its subsidiary county organizations, steps to secure it, and, if necessary, voluntary service to demonstrate its value. Such service has been given mostly in villages. There seemed not to be the organizing power to make it systematic in the country.

But under the new health bill practically all rural health supervision centers around the county health office. This office is financed in one county with only \$1600 (\$600 of local money). Usually there is a budget of \$4000 or more (including State funds), paying for a physician part-time, for a nurse, and for some clerical service. Oftentimes there is an additional nurse or two supplied by private or semi-public organizations.

However, it must not be understood that these nurses give all of their time to the schools or to children. In some they give no time to the schools; in others their chief service is in the schools. As the law says the board of health may "provide for the medical and dental supervision of school children" and for the inspection of schools, such variations were to be expected.

A goodly number of counties have recognized to some extent the need, and made or secured provision for it, so that the schools are visited fairly often, even if remote, and the children are examined, contagion is watched, unsanitary conditions are ordered abated. One of the big services has been the examination of the water supply. Many orders were placed on this in the State, so that few children are now drinking water of uncertain purity. The distribution of water has also been regulated by the county health service where the common drinking cup had not already been

abandoned. Many school toilets were examined and condemned, although many still remain the most obvious disgrace of our schools.

I have spoken above solely of rural work. Much the same could be said of the larger villages and smaller cities. Many of these have nurses employed by their boards of education or furnished by organizations. Their functions often include home visitation. Such school nurses are employed in almost all of the cities of 20,000 inhabitants or above.

The bureau of child hygiene of our State department of health has been very active for several years for the betterment of school children. It has secured the coöperation of a number of physicians in addition to those of the department and has held many clinics for the examination of eyes, throats, lungs, and glands. It has searched out and has endeavored to stamp out trachoma, much of which is brought to us from southern States. We are in a goitre belt, and the help of the best specialists has been rendered the department for examination of those with such symptoms. Much effort has been put on tuberculosis.

One of the large developments has been work for crippled children. In 1914 a law was passed providing that special classes for the crippled might be provided with State aid. Excellent classes were established in several of the larger cities; the one at Cleveland had existed for several years previous. The interest taken in the Toledo class by the Rotarians and the establishment of a class in the Children's Hospital at Elyria were forerunners of a much larger movement, promoted by the Rotarians of the State and the Ohio Society for Crippled Children, which is endeavoring to hunt out, treat, and educate every crippled child in the State. In 1921 a bill was passed increasing the per capita aid for the classes (up to \$300) and providing through the State Division of Charities a considerable sum (\$15,000) for the maintenance and care of the children who need operations. A supervisor of special classes, including also those for the blind and deaf, has been provided in the State Department of Education and many new classes have been established. This law aims in some way to provide proper schooling for every crippled child, no matter how situated. Our supervisor is working in close coöperation with the rehabilitation division, which can take care of the vocational training of those past sixteen.

While the Council is doubtless more interested in what is being done for normal or nearly normal children, I think I should speak of the Bureau of Juvenile Research. The name would perhaps indicate functions beyond what it has performed, for it has worked, since it was founded in 1914, almost entirely on mental diagnosis. Dr. H. H. Goddard was brought from the Vineland, New Jersey, school to head the Bureau, and is still in charge, although he has resigned to join the staff of the State University and to provide clinical work there in September this year. The Bureau invites superintendents of schools to refer to it cases of seeming mental defects, speech defects, and nervous disorders. It is usual for an agent of the Bureau to examine the children while he is at work in that neighborhood, although many are brought into the Juvenile Research building in Colum-

bus. Some are treated by the Bureau, even for long periods, as the case of double personality of which you have perhaps seen notice in the newspapers. Cases arising in the juvenile courts are also frequently investigated by the Bureau. Unfortunately the State is not well prepared to take care of those who should become its wards, as our Boys' Industrial School has long been inadequate and proper training or even good physical care of delinquent boys is not possible there, while our Girls' Industrial School is also overcrowded and notoriously unadapted to child rehabilitation. Ohio has, I believe, the unhappy distinction of having the largest boys' and girls' reformatories in the world. I wish we could write "best" instead.

Again the capacity of our Institution for Feeble-Minded is much too small, and many committed by the courts cannot be received. This has led courts to commit only those that parents desire to have committed, and has led the Institution to receive mostly those whose parents will pay for their maintenance. However plans are under way to increase the facilities for the custodial care of the feeble-minded, and it is hoped we may soon be able to benefit more largely from the scientific advice of the Bureau of Juvenile Research.

But we must hasten to return to the care of children who are not abnormal. Some of the most helpful work is that of the Modern Health Crusade and similar practical hygiene teaching. This work was largely introduced into our schools during the World War. It has been greatly promoted by a bulletin entitled "Course of Study in Hygiene," which was prepared by Miss Virginia Lewis, of the Ohio Public Health Association, and was published by the State Department of Education last fall. The 262 pages are entirely devoted to practical health teaching in grades one to eight. It is confined mostly to health stories and drills. It aims at strong motivation of the work. This booklet was put into the hands of every elementary teacher of the State last winter. It has brought great results in care of the teeth and other items of personal hygiene.

Miss Lewis will herself teach the course through in the model schools of one of our State normals this coming year, and all of the practical work will be filmed—a step which seems to have great possibilities.

The Richland County health demonstration will be fairly under way by fall. A careful experiment in intensive health service is to be made there for five years on a fund of \$200,000 appropriated by the National Red Cross. Naturally, much of the work will be done in the schools of the county and of Mansfield, a city of 28,000. At the same time the State Department of Health is conducting a demonstration in Portage County and its two small cities, Ravenna and Kent, the latter the seat of one of the State normal schools. These demonstrations should not only prove the value of adequate health staffs, but should furnish selected models for procedure in all lines.

Our new Ohio compulsory education law will help in several ways the health of children. In the first place, the provision of a county attendance officer has brought into school many who were escaping attendance entirely.

and it has made more regular those who had been careless. This alone will mean much for their care. Next, the age for leaving school to work is raised to sixteen. Finally, careful physical examination is required for work certificates, and such must be held by all workers to the age of eighteen. This places responsibility for the health of children largely on the schools from the time they enter at six or seven until they are established in industry or college at eighteen years of age.

Child labor in agricultural districts, especially the onion flats, which has been so bad in Ohio as to get National notice, is being broken up under this law, which after a year of operation has gained many friends and lost many enemies.

A big factor in all matters of child betterment in Ohio, has been the Ohio Council of Child Welfare, now merged as a department of the Ohio Institute for Public Efficiency. This Council was publicly supported during the war. After that it was supported privately and is now a part of the Institute, which is also privately supported. Miss Lucia B. Johnson has been secretary of this agency from the beginning and her broad vision and sensitivity to child needs, together with the wisdom of Fred C. Croxton, former director of the Institute, and R. E. Miles, present Director, have given us an understanding of our problems which we would not have otherwise had. The method is to bring together all agencies with a State-wide program, to study specific problems or specific territory. Reports of field workers of Red Cross, State department of education, health, industrial relations, and charities are brought in together, and sometimes the field workers go out together, accompanied by Miss Johnson or one of her assistants, to get facts or to urge local action. Thoughtless public officials of all sorts are helped to realize their problems and responsibilities. If necessary, some attention is given to legislation or unsatisfactory executive action or delays of the courts. For two years this agency has loaned the State Department of Education the services of Miss Hannah Protzman as investigator of non-attendance at school.

Much effort is being made in this State to have no child go neglected because of ignorance or poverty. Ohio is a State of many and varied conditions, of foreigners, negroes, illiterate whites of the mountaineer type, mill workers, miners, and almost every variety of condition hard to reach, because of remoteness or masses.

Poor soil, impassable roads, crowded populations, and bad housing, rural as well as city, present added problems. Against these are abundant resources and intelligence if they can be properly applied. At no point can they be made to yield as largely as in the proper care and guidance of children. We believe we are on our way to the standards that should become effective, but we cannot yet take much pride in our achievements.

Department of Classroom Teachers

OFFICERS

President—ETHEL M. GARDNER, President of the Milwaukee Teachers' Association.....Milwaukee, Wis.
Vice-President—SARA H. FAHEY, Manual Training High School.....Brooklyn, N. Y.
Secretary—MARY F. DWYER, Grade Teacher.....Chicago, Ill.

PROGRAM OF MEETINGS

FIRST SESSION—TUESDAY AFTERNOON, JULY 4, 1922
Mechanics Hall

The following addresses were given:

THOMAS JEFFERSON—Nina C. Buchanan, president National League of Teachers' Association, Seattle, Wash.
NEW IDEALS IN EDUCATION—William H. Kilpatrick, Teachers College, Columbia University, New York, N. Y.
IMPROVING THE SERVICE—THROUGH TENURE—Charl O. Williams, president of the National Education Association, Memphis, Tenn. THROUGH PENSIONS—Margaret Haley, Chicago, Ill.

SECOND SESSION—THURSDAY AFTERNOON, JULY 6, 1922
Symphony Hall

The following addresses were given:

THE CLASSROOM TEACHER AS A FACTOR IN EDUCATIONAL PROGRESS—Sara H. Fahey, Manual Training High School, Brooklyn, N. Y.
COÖPERATION BETWEEN CLASSROOM TEACHERS OF LARGE AND SMALL COMMUNITIES—R. C. Moore, secretary of the Illinois State Teachers' Association, Carlinville, Ill.
DISCUSSION Led by Mildred Miller, Teachers College, Columbia University, New York, N. Y.
ORGANIZATION OF THE TEACHERS IN ENGLAND AND WALES—W. G. Cove, president of the National Union of Teachers of England and Wales.
Reports from Organizations.

NEW IDEALS IN EDUCATION¹

WILLIAM H. KILPATRICK, TEACHERS COLLEGE, COLUMBIA UNIVERSITY,
NEW YORK CITY

The ideals here chosen, arbitrarily chosen among many, are those having to do with the aims and spirit of education. They are not new to the world—ideals seldom are—but only in emphasis.

First and most inclusively, education now aims as never before to know itself, to learn its strengths and its weaknesses, to become conscious of its hitherto blind traditions. It seeks to clarify and adequately found its deeper aims. It is trying to clean its house, to found itself on reason, on criticised experience. In one inclusive word it sets before itself the task of finding

¹ A condensed statement of what was said.

its proper aims and of ascertaining as exactly as it can the best ways by which these may be attained.

Among specific ideals is the social aim, to relate education properly, inherently, to our social life: on the one hand, to improve as we can and when we can the American conception of a proper social life; on the other hand, to embody in the rising generation the highest social ideals we can attain. And a remarkable and far-reaching conclusion results; democracy and education each mutually demands and supports the other. Each brings the other into being. Democracy seeks so to conduct society as to develop and express each member of society. Education cannot be education in any full unselfish sense except in such a democratic society. Democracy cannot be itself except its members grow as only full education can make them. Our social ideal then is the enthronement of democracy and education, a purified and enlightened democracy, an efficient and democratic education.

To us who teach are given the task and privilege of working out in all their ramifying details the ideal relationships of democracy and education. It is fitting that in this city and on this day we should clarify our ideals of democracy and education and rededicate ourselves to this cause of humanity.

The ideal of the good life which must guide education has been well stated by our foremost student in this field of endeavor. Professor Dewey's criterion gives us both the ideal relationships with others and the content of the good life considered individually. With others: Does our conduct increase and continue to increase the number and variety of interests shared with others? If yes, our conduct is good; if no, bad. With one's self: Does my conduct make me grow in such fashion that each act leads on to further continued growth both in myself and others. If yes, my life is full and rich and others through me. Growing then is the test of the good and happy life. But such growing is continued education. So life (the good rich life) and education are one, all one and the same. Our ideal is thus to increase the growing of all through the growing of each, and of each through the growing of all.

That all may so grow we must have an educational system aptly suited, in social relationships within the system, in properly conceived subject-matter and curriculum, and in suitable method. Within the system do we find all so working together, each in his proper place and function, as best to develop and express each mutually the other? Are conclusions of common concern reached only after mutual consultations? Does each contribute his best to the common store? The legal machinery to effect this is not always easy to contrive, the spirit only is here set forth. Whether we think of officer and teacher, or of teacher and pupil, such mutual respect for personality must be our goal and guide.

In like manner there must be a democratic conception of subject-matter. This is not, as often conceived, an affair of imposition from without and above by the old and strong upon the young and helpless. Subject-matter

is best conceived as ways of behaving. It looks in two directions. Looking backward it is the race-experience, saved and stored, available for the future. Looking to the future it will enrich the life and character of the individual. Learning is the process by which the individual raises himself to continually higher levels by embodying in himself this wealth from the past. Our criterion should be: Does what we last week taught reappear in these our pupils in higher and richer living here and now? If yes, good. Our ideal then is, no deferred values. We seek continually growing richer living. This if any is a new ideal, but one that must come as fast as we can work out the feasible details.

Correlative with a democratic administration and a democratic subject-matter is a democratic method. Our treatment of the young must be such as to build for democratic self-direction, unselfish and unspoiled, not for peasant-like subservience nor for selfish domineering. Such a method recognizes that the child is of necessity learning many things simultaneously, customary subject-matter focally, but marginally a multitude of ideals and attitudes. Shall these ideals and attitudes be good or bad? Our method is the largest factor in determining. This democratic method rejoices to use our most scientific psychology. In readiness and satisfaction it sees on the one hand personality respected, on the other learning best taking place. It adopts the whole-hearted purposeful act as the proper unit of instruction, believing that this best builds the kind of character we need, that only thus by practicing life itself can the child really learn to live.

Our new ideals are then new emphases in education. Education seeks to know itself and to fashion itself rationally. Thus seeking it finds itself needed for democracy, and democracy needed for it. It finds that life, the rich growing life, and democracy and education are all one. On this platform it seeks to found itself in the large and in detail. From such and in such the teacher lives as never before, the child lives both now and later as never before.

THE IMPROVEMENT OF THE TEACHING PROFESSION THROUGH TENURE LEGISLATION

CHARL ORMOND WILLIAMS, SUPERINTENDENT OF SHELBY COUNTY
SCHOOLS, MEMPHIS, TENNESSEE

That effective and definite tenure legislation will tend to improve the teaching profession is admitted without question. Studies have been carried on, and legislation of this type has been in effect for over thirty years. No one can question the desirability for such legislation or the need for the same. This seems, however, to have been and still is a lack of concerted action on the part of the teachers of the country both in the community and in the State, which has caused our legislators to neglect positive action along this line.

When the National Education Association's Committee on Tenure reported at Des Moines a year ago that the "teaching profession today has

no problem to face that is more important than that of tenure," it stated a truism which is more apparent as the time goes on. It is not my purpose to dwell upon the reasons for tenure, the necessity for it, or the advantages that accrue. I am taking it for granted that this subject has been treated at sufficient length both through National investigations and reports as well as through the activities of the State and local teachers' associations. I believe however that it is of interest to you to have a few remarks directed toward the essential requirements of a model tenure bill. The great onward sweep of educational and public opinion has carried this matter to a point where now it requires careful and serious consideration of the essentials of such tenure legislation as will afford equal protection to the teacher and to the community alike.

Teachers in some places have been maligned and charged with being too radical in demanding legislation for their own protection. We believe that this is a false assertion. We believe that the best protection of any teacher is the competency of her services and the satisfaction she is rendering in her school and community. We desire no class legislation that will set us apart from professional lines of activity. We feel that we are only entitled to that reasonable sense of security which will make us free to plan for the future. We desire only that certainty of location which will make it possible for us to feel that we can purchase property and establish homes in the communities in which we live and work. We feel that this permanency of employment is due, not to us alone, but to the community as well.

In order to assure stability in our profession, in order to protect ourselves from the dangers of political favoritism and at the same time adequately secure for the community efficient and conscientious teachers, what are the essential elements in the formulation of tenure legislation that will guarantee these mutual advantages?

A model tenure bill for the State and community should first provide for an adequate probationary period. This period should not be less than three years in order that it may bring out the adequacy of professional preparation and the skill of the teacher in classroom management as well as her initiative, enthusiasm, industry, and ability to coöperate with the entire teaching personnel. During the probationary period the school executive should have full authority to discharge a teacher at the end of the school year by giving at least sixty days' notice.

A model tenure bill should provide in that State that when any teacher shall have been placed upon indefinite tenure in a district and shall afterwards accept employment in any other district of the State this teacher shall be upon indefinite tenure in said other district after one year's probationary period in the new district. It should also provide that if a teacher after an interim is reemployed, having already served on indefinite tenure, she shall be reemployed on indefinite tenure.

A model tenure bill should state the causes and grounds for dismissal for teachers on indefinite tenure and the method of procedure in so dis-

missing a teacher. It should be required that proof of neglect of duty, insubordination, conduct unbecoming a teacher, immoral or criminal conduct be submitted in writing to the board of education and to the teacher. These charges should be signed by the superintendent of schools or by a majority of the board of education and the teacher should be given a reasonable opportunity for refuting such charges at a hearing before the board or in some other manner agreed upon by the board of education and the teacher. Pending this hearing the teacher should be suspended and such suspension shall be with loss of pay only when the charges are sustained. A two-thirds majority vote of the board of education shall be sufficient to impeach or remove a teacher upon indefinite tenure. As a further protection to the community and as a stimulus for higher professional training on the part of teachers this bill should provide that the benefits of indefinite tenure shall not accrue unless such teacher has had an education and training equivalent to a graduation from a first grade school and two years' work in a normal school or college approved by the superintendent of public instruction. This condition should not apply, however, to teachers who have had six years or more experience in a district or community.

The privilege of viewing the action of a lower judicial body, in this case the board of education, is a fundamental principle of democratic justice and a reasonable protection that should be provided. Since the majority of dismissals are on technical grounds, the final board of appeals should be one engaged in educational work and yet a disinterested body. The ideal practice would provide for an appeal to the State superintendent of public instruction.

Provisions should be made that no superintendent of schools or assistant superintendent, county or district superintendent, supervisors, or principals should be placed upon indefinite tenure unless they are graduates of accredited high schools and of four year courses of colleges approved by the superintendent of public instruction. Exception should be made to those persons who have had six years' experience previous to the enactment of this legislation.

Boards of education should be granted the privilege of releasing a teacher at any time upon application of the teacher. A teacher may resign at any time by giving sixty days' notice.

It should be provided that it be illegal for any superintendent of schools to appoint or have any board of education employ a teacher already under contract and employment of another board of education, except as stated above, with the further exception that during the months of May, June, July and up to the 15th of August of each year a board of education may, without penalty, employ, to begin with the following year, a teacher then under engagement with another board of education in the State, for the coming school year. After August 15 of any year any teacher already employed shall file with the superintendent of schools of any other district, desiring to employ said teacher, a statement from the superintendent of schools from the district in which said teacher is already employed, express-

ing his willingness that said teacher may be employed by the other district. In order to protect an individual teacher a provision should be made that no teacher employed to serve upon indefinite tenure shall suffer a decrease in salary without consent except by a general proportionate salary revision affecting all teachers of the district.

If this legislation is State legislation provision can well be made that no State money shall be paid to any district which is not properly carrying out the provisions of this act and also that the attorney-general can bring suit against the board of education to recover all money paid to any teacher employed in violation of the provisions of this act.

I have not time in the ten minutes allotted me to enlarge upon the specific recommendations for tenure legislation which are outlined above. Permit me to say, however, that these recommendations have only been made after carefully deliberating and investigating into the best practices in vogue in other States and communities. I believe that they constitute the ground for uniform and strong tenure legislation and that they constitute the basic essentials that should be put in practice in all the States and communities as soon as possible.

The time for deliberation and discussion has passed. Despite the fact that tenure laws for teachers were first proposed as far back as 1886, at the present time there are only seven States and a score of communities that have made provisions for placing teachers on the same basis of security as our other individuals in professional and business life. Let us today resolve that we shall return to our communities determined to secure during the coming year such local and State legislation as will protect us in the discharge of our duties and relieve us from the constant fear and apprehension, the anxiety and uncertainty which robs the conscientious teacher of her power and efficiency. Let us all unite to place upon our statute books effective tenure legislation that will serve to stabilize and dignify our profession and gain for it the recognition it merits because of the service it renders.

COÖPERATION BETWEEN CLASSROOM TEACHERS OF LARGE AND SMALL COMMUNITIES¹

ROBERT C. MOORE, SECRETARY OF THE ILLINOIS STATE TEACHERS'
ASSOCIATION, CARLINVILLE, ILLINOIS

Introduction: Origin and development of organizations.

A. Our civilization is evolving from individualism to socialization.

1. Our American forefathers were pioneers in a new country, and their struggle to conquer nature developed a sturdy individualism. Their neighbors were few and far away, and social relations were almost negligible.

¹ Outline of address.

2. As the population increased, as the free public lands were taken up and occupied, as numerous large cities grew up, and as the wonderful modern inventions brought people close together, their social, industrial, and economic relations increased and became more complex. Individualism had to be curbed, social relations considered, and the public welfare promoted. There has been a slow and reluctant evolution from the chaos of individual effort to a system of organized activities.

B. The present era is one of organizations and organized effort by classes and groups with common interests; for instance, Big Business with its gigantic trusts and corporations, labor unions, religious denominations, professional associations, and a complicated multiplicity of lodges, leagues, federations, etc.

1. This is a step forward in socialization, but it is still "group individualism," or organized effort to promote the interests and ideas of certain classes and groups, sometimes at the expense of other classes or groups.

2. But these group associations and organized activities suggest the idea and inspire the hope that some day we shall discover the great common interests of all humanity, and that all the human race will coöperate harmoniously to promote these common interests.

Teachers' Organizations:

A. The organization of the teaching class has taken place slowly. It began with local organizations of teachers for professional study and growth, for study of educational problems, and only recently for protecting the rights and welfare of teachers and children. But it is now generally conceded that the organization of the teaching class is necessary to promote the ideals and ideas of that intelligent class and important factor in our intellectual and civic life.

B. The organization of teachers by States is now considered necessary, because education is a State function, is financed by the State, and is governed by State laws.

C. A national organization of teachers is now considered necessary for professional study, comparison of problems, methods, legislation and results, and for establishing national ideals. The idea of a national system of education supported by federal taxation is growing.

D. The differences between organizations in large and small communities are:

1. Group organization and coöperative action naturally begin and develop most rapidly in the large communities where social relations are clear and definite, and are characteristic of these large communities. Hence, the large communities take the lead in these things.

2. Small cities and rural communities are more individualistic and imagine themselves more independent. Therefore, organizations form slowly and organized effort is weak.

3. In large communities, teachers' organizations are usually strong, active, and aggressive.

4. In small communities, teachers' organizations are more easily imposed upon by other interests. Small communities are often deceived by the wild stories of the anarchistic, socialistic, autocratic, or otherwise dangerous tendencies of teachers' organizations in large communities.

5. In large communities, teachers' organizations and their activities are accepted as a reality. They may be opposed, but few now question their right to exist and to act.

6. In small communities, teachers' organizations are small and weak and are considered by many as improper, unnecessary, and in error if they take an active part in advocating or promoting anything but professional work.

General Principles:

A. Community interests, social relations, industrial coöperation, and economic unity now reach beyond the small, local community and bind together all the people of the State, of the Nation,—yes, even of the world. The recent world war certainly impressed us with the idea of world relations and of the world as a community. Therefore, education and teachers' interests are at least State-wide, and possibly Nation-wide. And now an international conference on education is being considered and may be definitely planned at this meeting.

B. Therefore, teachers of large and small communities must coöperate through State and National organizations. This implies mutual discussion, toleration, and understanding, to be followed by unified effort.

1. Method of coöperation in Illinois:

- a. Division association meetings,—14 in State.
- b. Discussion of problems and principles, local, and State-wide.
- c. Formulation of resolutions.
- d. State association meeting, and its discussions.
- e. Adoption of State-wide resolutions.
- f. Plan of unified procedure.
- g. Unified effort to obtain legislation, and to promote helpful educational movements throughout the State.

All this is coöperation between the teachers in large and small communities.

C. A fundamental principle of such coöperation is that teachers in large and small communities throughout the State, or possibly throughout the Nation or even the world, must consider and adopt certain definite principles upon which to stand and for which to work. These should be stated in terms broad enough to fit both large and small communities, for instance:

1. Equality of educational opportunity for all children.
2. State and National support for schools.
3. A good, well-trained teacher and a pleasant, well-equipped school-room for every child.
4. A secure tenure for teachers, based upon character and efficiency and not subject to the whims of partisan boards.

5. Schools and school funds must be kept clear of partisan politics and political manipulation.

6. A fair chance for every child to develop his latent powers to maturity and efficiency.

D. Large and small communities must coöperate and support each other in promoting the principles agreed upon by educating the general public to support them and by obtaining helpful legislation. Teachers must be so altruistic and unselfish in doing this that they can act enthusiastically even if the principles adopted cost some communities more than others in money or effort.

E. Classroom teachers are the most numerous group of teachers—probably more numerous than all other educational groups combined. Therefore, when classroom teachers learn thoroughly the methods of coöperation and become able through their numbers, their high intelligence, and their organized activities to apply a tremendous influence on our social, economic, political, and educational life and institutions, they must not follow the example of some of the present powerful organizations and promote their own interests alone, but must use their great power to right wrongs, prevent exploitation, suppress selfish greed, and cultivate altruism. They must set a high example of service to humanity, of teaching and practicing the principles of real and universal democracy.

Department of Deans of Women

OFFICERS

President—MINA KERR, Dean, Wheaton College.....Norton, Mass.
Vice-President—GEORGIA L. WHITE, Dean of Women, Cornell University.....Ithaca, N. Y.
Secretary—KATHARINE S. ALVORD, Dean of Women, DePauw University.....Greencastle, Ind.
Treasurer—FLORENCE LORING RICHARDS, Dean of Women, Winona State Teachers
CollegeWinona, Minn.

PROGRAM OF MEETINGS

FIRST SESSION—Thursday Morning, February 23, 1922

Joint Conference with the National Committee of Bureaus of Occupations and representatives of college vocational activities.—CORA HELEN COOLIDGE, Chairman of the National Committees of Bureau of Occupations.

Vocational Activities in Colleges

VOCATION AND THE COLLEGE OF LIBERAL ARTS—Richard W. Husband, Associate Dean, Dartmouth College, Hanover, N. H.
THE PSYCHOLOGICAL ASPECT OF VOCATIONAL WORK IN COLLEGES—Agnes L. Rogers, Professor of Education, Goucher College, Baltimore, Md.
DISCUSSION.

SECOND SESSION—Thursday Afternoon, February 23, 1922

SERVICES WHICH THE BUREAUS OF OCCUPATIONS ARE PREPARED TO OFFER TO COLLEGES—
Directors of the Bureaus of Occupations in the United States.
DISCUSSION.

THIRD SESSION—Thursday Evening, February 23, 1922

Our Relations to Women in Industry

THE WORK OF THE WOMEN'S BUREAU—Mary Anderson, Director of the Women's Bureau, U. S. Department of Labor, Washington, D. C.
THE TRADE UNION WOMEN AND A BETTER DAY IN INDUSTRY—Agnes Nestor, President, Women's Trade Union League, Chicago, Ill.
THE SUMMER SCHOOL FOR WOMEN WORKERS IN INDUSTRY AT BRYN MAWR COLLEGE—Hilda W. Smith, Dean, Bryn Mawr College, Bryn Mawr, Pa.
INTERNATIONAL FEDERATION OF WORKING WOMEN—Mrs. Raymond Robins, President, National Women's Trade Union League of America, Washington, D. C.

FOURTH SESSION—Friday Morning, February 24, 1922

BUSINESS MEETING

Construction and Management of Dormitories

THE PLANNING OF DORMITORIES AND SOCIAL BUILDINGS—Elmo C. Lowe, architect, Chicago, Ill.
CONSIDERATIONS GOVERNING THE DEVELOPMENT OF THE IDEAL FLOOR PLAN FOR DORMITORIES—Blanche Geary, Director of the Architectural and Economic Bureau, National Board of the Young Women's Christian Association, New York, N. Y.
THE SERVICE DEPARTMENT OF THE DORMITORY—Mabel C. Little, Director of Halls and Commons, University of Wisconsin, Madison, Wis.

A DORMITORY THAT IS A HOME—Agnes E. Wells, Dean of Women, Indiana University, Bloomington, Ind.

ORGANIZATION OF THE WORK OF THE HEAD OF HALLS—Edith S. Tufts, Dean of Residence, Wellesley College, Wellesley, Mass.

REPORT FROM THE NATIONAL HOUSING COMMITTEE OF THE AMERICAN ASSOCIATION OF UNIVERSITY WOMEN.

FIFTH SESSION—Friday Afternoon, February 24, 1922

SECTIONAL CONFERENCES

DEANS OF WOMEN OF STATE UNIVERSITIES

Chairman—AGNES E. WELLS, Dean of Women, Indiana University, Bloomington, Indiana

Three University Problems

HOUSING—

HOW TO OBTAIN MONEY FOR DORMITORIES—

(a) FROM LEGISLATURES—Abbe D. Blitz, Dean of Women, University of Kansas, Lawrence, Kans.

(b) BY PRIVATE GIFTS—Grace Greenwood, Social Director of Martha Cook Dormitory, University of Michigan, Ann Arbor, Mich.

FUTURE OF SORORITIES—

FROM THE PAN HELLENIC STANDPOINT—Lillian Thompson, Pan Hellenic Delegate from Gamma Phi Beta.

FROM THE VIEWPOINT OF THE DEAN OF WOMEN—Mary Ross Potter, Dean of Women, Northwestern University, Evanston, Ill.

DELINQUENT STUDENTS—Ruby E. Mason, Dean of Women, University of Illinois, Urbana, Ill.

RECREATION—Jessie L. LADD, Dean of Women, University of Minnesota, Minneapolis, Minn.

DISCUSSION—Led by Myra B. Jordan, Dean of Women, University of Michigan, Ann Arbor, Mich., F. Louise Nardin, Dean of Women, University of Wisconsin, Madison, Wis.

DEANS AND DEANS OF WOMEN IN COLLEGES

Chairman—FLORENCE K. ROOT, Dean, Pennsylvania College for Women, Pittsburgh, Pennsylvania

Ideals of Scholarship

DOES THE CURRICULUM STIMULATE SCHOLARSHIP?—Lucy M. Salmon, Professor of History, Vassar College, Poughkeepsie, N. Y.

METHODS OF PROMOTING IDEALS OF SCHOLARSHIP AMONG THE AVERAGE STUDENTS—Pearl R. Wasson, Dean of Women, University of Vermont, Burlington, Vt.

THE HONORS PLAN AT SMITH COLLEGE—Helen Wright, Director of Appointment Bureau, Smith College, Northampton, Mass.

DISCUSSION.

DEANS OF WOMEN IN NORMAL SCHOOLS

Chairman—ANNA V. DAY, Dean of Women, Milwaukee State Normal School, Milwaukee, Wis.

METHODS OF TEACHING THRIFT—Jessamine Hoagland, National City Bank, Chicago, Ill.

REGULATION OF EXTRA-CURRICULA ACTIVITIES—Caroline Grote, Dean of Women, Western Illinois State Teachers College, Macomb, Ill.

THE WOMAN'S FORUM—Natalie Thornton, Teachers College, Columbia University, New York, N. Y.

DISCUSSION.

DEANS OF GIRLS IN HIGH SCHOOLS

Chairman—MARY C. ROBINSON, Dean of Bangor High School, Bangor, Maine

THE WORK OF DEANS IN HIGH SCHOOL—Romiett Stevens, Teachers College, Columbia University, New York, N. Y.

CHARACTER DEVELOPMENT IN HIGH SCHOOL—Josephine Mack, Dean, McKinley, High School, Chicago, Ill.

DISCUSSION.

SIXTH SESSION—Friday Evening, February 24, 1922

CONFERENCE DINNER

Toastmistress—GEORGIA L. WHITE, Dean of Women, Cornell University, Ithaca, New York

Relations to Other Organizations

NATIONAL EDUCATION ASSOCIATION—Charl O. Williams, President, Memphis, Tenn.

GENERAL FEDERATION OF WOMEN'S CLUBS—Mrs. George W. Plummer, Secretary, Washington, D. C.

AMERICAN ASSOCIATION OF UNIVERSITY WOMEN—Mrs. Aurelia H. Reinhardt, Vice-president, and President of Mills College, Oakland, Calif.

FEDERATION OF UNIVERSITY WOMEN IN CANADA—Mrs. R. F. McWilliams, President.

NATIONAL LEAGUE OF WOMEN VOTERS—Mrs. Maud W. Park, President, Washington, D. C.

SEVENTH SESSION—Saturday Morning, February 25, 1922

BUSINESS MEETING

Stimulation of Graduate Work Among University Women

CONSIDERATIONS TO BE TAKEN INTO ACCOUNT IN GRADUATE WORK FOR WOMEN—Louise Pound, Professor of the English Language, University of Nebraska, Lincoln, Nebr.

SOME RESULTS OF GRADUATE WORK BY WOMEN—Marion Talbot, Dean of Women, University of Chicago, Chicago, Ill.

THE WORK BEING DONE BY WOMEN IN GRADUATE SCHOOLS—Albion W. Small, Dean of the Graduate School of Arts and Literature, University of Chicago, Chicago, Ill.

EIGHTH SESSION—Saturday Afternoon, February 25, 1922

SECTIONAL CONFERENCES

DEANS OF WOMEN IN STATE UNIVERSITIES

*Business Meeting**Standardization of the Position of the Dean of Women of State Universities*

UP TO THE PRESENT TIME—Mrs. Lois K. Mathews Rosenberry, Former Dean of Women, University of Wisconsin, Madison, Wis.

IN THE FUTURE—Georgia L. White, Dean of Women, Cornell University, Ithaca, N. Y.

DEANS AND DEANS OF WOMEN IN COLLEGES

RETIREMENT SYSTEM FOR WOMEN MEMBERS OF COLLEGE FACULTIES—Grace A. Stayt, Dean of Women, Knox College, Galesburg, Ill.

HOW MAY THE DEAN BEST APPORTION HER TIME BETWEEN THE ACADEMIC, ADVISORY, AND SOCIAL SIDE OF COLLEGE—Anna L. Tannahill, Dean of Women, Beloit College, Beloit, Wis.

EXTRA-CURRICULA ACTIVITIES—Gertrude S. Kingsland, Dean of Women, Ripon College, Ripon, Wis.

DEANS OF WOMAN IN NORMAL SCHOOLS

STUDENT LEADERSHIP—Lulu E. Wirt, Dean of Women, Nebraska State Teachers College, Kearney, Nebr.

RELATION OF THE DEAN OF WOMEN TO THE PROFESSIONAL LIFE OF THE STUDENT—Bessie L. Priddy, Dean of Women, Michigan State Normal College, Ypsilanti, Mich.

DEANS OF GIRLS IN HIGH SCHOOLS

OUR UNSOCIAL CURRICULUM—Thyrza W. Amos, Dean of Women, University of Pittsburgh, Pittsburgh, Pa.

DISCUSSION—Led by Mary W. Sawyer, Student Adviser, High School, Brookline, Mass.; Lila M. Lawrence, Student Adviser, Broadway High School, Seattle, Wash.

OPEN DISCUSSION

VOCATION AND THE COLLEGE OF THE LIBERAL ARTS

RICHARD WELLINGTON HUSBAND, ASSOCIATE DEAN OF DARTMOUTH COLLEGE, HANOVER, NEW HAMPSHIRE

The personnel function in a college bears a close resemblance to the personnel function in a commercial house or an industrial plant. Each of them aims to secure the maximum necessary production consistent with the safety, health, and contentment of the workman. Transferring this into the terms more common in the colleges we aim to secure the highest scholarship consistent with the health, physical development, and social progress of the student. Industry has taken the responsibility of safeguarding the health of workmen and has found it extremely desirable to promote their contentment by adjusting pay, working conditions, living conditions, hours, and recreation to their needs. The colleges have in like manner paid attention to living conditions in dormitories, attractive and sanitary recitation buildings and laboratories. They have encouraged physical development by means of athletics and the gymnasium. They have recognized many forms of student activities for the sake of promoting habits of management and coöperation, which at the same time add to the contentment of those participating. In all these ways and in others that might be mentioned the colleges have long been doing good personnel work. The essential difference between personnel work in the colleges and that in industry is that the colleges are interested primarily in the future of the student and industry is interested primarily in adequate present production. The college is interested in high scholarship, not for its immediate usefulness but because it is a preparation for what lies before the student. The colleges are more interested in a promotional scheme than they are in present performance. Many industrial houses, also, are finding it advantageous to present to their employees and even to applicants for em-

ployment a promotional sequence which indicates by what steps an employee may rise to positions of greater responsibility within the company.

The first step to be taken in planning for a product which will fulfill expectation is an appropriate initial selection of students from those who apply for admission. In this matter we have recently laid down several principles for our guidance. In the first place we seek evidence of scholarship, not only from examinations and certificates, but also from the principals of schools. In the belief that students from one part of the country will be benefited by contact with those from other parts, quotas have been assigned to the different sections of the United States. But the most significant and valuable part of our selective process will consist in evidence regarding the character and personality of the applicant. Among the traits upon which we desire information are intellectual interest, native ability, industry and faithfulness, straightforwardness, school spirit, and leadership.

Professional schools have the expressed aim of preparing their students for a specific occupation. This holds true of schools of medicine, pharmacy, agriculture, law, theology, engineering, and many others. The sphere of vocational guidance in such an institution is restricted. At the other extreme is the college of the liberal arts, whose aim is not that of definite training for a specific profession.

The business of the college of the liberal arts is to offer its students the opportunity of making themselves ready to meet all phases of life's activity, courageously and competently. The college assumes a responsibility toward the physical, moral, and mental development of those whom it admits to membership in the student-body. Without attention to these three phases of development, one is not ready to face successfully the various emergencies and opportunities with which he will be confronted. It must be noted, however, that the college of the liberal arts merely offers the opportunity to students for development in these particulars, it does not force them to accept their opportunities. Inasmuch as many students, unfortunately, do not understand perfectly the importance of these three elements of growth, the college cannot entirely succeed in its aims. Freedom to accept or reject opportunities is left to the individual student. We are of the opinion that such freedom is in itself a factor in a student's development. Those of college age who have not learned self-reliance and self-control are so constituted that they probably never will learn it, or at any rate will not learn until they have been subjected to a somewhat serious penalty in the way of college discipline. We do not intend to force or closely supervise students. We anticipate that they will succeed through their own efforts, but if they cannot do that they render themselves responsible for their failure.

When the aim of an institution is clearly enunciated, the system of advice given within that institution should be in conformity with it. The trustees of Dartmouth College in the vote creating my office said that the work was "to be developed with the idea of enabling the men of the college to make the right contacts at the close of their college course and of helping them

to begin advantageously and promptly what is to be their life career." There are several significant phrases in this vote. The hope is expressed by the trustees that our students will be fitted to enter upon their life careers "advantageously and promptly." The word "advantageously" was obviously intended to convey the idea that the graduate of the college should be adequately prepared both in the substance of his education and in his mental attitude for the next step to be taken. The word "promptly" presupposes a preparation from which no essential elements have been omitted. The expectation, provided these requirements are satisfied, is that our graduates will, at an early date, be found useful in their professions or in the companies which employ them. The sentence quoted from the vote of the trustees contemplates a proper selection of courses during the four undergraduate years and places upon the adviser the duty of making suitable suggestions regarding courses. It places, also, upon the adviser the obligation of assisting men to make an early and wise choice of such careers as they may be fitted to pursue. These are the elements of vocational guidance within the college.

The vote also states that it is the duty of this office to assist men in making right contacts at the close of their college course. The trustees in using the term "right contacts" held the view that the office should include the placement function. Placement of college men involves putting some of them in contact with immediate opportunities for making a living and recommending to others appropriate institutions for engaging in graduate study. A mere job, or opportunity for work, is not of necessity a right contact. Our aim is to help graduates to shorten the period of adjustment to conditions by knowledge acquired in advance, and to establish relations with companies that have a progressive policy and a suitable system of making provision for the care and advancement of those in their employ. If our men ever had an idea that they belonged to a preferred class, we seek to disabuse their minds of such a notion. It is our desire that they enter into the study or practice of their professions or occupations ready to expect the necessary slowness of progress and even an unforeseen rebuff. At the same time we conceive it to be our duty to protect our students against such contacts as would not furnish them with opportunity for the fullest degree of self-development. We must acknowledge our obligations to do the best we can for the professions and for industry by supplying our material in the best form of which we are capable, but we must acknowledge, also, our obligation to our graduates who compose that material in assuring them that the powers they possess and the discipline to which they have subjected themselves will not pass without recognition or remuneration. It becomes the duty of the office, therefore, not only to be generally familiar with professional and commercial opportunities, but to know those opportunities specifically.

We come now to the question of the methods of a personnel office connected with a college. An outline follows of the records and the use made of them in such an office at Dartmouth College. In some respects these

are only typical of what may be found in all colleges; in other respects they are somewhat peculiar to ourselves. At the outset it is desirable to state plainly and emphatically that our records so far as they are official are public property, but so far as they include information supplied to us by the student himself they are held strictly confidential. The students know this. If it were otherwise I would not predict success for a personnel office.

We maintain a concise but somewhat thorough history of each student up to the date of his graduation. This history is then given over to the office of alumni records and is continued throughout his life. When a student enters college he fills out a registration card and from this we obtain certain facts which we find useful for our work, such as the place and date of birth, his school, his parentage, the education of his parents and occupation of the father or of the father and mother. From the records kept in the various college offices we make our own synopsis. These include the most important items of a student's physical examination, honors granted him and discipline to which he is subjected by faculty action, the courses he takes while in college, and the mark he obtains in each course.

We also keep a statement of the various student activities in which he engages while in college. This information is gleaned from the college newspapers and from interviews with the student. In interviews we inquire particularly into his intellectual and physical interests. We find out if possible the nature and extent of his reading, whether it is confined to the newspapers and the popular magazines or whether it extends to serious fields. We question him as to his physical interests to ascertain whether he is fond of outdoor or indoor games, whether he likes to play golf, go hiking, or play billiards.

We regard it as essential to find out how a student spends his vacations. We urge to the best of our powers that he spend at least a portion of each long summer vacation in some kind of occupation which will give him experience or keep him usefully employed. A summer spent in a factory, a bank, a store, a construction company, or with a lawyer, or a physician, will assist him in determining upon his preference and his aptitude for a life career and will also show him that the courses he has taken or expects to take while in college have values of which he did not dream. For many students we encourage summer travel—for example, when a student has an opportunity of going to Europe or of touring the United States either by train or by automobile. Similarly we are interested in ascertaining what students are paying part of their expenses through college by working during the academic year. Our interest in this subject is not based upon a desire to know what percentage of our students are wholly or partially self-supporting so much as it is to know what experience they are gaining and whether they are spending their spare hours usefully.

Detailed records of the mental alertness tests which are given to all freshmen are kept on file. These are consulted constantly in interviewing

men and reference is made to them in connection with problems of administration and discipline. Our experience with mental alertness tests induces us to believe that tests can be framed which will be reasonably indicative of the relative progress which students will make while they are in college. The tests which we have given up-to-date indicate to a fair degree what men are likely to be successful and what men are likely to be unsuccessful in their course. We find, nevertheless, a sufficient variation between the results of the tests and scholastic performance to put us on our guard against accepting them beyond the point of corroborative evidence. We know why some men who stood high in their mental alertness tests stand low in scholarship; we know why others who stood low in their mental alertness tests take high rank in scholarship. It seems certain that other evidence such as mental and emotional stability and the power of protracted application should be added to mental alertness tests in determining fully the probability of success or failure in a sustained intellectual effort.

Personal estimates if made with care are still frequently considered to afford the best evidence regarding the characteristics of those under consideration. We ask members of our faculty to estimate their students once a year upon the traits of intelligence, forcefulness, reliability, and personality. Each of these traits is defined in terms which can be evaluated by instructors and interpreted by students. Certain things are indicated which may be regarded as evidence of the degree to which students possess the qualities. We define the four traits as follows: *Intelligence*: Ability to grasp a situation; alertness of mind. Not to be identified with scholarship; *Forcefulness*: Personal force; initiative; assurance; decisiveness; *Reliability*: Evidences of solid character; dependability; sense of responsibility, perseverance; attentiveness; punctuality; *Personality*: Bearing; neatness; courtesy; personal acceptability. Instructors assign ratings A, B, C, D, and E as they think a student deserves on each of these four points. The ratings are then transferred into numerical values and averaged together. The true interpretation of the rating given is by no means an easy task. We have reached the belief that identical rating of a student by all of his instructors would rarely present a true picture of the student. He may show himself very alert and intelligent in physics and quite the opposite in Spanish. He may be much interested in history, but dislike chemistry. He will show himself a different person according to the course in which he finds himself and even according to the instructor he has. In conferring with a student we give him not only the average rating he has received from his instructors, but the individual ratings. Variation in estimates very commonly affords an excellent opportunity for discussion with a student concerning the effect he produces upon others in different situations and one can thereby put him on his guard with reference to the proper attitude for him to assume in any task assigned him. We assure him that he will find certain pleasant features and certain unpleasant features in every occupation and that he must be ready to perform the disagreeable

parts of his task with the same degree of reliability and cheerfulness as he shows in the agreeable parts. When a student has low ratings we frankly discuss the reasons for them.

The most successful device which we are using to give a student a picture of himself is what we call his Profile Card. This is a 3 x 5 inch card containing spaces allotted for certain aspects of a student's history year by year. In the first column we put his actual attainment and in the second column his rank in his class. A class is divided into ten groups on the basis of the records of attainment or estimates, and we assign the appropriate group to each student upon each of the points upon which the record is made. These points are scholastic average for the year, credit points toward graduation, personal estimates in intelligence, forcefulness, reliability, and personality, and the various sections of his Mental Alertness Test. We find that a student is much more impressed by the statement that he falls in the third, or sixth, or tenth group of his class on any of these matters than he was when we simply gave him his numerical record.

We have recently undertaken to make a mental survey of students who appear to require that attention. Students whose progress in their work is unsatisfactory by reason of some mental or emotional instability and those who have a tendency to become depressed or nervous by reason of overwork, inherited characteristic or accident are summoned to a conference. For this purpose we have a mental hygiene specialist come to our office regularly to interview such persons as we discover and can present to him. Our object, of course, is safeguarding the future of these individuals, and we do not wait, therefore, until a case becomes at all aggravated before requesting a survey. We hope to extend this work materially; up to the present the investigations into individual cases have been of the greatest benefit.

The object of preparing all the records to which reference has been made is the interview with the student. That is the heart of personnel work. A student is interviewed first during his freshman year with the help of such records as we have already collected. Thereafter we see him regularly every year, and more frequently if we feel that occasion for special consideration has arisen. Also we encourage students to come voluntarily whenever they have problems which need solution.

With the records at hand we feel in position to begin talking seriously with a man upon the occupation which he desires to enter after graduation or the occupation for which he is best fitted. If he has already made a choice we endeavor to find out why he thinks he would be successful in that occupation, and in the discussion we make use of all facts known about him. We also must take into consideration the opportunities that now exist and are likely to exist in the future in that specific career. For this purpose we refer him to pamphlets or books upon the subject and we give him the best picture we can of the work that is involved in the career he is considering. We go slowly in this matter, are cautious about giving positive advice, and are more inclined in the early stages of a student's

thinking upon an occupation to give warnings rather than positive encouragement and are particularly careful to make suggestion of a special occupation in contrast with the one the student is already considering.

To our surprise we have discovered that approximately sixty per cent of a freshman class has a fair idea of the occupation they wish to enter after graduation from college. During their college course many of these change their minds as a result of discovering weaknesses which they had not suspected, or strength and interest which they had not earlier realized. We keep a card catalogue of the occupations chosen by the members of each class, placing in a special file those who are uncertain. It is pleasing to feel that the uncertain group gets smaller from semester to semester as a result of decisions formed on the basis of acquired interests, new experiences, and deeper knowledge.

Meantime, as the permanent interests and aptitudes of the student become apparent, and as he approaches a decision regarding his life career, the problem of directing his electives grows more serious and complex. For the most part students have a decided tendency to choose as their major subject that branch of knowledge which they believe will be most beneficial to them in their vocation. Generally that is reasonable, and we encourage it. Filling up the elective card after a major has been chosen is then of immediate concern. Contrary to the opinion commonly expressed, we find that students are apt to elect subjects which appear to them to be of the "useful" or "practical" kind. If they fail to find a sufficient number of courses of this type some of them fill up their elective blanks with subjects chosen upon various unreasoned bases. The prevailing tendency of students, if left to themselves, is to choose only courses intimately related to their prospective vocation and neglect those subjects which should prove valuable to them as citizens and members of society. They do not commonly scatter enough. Particularly are they inclined to neglect courses in the liberal arts which form a splendid background for the enjoyment of life, for the cultivation of taste, and even for a broadminded view of one's occupation. It is difficult to induce a student who expects to enter business to elect courses in literature, philosophy, or art. It is equally difficult for one who plans to specialize in literature to become reconciled to giving much attention to the social sciences and particularly to the natural sciences.

The college and my office stand firmly for the principle of the desirability of an elementary knowledge in many fields of learning. My office has also adopted the principle of advising students to show restraint in electing those subjects which they are likely to pursue after graduation for the remainder of their lives, and in preference to devote a certain portion of their attention while in college to subjects which in all probability they will not enter into later by themselves. A third principle which we follow is that of advising students to take subjects which they cannot possibly get by themselves or without the aid of the college equipment. For example, it is quite improbable that many students after graduation would

have access to a chemical or physical laboratory and however great might be their inclination to learn something of the sciences of chemistry or physics they would find it impossible. Other branches of knowledge may demand familiarity with bibliography and methods of handling documents such as they will find it to be extremely difficult, and perhaps impossible, to acquire after graduation. This is especially true of some of the social sciences and of art.

One of the tragedies of the intellectual life is that as the years go by our reading and study becomes of necessity narrower. We find that the problems involved in our occupation take much of our time and strength and the remaining hours in which we have any leisure must be devoted to a study of those topics or points which may confront us in our profession or in our business of the next day or the next week. We have neither the leisure nor the strength left to read as broadly as we once hoped. This gradual narrowing of the scope of intellectual life may be compared to a pyramid which with a broad foundation gradually narrows almost to a single point. The broad foundation may be likened to the breadth of one's college course, the apex represents one's attainment in his narrow specialty or his narrow range of occupation. It is to be observed, however, that the broader the base of the pyramid the higher may be that apex, and it is our firm conviction that the breadth of knowledge gained in a college course will be indicative of the degree of proficiency one may attain to in his career. We feel sure that subjects which are far removed from one's specialty will be not only contributory to the joy of life, but will also be contributory to success in one's specialty. This must be the basis for advice in regard to electives in a college of the liberal arts and particularly in one which has declared its intention of doing its share to "convert society to the welfare of man."

A personal office cannot long be successful unless the officers have sufficient leisure to enable them to engage in research work. In recognition of this necessity Dartmouth College allied itself with the newly organized Personnel Research Federation. A brief statement of the nature of the research work that is being done in our office will indicate the point which I am now endeavoring to make clear. We are constantly engaged in an investigation of the kind of mental alertness tests which will be prognostic of success or failure in general scholarship and thereby show what freshmen will likely receive the greatest profit from a college course. We are also considering the nature of mental alertness tests which will indicate special aptitudes. We are eager for this in order that we may have a suitable beginning for a discussion of electives and a future career. Inasmuch as we are convinced that none of the mental alertness tests so far devised does or can determine what may be called mental or emotional stability, we are anxious to have some kind of experiment devised which will afford evidence regarding the degree of perseverance or stability which the student may possess. We feel that success in mental alertness tests bears some relation to reaction time and we are equally convinced that

many who have a slow reaction time have a larger degree of perseverance or reliability than have some of those with quicker reaction time. This seems to be a partial explanation of the fact that occasionally one who takes high rank in his mental alertness tests fails in his college courses, while others who take a low rank are successful in their intellectual efforts. As time goes on we hope to have some material in proof of our belief that a mental survey, if followed by attention to the directions given, will lead to decided improvement in scholarship, in attitude, and in general usefulness. At present it is merely a speculation that success in scholarship bears a direct relation to improvement in health. It may take many years to gather evidence upon this subject, but we do not propose to neglect it. In the outline of our records I laid some stress upon the value of personal estimates made by instructors. The Scott Company in Philadelphia has devised a system whereby foremen make estimates of the men under their direction. The Scott Company has found it desirable to make a comparison of the ratings made upon the same man by two or more foremen. We are working out a system whereby we may be able to compare ratings made upon students by one instructor as against ratings made upon the same students by other instructors. Such is the nature of research work which we are now contemplating and it will be evident that the conclusions we reach will have an immediate bearing upon the nature of our interviews with students.

It was stated earlier that the duties of the personnel officer of a college are of much the same type and demand much the same kind of information about the members of the student body as the duties of the employment manager of an industry require concerning the employees of his company. For this reason one engaged in personnel work in a college should familiarize himself with the best literature upon the subject of employment management. He should associate with those engaged in that work and know the nature of their records, their methods, their habits of interviewing, and their aims. He should belong to associations whose objects coincide more or less with his own.

When one tries to give an outline of the information a personnel officer in a college should possess he finds himself in difficulty. It is quite impossible for one man to know all the things a personnel officer should know. For this reason the staff of the office should be so constituted that certain kinds of information and certain fields of investigation would be assigned to each member. Meetings of the staff should be held frequently at which each specialist would outline to his colleagues at least the elements involved in his own specialty. This is made necessary by the fact that the interviewer may be called upon to give the student interviewed at least an introduction to any subject falling within the range of topics that must be handled in a personnel office. A student cannot profitably be transferred from person to person for advice. When, however, a case of unusual perplexity arises the specialist should handle it. Even when the range of knowledge seems fairly adequately represented by a personnel

staff, occasions will arise for more specific information. At such times round-table conferences should be held, to which students interested in any particular occupation are invited. At these conferences an informal talk may be given by a representative of the profession, the industry, or the business then being considered. Students should be encouraged to ask any question they desire about this occupation. Conferences of this nature can be held as often as students can be brought to them by interest in the presentation of a definite subject or a definite problem.

The following may be taken as an imperfect outline of the information which should be at the disposal of a personnel officer. The college with which he is associated, its history, its traditions, its aims, and the present condition of its plant should be known thoroughly. The members of the faculty should be known, their specialties and their characteristics should be familiar to him. The old joke contains a good deal of sound sense, that one should elect the professor rather than the subject. He should have an intimate acquaintance with the curriculum, not merely with its framework of required courses, but with the contents of the various courses offered as well as he can, the manner in which they are conducted, the expressed aims and the ultimate value for different purposes. He should also know the nature and the spirit of the various student activities that are carried on and the nature of the social life of the student. So much for the inside of the institution itself.

A personnel officer is then confronted with the almost impossible task of securing an intimate knowledge of opportunities in the line of careers that are open to graduates of the institution. He should know the present condition of the various professions, businesses, and industries. He should know something of the jobs themselves, the demand, the mental and emotional qualities necessary for success, aptitudes involved in the occupation and the remuneration which may come, whether from the standpoint of pay or recognition or personal and spiritual satisfaction. In order to gain the knowledge that is requisite the personnel officer should inspect typical occupations throughout the country. Commercial and industrial establishments will welcome him and will give him available information. It might be added incidentally that such contacts will commonly result in opportunities for placement of students.

Finally a personnel officer has been aptly called "a two-fisted man with the instincts of a gentleman." This applies to such an officer of a college as well as to one in industry. His whole aim is to be of benefit to the students with whom he comes in contact, but the nature of the problem sometimes calls for a discarding of the methods of diplomacy and a substitution of armaments without limitation. Dealing with college men is satisfying and inspiring, because they are almost invariably broad-gaged enough to accept the truth without flinching and without resentment. They demand, however, that the interviewer be square with them and have their interest at heart. They expect only one other thing, and they have a right to expect it—namely, that whatever they say in the personnel office, and

whatever information they may give, will be held in strict confidence. When these principles are understood and accepted, the days of the personnel officer are filled with the keenest enjoyment and afford him the largest degree of continuous satisfaction.

PERSONNEL WORK IN DARTMOUTH COLLEGE

THE PSYCHOLOGICAL ASPECT OF VOCATIONAL WORK IN COLLEGES

AGNES L. ROGERS, PROFESSOR OF EDUCATION, GOUCHER COLLEGE,
BALTIMORE, MARYLAND

Psychology has recently made advances that will hasten the solution of the problem of vocational guidance in colleges. By the construction of tests of general ability or intelligence, it has furnished a means of eliminating from colleges those unable to profit by academic study, thus preventing persons embarking on training for certain careers for which they are unfit. Such guidance is negative and though valuable is of less worth than positive prescription. Intelligence tests very shortly will furnish the latter also, for in time we shall know the intelligence level of most of the professions as study is now being made of their selective influence. Soon we shall be able to advise a college graduate in the light of his own general ability and the mental level of those in the occupation he desires to enter, with whom he will necessarily be compared and with whom he must compete.

Indirectly such intelligence tests likewise assist us in discovering students of high capacity, who have failed to identify themselves heartily with academic work owing to lack of industry, coöperativeness, interest, or sound health. Such facts are obviously crucial in vocational guidance.

The second contribution of psychology is the construction of rating scales. It is true that today we have satisfactory scales for only one profession, that of teaching, but it is only a matter of time before we shall have excellent adaptations of existing instruments for vocational guidance purposes to many other callings.

Signal advance has also been made in the technique of construction of vocational tests proper and we may look for the appearance of measuring instruments which will be of service to the vocational adviser. So far Frey's test for journalistic aptitude is available, but it will shortly be followed by others of like kind for other occupations.

WOMEN IN INDUSTRY

MARY ANDERSON, DIRECTOR OF THE WOMEN'S BUREAU, U. S. DEPARTMENT
OF LABOR, WASHINGTON, D. C.

The words "women in industry" are becoming more and more a familiar phrase as the number of women in industrial pursuits is growing larger year by year and becoming a more important factor in the development, the very life itself, of the American people.

The Census figures of 1920 tell us that one of every four workers is a woman. Going back nearly half a century to the Census figures of 1880 we find that at that time more than 14,000,000 men and more than two and a half million women over ten years of age were in gainful occupa-

tions, and in 1910, our latest figures, more than 30,000,000 men and 8,000,000 women over ten years of age were so classified. It is apparent that in the thirty years the increase was very much greater among the women than among the men, the per cent increase being 104.1 for men and 205.1 for women.¹ That the per cent increase among the women in this period—1880 to 1910—was almost double that of the men is significant as proving that the encroachment of women in industry was not caused by the World War, but was well under way for several decades before that and may be considered a natural evolution. During the ten years immediately preceding the war—that is, from 1904 to 1914—women wage earners increased in numbers at a higher rate than did men in several of the most important industrial States—for example, in New York the per cent increase of male wage earners was 22.8 and that of the women wage earners 25.7; in New Jersey the corresponding figures were 38.7 and 55.5; in Pennsylvania 20.3 and 35.8; in Illinois 33.2 and 37.2; and the list might be very much extended—a total of twenty-five States and the United States as a whole showing this condition of a higher percentage for women than for men.²

The past few years have seen a remarkable development of industries. When the spinning, the weaving, the making of clothes and shoes, and all the other industrial pursuits once followed in the home, were taken away and developed into factory industries, women were called upon still to conduct many of the operations, and thereby became part of the army of gainfully employed. Naturally they have not been restricted to these transplanted industries but have entered other avenues of employment as occasion offered. A Federal investigation in 1908 which covered more than 167,000 woman and child wage earners disclosed the fact that women and girls formed approximately one fourth of the wage earners in the making of tin-cans and boxes, hardware, nuts, bolts, and screws, pottery, and stamped and enameled ware; approximately one third of the wage earners in the making of clocks and watches, rubber and elastic goods, jewelry, and needles and pins; and one half or more of those engaged in making cigars and tobacco, cigar boxes, and paper boxes—all of these being outside of the food and clothing industries essentially woman-employing.³ The public is inclined to forget this gradual development, and to think that women entered industry in large numbers only during and since the war. It is because women wage earners became so numerous and are being relied upon more and more to supply the working force of the factories, that we have come to realize the importance of women in industry.

The large number of women in industrial pursuits therefore present a special problem of their own. When I began to work as a piece worker in a boot and shoe factory in Illinois, there was very little said about the

¹ Thirteenth Census of the U. S. Population Vol. IV, Occupation Statistics, pp. 36 and 37.

² Abstract of the Census of Manufacturers, 1914, pp. 463-465.

³ U. S. Department of Commerce and Labor, Bureau of Labor Statistics, Woman and Child Wage Earners in the U. S., summary of report, pp. 15 and 398.

importance of the eight-hour day. We were then working ten hours and little thought was given to the health of the working woman and what it meant to the Nation as a whole. In the second year of my factory work the State Legislature passed an eight-hour day for women. That was more than twenty years ago, but I remember clearly that we worked one day of eight hours and the next day went back to the ten-hour day because the Supreme Court of the State, in a surprisingly short time, had rendered a decision that this law was unconstitutional.

After this there was a long period during which the women in my trade became more and more united in organization, and finally we were able, through agreements with the manufacturer, to institute the nine-hour day. The eight-hour day by legislation was our goal. From that time on we were active in furthering legislation for working women, but it was fifteen years from the time that the Illinois Legislature passed the short-lived eight-hour law that it again took up the question of hour legislation for working women and passed the ten-hour law which is the present statute, the Supreme Court reversing its earlier decision and declaring the law constitutional.

While the first attempts at legislation had been made entirely by women who were in sympathy with working women, the later attempts were a joint effort between these women and the organized workers themselves, with the latter speaking for the workers, organized and unorganized, in the legislative hearings.

What happened in Illinois is happening in every State in the Union. As the women are becoming stronger both politically and industrially, to that degree progress for women is being made. Everywhere we find the voice of the organized working women speaking in behalf of the workers. The second International Congress of Working Women, held in Geneva last October, is an expression of this development the world over.

It is not surprising then that the movement in behalf of the working women should have received recognition by the Federal Government itself. The Women's Trade Union League of Illinois and its President, Mrs. Raymond Robins, realizing that the Federal Government had taken no special cognizance of this great question, sent Miss Jane Addams, of Hull House, and Miss Mary McDowell, of the University Settlement, Chicago, to Washington in 1907 to appear before the Appropriation Committee of Congress to ask for money with which to make a special investigation of women in industry. Congress granted such an appropriation, and an investigation extending over three years—1907 to 1909—and covering many of the industries in which women were employed was made by the U. S. Department of Commerce and Labor. The report was published in nineteen volumes and was the cause of the increasingly insistent demand for a bureau in the Government to be concerned with women in industry. In 1909, at the convention of the National Women's Trade Union League, a resolution was introduced asking for a women's bureau in the Government. In 1916 Representative Casey, of Pennsylvania, introduced in Congress a bill

to create a women's division in the Department of Labor. This bill did not pass, however, and upon the entrance of the United States into the World War the Secretary of Labor called a conference of representative men and women to work out the best possible way of recruiting labor for war services. The Woman in Industry Service was among the several organizations created in the Department of Labor, and in 1920, when it was found from the work during the war and the demand made for the kind of service rendered that it would be expedient to make this war service a permanent bureau, Congress passed a bill making the bureau permanent.

As the Department of Labor is the youngest Department in the Government, so the Women's Bureau is the youngest Bureau in the Government. As the increasing strength of industrial workers made more insistent the demand for a Department of Labor, until finally such a department was created, so it was with the Women's Bureau—as the women workers entered industry more and more the demand became insistent that there should be created in the Government a bureau concerned solely with the problems peculiar to working women.

It is very important that the Federal Government should more and more interest itself in the human problems of the Nation. The Department of Agriculture is of tremendous value in conserving animal and plant life, but what is even more important is the conserving of human life, and in this we come down, in the final analysis, to the importance of the woman. The woman as an individual has a right to health and happiness, but this individual right has a much larger significance when we think of the working woman as a mother or a prospective mother of the race.

It is the duty of the Federal Government, as I see it, to make sure that in our rush for expansion of industries and the ever-growing demand for more production, so that the world shall be adequately housed and fed, we do not exploit these women to the detriment of their individual selves and to the detriment of the country as a whole. The Federal Government has no mandatory powers to enforce any laws for the regulation of women's work. We are a government by the will of the people with State autonomy. Therefore the enunciation of standards and policies by the Women's Bureau is a guide rather than a law, and serves to make uniform the actions of the several States. Because we legislate in forty-eight States we are prone also to legislate in many different ways. Though we have the eight-hour day in eight States, this does not always include all the women workers in these States. Some laws cover the mercantile establishments only, others manufacturing, while others include hotels and restaurants. Scarcely in any two States is there uniformity in legislation, and therefore the pointing out of inadequacy and the more or less haphazard way in which the States are legislating can best be done by a Federal agency, such as the Women's Bureau. The State agencies have no adequate way of getting this all-round information. Constantly the Women's Bureau is asked for data concerning the employment of women. Some of the questions most repeatedly asked are: How many married women

are there in industry and in what industries are they employed in the greatest numbers? Do the married women prefer night work because they can devote their day-time hours to the house-work and the children? To what extent do women support families? and many similar questions having to do with the family unit.

There is a growing demand by the American public for the facts, and it is the duty of a Federal agency to supply these facts. The Women's Bureau makes special investigations in the industries where women are working, upon which to base conclusions and from which to give information in order that fair standards can be formulated upon actual figures. Such studies are of great importance. A careful study of a large number of cases of lead poisoning among men and women, over a considerable period of time, produced the evidence which later established that lead poisoning is more injurious to women than it is to men. Because of this knowledge, in some States laws have been passed prohibiting women's employment in occupations where the danger of contracting lead poisoning is very great. Women are working in many other occupations where they are exposed to poisonous fumes and dust, but we have no evidence to show whether these elements are more or less dangerous to women than to men, and without such evidence there can be no just and wise legislation for the employment of women in such places.

One of the subjects which causes a great deal of discussion and comment is the adequate remuneration for work performed by women in industry. There is first the question of whether employees shall receive equal pay for equal work regardless of sex—that the wages should be based upon the job, whether performed by men or by women.

Again there is the question of minimum wage laws for women. Studies of these questions are important, even essential. From investigations made by the Women's Bureau we have found that women are, to a very large degree, either wholly or in part supporting families; that young girls in large numbers bring their pay envelopes home unopened, and thereby turn in every dollar received to the family budget. One is accustomed to think of the man as the head of the family and, for that reason, that the wages received should be adequate for the family budget. But when we think of women we think of them as individuals, with little or no economic connection with the family, and we have in a large measure failed to realize that women do support families. Therefore we must no longer disassociate women from the family life and treat them as individuals. We must take cognizance of the fact that the woman as well as the man is responsible for the family budget and that the wage she receives is money necessary to the support of the family unit.

Sufficient testimony by both employers and workers shows that women do just as good work and as much work as men, and are as faithful on the job. Therefore there is no excuse for a double standard of pay. The women are now, as they always have been, working to earn a living. Low wages for women mean an inadequate standard of living in families in

which they are the chief support. Low wages for women mean a lower wage scale in those industries which they are entering in such large numbers. The theory of wages that establishes a lower scale for approximately one fourth of the workers of the country—that is, the women—is a menace to the standard of living for the individual and the family, and therefore hurtful to the citizenship of the whole country.

There are certain minimum working standards which are essential to the health and the efficiency of the workers. The lighting of factories, both natural and artificial, plays a prominent part in the efficiency of the workers, particularly where there is close stitching or inspection on shiny particles. It is especially aggravating when the rays of light fall so that they are injurious to the eye. Again, there is nothing so fatiguing to the workers as being confined long hours in poorly ventilated quarters. It goes without saying that there should be thorough cleanliness in the work-rooms and safety devices on dangerous machinery, and that every possible attention should be given to safety measures so that we may approach the condition of the least possible amount of injury in industrial occupations. We have been told over and over again through investigations that the industries of the country are taking far too heavy a toll in human life, and through accidents are incapacitating workers, wholly or in part, for the rest of their lives. The standards spoken of in this article cover conditions in a general way, but they are the fundamentals and should apply to all occupations in all industries. More searching evidence and more detailed information will have to be applied to meet special cases and peculiar conditions, but compliance with the fundamental standards necessary to insure health and efficiency should be made compulsory.

Since the time when the Illinois Legislature passed the first eight-hour day for women, more than twenty years ago, there has been a marked change in the industrial conditions relating to women, owing largely to the increasing number of women in industry and to the evolution of the times, but in no small measure to the demands of the women themselves. Many elements enter into progress, such as constant agitation for better standards and a better understanding of industrial problems, and the fact that industry is becoming more and more the dominant factor in the life of the Nation. Willingly or unwillingly, people will have to take their stand on the industrial question; no one in the Nation can escape. There is not an hour of the day that we are not confronted by it—the clothes we wear, the food we eat, the implements used in the household, all are a part of the industrial question.

It is not surprising then that the Government itself, in order to deal intelligently and effectively with this all-important subject, has set up a department, and bureaus within that department, to deal particularly with special phases of the problem and be of help to the woman wage earner.

BRYN MAWR SUMMER SCHOOL FOR WOMEN WORKERS IN INDUSTRY

HILDA W. SMITH, DEAN OF BRYN MAWR COLLEGE, BRYN MAWR,
PENNSYLVANIA

A two months' course for women workers in industry was started at Bryn Mawr College last summer. The idea originated with President Thomas, who thought such a course would be the most constructive contribution a woman's college could make in the solution of modern industrial problems. The more extended use of the college buildings was also a consideration.

Plans for the school were drawn up by a Joint Administrative Committee, consisting of representatives of the Directors of the College, the Faculty, and Alumnæ, together with a group of women workers in industry, selected by Miss Mary Anderson, chief of the Woman's Bureau of the Federal Department of Labor.

On the financial side, the plan was to offer scholarships of \$200, covering a student's expenses for two months at the school. These scholarships were raised throughout the country by local committees made up of college alumnæ and women workers in industry. Trade unions, women's clubs, or interested individuals contributed to these scholarships. Students were selected according to the following qualifications: Ability to read and write English; a common school education or its equivalent, and good health, a preliminary medical examination being required.

For the purposes of the school the term woman worker in industry was defined as meaning "women who are working with the tools of their trade and not in a supervisory capacity" and for the first summer at least this was not to include teachers, office workers, saleswomen, household workers, or waitresses.

Students were finally selected by the local committees—eighty students from a group of 212 who applied for scholarships. A special group of ten leaders in industry were admitted for more advanced work.

Among the students all groups of industry and of the labor movement were represented, including nineteen trades, organized and unorganized, forty-eight students belonging to the organized and thirty-four to the unorganized; thirteen nationalities, and many religious beliefs.

Many students had made sacrifices to come. Some had given up jobs; most of them had to meet family obligations while they were at the school. They appeared to have a feeling of responsibility that they had been chosen for this opportunity. They were an unusual group, eager, keen of intellect, with mature minds and an ambition to go on with education. Many of them had left school at twelve or thirteen to go into the factory.

The educational problem was a serious one. For this reason, classes in small sections were followed by hours of tutoring, or individual work. Many difficulties of studying, such as grasping lectures, writing papers, and

reading, were evident, but great improvement was seen in all students within two months. It was difficult to find books simple enough for textbooks.

The courses offered were: English literature and composition, labor economics, social and political history, hygiene, music, and special lectures on science, industrial organization, women in the labor movement and community life. Instructors were chosen who had had experience in adult education.

There was the organization of the health department, a feature of the school so much appreciated by students that doctor's recommendations were followed by the students after their return home. This department gave medical examinations, treatment, corrective gymnastics, and hygiene lectures. Athletics including baseball, swimming, tennis, and folk-dancing, were popular. Great progress was made by students who had never had an opportunity for these sports.

The music course was also much appreciated. Informal singing and school songs, as well as more formal concerts, were well liked.

Excursions were held during the summer to Washington, Philadelphia, Atlantic City, Valley Forge, and other nearby places.

Students elected representatives to all committees of management, as the Directing Committee, House Committee, Health Committee. The Student Committee met with the faculty for conferences on matters of courses and instruction.

Debates and open forums were arranged by students for discussion of such subjects as Shop Committees vs. the Trade Union, the Irish Question, and Legislation for Women. Freedom of speech was the keynote of these debates. A decided growth of tolerance and open-mindedness was felt. Freedom of teaching and no propaganda were decided on by the Joint Administrative Committee as two policies of the school. There was a discussion of the possible attitude of organized labor toward the school, and a conference of representatives of labor organizations was called at Bryn Mawr to discuss this question.

A certificate stating that student had attended this two-months' course was given to each student at end of term. Reports are coming in from all over the country that students are going on with studies, and demanding courses for themselves and other industrial workers through Y. W. C. A. and other groups. These students have formed an Alumnae Association and elected officers; they plan to keep in touch with each other and the school.

Next year we hope to admit one hundred students, including a group of second-year students. New courses for next year will be science, psychology, and history of the labor movement. A representative of labor is to be the Assistant Director of the school.

THE PLANNING OF DORMITORIES AND SOCIAL BUILDINGS

ELMO CAMERON LOWE, ARCHITECT, CHICAGO, ILLINOIS

Within recent years there have been erected at many of our colleges beautiful buildings for the housing of men and women and for their recreational and social life. The freshman dormitories at Harvard, for example, are much admired, also the new dormitories at Cornell and at Princeton. The architects of the latter, Messrs. Day & Klauder, have succeeded in combining in these buildings many interesting variations and details which add freshness and charm to the whole. At Princeton also is the beautiful quadrangle for the Graduate School with its lovely Cleveland Memorial Tower, designed by Cram & Ferguson, of Boston. This is one of the best groups from an architectural standpoint built in America. The new dormitories at Smith, designed by Ames, Putnam & Dodge, combine dignity with a feeling of domesticity.

More extensive than any of these is the fine memorial quadrangle at Yale, designed by James Gamble Rogers. One pleasant afternoon, a few months ago, I spent several hours strolling about these buildings inspecting to my heart's desire the hundreds of features which taken together make them the most charming student dormitories in America. As I ambled slowly from one court to another I was overtaken and passed by many students. (The rooms were occupied for the first time last autumn.) It was most interesting to hear their expressions of affections and delight and to know that what had been done for them was really appreciated. I overheard two boys talking who evidently were not living in the quadrangle. One said to the other, "I come this way every chance I get." This seemed to me to be a most sincere and unconscious tribute to the designer and builder. Surely every boy living there must absorb some of the beauty of his surroundings. The good proportions and the charming color must make upon him an impression never to be forgotten.

Buildings for girls may differ from those for boys in many details of plan arrangement, but certain characteristics must always be present if they are to be successful. These are good taste, common sense, simplicity, and the economic use of constructive materials.

We who have a hand in the planning or designing of buildings which are to be the homes of boys or girls for four important years of their lives have a serious task. We must make our architecture contribute something to the growing appreciation of the beautiful things of life.

Individual units—Reference was just made to the Yale Memorial Quadrangle. It is interesting to know that when Mr. Rogers, the architect, appeared before the Committee on Building Plans to submit his design for the quadrangle, he laid before it only the type plan of a study with two single bedrooms. This is the primary unit of a single suite of rooms forming the basis of the full development. This arrangement of two suites on a floor with a stairway between it, as you know, is much liked for men's dormitories. I know of no instance where it is used for girls.

We find at Pembroke and Rockefeller Hall, Bryn Mawr, a grouping of rooms into suites with a study-room and one or more bed rooms adjoining and connected directly therewith. At Michigan, in the fine new Martha Cook Hall, two single rooms adjoining are separated from the main corridor by a small vestibule. One door leads from this vestibule to the corridor, and one door opens from it into each of the rooms. Two students occupying the suite may have some freedom in devising their manner of living. Each may occupy a single room for study and sleeping or a common study may be made of one room and a common sleeping-room of the other. In the vestibule is placed a wash basin with hot and cold water. In the dormitories now under construction at Smith College the architect's plans show that all rooms are to be single rooms, opening directly from a 7-foot 6-inch wide corridor. There seems to be, therefore, some difference of opinion as to the ideal arrangement.

The general feeling, as I gathered from my talks with many deans, is that sixty girls living together under one roof and under one control form the ideal group. At the University of Chicago the number varies from forty-two in Mary Beecher Hall and in Kelly Hall to sixty-seven in Green Hall and sixty-eight in Foster Hall. The Martha Cook Building is large enough to take care of one hundred eighteen girls. I have visited the building and have talked with a representative of the management. She does not feel that this building is too large for convenient control nor for the best interest of the students who live there.

My own inclinations, however, is to favor a smaller unit, say of sixty or sixty-five. This is the plan at Smith.

Since I am sure Miss Geary will explain to us the most desirable arrangement of social rooms, dining-room, and so forth, I shall omit all reference to this important subject, and proceed to the question of grouping.

Grouping—Having determined the best size of individual units, the next question for consideration would naturally be the relation of these units one to another. Too often limitation of site, lack of definite plan, or other reasons cause the erection of a unit as a single building without reference to any thing which has been done before or which may be done later. You all know instances of this. The Martha Cook Building at Michigan, for example, is very attractive in itself, but it seems to me it would have been more attractive if it had been conceived as a part of a group. Chicago University has built its dormitories in quadrangles. The more recent buildings at Bryn Mawr are joined as you see. Miss Wells will tell you that the proposed buildings for Indiana University will be joined in some similar fashion. At Smith the present construction consists of three units about a U-shaped court. In the future another group of three units will be erected forming a large square. A number of tentative plans for Northwestern have been made which show the dormitories placed about various shaped courts. It is the intention here to do for the women what was done so successfully a few years ago for the men, namely: Build the fraternity houses and dormitories about the same quadrangle. Most of the fraternities gladly accepted an invitation to build

upon the campus. None of them, I think, found the restrictions imposed by the university to be other than advantageous. These restrictions were that the buildings must be placed upon a designated site and must be designed to harmonize in every way with the dormitories to be built by the university for non-fraternity men on adjoining sites. Here we have fraternity and non-fraternity men living in equally comfortable quarters in close proximity on the same campus. Why should not the problem of housing women students be handled in the same way?

Note the Yale Quadrangle. On a single city block provision has been made for 650 students in 1100 rooms. Here is, to my mind, the finest grouping so far produced in America.

Architectural treatment—While admitting that the plan arrangement is the first and most important consideration, I hope you will all agree with me that the appearance of the building or group of buildings is worthy of the most serious thought. I shall not point out examples of the poorly designed buildings. Many of you have them to endure. The very first thought in connection with the design it seems to me should be to get away frankly and openly from the appalling monotony so often found in institutional buildings. As we look at some of the pictures which will be shown on the screen I shall call attention to certain features which seem to me to make them worthy of your consideration.

I hope you will all accept the invitation of Dean Marion Talbot to visit Ida Noyes Hall at the University of Chicago. No pictures I have seen begin to do it justice.

May I venture to offer a wish in closing? The wish is that you may see this year the beginning of the realization in brick and stone of your dreams for the housing and the social life of your girls.

CONSIDERATIONS GOVERNING THE PREPARATION OF FLOOR PLANS FOR WOMEN'S DORMITORIES

BLANCHE GEARY, DIRECTOR OF THE ARCHITECTURAL AND ECONOMIC
BUREAU, NATIONAL BOARD OF THE YOUNG WOMEN'S
CHRISTIAN ASSOCIATIONS

The responsibility of the educational authorities for the suitable housing of students—men or women, is gaining wider and wider recognition. The present shortage of small houses in which rentable rooms oftentimes can be found, coupled with the ever-increasing demand by the American girl for a college education, has forced home the demand for special building. Closely linked with this is the imperative necessity that the deans shall have a suitable setting for the promotion and control of social life and standards.

Granted the real need for the special provision of living quarters for women students, the first question to answer concerns the character of the accommodation we shall offer. Shall it be of the cottage variety or not?

My studies lead me to conclude that the smaller the unit the better, because of its closer resemblance to family life, and because of its character-building environment. But, as a matter of practical politics, the costly duplication required by the cottage plan generally restricts the development of such a scheme and the need is consequently not met. So many basements to excavate, so many steam heating and hot water plants to install and care for, so many roofs, so many entrances to build, so many house mothers to find and to pay—spell defeat.

If enough suitable accommodation is to be provided, whether for the student or for the city employee, to the extent demanded by modern conditions, a floor plan and a specification must be chosen, I venture to think, which will house relatively large numbers under one roof. *Per capita* costs for management and for upkeep argue loudly for this conviction. (It is far more economical to run one large heating plant than fifty small ones; one cook's wages can serve many more than a cottage family.)

If we agree that the only practical type with which to meet a huge modern need is the large residence housing 100 to 200 under one roof, what are some of the ideals which *should* control the inspiration of a good floor plan in that type of building? The time has gone by when a man, because he is president of a college or chairman of a board of trustees, is thereby qualified to make decisions on the floor plan for a woman's building. Equally true is it that there are many architects whose performances with State houses, schools, and post offices do not of necessity argue their preëminent qualification to design residential quarters for these large groups of women!

Still another consideration is *economy* in construction. Away with waste space—it costs possibly sixty cents a cubic foot to build, and no man knows how much to maintain. Over-wide halls and corridors, unused or unusable spaces, whether upstairs or downstairs—let us with determination insist upon the (a) minimum cubic contents which will meet the need. (b) Away with unnecessary expense in materials, having in mind, of course, the need of safeguarding against wear and tear and depreciation. (If limestone will serve, why buy granite? If a Keene's cement finish is satisfactory, why supply tile? If a simple, uniform design for trim can be found *which is suitable*, why pay for special designs for the special treatment of special rooms costing special prices demanded by special service at the special mill?) If scrupulously thorough study, seeking reduction of cost, will result in saving enough to add measurably to the housing capacity of the scheme, it behooves us all to give the time and attention required to effect the saving. (c) Away with extravagance in upkeep. As the years roll by and the bills roll in, it is comforting to know that the clever architect, allying himself with the proper specialists in such housing schemes, has given you a building in which the natural draught of the properly designed boiler does not call for an expensive fan system without which there is not draught enough to burn the coal to make the steam to heat the house that Jack built! It means dollars and cents in wear and

tear, in time and temper, when the housekeeping units are so separated that constant elevator service, or endless stair trips, or long walks are required to perform properly the daily duties. The closest possible study is required of the relation of space to space. The influence of the floor plan and the specification on the financial results of operation are enormous and demand thorough and understanding attention.

Next in importance to economy, which seeks to make the available dollars meet an apparently endless need, I place *comfort*. There must be enough heat for all winters, and that heat must be available, by the way, for long enough hours. Our floor plan must encourage refreshing breezes, or at least provide shaded spaces for all summers; there must be such a thoroughgoing study of lighting as will eliminate all dark, artificially lighted spaces during the daytime, and ensure enough cheerful, effective lighting at night. American eyesight, we have been told recently, is below par—let us be sure that there is plenty of light for the reading that must be done and for the stitch that saves nine. Bedrooms, libraries, social rooms all need the comfort of enough light by day and by night.

Closely related to comfort is the question of plumbing. Far be it from me to suggest that there are centers at which women assemble, where there is no noticeable punch in their demand for enough plumbing; we can draw deductions, perhaps, from the gracious way in which they continue to stand in line, first on one foot, then on the other, waiting for a vacant tub or a shower, or a chance for a hurried turn at a wash basin much in demand. There is a recognized minimum in the provision of wash basins, toilets, tub and shower baths (also of slop sinks), below which it is not wise to plan. Can one, under the general head of comfort, put in a plea for enough hot water for all at any hour when needed?

My final desire for a minimum of comfort is privacy. The specialist on floor plans for halls of residence for women, whether students or wage earners in the business and professional world, having in mind their need for conditions making for perfect health, cannot afford to overlook the connection between crowd-nerves and the prevalent absence of privacy. Lacking teachers, classrooms are crowded; lacking houses, home life is crowded; having the crowd habit and the ground plowed ready for sowing the crowd-nerve seed, the girl reaches college usually to find a crowd in her bedroom, a crowd at her dinner table, and, inevitably crowds at every other moment in her day. This explains possibly the present apparent inability of thousands of women "down from college" to promote family life of their own without the ever-present crowd surrounding, whether "home" is in the small town or the larger city life.

The ideal floor plan recognizes the character-building value and the health-giving value of privacy at the wash basin, and of privacy in the retiring rooms. Some here may accuse me of early Victorian prudishness, but I think these niceties in early life have a real relation to culture and morals.

A fourth governing consideration is that of *beauty*. The ideal quarters

cannot be developed today without unqualified recognition of the educational value of true beauty of environment. These values are as obvious and as definite in their influence on life as are the results on health, of too little plumbing, or too much crowd. Beauty can hardly be attained without due regard to suitability, and since suitability by common consent is mother to simplicity, beauty will depend in the final analysis on perfection of design and color. It is not impossible that, having lived for six years surrounded by the utter absence of gingerbread ornament, rococo treatment, and florid escapades in woodwork, plaster, or wall paper, the charming college-bred bride of tomorrow will turn instinctively from such modern "beauty" in apartment house or villa and will insist upon an exquisite simplicity and beauty which architects and builders will be bound to provide. My argument is not for barracks nor for palaces, but for the friendly, well-equipped, well-run, harmoniously developed home which lies between the two extremes.

The ideal floor plan, it will perhaps be agreed, should contain the following items in measure large or small as the scheme demands: Social rooms varying in sizes on the ground floor, predicated by reason of their friendly, informal character and equipment, easy and pleasant conference with one's men friends and arguing boldly the possibility of occasions pleasant to the socially minded, when folding doors are thrown wide open, rugs vanish, and joyous music preludes good times of many kinds. On the ground floor other spaces, such as sitting-room for the house mother, cloak rooms, lavatories, storage, and last but not least, as inconspicuously placed as possible, whatever business office may be required. Access from this floor of course should be had to the dining room and its kitchen dependencies if conditions demand the provision of table board for the family. The ideal plan cries aloud for windows on two or even three sides of the dining-room, which thereby, and because of its charming furniture and color scheme, becomes the prettiest spot in the countryside in which to eat.

Much thought is given by all concerned to the elimination of waste footsteps tramping hither and yon, whether on kitchen duty or waitress duty or whatever other duty bound. Adequate provision for the comfort and well-being of all the help while on duty and when off duty is of prime consequence in the perfect building.

Upstairs a very large majority will probably sleep in single bedrooms. Where circumstances demand adding one or perhaps two individuals to the room or planning dormitory sleeping accommodation, certain it is that each girl should be given her own bureau, her own hanging closet, and opportunity for private care of her person, whether by means of properly installed screening or curtaining or partitions.

Adequate trunk-room facilities, a laundry with a generous allowance of tubs, ironing boards, drying arrangements for the use of the family, and possibly, where prices and conditions favor it, a laundry for the housework adequately equipped and staffed, should be provided.

A certain small domain will probably be set aside for use as an infirmary

for the segregation of suspicious possibilities prior to disposal or treatment. This infirmary would, of course, be suitably equipped.

On one or other of the bedroom floors or in some other suitable space one would hope to find a neatly fitted up sewing room having in it a cutting table, a sewing machine, a wall mirror, and a pressing iron and board. And in some suitable and accessible spot, would it not seem desirable to install a fudge kitchen of doll's house dimensions but containing the necessities in the way of a small sink, water supply, gas range, and china closet?

Many more paragraphs could be added describing ideal closet accommodation of all kinds, whether for linen or brooms and brushes, or cook's closets, or office closets; and still more paragraphs to be written on bathroom and lavatory spaces, basement spaces, kitchen domain—all of them of first importance when the question of cost of operation is acute, but much too detailed for a paper of this kind.

Nothing that I have said, it is to be hoped, will be taken by anyone as reflecting upon the many delightful house mothers brought through room registry efforts to the point of being willing to open their pleasant homes to the reception of students. I cannot speak emphatically enough of my appreciation of the invaluable service which the registries offer as long as they actually function and really secure adherence to their standards. One would not, I am sure, dream of arguing the registries out of business and all the girls automatically herded into huge and specially-built residences. Many there are, I think, who will join heartily with me in hoping to see the day, however, when the students who cannot be housed in efficiently supervised small homes shall be safely provided for in specially-built buildings as much like home as they can be made by a clever and experienced architect, an artistic interior decorator, and a skillful house manager. Physical safety, moral safety, as well as intellectual progress, and the character of future American family life are closely tied up with this whole question of housing.

A DORMITORY THAT IS A HOME

AGNES E. WELLS, DEAN OF WOMEN, INDIANA UNIVERSITY,
BLOOMINGTON, INDIANA

No doubt every woman has asked "What makes a home?" The answers are as varied as the questioners; yet underlying all replies, a feeling exists that the fundamental principle is harmony; a rhythmic atmosphere which soothes and relaxes and in which ideals materialize and flourish; a co-operation that leads to friendships and to a desire to do for others. Many factors enter into its structure; the type of building, the furnishings, the members of the household both family and helpers, and most important of all the directors.

The type of building for a college home is determined first by the material available at most reasonable cost. This then, for the most part,

determines the style of architecture. An English architect recently said that the Tudor type, for stone buildings, as found at Bryn Mawr, is the best, in his judgment, for American college buildings. The size is first determined by a paying unit, because no college can afford to run into debt for the housing of her students. It is the opinion of the majority of people planning new buildings, that to have a dormitory a home the unit buildings should not be large. Smith College has completed excellent plans for a new group, each unit to house between forty and seventy-five. While not the most economical number this seems to be, taking everything into consideration, the most satisfying unit.

An arrangement of rooms as worked out after considering many buildings in coeducational institutions might be as follows: on the first floor, an entrance hall, office, elevator, reception room, men's cloak room, drawing room, library, living room, guest suite, and social director's suite; in the basement, receiving room for all deliveries, recreation room, trunk room, janitor's suite, laundry, and lockers for help, storeroom and kitchen; on the second floor, in the center above a tower entrance; a dining room and serving room, the rest of the floor to be given over to students' rooms, both single and double; on the third and fourth floors, rooms for students; an infirmary in the tower on the fourth floor; kitchenette and club rooms at the end of each floor, and an enclosed fire-proof staircase.

Beautiful architecture and well planned interiors have no real meaning unless the furnishings are harmonious. Rooms furnished to be exhibition rooms have no home atmosphere. Many perfectly appointed buildings are not homes; they are, rather, beautiful palaces or elaborate hotels. A home must be adapted to the individuals who live in it. It must contain what is expressive of and necessary for the daily needs of the occupants. The furnishings must reflect the physical, mental, and spiritual activities of the people in the house. The aim in the furnishing of all college dormitories should be to carry out this idea in such a way that the girls will take with them into their own homes the unconscious training they have received by living in perfectly appointed, though simply furnished rooms.

The first thing to consider is the color and finish of the floors, the walls, and the ceilings. The rule to follow is taken, as is everything worth while in furnishings, from nature; the ground dark, the trees and foliage lighter, and the sky lighter still. There must be a feeling of stability in each room obtained by this treatment of the background. If the background is badly planned, the whole picture is spoiled. The furniture must be chosen for each room, not bought in wholesale lots, in order to save expense, without regard to the place in which it is to be used. The rooms must be well balanced. This is obtained in two ways, by symmetric and by occult balancing. In dining rooms and reception rooms, bisymmetric balance is used. Occult balancing is more subtle and should reflect the artistic taste of the home maker. The large college living room should be the center of the social life of the dormitory. Desirable proportions as worked out, for a group of seventy-five, by experienced architects are

length, forty-three feet, width twenty-five feet, and height, nine and one half feet. Such a room may be perfectly balanced by attractive grouping. Betsy Barber House in Ann Arbor is a good example of perfect balancing, both bisymmetric and occult. For larger rooms, good examples of occult balancing are the living room at the Martha Cook Building, Ann Arbor, and the large reception room in Alumnæ Hall, Mt. Holyoke.

Very often donors of buildings present pieces of bric-a-brac which are absolutely inappropriate and have no meaning in a dormitory, but which must be used. A cabinet harmonizing with the furnishings might be used for such gifts.

The colors used for rugs, furniture, and hangings might be chosen to harmonize with nature in the locality. Lippincott publishes a book "Color Schemes for Homes" by Frohne, Jackson and Jackson of interest to anyone planning home furnishings. For color schemes for living rooms, they suggest brown and green, blue and old gold, mulberry and faun, green and gray. They also suggest the kinds of rugs and the style of furniture to go with these color schemes. A study of color is essential because many people are made unhappy and disagreeable by inharmonious colors. A study of primary, secondary, and complementary colors and of greying and keying is important.

In choosing the styles of furniture, the governing idea is weight. When heavy furniture is wanted there are many types from which to choose: Elizabethan, much of Jacobean, Spanish, early French and Italian, French Empire, American Colonial and Mission. Lighter types for elaborate drawing rooms or reception rooms may be chosen from Louis XV and Louis XVI styles. For living rooms and parlors when lighter types are wanted, the choice may be made from the styles of William and Mary, Queen Anne, Georgian, Jacobean, Chippendale, Hepplewhite, Adam, and Sheraton. Cheap reproductions of good models are better than expensive but inartistic makes.

The library should be furnished with sets of reference books needed by the students but most of all it should have books of art and history, biography and literature, and good fiction, that girls may learn to read and love to read, not to "make a grade," but to have a broader view of life. Vassar has a fine library in Main Hall which girls are not allowed to enter with note book or pencil. There they read for the love of reading. Picture shows, sugar-coated high-school education, and the "hurry up" life brought about by the automobile have largely destroyed the home-reading circles. Hence many students must acquire in college a love for good books. There is an extra reward awaiting a dean of women who has for years had frequent hours of reading with her girls. Many Minnesota women have learned to love to read through these "golden hours."

However important the furnishings of the living room and library may be, the rooms in which the girls spend most of their time must be given careful attention. Each room should have a good rug, probably of two neutral tones; the walls preferably painted, a warm color for a north

room and a cool color for a south room. There should be a comfortable single bed with mattress and pillow and a good dresser or chiffonier. The separate mirror as in the Wellesley dormitories is practical and much less expensive. Necessary also, are a desk, not too heavy to be moved easily (students often decide to rearrange their furniture at 1:00 A. M.); a desk chair, comfortable and durable; book shelves; an easy chair; a wooden suitcase stand, useful as support for a tea tray; a floor lamp; and a wardrobe or closet. The closet may be balanced by an enclosed lavatory with door panels perforated for ventilation, as in some of the rooms at Bryn Mawr.

The play room in the basement should be furnished with a good floor for dancing—as at Rector Hall, DePauw—and with a fireplace, a player piano, and a victrola. In this room all “jazz sprees” should be worked off and only good music be played on the living room piano.

The advantages of a building of this description are many. Least among them are the physical comforts such as sanitation, proper light and heat, cleanliness, with the possibility of a daily bath instead of the two (often luke-warm) baths a week permitted in many rooming houses. On a campus especially in universities where from 50 to 60 per cent of the women live scattered over the town, the standards are set by the girls in a dormitory. The companionship of many girls instead of the loneliness of too many of our girls in small scattered rooming houses is another advantage. Tea prepared daily at four by the house social committee serves not only to bring the girls together after classes for sociability, but often to interest the listless girl in real college work through the lively social, philosophical, and political discussion of the upper classmen. The development of a scholastic atmosphere is very important. Well-chosen pictures, books, and magazines help to accomplish this. A scholarship committee is most valuable and should function constantly. Pride in house standing helps to keep a high standard of scholarship. The girls learn to be hostesses by entertaining formally and informally the faculty and honored college guests.

In order to bring about all of these desired results the university should choose as director a refined, cultured, well-bred, college woman who has the power to make an architectural pile a home; a woman of social graces so that talks on etiquette are not necessary; a woman who presides always with grace and friendliness and who commands the respect and admiration of all who know her. The business director should be a college woman of the same social standing as the social director, and their positions should be recognized on the campus as on a par with women of the faculty. The salary of each should be such as to attract to the positions the right kind of women and to keep them there. The business director adds to the home life by observing birthdays, special feasts, giving dinner dances and by helping to direct the work for physical comfort so that no one is conscious of the machinery. The social director may love music, science, art, literature, but above all, she must love humanity. She must be able to direct the taste of the girls in dress, etiquette, and speech without the girls being

conscious of it. She must be able to bring order out of chaos, to bring harmony to dissenting groups—in short, she must be a superior woman. It is her friendliness which will create the atmosphere which makes the college dormitory a home.

ORGANIZATION OF THE WORK OF HEADS OF HALLS

EDITH SOUTHER TUFTS, DEAN OF RESIDENCE, WELLESLEY COLLEGE,
WELLESLEY, MASSACHUSETTS

In taking up the topic assigned me, I must necessarily limit it to the college which I know best, the only one of which I have sufficient knowledge to speak with authority. My subject therefore becomes The Organization of the Heads of Halls at Wellesley College.

Doubtless all colleges, at least the larger women's colleges, have had a similar history of gradual development. No one of them has sprung Athena-like into life, fully armed from the brain of a founder Zeus.

My own college, after the fashion of Mt. Holyoke and Vassar, began with a single great building, assembling under its roof all the college activities. To this was added after six years, a second hall housing approximately one hundred students and the department of botany. A year later was built a smaller house intended for those students who found themselves unequal to the strain of the large groups. Norumbega followed in 1885, for fifteen years our house of distinction because it contained the President's suite, in addition to rooms for thirty odd students. Up to this time to the best of my knowledge, no especial need for organization was felt. Each house presented its own problems, which its head met as best she might, being responsible directly to the president of the college.

Two more cottages, so-called, were built within the next five years upon Norumbega Hill and this group of four was completed by the erection of Wilder Hall in 1900.

Meantime the first of the village houses was Eliot, bought by Mrs. Durant and equipped by generous friends to house thirty students upon the coöperative plan. The college had also in the nineties equipped a second coöperative house for forty students at one of the entrances to the college grounds. These two houses carried on the tradition of "domestic work" abandoned for the remainder of the student body in 1894.

The first need of organization to secure consistent action was felt in the early nineties and by the end of the decade the meetings of the heads of houses had become comparatively regular and were presided over by the president of the college, or her representative. The Registrar of the college acted as secretary. In 1904 the President announced that she had appointed Miss Olive Davis, at that time head of Wilder Hall, permanent chairman of the Heads of Houses with the title of Director of Halls of Residence. Miss Davis held this post for thirteen years and under her leadership the present organization was developed. Ill health compelled her to resign in

1917. The years since have brought some further developments but the general scheme is practically as she left it.

Wellesley has now twenty-six houses varying in size from little Homestead with its ten students to Tower Court with its 200. Thirteen of them are within the limits of the college grounds, thirteen in the village of Wellesley as near as possible to the college boundaries. The thirteen college houses in the village of Wellesley differ in size and character quite as much as those upon the campus. Four of them have dining rooms seating from fifty to 135, each sufficiently large to accommodate more than the students living in the house. A fifth dining room with no student rooms attached has seats for eighty. Nine lodging houses, either owned or rented by the college, help fill the extra dining room places, leaving still some space for the lodgers in the few supplementary private houses. I may state in this connection that Wellesley has been able since September 1919 to feed all its undergraduates at its own tables.

The summary of dormitories at Wellesley is then as follows: Thirteen houses on the campus—One for 200, six for 100 (approximately), four for 50 (approximately), one for 40 (coöperative), and one for 10 (lodging house only); fourteen houses in the village—four with dining rooms seating from 50 to 135, one additional dining room for 80, and nine lodging houses, housing from 13 to 24.

The detached dining room is under the charge of the head of the nearest lodging house. Two other lodging houses are under the charge of one head, assisted by one of the instructors as resident chaperon.

With so varied an equipment Wellesley might be expected to have data for deciding upon the ideal size for a college dormitory. We consider a house of from ninety to one hundred the most desirable unit from the point of economy in administration, though in our present opinion a house of sixty is perhaps more nearly ideal, so far as social life and standards are concerned, if one need not consider the matter of expense. We have tentative plans for our next dormitory group on the basis of a common kitchen, serving three connected dormitory units of sixty, each with its own dining room.

Upon the resignation of Miss Davis, the Registrar of the college succeeded to the chairmanship of the Heads of Houses. It seemed advisable to the President in 1919 to make a clear and consistent division between certain of the offices. She therefore changed the title of Registrar to Dean of Residence as more accurately describing the duties of the position and by certain readjustments assigned to this office the superintendence of that part of the college life connected with the housing and social intercourse of the students. The Dean of Residence is the third administrative officer of the college, a member of the Academic Council of the college, a member of the Senate of the College Government Association and a member *ex officio* of the Committee on Discipline.

It has been the policy of Wellesley to gather the duties of house superintendence into the hand of a single officer. The Head of House is therefore

not only social head of her household and house mother of her students, but head also of the domestic department, engaging her own staff, organizing the work of her dining room and kitchen, making out her menus and ordering her supplies through the college buyer. While this creates a position of unquestioned difficulty, we believe that it also creates one of great interest and that the work is more unified and the home life a more complete and satisfactory whole than when the authority is divided.

This centralization would not be possible, if Wellesley were not most fortunate in her purveyor. Since 1896 the College has employed a single buyer for all its houses. Mrs. Charlotte S. Whiton, who for more than twenty years has bought the food supplies for the Wellesley dormitories, is the second person to hold this office. Mrs. Whiton is not by any means a mere buyer of food, receiving mechanically once a week the orders of the Heads of Houses. She is a counsellor of greatest value, understanding not only the market, but also the needs of the houses and the preference of the students, and is ready at all times to advise and suggest. To a new Head of House her help is beyond price. Mrs. Whiton has her home in Boston but spends a certain amount of her time in Wellesley, having her office in the Administration Building. It is her custom to meet weekly with the Heads of Houses in groups,—with the village heads of dining rooms at one time, with the Quadrangle heads at another, with the hill houses and with the remaining four at still other times.

Another officer closely connected with the heads of houses is the Purchasing Agent who buys supplies other than food for the houses—furnishings, linen, china, and the like. Miss Bertha L. Caswell has served the college excellently in this capacity for twenty-five years.

To secure greater efficiency in work the Heads of Houses are subdivided into committees—the Food Committee, whose gallant service during the trying years of the war will not soon be forgotten; the House Committee, whose province is the various details of house equipment; the Social Service Committee, which is in charge of the interests of the maids, their wages, social life, and so forth; the Committee on Student Interests, which is concerned with the house and social life of the student body, connecting closely with the College Government Association. These committees hold meetings at irregular intervals as occasion arises.

The policy of Wellesley is to secure uniformity in house management, not identity. For instance, we do not have and do not wish to have the same menus for the same meal in every house. We have a keen appreciation of the importance and scope of the position of Head of House. We intend to use the greatest care in selecting candidates for our staff, but having found the right person to give her freedom within certain broad lines to stamp her own individuality upon her house.

The meetings of the Heads of Houses occur upon the first and third Tuesdays of each month, lasting from 10:30 to 12. I give a typical docket—(1) Minutes; (2) Letters of appreciation from conferences; (3) Committee Reports: *Food*—Announcement of meeting under auspices

of Educational and Industrial Union of Boston to discuss proper food for students; *House*—Letter from Purchasing Agent; *Social Service*—Report on Maids' Classes; and *Student Interests*—(a) Approved restaurants in Boston; (b) sales and agencies; and (c) chaperon regulations; (4) Report on unsatisfactory students; and (5) Financial statements from cashier.

We make no claim to having achieved perfection at Wellesley, but we believe we are on the right road. We are eager to learn from fellow-workers in the same field. We see infinite possibilities for development in many directions. We hope each year to make some advance toward our ideals of house management in order that our college may attain higher standards in academic and social life. We are above all things interested in our job.

METHOD OF OBTAINING LEGISLATIVE APPROPRIATION FOR WOMEN'S DORMITORIES AT KANSAS INSTITUTIONS

ALBERTA CORBIN, FORMERLY ADVISER OF WOMEN, KANSAS UNIVERSITY

Read by Anne Dudley Blitz, Dean of Women, University of Kansas,
Lawrence, Kansas

Ten years ago, there was little sentiment for dormitories in Kansas. The older and more influential alumni had not yet realized the change that had come about in the living conditions of students. They thought of their own almost ideal college life where students were taken into the homes of citizens and faculty and made members of the family during their college course. A movement undertaken about 1910 to collect private funds for a "building for girls" at the University of Kansas did not reach the goal but did succeed, at least, in informing the alumni of the unfavorable conditions in which the young women in State schools live and in making the alumni sense the need for college homes.

The attempt to collect money having failed, thought was then turned toward a legislative appropriation. Several times after 1910 the university included a dormitory for women in its budget, but without avail. It now became a question of education, not of the alumni alone, but of the people of the State.

Very soon after the movement had been undertaken for a "building for girls" at the university, there was formed the *Kansas Council of Women*, an organization made up of president and past-presidents of State-wide women's organizations such as the State Federation of Women's Clubs, the American Association of University Women, the Women's Christian Temperance Union, the Daughters of the American Revolution, the Women's Relief Corps, and the League of Women Voters. Deans of Women are also *ex-officio* members. The object of this organization is service to the State. Fortunately for the cause of dormitories, one of the women who had been closely associated with the movement for the

"building for girls" was an active member of the Kansas Council, and it was through her influence that the council voted to undertake the securing of an appropriation for dormitories as one of its principal achievements.

For several legislatures the council merely supported the bills introduced by the schools, but finally a plan was made for independent action. The plan was, in reality, developed at the State meeting of Deans of Women and Deans of Girls that was held in January, 1920, at Pittsburg, Kansas. There a motion was introduced and passed to request the presidents of the State schools to form a State-wide committee on student housing, to consist of four members from each school to be appointed by the president of the school and to be made up of the Dean of Women and one representative each from the faculty, the alumni, and the student body.

The presidents received the suggestion favorably, the State-wide committee was constituted, and had an early meeting in Topeka to discuss plans.

Cost of building was at that time almost prohibitive but the committee, after consulting with the presidents of the schools, the Board of Administration, and the Governor, recommended a plan that had the favor of all these persons: namely, that a bill providing for a bond issue of \$1,000,000 be introduced into the next legislature, in order to initiate a building program for dormitories at the five State schools. Eventually this plan was taken over by the Kansas Council. Indeed, it was originated by the deans who are members of the council. Thus a State-wide organization was effected which had the favor not only of five schools, which had usually appeared as rivals before the legislature, with their faculty, alumni, and student bodies, the Board of Administration, and the Governor, but which also had the solid support of a vast body of women, more than 80,000 altogether. The cause, too, was an asset, since no personal interests were involved.

The council entered with great vigor upon the prosecution of the plan. A committee of five was created to provide necessary publicity, to draft the bill, and push it in the legislature. While the council bill had the favor of the schools, it was of course entirely separate from the appropriation bills for the schools and had no adverse influence so far as could be noticed upon those bills. Incidentally the committee had also to provide funds. No worker was paid for her time, but all actual expense for railway fare, hotel bills, printing, stamps, stationery, and telegrams were met by friends of the movement. At two of the schools, a large per cent of the expense incurred was raised by small contributions of the women students. It may be of interest that while the estimated budgets made by men of experience in legislative lobbies, ranged from 1500 to 2500 dollars, the actual total of the campaign in question was slightly over \$700.

It was no small task to conduct the campaign. The formal support of the various constituent organizations of the council had to be made real and active by personal appeal. For this purpose the cause was laid by the Deans and others vitally interested before the State, district, county, and

city meetings of many organizations. The publicity woman was very active. Bulletins from all the schools were sent out to the Alumni, stories were run in all the leading newspapers—all this throughout the fall months. After the legislature assembled in January, petitions, letters, and telegrams were called for from local constituents to overcome opposition or stir the active interest of legislative members.

The council members themselves, sixty to seventy-five in number, did admirable work, in fact the chief work of the committee in charge was to direct and organize. At the annual meeting of the council, which occurred soon after the legislature convened, it was voted to register *en masse* to lobby for the bill. At this meeting, too, the names of the members of the legislature were divided among the women, in order that each member might receive full information about the needs of the schools. The chief characteristic of the lobby was its educative policy, the idea being that the knowledge of the actual facts and conditions would secure votes.

Frequent conferences of the council were held in Topeka during the session of the legislature. These conferences were more or less open; wives of members of the legislature were invited to be present; so were also as many women as possible who were leaders in the local community. Some of these women rendered valuable assistance.

It was an interesting and valuable experience to watch the bill on its progress through both houses—an identical bill was introduced into each house at the same time. It was introduced into the House of Representatives by a woman, had the support of all the women members, and was intended to be treated as a woman's measure. In the Senate it was introduced by the Chairman of the Committee on State Affairs.

The choice of persons to introduce the bill and the selection of the chief supporters was carefully thought over in advance by the committee in charge, great care was given to the drafting of the bill in the first place.

The possible committees to which the bill might be referred were carefully considered with the probability of their favorable report in mind. The members of the committees to whom the bills were referred were interviewed preparatory to the hearings and the presentation of the cause at the hearings was planned with the greatest care. After the bills were reported favorably and before they came up for discussion, every member of both houses was interviewed. When a member was found to be doubtful or opposed, every endeavor was made to win him over, especially by giving him information and by securing the interest of his constituency "back home." At least two members of the committee in charge stayed almost continually at the Capitol, and for days together they had the assistance now of one woman, now of another, whose interest was keen and whose support was felt to be needed at various junctures.

The actual obstacles to the passage of the bill itself were considerable. Building prices were still high and farmers were complaining of high taxes. There was strong opposition to any bond issue, because Kansas had burned her bonds some years before and was proud and boastful about

being out of debt. The bill called, besides, for the limit of indebtedness under the State law. The bill passed the Senate as originally introduced, however, by a majority of one. In the House a lively fight was made against it, and it was not passed until it had been amended by substituting a direct appropriation for the bond issue and by cutting the amount from one million to half a million dollars. At the urgent request of the friends of the bill, the Senate voted favorably on the House amendment. It did not seem safe to try for an increase. While there was a very real need for all the money for which the bill originally called, the women felt that the effort put forth had nevertheless been rewarded.

A great American architect has recently said that success is due to three elements, untiring work, interest (rather than inspiration), and coöperation. These three elements the council certainly had in rich measure. The success of the undertaking was due to the coöperation of many interested, untiring workers. Here and there a leader stands out, to be sure, but in fairness to the many, perhaps, no names should be mentioned.

HOW TO OBTAIN MONEY FOR DORMITORIES BY PRIVATE GIFTS

GRACE GREENWOOD, SOCIAL DIRECTOR OF MARTHA COOK DORMITORY,
UNIVERSITY OF MICHIGAN, ANN ARBOR, MICHIGAN

In view of what has been said by the previous speaker, it is obvious that whatsoever the legislature may do to meet adequately the present growing demands of housing the women of State universities, it is highly improbable that these needs can be fully met. The sums required for a complete system of dormitories for housing women, together with the other most pressing needs of the universities, are so great that at the present time it is unthinkable that the legislatures will find it possible to grant sums needed for such purpose. It would therefore appear that we must appeal to other sources to secure, as soon as possible, needed dormitories.

The first thing to do, then, is to make the communities of the various State universities realize sufficiently, and to the fullest measure, the facts of the situation as they obtain in their respective university. For this purpose, it is necessary that in every State university a representative committee be appointed by the governing bodies to gather all information bearing upon the housing question and formulate it in the most emphatic and impressive way, and then see to it that these facts are urgently presented on every opportune occasion. Indeed, I think it would be wise, from time to time, to have these facts published in the leading newspapers of the respective States. In other words, a sound sentiment on this all-important question should be aroused in every community.

In general, in all these respects, it seems to me the idea should be stressed that it is important that the life of the students in their houses should be in full accord with the ideals of the university.

After public sentiment has been aroused, it is reasonable to suppose and to assume that some wealthy and public-spirited men and women will be made to feel that a great service to society may be done in this field. It is my feeling that the manner in which these public-spirited citizens should be approached or appealed to has not been at all times sufficiently considered. Every benefactor has certain distinct views as to the way in which the needs and ideals of his particular university may be furthered. It would be, it seems to me, the part of wisdom for the person or persons entrusted with the task of interesting such prospective benefactor to find out in the first instance just how and what he feels in respect to the phase of university life which requires his interest and assistance. Whether we agree with him or not as to the prime needs of the university, it is but just and fair to determine as closely as possible his point of view, whether it be broadly philanthropic or more restrictedly religious or generally social. The representative of the university coming to this point of view would then naturally make it his task to try as far as possible to adjust this point of view to the ideals of the university. This, to my mind, is the ideal of the true university diplomat.

RECREATION AND THE UNIVERSITY MIXER

JESSIE S. LADD, DEAN OF WOMEN, UNIVERSITY OF MINNESOTA,
MINNEAPOLIS, MINNESOTA

Dean Wells of Indiana, in her request for a paper on the subject of Recreation and the University Mixer, says that she understands that we have "practically solved this problem at Minnesota." Knowing well how far we are from this blessed consummation, I am rather loath to speak on the subject. However, I am glad to tell you of what we have done, if you, on your part, will remember that we do not consider the problem solved.

What opportunities are there for social contacts at the University of Minnesota? In the first place, as the center and heart of the recreational activities of the women, we have our Woman's Building, Alice Shevlin Hall. Shevlin Hall was given to the women of the University of Minnesota about fifteen years ago, by a wealthy Minneapolis man, the late Mr. Thomas Shevlin. We were very fortunate in that a man of large and generous ideas was able to see the need. It was due to the efforts of the Woman's League and the Young Women's Christian Association that this need was made clear to him. First, then, there was the need; second, the need was made clear, and, third, the need supplied.

From the spacious hall there is a generous view of the living room, a lofty, panelled room suggestive of old-English comforts. There are inviting chairs—pleasantly uninstitutional—davenport, and tables on which are the latest papers and magazines. On cold, wintry days a fire blazes in the great fireplace. Thirty to fifty girls may be seen here at

all hours of the day, visiting or studying. On Wednesday afternoons, for the last fifteen years, I have read aloud in this room to groups of girls. The Fireside Reading Hour has come to be quite a feature at Minnesota. I read short stories and the girls come and go as they please. It has proved a very restful and pleasant hour. We serve cocoa and cakes, and I have an opportunity to chat with the girls in a most informal fashion.

During the week of examinations, I serve refreshments. This gives an opportunity for lessening the strain of this trying period. The girls flock in and seem so grateful for the hot tea, the informality, and the atmosphere of "nothing is expected of you now."

Then for those students who wish a smaller and more intimate meeting place, we have a room, cozy with fireplace and candles, where groups of twenty or more may gather. This may be reserved in advance, and there is seldom an afternoon when this room is not in use for small teas, for committee meetings, for various women's organizations on the campus. There is no charge for this privilege.

Opposite the living room is the assembly room, white enameled, sunny, with a good floor and graced by the portraits of ex-President Vincent and our beloved Maria Sanford. Here, at the noon hour, the girls dance. They are mostly non-sorority girls. This has always seemed a happy, care-free time, when they can chat and play and cast off the strain of the classroom. The room is provided with a piano, victrola, and stage curtain. Evening lectures, plays, dances, and musicals are also given here.

I will mention some of the clubs which entertain at teas and evening parties at Shevlin Hall. There are the State clubs, the women's class organizations: Bib and Tucker, Pinafore, Tam O'Shanter, and Cap and Gown—Pharmacy, Dental, and Chemistry Clubs, Girl Scout Clubs, the Menorah Society, made up of Jewish men and women; the Women's Glee Club, Scroll and Key, the Architectural Club, Torch and Distaff, a new Home Economics Honorary Society, and the Mortar Board. Then too, there are the literary societies, dramatic clubs, and so on almost without end.

In this connection, I might say a word about the chaperonage of parties on the campus, which is under our immediate jurisdiction. Practically all evening parties are dancing parties, and are given on Friday or Saturday evenings. We ask for two faculty chaperones for each party. Printed slips are sent out asking each chaperone to report to the dean's office as to the style of dancing and the courtesy which they receive. We feel that some gain is made in this way, as chaperones tend to take their duties more seriously if they think an accounting is requested.

The Young Women's Christian Association rooms are just beyond the assembly room of Shevlin Hall. Religious meetings are held here once a week. Many general teas are given to the university girls by the association. The Christian Association parlor affords another opportunity for girls to meet and visit with their friends. Early in the year the Young Men's and Young Women's Christian Association give one or more receptions to the new students.

The lower floor of the building is occupied mainly by the constantly expanding cafeteria. Fifteen years ago we could only seat 200 in the dining room. Now, owing to a generous appropriation from the legislature we are able to seat 600. About 700 girls lunch here daily. This lunching together helps the girls to become acquainted and to form friendships. There are both large and small private dining rooms for the use of any group signing up in advance with the cafeteria director. For the non-sorority girl this is a most desirable feature. A successful innovation of this year is the small kitchen which has been furnished for the use of the girls who want to prepare their own spreads and teas.

The third floor is given up to the Women's Self-Government Association office, the study room, rest room, the Women's University Club room, a small sewing room, and the office of the Housing Bureau. Our Housing Bureau, under the supervision of a most competent woman, Mrs. Mary Staples, is taking an increasingly important part in bettering the living conditions for the students. In connection with this, you might be interested to know of the success which we have had with our Householders' Council. This was started four years ago by Dean Gertrude Beggs. Semi-monthly meetings are held at the different rooming houses. Meetings of the same sort are held by the sorority chaperones. Matters of interest concerning the health and well-being of the girls are discussed. In this way the Dean of Women has had the confidence and coöperation of the heads of the houses.

To return to Shevlin Hall, my own office is on the first floor, a most desirable feature as it is easy for the "new" student to find and convenient for the older students.

The soul of Alice Shevlin Hall, if you will allow that a building may have a soul, entered with the class of 1907. This class was most appreciative of the wonders of Shevlin in that they had known what it was to go without it. The delight in the building, with its opportunities for comfort and the forming of friendships, has somewhat cooled as the years have passed. The students are less conscious of its joys but their use of the building and its steady influence in their lives plays as important a part as formerly.

The second most important factor in providing a satisfactory recreational and social life for the women students is our splendid Women's Self-Government Association with its council room in Shevlin Hall. It is an organization to which all the women students belong. Two of its express purposes are: (1) To create a sense of unity and fellowship among the women; and (2) to promote and to maintain the highest standards of university life. I cannot speak in terms of too great praise of the place the Women's Self-Government Association holds in university life. There are eighteen members on the board. The Dean of Women, at the invitation of the board, attends all meetings. I am always highly pleased at the serious and enthusiastic manner in which business is conducted. The Women's Self-Government Association is a tower of strength to the Dean of Women. I will mention some of their activities.

Every two weeks, on Saturday afternoon, they give sunlight dances. These were started in 1914 to help the girls who have few opportunities of making acquaintances among the men. The men are asked to pay twenty-five cents, the girls pay nothing. Two or more faculty women act as chaperones. Introduction committees of both men and women are appointed. These parties are given during the fall and winter quarters and are attended by from two to three hundred couples. In the spring, the students seem to prefer the out-of-doors. The students have attempted to have good music, not jazz, and I think that it has made some difference in the manner of dancing. If a couple are noticed to be dancing objectionably, a card bearing this inscription is handed to the man:

UNIVERSITY OF MINNESOTA

School Year 1921-22

We do not dance cheek to cheek, shimmy, or dance other extreme dances. You must not. A second notice will cause your public removal from the hall.

"Help keep up the Minnesota Standard."

Signed,

WOMEN'S SELF-GOVERNMENT ASSOCIATION, and
ASSOCIATION OF MINNESOTA UPPERCLASSMEN

The threatened public removal from the hall has occasionally been exercised by a strong armed force of men. The most favorable and hopeful outlook on the style of dancing is that our strong women's organizations, such as the Women's Self-Government Association, the Young Women's Christian Association, and the Women's Athletic Association, do not favor extreme dancing.

Lord Northcliff says, in a recent publication, that "what interests a person one year may not interest him the next. We are always outgrowing ourselves. Old people cannot set their mental clock back and see things with the eyes of youth. I am fifty-six and for the life, I cannot understand young folks' interest in dancing." Now, although I am older than Lord Northcliff, I can perfectly comprehend this great interest, even passion for dancing, for I have loved to dance from youth to age.

To cite other activities of the Women's Self-Government Association. Early in the year, they have open house on Sunday afternoons, at Shevlin. A general invitation is given out and many lonely students, both men and women, come and enjoy the open fire and the opportunities of meeting other students. Occasionally the Young Women's Christian Association acts as hostess at these meetings.

Every Friday afternoon, a social hour is held at Shevlin. Some little entertainment is given, and light refreshments are served. A general invitation is given to all university women, and seventy-five to one hundred girls attend. The Pan-Hellenic Association is also giving teas at Shevlin once in two weeks. All university women are invited. Sorority and non-sorority girls attend. I am sure that this mixer makes for a better feeling and is a move in the right direction. A genuine attempt is being made on the part of the sorority girls for more democracy in the sororities.

It is an interesting fact that if these Pan-Hellenic teas were given in sorority houses, very few non-sorority girls would attend.

The House Council is one arm of the Women's Self-Government Association. They attempt to improve living conditions at the university, and also to regulate matters of conduct in connection with the houses. Just now, they are trying to reach the lonely girls in boarding houses. A big party, the first of its kind, has recently been given, to which all such girls were especially invited. About one hundred and twenty-five attended, and it was a great success. An organization of these girls has just been formed for mutual enjoyment and benefit. The girls at the head of this movement are so fine and democratic that I am hoping for great results. The House Council has recently passed a ruling whereby the dormitory and all the sorority and rooming houses may hold open house on Saturday evenings.

The valuable work of the Big Sisters is also under the direction of the Women's Self-Government Association. These Big Sisters are appointed in the spring term from the ranks of the junior and senior classes. For some years the attempt was made to have a Big Sister for *each* incoming freshman, but it proved to be unsuccessful in that the Big Sisters had too many freshmen to be able to look out for them in a satisfactory manner. Last year the board decided to appoint Big Sisters to look after all out-of-town freshmen. This has proved much more satisfactory. Big Sisters do not have more than three or four Freshmen to look after. The Freshmen are written to during the summer, and are often met at the train and assisted to find a rooming-place and helped in registration. Later, a tutor is found for them if they have difficulties with their studies. Parties are given for them, and they are escorted by their Big Sisters. In this way a sisterly eye is kept upon the freshmen until they become accustomed to the university and learn its ways and traditions.

The Women's Self-Government Association have a dancing class every Thursday from seven to eight p. m. in Shevlin Hall. A fee of ten cents is charged. The class is taught by university girls and is well attended, especially by freshmen who have not had many social opportunities. To work together or to play together seems the best way to form real friendships.

The Women's Self-Government Association also gives a Thanksgiving dinner, each year, to out-of-town girls, and they make great efforts to see that the lonely ones really come and that they have a good time.

The second organization which offers recreational opportunities is the Women's Athletic Association. "The purpose of this organization is to promote an effort for physical efficiency, to stimulate an interest in athletics, and to create a spirit of good sportsmanship." About fifty girls belong to this association.

The membership basis of the Women's Athletic Association has recently been changed from the open to the closed type. A certain number of honor points are an eligibility requirement, the points to be won by class

team membership and other ways. The number out for the various sports is an indication of the variety of interest shown: During the fall, 75 to 80 for field hockey; in the winter, 25 to 30 for ice hockey, 90 to 100 for basketball, and 40 to 50 for skiing; in the spring, 90 to 100 for baseball and 25 to 30 for archery. These are all contestants for class teams. In addition, there are about one hundred more girls playing in the House Baseball and Basketball teams. The House teams were begun in an effort to stimulate interest in sports among the sorority girls. The teams playing in the House Contest are from all the sororities, East and West Sanford Hall (our one dormitory) and the three coöperative cottages.

The Aquatic League is also a branch of the Women's Athletic Association. This has a membership of about twenty-eight. They meet once a week, and an exhibition of fancy swimming is given about once a month.

Another group which offers recreational opportunities to all women is the Trailers Club. There are forty active members and a large and enthusiastic group of Alumnæ. Every Saturday afternoon, the Trailers, with some outside girls, get together for some sort of fun—skating, hiking, swimming, snow-shoeing, and skiing. Also, during the spring vacation every year, we girls—this includes myself—have a “spring running.” We start out with knapsack on back, for a two or three days’ tramp. We cook our lunches out of doors and stay over night wherever night overtakes us. A rest of ten minutes out of every hour, helps one to tramp all day without excessive fatigue. This hike is a joy to anticipate through the winter months. To awaken the love of tramping, or as Stevenson puts it “the delight of the tightening of the muscles of the thigh,” to know the joy of the open road this is a most worthwhile endeavor.

In conclusion, let me say that we at Minnesota recognize the importance of recreation. Our task is to make the student's recreation serve her best interest. When I think of the way in which some students dance, of the excessive gayety of the few, of the loneliness of the many, I feel almost discouraged. But some of this we may lay to the war and justly so. The method of dancing is much better than a year or two ago, and more hands are being held out to the lonely girl. So there is hope. With patience and the active coöperation of the fine student leaders at the University, we may accomplish the impossible.

DOES THE COLLEGE CURRICULUM PROMOTE SCHOLARSHIP?

LUCY M. SALMON, PROFESSOR OF HISTORY, VASSAR COLLEGE,
POUGHKEEPSIE, NEW YORK

An able woman whose education was being acquired outside of college walls recently asked a young sophomore what a college does for its students. Her guest reflected a moment and then replied with conviction. “Well, first they teach you poise, and then they make you optimists.” Is it possible

that the college student unconsciously expressed the judgment we have all at times secretly formed as to the negligible character of every curriculum in the process called education?

Our present curriculum retains little in spirit or in content of the old Greek curriculum whose sole object was education, whose content was planned to promote education, and whose only instrument in achieving it was the teacher. Our present curriculum derives rather from the medieval period when education was controlled by the Church, when information of a very definite character was essential to the promotion of the interests of the Church, and when the teacher was the friar. Our educational system has retained many of these characteristics, but it has added others growing out of the real or fancied needs of the State, political parties, industry, business, the professions, and also of conventional social life.

If then the question is asked, "Does the college curriculum promote scholarship?" the categorical, dogmatic reply must be made, "No, that is not its object." But it is far easier to define its object in terms of negation than it is to state its object positively. The universal criticism of the curriculum is directed towards its shortcomings and its failures. It pleases no one,—all vie in pointing out its inconsistencies and its imperfections, in showing its utter inadequacy to prepare for the particular conditions each person deems it imperative the curriculum should meet, and all protest that it must be changed in the particular direction each desires.

Accepting this collective opinion that "something must be done," the question naturally follows: What are the obstacles in the way of working out an ideal or even a satisfactory curriculum?

The college, like the individual, is not a free agent and back of it is the State represented in its legislature. When one State legislature proposes a bill that prohibits any institution that receives State funds from teaching the theory of evolution; when another proscribes the teaching of the theory of a protective tariff; when a third virtually compels the teaching of the gold standard; and when the most populous State in the Union compels subscription to a specific form of patriotism, the privately endowed college, as well as the State institution, may well shrink from working out a curriculum that will conform to the demands of the body politic.

Church organizations also make their demands on the curriculum, and while they have not shown the superiority of the Presbyterian method of teaching the classics, of the Baptist way of teaching science, or the Methodist manner of regarding mathematics, or the Roman Catholic attitude towards modern languages, all denominations prefer their own special colleges with the usual curriculum, but with the addition of religion as they severally understand it. To satisfy the demands of one sect, the curriculum must include the study of the Bible; to satisfy another the Bible must be excluded.

Another obstacle is the effort to make the curriculum the vehicle for conveying information of a definite character. Vocational and pre-voca-

tional training, professional and pre-professional preparation are urged as objective points in shaping a curriculum, but such objects are far removed from scholarship. The college student as an individual is forgotten in the effort to train him for a special occupation. The young woman in particular is often the object of special solicitude and a curriculum is urged, not to promote her scholarship, but to prepare her for a life of domesticity. But this is aiming an arrow into the air, for it often seems as if the young women who have been trained for domesticity go into business or the professions while those who have been trained for business or the professions marry and bring up children. Incidentally, could not a solution be found in arranging for engaged young women to attend special schools where they could be trained for homemaking and the rearing of children?

Boards of college trustees may act as a brake on changes proposed. Since they have the ultimate responsibility for the expenditure of funds, they may complain that they have provided an elaborate and costly equipment for work in certain fields of knowledge; that courses in these fields are no longer largely elected; that this equipment must be utilized; and that therefore the study of these subjects must be required.

These are but suggestions of certain conditions that block the path of the curriculum. The promotion of scholarship has not been the goal of the present curriculum, nor do any of the changes proposed to-day apparently consider scholarship an aim to be considered in and of itself. The ulterior object may be one far removed from scholastic pursuits. But however much these plans may vary among themselves, they all have at least this in common,—they record the belief that it is the primary function of the college to pass on to college students a body of ready-made, ready-to-wear information.

This confusion of information with education that characterizes so much of our thinking, explains in part our distrust of the present curriculum. We distrust any arrangement of college courses that is definitely proclaimed to be a preparation for citizenship, or for service, or for life. Any curriculum thus arranged not only fails to promote scholarship but it must fail to educate. And if the college fails to educate in the true meaning of the word, if it fails to draw out from college students the best that is in them, and to train them along these lines, is it strange that college graduates often feel that the best they received from their college course was not in any way related to the subjects studied, but came from extra-curriculum activities, from friendship formed, from social relationships established, from the contacts made with persons worth knowing, from the opportunities given of visiting famous art collections, of hearing eminent musicians, of seeing and of meeting distinguished personages? If it is the primary object of the college to educate its students; and if it is the responsibility of the students to apply that education to whatever end is essential, under whatever conditions may arise, it is not strange that students in their shortsightedness apply it to the object nearest at hand.

But the failure of the college to promote scholarship must not be at-

tributed wholly to the curriculum. Have we not fixed our attention exclusively on the content of the curriculum to the exclusion of all discussion of the ways and means of carrying it out, and to the exclusion of all consideration of the soil and the atmosphere necessary for its growth? The ideal curriculum will not and can not promote scholarship unless it is placed in congenial surroundings.

The colleges for women are particularly susceptible to a certain form of maternalistic language that is diametrically opposed to scholarship. When a boy goes to college, he becomes a man, but when a girl goes to college, she is always called a girl, is addressed by her given name, and is often referred to as a child; the college students collectively are often called "children," and the college as a whole is referred to as "the college family." This aversion to putting away childish things and to becoming women seems incompatible with high ideals of scholarship, yet as long as young women profess to like it, and as long as we are unwilling to abandon coddling our students, there will be obstacles in the path of scholarship.

The academic world has brought over from politics customs that unerringly record the existence of a system based on suspicion and fear and that results in series of checks and balances, prohibitions, preventive measures, and obstructions that are fatal to genuine progress. When the routes to progress have been carefully barricaded, when every advantage has been balanced with disadvantage, and when we have carefully made it impossible to do very much, we congratulate ourselves that we have at least forestalled disaster.

If then, whatever may be the printed curriculum, the assumption is that it is not intended to promote scholarship; that neither faculty nor students are primarily interested in scholarship; if students assume that the curriculum is a necessary evil in floating the more essential part of college life; if it is not strange that "a college man is cocksure of knowing, as has been said, 'that mediocre C is a gentleman's mark;'"¹ if the effect of putting into the hands of college officers a system of marks and grades is to encourage among students, not a love of scholarship, but a desire to "please teacher," by finding out what "teacher wants," can we wonder that the result is not scholarship, but "the golden age of successful mediocrity," as Buckle has characterized the age of George III.

But granting that it is possible to arrange a curriculum satisfactory to all and that it is possible to wipe from our academic code every statute that has its origin in competition, fear, suspicion, or distrust, scholarship will still not be attained without the coöperation of the teacher. Any curriculum, no matter how perfect it may be in itself, is but a lifeless mechanism without the inspiring teacher to give it vitality. No curriculum will promote scholarship if it is carried out by teachers who are indifferent to their classes, who are unsympathetic with the problems of the individual members of their classes, and who regard discipline as the chief cornerstone of the educational system. Scholarship does not thrive where teach-

¹ C. Britten, "School and College Life," *Civilization in the United States*, p. 114.

ers are self-centered; where their eyes are fixed on securing an administrative position because the salaries attached to such posts are higher than are accorded those in the professorial ranks; where research absorbs time and energy because success here means "recognition" while teaching does not; whose constant reference to "my department" carries an implied warning to all trespassers to "keep off" the claim staked out in the field of knowledge.

The function of the teacher in the educational system does indeed seem negligible when the attitude of the public towards teaching is recalled. Teaching may do well enough for women, but it is not the thing for virile young men. Every discouragement is put in the way of able young men who are considering teaching as an occupation, especially if they belong to well-to-do, prosperous families without absorbing intellectual interests.

The ideal teacher, as he has been described by George Herbert Palmer, must have, among other characteristics, "an aptitude for vicariousness" and "a readiness to be forgotten."¹ More recently, Henry Noble Mac Cracken has stated the prerequisites of a teacher to be a belief in his subject, a belief in his pupil, and a belief in himself.² Must it not be said that, in spite of a semi-contemptuous opinion of the teacher held by at least a part of the public and of his own frequent misgivings, the curriculum without the true teacher is but a grinning skeleton?

But our difficulties do not end here. Granted that all the conditions are favorable for the formation of a new curriculum, we are at once confronted by two hostile camps between whom no peace, no compromise is possible since they view the curriculum from antagonistic standpoints. To one group the sole function of the curriculum is to furnish information,—a view supported by the much-advertised five-foot shelf. To another group, the development of a method of work is a prerequisite in the attainment of information. This view also has the support of distinguished educators. "The ideal college education," said President Hadley, "seems to me to be the one where a student learns things he is not going to use in after life by methods that he is going to use. The former element gives the breadth, the latter element gives the training,"—an opinion cited with approval by President Lowell in his inaugural address.

As long as many persons connected with educational institutions state that they do not believe in the process called education and deny the possibility of educating any one, and as long as many others fly at the mast-head a belief in the importance of acquiring a method of work, just so long will it be impossible to reconcile irreconcilable differences and form a curriculum satisfactory to both of these opposing groups.

Frankly stating the belief that the first essential in education is to acquire a method of work that may be serviceable everywhere, what are the subjects best adapted for securing it? There has long been a tendency for all subjects to approach each other in method. Every subject in the

¹ G. H. Palmer, "The Ideal Teacher," *Atlantic Monthly*, April, 1907, 99: 433-442.

² H. N. MacCracken, "Religio Magistri," *Atlantic Monthly*, January, 1921, 127: 76-84.

curriculum is a means through which may be developed accuracy, observation, imagination, experimentation, interpretation, the value of evidence, and correct reasoning. This training constitutes education in the truest sense and there are no subjects in the curriculum in which any of these characteristics of education can be dispensed with. Is it not possible to secure training—education—through any group of facts that seem of paramount interest to the student?

Technique is method applied to a particular subject. Conversely each subject develops its own technique and this technique is necessarily determined by the nature of the subject. The study of tone, color, form, facts of nature, facts of human relationship, abstract theory, each and all develop a different technique, but the method employed by music, art, science, history, economics, mathematics, philosophy, by all subjects in the curriculum is fundamentally the same.

The superstition prevails that virtue is inherent in certain subjects and that therefore they must be retained at all cost. This is especially true of mathematics that still holds its own as a required subject in a curriculum that has greatly increased its elective courses. It is retained on the theory that only through it can logic and the processes of reasoning be taught. Is not our thinking illogical, are not our judgments hasty and ill-founded, do not our own personal experiences suffice for far-reaching decisions in regard to the subjects to be included or rejected in planning a college curriculum, in spite of the courses we have all taken in logic and higher mathematics?

Moreover since all subjects tend to approach each other in method of work, and have indeed become identical in method, is it necessary to retain as a required subject any study not required in a sequential course? It has recently been suggested¹ that educational psychology has shown that training in one field does not "carry over" into another, and that the study of solid geometry for example prepares students to solve problems in solid geometry, it does not "strengthen the mind," make students logical, or in any way help the processes of reasoning applied to other subjects. The study of mathematics is of use in the further study of mathematics and in subjects based on a knowledge of the principles of mathematics, but it is not necessarily of use in other fields.

Somewhat the same feeling prevails in regard to the classics. They have long held and still hold an honored place in the curriculum. But when we find that students who have nominally been studying Latin and Greek for five or six years are still unable to read Latin and Greek without thumbing a dictionary, we draw the conclusion that it is useless to study Latin and Greek. Would a more reasonable conclusion be that such students have never studied these languages as languages, and that they have never acquired a method of work that has enabled them to master either language or literature?

¹ James Henle, "Unhonored Educational Honors," *North American Review*, February, 1922, 215: 249-254.

Is there not moreover great confusion between language and literature? Every student should be familiar with at least one great literature, as every student of literature should become a student of comparative literature. But is it necessary that this familiarity be acquired through the language in which it is written? This does not necessarily follow. The New Testament is presumably read by few in the original Greek and there are still fewer who read the Old Testament in the original Hebrew, yet the Bible is probably the most widely read book in existence. Ignorance of the Scandinavian language does not prevent the literature of these countries from being enjoyed by thousands to whom Danish and Swedish are neither native nor acquired tongues. Nor does ignorance of the Russian language prevent any one from reconstructing the thought of representative Russians through the translations of Tourgenëff and Tolstoi.

We find college students and college graduates ignorant of all questions of science and of the history of scientific theory and we find a remedy in requiring a laboratory science of every undergraduate. Is it possible that we confuse information of the development of science which may be acquired outside of a laboratory, with a scientific method of work which may be gained through other means than through a study of nature in a laboratory?

What may it be said should be some of the essential principles in any curriculum that is formulated to promote scholarship? First, it must develop the curiosity inherent in every normal person,—a curiosity that under favoring conditions develops into investigation and later into research. Our curriculum largely represses curiosity, as does our social training; it is not polite to show curiosity or be interested in what is about us. In a similar way the imagination is repressed, although imagination lies at the bottom of all constructive work. In hundreds of advertisements noted for men desired in important positions, the qualification most frequently specified is that the man desired for the place must have "vision." In the educational world, it is through curiosity maturing into research that the confines of knowledge are extended, and it is through the imagination developing into vision that the results of research are vivified.

A second principle is that if a method of work is to be developed from the germs of curiosity and imagination, it is best done by taking advantage of the natural interests of students. Roughly these may be classed into the two groups that concern man or nature. If the interests of students are primarily with human life in the past and the present, a method of work may be developed through the subjects that concern the life of mankind. Similarly if the interests of students are chiefly concerned with nature, it is through the study of nature that a method of work must be developed. But is it not possible to give students of both groups certain informational courses that will introduce them to great fields of knowledge at the same time that they are mastering a method of work and gaining the technique of a special subject? It is often the best students in college who are looking for one or two "snap courses" that will fill up the quota

of hours and thus allow them more time for their own special interests. Why not recognize this fully and frankly and provide informational courses that will meet these needs? Is it necessary to deprive a student of science of all knowledge of classical literature if he has no knowledge of the classical language? Is it necessary for a student of the humanities to be deprived of all knowledge of science and of scientific theory unless he gains it by personal experience in the laboratory?

A third principle must be suggested that raises a somewhat different question. Education as thus far considered has been concerned only with that part of training connected with research and information, each inseparable from the other. Assuming that the college curriculum has provided a method of work applicable to any subject and the technique of a special subject, that it has brought to maturity curiosity and imagination, and that from the standpoint of the educator these complete the circle of the educational process. The plan, as looked at by the student, still does not provide for the pearl of great price. He seems to himself to be in the position of the man who married a dumb wife, as described by Anatole France. The curriculum has provided no outlet for his "suppressed desires," no medium for conscious expression of the new ideas surging within him. Some outlet must be found, and the college curriculum practically offers none. The student is thus driven to find his own means of self-expression. The college student, finding in the curriculum comparatively little opportunity for self-expression, resorts to college and intercollegiate athletics, dramatics, or dancing of every form; jazz music and the moving pictures; "writing," "selling copy," and scores of unregulated heterogeneous methods of attempts at self-expression. College faculties strive to regulate these efforts through suppression, through prohibitions, through penalizing students who take part in them at the expense of their laboratory and library activities, but these efforts are practically vain.

Is it not possible for the curriculum to recognize the obvious necessity for providing such training and for giving it a legitimate place in college education? In so doing is the curriculum not taking advantage of the spirit of the times and turning it to better advantage? While the spirit of competition in business is being supplanted by the larger, more generous, and more effective principle of coöperation, it must be remembered that the principle of vicariousness in our recreations, amusements, diversions, and all means of self-expression is still in the saddle. Must not the curriculum recognize the changing conditions of home and social life, must we not as college officers realize how large a part of the education that once was found in the home has now been made impossible through changed conditions of home life? Where once the home afforded opportunity for self-expression and an outlet for the emotions, it no longer does so. The desire for self-expression, finding no outlet in the home and repressed in the college, forks outside the home into vicarious recreation, and within the college into extra-curriculum activities.

Education outside of the college has already met this demand. Every newspaper advertises by the score schools of expression, schools for dramatic expression, instruction in how to become a writer, in how to write short stories, how to write plays, how to write scenarios,—what is this but the opportunity provided through commercial interests for an outlet for the emotions suppressed by home conditions and ignored in the curriculum.

If the college has with some measure of success provided means by which natural curiosity matures with research and the imagination is able to reconstruct conditions of other times and places, may not the college not only justifiably provide courses that train, control, and direct this universal desire for self-expression, but is it not under obligation to do so? Are not art, athletics, dancing, dramatics, music, writing, as they are found in their worst forms in life today, one result of the failure of education to provide a legitimate place for them in the college curriculum? If these subjects make up the non-academic activities of student life, is it not because they have been banished from the curriculum on the plea that they are not intellectual subjects or that they have never been admitted into it, because it is said they do not promote scholarship? Curiosity and imagination are provided for in the curriculum, self-expression, or the reasonable training of the emotions, yet waits without the pale.

But this does not complete the opportunities knocking at the door of the curriculum. The desire of the college student is for the integration of what he has acquired. At the beginning of his course, he seeks some knowledge of what the aim of the college is, and at the end he seeks some course that shall unify his work, yet the college fails to give him the unifying principle.

From time to time new courses, like that on contemporary civilization at Columbia, are introduced into the curriculum and they prove of absorbing interest to instructors and to students alike. This remarkable interest has been explained by some as due to the modern character of the content of the courses, and by others to the interest inhering in a new experiment. Does not the real explanation, however, lie in the unification these courses give of several fields of knowledge previously unrelated? The separation of knowledge into water-tight compartments has for college students become so much a matter of course that the possibility of breaking down the divisions between them comes almost as a revelation from above. Is it not possible for the college to put the capstone on the curriculum in the form of a course that looks towards the integration of the different fields of knowledge?

METHODS FOR PROMOTING IDEALS OF SCHOLARSHIP AMONG AVERAGE STUDENTS

MRS. PEARL RANDALL WASSON, DEAN OF WOMEN, UNIVERSITY OF VERMONT,
BURLINGTON, VERMONT

"I realize that I am just one of the second-rate chaps, chaps who make up this big land of ours,—just a second-best fellow,—but—and this is a

big 'but'—I know that Columbus discovered America in a second-best boat—that the British whipped the Spanish Armada with a second-rate fleet; that the Revolutionary War was won by a second-best army; that history fairly shouts the deeds of second-rate folks and that I'm going to be at eighty the best second-rater in my line or bust." Crudely but vividly, with these words, a modern plumber voices the constantly advancing ideal which leads ever onward an individual who frankly recognizes the fact that he belongs to the great class known as "average" and who visions clearly the tremendous possibilities which lie before the average man or woman.

The last sixteen or seventeen years have brought a startling change in the personnel of our colleges and universities. In 1905-6 (according to statistics published by the U. S. Bureau of Education) the total attendance at institutions of higher learning in the United States was 258,603. In 1915-16 this number had increased to 387,106, or an increase of 49.7 per cent. Mr. George F. Zook, of the Bureau of Education, Washington, D. C., tells us that, notwithstanding the powerful influence of the war, there was little falling off in the total student attendance during that period. In 1919-20, 221 out of 250 colleges report increased enrolments and nine report an increase of 100 per cent or over. Since 1890 the total high-school enrolment has likewise grown greatly.

Certainly, as one of the by-products of the world war, we find the great mass of our American people impressed, perhaps unconsciously, with the ideal which was voiced years ago by James Madison, "A popular government without popular information or the means of acquiring it, is but the prologue to a farce or a tragedy, or probably both. A people who mean to be their own governors must arm themselves with the power that knowledge gives."

It has seemed almost necessary to make this long digression in order that we may see clearly the problem which faces the universities and colleges of today. The college may limit its student body, the college world may be divided into those colleges which admit by comprehensive examinations and those which admit by certificate, into those which limit the Freshman class by one means or another and those which admit all who satisfy the college entrance requirements. One college may consist of students who have been carefully selected, may proudly point to the fact that no student with an entrance condition is a part of that college body, that every member of the Freshman class has been chosen by the process of elimination of the "lesser fit" and that the maximum number of students has been determined by the maximum college capacity to house and train its student body. Another college may point with equal pride to the fact that its student body is unlimited but that every student represents a human being who has met the standards which have been determined by the coöperative spirit of college and high-school administrators. Each one of these two types has its problem of the average student. The first college has by its process of elimination raised its standard of the "average" student, and at

the same time increased the measurement of the small percentage known as honor or superior students. With the careful elimination and selection, such a college has also eliminated a cross section of "average humanity." The "average student" of such a student body is, by the very process of elimination, imbued with certain definite high ideals of scholarship and in the majority of cases, doubtless, should achieve superior attainment. In other words, is it not fair to conclude that such colleges have a definite function in the educational world and that direct contributions of scholarship *not* the average may be expected from them. Their problem contains the joy of building when the material has been carefully selected, polished in preparation for use, and ready for the finishing touches which may bring out hidden beauty, unexpected possibilities, and creative art.

What then is the problem for those colleges in which many students represent the average ability of the average preparatory school? Statistics show that the scholarship rank of a student in high school corresponds with the grades of that same student in Freshman year in college. Granted that the Freshman class in college represents students whose high-school records are at least average, how are the colleges to give to such students ideals of scholarship which will develop dormant qualities and lead to the maximum extension of individual capacity?

Professor Lester F. Ward, in his "Applied Sociology" contends that "Genius is latent in all classes and is dependent upon economic, social, and educational opportunity." In other words he insists that the spark of genius, engendered by heredity, will not spontaneously force itself to expression but may remain dormant because economic conditions make its development impossible. This theory lends an added interest to the problem of the average student. One psychiatrist has defined heredity as "the sum total of the adjustments which our ancestors have affected to their various environments" and adds that "Efficiency depends on capacity, and capacity is chiefly a matter of training,—mentality is for that matter largely a product of training."

The unfortunate thing is that habits of study are determined in childhood and the colleges are faced with the problem of overcoming in many cases the "slant of prejudice, of half-learning or crudity that the young man or woman inherits and in some measure retains as a heritage from the home and school of childhood." There is one encouraging thought however: The average Freshman is faced with a new world in college. He is at the age when he must have ideals; he is ready to have heroes and to worship them. The character of this hero worship at the beginning of his Freshman year is the reflection largely of the composite opinion of the student body in which he finds himself. At the close of his Freshman year his ideals reflect not alone student opinion but also intellectual horizons together with ethical and æsthetic standards which have been presented to him by the faculty. A recent article asks "Do colleges stress sufficiently the inspirational side of education? If education is really to educate, it must generate motive power in the student and leave with him its most

valuable bequest when he goes forth into the world of action, those moral and spiritual ideals and incentives which will arouse, stimulate, kindle, and inspire throughout life."

Winthrop Dudley Sheldon says that "Motive power in human life is not produced by spontaneous generation any more than is a steam engine" and suggests that the first duty of the college is "to inspire the student to know himself," and the next is "to weave into his character the great principle of moral obligation as the supreme source of motive power." I should add to these requisites a sense of values, of the interdependence of the great sources of knowledge and power in the world, a bird's-eye view, as it were, which would show to the student the unity of all knowledge. In the Freshman mind there is complete ignorance of relationship between history and economics, for example,—between English and history or mathematics and science.

In the psychological tests we have a means of inspiring in the student knowledge of himself, but like all instruments of knowledge, the tests must be used with discretion. Semi-selfknowledge is sometimes a deadly weapon. I have in mind a student thirty-three years of age, a Freshman, who has entered college for the second time. Fifteen years ago he was sent away from college by the President who frankly told him "You should not stay here, you have not the mental ability to do college work." During the fifteen years he has sent his sister to college, assisted his brother, and now enters college only to fail in mathematics and to find himself rated a "near-genius" in English. During the fifteen years, like a perpetual extinguisher of initiative has sounded the thought—"I am sub-normal mentally. I am bound to fail." In interviews with Freshmen who have fallen below or who have barely averaged in our recent intelligence tests, I find a decided tendency on their part to accept this classification of themselves as sub-normal. Ambition, courage, and vision are blocked at least temporarily. Youth needs, must have an ideal which is constantly advancing but which seems possible of attainment. The intelligence test, a measure of experience, environment and, in a limited sense, of natural ability may reveal the student to himself but with the knowledge of his limitations there also should be given to him in some way a glimpse of his potentialities. This is not an easy thing to do. The potentialities of the individual are determined by the long chain of ancestral reactions to environment. Unexpected opportunities often arouse unsuspected abilities. However, it is possible to point out to every individual dominant faculties which will achieve worthily if once aroused by the proper stimuli. How this may be done is one problem of the college.

I believe there is a renewed ideal in the mind of the average college student today. There seems to be an increasing feeling that the colleges are to exist only for those who are worth college training, and that the average student as well as the honor student must find his ultimate goal and develop his *possible* power. Thus, is he not beginning to have sense of his obligation to society?

How are we to present to the average student a glimpse of world-wide learning, a vision of wisdom? This is the most difficult problem of all, but it is the one whose solution is most essential. Without this perspective, the student masters a number of disconnected facts, of whose inter-relationship he has no conception. He must in some way be brought to see the value and the joy of learning,—but how?

The personality of the teacher must ever remain the great vital force in the development of any student's intellectual life. Today, as of old "Mark Hopkins on one end of a log and a receptive student on the other would constitute a university." The really great teacher is the link that connects his students with the scholastic tradition of the world. It is not enough that the teacher should be master of his subject. Through the magnetism of his personality, the compelling force of his humanity, he leads his students to direct, personal contact with culture in its universal aspect.

Although the teacher must always be the *direct* moulding force in student life, yet other less direct and more subtle influences contribute to the development of the undergraduate point-of-view. The college years are the ones in which the eager, expanding mind absorbs involuntarily, from whatever surrounds it, foundations for its future tastes and ideals. The college must see that the suggestions made to the developing consciousness by environment should contribute a receptivity for the higher kinds of scholarship. To live day after day for four years in buildings whose harmony of line and coloring stamp themselves upon the subconscious mind will create a permanent longing for beauty which is after all a synonym for truth. The masterpieces of painting, of sculpture, and of music with which the college should surround its students will produce in them an ever-increasing love and need for the finer expressions of culture. Blest indeed is the college which gives to its students, in addition to the artistic achievements of man, influences in which Nature plays her part.

When our average student has gained an understanding of his own limitations and possibilities, has accepted his moral responsibility, has learned from experience the satisfaction which comes from the conquest of a difficult obstacle which stands between him and his goal, has learned "by doing to do," is no longer afraid of the unknown and the untried, has sensed in a measure the scope and power of wisdom and beauty, as it exists in the world and through the ages, then the average student is ready to follow with understanding the leadership of the honor student and intelligently to put into circulation the truths unearthed by the research of the scholar. Then, and only then, is the average student equipped to develop every possibility of his inherent capacity; in the development of the inherent capacity of the average lies the hope for the future of democracy.

THE SPECIAL HONORS PLAN AT SMITH COLLEGE

HELEN WRIGHT, DIRECTOR OF APPOINTMENT BUREAU, SMITH COLLEGE,
NORTHAMPTON, MASSACHUSETTS

Almost everyone engaged in educational work is, I suppose, frequently impressed with the amount of time and thought which must be expended upon the unpromising student, the backslider, the student who for lack of will or of mental capacity, raises doubts as to whether she is quite able to absorb the benefits of a college education. Every teacher faces the problems raised by the presence of such students and every teacher must sometimes, I think, regret having to turn away from offering the opportunities which better students could use so well, in order to put the class through tedious drill that might well be dispensed with, were it not for the laggards. There is no new discovery here, no novel idea that has suddenly thrown a new light upon educational systems; but there is, perhaps, a tendency recently to discuss this phase of our work, to recognize the conditions and abuses that now exist, and to make a concerted effort to devise ways and means of giving the brilliant student more nearly her share of the advantages the college has to offer. Such students suffer not more from the negative effect of having their own best powers lie dormant, than they do from the positive disadvantage of being frequently in an atmosphere of intellectual standards lower than their own, and of having their thoughts directed into commonplace and stultifying channels. It is conceivable that such students might better not be in college at all; and if one admits that, one must next ask whether the colleges should not, in justice to society, either eliminate the students capable of only the lowest passing grade, or else make plans to give the ablest an opportunity for far more advanced mental development.

It is, I think, out of some such considerations as these that certain colleges are working out plans for specialized work largely "without benefit of classroom" which may be elected by high-grade students for the later years of the course. At Smith College, we call our plan that of "Special Honors." Colloquially it is known among the undergraduates as the "Oxford System," but no one knows just why they hit upon that title. They have shown a great deal of interest in the plan and indeed two or three juniors, as soon as the plan was announced last fall to the freshmen and sophomores, asked to be considered as candidates although it had not been our plan to begin with their class. Their request was considered favorably however, and certain adaptations will have to be made because it is not possible now to give them two full years of this type of training. Nine or ten juniors have already begun to work under the new regulations, as candidates for Special Honors.

The plan is too new to be thoroughly worked out as yet. Many details will have to be acted upon in the light of practical experience. Candidates are expected to apply in April of the Sophomore year; they must have at-

tained an average of at least B in the work of the first three semesters and their applications must be approved not only by the Committee on Special Honors, but also by the department or departments in which they seek to do their work. If a student's average is not quite B, she has still a chance of being accepted if highly recommended, and she has further, the right to be considered if she brings her average up to B by means of the fourth semester's work.

So much for admission into this select group. The work during the junior and senior years will be designed to throw upon the student herself a much larger share than we now do, of the responsibility for her own education. She will be excused from all regular class work, except when her instructors deem it wise for her to attend certain lectures relating to her own special studies—and in such cases, she will be excused from class exercises and examinations in such courses. Her work will fall into eight divisions, which we have called "units." A unit is half a student's working time for a semester. There will be a general director for her course, and he will assign her to two special instructors. It is generally expected that she will, in alternate weeks, report on the progress of her work to these instructors so that there will be some kind of statement coming in for her about once a week. Our required hours for the Junior and Senior years have been fourteen, with the assumption that two hours of preparation would normally be necessary for each hour of recitation. This presupposes work for about forty-two hours a week, so that a fair estimate of a unit would be twenty-one hours of work weekly.

Of course, the outlining of this work will depend largely upon the general director of each student's course. He will decide, after consultation with other faculty members and with her, upon the divisions of her task and upon the combinations of her studies and the interlocking of departments. The preparation of a single paper or thesis will be expected to occupy one full unit and will usually be done in the last semester of the Senior year. The other unit for that semester will be devoted to general review for the final examinations held at the close of the course and covering all parts of the field included in the studies of the Junior and Senior years. No other examinations are required and no regulations are laid down as to absence or other technical matters. Experience may show the need for change or extension of the present stipulations, but it will doubtless always seem wise to allow considerable leeway in the administration of the system and let the student work out for herself her own rule of life.

Honors will be awarded in two grades—Highest Honors and Honors. If a candidate for honors fails to be awarded either, she may yet be granted a pass degree if her work is of sufficient merit.

It is clear that all this requires effort and time to administer. We hope to be able to carry it on, however, without great additional outlay of money and without appreciable increase in the regular staff. Whether we shall succeed remains, I suppose, an open question. So far, it looks as if those who have most to do with it, will always find the instruction of these

Honor students a stimulating and rewarding part of their work. It doth not yet appear that there are any insuperable obstacles to the plan, and we all entertain high hopes that it does contain some helpful suggestions for meeting the challenge that our abler students certainly present.

REGULATION OF EXTRA-CURRICULA ACTIVITIES

CAROLINE GROTE, DEAN OF WOMEN, WESTERN ILLINOIS STATE TEACHERS COLLEGE, MACOMB, ILLINOIS

We are coming more and more to believe that education should determine its main objectives before determining its curricula. Many vital elements of education have not found their way into the classroom. The schools and youth of today are seeking to supplement standard curricula by providing and engaging in extra-curricula activities. What are these and how should they be regulated?

Fortunately the Commission on the Reorganization of Secondary Education, appointed by the National Education Association some years ago, has summed up for us, in the able bulletin, entitled *The Cardinal Principles of Secondary Education*, as the main objectives in education, (1) health, (2) command of fundamental processes, (3) worthy home-membership, (4) vocation, (5) citizenship, (6) worthy use of leisure, and (7) ethical character.

To what extent do our classroom activities take care of these objectives? Is it desirable that they should take care of all of them? When we are wise enough and have experience enough to use the socialized recitation to the best advantage for all concerned, it may become unnecessary for us to have extra-curricula activities. Then and not till then, we may be able to trust ourselves to take care of all educational activities in the classroom, that is, make it a clearing-house for the information, experiences, and activities we have gained, and even then, the clearing-house may not be the better way. We Deans of Women coming from and representing the normal schools and teachers' colleges where teachers are trained, we teachers of teachers, should, above all others, understand the problems involved and be able to regulate the extras in such a way as to have them render the greatest service to education.

Taking the objectives in the order determined by the Commission, *health* comes first. In Western Illinois State Teachers' College we have a great variety of courses in biology and physical education which offer a specific program in health studies and yet we largely depend upon our extra-curricula activities along these lines to do for the students the things they have long known how to do for themselves. They have needed the spur of some voluntary organization to make themselves take care of their physical well-being. Girls who knew perfectly well that they should observe regular sleeping hours for health's sake would transgress frequently under pressure of work or social duties, but since joining the Woman's

Athletic Association, which prescribed specific hours of sleep, they have taken care of this matter for themselves. They refrain from eating between meals, from doing without meals, from eating sweets, because they are in training.

In the upper grades of our training school, we have the Boy Scouts and the Camp Fire Girls. These are regulated in accordance with the rules and regulations of the National organizations but are sponsored by some member of the faculty who is vitally interested in them. When we have lacked the right leadership for either of these organizations, we have failed to accomplish what we have desired.

In our academy and college groups we have tennis, hockey, basketball, football, baseball, and track events. Some of these are class activities. A few of them are managed by clubs. Others come under the general direction of the various athletic associations, of which there are three, the Athletic Association, which takes in the entire school, the Woman's Athletic Association, and the Academy Athletic Association. The last two are for girls and take care of many of their extra-curricula physical activities. The Athletic Association is controlled by a joint committee of faculty and students, known as the Athletic Board of Control. The student members of the board are nominated by the students and the faculty members by the faculty, but both are elected by students and faculty. The board makes the rules and regulations, but these are subject to faculty approval. The association manages the boys' and men's events. Membership in these activities is based on scholarship and character. No student is permitted to take an unlimited number of curricula or extra-curricula activities. We have a definite weighting system and the Dean of Women is chairman of the weighting committee for both men and women. For each of the athletic associations there is a faculty adviser, director, or sponsor, the title varying with the organization. The physical director for men and the physical director for women are usually the moving spirits, but they are assisted and strengthened by other enthusiastic faculty members. The students are learning to take care of themselves. Student control, under faculty supervision, is proving a satisfactory way of regulating such activities in our school.

The contribution that the physical makes to health is emphasized by giving over one day each spring to field events in which neighboring schools are invited to participate. Another day is given to interclass contests. Two days are given to a basket-ball tournament.

For years the problem of permitting dancing proved very vexatious. Now it is regularly permitted in the gymnasium on stated occasions and is regulated by a joint student and faculty committee. Rules and regulations were adopted by this committee, and these are enforced by the committee and chaperons. The dances are contributing to the poise, grace, and health of the students, and are teaching self-control.

The second objective given by the Commission is *command of fundamental processes*. Our regular classroom activities take care of this ob-

jective, but plays and games and supervised play are used to aid in acquiring this command. Perhaps the Safety First and the Audubon and other clubs among the children help here also, and if they do not, they at least initiate the children into the mysteries of group life which stands them in good stead a few years later.

The third objective given by the Commission is *worthy home-membership*. It applies to both boys and girls and is not confined to adult life. Here we have a Home Economics Club which works for better homes and improvements of all kinds in food, shelter, and clothing. This is regulated from within. The girls take care of themselves almost entirely, making their own rules and electing their own officers, but they are under the guidance and direction of the head of the Household Arts Department, a woman of rare grace and power, and by her assistant, who possesses boundless energy and loves the girls. It would doubtless be correct to add that our musical organizations contribute to worthy home-membership. They will be considered in another place, however.

The fourth objective is *vocation*. Naturally, a normal school or teachers' college exists—as it does—for the purpose of preparing people to teach, and is a highly specialized vocational institution. Everything that we do is in some way linked with this vocational purpose. Our young people look forward to leadership in our extra-curricula activities when they enter their vocation and most of them realize the importance of doing other things than simply taking care of classroom work.

The fifth objective is *citizenship*. Our literary societies contribute largely to this objective. We have wonderful courses in history, government, and sociology, but the literary societies aid in giving the ability to perform the services necessary to society in general in music, art, literature, expression, debate, and parliamentary usage. Our literary societies are student activities fostered and encouraged by faculty members. The basis of membership is school membership and scholarship. There are three societies, one for first-year academy students, one for second-year academy, and the other for senior academy and college students. Membership in and attendance upon the first two are compulsory. Two faculty members are appointed as their advisers. They hold themselves responsible for these societies and assist them in every way they see possible. Meetings are held bi-monthly. Officers are selected by the members from their own number. Programs are prepared by committees assisted by the adviser. School and group spirit is fostered and encouraged and has done much to inculcate in the youthful members the qualities that make for citizenship.

The older society is different and is more largely regulated by the students themselves. Membership is not compulsory and so attracts only those who want civic and cultural opportunities, and not all of these find it possible to belong. In it you will find the leaders of tomorrow, those who have high academic standards and who aspire to a high intellectual plane. This society calls itself the Forum. It has the usual faculty

encouragement and conforms to the general regulations for all such activities. It meets bi-monthly during a regular assembly period, at a time open to all entitled to belong.

Other activities in which the students have a controlling interest are the Courier Board, the Oratorical Board, the Sequel Board, the Student-Activity-Fee Board, and the Student Council.

The Courier is the weekly school paper and is managed by the Courier Board, which consists of editor, assistant editors, exchange editor, athletic editor, business manager, circulation manager, advertising manager, cartoonist and assistants, and reporters. Quite a magnificent array for a small college paper! All of these people are students. It has been said that man is the head of the family but that woman is the neck that turns the head. The Courier has a big head, and the neck that turns it is a fine little woman from the English department, who succeeds in effacing herself so well that the students really think they run the paper. They are getting the experience and training and she is big enough to let them think they could do it alone, and perhaps they could.

The Oratorical Board arranges for oratorical, declamatory, and extemporaneous speaking contests. The head of the public-speaking department is a member of this board, but it is largely student controlled. She is its godmother, however, and looks well after the ways of her child.

The Sequel is the year book of the school, put out by the Sophomores. The Sequel Board is made up of members of the class and is advised by three faculty members, representing different departments in the school or college. Aside from certain regulations the year book is decidedly a student activity.

In order to finance the various student activities it was voted by the students some years ago to assess all students a dollar a term student-activity fee, which should entitle to membership without additional fee to all organizations then existing in the school, provided other requirements of membership were met. The fund thus secured practically supports all the activities of the school. Organizations are permitted to supplement funds thus obtained by giving shows, movies, musicals, and plays, and by having stands on great occasions, but permission for such endeavors must be granted by the president, so that they may not come too frequently or encroach upon each other. The student activity fund is managed by a board which apportions the money or makes appropriations to the various applicants according to their relative membership and importance in the school.

There are also class organizations with a full complement of officers. These are not managed by faculty members, but entering classes each year are advised to organize at once and to name their candidates for the various boards and committees in which they are entitled to representation. Some of the classes elect a faculty adviser or sponsor, but they manage their own affairs, subject always to some faculty regulation as to time and place of meeting and to the kind of extras they may undertake.

The faculty annually gives three parties made to include all of the students. These are for the pleasure of the students and are intended also to give some insight into management of social functions to those who have been deprived of that experience. There are two annual receptions, for students in the fall and for summer students.

Last in the group that make for civic value is the Student Council, a small body of students, selected by the classes, that meets bi-monthly, at times with the president of the college, frequently without him. Questions of student policy and conduct are discussed. Suggestions and recommendations are made and requests preferred to the faculty. We are finding this council an aid in the affairs of the college in things pertaining to conduct and discipline.

The sixth objective in education is *worthy use of leisure*. Here, too, we have extra-curricula activities to supplement the regular classroom ones. Literary societies contribute to both citizenship and worthy use of leisure. The same may be said of physical activities. Our library, through the aid of the efficient librarian and her assistants, helps to locate the materials on any topic in which the students are interested. The literary societies give ability to present to an audience with reasonable clearness and effectiveness any body of thought organized for that purpose. Presumably, the faculty have had such training.

The physical and literary activities are not the only ones that contribute to the worthy use of leisure. There are the musical, dramatic, and foreign-language clubs that make extensive contributions along that line. A chorus, a glee club, a band, and an orchestra, all sponsored by the music department, give abundant opportunity to develop and cultivate any line of musical ability. Membership in the musical organizations is based on ability and scholarship and willingness to serve, and willingness to meet regularly for systematic and thorough practice. They are regulated more directly by faculty members than are the other voluntary organizations of the school. They assist in such programs as are occasionally offered for the pleasure of the school. They are financed in part out of student-activity funds, but on the theory that the members get quite as much as they give, that music training is largely a personal advantage, they are allowed partly to finance themselves.

A strong dramatic club helps in the production and appreciation of high class plays. The head of the public speaking department guides and directs this club in the selection and rehearsal of plays. The most surprising feature of the club is that it can take care of so many different people in so many different ways and bring out the talent of each. Membership is open only to those who have been tried out, but people who want an opportunity are usually found to have enough ability to be admitted.

Every member is held responsible for some part of the play being learned, whether it is presented publicly or not. There are prompters, stage managers, property men, electricians, mistresses of wardrobes, and all of the cast. No part is too humble to be mastered thoroughly. They meet once

a week for an hour, but they may have to remain longer. This club gives an opportunity for self-expression to those who, consciously or unconsciously, are hungering for it. It has something to do with making them understand themselves and preparing them to live their own lives.

Another of our extra-curricula activities is the moving picture. We have the necessary equipment. At more or less regular intervals, a "movie" is given for the pleasure and profit of the student body. This enterprise is managed by a faculty committee, who select and present the picture. This is one of the things we do "just for fun." Organizations are allowed to put on a movie once in a great while to improve their financial condition.

The sophomore class gives an annual play. This is a tradition of the days when we were a normal school. This play is guided and directed by the same leader who guides the dramatic club. From the standpoint of an educational objective, the class play contributes largely to the appreciation of high-class plays. Shakespearian plays have been rendered in a highly creditable manner; occasionally a strong modern play is given. The difference in production and effort under different leaders, shows how large and important a factor good leadership is.

Still other extra-curricula activities that lead to worthy use of leisure are our lecture course and summer plays. These are managed by faculty committees and are partly financed out of the student-activity-fee fund. By means of the former, prominent speakers and leading musical talent are brought to us about three times a year. These lectures and musical entertainments are offered to students at reduced rates and financed from this source and the higher rate charged outsiders. We have a fine outdoor theater in a natural ravine on the campus.

Pageants are put on annually under the combined direction of the physical education, the art, and the music departments. Much of the work is done by the students, who thus get the training, but the efforts are guided and regulated by the faculty.

A faculty club is managed by a faculty committee. It meets once a month from 4:00 to 5:00 or 5:30 and its programs vary from serious discussion of some of the leading questions of the day to faculty teas. It makes for better acquaintance and fellowship.

During the past year the Dean of Women has held regular conferences with all of the girls, grouped according to classes, in various sections. These are scheduled in the regular program. The girls are expected to be present, and they seem to be entirely willing to come. These informal conferences have been on the questions of the social life and conduct of the day.

The seventh and last objective in education as worked out by the Commission is *ethical character*. I believe that character is developed in meeting the daily problems of life, that classroom activities are powerful factors in such development, that history, literature, science, mathematics, music, and art, all contribute their quota to character building, but that there is still room for extra-curricula effort for this purpose. In our school the

Y. M. C. A. and the Y. W. C. A. contribute to this end. They are managed in the regular way of cabinet and advisory board. Each of the associations has one faculty adviser, who may be counted upon to attend the weekly meetings, and to whom they feel free to go for help and suggestions. The money comes from the student-activity fund, but both associations are permitted to supplement their finances in other ways, subject to the general restrictions placed upon all organizations. For ten or more years the Y. W. C. A. has maintained a little store, where necessary school supplies are sold. This yields a small but regular income.

In a normal school, or teachers' college, it sometimes seems almost impossible to find a regular time of meeting for Christian associations. We solved this problem a few years ago by giving one assembly hour a week to the associations. Attendance is not required, but no one has the right to demand the time of any student for that one hour. Therefore, every student who wants to come is free to do so. The only exception to this is that those who are teaching in the training school at that time cannot be excused. Not all attend. The study hall and library are full then, but there is always a goodly number in attendance. When programs are worthwhile, they get a good attendance; when programs are allowed to slump, the attendance slumps also. All in all, the associations are doing much for the school in giving a vivid sense of membership within a world group, a group consciousness in relation to this world-group, the idea of world-brotherhood, of community of right, duties, and needs, and a disposition to follow the leadership of the world's great moral leaders. The red triangle and the blue speak for service and render it, not always unselfishly, but, nevertheless, with a tendency and habit dictated by an enlightened religious sense.

The curricula and extra-curricula activities form the college life of the student. Their connection is oftentimes quite close, but their distinction is still fundamental. It may not always be. We must so regulate both that there may be no over-emphasis and no neglect. The problem confronting all of us is how best to establish proper relations between the two. They should complement each other. They need to be so regulated that faculty control is maintained and given full prestige, and that student responsibility in their management will develop high qualities of leadership and make for the attainment of all the objectives in educational activities.

THE RELATION OF THE COLLEGE WOMAN TO THE GENERAL FEDERATION OF WOMEN'S CLUBS

MRS. GEORGE W. PLUMMER, CORRESPONDING SECRETARY OF THE GENERAL
FEDERATION OF WOMEN'S CLUBS

First let us speak of Woman then upon that division of the sex called "college women," for after all, like the Colonel's Lady and Judy O'Grady they are sisters under their skins.

You will agree that it is not easy to organize women. They have been taught that they are Queens of the Home, and do not take kindly to being in the ranks and taught the goosetep. All prefer to be the queen-bee abroad as well as in the hive, and this has its difficulties.

I suppose the first organizer among women was she who organized a home and induced primitive man to sleep in one cave more than two consecutive nights and bear at least a part of the burden of the support of their children. I fear no contradiction when I declare in the language of the street that she was "some" organizer. It is true that there have been lapses—in fishing time for instance—but on the whole the home as an organization has withstood many serious strikes. Since then women have banded themselves together in the interests of the church and industry, but the woman's club movement has done more than any other one factor to teach teamwork, self-reliance, group-consciousness, discipline, tolerance, democracy, and loyalty. The institutions of learning have lifted and widened the horizon of a favored and gifted minority, but the woman's club has been the door of opportunity to thousands who might never hope to enter the scholastic gates.

But my task is to show the relation of the College Woman to the General Federation of Women's Clubs. It is true that the college woman before marriage or before the cares of life press upon her, has little regard for the woman's club of the usual type. Their College Clubs rarely join the Federations—District, State, or General, and these College Clubs are devoted mainly to entertaining notables, hearing clever papers, and to social gatherings.

Those of us who had not the advantages we have secured for our daughters, looked forward eagerly to the time when these gifted and trained minds would come into our membership and push to a successful and glorious termination the tasks over which we had long labored. Alas! mother's club does not often attract them. They use it to whet their witty tongues, and are more attracted to the newer cults, the more radical and exciting causes. They dub mother's club "slow."

Nor is this complaint without cause. The General Federation of Women's Clubs has always debarred from its membership clubs or organizations having sectarian or political qualifications for membership, as well as secret orders. In the days of its inception it was considered that politics and religion were fraught with too much feeling to be safe topics for an organization whose very life depended upon harmony, and so we drew the cordon including the most conservative sister and leaving the controversial questions outside.

As a great army moves no faster than its rear ranks, so the Federation, although seeing the vision, pressed forward no faster than all were ready to follow. This has been our weakness and our strength. It has enabled other organizations to snatch the banner of a new cause and push to the lead, but on the other hand when the solid phalanx of the General Federation came to the support of our ardent and sometimes well-nigh exhausted

sisters, the cause was won. While the Woman's Club may not attract the young college woman in the first flush of her intellectual strength, there comes a time later when she is glad of its motherly comfort and support.

May I tell you briefly the story that was told me the other day by a little middle-aged woman of the faded-calico type, with eyes that tears and anxious watching had dimmed; whose once bright hair looked now like sun-bleached hay, her hands bruised and knotted by domestic work and whose shoulders still kept the gracious bend of baby-tending.

"I was married almost immediately after I left college," she said, "and my first baby came within a year. My husband was not successful in business and we had a hard time to make strap and buckle meet. We had six babies in ten years, and I did my own work. I had specialized in English Literature in college, and I hoped to write for the magazines. I carried the plot of a novel in my brain as I carried my babies under my heart, but I worked so hard I could not create; my brain seemed asleep; I thought through the cotton-wool of fatigue. My idea of perfect bliss was a good night's uninterrupted sleep. I grew dull, did not care even to read the papers, dreaded company, and grew careless of my personal appearance. There came a day when one of my neighbors insisted on my being her guest to her woman's club because the president of my college was to speak. I went and I was like a lost child who hears for the first time the call of the searchers. That was a "white night" for me. Like a drowning person I seemed to see my past life like a panorama, and before stretched the future like the Desert of Sahara. I took my courage in both hands and joined that club. I could not enter into all of its activities, but I attended some of its classes and lectures and kept my soul alive. Now that my last baby is in my old Alma Mater, I am taking my share of the work, and every night I thank God for that club. It has meant fellowship, the keeping alive of my ideals and it has taught me to love women."

A composite picture of many blended into one reveals only the lines of unity, leaving shadowy and vague those diverging from the common type. Even so the General Federation is the composite of two million women—women who come from all walks of life, having all degrees of culture (or none); women who have had every advantage that wealth and position could give; women from the little towns, from the great cities, from the farms; women who are in industry, who have the care of great fortunes; women who work for their board and clothes from ten to eighteen hours a day, business and professional women,—all, all blended and united into the composite club woman. As our president, Mrs. Winter, puts it, the club woman sees life whole and not in terms of causes or conditions or creeds. The departments of work illustrate this; they are Fine Arts, Applied Education, American Citizenship, Public Welfare, Legislation and Press, and Publicity.

The women who head these departments, their divisions, and committees are experts; you have some of them at this table. The General Federation has through its sane outlook and its conservative and thoughtful manage-

ment of its policies, grown into the respect and confidence of city, State and National governments. It is appealed to on every hand; it is the support of every noble cause. It is not spectacular; it does not always lead the van in new causes, but it has the strength of a trained army, with an unshaken morale, under great leadership. It needs the young college woman. That it does not always get her in the first flush of her young womanhood is a poignant regret. But when life teaches her that she was never born to set it right alone, the Mother of Clubs welcomes her to share in her tasks and partake of her bounty.

Success speaks not only in the beat of the drum, the waving of the banners, the tumult and the shouting. There must be the steady, unflinching, loyal rank and file, who will keep step, obey orders, and carry on as faithfully in the least as well as in the grandest service. The woman's clubs offers then to the college woman a laboratory in which to test her theories. It offers her an opportunity for discipline—teaching her to subordinate her play to that of the team. It offers—although this may be harder to believe—a post-graduate course in many lines not to be despised, and most of all it offers her an opportunity of service to her less favored sister. "No man is greater than the service he renders to the world." The Woman's Club invites her service; it needs and can reward that service.

NATIONAL ASPECTS OF THE AMERICAN ASSOCIATION OF UNIVERSITY WOMEN

AURELIA HENRY REINHARDT, VICE-PRESIDENT, AND PRESIDENT
OF MILLS COLLEGE, OAKLAND, CALIFORNIA

Organization for group purpose is as old as mankind. Organization for altruistic group purpose is a late development of civilization. Organization of women solely, for the public welfare belongs to the last two generations, and has had most varied expressions in English-speaking lands. Here tonight the hostesses are a national organization of women whose profession is the administration of an educational system as it touches, may I say, the morale of American girlhood. The guests are representatives of other national organizations concerned with education in some respect, its professional standards, its direct relation to legislation and its indirect effect on the Nation's life in a variety of ways.

The President of the National Education Association, whose personal contribution to the transforming of rural education in the South has won her country-wide recognition, represents a professional group of which ex-President Eliot of Harvard is continually quoted as estimating that 93 per cent of the workers are women. This National Education Association concerns itself with public education in all its aspects—standards of teacher-training and administration, curriculum, schedule, finance, and legislation. The potential force of such an Association of specialists in education, where nearly seven hundred thousand people are engaged in teaching, needs no proof.

The General Federation of Women's Clubs, that largest and most inclusive of Women's Associations in purpose and in membership, has done more than it knows to create in the average woman of America a respect for accurate knowledge and a belief in broader and more firmly founded education for all women. It has proved to literally millions of non-professional women that like Portia, they were not yet so old but they *could* learn. Through more than a score of special departments they have encouraged volunteer leaders to gather about them students of art or public health, literature or civics, drama, parliamentary law, inscription, rural housing, or city plannings, and the results have been many. The members became mentally more alert and broader-minded; they grew to see the relation between home, community, and State; they learned some of the values of group activity; and their national conferences brought women of the South, West, East and North into sisterly understanding, which makes for National intelligence. The efficiency shown during the War by "the second line of defense" was due in part to the study and group government of women's clubs.

The National League for Women's Votes, that Athena which sprang into life full-panoplied among women's organizations after the passing of the Susan B. Anthony Amendment, sees American women as American citizens—its purpose is frankly and concretely to educate all women to think and to legislate nationally.

What is there left for us to do educationally, we, of the American Association of University Women? It is a generation since the Association of Collegiate Alumnae was formed, by certain college and university women who were aware in the eighties of a number of educational facts: few women were entering college; fewer were entering research fields; they were not always welcome; women students at college were given little care, academic, ethical or social; few scholarships and fellowships had been founded to encourage brilliant women to continue research; few positions in colleges and universities were open to graduate women, however brilliant; and so on and so on. These early college women said, "The future will need more trained women, let us work to increase opportunities for study, let us standardize life for the college woman, and let us create an interest in giving juster rewards for individual achievement."

Thus, simply and altruistically, was begun a movement which within forty years has put Deans of Women into Universities and into practically all other coeducational institutions. It has opened the doors for women into all subjects of study and into professional schools. It has encouraged vocational advising, made research into occupation for women, opened placement Bureaus, and studied standards of remuneration, rank, and authority in different lines of business and in professions. It has founded opportunities for research in memory of women or institutions working for the cause of higher education. Fellowships known by the names of Alice Freeman Palmer, Sarah Berliner, Anna C. Brackett, and Julia C. G.

Platt, as well as the Fellowships of the Association of the Collegiate Alumnae, Boston Alumnae, Gamma Phi Beta, and others bear witness to this work.

Indirectly and more generally the organization has given much service to the cause of American education. Our system of public instruction is a local matter in all the States. There exists no machinery to stimulate a locality to better standards and ideas unless the stimulus is from within. The Association of Collegiate Alumnae brought together women who were united by an inner bond. They had enjoyed like training, a like inheritance of mental treasure, and had grown to possess a like faith in ideals and ideas. As individual members and as branches of the national body, they have been sensitive to educational conditions in their environment, have known how to better these conditions and have coöperated for such betterment. They have carried the idea of higher training to girls who have no information, and by virtue of their training have become leaders in community movement for social betterment of all kinds. This is as it should be. The activities of a group of university women cannot be confined to a few formally stated purposes however excellent. The power and desire to enrich life in all its phases claims expression.

At the national meeting of the association in 1920, the Collegiate Alumnae realized that the first purpose of its existence had been accomplished. Opportunities for women had become legion and the time was ripe to restate a purpose fitting the new generation and to go forward with educational improvement as this decade requires it.

The total of women students in colleges and universities outnumbers the men. Opportunities for training, for research, for professional achievement are found on all sides. *The success of the individual woman in her chosen field of work will in the future depend on her personal ability and stability. The newer problem which presses upon the university woman of today is that of widening and deepening the educational process for all. Particularly must elementary teaching in this country be vastly improved, and to bring this about the elementary teacher must be given better financial remuneration and professional recognition.* Further, the time has come when the national as well as local problem of the public-school system must be understood by all citizens. These are some of the reasons which led the National Conference in 1920 to restate the purpose of the organization and to urge certain activities upon its members. It begged the 12,000 faithful to double and treble their working membership from the quarter of a million university women in this country. It pledges the members' coöperation in impending legislation. It arranged for the selection of an educational secretary in order that a field worker might take from branch to branch of the Collegiate Alumnae intelligence of the progress made in this important field of instruction and stimulate action in its behalf. It arranged for a National Club House and Headquarters in Washington in order that there might be an outward and visible sign of the unity of the university women of our land, and in order that they

might act as perpetual hostesses to the university women journeying through our country from other parts of the world. And finally, as proof of the desire to work for international understanding, the name of the Collegiate Alumnae was altered to one more like the University organizations across the Atlantic. It became the American Association of University Women. Plans were then perfected to coöperate with the International Federation of University Women, a coöperation which included financial help, exchange of information regarding colleges and universities, and arrangements for interchange of students and instructors.

How purposes grow in significance with the passing of time! Where scholarships and fellowships were local they are now being founded to send American women to England, France, Germany, and Italy and to bring women of these countries to America. International hospitality for students and instructors will mean patient effort, but it will also mean understanding and friendship. Those who seek truth with sincerity cannot be mortal enemies however different are the tongues in which they speak. Those who study to ameliorate the sorrows of the poor, the ignorant, and the diseased cannot but respect each other in whatever part of the world they may have been born. Because the work of university women is high-minded and altruistic, its power for good cannot be limited to one locality or one time.

The purpose of the association should appeal to all women here present. All women teaching in colleges and universities, officers of administration and others should be aware of this National and international movement in which women who have enjoyed the opportunities of training are endeavoring to make possible better training for all women and therefore to add to life a finer beauty and higher dignity. Let the undergraduate student know of this movement, what it has done, what it is doing, and what it may do in the future. And let her graduate into active working membership.

Alumnae organizations are of imperative service with their bonds of youthful friendship and their institutional loyalties. This organization of women from all colleges and universities is wider in scope and more varied in usefulness. It supports not one institution, but all institutions of higher learning. It emphasizes not the differences, but the likenesses of higher training. It carries the benefits of such training into all localities and to all people, whether or not they have enjoyed like opportunities. It is a call to student girlhood to fit for the finest type of womanhood. It says there are no national limitations to goodness, to truth, and to brotherly love, but in so far as we search for and possess these three we are all kindred.

To you deans of women in colleges and universities, you, whose alluring task has to do with the morale of the woman student of America, may I put a last question—Are we making clear to our students the purpose and function of education? Do they see it as a means or an end? As a privilege, a luxury, or a responsibility? Do they associate it with accurate knowledge, moral character, commanding personality, and creative imagina-

tion? Do they believe it a preparation for making a living or is it a part of life? Do they realize that it is through education that human beings may veritably become co-creators of this modern world? How can women students of today make the university more truly the center of learning and how can they make it for tomorrow the most important factor in a civilization of individual beneficence?

RELATIONS TO OTHER ORGANIZATIONS

MRS. R. F. MC WILLIAMS, PRESIDENT OF THE FEDERATION OF UNIVERSITY WOMEN IN CANADA

A distinguished citizen of our commonwealth, dwelling near the heart of things in London, has recently set forth in the preface of her book, "A Political Pilgrim in Europe," her belief that it is needful in the cause of peace that all should become pilgrims, if possible, and if not pilgrims then prophets and priests of peace and good-will. No patriot, she says, can afford to wait for peace to come right. He must begin to make it come right. I have no claim to distinction and I do not, as does Mrs. Philip Snowden whose book I commend to you, dwell at the center but rather at one of the outposts of that British Commonwealth of which we are both citizens. Yet it is in the spirit to which she has given expression that I come to you tonight willing, yes, eager, to make my pilgrimage of a thousand miles, if by so doing I can offer the smallest contribution to the forging of the links which bind our two countries in a common love of peace—in a common wish to see that peace which we have realized for over a century spread through the world so rent with vain strivings.

Other speakers this evening have made their contribution to the general topic of the relation of your association to other organizations from the viewpoint of those who dwell within your own country. Will you for a moment turn now your eyes outside your own country and think upon your relation—your service—to the world at large. For if there be a relation—and I think there is a vital one—between the Federation of University Women in Canada and the National Association of Deans of Women in the United States of America, it arises from and becomes vital only through that world relationship, that impetus towards world service, which is the sign of life and growth in this new day into which we have entered.

There are many aspects under which we may view this new day. Only one I ask you to hold in your minds at this moment, and that is that now we see clearly and definitely what before we grasped as a theory only, that build we never so well in matters of education which is your first care, or matters of philanthropy, or matters of *haute politique*, or even matters of business we shall never build so well that all our buildings may not be swept away in a catastrophe of war. Formerly we knew this because we read it in histories. Now we know because we have seen it happen under our own eyes. That it did not happen in all its naked horror to those of

us who live on this continent is due to a happy fortune and the valor of our men. That it may not yet happen to us, no man can say. Seeing this clearly we have a new conception of the value of the search after peace—of the need of determining greatly that with all our building we shall build for world peace. It is in that necessity to work for the peace of the world that we shall, I hope, find the basis for instituting and maintaining a real relationship between your association and the federation which I have the honor to represent.

From the fundamentals of human nature it follows, I believe, that a smaller nation thinks more about its relation to a larger nation than does the larger one about the smaller. I have lived my adult life in that period of the history of my country which has seen the rise of a national consciousness—a consciousness much intensified by the war. It has been for us a matter of happiness and for you, I think, a matter of some pride that that national sense has been developed not as a protection from racial enmity and aggression from the outside but rather from a desire to play worthily our rôle in the British Commonwealth of which we are a part, as well as to emulate happily a successful and friendly neighbor. And something in addition. For any careful student of the growth of Canadian consciousness has seen interwoven with it—slightly before the war, predominantly since—the compelling sense of a special and a high destiny. Perhaps like the man of small physique we overestimate ourselves, but it is not to be denied that in the minds and hearts of thoughtful Canadians lies ever the hope that it is their mission to aid in drawing together the two great branches of the English-speaking race who through the madness of a King and the vanity of his Minister were needlessly estranged. That our Federation might have some real part in that was one of the motives actuating those who hastened on its formation, so that it might be ready to share with the American Associations and the British Federation in the work of creating the International.

We are, as our name will indicate, a federation of existing organizations: some of them *alumnæ* of our universities, others clubs of the graduates of any university living in the same city. We started in the autumn of 1919 with seven of these organizations. We now have twelve with a thirteenth—we hope a lucky thirteenth—just ready to come in. We have not, as I understand your organization has any individual members, but we have through the federated bodies nearly 1,100 women in membership and they live in a territory which extends from Montreal to Victoria, from tide water on the east to the Pacific Ocean on the west. We hope through the thirteenth organization of which I spoke to be able to describe our territory in the words of the well-known hymn "From ocean to ocean." With your large membership that 1,100 must sound very small. Perhaps you will permit me to remind you that, having regard to our respective populations, this is equivalent to a membership for your association of 14,000.

The purposes of our organization as set forth in our constitution are threefold; first to stimulate the interest of university women in public

affairs and provide an opportunity for the expression of united opinion; second to promote the higher education of women and especially to encourage research work; and lastly to promote social intercourse and coöperation between the women of different universities. And may I say here that we seek this coöperation not only among the graduates of our own universities but among the university women living in Canada, admitting freely to our membership the graduates of any university who are eligible to membership in their own national body?

As has been said, we were able to help in the formation of the International Federation in the summer of 1920—that International which beginning with three nations less than two years ago now includes fourteen. That organization cannot we feel but contribute greatly towards our first object. Less than two years after our organization meeting we had our first scholarship winner over in France preparing to take up her work in historical research at the Sorbonne, where she is now. We have already in the treasury the money for a second scholarship, the matter of selecting the winner being now in hand. Thus we serve our second purpose of being.

With the third object in mind, we have carried out through the medium of our educational committee a survey of the primary schools with intent to display the variation in accomplishment of the different provinces and to reveal points at which our federation might be of assistance. We are now carrying on a similar enquiry into the library system, a most important matter in a country so sparsely settled as ours. We feel sure that out of it we shall find a work for our organization to do in the matter of winning public support for making good books easily available to the people of the smaller communities. We have made a beginning in the matter of a vocational bureau proceeding by way of coöperation with our Government employment service. Some day we hope to be as successful in this matter as you are in the very fine bureau maintained by the university women of this country.

More interesting to you, as offering a basis of comparison between the fate of the university graduates in our two countries will, no doubt, be some figures from the comprehensive analysis of our membership recently completed by our membership secretary. Within ranks are the graduates of some sixty universities of which only fifteen are Canadian and no fewer than thirty-three are American. This should help to give us the cosmopolitan outlook, which it is a commonplace smaller countries frequently lack. But it is when we come to the analysis of the vocations followed by our members that we get most light on what the Canadian University woman is contributing to her country. Speaking in round numbers one third of our membership belongs in the category of the married woman not pursuing any remunerative occupation; another third are in the teaching profession including the universities and schools; while the last third pursue a variety of those newer occupations which have been gradually opened to women. These vocations are classified under thirty heads including

social service workers, librarians, journalists, doctors, lawyers, dentists, nurses, motion-picture censors, psychiatrists, women in administrative positions in colleges, hospitals, the large departmental stores and government services, while one of the largest sections of this third group includes those university women who have found their way into the work of commerce and who are industrial chemists, seed and textile analysts, economic experts, insurance and advertising agents, commercial artists and private secretaries and clerks of various kinds.

Between the first and third of these groups and the deans of women there would seem to be little relation. Yet I am not sure that it is not there. In the third group are those more adventurous spirits who are doing the pioneering of these days and so making easier the ways of those who come after. In another way, too, the married woman among us is preparing the way. You will find her in all the woman's clubs, in all the movements for progress; not always the vocal leader, but generally the backbone of the working committee, giving of her heart and strength and leisure to the improvement of the social fabric.

I have said that it is a truism that in the hard and fast union—I mean of course, a union of the spirit and not in political form—of the English-speaking peoples rests the world's greatest bulwark of safety. Perhaps I should say that it is a truism with us, since it is not simple for one outside your country to sense your opinion however carefully your journals be read. To us for instance the great outcome of the Washington Conference was not the limitation of the building of great ships, not the four-power treaty, not the Shantung settlement, not any one of the formal agreements though we hail them all as achievements of great worth. The greatness of the conference to our eyes lay rather in the fact that for the first time in generations your people as represented by Mr. Hughes, and our people as represented by Mr. Balfour worked side by side with high courage, incomparable skill, and a firm belief in each other's sincerity of purpose and that out of that working together they wrought, to quote Lloyd George, "one of the most notable contributions statesmanship has ever made for the sum of human peace and human happiness."

Shall we not together build on this foundation? Shall we not make the most of the happy circumstance that between our countries lies almost nothing of suspicion of motive and no shred at all of ancient wrong and build as we may for this world union of the English-speaking races? Right at our hand lies so much material for building that it would almost seem, our eyes being opened, we can miss the way only through wilfulness.

CONSIDERATIONS TO BE TAKEN INTO ACCOUNT IN THE STIMULATION OF GRADUATE WORK FOR WOMEN¹

LOUISE POUND, PROFESSOR OF ENGLISH, UNIVERSITY OF NEBRASKA,
LINCOLN, NEBRASKA

The question, once warmly debated, "Are women able to do graduate work?" is now omitted from programs. New questions are being considered today. Accepting the woman graduate student and her ability as demonstrated facts, how shall she be attracted to educational institutions in greater numbers and higher quality? Is it wise to try to attract her? What shall be done with her when her study is completed? May not a time be looked forward to when it will be neither profitable nor necessary to speak separately of graduate study for men and for women?

Some present views concerning graduate work for women. Current expressions of disappointment at the supply of academic positions available for women with higher degrees, and the inferiority of most of these positions. Are opportunities for the holding of academic positions by women lessening? Their present status on the faculties of educational institutions. Does anything turn for them on advanced study, outside activities, or published work? Or is it wiser for them to stay by the routine of pedagogical details? Percentage of men appointed on the faculties of women's institutions. Suggestion of the committee, headed by Dr. A. Caswell Ellis, of the American Association of University Professors on the status of women, that the reasons given for the appointment of men on the faculties of women's institutions hold also for the appointment of women on the faculties of men's institutions. At present, work in graduate humanistic subjects must be followed for the work itself, rather than with a view to direct returns. Superior opportunities in lines like household arts, home economics, dietetics, textiles, clothing, physical training, headships of halls, etc., for which men do not compete. Advisability of the taking into account by professors of the capacity of individual students who are encouraged to continue work, as well as of the opportunities opening up.

The often-heard affirmation that few strong women are available for academic positions not valid. Evidence regarding feminine ability of Phi Beta Kappa statistics, when the method of selection is based on grades only. Some institutions, as Brown University, discriminate in their treatment of the sexes, to the disadvantage of women students. Well-equipped women easily had or developed for academic positions, if they are wanted. Strong material now to be found on the faculties of secondary schools.

The more optimistic view. Great progress already made. A stage of experiment and adjustment inevitable. Growing recognition of the principle that women instructors are needed in fair proportion to the number of women students, just as men teachers are needed in fair proportion to

¹ This paper was printed in full in *School and Society*, Vol. XV, No. 387, May 27, 1922.

the number of boys in attendance at high schools. Some of the large institutions slowest to see the fairness of employing an adequate percentage of women teachers are California and Michigan. Improbability that the percentage of women on the faculties of coeducational institutions will remain so small. Willingness of the larger-minded men, when they understand and get around to it, to lend a helping hand. Meantime, much turns on the scholarship of women in the graduate school. Helpful agencies like the Association of University Women now encouraging higher education for women. Leadership of far-seeing women like Miss Thomas, of Bryn Mawr, and Miss Gildersleeve, of Barnard. Larger part to be played by intelligence tests to be welcomed. Rôle played by organizations like that meeting today. Promise of the outlook.

SOME RESULTS OF GRADUATE WORK BY WOMEN

MARION TALBOT, DEAN OF WOMEN, OF THE UNIVERSITY OF CHICAGO,
CHICAGO, ILLINOIS

The question is frequently raised as to the status of women in graduate work and their future in academic positions. In the belief that the experience of the University of Chicago has been long enough and the number of students in the Graduate Schools has been large enough to make some study profitable or at least suggestive, a few facts have been gleaned from the university records, covering in general the years 1910-15 inclusive. The period is long enough to indicate some general tendencies as well as a few definite facts.

These may be summarized as follows: (1) A larger proportion of women than of men admitted to candidacy for the master's degree complete the course and a smaller proportion for the doctor's degree; (2) the proportion of women taking the doctor's degree with the lowest grade is smaller than of men, with the highest grade larger and approximately the same for the intermediate grades; (3) a smaller proportion of women than of men hold college and university appointments, a larger proportion hold normal and high-school appointments, and the same proportions are in miscellaneous occupations; (4) nine per cent of the men holding the doctor's degree from the university occupy faculty positions and 5 per cent of the women; (5) eighty-seven per cent of men Doctors of Philosophy holding faculty positions in the University of Chicago are of professional rank of different grades and 66 per cent of women.

From certain points of view these results are very discouraging, but it must be remembered that graduate schools have been open to women for a comparatively short period of time and considering all the circumstances, women have made satisfactory progress and have ground to believe that in time recognition will come to them in proportion to the thoroughness and scholarly quality of their attainments.

RETIREMENT SYSTEMS FOR WOMEN MEMBERS OF COLLEGE FACULTIES

GRACE A. STAYT, DEAN OF WOMEN, KNOX COLLEGE, GALESBURG, ILLINOIS

The college woman of today is committed to the principle of economic independence. She is no longer satisfied to know that she is able to provide food and shelter for herself during the years when she is actively contributing to the world's work; she wants the assurance that, when this period of productivity is over, she can look forward with good cheer to the years which Browning, in a fine spirit of optimism, has characterized as "the best —, The last of life for which the first was made."

But this "last of life" can never be the best if, overshadowing it, is the constant fear that increasing years may bring deprivation of the things that make life dear. I am not speaking of material things but of qualities of the spirit, serenity, self-reliance, courage. These qualities cannot long withstand the insistent siege of dependence and fear of want. It is from the deadly foes of anxiety and apprehension that a wisely conceived retirement system is able to release the teacher, leaving him free to bring to bear upon the every-day duties of life the quickening impulses of an unfettered spirit.

What constitutes a well-conceived retirement system? Briefly expressed, the answer would probably run about as follows: A system, which, through some form of pension or annuity, or combination of both, assures to the worker adequate protection against dependence due to old age or disability.

I should like to establish at the outset that, while it is true that most teachers' retirement systems owe their existence to a newly awakened sense of social responsibility, they are in no sense a form of charity. The provision for the continuance of a teacher's salary beyond the years of actual service is simply a form of deferred pay which no teacher, however scrupulous his feeling in regard to maintaining his independence, need hesitate to accept.

To what extent have the colleges of the country been able to assure members of their faculties continuance of income after their teaching days are over? A few of the larger colleges have established retirement systems of their own, in some of which the entire burden of support has fallen upon the institution; in some, upon the teacher alone, through a plan of compulsory monthly contributions toward the purchase of deferred annuity, and, in other cases (probably the largest number), upon both institution and teacher, each making an equal contribution during a series of years for the purchase, generally at the age of 65, of a deferred annuity—the income of which is available either to the teacher alone or to the teacher and his heirs.

Within the past three or four years several institutions, which had previously maintained independent retirement systems, have abandoned these, accepting in their place participation in the contributory plan of old-

age annuities offered by the Teachers' Insurance and Annuity Association of America and other insurance companies. The total number of colleges and universities which have voted to adopt such a plan at the present time is sixty-three. Included in this last number are Bryn Mawr, Mount Holyoke, Smith, and Wells.

The formulation of such a plan usually includes provision for the payment by the institution of an amount equal to 5 per cent of the teacher's salary toward the purchase of a deferred annuity or endowment insurance on the condition that the teacher contribute a like amount for the same purpose; that participation in the system be optional, the institution not to contribute for the teacher unless he contributes for himself and that the contribution of the institution cease when the teacher reaches the age of sixty-five.

Seventy-four colleges and universities, known as the "Associated Institutions of the Carnegie Foundation," enjoy the benefits of the system of retiring allowances established by the Carnegie Foundation. This operates under two distinct plans, the first of which applies to members of college and university faculties whose connection with an Associated Institution began prior to November, 1915, and includes, briefly stated,

(1) Provision for an old-age retiring allowance computed as follows:

(a) For an active pay of twelve hundred dollars or less, an allowance of one thousand dollars, provided no allowance shall exceed ninety per cent of the active pay.

(b) For an active pay greater than twelve hundred dollars, the retiring allowance shall equal one thousand dollars, increased by fifty dollars for each one hundred dollars in excess of twelve hundred dollars.

(2) Provision for a disability allowance computed as follows:

(a) For an active pay of twelve hundred dollars or less, a retiring allowance of eight hundred dollars, provided that no allowance shall exceed eighty per cent of the active pay.

(b) For an active pay greater than twelve hundred dollars, the retiring allowance shall equal eight hundred dollars, increased by forty dollars for each one hundred dollars in excess of twelve hundred dollars.

The second plan applies to members of faculties who entered Associated Institutions after November, 1915, and who are participants in the contributory plan of annuities maintained by the Teachers' Insurance and Annuity Association of America. It offers the following benefits:

(1) The privilege of setting one's own date of retirement, "the amount of the retiring allowance to be based upon the joint contributions of the teacher and his college and their accumulations,"

(2) In total permanent disability a disability allowance of "two thirds the amount the teacher would have obtained if he had continued to age sixty-five average contributions equal to the average of the five years preceding his disability."

But there are many colleges and universities which do not enjoy the privileges of the Associated Institutions of the Carnegie Foundation; which

have not committed themselves to the support of any system of retiring allowances and which do not coöperate with existing agencies in making any provision for retiring allowances. To teachers in such institutions there is still the opportunity of making individual provision for protection either through a deferred annuity contract or endowment insurance in any responsible insurance company. As to younger teachers, if they are receiving fair compensation for their services, this can be taken care of without undue hardship, perhaps, but to older teachers, whose expectation of continuance in the profession is limited to a brief period of years, it is likely to prove a great burden.

The payment, for instance, of a monthly premium of ten dollars beginning at the age of twenty-five will give a woman an annuity beginning at the age of sixty-five and payable in monthly installments of ninety-six dollars and twenty-seven cents. But if she waits until she is forty-five before she begins to make her payments, the same premium, ten dollars per month, will yield her at the age of sixty-five a monthly income of thirty dollars and seventeen cents (less than one third of the first amount), which is reduced to twenty dollars and twenty-nine cents if payment of premiums is not begun until the age of fifty. The whole value in any such system obviously lies in making an early start. It is the accumulated earnings extended over a long period of years that count.

The importance of this principle can not be too strongly recommended to the attention of young teachers. To those who are just entering upon the profession of teaching, the day of retirement seems far removed but today and tomorrow become yesterday before we know it and the rainy day, for which provision must be made, still has a place in the teacher's calendar.

It seems altogether probable that a better understanding of the economic effect of retiring allowances will eventually convince Boards of Trustees of their interests in the matter, for the day will inevitably come when the teacher in deciding between two institutions, one which offers protection against the loss of income earning power, either through disability or age, and the other which says "These are matters of no concern to us" will know which one to choose.

In the meantime, I fancy that many a college teacher for whose protection no provision has been made, is looking somewhat enviously upon the more favored situation in this respect of the teacher in the public schools. To be sure, the pension of the public school teacher is usually small. Four hundred dollars represents a fair average, but four hundred dollars is the income at four per cent on an investment of ten thousand dollars, and how many college teachers, at the end of twenty-five years of service can point to an accumulation, from their earnings, of ten thousand dollars?

With few exceptions, retirement systems are framed with reference to the needs of men teachers rather than of women. When one considers that out of the six thousand five hundred ninety-three teachers actively engaged in service in the seventy-four Associated Institutions of the Car-

negie Foundation in 1917, only seven hundred fifteen were women, one could hardly expect it to be otherwise. In reality, these needs differ in certain important respects. For instance, the assumption in the case of the man is that he is married and has a family dependent upon him. His interests, therefore, would seem to be best met by an arrangement that will most satisfactorily provide for the joint protection of himself and family; in the case of the woman, while it is true that in a large number of cases she has dependents, the general assumption is that she has only herself to provide for. Her needs would, therefore, apparently best be met by whatever arrangement would give her as large an income as possible for her own use during her own lifetime. This might best be accomplished by the purchase of a straight annuity without provision for return of money either in case of death during active service or after retirement. The cost of such an annuity should, I understand, be about one fourth less than that which guarantees the return with interest of all money paid in the form of premiums.

As to the woman with dependents, the situation still differs from that of the man in that, in his case, the time of greatest responsibility for dependents is usually during the earlier years of his active service while his children are still young. As they grow older they become an increasing source of protection to their parents; the dependents of the woman teacher, on the other hand, are usually older than herself, a father or mother, older sister or brother, and are apt to become an increasing responsibility as time goes on, the greatest need for care coming presumably during the later years of her service. There would often seem to be small need for an annuity that would continue for a long period of time after the death of the teacher—an option of cash value at death, such as is found in the superannuation scheme of the English universities, or an option between a five, ten, fifteen, or twenty-year period for the continuance of the annuity, such as is permitted in many of our commercial insurance companies. The amount of the annuity being, of course, proportionately larger for the shorter periods, would seem to be of value in such cases.

Only a limited number of institutions afford adequate protection to the teacher who has reached the years of middle life, before having an opportunity to contribute toward a retiring allowance. Her contributions begin at too late a period to admit of the purchase, at the age of retirement, of an adequate annuity.

Many colleges make no retiring allowances to teachers who were in service prior to November, 1915, for the reason that, as members of an Associated Institution of the Carnegie Foundation, they are eligible to the retiring allowances made by that organization to teachers whose connection with their institution began before that date.

This suggests another matter for consideration,—namely, that while new contributory systems practically all permit of retirement at whatever age the college and teacher may jointly agree upon, the teacher who retires upon a pension from the Carnegie Foundation must have reached a mini-

mum age of sixty-five. While we all know many instances of women rendering conspicuous service to their institution up to and beyond the age of sixty-five, nevertheless, I believe it is true, in the main, that few women have the physical endurance to meet the strenuous demands of a teacher's life beyond the age of sixty. Moreover, public sentiment is, in some places, so opposed to their continuance in service after this age as to make it undesirable. This means that a large proportion of the women who have done the greater part of their teaching during the years when salaries were at a low ebb are in danger of being cut off (either from inability to continue their labors longer or from pressure of public opinion) from any share in the protection offered by existing systems—other than such as is afforded by the disability clause.

Lastly comes the question of disability allowance. Probably there is no one thing that the average women dreads more than dependence due to disability, and so she would like to make very sure in purchasing protection against dependence that the loss of income through physical disability shall be taken into consideration. Most insurance companies permit a waiver of premiums in disability; a few guarantee a disability allowance but usually under conditions that are more applicable to the lives of railroad engineers than of college teachers. The provision for a disability allowance to members of the Associated Institutions of the Carnegie Foundation has already been touched upon. In addition, I believe the trustees of the Teachers' Insurance and Annuity Association of America have under consideration at the present time the question of the desirability of making provision for a disability income in connection with its life insurance policies.

There are certain commercial insurance companies which are offering individual and group insurance whose greater range of freedom in options over those offered by the Teachers' Insurance and Annuity Associations, thus permitting greater adaptation to individual needs, compensates in part, at least, for their somewhat higher cost.

HOW MAY THE DEAN BEST APPORTION HER TIME AMONG THE ACADEMIC, ADVISORY, AND SOCIAL SIDE OF COLLEGE?

ANNA L. TANNAHILL, DEAN OF WOMEN, BELOIT COLLEGE,
BELOIT, WISCONSIN

To apportion the time of the dean of women among the various important phases of her work, which, plan as she may, seem to demand every atom of her strength and every moment of her time, is no easy matter. It practically amounts to an attempt at standardization.

Without question those aspects of the work which may be termed administrative and advisory are of paramount importance and should receive

by far the greatest allotment of time. It is highly desirable, if compatible with the organization of the college, that the dean of women should act for the women students as dean of the college. This entails the supervision of scholarship, with the attendant sending out of notices to students whose work is below the standard required by the college or reported by instructors as below the grade of which they are capable; the holding of conferences with individual students to ascertain the causes of such deficiencies, and with the scholarship chairman of the various groups to keep them informed as to the scholastic status of the members and to help them develop within the groups right attitudes toward scholarship and practical and effective means of upholding it. It entails also the consideration of the cases of students who wish to carry more or fewer than the required hours and the granting of such permission when the requests are justifiable. It requires the placing upon probation of such students as do not obtain in any given quarter or semester the number of hours and credits required of their class and the recommending to the faculty committee concerned the dismissal of such students as are hopelessly deficient in scholarship. It requires also the assignment of each incoming freshman to a faculty adviser who should remain her college adviser until she selects her major, and the coöperation with this adviser in matters affecting the interests of the student.

Other administrative matters demanding the time and attention of the dean of women are the general oversight of the halls of residence, with the appointment of properly qualified directors; the selection and supervision of rooming houses, if the college has not adequate accommodations for all of its women students; the finding of employment for young women who need entirely or in part to earn their way in college and the special oversight of those who are working in private homes for room and board; the keeping of careful records of attendance together with the granting of excuses for non-attendance when such are warranted, and the keeping of records of the health and of the activities of the individual students. No small portion of the time which the dean of women devotes to administrative duties needs to be given over to work on various important faculty committees, such as those on administration and student work, course of study, regulation of student activities, religious and social life, and physical education.

Her administrative duties shade off into the advisory. Of the latter those requiring the most time have to do with the personal or scholastic problems of the individual students, with the women's self-government association, with the big-sister movement so important in inducting new students into the life of the college and helping them make their adjustments, and with helping the young women to develop their various organizations. From my point of view these important administrative and advisory responsibilities demand at least seventy per cent of the dean's time.

The remaining thirty per cent, I believe, should be divided about equally between academic work and social relationships. That the dean of women

in the coeducational college should be a recognized member of the faculty and that it is desirable that she be accorded at least the rank of assistant professor needs no emphasis. The importance of her having a definite place upon the instructional staff is fourfold—in its effect upon the regard of the student body of the college; in its effect upon her relations with the faculty, in that academic accomplishment will engender respect and that similar experiences in the classroom will create a bond of sympathetic understanding; in its effect upon her wise discharging of her administrative duties; and finally in its effect subjectively, in that it will broaden her horizon and prove a saving relief from the routine of administrative duties. Important as teaching is, it is, however, imperative that it should not be allowed to consume too great a portion of the dean's time. Although a dynamic part, it is, after all, in matter of importance, a relatively small part of her work. I feel strongly that the dean of women should not teach more than one course during any given quarter or semester, and that if possible this should be not more than a three-hour course. One exception I would make. If the faculty can be brought to sanction for the first quarter or semester of the college year, a one-hour course in college life and adjustment to be given by the dean to freshmen women, she will gain more in the way of results and in actual economy of time than through the expenditure of an equal number of hours in any other way.

To say that the remaining fifteen per cent of the dean's time will care for her manifold social duties will of course bring a smile to the face of every one familiar with these demands. I have merely assigned to them the portion of a normal eight-hour day which I feel their relative importance justifies. They will always crowd over into those hours which the dean would like to call her own, but never does. They are many and varied—entertaining students at teas and in informal groups; holding fireside story hours; attending student functions; dining frequently at the several halls of residence, at fraternity houses, and at the homes of town students; entertaining for guests of the college; meeting parents and relatives of the students, when they visit the college, and likewise meeting the parents of prospective students; meeting many important social demands in the town community; endeavoring to bring into normal social relationships the young women who are working for room and board in town homes; drawing out the shy girl; and, most important of all perhaps, developing and guiding a distinctive social life among the women students which is not dependent upon the men of the college—demands which, if we meet them as our hearts prompt, could easily leave little time for the larger responsibilities of the office. Important as are the social relationships and the academic contacts, the administrative and advisory duties of the dean are her larger responsibilities and should receive by far the greater portion of her time.

*EXTRA-CURRICULA ACTIVITIES—WHAT ONES DO YOU
CONSIDER OF SUFFICIENT IMPORTANCE TO JUSTIFY
THEIR EXISTENCE AND HOW MAY WE
KEEP THEM IN A SUBORDINATE POSITION?*

MRS. GERTRUDE S. KINGSLAND, DEAN OF WOMEN, RIPON COLLEGE,
RIPON, WISCONSIN

An educational problem confronts us in extra-curricula activities. The problem is too salient to be unseen, too wide-spread to be unrecognized, too consequential to be ignored. It is conspicuous on every campus; it is discussed in every assemblage of educators. According to differing opinions it either threatens to push aside all scholarship, or promises to correlate with the curricula in building character and developing ability. Professor Robert Corwin, of Yale, has said that the scholastic work accomplished by the students does not compare, either as to amount or quality, with that on the playing fields and in all extra-curriculum competitions. Are these activities of value in accomplishing what education desires? Do they invite academic coöperation? Do they need academic control?

The varying answers denote unsettled opinions and indicate the transitional period through which we are passing. Although periods of transition are always dangerous, yet advance cannot be made without passing over from an old order to a new. Time was when education was preparation for life, which began theoretically at Commencement; time is when education is guidance in living, and the independent, self-reliant existence directly follows college matriculation. Time was when knowledge was acquired to educate the human being into a gentleman of society; time is when men and women with whetted curiosity seize upon facts and experiences in order that they may form their own philosophies, live to the full their own lives, and give richness of health, support, inspiration, and joy to an ever-widening circle. Time was when the college provided the living conditions for the students, dictated their sports, and appointed and arranged their social functions; time is when fraternities and clubs manage their own luxurious homes, athletic associations control the inter-collegiate sports, and social functions monopolizing week-ends and holidays, clamour for intervening dates.

Through two generations the extra-curricula activities have been transforming college conditions. They appeared on the horizon fifty years ago like a small evanescent cloud; today they overhang the academic sky, threatening, as some educators believe, a devastation, or promising, as others think, revivification and growth. College faculties waver before this thing grown so suddenly great and ominous. But out of much discussion and out of many varied experiences, they will come to some concerted opinion and, discriminating the activities of value, will place them in a recognized position where the student in freedom will be guided by the wisdom of

counsel and will receive the benefit of training as well as accomplishment, which many of these activities offer.

What are these activities which are prized by serious minded educators and contribute to the right formation of character? They are the activities which beget dynamic enthusiasm, calm justice, intelligent sympathy, loyalty to friend and college, and honesty in sports as well as in work. Furthermore, activities which develop initiative, poise, courage, judgment, perseverance, are worthwhile for the college life that now is and for the freer life which is to follow. There are activities athletic, ethical, musical, dramatic, controversial, oratorical, literary, governmental, scholastic, and social. These activities afford fields for both individual and group achievement. The students to gain individual distinction are spurred on by ambitious parents; to win honors for the college they are incited by active alumni.

Athletic contests, glee clubs, debating teams, and college publications offer not only opportunities for both personal distinction and group achievement, but, being recognized advertising media, are given faculty attention and supervision. Under right control these activities contribute to the development of character and the experience of living. The ethical field, though the most neglected and neglected usually in direct ratio to the increasing number of the students, has its Christian associations, missionary interests, and welfare service clubs. While large universities hire secretaries to encourage the work of the Christian associations, the colleges with equal appreciation of the work appoint faculty advisers who give time and thought to the fostering of these organizations whose ethical influence reaches beyond the campus. The departmental clubs, superseding the old literary societies, bring the theories, formulas, and formalities of the classroom to the free discussion and practical demonstration in the intimacy of the club. The governing forces of the classes, clubs, legislative and executive councils place a responsibility which develops control and diplomatic management. Bursars, treasurers, auditors, receiving and paying out moneys, making budgets, auditing accounts, are growing financiers and economists. Even the social life develops such valuable traits as friendliness, sympathy, courtesy, esthetics, and, perhaps as great as any, the spirit of joy.

Encouragement, therefore, is given to the extra-curricula activities desired. In some offices records of students in these activities are kept on file and these records are often sought by future employers of the students. Liberal space is given in the college papers for the publicity of activities. Prizes are awarded for general excellence, as letters and trophies are given for definite participations. Social distinctions reward social service; honorary positions repay expressed talent. In many colleges advisors are appointed to augment the interest in the worthwhile activities and to increase their excellence. Recognizing the benefits which through these activities accrue to the student, who thereby learns modesty as well as fortitude, leadership as well as loyalty, ethics as well as esthetics, business

management as well as social grace, the educator wisely determines to hold fast to that which is good. But knowing that often these same activities when left without guidance or restriction tend to extremes, extremes which waste health, intellect, time, money, and morals, he firmly sets himself to compute and control, to devise, and to deny. The proper restriction of activities is the unknown solvent to the solution, the hidden twist in the knot. The evils entailed by unrestricted activities are self-evident. They need not be enumerated. They are not additional activities of a baser sort but are the excesses of the good.

The faults of the college activities, however, are the faults of similar activities in the world, the greater discretion and control preponderating in the college. The age is restless, pleasure-seeking, irreverent. Wealth and popularity are at a premium; duty is below par. Bizarre fashions, barbaric music, hysterical actions, and extravagant display are prevalent in all circles of society. The college is the place, however, where responsibility should fall most heavily, where concerted action can control, and where exemplary conduct is expected. This responsibility college faculties accept. They are by various methods trying to allay the social frenzy, disentangle the intricacies of overlapping interests, and secure from each activity the greatest good for the greatest number of students concerned. Experiments are going on in every university, college, normal, and high school. Point systems are devised, amended, discarded, and restored. Scholarship requirements check in the heady activities. Councils, congresses, and conferences of students, organization presidents, and inter-collegiate representatives meet, legislate, and act. Faculties advise, dictate, and dominate. But as yet no established policy workable in all schools has been constructed. No plan approximately adequate for correct limitation has been discovered.

The pioneer work in the control of activities has been done by the boards and associations which govern athletics. Some uniform basis being necessary for intercollegiate sports, the different athletic associations of the States and districts have established rulings which not only give uniformity of control to athletics but suggest methods for the limitation of other activities. These associations require full college standing and definite hours of passing work; they forbid professionalism and a fifth year of participation. The regulations are not perfected. Constantly cases arise where financial offers, direct or indirect, thwart the ideals of the association; even professors at times pervert their gradings to give the athlete the required passing hours. On the whole, however, the rulings of the athletic associations do set metes and bounds to athletic activities. In the comity of colleges should not the professionalism cried down in athletics be forbidden in other activities? The athlete may not commercialize his muscle, but the glee-club man may commercialize his music. Is not the professional musician on the glee-club program as gross a misrepresentation of student ability as the imported professional baseball pitcher who falsified the diamond twenty-five years ago?

The scholarship qualifications are without doubt the most effective and reasonable means of limiting other activities than athletics. Most colleges insist that a man not passing in the hours required for good standing must not be allowed to make a public appearance representing the college. This affects especially public games and entertainments. When the requirement includes grade points as well as hours this basis of scholarship may have its disadvantages. A mediocre student may need the training the activity offers, but the scholarship requirement being beyond his reach may exclude him entirely, or may entice him into a struggle of such intensity that to meet the requirement he brings upon himself mental or physical injury.

Chicago University presents definite rulings on eligibility for public appearance, including under public appearance not only contests, entertainments, and exhibitions for which an entrance fee is charged or prizes given, but also management of social affairs for which an entrance fee is paid, and official service on any publications for which a subscription price is asked. To be eligible for such public appearance a student must have full-admission credit, at least six majors of credit for resident classroom work of college grade with not less than nine grade points, must sustain his current work at an approved grade, must have a satisfactory health record, and be qualified, in the judgment of his Dean, to assume additional duties.

Point systems are used as means of control in many schools, especially in the large universities. These systems bear some variation but work on the same general plan. In the University of Wisconsin the Census Bureau maintains "a card catalogue, in which is recorded the name of every girl in the University, the office she holds, and the committees on which she is working." There is a rating of point values and a checking of point excesses. Upper classwomen are allowed sixteen points; lower classwomen, twelve. Major points in most colleges using the point system are the captains of the athletic and debating teams, the two editors and the business managers of the college publications, the presidents of the large associations, the chairmen of the committees in charge of the Junior Hop, the college circus, or affairs of equal importance. Minor points include the officers of classes, clubs, and lesser organizations. The University of Minnesota after many years of experimenting with a point system, has divided all activities into three classes, and allows a student only one position in the major activities designated first class, two in those of the second class, and any number in the third class.

In the best established point system, however, there is little or no control provided for those willing satellites who revolve about popular leaders, do their bidding, consume time and energy, and yet whose names do not appear to reveal the overwork which is being done. Thus all the iniquities of neglected classwork and broken health may result under the shadow of the best formulated point system, which does protect the leaders but cannot control the good-natured, willing, but unnamed assistants.

Many colleges rely with greater confidence upon special faculty advisers, one of whom is appointed for each activity. If an adviser is in close enough contact with the students to be regarded with confidence, he may not only mould general opinions but often influence the choice of group leaders, and, recognizing latent ability in the untried student, be able to bring him to a better opportunity.

Certain conditions and requirements in the colleges indirectly but forcefully control the extra-curricula activities. Business methods demanded by the college authorities have a salutary effect not only in training the managers of activities but in limiting the procedures. Among these methods required are a budget system for every organization, requisitions made out in duplicate or in triplicate for all purchases, moneys collected through authorized channels, and all financial accounts passed by an appointed auditor. The number of activities is limited also by the necessity of submitting constitutions for approval and sanction to the governing control, whether that control be the president, the faculty, or the student government association. Councils and congresses composed of the presidents of each activity form a controlling force which not only unifies the work of the activities but tacitly withholds unmeritorious organizations from forming. The "try outs" afford the natural selection of ability for plays, debates, oratorical contests, glee clubs, and other public entertainments.

The social activities, though difficult of adjustment, are when rightly guided of great value to the student body. These encroach most easily upon other college interests, monopolize the time and thought of certain students, and often overshadow worthy organizations. To keep the social activities within bounds and to guide them into the best channels require the constant vigilance and broad understanding of some director or supervising committee. This supervision and management is usually entrusted to the dean of women. A social committee may assist, college traditions may have established precedents to follow, but the advisory relation and the restricting force come from her office.

The formal social events tend yearly to greater financial expense and to more frequent recurrence. New social functions creep in, trivial social affairs multiply, later hours are requested, greater freedom is demanded. In the bewilderment of requests that come the dean finds a work constantly awaiting her attention. The importance to the welfare of students that these social affairs be freely but properly conducted, elegantly but inexpensively appointed, frequently but restrictively held, presents bewildering contradictions to confuse the wisest. In an age of hectic gaiety when half the world stands aghast at the daring social escapades of the other half, when the college is divided against itself in social observances, when cliques, fraternities, and clubs threaten to hold forever at variance college unity, it is supremely important that a faculty member who is in close sympathy with the student body as well as with the college policy be the authority on social concerns. Whether in the management of the social activities

the dean of women is chairman of a joint committee of faculty members and students, or whether she merely holds an advisory relation with a student committee, the control of the situation is in her hands. The restriction, license, or modification rests with her judgment, succeeds with her strength. In most schools she registers all social events in advance, the character of the event, time, place, chaperons, and estimated expense. She restricts these events to Friday and Saturday nights, or those preceding holidays. In some schools she submits her reports for approval to a board on organizations, or to the faculty itself. By such methods the details of the social activities are made to conform with the general policy of the college.

The extra-curricula activities are keeping pace with the Nationwide tendency for organization. While the brunt of the burden of control falls on the deans, and the social control almost universally on the dean of women, the importance of these activities in the lives of the students rewards the advisor for the time exacted. Different methods of limitation apply to different institutions, but certain principles apply to all. Scholarship requirements, try-outs, point systems, student boards of control, faculty commissions, and faculty advisers, all have been found useful. A combination of these methods, with emphasis on the personal interest, sympathy, and wisdom of the faculty adviser, is the most promising solution to the complex problem of the extra-curricula activities. These activities have come to stay. Though now in a transitional stage, they will settle back to a subordinate but acknowledged place, where, regulated by college authority and conducted by student enthusiasm, they will yield educational values in character formation and in applied wisdom.

STUDENT LEADERSHIP

LULU E. WIRT, DEAN OF WOMEN, NEBRASKA STATE TEACHERS COLLEGE,
KEARNEY, NEBRASKA

The trend of all lines of organization since the World War has been democratic. In the business, the political, and the religious life, every one has been thinking of the group, but the group cannot be developed unless someone leads the individuals in the group. Over-stressed leadership tends to autocracy; over-developed individualism leads to Bolshevism. The seeming balance is a democracy subject to control. In the governmental life of America, a directed democracy seems to be the ideal.

If such method of organization is needed in the religious and political life, why is it not more vital in the educational? All educational papers and journals are filled with suggestions that teachers organize in order to secure proper professional recognition. Why does this seem to be such a hard problem? Probably because we have been without any true leadership, since we have no representation in the Federal Government. We as

teachers have not sufficiently advertised education to make the public feel this great need.

What are the aims of an education? In the findings of a recent questionnaire it was learned that a liberal education ranked first, civic and social education second, character third, and leadership fourth. But we cannot develop civic and social education apart from leadership. The colleges have been giving most of the time to teaching instead of training; they have been giving time to the "what" instead of the "why" and "how." In teaching citizenship, we must emphasize leadership, since the true purpose of leadership is to develop the individuals in a democracy. One cannot be educated unless "led out," and in order to be "led out" some one must do the directing.

It is said that the university is the school of leadership, but when we investigate statistics and find that one per cent of the American people are college graduates, we recognize what a problem is before us. If the universities which have a four-year course have difficulty in producing a sufficient number of real leaders, how vital it is that normal schools and teachers' colleges pause for introspection and study carefully the principles of training leaders. Although the need of developing our students as leaders is recognized, yet very little attention has been given the idea by educational writers.

Student leadership means leaders in training—training for the solving of problems in the practical world. The characteristics of a student leader therefore should be those of the leader of any great organization. The characteristics of the great leaders of our past can be best classified in the terms personality, knowledge, and initiative. Often some phase of these qualities is inherited, but in many people these qualities would lie dormant if not drawn out by training.

Personality, the first characteristic of a leader, is the intangible something within which exerts an unspeakable power through a faithfulness and sympathy for others which is bound by no thought of self; it is the understanding which knocks at the doors of the most timid, enters with the keys of insight, tact, and helpfulness, and wins the good-will of all who follow.

Knowledge, the second characteristic, is the power to inspire confidence, to understand situations, or to meet any occasion be it intellectual or social. Members of any group will not follow one who does not show some superior quality. Absolute honesty in knowledge must be evident; a leader must stand on a rock foundation, not on bags of bluff.

Initiative is the third quality of a leader, for how is one to guide and direct even if he has knowledge and personality if he is not able to make these qualities effective. A leader must have a vision and then have the "pep" and "ginger" in power of organization to put across the ideas which he has conceived. There are many intellectual dreamers, who are not leaders, because they have no method of crossing the stream. A project cannot be put across or a group cannot be led unless the leader knows how to guide by being able to organize so well that he can subordinate his own

personality to the personality of others. The true leader's place is not above and in front, but behind and beneath. Men of influential position have failed in leadership, because they were always in front, while others in an unostentatious way have succeeded by developing their subordinates. It is said that a leader must be a scene shifter and not a star. True leadership means service. It is not a gift of fate, but a gift of "pay the price."

Agreeing that a trained leader should have personality, knowledge, and initiative, the problem is how are we to develop these characteristics. From a questionnaire we discover that few schools are making conscious efforts along the line as yet, although some schools believe that attention should be given in colleges to the advancing of superior ability. This has been a recognized part of the elementary and secondary education in the semi-annual promotions. If some attention is given in the earlier part of the course, there should be greater aid given in college life. What are the conscious or unconscious means of developing leadership? How can our colleges adjust their ideals, their curricula, and their methods to produce leaders. I think one of the greatest difficulties is that the faculty, either individually or as a unit, does not work to this goal. In the normal schools the students are usually so young, so inexperienced, so changing in personnel that opportunity is not given to accomplish results. Pupils in the grades and high school are so carefully directed that when they come to the college they are not ready to think or act for themselves. The faculty is usually so absorbed in their departments that they do not peer into the future and see the broad field of leading out the individuals in the group. For this reason some movement should be taken by the faculty toward advancing superior ability and finding hidden talent. It is just as important to know how to use knowledge as it is to gain it. Although normal schools stand for training, they seem to have overlooked the larger application of education in knowing how to develop true humanistic qualities of the individuals.

Another method of developing leaders is student self-government. Many normal schools report no form of self-government; others have student advisory councils, student executive committees, Men's Union, or a Women's League. Some report that they have had student government for two years with marked success. Others have a modified form, preferably called representative government. The principal advantages of student self-government as we find it in many able arguments, are to create a sense of responsibility and to apply the principle of learning by doing. It seems as every school progresses, there is some tendency toward student government, and whenever this movement comes through the call of the student body, it should be carefully fostered by the faculty. The schools are for the students, and they should look after all interests, subject to the control of the faculty. Student coöperation in school government develops high sense of responsibility for community affairs.

Besides the self-government associations for the development of leaders we have the extra-curricula activities. Each one of these should have as

its goal to develop the individual for the sake of the group. Among these clubs we have the departmental clubs, each of which attracts in interest different types of students. The various organizations train, of course, along the line of their major interest. The debating society appeals to the logical, the science to one adapted to research, the language clubs to those of literary turn, the dramatic to those of artistic nature. Each in its turn tends to develop leaders whose ability would be otherwise unsuspected. To these may be added the athletic clubs, the religious organizations, honor associations, the Women's League—all of which afford opportunity for talent hitherto undeveloped.

The main function of the extra-curricula life of the school is to train for future service. Officers of class organizations, chairmen of committees, and even membership on committees help to give confidence, and create an interest which will bring marked results. In making an estimate of the number of organizations in the schools, we find that the average is twenty. With four officers and the chairman of three committees we would be giving opportunity to about one hundred fifty persons for some leadership during a term. If the regulation for extra-curricula activities is well organized, either by the point or group system, so that there will be a rotation in office each term, a large number of the students will have some means of assuming responsibility. The tendency is to load down the student of proved ability rather than to try out new talent. Sponsors permit regulations to be overstepped and allow the natural leader to remain in charge either on account of following the line of least resistance or on account of aiding the progress of the club which will advance much better in the hands of the experienced leader. Teachers depend too much upon the seniors and give them all the honors. They undoubtedly do manage well, but when they are gone there is no one trained to start the new year. Responsibility should be best placed upon the juniors and the best underclassmen, in order that there may be good material for the succeeding year.

There are many other ways besides the self-government councils and extra-curricula activities which furnish training in leadership. The organization of the daily class on the principles of the elementary socialized recitation will accomplish much. Often there are class officers and leaders of special groups which have a definite problem to work out. Any of these methods of giving responsibility will add much to the regular work. The special attention and direction which a faculty member as adviser gives to a group of students assists much in helping a student to find himself and to know in what line he should develop. In some schools we have an excellent illustration of a conscious effort of developing leadership through an Open Forum, where a number of selected students conduct programs, these students being specially prepared to answer any questions which are asked by a student body. This is especially fine in taking up world problems.

Leadership is gained principally through practice, and in every way impression precedes expression. It is undoubtedly the experience of every

teacher that students do not usually assume responsibility, but depend too much upon their advisers to carry on their work. If the sponsor does not lead, nothing is done. For this reason, a member of the faculty should acquaint herself with the principles of true guidance. The chairman of a committee should be held responsible for a certain task in a group, but before she can be held responsible for this task, such as taking charge of a devotional committee of a Y. W. C. A., she must know what is the policy and the aim of the committee. Here as in teaching we must have direction or illustrative teaching. Sponsors should take part in making plans but not in carrying them out. Directions too often are vague and students fail to measure up. Faculty must give counsel but not take work out of students' hands. Before a girl can be held responsible for a task she must know exactly what it is. After a sponsor knows that a student understands the general plan of work, then all opportunity should be given her to develop her own ideas. If students are given free reign to accomplish a certain end, this desired end will be accomplished. Make the student responsible for fact and form, but give privileges and power only as fast as they can be assimilated. Contributions will increase in amount and ability as the student gains in age and experience. Trained leadership requires direction and sympathetic coöperation. College teachers should enter upon their careers because of the opportunity to develop leadership in young people, and thus render to society a great service. There is no more gratifying news to a faculty member than the report of the success of a graduate in any social or intellectual leadership.

Since there is such a growing tendency to measure all educational work by standard tests, one pauses to reflect upon a standard of measurement for student leadership. It should be judged by the people interested in the group, but one knows that it is hard to measure either the process or the ultimate products since in the mental and spiritual life there can be no ultimatum. Life is a growth, and growth is a continual process. A leader must grow with the world's progress. A most gratifying reward of a teacher is to watch a student grow physically, mentally, socially, and spiritually, and to know that she has had a part in that growth.

With the great change in world conditions, educators should realize that we are to develop the humanistic as well as the intellectual—which means a development in personality, culture, and leadership. Let us understand the characteristics of a great leader, then apply the many concrete ways of training these leaders. Then shall we see through our well-trained student leaders many changes in the social world.

RELATION OF THE DEAN OF WOMEN TO THE PROFESSIONAL LIFE OF THE STUDENT

MRS. BESSIE LEACH PRIDDY, DEAN OF WOMEN, MICHIGAN STATE NORMAL COLLEGE, YPSILANTI, MICHIGAN

It may be well to state in advance that inasmuch as this paper is written for a Normal School section of the Dean's Conference we are putting aside all thought that young women in our respective institutions may be preparing for other professions than teaching, excepting in so far as when we are compelled to seek the elimination of any students from our normal school. We may at those times necessarily look over the palings of our most sacred precincts and try to point our rejected ones to other vocations and professions.

In devoting our attention, then, exclusively to the topic of how deans of women may aid normal students in their professional life the question that naturally arises is, is teaching a profession? If we answer affirmatively for either the present or the future it will be necessary for us to define for ourselves just what we mean by a profession. "In a true profession the pursuit of gain is subordinated to the aim of service."¹ There can be no nobler thing to demand of man than that he have a constant, a sincere, and a dominating desire to serve society. If this is to be the first significant trait that entitles teaching to be classed as a profession we shall rest assured that we shall be scarcely able to find any other distinguishing characteristics so important as this thing of demanding that a man or woman be possessed of a consuming desire to have this world better for either having lived in it. But there are other very essential earmarks of a profession and probably to the ordinary mind the really distinguishing mark of a profession is the fact that in order to practice one it is necessary to acquire somewhat difficult technical knowledge not possessed by ordinary people and not at all necessary for them to acquire in order to be successful in unprofessional walks in life, knowledge, the benefits of which they are to receive through the agency of these same professional people. It goes without saying that this certain knowledge is presupposed to be actually and honestly and thoroughly acquired. Sometimes it is taken for granted that those acquiring it are especially talented. There is a corollary to this matter of the professional classes possessing a body of technical knowledge; the layman is necessarily entirely dependent upon the classes that possess it, he must put himself trustingly in their hands.

Then it follows as the night the day that there is the necessity of excluding the unfit from the ranks of the professional callings as well as the desirability of attracting to these ranks the highly suitable and superior. There is also the social recognition of the value and importance of the service rendered, this recognition coming formally through certain privileges and protections accorded by law to the various so-called professions

¹ Ross, Edward Alsworth, *Principles of Sociology*, p. 474.
Parts of the discussion of a profession also follow Ross.

and informally in certain intangible social attitudes unmistakably present when professional services are rendered. The truly professional in spirit are devoted to the welfare of their clients, placing the client's good before their own when once they have undertaken to serve him. Yet the highest professional attitude lies in considering the good of all society even before the good of the client.

People in truly professional attitude will often serve without pay or according to the ability of the client to pay, and they will neither laud themselves nor seek to sell their wares to the highest bidder, laboring always for love of the work and interest in the problem rather than for fame or wealth. Their service, too, will be none impaired because reward fails, nothing less than the best that is in them can they bring themselves to give.

We think of the one in a profession as having not only a certain loyalty to the client, to society, and to his own ideal of service, but we also expect him to have a certain fidelity to his co-workers, a certain pride in them, zeal for them, and even an enthusiasm not only for achieving with them but a capacity for suffering through their sufferings. And lastly we conceive of a profession as an institution that has, from within, established a code of ethics which although compatible with the best interests of society is none the less enforced from within its own group.

Just what services may be classed as professional perhaps none will agree. That many times people are able to maintain a professional attitude only in part is doubtless true. Society has long conceded the dignity of professions to law, medicine, and theology. When the art of politics has produced a statesman, we have the professional attitude in service to the State; when we study the mere politician, we perceive that he escapes being great by that margin which measures his failure to let the spirit of service dominate his activities. The architect, the public accountant, the artist, the editor, the poet, the dramatist, the novelist, even the banker, the merchant, or the maid may achieve the professional spirit but where gain becomes the objective, no matter what the nature of the work, the professional life is not created.

With this prelude in mind we can perhaps better answer the question propounded to us this afternoon—"How may we as deans of women in normal schools aid the students in their professional lives?" Let us consider first the characteristic of possessing a certain amount of technical knowledge, acquired through expenditure of money and time and effort and also perhaps by virtue of that indefinable something we call ability. The deans of women are certainly as yet somewhat limited in their power to influence this condition. Certainly their influence in the shaping of curricula is not large at present. Usually to them is given the *occasional* opportunity to advise with some student upon her selection of a course of study or upon her choice of subjects within the course. At the best these opportunities are haphazard and almost accidental. A surer but not altogether to-be-desired opportunity comes in periodic consultations with

failing students. Opportunity for suggestion at these times is not particularly promising, because here they are always dealing with the handicapped, the limited, the misfits, and yet right here if they can but get the time to prepare individual schedules and study each case as carefully as a social worker would her cases of dependency, delinquency, and the like, they may in time both systematize the methods of determining and treating certain types of problems and also be ready to aid students in attempting to obtain the particular kind of technical knowledge and develop the particular kind of skill for which their abilities and environment have fitted them.

That administrators in education have much of power to attract young people of superior ability into certain lines of work is of course recognized by all. Probably the nearer their own characters square to the ideals of personal worth, the greater will be their contribution in bringing others into the teaching profession. On the point of the power of the dean of women to raise the standards of our professional life by the elimination of the unfit doubtless many of us have most decided opinions. It is my personal feeling that so far as the women students of an institution are concerned a dean of women should have it within her power to eliminate objectionable young women from the campus, checked only by a review of the cases by a faculty committee, this committee acting only in an advisory capacity. If a woman is big enough to take the responsibility of the welfare of the women on her shoulders she certainly should be trusted enough to be allowed to eliminate the dangerous from the group for which she is responsible.

The statistics of the institution with which I am most familiar go to show that fully 90 per cent of the social problems on the campus come from the group of girls whose mentality by the army test measures below 110 points. Low mentality and faulty early home environment practically cover cases of grave social errors, and we would be furthering both the interests of the teaching profession and simplifying campus problems enormously if we could expeditiously subtract these people from the student body.

It is always an open question if people of low-grade mentality can do college work well enough to warrant expenditure of State money upon their education. Their fitness to enter the teaching profession is most doubtful, the economic waste of the process of trial and error is terrific, and the social menace accompanying the experiment is often unfair to the people with whom they are thrown in contact. Inasmuch as scholastic achievement quite markedly parallels the findings of the army test it would seem reasonable after applying said test to all freshmen to allow all those accepted under a certain grade to be placed on probation for one term only, to be dropped either for inability to do the work or for doubtful social standards.

The establishing among the women of an institution of the ideal of painstaking, accurate high-grade scholarship is no mean task for a dean

of women to set for herself. The trend of modern education has been utterly away from the emphasis on scholarship for scholarship's sake. The utilitarian value of subjects taught, the market value of skill attained, and results rather than methods have engrossed the thoughts of twentieth-century schoolmen. The pace of modern life has caught the whiz in transportation and the tum-tum of the jazz, and youth seems reeling in a hectic swirl, where joy is found in a high exhilaration of the senses, of which the sense of motion seems to be the most courted. Those quiet satisfactions that once came from appreciation of æsthetic values, from acquisition of intellectual comprehension and power, from speculation upon and interpretation of the everlasting meanings of human living seem no longer to be the objectives of education.

To an administrative woman would come the precious opportunity of finding and gathering about her souls still open to this sort of appeal if ever her work were standardized enough to leave her time and strength for such vitally constructive efforts. As the position of dean goes today, however, the time of the office is absorbed with the bad actors and the poor thinkers, with the problems that should be off the campus instead of on it, and the people of promise achieve, if achieve they must, with little of aid or attention, with even much of obstacle that should have been removed from their paths. Ability to eliminate would save muck-raking and increase building power.

Something of this spur to scholarship, however, the office of the Dean may apply to student group life by leading women's organizations to make formal recognition of scholarship achievements and by inspiring competitive spirit in regard to scholarship attainments. Scholarly attainment may be further promoted by the creation of a scholarly atmosphere through recommended lectures, available reading material, and type of social activity fostered. Devotion to truthful scholarship would certainly be a most valuable asset to furnish these young people as a preparation for professional life.

The helping a student to find the proper sphere in the teaching life is a task that sometimes comes to advisers of women. Girls find it absolutely necessary to change courses attempted. Self-supporting girls, girls out of peculiar environments and the children of immigrants all need our especial attention that they may find with as little waste as possible their places of greatest service. Today Finns, Poles, Russian Jews, and Italians are filtering into our normal schools, tomorrow it will be Czechs and Serbs and what not. Quite often one finds them filled with an earnest desire to so prepare as to be best able to go back home and teach their own people. What an opportunity is this to do real Americanization work, an opportunity sitting as it were on our own doorsteps and waiting to be embraced. In all these cases as with the special problems heretofore mentioned the special individual studies arranged in a card file with a regular social worker's schedule of the case under consideration will be found to be of great value. Such schedules should have blanks for in-

formation on home address, high-school record, church, parentage, age, nativity, data on pre-college experiences, college address, course, scholarship record in college, financial situation, social record, health, notes as to talents, ambitions, present plans, possibilities, and mentality. On the reverse of this card could be kept any post-college activities known so that as the years go by one will be able to measure, somewhat, precision of judgment in advising and efficacy of one or the other method of treatment of peculiar cases.

As to this biggest thing of all in the professional life of the teacher, the spirit of service, perhaps here is a golden opportunity for our ilk. Ethical and moral principles seem to be best taught when they are presented casually, occasionally, and unexpectedly. Advisers of women may by their own examples, by their formal talks to women's organizations, by communications to house groups and by individual work get over to the student body this very necessary ideal for the teaching profession and they may aid in many ways the development into the kind of woman that can really serve.

A teacher's service has two big general subdivisions, the service she renders to individuals and the service she gives to the community. A part of her service to individuals lies in her fitness to be an example to others of fit living, seemly looking, gentle acting, and high thinking. To learn the art of sane, well-balanced living while a college student is no mean or easy accomplishment in these modern days of ours, to lead the twentieth-century girl to dignified and demure adornment would indeed surprise the gods themselves, to obtain the well-modulated voice, the patient, loving kindness, the neighborly hand from one to another is of worth beyond computation, and she who can alter the standards of valuation for the next generation, who can lead the young to prize the things of the mind and the spirit, has indeed created treasure beyond compare.

The simplest matters of health and sanitation, of propriety in dress and manner, of seemly conduct in both business and leisure hours, of attitude of mind to companions, to youth, to age, to inferior and superior, all of these things enter into the preparation of our students for the teaching profession. Much of this must be obtained if obtained at all, from extra-curricula activities.

If once the prospective teacher fully absorbs the point of view that she is seeking the privilege of leading a life of personal example which many of the next generation will elect to follow, surely her spirit will be chastened and her manner tempered.

The revelation to the young people of a true teacher's place in community living is the crowning opportunity for all who now teach or administer. On the finding of this place rests the hope of future progress. One by one restraints and sanctions of authority seem to melt away and be disregarded. In this new freedom that seems recently to have been almost precipitated on us, in this utter absence of so many of the old restraining influences,

chaos and anarchy, destruction without reconstruction will surely come unless in the absence of other control, self-control be learned.

The art of teaching self-control may perhaps be placed as the real ultimate goal of the educator. On the basis of a desire for self-control rests our faith in all student self-government organizations. On account of our faith in being able to develop self-control we are keeping ourselves heartened for the future. From the ones who have learned the art of self-control the community life of this country must draw its leadership. Every community has a right to expect such leadership from its teaching body.

We were once a highly individualistic people. Pioneer condition, homogeneity of culture, ideal, race, and religion, the agricultural basis of our economic life all tended to emphasize the self-sufficiency of individual worth. Complex social life has come, heterogeneity of race, religion, culture, and ideal is upon us. Only as we succeed in developing self-conscious and ably lead community living here shall we be able to make survive those ideals we as a people prize.

It has been said that a Nation is a way of thinking upon fundamental social institutions. If there is an Americanism it is the sum total of American ideals of home, of church, of school, of business life, of State. Upon this profession of teaching rests the responsibility of perpetuating such ideals. If the preparation for this professional life is well guided, then the true mission of this professional life will be achieved. To be a guide in such preparation is indeed a sacred trust.

Department of Educational Publications

SECRETARY'S MINUTES

OFFICERS

President, GEORGE L. TOWNE, President of the University Publishing Company, Lincoln, Nebr.
Secretary, C. W. TABER, Western Manager of Lippincott & Co.....Chicago, Ill.

The meeting of the department was called to order promptly at 2 o'clock by J. W. Searson, professor of English of the University of Nebraska, who was asked by President Towne to express to the department his sincere regret at being prevented by the doctor's orders from attending the Boston meeting. Mr. Searson also expressed the regrets of Secretary Taber, who was prevented from attending meeting on account of important business.

On motion, J. W. Searson was unanimously requested to preside at the meeting and take the minutes of the proceedings. The following program was then carried out:

AFTER-WAR RECOVERY IN THE TEXTBOOK PUBLISHING BUSINESS—Charles H. Seaver, Manager of Educational Department, The Macmillan Company, New York, N. Y.

KEEPING PACE WITH NATION-WIDE DEMAND FOR REORGANIZATION OF ELEMENTARY-SCHOOL COURSE OF STUDY—Howard R. Driggs, Author and Lecturer, New York, N. Y.

DISCUSSION—Led by Charles Swain Thomas, Editor of Educational Department, The Atlantic Monthly Press, Boston, Mass.

SAFE ECONOMICS IN TEXTBOOK MAKING—George W. Ohler, Chicago Manager, The University Publishing Company, Chicago, Ill.

GENERAL DISCUSSIONS

At the business meeting following the program, the following officers were elected unanimously for the coming year: For president, George L. Towne, president of the University Publishing Company, Lincoln, Nebr.; for secretary, C. W. Taber, Western manager of Lippincott & Co., Chicago, Ill.

AFTER-WAR RECOVERY IN THE TEXTBOOK PUBLISHING BUSINESS

CHARLES H. SEAVER, MANAGER OF EDUCATIONAL DEPARTMENT,
THE MACMILLAN COMPANY, NEW YORK CITY

The effects of the war on the school-book business were not fully realized until after the war. During the first three years of the war, before American participation, the costs involved in the school-book business gradually rose. This was recognized here and there in certain small adjustments of prices, though publishers were slow in their appreciation of any change and

generally adhered to established prices of books already published. In 1917 and 1918 the rise in costs became more marked. Prices had to be adjusted all along the line, but the fetish of the pre-war as the normal was still cherished and adjustments sufficient to meet the realities of the situation were not ventured. The two years after the war was a precarious period for publishers of school books, already injured by their slowness to appreciate the tendencies of the times and not fortified against a day of trouble by anticipatory measures. All of us expected a speedy return to normalcy and thought we had weathered the worst storms. Then came the real effects of the war for us.

It is painful to open old wounds, to recite in detail the ills we suffered in those days. We tried to make bricks without straw—books without paper. Much wisdom was left unexpressed for lack of paper, and in those days paper was certainly more precious than wisdom. Compositors, electrotypers, printers, binders took vacations with exasperating indifference or worked with exasperating inefficiency. "A binder, a binder, my kingdom for a binder!" was the cry of many a publisher, and some nearly sacrificed their kingdoms. The labor turnover in offices also increased the publishers' distress. Stories are told of weird and wonderful bookkeeping and shipping. Authors whose manuscripts had been put in cold storage during the war now thought them well cured and wanted them published and marketed in spite of almost prohibitive conditions. High on a throne of royal state, dominating the school-book business, it seemed that Satan exalted sat.

Amid such difficulties and with costs 200 per cent greater than had prevailed before the war, we were expected to furnish for the schools, with usual promptness, books of unimpaired quality, at prices in many States and other communities fixed by contract or listing when another level of costs prevailed. We tried to obtain mercy or at least justice. We got some concessions. Many school men were sympathetic, but in general the laws as interpreted allowed no relief. Coöperation on the part of the publishers might have mitigated their common distress, but for various reasons general and whole-hearted coöperation seemed impossible. In one way or another, however, we all struggled through.

The years 1921 and 1922 have been years of recovery. The present situation offers several contrasts with the situation that has just been briefly described; five features of the situation may, perhaps, be worthy of mention.

- (1) Costs have been reduced to some extent and seem to be fairly well stabilized, at least in comparison with the day-by-day shifting costs of the few previous years. Manufacturing costs are probably about three fourths higher than in 1914 or 1915, but substantially lower than in 1919 and 1920. In manufacturing costs the element of labor has shown little change, but the efficiency of labor has improved; the element of materials, such as paper and cloth, has shown considerable change. Operating cost, working expense, overhead—whatever this necessary part of the cost of school books may be called—has not fallen to any large extent and seems unlikely to fall, though the enforced introspection and economy of the war

experience may have sometime brought about more efficient methods and abolished some wasteful practices. The principal elements, salaries and wages, cannot be reduced under present conditions. All who are sincerely and intelligently interested in education believe, I am sure, that the superintendent, the principal, and the teacher, the author and the publisher of textbooks, and the bookman, the missionary of new educational ideas, are all worthy of their hire. Our Salvation Army of the Gospel of Educational Progress, constituted by the organizations of school-book publishers, must be maintained to bring light into dark places, to make wise the simple, and to equalize educational opportunity.

(2) Although in every other industry increased costs were quickly reflected in increased prices, publishers of school books were slow to respond to the demands of new conditions, as has been noted, on account of the keen competition of the business, the variety and complexity of school-book legislation, and the general optimism that long prevailed. They made advances in prices only when ruin stared them in the face. When relief came, publishers generally charged off losses on stock manufactured at high costs and gave the public the benefit of prices fixed according to the new level of costs. Some publishers had survived the severe ordeal by such a narrow margin that they were unable to respond to new conditions so quickly as others; and others have so-called overhead expenses of a questionable character that require high prices; but in general there have been such reductions as the present level of costs justifies, showing that profiteering is not justly chargeable to this business. In every subject textbooks of the highest quality in content and manufacture can now be obtained at unquestionably reasonable prices, which are not likely to be substantially lowered in the near future.

(3) The market for school books, varying somewhat from year to year according to general business conditions though not in any direct relation, seems reasonably steady and not at all discouraging. A serious problem confronting boards of education is to meet increasing educational needs with limited taxing possibilities. But there must be provided, in one way or another, adequate school buildings, competent, well-trained teachers, and a sufficient supply of suitable textbooks. The cost of textbooks is such a trivial item in the total educational expenditure—probably about 2 per cent—that the publisher is not likely to be asked to abandon his efforts to keep American textbooks the best in the world or to be discouraged in his mission to incorporate in this form the steady advance in educational thought and practice for the increasing millions of children who pass through our schools.

(4) The term propaganda came into general use during the war. There was pro-German propaganda, pro-Ally propaganda, Government propaganda, peace propaganda, Democratic propaganda, Republican propaganda, Socialist propaganda, prohibition propaganda, Bolshevik propaganda, and so on in profusion. There was much silly talk along with useful agitation. For instance, I attended a schoolmasters' meeting in 1917

where a New York lawyer pointed out the terrible menace of a reader used in American schools. It contained a story in which Frederick the Great of Prussia appeared in a favorable light. If Greece and Italy had joined the enemy, what should we have done in those days to Homer's Iliad and to Caesar's Commentaries? School books were examined with high-power microscopes for words or phrases which, with or without their setting, might be construed as pro-German or anti-Allies, or pro-Socialist, or pro- or anti- something else. The habit of looking for propaganda in school books, or conversely of insisting that propaganda be placed in school books, has not yet reached pre-war proportions but is certainly waning. If any authors and publishers yielded to the pro-British propaganda of the war period to the extent of emphasizing the British side of the controversy that led to the American Revolution and depreciating the cause of the Revolutionists, they now confront an anti-British propaganda at least equally vigorous and most embarrassing. This is but one example of propaganda and counter-propaganda. With Vierecks, Stevensons, Forrests, and other professional propagandists busy earning their living in this interesting profession, what are the publishers to do? The temptation to aid and abet the agitators whenever our interest happens to lie that way is almost irresistible, but a vicious practice is thus encouraged and experience has already shown that those who applaud one inquisition may be the victims of the next. The temptation also to sacrifice truth and justice in weakly yielding to propaganda has been alluring to some authors and publishers. One is reminded of the candidate for a teaching position in a rural community who was asked by the examining trustee whether he taught that the earth was round or flat. He replied, "I am prepared to teach either, according to local sentiment." In regard to propaganda of the sorts I have mentioned, if authors and publishers steered a straight course, fairly considering all criticisms but trimming their sails to none of the current breezes that would blow them outside such a course, they would find their own interests and the interest of the school-book business and the interest of education, in the long run, best served.

(5) Schoolmen and bookmen whose experience gives them a good perspective, who can compare present conditions with those of fifteen or twenty or twenty-five years ago, have noted a real change in the relations of school-book business to the school world, in the ways and means of choosing textbooks and of securing the choice of them. The ideal of the choice of textbooks according to merit and the submission of them on the basis of their merit would exclude from competition the greater part of our textbooks and perhaps some publishers altogether, but yet it would allow some range to school authorities and publishers on account of disagreement among experts as to educational methods and the demand for progress through experimentation. While no such ideal, of course, is fully realizable, schoolmen and school-book publishers ought to join in keeping it before themselves and in prizing it as an ideal; ought to resent and to combat the scorning of it. School books are submitted and adopted by human

beings, it is true, rather than by disembodied intelligences. We might compare our minds even in this highly intelligent age to the old-fashioned houses that many of us knew in our youth. There is the parlor of reason, in which we take great pride but which we seldom enter, except on extraordinary occasions. There is the sitting-room, a sociable place where we spend much time in adjusting ourselves to our environments and entertaining our friends and acquaintances. There is the dining-room where we take in mental food and drink, nutritious and unnutritious, furnished by publishers, or by the N. E. A., or other sources. There is the bedroom where we rest, which some of us occupy almost continuously. There is the attic, where the outworn furniture, old clothes, and rubbish of our minds are stored. School books are sometimes offered and adopted in the parlor by a thoroughly rational process—a procedure found to be fairly possible under proper administration and, of course, highly desirable. More often these things are done in the sitting-room or dining-room in human and not altogether deplorable ways, with perhaps brief excursions to the parlor. Then, too, schoolmen may be mentally bed-ridden or somnolent and cannot be waked up, especially when publishers and bookmen are likewise disposed. Some also live so much in their mental attics that old prejudices rule them. But let us try earnestly at least to keep textbook adoptions from being made in the cellar. There may have been some reaction after the war—a little more license for the continuance or revival of practices that were gradually becoming outlawed in the school-book business; but in the long run, superintendents of schools, textbook commissions, and other school authorities still show increasing unwillingness to participate in or to countenance the prostitution of their positions and of their schools in this way. Moreover the standards of publishers in general have certainly risen within the past twenty-five years and most of them are more regardful than ever of the good repute of the school-book business.

In summary, we have put behind us our troubles and liquidated our losses of several disturbed and disturbing years. We face new conditions different from what prevailed before the war, in some respects worse, in most respects better. Significant features of our present situation, as I have mentioned, are the stabilizing of costs on a level below that of the war period but above that of the pre-war period; the adjustment of prices on a corresponding level; the steadiness of the school-book market; the gradual subsidence of propaganda affecting school books; and the persistence, even in a time of reaction and in spite of many exceptions, of high standards among schoolmen and bookmen as to the conduct of the school-book business. We all recognize and are studying the realities of today and should be fully conscious that the so-called war period has left permanent effects which we must take into our reckoning. The war was not a mere parenthesis, and pre-war conditions will, of course, never return. The old is not the normal. What is normal is change and development.

*KEEPING PACE WITH THE NATION-WIDE DEMAND FOR
REORGANIZATION OF ELEMENTARY
COURSE OF STUDY*

HOWARD R. DRIGGS, PROFESSOR OF ENGLISH, SCHOOL OF EDUCATION,
UNIVERSITY OF UTAH, SALT LAKE CITY, UTAH

A few winters ago a blizzard swept over New York, burying the city under several feet of snow, paralyzing surface traffic and keeping most folk at home for a few hours. When the storm finally subsided, the speaker, in company with a number of other dwellers in the "human filing cases," in trying to make his way to the nearest grocery store to replenish his larder, saw a rather interesting sight. Along the car track along Broadway were more than a thousand men all working with the same central purpose: They were digging out the life line. Beneath the snow and beneath the frozen ground was the electric wire. Until that was uncovered not a street car on that line could move a wheel.

What has this incident to do with textbook production? Nothing, except to serve as a kind of parable with which to illuminate the main point in this talk. In the frantic effort of publishers to keep pace with the times, within recent years our schools have been subjected to a blizzard of books. From the days of the old blue-backed speller we have rather suddenly leaped into a time when texts are being broadcasted over the country by the billions. It is a very grave question whether this storm of printed pages will not eventually stop the wheels of educational progress—if, in some measure, it has not already done so.

How, you ask. Principally in three ways: first, by substituting reading for thinking; second, by smothering the curriculum with hurriedly written, time-wasting texts; third, by piling up burdens on the school budget till it breaks.

Regarding the first point, there certainly would seem to be more dissipation than education in the ordinary reading of today. It consists for the large part of glancing at the headlines, fingering nervously through the magazines to see the pictures; or chasing through some popular novel to discover whether the Sheik, or some other hero, *finally* landed the prize.

As to school work, there is much of the same superficiality. From the old pioneer diet of the "Three R's," our course of study has developed into a Thanksgiving feast. The result is that pupils are nibbling of this and tasting of that and getting in most cases not a sound building up but mental dyspepsia. There is too much reading and too little thinking in our schools. Children are being flooded with printed matter. And worse still, familiarity is breeding contempt for books.

All of which brings us to the second vital point. Much of this disrespect for books comes from the books themselves. In the mad race to keep up with recent kaleidoscopic changes in education, publishers have been pouring out a multiplicity of "half-baked" books. These thoughtlessly

prepared, unteachable texts have been thrust upon the schools to the distress of teachers and pupils alike. The result has been a deplorable waste not only of teaching and study effort, but of school funds.

And this brings us to the third point. In face of the serious financial stringency through which our schools are now passing this question must be faced fearlessly. To what extent is this stringency caused by wasteful methods in textbook making and book buying?

Publishers, as well as teachers, are most vitally concerned in the answer to this question. They are even more deeply interested in the solution of another question which naturally springs out of the one just propounded: What practical measures can be taken to prevent the production of ill-prepared, unteachable texts?

The temptation is strong right here to propose a ten-year-textbook holiday to dig out the life lines. Such a daring suggestion might seriously shock the hopes of a few million textbook bees that have been started buzzing 'round various heads by bookmen, over anxious to win adoptions, but there are certain folk who would give it a hearty welcome. The holiday would offer to a host of buried editors an opportunity to dig out; it would give authors a chance to think before they write; and it would enable some big men to read through the book with a little more care before they allow their names to go on the cover thereof as co-authors of the product.

But setting aside the suggestion of a textbook recess as impracticable, if not undesirable, let us face a few suggestions that may offer a practical way to protect both the publisher and the public from poorly prepared texts and at the same time keep our schools moving along the life lines of real progress.

Textbooks we must have. Only the very best are good enough. It may be to get these we must still continue to go through the wasteful process of fiercely competitive selection, which results too often not in "the survival of the fittest" but rather in the selection of those with the best political pull. But our hope is that real merit will come eventually to its own. And to further such merit we propose for consideration the following protective preliminary requirements:

1. "Camouflaged texts" are hereby taboo—the real author's name must hereafter appear on the cover.

2. "Tangent texts" are likewise to be given little or no consideration. The book must fit sensibly into the course of study.

3. Duplication of subject matter under new headings is not to be allowed. Each new line of work must stand on its own ground.

4. Authors are to be asked to submit with all texts for children answers to their own questions, and to work out the exercises they propose. And further to stand ready to demonstrate the practicability of the lessons.

5. Texts must be written in clear, correct, concise, and stimulating English.

If some such requirements as these were made, the result would be a

"scrapping" of thousands of useless texts that now burden our schools and a protection of defenseless teachers and pupils against the blizzard of poorly prepared books that are robbing us not only of money but time and the truest educational training.

In a word, it is my feeling that the best way to keep pace with the present mad chase is to set a new, more sensible pace by demanding greater care in the publications prepared for our schools.

DISCUSSION OF MR. DRIGGS' TALK ON KEEPING PACE WITH THE REORGANIZATION OF ELEMENTARY EDUCATION

CHARLES SWAIN THOMAS, EDITOR OF THE EDUCATIONAL DEPARTMENT,
THE ATLANTIC MONTHLY PRESS, BOSTON, MASSACHUSETTS

In contemplating the changes that have taken place in the making of American textbooks during the past years, it is interesting to note the emphasis that has been placed upon what I shall call four different notes: (1) The individual note; (2) the inspirational and interpretative note; (3) the human note; and (4) the æsthetic note.

The individual note—Perhaps if there has been one consideration that has dominated all others in American education during the last twenty years, it is the consideration that has been given to the individual pupil. We have seen the errors that result when we have tried to educate children in large unwieldy groups. There was a tendency in the past to think of these in a collective way, and to ignore the peculiarities of the especially bright or the especially dull child. A teacher was satisfied if there was secured at the end of the term a reasonable level of efficiency.

In the best of our schools that tendency is no longer observable. We give consideration to the students of exceptional ability, and to those whose mental growth has been unfortunately retarded. We have even in many schools abandoned our emphasis upon class instruction, and have made it center upon individual instruction. We have adopted both here in America and England what has come to be known as the Dalton Plan. By this plan a comparatively few number of recitations are held. Pupils are given the individual assignment of work for an entire week, or an entire month, in all the branches studied. The time in which this work may be done and the way in which it may be done is left to the individual pupils. If he wishes he may complete all his arithmetic work in a single day, and allow the work in language to lapse until the end of the week or the end of the month. He is held to the strict accomplishment of the total task, but left large freedom for the execution of the particular task. Always he is encouraged to seek the personal aid which their instructor in conference may give.

Emphasis upon this type of instruction guides the textbook editor in his method of procedure. He sees the work being done, not in class groups,

but by the individual pupil. The editor is naturally a little more careful to see that his instruction is so clear that the dullest may understand, and at the same time, so comprehensive in scope that the brightest may be properly incited to higher attainment. The editor, as well as the teacher, is looking to the fullest possible development of the individual.

The inspirational and interpretative note—Another tendency in textbook making and in school instruction is seen in the emphasis that has been placed upon what I have called the inspirational and interpretative note. We have come to recognize the fact that education does not consist so much in the accumulation of a mass of data as it does in the arousal of the spirit. We shall always recognize the value of information, and we shall place proper stress upon the mastery of technical details and care in such important essentials as spelling, punctuation, and grammatical form; but in all our instruction, particularly in our language work and particularly in literature, we shall be concerned in the interpretation of the spirit of the selection. We shall try to make the student feel that he should, so far as possible, come into co-incident thinking and co-incident feeling with the author. To do this with poets of high merit is difficult, but it should, nevertheless, be the constant aim of the reader. Only by such an endeavor can we really come to understand the deeper thought and the higher spiritual note of any given author.

In particular ways, moreover, the teacher and the editor can be of constant help. Mere abstractions can be explained by the means of many concrete illustrations. The character of an individual in fiction can be interpreted by his likeness to or his difference with certain individuals in our own acquaintance or within the acquaintance of the group to which we make our appeal. A description of some particular landscape in England may, by a teacher and editor, be made clearer by bringing to the attention of the readers similar well-known scenes in the United States. Political events and movements of one country may be explained by reference to political events and movements in another country. The method of contrast and comparison will constantly be used, and the message be made clearer by such practice. An endeavor to make the thought clear and at the same time to fire the enthusiasm and inspire the spirit of the pupil, will be the constant aim.

The human note—We have made, particularly in our geographical texts, tremendous progress in the human appeal. We are no longer satisfied with such bare and sterile demands as "Bound Kentucky." We wish to inspire our pupils to acquire acquaintanceship with the boys and girls and the men and women of Kentucky. We lead them through various States and see conditions in various parts of the country, in the cities, in the rural districts, at home and abroad—everywhere we strive to make ourselves, in imagination at least, cosmopolites. We throw emphasis upon the men at work and try to understand something of their feelings in the shop, or on the farm, or in the home. We try to get away from mere figures, and maps, and plans, and allow full scope for the imagination as it manifests itself in human, intimate ways.

The æsthetic note—A contrast of the study of the textbooks of many of our foreign countries reveals the emphasis that we are placing upon the format of the book, the type that we use, the illustrations that we insert, the binding selected—all these are recognized elements in present-day American education.

It has recently been my privilege to spend three or four months in visiting English schools. While I have recognized in certain directions superior qualities in British instruction, I have been pleased to note the superiority of American texts, particularly in this manner of æsthetic appeal. While we are striving to make our books attractive to the child, we are not unmindful of a permanent æsthetic base in our schoolroom instruction. We try to introduce more comfortable and warmer effects. We are not satisfied that our æsthetic temperature should be low and frigid in textbook-making as it is low and frigid in English schoolrooms.

Much remains to be accomplished in this line in America. Competition is keen, and school boards are crying out for economies. Some publishers have yielded to this cry and have used a poor quality of paper, poor style of type, and cheap and unattractive bindings, but these are becoming rare, and reputable publishers refuse to compete for business that must be secured at such a sacrifice.

As we review all these tendencies in American textbook-making, we believe we are justified in the assertion that those engaged in the editorial and in the manufacturing departments are dominated by an ideal that is already high. As the results in these four directions that I have enumerated become more apparently perceived by American parents and teachers we believe that provision will be made for a constantly increasing elevation of standards. There will be the recognition that the child in his formative periods shall not be sacrificed; that he shall, on the other hand, in these earlier years, receive sound training along all those lines that make for firmer and firmer intellectual and spiritual integration. We shall, as teachers and publishers ourselves strive for greater success along these lines and perhaps some day—

The tasks in hours of insight willed
Can be through hours of gloom fulfilled.

SAFE ECONOMIES CONSISTENT WITH IMPROVED STANDARDS OF TEXTBOOK MAKING

GEORGE W. OHLER, CHICAGO MANAGER, THE UNIVERSITY PUBLISHING
COMPANY, CHICAGO, ILLINOIS

When our president sent me a copy of his program for this meeting and requested that I discuss the question assigned me, I was tempted to decline the honor, but on second thought remembered that I had always urged closer coöperation among publishers and because of this stand could hardly

refuse to help, if by my help better trade conditions might be brought about in our industry. I have attended a number of these programs and I know the tendency of hard-boiled publishers to find holes in suggestions made and to criticize the papers read, but since I have criticized your papers as well as enjoyed them it is only fair that I take my part of the load.

No paper gets far these days without discussing present economic conditions and in order to keep in step I shall briefly mention some things which are of common knowledge and concern to us as publishers. General business conditions are slowly growing better. Compared with other industries, I am inclined to think that during the last few years we, as a whole, have enjoyed far better than average prosperity. Business has held up remarkably well if reports of our sales are correct, and no doubt they are. The past year has shown beyond all question of doubt the stability and soundness of the textbook business, since in time of great general business depression it has increased in volume of sales and today shows fine prospects for a continuance of good business. During this period of stress we have had no financial failures so far as I am informed. Surely, we must recognize the honesty, good business sense, and strength of an industry which holds so fine a record.

Today we find war-time manufacturing costs a thing of the past. Paper costs, labor costs, because of increased production, practically everything that enters into the manufacturing end of our business is considerably reduced from the peak prices of 1920. Unfortunately, selling and overhead costs have not immediately reflected the same decreases and I doubt if ever these items will be greatly reduced. School officials are not likely to expect sharp reductions at once in our selling prices. While we cannot ask them to make up the losses we have suffered by reason of pernicious textbook legislation and by our failures to use good ordinary business judgment in adjusting our prices soon enough to meet changed conditions, we must insist upon the right to adjust ourselves to meet the present situation and price our product in accordance with present manufacturing, selling, overhead, and other legitimate expenses. In our endeavor to meet our customers' fair demands we must base our prices on known costs without paying undue attention to our competitors' price lists. The selling and overhead expenses vary considerably between houses, and it seems to me only good business for each house to face its problem individually and price its publications to make a reasonable business profit regardless of what the other fellow may see fit to do with his prices.

To make the most of our present opportunity, we must recognize certain clearly defined fundamentals which have to do with textbook making. We might group these under the heads of service and sound business policies, which certainly embrace safe economies. Service, as I view it, spells forward-looking textbooks, superior authorship, and selling prices high enough to insure these. The book which is not better than others in its field and which has no special reason for its existence other than to create sales, certainly does not fit into a policy of safe economies. Such publications demand heavy selling campaigns and at best cannot command big sales.

Their lives are limited to a few years and seldom do they bring satisfactory returns. Most of them were brought out to enable publishers to add to their lists so that they might go after business in more subjects, rather than because the books were of outstanding worth and fitted to serve better than others the places for which they were intended. We all can remember the experiences of many concerns which almost over night sprang into the field with long lists of books and with a determination apparently to make these lists complete in the shortest time possible. We all know the period of adjustment through which these concerns had to go before they found themselves with shorter lists, most of which represented new material quite foreign to the books with which they had started and with a cavity in their resources almost equal in size to that of Mammoth Cave.

Books should be built right for long life and long sales if big returns are expected. Not many books for a period of ten years live vigorous lives that bring increasing sales as the years go on. You can count them without employing an adding machine to help you. Most of us owe our beginnings and such success as we enjoy to this type of book. Their sales won us friends, because they were so made that sales and services were one and the same. Certainly improved standards in textbook-making mean that we must hold closely to the policy of selecting books for publication that are outstanding, books that fit into their proper places better than any other yet produced, books that are sure to have long and steady sales, and books that make friends through service.

Certain economies in harmony with the above standards can be practiced. First in importance is the selection of authorship which offers the finest type of constructive new material and long-time coöperation. A large per cent of the long-time costs of textbook-making is due to poor guesses as to the authors and their willingness and ability to coöperate. Rapid change of authors has the virtue of bringing in new life and new material occasionally, but the right choice of outstanding authors with bigger vision would accomplish the same results with far less cost. Every author has to be developed and it costs a great deal less editorially and commercially to develop him to a satisfactory degree. The overhead of editing and developing authors is reported to be as high as 40 per cent in instances where the best editorial safeguards are placed about the new text. It would be better to spend a bit more money in discovering what books not to publish than to spend so much on books having a temporary life and questionable educational influence. The day of wild-cat publishing is over. Temporary profits and the speculation in texts, which have but temporary or local appeal, should be passed at once.

Again, we must keep the right book growing to meet changing needs instead of wild-cattling in new books of questionable merit. To do this we must keep alive the author's interest in this production. It is seldom advisable to purchase outright his right to share in royalties. To keep the book alive to changing conditions the publisher must make revisions from time to time. No one can coöperate so well in this as the creator of the book. If his rights to participate in the earnings have been disposed of,

his real interest in his book and his desire to perpetuate its influence are greatly lessened and any work he may perform in its revision is likely to be half-heartedly done. If the right type of author is selected, his financial rights in the book secured, and the right encouragement from the publisher is given, he will be anxious to coöperate with the publisher to help make the book grow up to fullness of stature and usefulness.

To continue our program of economy we must make books right mechanically. The very best illustrations which add to the content should be used. Color used should be selected and applied with artistic care. Gaudy, grotesque, or inharmoniously colored illustrations may temporarily attract buyers but in the end will displease the teacher and the child. The wise publisher will use color only when by so doing he adds distinctly to the interpretative power of the illustration as well as to its artistic value. Color without purpose other than to make pretty pictures temporarily to attract buyers should be avoided. It costs too much and fails to fulfill its real mission. The most legible print, right line lengths, right spacing, right care in securing durable bindings, and the like are in the end most economical, because they give satisfaction to the user and in turn become the best advertisers for the product. Satisfied customers are always our best advertisers.

Furthermore we must consider ourselves as exponents of the highest type of bookmaking and as such we certainly cannot find room in our publications for the advertising of food products, soap, perfume, and stock feed. These products may be of superior merit in their respective places but it takes a far flight of fancy to imagine that they have any slight connection with textbook making. If we as publishers expect to have the school people of the country show us the respect and honor we crave and have a right to receive from them, then we in turn must keep ourselves on a plane that warrants such regard. If we cannot finance, manufacture, and market our publications without calling upon foreign industries to help through advertising in our product, then we are not necessary to the school. Textbook publishers should leave to the newspapers and magazines the field of advertising which they have covered better than other agencies. If we serve the school well and offer a necessary service without which education would be crippled, then we have a right to ask a price for such service sufficient to maintain our business with dignity and profit without help from outside sources.

Since my discussion has to do with the making of textbooks only, I shall not attempt to deal lengthily with the selling end. We all know the troubles that beset us there. The exchange problem, the abuse of the sample copy privilege, and the "onrush of the book grafters" represent only a few of them. Until we get the business foresight necessary to coöperate in a trade organization for the mutual benefit of publishers and customers we can scarcely hope to get the relief we need. Until we determine to coöperate, even just a few of us, along such lines as we can agree upon, letting others come into our organization or stay out as they may elect,

just so long will we fail to carry over into the selling and distributing end of our business a few sales economies which certainly are in harmony and consistent with approved standards in the textbook selling.

To sum up, I have endeavored to show that wise economies are possible in textbook-making only through expert business and professional care. The books must be built right for long sales, life, and service. The authors' interests must be kept one with the publishers' interests. Then, right books made right mechanically may be kept growing through effective coöperation. Advertising should be excluded from textbooks and left to newspapers, magazines, and other legitimate mediums. The publishers themselves should coöperate in a friendly way to reduce unnecessary competition. With all these economies practised the customer may be assured that his children may have the highest class textbook available at the lowest cost.

Department of Elementary Education

SECRETARY'S MINUTES

OFFICERS

President—MARY E. LAWLER, Principal of School No. 12.....Paterson, New Jersey
Secretary—BESSIE BACON GOODRICH, Director of Elementary Education....Des Moines, Iowa

FIRST SESSION—Wednesday Afternoon, July 5, 1922

This was a joint session of the departments of Classroom Teachers, Elementary Education, Elementary School Principals, Kindergarten Education, and the National Conference on Educational Method. The meeting was called to order by Miss Mary E. Lawler, president of the Department of Elementary Education. The following program was presented:

The Mental Health of Young Children—J. Mace Address, Head of Department of Psychology and Child Study, Boston Normal School, Boston, Mass.

Present-day Tendencies in Education and their Relation to the Kindergarten and Primary Departments—Eugene R. Smith, Headmaster of Park School, Baltimore, Md.

The Adjustment of Elementary Education to the Project Method—James F. Hosis, Teachers College, Columbia University, New York, N. Y.

The Needs of Young Children in Rural Schools—Mrs. Katherine R. Cook, Specialist in Rural Education, U. S. Bureau of Education, Washington, D. C.

The Value of the National Education Association to the Classroom Teacher—Agnes S. Winn, Assistant Secretary, National Education Association, Washington, D. C.

SECOND SESSION—Friday Afternoon, July 7, 1922

At the second session of the Department of Elementary Education, held Friday afternoon, July 7, Dr. A. E. Winship, editor of the *Journal of Education*, gave a splendid talk on "New Elementary Hopes and Fears" wherein he showed the progress of elementary education and expressed his hopes for its future. He especially stressed the fact that good teachers should not be too anxious to enter the special field in educational work.

Dean Henry W. Holmes, of the Graduate School of Education at Howard University, spoke on "The General Philosophy of Grading and Promotion in Relation to Intelligence Testing," making a number of valuable suggestions with regard to the use of tests.

Dr. M. B. Hillegas, Teachers College, Columbia University, New York City, spoke on the "Intelligence and Standard Tests as a Supplement to the Teacher's Judgment," emphasizing the fact that intelligence tests should be a means to the end.

The topic "Measuring the Capacity of Pupils and the Efficiency of Schools" was ably discussed by Mr. Lincoln Owen, principal of the Rice School, Boston, Mass.

Miss Harriet M. Barthelmess, Department of Elementary Education, Teachers College, New York City, talked on "The Contributions of Measurement to Education."

Ira A. Flinner, Headmaster, Huntington School, Boston, Massachusetts, illustrated his talk on "Rating Students on the Basis of Native Capacity and Accomplishment" with a number of well-arranged charts.

Miss Florence Holbrook, Forestville School, Chicago, Illinois, had as her topic "The Value of Tests" but in her talk she stated that, until teachers were given classes with fewer pupils, tests should not be used as a criteria of judgment.

Miss Myra L. Snow, ex-president of the Seattle Grade Teachers' Club, Seattle, Washington, spoke on "Coöperation Between Civic Organizations and School Authorities." Miss Snow was well qualified to speak on this subject since the Seattle Chamber of Commerce had paid the expenses of two delegates from Seattle to the N. E. A. convention, because of assistance rendered by the teachers in advancing the Chamber's project, an exhibit of the Northwest products.

At the close of the professional part of the program, Miss Marjorie Moody sang a group of songs, from Miss Jean M. Loughbridge's "Fifty Rote Songs for Little Singers."

THE MENTAL HEALTH OF YOUNG CHILDREN

J. MACE ANDRESS, HEAD OF THE DEPARTMENT OF PSYCHOLOGY, BOSTON
NORMAL SCHOOL, BOSTON, MASSACHUSETTS

One of the most significant educational movements of our time is the increasing attention to the health of children. It is a natural sequel to the long chain of brilliant discoveries beginning with Pasteur and Lister and the remarkable achievements in sanitary engineering. We once had the belief that the great battle for health could be brought to a successful conclusion through the improvement of environment and the prevention of disease infections. This belief has not been justified. The recent revelations in connection with malnutrition, for example, show the need of additional methods to promote the vigorous health of our children.

We have now entered a new epoch in health education and control. *It is a period of realization that the training of the individual is of tremendous worth.* Sanitary science may provide pure water and milk, but one of the great needs of the present is to teach both children and adults to drink the pure water and milk provided. A campaign for the inculcation of health habits has now been inaugurated. The U. S. Bureau of Education, the Child Health Organization of America, the National Tuberculosis Association, and many other National organizations have so popularized training

in health habits that it is no exaggeration to say that no problem has been attacked with more originality and vigor in the last few years. Teaching health habits has now become a vital part of the curriculum of many of our public schools.

The health habits now taught, however, relate almost exclusively to the physical welfare of the child. There is an obvious neglect of training in those habits that insure mental health. Here is a virgin field for parents and teachers comparable in its importance to the one which is now making its dramatic appeal to teachers and children. Such training is now known to be necessary to prevent insanity and nervous disorder.

The recent war shed much light on this whole problem. Statistics show that 72,000 men were rejected from our draft army because of mental disease. In the British army one soldier in five was discharged because of functional nervous disorder. In our own country today one in every three of our disabled service men in hospitals is a neuro-psychiatric patient. The draft and world war not only showed the shocking prevalence of mental disturbance but also the effectiveness of measures of prevention and cure.

In peace we notice that the number of patients in our mental hospitals is about equal to those in all other hospitals. About 200,000 new patients enter every year. They represent a tremendous expense to the State. However, all authorities agree that our hospital facilities for mental patients are quite inadequate. Besides the more serious disorders requiring institutional treatment there are minor ones called nervousness and nervous breakdown which entail great economic loss and suffering. In addition we have nervous and behavior disorders leading to juvenile delinquency and twists of character.

The thoughtful student of mental disorder must be appalled by the situation today. The thousands of individuals who will find their way this year into mental hospitals or develop nervousness and mental breakdown have with very few exceptions passed through our public and private schools without any recognition of the signs of mental disorder or without any steps being taken to prevent a personal tragedy. Both parents and teachers need to recognize the signs of mental disturbance, but it is even more necessary that they should know how to deal with children so as to prevent the appearance of any such symptoms.

Fortunately prevention is both possible and practical. Dr. Riggs in a recent article says that "Simply through applying a little of the knowledge formulated by mental hygiene, a great many, probably all, cases of nervous breakdown could be prevented." Authorities differ as to the amount of

The present situation is a challenge to our schools, particularly to our kindergartens and elementary schools; it is in early childhood that many pernicious mental habits are formed which later on in adult life result in nervous disorder. How important it is then that children in the very beginning of school life should be trained to meet life in the right way. While heredity is very important normal children with a good inheritance may become mentally unbalanced through bad training. It is only by

inculcating good mental habits that children will develop strong and wholesome personalities capable of adjustment to an increasingly complex civilization.

Many of the mental habits which mental hygiene would have established seem commonplace, but those who have come in contact with the mentally unbalanced and have had a hand in their reëducation back to sanity appreciate their significance.

Before considering those habits which are primarily mental let us notice the importance for mental health of the cultivation of those habits which relate more specifically to the physical health. It is an obvious principle of psychology and physiology, although frequently disregarded, that conditions of mind affect the body and conditions of body affect the mind. Every teacher should keep this principle in mind: A healthy mind makes for a healthy body. The literature of mental hygiene is filled with proofs of mental disorder carrying in its train abnormal physical conditions. Individuals who shrink from meeting the real facts of life in their failure take refuge in a neurosis with symptoms of physical illness. We all know that even a cold or some other minor disability clouds our mental horizon. It is evident that the health habits that are now being stressed in our schools—habits such as playing in the open air, cleanliness, drinking plenty of milk but avoiding tea and coffee, eating fruit and green vegetables, long hours of sleep, and daily elimination—help to make the body strong and vigorous and thus promote healthful states of mind. One of the habits which is now being stressed in nutrition classes, but should be emphasized with all children, is that of taking a few hours every day for thorough relaxation and rest. This habit if established in childhood and carried on into adult life will tend to prevent fatigue psychoses and help in the cultivation of a sense of leisure so badly needed to withstand the strain of modern life.

What is not generally recognized by parents and teachers today is that the persistent resistance of certain children in forming food and sleep habits may be a sign of nervous disorder and should be treated as such.

In a discussion of some of the distinctive mental habits which little children should form it should be borne in mind that these habits are essential at every age. Great effort should be made to have them formed in early childhood, however, because this period is characterized by great plasticity. At no time can they be learned with such ease. This early period is also a danger period when vicious mental habits may fasten themselves on children unless good mental habits are fostered.

A brief review of some of the more important mental habits for normal children now follows:

Meeting reality squarely—This is a statement of a very general attitude which is involved in every mental habit to be discussed. Reality in the sense in which it is used here refers to everything in the world to which the individual is called upon to make adjustments. In a broad way it includes one's environment of people and things. The most pernicious of

mental habits is that of dodging reality. The little child soon realizes that crying will often lead to satisfying the sensations of hunger. Later he may discover quite unconsciously that an attack of tantrums will also help him to avoid something disagreeable. He dominates the household and imposes his will not merely in situations relating to food but in all other situations which he wishes to avoid. An indirect rather than a direct way is found to gain his ends. A vicious habit of mind is formed. He becomes a fussy and nervous child. All this happens because the parents are likely to have mistaken ideas of sympathy; they lack insight and courage to train the child to meet reality directly and successfully. The nervous child answering this description needs to cultivate better habits of adaptation to life. With such a child the teacher can do very little without the coöperation of the home. It is in just such situations that we need psychopathic nurses or psychiatric social workers to visit homes and help to reëducate the parents so that a child's home program may be revised. Every school system needs also among its regular school physicians one or more physicians who are skilled mental hygienists.

Every teacher may do something to encourage children to attack a problem squarely and carry it through to a successful conclusion. The child that attempts to do something and finds it much more difficult than he expected, who tries to avoid it by shallow excuses, needs to be inspired to carry on until he succeeds. He can be shown in this way that the reasons he gave for not continuing his efforts were unsound. Children when they are beaten at a game or a contest are likely to develop grudges and grouchiness. Instead of trying to discover just why they failed they are likely to give irrelevant excuses, such as being tired, sick, or perhaps younger than their competitors. The spirit of good sportsmanship needs to be encouraged. Admiration for the good player and the play should be stimulated. The loser should be inspired to profit from his mistakes and the victory of others. To teach children to lose gracefully without ill-will should be the aim of every good teacher.

Expecting and achieving success—Success is one of the necessities of healthful living. It takes the sting out of worry and makes life happy and efficient. Habitual failure leads to depression and a morbid state of mind with accompanying nervous disorder.

One of the most caustic criticisms to be made of our schools is their inculcation of habits of failure. This is the result in part of a discredited pedagogy which emphasizes the teaching of subjects rather than children, but it is probably due largely to the teacher's ignorance of the varying abilities of children. If the teacher really knew that certain pupils were unable to do certain kinds of work she would not attempt the impossible; she would teach those children what they could learn and that would mean some measure of success. The development of educational measurement offers alluring possibilities in helping us to teach children what they can learn. A thorough physical and mental examination of children at school

entrance should be encouraged. It will enable teachers to know much more about the material with which they must work.

In the more perfect school system of the future we may hope that failures will be so uncommon that they will be reduced to a vanishing point. This does not mean that every boy and girl will be successful in graduating from grammar school, high school, or college. It means that we may know so much about children's abilities that they be directed into those fields where they will be successful.

One of the first essentials of mental health is this: An individual must retain respect for himself. He has a most insistent craving for the approbation and respect of others and for a certain amount of superiority over them. His own life must seem to him to be worth while. It requires but little reflection to realize this. Recall how sensitive you are to slights and how depressing often a slight failure is to all of us. But witness also the intoxication of success. Many of us can trace the larger successes of life back to the minor ones of childhood. While a certain amount of failure is desirable, particularly if used as a stepping-stone to achievement, habitual failure is a crime. The child meeting with habitual failure is bound to retain his self-respect through the bypaths of physical disability or possibly by becoming a delinquent.

Those of us who lived through the experiences of the World War know how important morale was considered. We strove to undermine it among our enemies and by the most skillful methods we endeavored to get our soldiers and civilians to expect and achieve success. If morale is so important for armies how important it is for the great army of boys and girls in fighting the battles of life.

Effective action in the face of difficulties—When a disagreeable situation presents itself the natural tendency is to run away from it, to deny that it exists, to worry about it and finally perhaps to build up defense mechanisms of delinquency, nervousness, and physical disability. None of these reactions make for effective living. The difficult situation still remains and the method of response only makes the situation worse. Instead of fleeing instinctively from danger it is better from the point of view of mental hygiene to face and attack the danger.

In dealing with little children we should try to realize that their little problems are often as acute, if not more so, than our own and that it is very important that they should be taught to solve them in a satisfactory way. Training children to make clear cut decisions and act in difficult situations eliminates the feeling of helplessness, reduces fear, and repels worry. Encouraging children to do their best and to abide cheerfully by the consequences is of tremendous worth in furthering a happy childhood and in the prevention of nervous breakdown in later life.

Self-expression—The nervous breakdowns of adolescence and later life are never due to hard work. It is the conflict between doing what one feels that he must do and doing the thing that he would like to do that saps one's vitality and disturbs mental balance. No better example of

healthful mental activity can probably be found than in the life of Thomas Edison, whose indefatigable and fruitful application is a marvel to the world. He has found an adequate expression of himself in his work.

Fortunately the kindergarten was a pioneer in the field of self-expression and now both kindergarten and elementary schools are fairly well launched on this new adventure of projects and free work which promises much for mental health and education.

Self-control—Giving children a chance to express their instinctive life through wholesome, habitual activities leads also to self-control without which the individual is helpless in the mastery of self or the world. Lack of self-control means that there is a break between one's ideals and his deeds. This means failure and dissociation, both allies of mental disorder.

Parents and teachers need to remember that self-control does not develop from prohibitions and inhibitions but through the growth of worthwhile interests and activities. If children form the habit of reacting from higher motives lower impulses will lose their attractiveness.

Concentration of attention—In the child's world of play there is complete absorption. The attention is focused intently on the problem at hand. There is no opportunity for vicious dissociation.

But in the schoolroom the child is too often concerned with tasks that are humdrum and meaningless. Under such conditions daydreams, expressions of his instinctive life, become a substitute for reality. His world of dreams becomes so much more attractive than school tasks that it projects itself frequently into the stream of consciousness interfering with orderly association and promoting a disorderly and inefficient mind.

To develop habits of concentration of attention and orderly association the teacher should plan her work in such a way that the children will have a clear notion of what is expected of them; it should be adjusted to their capacities and interests. In the lower grades the class periods should be short and vigorous followed by change and relaxation. No dawdling should be tolerated. Such a procedure would not only advance the regular work of the school but also the mental health of the children.

Objective interests—Mental health depends on making adjustments to the world in which we live. Many children finding difficulty in adjustment and experiencing keen disappointment substitute wistful thinking for reality. Facts are replaced by symbols. This drives the mind inward to escape reality and develops morbid self-consciousness and a divorce from the real world.

Morbid introspection is a bad mental habit, and one way to prevent it or cure it is to develop interests in the objective world. Much of our academic work in schools unfortunately leads to a lack of contact with a real world of things. Playing with blocks, cutting and pasting, learning to use tools, gardening and the various constructive activities foster interests that are desirable for little children.

The rapid and successful development of occupational therapy in our mental hospitals is an eloquent testimony of the worth of objective interests.

Normal social relationships—The escape from reality often means an escape from human beings. Practically every case among the thousands that flow through our psychopathic hospitals bears evidence of social maladjustment. Treatment invariably means making such a change in social relationships that the individual can get along.

The flight to an ideal world is normal to a certain extent. It is found in early childhood. Little children build up a play world peopled by companions of their own choosing. Ordinarily this is a pleasant diversion, makes the commonplace interesting and offers an opportunity for originality and creative imagination. It is only when this world becomes habitually more attractive than the real social world and takes on the tang of reality that there is grave danger. Such a child finds the real world of people hard to get along with, shrinks from contact with it and develops antisocial tendencies. In attempting to get along with people such a child may be so keenly disappointed that he retires more and more into a shut-in personality. Then in his dreams all desires are satisfied; his ambitions become realized; but he finds it more and more difficult to get along with real companions.

In dealing with such children we are often likely to make fun of them or to be over-sympathetic in our attitude. Both methods will tend to confirm them in their bad habits. The best way is to let the child know that you understand his sensitiveness. Then try to inspire him to take the spirit of the sportsman and mingle with his fellows in spite of his feeling. To provide opportunities for social coöperation, to teach children how to get along with others is of the very greatest significance for mental health.

Self-reliance—This is one of the virtues associated ordinarily with moral and successful living. We now know that it plays a powerful part in mental health.

One of the hardest things in life is to learn to depend on one's self. Each step forward in normal growth means pulling up anchor in a safety cove and embarking on an untried sea. Children are likely to shrink from such undertakings unless they are carefully trained. Failure in this often leads to much mental disorder and invalidism.

Failure in self-reliance is common in our homes. Parents prefer to do things themselves rather than to be "bothered" to train their children. Frequently the excuse is that it is so much easier to do it themselves. This is doubtless true but they are neglecting opportunities for character development.

One cause of failure is the mother's desire to keep her children young as long as she can. She bathes, dresses, and fondles a child, and gives him his own way to such an extent that his emancipation from parental control is greatly handicapped. Often a father wishes his children to have all the things he missed. Since he had to work in childhood he decides that his children shall have all their time for play. The development of healthy work interests, which every child should have, are forbidden. The father forgets that in handing his children such gifts with no effort on their part he is giving his children a poor training for life.

As teachers we have been obsessed with the value of the formal studies to such an extent that it is only recently that we have emphasized the need of giving children responsibility so that they might learn to do things themselves and so gain confidence. This newer tendency is one of the most hopeful signs of our times.

Wholesome interests and attitudes—We have been so interested in teaching children facts that we have sadly neglected the education of the child's feelings. Power to recall facts is desirable, but modern psychology teaches us that the process of forgetting is exceedingly rapid after learning. Most of us would pass a sorry examination on the facts of ancient history that we studied five or ten years ago. If this is true of other studies we might seriously ask ourselves: "What is education?" If the fact jamming process is largely a failure what does count? Is it not attitudes and interests? Does the study of history leave our students with a craving for more knowledge, with an admiration for the great personalities of the past or is there a feeling of exultation that one part of the disagreeable road toward promotion and graduation is over? No matter who studies history he will forget most of the facts learned but attitudes will remain. He will hate it or abhor it, he will be indifferent or he will be fired by brave deeds and perhaps realize more fully his obligation to the past, his opportunities and responsibilities in everyday citizenship.

Mental hygiene emphasizes the importance of children cultivating wholesome interests and attitudes. If these are not established school and home training is a failure. Children should be taught to love the things they ought to love and hate the things they ought to hate. Do not be deceived. These attitudes, interests and sets of mind are essentials. Are you teaching children to love truth, to accept defeat graciously, to develop a love of fair play, courage, self-control, cheerful contentment, determination to do the best they can and be content no matter what the result? Are you teaching your pupils to feel that they count in the world, that they are worth while? If you are, you are doing something worthwhile for the cause of mental health.

In this very cursory review of a few of the mental habits which young children should form it will be observed that the problem is one of adjustment to environment. The way the little child learns to meet his world is of the greatest significance in after life. To learn to face life aggressively, to meet every situation fairly and squarely, to learn to feel satisfied with one's best, to get along well with one's fellows, to preserve optimism, self-respect, and good-will, to develop such habits means steady growth in sanity and mental poise. To retreat from reality, from the actual world, is to seek satisfaction in dreamland, in extreme sensitivity, in twists of character, in perversions, in nervous breakdown, in what the layman is pleased to call insanity.

May I pause here to pay my respects to the kindergarten whose crowning glory lies in its revolutionary conception of the need and value of a school

without books. From its very beginning it has recognized, as no other part of our school system has, the worth of the individual child. It has recognized the child as a human being with human instincts and human problems. Satisfying the legitimate human needs of childhood has always stood above the thrall of methods, dogmatic theory, and subject matter. The social note, too, has always been conspicuous in the kindergarten. It was among the first to realize keenly the need of socializing the child. Children must be made fit to get along with others. The sensitive, the stubborn, the peculiar child—now the particular problems of mental hygiene—have always absorbed the attention of the kindergarten. In other words you have been teaching mental hygiene unconsciously for many years. It is now possible for you to see your old problems in a different perspective, to realize more clearly their origin and meaning and to grapple with them more effectively.

There is so much caustic criticism of our schools that it is a pleasure to refer to the humanizing tendencies in elementary education beyond the kindergarten. In giving children more self-expression, in developing a curriculum related to their interests, in encouraging self-reliance, originality, fine morale, and in its growth in appreciation of childhood, the elementary school has done much for the mental health of children.

As teachers if we are to play your part more consciously and skillfully in training for mental health we must realize that in this field as in all others example is better than precept, that children, particularly little children, are sensitive to our moods, ideals, and habits. It would be difficult, if not impossible, for any teacher to convince children that cleaning the teeth was very important if she neglected cleaning her own teeth. Likewise we shall be greatly handicapped if we have not made our own lives sweet, sane, and wholesome. As long as you remain human and teach children rather than formal subject matter, you will be powerful aids in promoting mental health. The study of mental hygiene by the kindergarten and elementary teacher presents one of the most fertile and fascinating fields today for practical child study. Learn to practice with your pupils the habits of mental health. Take the world as you find it. Do not kick against the pricks. Assume that you are a pretty good sort of person and that this is a fairly good sort of world. Then train yourselves in sportsmanship qualities in the mastery of yourself and your world. The program for mental hygiene is ideal, but we shall be richly rewarded in proportion to the efforts we make in practicing the principles of healthy living.

In closing I should like to quote a paragraph from Dr. Austen Fox Riggs which is suggestive for us as adults and teachers:

"Do not criticise your part in the play; study it, understand it, and then *play* it, sick or well, rich or poor, with faith, with courage, and with proper grace."

*PRESENT-DAY TENDENCIES IN EDUCATION AND THEIR
RELATION TO THE KINDERGARTEN AND
PRIMARY DEPARTMENTS*

EUGENE R. SMITH, HEADMASTER OF THE PARK SCHOOL, BALTIMORE, AND
THE BEAVER COUNTRY DAY SCHOOL, BOSTON

Since the title for my talk was decided upon, this meeting has been changed to include a much wider range of educational interests. I am very glad of that because it seems to me education must be treated more or less as a whole. I therefore am not going to confine myself this afternoon to the kindergarten and primary but rather shall treat the tendencies as a whole, emphasizing their applications to the different departments.

Whenever one speaks of modern tendencies or present-day education, there is a feeling of antagonism on the part of some, a feeling that there must be something very radical in such changes. On the contrary, such changes are natural and to be expected. They are brought about primarily by two causes: First, the influence of the changes coming about in all our living habits; second, the natural progress that must go on in any constructive activity.

The question of living conditions presents two sides; the first is that people are crowding more and more into close communities, taking away from the children the natural opportunities they had in the past for getting for themselves a part of their education, that part for which the home formerly gave facilities. It included skill in the use of the hands—in doing things that were not at that time considered as school work—the opportunity for physical preparation for life, and the moral and social training of the child. As our cities absorb the population from the country, as we more and more largely crowd into apartments instead of living in small communities with the family as the center, just to that extent do the children lose those opportunities.

But that is only one side of the question. The second is that the school must teach a much greater amount of information than has ever been given before. If you think of the complexities of modern life as during the last two decades they have increased the amount that all children must learn about, you realize how much more efficient even fact teaching must become to keep pace with such advances.

The most fundamental change is in child study. This has always existed to some extent, but at present it is receiving emphasis beyond anything previously dreamed of. We are trying to find out not only about children as a whole, but about each child. As no two people look exactly alike, so no two children think, or act, or are alike. Each child has to be studied as an individual and has to be treated as an individual. Even the physical study of children has made greater progress the last few years than in all previous time. Until we know his physical condition we cannot know what possibilities a child has, what handicaps he has, what he is capable of doing.

The wonderful work done by Binet in paving the way for scientific

mental testing has opened up a new field and has given educators a tool whose value is beyond estimating. Although the study of mental ability and characteristics is still in its infancy its success has already been startling, and the promise for its future is still more significant. It seems certain, among other things, to reach a stage where, by its use, we shall be able to wisely decide upon courses for those of varying types of thinking ability, and even to help them select fields of occupation in which they can be useful and contented.

But physical and mental studies cannot alone determine the possibilities and the weaknesses of a child. Work habits, social and moral responses, in fact all the personal characteristics, inherited and acquired, are also of vital importance. The more or less objective study of such factors is one of the later developments in the movement for better understanding of childhood. Dr. Patty Hill, of Teachers College, was one of the first to find a practical way by which teachers could make such studies of kindergarten children, and her work has been expended and carried on by others. There are now in process various experiments along this line, varying in use from kindergarten children to those in high school or college. One that seems to serve the double purpose of focusing the minds of the teachers on child study, and of giving a background for constructive work with the children, separates its pupils into five classes in each of a number of characteristics. For example, the classes under *Industry* are:

Class 1—Those who try to get as much as possible from the course, showing enough interest and initiative to investigate beyond the teachers' requirements.

Class 2—Those who conscientiously meet all requirements, both in giving attention and in doing assigned tasks.

Class 3—Those who have the general intention of conscientiously applying themselves to their studies, but fail often enough in carrying out this intention to force the teacher to take too much responsibility for work the pupil should do.

Class 4—Those who are decidedly irregular in their attention and application, so that the teacher must continually apply pressure.

Class 5—Those who will not, or cannot, hold their attention to their work. This may be shown in class, in project work or study, or in all.

Such work habits and social and moral characteristics are of equal importance with physical and mental qualities and must equally be studied by the school. Education must, then, take each child as an individual problem and must consider that problem from all sides.

Discovering that children are as different as they are has had a tremendous effect on curriculum and methods. The elementary school in particular was, in the past, a place where teachers taught only certain fundamentals of learning: reading, writing, and arithmetic. The kindergarten was too often a place where the children were simply kept out of mischief, in other words a nursery rather than an educational institution. The kindergarten has become a place where habits are formed, where

strong characteristics are made use of, where weaknesses are overcome, where every move—whether under the name of play or not—is planned and has a purpose. The elementary school has broadened its scope until nothing that affects the child's life is left out. It is not only a place to teach subjects, it is one to give opportunity to meet and prepare for the things coming in after life.

In industry, and especially in manufacturing, those in authority study the material available on the one hand, and the market for their products on the other. The mill or factory then takes the material and tries to change it into a finished product that is in demand. If it is a good factory it tries to turn out an honest product, one to give service and to do it economically and efficiently.

So, when the school has studied the material that comes to it, it is also its business to know the world's needs for its human products. Its work then lies in economically and efficiently preparing the child material to become a product fitted to these world needs. Everything that comes between the raw material stage of the uneducated child and the state of preparedness for after school life is its business. It is on this account that the scope of the school for all ages of children has so greatly broadened.

This has not come without opposition. There are those who object to the time spent on the playground, in the workshop or kitchen. We often hear parents say, "That was not done when I was young. I went to school to work. I was not taken to shops, to the playground, or on a trip to a museum. I was drilled all the time, and that is what taught me." School today must not only make people prepared in subject matter, but must make them prepared in citizenship. It must make children accustomed to succeed, but it must also prepare for enjoyment of leisure. The lack of capacity of many of our citizens to get anything at all out of their free time is a menace. Lack of resources for enjoyment means dissatisfaction and often a destructive attitude toward the pleasures and progress of others. We do not know how to enjoy the things of worth—nature, art, music; taste for them must be cultivated just as much as anything else.

The school also gives and takes more and more from the non-academic world. From the country, factory, and store it brings the men who have found something worth while in life and asks them to pass it on to the children. We no longer stay inside of the four school walls; we go out into the world to learn, and we bring the world in to our children. Whatever lessons life has, wherever they are taught, they become part of our schools.

If the purpose and the scope of schools are broadened to this extent, it necessarily makes a tremendous difference in methods of teaching. There are two particularly significant sides to the changes in teaching; advance in scientific methods and a change from textbook instruction to a freer and more coöperative handling of classes. The advances in scientific methods start from the kindergarten. One of the greatest changes here is the use of larger material. This change is founded on the understanding

that the larger muscles can better be used in young children. There is greater pleasure and interest to the children also if they make things that seem real to them. I remember the tremendous pleasure it was to me as a boy to get hold of pieces of lumber large enough to make a shanty into which I could get—it marked distinctly the difference between a plaything and something that seemed real. When kindergarten children make something large enough to be real, they have obtained a genuine satisfaction, as well as the muscular, social, and mental gains that go with the project.

As you go into the elementary section, changes in methods of teaching subjects are very important. One of the most interesting experiments on methods ever tried seems to me to be the one carried on at the University of Chicago in regard to reading. A moving-picture camera was used to get a record of the movements of the eye while reading. Poor and good readers, young and old, silent and oral, were photographed, with results that should influence the teaching of reading everywhere.

Many teachers have taken it for granted that the eye in reading moved smoothly across a line of print. The pictures showed that what some previous experimenters had claimed was true, namely that the eye could move only in jerks or steps, stopping at the end of each step to see a word or group of words if one read rapidly, or a few letters if one read poorly. Among the lessons that came from this proof were, that a child should learn to read, not by building words from letters, but by learning to recognize words or phrases as a whole, that oral reading should not be persisted in to an extent that would prevent the more rapid eye moves needed for good silent reading, and that a child should read much for himself instead of being read to by adults. The teaching of reading, while better than ever before, can still profit by the study of such experiments for there is still much poor teaching, and many are still handicapped by it; school children who have supposedly learned to read well, may show ranges of reading speed as wide as from ninety words a minute to five or six hundred. Even in high school, pupils sometimes prove unable to do the work simply because they read so slowly. The cause is many times an oral reading habit drilled into them by unwise teachers until they are tied down by the speed—or rather the slowness—of their tongues. Recently I had a sixteen-year-old boy come to me with a record of failure after failure in school. He had an intelligent quotient of 110 and every qualification, apparently, for success. But he could read only about 100 words a minute. His eye habits, fixed by poor teaching, were so bad that he could not finish the study he must do each day. Such cases, unfortunately, are not rare.

In other subjects also experiments are being made in scientific methods. Writing seems to depend so largely upon rhythm that experiments in teaching it with the aid of music are going on. The question of writing is, however, still an unsettled one. The increasing use of the typewriter as well as other conditions make it difficult to arouse enthusiasm for its improvement.

One of the surprising things about the teaching of arithmetic is that so

few schools follow the reports of various committees on the teaching of mathematics. I have gone over every report I can find issued since 1900 on teaching arithmetic and I cannot find anything in this country or abroad that does not stress the Austrian or shop method of subtraction and does not recommend that schools use it. Yet I often find teachers who never heard of it and who resent a suggestion that they try it. Many other such method changes have entered the schoolroom, but I have no time to discuss or even list them.

The most interesting advance in classroom methods is the freedom that is coming more and more into the work—the classroom becoming a workshop where children are self-active. It seems to be conclusively proved that by self-activity, with interest behind it, children gain more than they can in any other way.

We hear a great deal about the project method. Whatever one calls it, the present tendency is to have the child actually inside of what is going on, feeling himself a part of it. The thing must be real to him. If a child is living his work in some way there is behind it a tremendous force of interest, all the incentive and impulses inherent in mankind pulling with the school and the teacher instead of against them. Just as soon as you put the child down as a passive thing to be acted upon, you lose all this, and it is simply a question of how much the teacher can force in.

If one uses free methods and changes schoolrooms into workshops, one is not safe without testing to see if the pupils are getting their fundamentals well, for it is possible to have interest without complete clearing up of difficulties. Standardized subject-matter tests serve this purpose, provide minimum and maximum standards of achievement, and to an increasing extent, serve as a means of analysis in finding individual weaknesses. Their use is already widespread, and it is growing by leaps and bounds.

An excellent example of diagnostic work is that being done in arithmetic by Dr. Colin Scott in the Springfield schools. He reports remarkable progress in speed and accuracy after the eradication of weaknesses discovered by complete surveys of the fundamental processes. A girl in a sixth grade began to drop back in arithmetic and to have more and more difficulty in it. Such an analysis was tried with her and it turned out that her mistakes practically always came in multiplication, in the 7, 8, and 9 tables. Of course an attempt was made at once to correct this weakness. The child's career was also traced back to the year when those tables were learned and it was found that she had been sick and out of school at that time. The work had been made up, but it was not sufficiently well done, so the child was left with that weakness buried under the accumulation of new things studied. We often go on burying weaknesses until they are carried for years. Their results show, but it is very difficult to find from where they come. Such diagnostic discovery is one of the most valuable things that have come to us as a result of the testing movement.

Perhaps the greatest tendency in modern education is one that in the utmost degree possible, from kindergarten through college, uses the children's

coöperation and the ability to serve that is in them. We have thought of children as good or bad, instead of as ignorant of all social and moral laws when they were born, and only so far informed afterward as the teaching of parents and teachers has made them. We must teach them laws as standards to respect and understand, giving them experience in forming standards themselves and in putting them into effect both for themselves and for their school communities. Just so far as we do these things we will build up citizenship fit for democracy.

We now turn men and women into full citizenship, allow them to vote, ignorant when they are twenty, no better prepared when they are 21, and expect to have good government. We do not get it, and will not get it until you and I, and every teacher, are working for citizenship from the first day the child is confided to us. If in place of our deciding everything we let the children have a chance, ask from each as much as possible, give them increasing opportunities, lead them on day by day to greater development, then, just as surely as we do that, the time will come when they can shoulder the responsibilities we are carrying today far better than we are doing it. In building up this social and moral responsibility, precept has some part, but example and participation, and being given responsibility, have the greatest influence.

The most important tendency in our schools today is this one of building character through coöperative service. No matter how handicapped you each may be by size of classes and other conditions, no matter what you have been working against, you can nevertheless instill into the children, by your belief in them, the power to think social and moral problems out for themselves. You can make them strong in service, and proud to serve. This is the greatest of all that you can do for them, for it is only through unselfish service that the world will be saved.

THE ADJUSTMENT OF ELEMENTARY EDUCATION TO THE PROJECT METHOD

JAMES F. HOSIC, ASSOCIATE PROFESSOR OF EDUCATION IN CHARGE OF
EXTRAMURAL COURSES, TEACHERS COLLEGE, COLUMBIA UNIVERSITY,
NEW YORK CITY

The improvement of elementary education demands formative ideals. The most fruitful of these at the present time is embodied in that conception which may be conveniently suggested by the term *project method*. The term has been used by several in a narrow sense. I wish, however, to employ it as a fundamental educational viewpoint.

What is meant by the project method may be conveniently suggested by calling attention to the ordinary use of the word *project*. When we speak of a project, we generally mean an enterprise of some sort which is entered into with zest because it is thought worth while, which is pursued with a more or less clear view of the goal to be attained, and which is guided by

a conception of the appropriate means. The pursuit of enterprises is common enough in life and should be in education. Unfortunately, our educative processes become, from time to time, unduly formal and must be revised. It is such a redirection which is now taking place.

We may ask, properly, what will be the influence of the project concept on the making of courses of study? It is clear that in the first place the courses will be restated in such a way as to suggest project activities. A course in geography, for example, will be no longer a mere outline of topics logically arranged, but a series of problems so presented as to suggest self-directed activity on the part of the pupils. This type of activity will be described and illustrated and the means by which it may be made effective will be set down. In a word, the course of study itself will be a guide to the enterprises which the pupils should engage in. The outcomes, moreover, will be stated not merely in terms of facts to be remembered but of skills to be developed and particularly of attitudes to be induced.

Such courses of study are already in existence. Notable examples are those recently prepared by teachers and supervisors in Berkeley, California, under the general direction of Superintendent H. B. Wilson. As a background for these courses, the volume prepared a year or so ago by Professor Bonser, entitled, "The Elementary School Curriculum," will be invaluable. We are clearly at the point where courses of study will be conceived as in fact a series of experiences to be realized by the children in the pursuit of certain social values.

The second field in which fresh application of the project idea should be made is in the field of teaching. The course of study represents the point of view of the supervisor and his helpers as to what ought to happen. The teacher in the classroom, however, is the final arbiter. What she does determines finally, in large measure, the actual course which the pupils pursue. Fortunately, large numbers of teachers are interested today in the study of the principles of teaching. Never before in the history of the country has so large a number of teachers in service been enrolled in classes for the study of education. Courses in the project method are most popular of all. Teachers seem to feel, and not without reason, that here is a new key to the technique of the classroom. In spite of many vagaries, which are to be expected, there is marked improvement in the kind of appeal which teachers are making to their pupils. Fewer and fewer are content merely to give out formal assignments. At the least they seek to orient the pupils as to the purposes to be carried out and the plans of work. At the best they encourage the pupils themselves to define their purposes and organize their plans.

That there should be some waste of energy in the trying out of a new idea is not to be wondered at. It seems certain, however, that better results are obtained by project methods than otherwise. Probably the experience of a teacher of geography is typical. She employed the project method in that subject contrary to the wishes of her superior officer, who feared a lack of thoroughness. At the close of the term she gave to the

class an examination more rigid than usual. The results surpassed her expectations. She handed her papers to the superior who, at last accounts, had nothing to say in protest.

In adjusting our teaching technique to the project idea, the most important consideration is that we should recognize that it is, in fact, not a single idea but rather a synthesis, or union, of ideas of method. Few, if any, of the concepts which have been shaping our practice since the days of Rousseau are without a place in this new principle. Self-activity, learning to do by doing, interest, motivation, concreteness, individual differences, coöperation, permanent retention, transfer, judgment of values, training in leadership—all these and many more are obviously included. At least this is so if we are disposed to interpret the concept liberally and not in the narrow sense of planning tangible activities or carrying out concrete constructions, as some would have it.

We should beware of the attempt to bring about wholesale change. The principal who announced that on November 14 the project method would be introduced into his schools had, of course, a rather superficial view. Much better is the more conservative step of discussing with a body of teachers the question as to how far the pupils have clear-cut purposes in what they do. This may easily be made to lead on to experimenting, and, ultimately, to a fresh appreciation of the place of purposes in activity. With this entering wedge, other aspects of method may be called to attention one by one and genuine growth be brought about. As a matter of fact, very many good teachers have more or less completely embodied the project ideal in their work whether they use that term or not. Our task now is to develop the idea into a conscious educational policy and work out an appropriate technique for it.

The third aspect in which there is the possibility and need of adjustment of elementary education to the project idea is in the field of supervision. Here, as everywhere else, example is more powerful than precept. The supervisor who would have his teachers use the project method must use it himself. He has but to raise the question as to how the teaching in the schools may be improved to call out responses from various members of his staff. Once these are subjected to discussion, a policy of experiment decided upon, and the teachers at work each in his own way, and the idea is launched. The follow-up will consist of group and general meetings, various visits of the supervisor to the classrooms, individual conferences, and, from time to time, a summing-up of results to date.

This implies, of course, that the supervisor himself is an earnest student of educational method. He cannot, certainly, expect to run the mill with the water that is by. Ideals and practices good enough in his youth are not good enough now. He must expect to find in his classrooms suggestions new to him and should approach these with an open mind. Above all he should bring to bear upon their evaluation a reasonable grasp of modern educational philosophy and its counterpart, modern educational psychology.

The supervisor is really a teacher of teachers, and, as such, has an un-

measured opportunity. Through his sympathetic leadership of the members of his staff, he multiplies his personality and insures to the pupils of his schools the best possible opportunities of growth. Meanwhile, he is instrumental in enlarging the lives and increasing the happiness of his teachers, and adding to his own a wealth of blessings. All of us who believe in the project method may well pray for large accessions to the number of supervisors who can become its intelligent and effective exponents.

There is time to touch upon but one other aspect of our theme. This, too, is fundamental. By some it would be called the most fundamental of all. I refer to the training of young people for entrance upon the vocation of teaching. The graduates of our high schools who are now entering our normal schools have, for the most part, had a classroom experience more or less widely at variance with that which we picture when we think of the project method. This is especially true with regard to the high school years which lie immediately behind. The high school subjects are as yet largely formal and they are too often presented by formal methods. College graduates, as is well known, tend to present their subjects to high school pupils as college professors presented those subjects to them in their college years. As a result, the common conception of the entering normal school student is that teaching consists in assigning a lesson and later in hearing it, and not until a more modern practice has become established throughout the twelve years of common and high school education will the young person entering normal school bring with her the modern conception of method. As was said above, example is more powerful than precept. The other years of the normal school course will prove quite inadequate for the development of the project point of view unless it dominates all the activities of the training school. The most effective lessons in method are the examples set by the teachers themselves. It follows that courses in educational psychology and in principles of teaching, as well as in the teaching of the various common school branches, must themselves be conducted in the spirit of the project method. Not only so, but the principles which characterize that method must be called to the attention of the beginner and made a part of her conscious policy of teaching. Such a procedure is evidently economical if it combines theory and practice in the same class hour and insures application because it becomes a part of the total experience. The normal school student who has studied geography by the project method will understand what is meant and will have relatively little difficulty in adjusting her activities when she comes into the practice school to try her hand. Mere theory by itself, however, will not accomplish, as it never has accomplished, an effective making-over of the student teacher's notion of teaching.

By way of conclusion it may be remarked that the adjustment of elementary education to the project method has been going on for a long time. We have reached the point where the various conceptions it embodies may be effectively combined and focused in a single fundamental point of

view. The time is right for the widespread application of a philosophy of method. For more than a generation we have had mainly a somewhat formal scheme for the conduct of the recitation. The new concept of method is much more far-reaching and much more flexible. It affects, as we have seen, many of the more important aspects of educational organization and endeavor. Because it is found in life we can go to life for its meaning and interpretation, and because it is as far-reaching as life, it is also inexhaustible in its possibilities.

THE EDUCATION OF YOUNG CHILDREN IN RURAL COMMUNITIES

MRS. KATHERINE M. COOK, SPECIALIST IN RURAL EDUCATION, U. S.
BUREAU OF EDUCATION, WASHINGTON, D. C.

To an audience made up as this one is of specialists in the education of young children it would be as fulsome as it is unnecessary on the part of one, not such a specialist, to enumerate or enlarge upon the principles governing this kind of work. Whatever may be the truth of the statement credited to some authorities on, and critics of, education that the quality of teaching in our public schools is best in the kindergarten-primary grades and continues to decline in quality as we go up through the grades, high school, and college, it is, I think, safe to say that no group of teachers is more expert in the knowledge and application of the best ideals, principles, and methods than are those represented in this audience. I need offer no apology then if I confine myself in this paper chiefly to the field of rural education and to the question uppermost in my own mind—even at the risk of seeming narrow in yours—namely, what can the application of the principles now practiced in our best kindergarten-primary schools do for the education of young children in rural communities?

I wish to discuss this question from three viewpoints: first, the practicability of their application to the needs of rural children as understood by the thoughtful farmer, himself, and his children and by educators working in this field; second, the efficacy of those principles in working out the solution of the special problems of rural education as understood and recognized by thinking country people and by those of us immediately engaged in securing better educational conditions for country children; and third, the possibility of the use and adaptation of these principles to the organization of the new kind of country school.

I say "practicability" advisedly, but with some trepidation, feeling as I do the connotation of the word, and knowing that its use is almost inevitably misunderstood. I hope I may be pardoned then for a brief explanation. With those to whom ideals in education arouse reverence I am in the utmost sympathy.

May I, however, remind you that we are not talking to each other alone if we are looking for results. It is a fact that must always be remembered

by those of us engaged in rural education that the farmer is an eminently practical person, that farm boys and girls are the most practical of children. They deal with realities as other children do not. The farm home is also the farm workshop or at least it is close to and familiar with it. The children know the economic problems of running a home and making a living in all their varied aspects. They share the knowledge and fear of misfortune from unfavorable conditions as well as the elation and uplift which comes from favorable ones. The farm child is nothing if not practical-minded. With this experience and attitude we perhaps deal as others in our profession do not in our efforts to disseminate educational ideals. I like, therefore, to weigh principles and their application on the scale of what I call their practicability—meaning their probable appeal to the practical farmer, the man on the road, if I may so paraphrase the popular expression signifying the average man, with whom we must deal if our educational ideals are to be made realities. Is it then practicable to advocate to thinking farm people the introduction of these new principles and practices for the education of young children, or are farm children so different in their natures that principles of education applied successfully in city kindergarten-primary schools are not equally efficacious in the education of rural children?

Farm children know that they are alike as they wish to be not unlike city children—what's good for the gander is good for the goose. Any intelligent farmer, too, will answer the question. Indeed, it seems to me to carry its own answer. Principles of education, if they are right, are right throughout the school course and in however varied surroundings. If there is any fundamental difference in the nature of children based on the accident of place of their birth, that is, whether in the country or in the city, we have yet to have evidence of this fact. In the meantime it may be assumed safely that children are born with the same instincts and potentialities, the same educability whether in a crowded city or isolated rural community. Certainly not in this group need one speak for the eternal justness of the right of all children to equality of opportunity; for fullness of development by all, whatever means we know. Our knowledge, if we apply it all, is meager enough.

There are those who say that the country child does not need the advantages which they, themselves, agree should be offered to children in the city, that the country *per se* offers training which must be brought to and devised for the children of the city: that the rural child who follows his father about the farmyard, or his mother about her household tasks, gets of his own accord all the education which the trained kindergarten-primary specialist has to offer. To say this seems to me to deny that there is any such thing as a profession of teaching, or any such thing as the science of education.

Let us examine this contention further. No one believes more than I in the country as the ideal place in which to rear children, especially young children. It is the real "child garden" designed especially for children

by the greatest of teachers. It offers as no other environment does, the *opportunity*, the *materials* for education. But, like all opportunity, it must be utilized; like all other materials of education these offered by nature are useless unless organized, in "significant sequences." All education must use and supplement the experiences the child has already met. If the farm in itself, the mother and the father without training can do this, of what use are prepared teachers? If trained teachers are not needed for young children why are they needed for any?

Experience, too, fails to bear out this theory. Nothing has seemed to me so pathetic as the prevalence among country people and country children of eyes that see not, of ears deaf to everything worthy about them, of the paralysis not alone of the senses but of the finer sensibilities to the miracles of nature that surround them in such abundance. One month spent visiting schools in the country would be to any one here an everlasting refutation of any such tenet as that mentioned.

Any careful observer of rural people, especially of rural children, could give numerous illustrations of the sordid, monotonous existence of the inhabitants. No misfortune, it seems to me, can be greater than that country children should grow up with the conviction that life on a farm is necessarily one of uninspiring drudgery. Yet this is the attitude we are implanting in them by the shortsighted system through which we have crushed out joy and beauty and inspiration from education of country children and substituted a little formal knowledge designed to increase production and thereby save the nation from rearing a peasant class or from added increase in the cost of living.

We need to understand then that it is not safe to leave the child to the chance of being educated by his environment unassisted. All country children are not Lincolns in ability. The fundamental principles of sound education for rural as for city children recognize the importance of bending the twig as the tree should grow; that children of the age we are discussing—namely, from 4 to 8 years, are in that period when lifelong reflexes are established; that the opportunities and materials of education, varied and abundant as they are in the country, must be organized and used and that only those with special adaptability and training can do this best.

To return now to our second consideration that is, the efficacy of the principles practiced in kindergarten-primary schools in the solution of the special problems met in the education of rural children. Perhaps first in importance among the needs of country children I should put love and appreciation of nature for fullness of life and joy in the day's work without which life in the country is uninspired drudgery. To this I have already referred. Any career must have a "setting of inspiration" if it is to appeal to the child with imagination, and the foundation for this must be laid early in life before the golden moments when impressions are glorified by imagination have forever passed. In these early years or never must the love of farm life be instilled.

It is all very well to appropriate money from the Federal Treasury to

promote production through vocational agriculture, but much of it is and will be wasted because these golden moments have passed and the boy or girl has faced in the wrong direction before this opportunity comes. Appreciation of nature, love of the open country, a wholesome respect for the land and the people who live in it must, like appreciation of literature, music, and all the fine arts, be developed through early association with what is good and beautiful in each at a time when much of life is accepted without undue questioning. It must come from association, contact, familiarity; just as a teacher must be a child among children so must she be a nature lover among other nature lovers. The country child needs the stimulus of success, pleasure in his surroundings, physical, social, spiritual, and intellectual training to supplement his experiences, just as any other child does if he is to develop ideals and sentiments of worthy living and to cultivate love and appreciation of life in the country. Here, indeed, can the teacher with the special training for teaching nature, and its appreciation help us to solve our special problems.

In school and out of school we are beginning to give some consideration to the health of rural people. Time was when, like those critics already referred to, who think that country life in itself obviates the need of kindergarten training; there were those who said that the country was a healthful place in which to live and rear children, therefore, all country children were essentially healthful and special provision or attention to this matter was unnecessary. That delusion has been dispelled by the draft data and by every investigation made concerning the health of rural children. There has been of recent years a good deal of scientific study devoted to the education of little children from which it seems to me the country child has profited least. No one now would deny that we must begin early in our consideration of the child's physical welfare or that the teachers most carefully trained for it at the present time at least are those who have specialized in kindergarten-primary work.

The country child notoriously lacks the social graces, the ability and desire to play with other children. Many country children are reared alone or in small families and are deprived almost or entirely of the opportunity to play with or enjoy the society of other children of their own age. It is a mistake to think that the old-time large family still abounds in the country. A study recently made of farm families in a rural community shows the average number of children per farm family to be a fraction over one. Visit any typical rural school and you find children at the recess period sitting about alone, or in small groups, knowing few games and finding pleasure in still fewer. No wonder Jack is sometimes considered a dull boy! Lack of the companionship of other children, dullness, and boredom have all done their work before the period of early training has passed.

We find little in the curricula of rural schools that develops the imagination, builds character, and instills ideals as the study of good literature does. Mr. Chubb tells us that the child who passes the nursery rhyme

stage without knowing Mother Goose has missed a contact which no amount of after training can fully supply and that this loss can be detected in a certain lack of full appreciation of literature in later life. What shall we say of the child who misses entirely the culture which comes from a familiarity with good children's literature which the trained kindergarten teacher knows how to select and tell? No one needs appreciation of literature and love of books and reading as the farmer and farm homemaker whose isolated lives throw them on their own resources for recreation and amusement. Indeed, students of rural education and of farm life and its needs are becoming more and more convinced that "as a man and as a citizen in a democratic country the farmer needs and is entitled to the same education for human development for sweetness and light and for an understanding of the responsibilities of citizenship as is any other man." The farmer, the farm homemaker, and the farm child are dependent on their own resources for culture and recreation as others are not.

It appears, then, in considering the educational needs of young children in cities and of elementary children in rural communities we are on common ground fundamentally at least. Both groups interested—namely, those in the rural education and in the kindergarten-primary fields are working for more nearly equitable educational opportunity for all children based on their needs rather than on any accident of the place or the time of their birth. Both are interested that education should grow out of the child's own experience and environment in increased opportunity for social contacts and development of social instincts through work and play under guidance and in right surroundings and in laying a foundation for liberal education, through more general appreciation of Nature, music, literature, and other arts.

There remains, then, for our consideration only the practicability of adjustment to the organization of the new kind of rural school. I mean, of course, the larger consolidated schools which are now rapidly increasing in number and extent throughout the country; so much so that there are now probably 12,000 such schools in operation. Their special needs, therefore, give rise to problems worthy of practical study and consideration. Among these may be mentioned the following: (1) In all rural communities—those having consolidated schools included—many children enter school before the customary age of six years. This is due in part to laxity of rural boards in making and enforcing regulations, as is customary in cities where crowded conditions usually lead to more drastic action; in part to the fact that legal school age (in many States five years) and the age at which children should enter school often confuse country people. (2) The introduction of large motor trucks for transportation has led to the practice of using each vehicle to cover two or more routes or to cover the same route two or three times, hauling a large number of children per vehicle. This method of transportation is the most economical. Wherever teachers act as drivers of transportation trucks and more or less wherever transportation is used extensively the children have from

twenty to thirty minutes before and after school which, for larger as well as smaller children, could be busily and happily employed in supervised play, a story hour, with directed handwork, or in various other ways which the trained kindergarten is especially well fitted to direct. In many schools this free time of children offers a serious problem to the regular teachers who have been accustomed and desire to spend this time in preparation of work for the day.

These conditions offer at least two opportunities for the introduction of a special teacher and special room for young children in consolidated schools. If a teacher with kindergarten-primary preparation were employed in the school to have charge of a room for young children from 4 to 8 years of age, either by herself or with an assistant, she could conduct a school of the ungraded type, retaining all the traditional freedom and spontaneity that have characterized the best of the old one-teacher schools and at the same time having all the advantages of the best modern ideas in education. In addition to the regular work of the special teacher (particularly in small consolidated schools) all the children of different ages who arrive at the school building early or leave it late on the transportation busses could be under her charge during these free periods.

The question naturally arises if the introduction of special training for young children is practical in consolidated schools in rural communities why has it received so little attention? Those whose special interest this field of education is, must speak for themselves. For those of us whose special interest is in country children, I think I may say authoritatively that neither indifference nor lack of appreciation of benefits to be derived is responsible. The problem is one of administration and finance in the larger consolidated school with the added one of organization in the smaller schools. Promoting better school conditions in rural communities is a tremendous problem with serious handicaps which need not be enumerated here. It is enough to say that so far they are being overcome only slowly and gradually. Adequate financing is not only difficult but impossible in some rural communities and will be until States pass more equitable laws for raising and distributing State and local funds. In communities able to finance schools without better administrative organization it must be remembered that consolidation itself is a comparatively new movement in the majority of States, and that the present serious financial crisis affecting the farmer, came just at a time when the situation seemed in a fair way to improve with greater rapidity than before, and that for the present, at least, it offers a very difficult obstacle to overcome.

The introduction of this special work in rural schools involves also the added problem of securing adequately prepared teachers. At present less than 25 per cent of the rural teachers have any adequate training whatever for their work. To introduce a new field without a sufficient number of prepared teachers would be a serious error. The rural kindergarten when she comes must be no follower of the letter but rather of the spirit of the law; to such the country opens a world undreamed of by

the city teacher, a world where every child may see at first hand the miracles of growth in their own natural setting, where opportunities for service in new and untried fields open up with amazing regularity and where the uses of initiative, ability, and possibilities of experimentation are infinite in variety and extraordinary in appeal. To open up such a field to an untrained group would hamper rather than further the desired end.

Not too much at a time must be our guiding slogan. If we are able to secure consolidated schools for our country children we will, we hope, eventually get the other advantages which accompany them. In the meantime we must be patient and reasonable in our demands—without losing sight of the ultimate goal. We want for children in rural communities educational opportunities equivalent to those now offered, or which shall be offered, in the more progressive cities. We shall be satisfied with no less. Without insisting on their immediate fulfillment there is no time better than the present to work toward this end. Various conditions, accidental and otherwise, have combined to popularize the idea of greater liberty in the education of children. The mind of the public is better attuned to educational needs of small children than ever before. It is expedient while popular interest is alive to these needs that we keep constantly foremost all that makes for better education, for more normal, fuller, and richer lives for country children.

THE WORK OF THE NATIONAL EDUCATION ASSOCIATION AS VIEWED FROM THE STANDPOINT OF A CLASSROOM TEACHER

AGNES S. WINN, ASSISTANT SECRETARY, NATIONAL EDUCATION ASSOCIATION, WASHINGTON, D. C.

The most pressing duty that lies before those of us who are engaged in educational work today is to convince those outside of the profession that we are united on a common program—the training of the children of the Nation for the highest type of citizenship. Groups vying with each other for influence and prestige can never bring this about. They must be willing to lay aside their group interests and unite their forces to carry forward a professional program of National service.

These first few months at headquarters have strengthened my previous ideals for a great National association, an association having the unique privilege of binding the teachers of the Nation in one great professional organization with a common purpose, with a common understanding, and with common ideals. Through my office at headquarters I am hoping to keep in close touch with both administrators and teachers in every section of the country to assist in bringing about this unity.

Since its reorganization at Salt Lake City two years ago the Association's membership has increased from 35,000 to 110,000. With this re-

markable growth in mind, the officers realize that the Association must equip itself for a greater future service and for a more vital influence in the lives of its members than it has ever exerted before.

For this purpose a Research Department has been established where information on salaries, tenure, and pensions, educational State and Federal legislation, rural schools, in fact anything pertaining to the school systems of the country may be had for the asking. It is there to serve you in whatever capacity you desire. *The Journal* has been established to give information regarding the Association's policies and to acquaint the members with the activities of the field and with the larger problems of education.

The benefits you receive from membership in the Association will depend largely upon what you are willing to put into it in the way of helpful co-operation and constructive suggestions. It is your Association, not ours. Use your opportunity at the meetings of the Representative Assembly to let those of us who are carrying on the work of the Association know what we can do to make the National Education Association meet the needs of the educators of today.

MEASURING CAPACITY OF PUPILS AND THE EFFICIENCY OF SCHOOLS BY MEANS OF TESTS

LINCOLN OWEN, MASTER OF THE RICE SCHOOL,
BOSTON, MASSACHUSETTS

The general topic, The Value of Measuring Intelligence and School Progress by Standard Tests, means to me measuring individual intelligence, individual progress, and the efficiency of an individual school.

In giving an intelligence test we ordinarily test language capacity and experience considerably more than we test intelligence and from these results we infer the degree of intelligence.

The National Intelligence Tests were given recently in grades four and six of the school under my charge. Soon after Courtis Tests in Arithmetic were given in grades four and five and fraction tests in grades six, seven, and eight.

In attempting to find the meaning of the results obtained my teachers prepared digests of the results and some graphs. We have made many comparisons. The pupil's rank card for the year may be taken as the most reliable evidence of a teacher's honest judgment as to the mental capacity of the individuals in her class. Grade six is a critical year, and I shall use for illustrative purposes the results in that grade.

In all classes tested we found a marked agreement in about 80 per cent of each class. The cases of wide divergence need to be interpreted and explained.

When results of scientific tests agree so markedly with the judgment of experienced teachers, is it worth while to give such tests? This question

has been given to many principals and many teachers and the composite answer is "Yes, provided the tests do not run in grooves and thus stimulate excessive preparation for the passing of tests."

TABLE 1—GRADE SIX

<i>Class A</i>					<i>Class B</i>				
(R 14)	Rank	Card	Intelligence	Test.	(R 17)	Rank	Card	Intelligence	Test.
	No.	1	is	No. 10		No.	1	is	No. 1
		2	"	3			2	"	6
		3	"	23			3	"	10
		4	"	28			4	"	18
		5	"	2			5	"	13
		10	"	1 (148.1)			10	"	4
		20	"	25			20	"	31
		33	"	17			31	"	29
		34	"	7			32	"	34
		35	"	22			33	"	32
		36	"	32			34	"	30
		37	"	27			35	"	28

What can be done with the results of these special tests?

1. Understand and interpret them. Ask and answer the questions suggested by them.

2. Comfort the teacher by confirming her judgment. Improve the teacher's power to rate capacity fairly.

3. Use them as a help to a better understanding of one's individual pupils. Find the shirks.

4. Use them as a help in grading pupils. Many schools admit 50 per cent of the pupils from grade six into the foreign language divisions of grade seven on the basis of the results in the intelligence tests!

The results of these tests are revealing and suggestive, but they are not absolute.

Scientific tests of intelligence, of arithmetic, of reading, and all other tool subjects—important and suggestive as these are—do not adequately measure the efficiency of a modern school. What then are the types of test or forms of inspection that would enable one to determine whether or not an individual school satisfies reasonable expectations?

An inventory that is reasonably thorough should cover the following points: the spirit of the school and its dominating ideals; the physical condition of the pupils; the methods and the processes of the classrooms; the adaptability of subject matter and of required activities to the needs and capacities of individual pupils; and intellectual results—both tangible and intangible.

Because of time limitations I must omit a consideration of the most vital elements that determine the efficiency of a school and comment briefly upon schoolroom tests in comparison with scientific tests as a means of determining individual capacity, individual habits, and fitness for promotion.

These same pupils were given searching tests upon their work in fractions. Class A whose average score was ten points lower than the average score

of Class B surpassed the record of Class B in three out of five tests. In earlier school tests upon fraction work Class A also surpassed Class B in each of five separate trials.

There was a striking correspondence between the teacher's merit list for promotion and a list based upon the fraction tests.

In my view the judgment of a fair-minded, experienced teacher as represented by the report card plus a recommendation by such teacher is a safer basis to be used in grouping pupils for next year's work than the results of intelligence tests.

Why, then, do the private schools make so much use of intelligence tests as a basis of classification? Because they have not reliable data furnished by experienced teachers to serve as a basis of classification.

School tests in arithmetic and English can be made to yield to the principal results which have values of a high order. A few years ago a brother master gave a test in arithmetic in my school in grade four. While only seventeen out of forty-two had perfect papers, this test showed clearly that the class possessed intelligence, the habit of attention, and a willingness to attack a new problem.

Such a test is suggestive but it would not be suited as a means of determining fitness for promotion. In June, the same class took an appropriate problem test. There were thirty-one perfect papers and no child was below passing.

When arithmetic tests, however, become so scientific that they test only abstract work, they tend to induce excessive drill upon the fundamental processes and there is no permanent gain in doing either abstract or problem work. Test results should be confirmed by comparison with standard scores, when available, and with the results in other classes or schools.

Unless we are to confine research tests to the fringe of arithmetic, some problem tests should be given.

Any attempt to determine the efficiency of a school should include some inspection of desk habits and an inventory of English results. The most economical test in English is a dictation exercise, with correction by members of the class, and a rank mark obtained by counting the number of errors. Such an exercise need not take more than twelve minutes.

The work in composition should be tested in writing, and orally to some extent. Oral composition should be accompanied by some class criticism to reveal the custom of the class. Written compositions should be marked by the teacher and should be arranged with the best at the top and the poorest at the bottom.

What shall be done with the results of such tests?

1. Keep some as an index of attainment and growth.
2. Compare with earlier tests in the year.
3. Compare with some other school.
4. Ask and answer the questions suggested by the results—Do these pupils have sufficient variety in their composition work? Are they imaginative and resourceful? Are they reasonably correct in the use of language?

Something may be learned from the criticisms of our schools. Some of the educational ideas of business men are expressed by their criticisms. "The children cannot add correctly." "They are not thorough in anything." "They cannot write a short letter and spell the words correctly." A few hours' visit to any classroom would change these wholesale condemnations to a fairer statement beginning with "some."

In reference to tangible intellectual results there is now a widespread movement throughout the country to test schools and rate their products. The subject in which results can be easily tested is arithmetic. This subject is taken partly because its results can be easily tested, partly because the subject is found in all grades, partly because it is fundamental in character, and largely because business men say: "All children should add correctly and they cannot."

With reference to this insistent demand for thoroughness, whether made by business men or professional testers, it is important to observe that absolute thoroughness is not the most essential element in a successful life. Of course, honesty, truthfulness, and fidelity are of fundamental importance, but the required power that makes for effectiveness in every department of activity is good judgment. Much of our school work, therefore, must be concerned in training children and young people to make wise decisions that they may become possessed of good judgment.

With reference to the adaptation of the course of study to the needs and capacities of individual pupils, we are not succeeding in a manner entirely satisfactory. We are however, approximating to a condition of efficiency. We are efficient in adapting our program to about 85 per cent of our pupils. Schools generally are least efficient with the slower children. In nearly every class there are some children who are over-age for their grade. This problem, however, of dealing with over-age pupils is already half solved because we recognize the problem, its seriousness, and the direction in which the solution lies.

It is the teacher's duty to improve the average, but it is just as much a duty to improve the best and the poorest. Children differ greatly as to their capacity to do school work, for example, to express themselves in written exercises. In a set of papers written in a classroom the results will vary in quantity from half a page to two pages. The variation in quality will be equally great. As Dr. Charles W. Parmenter has stated the case, "In any given group of pupils, there are enormous differences of native aptitude, industry, ambition, and perseverance that cannot be overcome by the best organization and the most competent teachers."

The fundamental need is to make sure that every individual is making week by week a reasonable gain.

RATING STUDENTS ON THE BASIS OF NATIVE CAPACITY AND ACCOMPLISHMENT

IRA A. FLINNER, HEADMASTER, HUNTINGTON SCHOOL,
BOSTON, MASSACHUSETTS

In this article I am making a plea for a careful study of the boys and girls who are placed in our care and for whose development we have a great responsibility. We schoolmasters can learn a valuable lesson by observing the athletic coach. On the athletic field the coach sizes up his material and assigns boys to tasks in keeping with their abilities. A boy is asked to play fullback because he possesses certain qualifications or certain potentialities which make him valuable for that position. The track coach does not select the under-sized boy of small muscles to try out for the shot put, nor does he select the big, heavy boy for the dashes. He assigns his material according to pretty well-established principles, which are the result of long experience.

Such a study of individual differences should take place in classroom work. Among teachers there is a tendency to suppose that all students can do all kinds of mental work and that all students can attain high rank in school subjects if their effort is great enough. In fact considerable pressure is brought to bear to develop honor students out of all the raw material. Scholarship prizes, honor societies, honor lists, and praise by instructors, are means that most schools use to encourage the whole school to a high accomplishment. It is decidedly laudable to secure excellent performances, but teachers and parents must realize that only a limited number of students are able to do superior work. Classroom teachers must appreciate that pupils differ as much in their ability to do mental work as in their ability to do certain physical work. If teachers and parents understood this fact fully, then greater effort would be made to secure high grades from superior individuals, and less discouragement given to individuals of average intelligence who do not measure up to the expectations of teachers but who, nevertheless, are working in accordance with their talents.

In some respects school children are like gas engines whose ratings have been established by the manufacturer and under favorable conditions are expected to perform according to the official ratings. Each child has a different mental ability, ranging from very poor to very good. To set before individuals of average and poor mentality tasks that are very much beyond them is unwise and unjust. To be satisfied with average accomplishment from individuals of superior ability is just as unwise. Each individual should perform according to his possibilities. Each one should be urged to give his maximum effort so as to produce results in accordance with his ability.

The great task before educators today is a scientific study of the raw material. We are now able, by psychological tests and through other means, to estimate quite accurately the ability of individuals to do mental

work—that is, the ability to acquire subject matter such as is given in our schools today.

At Huntington School we have devised a rating plan which takes into consideration both the accomplishment of the student and his native intelligence. By native intelligence we mean the innate capacities by virtue of which the individual is capable of learning, and by accomplishment we mean what he has learned because of those capacities.

At the beginning of the school year, 1921, each of the three hundred boys in the school took the Otis A and the Otis B group psychological tests.

Scores obtained from the Otis A and Otis B group tests for the first eighteen boys alphabetically arranged.

The scores recorded are the number of points above or the number of points below the Otis norm for the ages given.

The A and B scores were averaged in most cases. When large differences appeared between the two tests the higher score was used as in Case 4.

Eighty-five per cent of the student body received scores above the standard norms.

In Table 1 are given the scores which the first eighteen boys in the school alphabetically arranged secured.

In Column 1 are given the ages of the boys; in Column 2 the number of points each boy secured in Test A above or below the standard norm; and in Column 3 the number of points for Test B above or below the norm. In the third column are the averages of the two tests. In some cases, however, where there was wide variation in the results, as in the case of the fourth boy, who scored 31 above the norm in Test A and 73 above the norm in Test B, we took the liberty of adopting the higher score. Such wide variation we attributed to errors in testing, and so gave the student

the higher score. Obviously no boy could do better than his native ability, but there are many reasons why he might not perform according to his capacity. These increments and decrements were then translated into terms of the school grading system, using A, B, C, D, and E, as indicated in the fifth column. Just how the transition was made from the number scores to the letter grades will be explained in a later paragraph.

In addition to these group tests we called upon the teachers to make estimates of native intelligence. At the close of the first two months of school teachers were asked to give their estimates of native capacity of the pupils whom they had in their classes, using the regular school grading letters for this purpose. It was understood that they considered all students rated A, B, and C able to prepare for college, that boys rated D and E, although they would profit by pursuing many of the subjects in a college preparatory program, would not likely enter college. Teachers generally are fairly accurate in estimating the native ability of students who lie at the extremes on the scholarship scale—that is the superior and the inferior pupils, but they are not always able to differentiate between good and average students. It is also a matter of record that where there is any conscious attempt made to separate college material from the non-college material there is considerable accuracy. That our teachers were able to estimate the native capacity of the students fairly accurately is indicated by the fact that the correlation between the average of their estimates and that of the Otis scores is 71.¹ That this correlation, considerably higher than is usual, was secured is due very largely to our small classes and the fact that all members of the staff had had considerable experience in teaching. Correlation scores usually run from 50 to 65.²

In Table 2 are the same eighteen boys listed in Table 1 and the estimates of their native ability as given by their teachers. The numbers from 1 to 5 refer to the teachers who made estimates. The reader will observe that there is considerable agreement among the various teachers' estimates. These eighteen cases can be considered a good sample of the estimating done by the staff for the entire school of 300. Whenever the individual estimates of teachers showed wide variation, investigation showed that teachers who made these variable ratings did not have accurate data on which to base their judgments. For example, some of the pupils who were rated too high were repeating courses and for that reason during the first part of the school year were doing well in those courses. These boys received estimates that were higher than their real ability. Teachers' ratings which were obviously not correct were thrown out. In Table 2 in the last column the average of the various estimates is given. It will be observed that the average varies but little from each individual estimate.

Now let me explain how the Otis scores were translated into the letter grades. The increments and decrements of the Otis scores, which ranged

¹ Pearson's method.

² A correlation of less than 100 is due to inaccuracies in both the Otis scores and the teachers' estimates. I refer to nervousness when taking the group tests, lack of time for slow students, etc. In estimating native ability, teachers rated over-age students repeaters and loafers inaccurately.

from -60 to +80, were plotted on a base line of fifteen divisions. Each division included ten points. Likewise the teachers' estimates of students were plotted, using a base line with fifteen divisions corresponding to the letter groups A, B, C, D, and E, each one divided into three groups by the use of minus and plus signs. As previously stated, it is likely that there is greater accuracy in teachers' estimates between the C and D groups than at any other point on the curve. Accordingly the line separating the D and C groups as indicated by teachers' estimates was extended to cut the Otis curve. An examination of the curves on page 9 will show that those who made Otis scores above the norm could be considered in the same classification as those who were estimated by the teachers in the A, B, and C groups.

The reader will readily see, therefore, that the middle or C group must include those with Otis increments ranging from 0 to 30; the B group with increments from 30 to 60, and the A group increments above 60.

The writer realizes that the fifteen divisions are really not of the same size, but for all practical purposes they can be considered equal.

So far the data which we have discussed in classifying the students of the school included the two group psychological tests and the teachers' estimates. Inasmuch as there were inaccuracies in both these methods of rating students, it seemed wise to give to each student the ¹Stanford Revision of the Binet Simon Tests to check results.

¹ These tests were given by a trained psychologist

TABLE 3—THE INTELLIGENCE QUOTIENTS OF THE SAME EIGHTEEN BOYS GIVEN IN NUMBERS AND LETTERS

The following distribution was used: A=120 and above; B=110-120; C=95-110; D=80-95, and E below 80. This is approximately the distribution recommended by Terman.

In calculating these intelligence quotients sixteen, as recommended by Terman, was used as the divisor for all boys sixteen years of age and over. There seems to be considerable evidence available to indicate that the growth of the innate capacities of individuals does not continue for the majority of persons beyond fourteen and one half years. If we had used fourteen and one half as the divisor for the boys of that age and older, as recommended by Professor Dearborn, of Harvard, we should then have to increase the I. Q.'s for those boys from ten to twelve points. In the third column of Chart 4 we have given the I. Q.'s in terms of the school-grading system. Those boys who received I. Q.'s of over 120 were classified as A boys; those between 110 and 120, B boys; between 95 and 110, C boys; and between 85 and 95, D; below 80, E. This classification was made more or less arbitrarily. We should have included in the A, B, and C groups only those who had I. Q.'s above 100, because we found that all A, B, and C boys as classified by teachers received scores above the norm on the Otis tests; therefore they should be rated above 100 in the individual tests. We chose to include within the C group I. Q.'s from 95 to 100 instead of from 100 to 110, first, because we wanted to give the benefit of any doubt to the student and, second, our data indicated that the I. Q.'s of boys fourteen and one half years and over were too low, as already explained.

TABLE 4—DATA FROM OTIS GROUP TESTS, TEACHERS' ESTIMATES AND BINET TESTS, WITH THE SCORES GIVEN IN THE SCHOOL GRADING SYSTEM

In Table 4 we have combined the various results obtained from the two Otis group tests, teachers' estimates of native intelligence, and the individual Binet scores. In the last column of the chart is given what we call the "Huntington Index of Intelligence," arrived at by averaging or weighing the evidence given in the three columns to the left. On the basis of the data given we are able to state that student No. 1 has D ability; student No. 2, A ability; student No. 3, B ability; student No. 4, B ability. A glance at the chart will indicate that there is considerable agreement in the three methods of rating students. In the case of the first boy the estimate given by the teachers is somewhat higher than that given by the psychological tests. This is because the boy was taking work of an elementary character. All methods agree in rating the second boy A. Whenever there is wide variation it is usually explainable.

In some instances we did not use the average of the three scores, but weighed the available evidence. To cite an example: In the case of one student his ability was rated by his teachers as A; by the Otis group test C; and by the Binet test he was given an I. Q. of 140. We found a discrepancy here. Since the boy is only eleven years of age we could readily see which one of the three methods of rating was most likely to be incorrect. We, therefore, threw out the score given by the group test and used only the Binet I. Q. and the teachers' estimates.

Having obtained the ability index of each student, it remains to explain how we use this index. It is used as a measure of his efficiency. The accomplishment of a student divided by his intelligence gives his efficiency.

¹ H. I. I. is the Huntington Index of Intelligence, arrived at by averaging or weighing the three ability scores: Otis group scores, Binet scores, and teachers' estimates.

An A student who does A work has an efficiency of A divided by A, or 1, but for convenience the score of 100 is used. A student of B ability who does B work also receives an efficiency rating of 100, likewise the C and D students who do C and D work. But the A student who does B work scores less than 100, as does also the C student who does D work. To obtain the actual efficiency score which each student of a known ability should get because of a certain accomplishment one must assign numerical values to the various letter grades.

	E—	E	E+	D—	D	D+	C—	C	C+	B—	B	B+	A—	A	A+

TABLE 5—A CHART OF EFFICIENCY QUOTIENTS

The letters at the left of the chart indicate the classification of the students, and the letters at the top of the chart their accomplishment or scholarship grades, properly averaged. Thus the B boy who does B work receives a score of 100; an A boy who does A— work receives a score of 96; a B boy who does C work receives a score of 88.

In compiling Table 5 we used the following values: A, 95; B, 85; C, 75; D, 65; E, 55. The values given to A plus and A— are, respectively, 98.33 and 91.66; to B plus and B— 88.3 and 81.33, and in like manner the numerical equivalent for the other three grades were determined. The numbers in the squares are the quotients obtained by dividing the numerical values of the letters at the top by the numerical values of the letters at the

side. The letters at the top indicate the average accomplishment and the letter at the side the grade of intelligence of the individual.

This chart has been subjected to a smoothing process, the reason for which will be seen in the following explanation: The quotient of

$$\frac{B}{A} = \frac{85}{95} = 89; \text{ the quotient of } \frac{C}{B} = \frac{75}{85} = 88; \text{ and } \frac{D}{C} = \frac{65}{75} = 87. \text{ It is}$$

noted, therefore, that the quotients obtained by dividing the larger numbers is larger than by dividing the smaller numbers. By using the actual quotients there would be, therefore, an unfairness to students whose ability was low. Accordingly the differences found between these various quotients in the C column were used for the entire chart. By smoothing the chart in this manner the efficiency score for all students is the same in case they do work one step below their ability. To illustrate: The score of a B boy who does B— work is 96. So also is 96 the score for a D, C, or A boy who does D—, C—, or A— work.

TABLE 6—ACCOMPLISHMENT OR SCHOLARSHIP GRADES GIVEN TO THE SAME EIGHTEEN BOYS FOR THE SPRING TERM, 1922, BY VARIOUS TEACHERS

Grades are based on a two-hour examination in each course.

In Table 6 are listed the same eighteen boys and the grades which they obtained on the spring term examinations. The average of these various grades is given in the last column. In examining them it must be remembered that these students are preparing for Harvard, Massachusetts Institute of Technology, and college board examinations, and are pursuing for the most part a classical course of study.

Table 7 gives all the data concerning these eighteen boys which have been given in the preceding charts. In the last column are the efficiency scores of these students for the spring term of 1922, obtained by dividing the accomplishment by ability. The scores range from 80 to 104. It will be noted that of the boys who receive a perfect score: Student 1, 10, 13, 14, one is a so-called D boy, one an A— boy, one an A boy, and one a C— boy. All deserve the same score, for each has performed in accordance with his capacity. Practically all quotients are less than 100, as might be expected. When higher quotients are obtained, it is because the work is easy or the students put forth unusual effort. It must be remembered that the ability scores were obtained when students were in most cases performing with a maximum effort; so it is not likely that many of our students will do much better than their ability indices. In rare cases a boy who may obtain a score of 100 does not put forth his maximum effort, because such a boy belongs to the brilliant group, and even the arduous task of preparing for college does not challenge his best ability.

The rating plan which has been described and which is in use at the Huntington School in Boston is supplementary to the usual method of rating students. It is used very largely by the school office and by teachers. The efficiency scores are not given to the students or to the parents in any perfunctory manner. Students of honor ability are informed of their rating in conference. In the case of a boy of poor or average ability the information is used very largely to aid the parents and the school to guide him wisely in his program of work and in the choice of his career. With the office and teachers informed as to the possibilities of the students, it is possible to secure under this rating plan better work from all the students than from the usual rating plan, alone. There is a tendency in any school system for the principals and teachers to direct their attention to boys in the lower extreme of the scholarship scale, because it is from that group that come practically all the failures in scholarship. But an A boy

who does B work is really failing just as badly as a D boy who does E work. This plan of rating directs the attention of the school to all the students. It is of most help with students of good and superior intelligence. These students are checked up just as carefully if they fall a grade below their ability as are the students who fail. It is valuable in dealing with average or poor students, because they are not discouraged by an expectancy which is unfair.

The whole theory of the grading plan is that each student should perform in accordance with his capacity, and no pupil should be asked to do a task that is beyond his ability. Success in life is obtained more through tasks that are accomplished than through failures that are recorded.

It is the contention of the writer that an ability-index which will show with some degree of accuracy the success an individual is likely to have in the type of school work which is ordinarily given in secondary schools can be arrived at by the use of group tests, teachers' estimates, and individual tests. Where the expense of giving individual tests is too great, practically the same results can be secured by using several group tests for the general group and individual tests for doubtful cases.

After securing such an ability-index, it is fairer to judge a student on the basis of his efficiency arrived at by dividing his accomplishment by his ability than by the use of comparative grades alone.

SPECIAL NOTE.—The writer realizes that there are a number of inaccuracies in the foregoing calculations, but he believes there are none that will seriously affect the results, viewed from the standpoint of the practical schoolman.

Department of Elementary School Principals

OFFICERS

President—LEONARD POWER, Principal of the Franklin School.....Port Arthur, Texas
First Vice-President—KATHERINE D. BLAKE, Principal of Public School No. 6.....New York
Corresponding Secretary—JOHN L. BRACKEN, Principal of the U. S. Grant
School.....Duluth, Minnesota
Chairman of Yearbook Committee and Program—WORTH MCCLURE, Principal of Gatewood
School.....Seattle, Washington

PROGRAM OF CHICAGO MEETING

FIRST SESSION—Monday Afternoon, February 27, 1922

The Professional Status of the Elementary School Principals

SOME OBJECTIVES OF THE DEPARTMENT OF ELEMENTARY SCHOOL PRINCIPALS—Leonard Power, Principal of the Franklin School, Port Arthur, Tex.

THE ELEMENTARY SCHOOL PRINCIPAL FROM THE VIEWPOINT OF THE SUPERINTENDENT—David B. Corson, Superintendent of Schools, Newark, N. J.

DISCUSSION—Led by Fred M. Hunter, Superintendent of Schools, Oakland, Calif.; Charles S. Meek, Superintendent of Schools, Toledo, Ohio; Edward N. Stitt, District Superintendent, New York, N. Y.; David C. Porter, Superintendent of School, Bridgeton, N. J.; William M. Davidson, Superintendent of Schools, Pittsburgh, Pa.

Tuesday Afternoon, February 28, 1922

The Elementary School in Its Social Setting

DEVELOPING THE ELEMENTARY SCHOOL AS A SOCIAL UNIT—Ide G. Sargeant, Principal of School No. 10, Paterson, N. J.

THE PUBLIC LIBRARY AND THE PUBLIC SCHOOL—Elizabeth Dolan, Principal of the Mark Twain School, Kansas City, Mo.

THE SPECIAL TEACHER IN THE GRADES—W. W. Walters, Principal of the Ashland School, St. Louis, Mo.

JUVENILE DELINQUENCY AS A SOCIAL FACTOR IN THE ELEMENTARY SCHOOL—Olive M. Jones, Principal of Public School No. 120, New York, N. Y.

SOCIALIZING THE ELEMENTARY-SCHOOL COURSE OF STUDY—Thomas Agnew, Jr., Principal of the Horace Mann School, Bayonne, N. J.

Wednesday Afternoon, March 1, 1922

HOW PRINCIPALS MAY PLAN THEIR WORK AND AVOID GIVING UNNECESSARY TIME TO PETTY ROUTINE MATTERS—Thomas Alexander, Professor of Elementary Education, George Peabody College for Teachers, Nashville, Tenn.

THE ELEMENTARY PRINCIPAL AS A PROFESSIONAL LEADER—C. E. Marston, Principal, Woodland School, Kansas City, Mo.

Thursday Afternoon, March 2, 1922

An open conference.

SOME OBJECTIVES OF THE DEPARTMENT OF ELEMENTARY-SCHOOL PRINCIPALS

LEONARD POWER, PRINCIPAL OF THE FRANKLIN SCHOOL, PORT ARTHUR,
TEXAS, PRESIDENT OF THE DEPARTMENT

We must bring to our problems the combined thought of all members of the Department. To do this we must have a ready means of disseminating our studies. This necessitates a Yearbook and will probably necessitate a monthly bulletin.

We shall have the first Yearbook in the hands of members before the schools close this year, by the fifteenth of May if possible. This Yearbook will be the basis for the summer program at Boston. This program will be conducted by Mr. Worth McClure, who is chairman of the Yearbook committee.

We expect to unite all organizations of elementary-school principals. Instead of having each struggling at tasks not known to others and perhaps investigating problems that have been carefully studied by other organizations, we shall make known the work of each to all. The Department will become a clearing-house for all principals. It will save much duplication.

We propose to learn the present status of elementary-school principals. We expect to raise the professional standard to a higher level. This will be done by encouraging more men and women of high ability to enter and remain in positions as principals of elementary schools. We shall stimulate them to take higher degrees after having investigated problems for this organization.

We propose to hold two meetings annually. The summer meeting will put us in closer touch with the teachers. The winter meeting will put us in closer touch with the superintendents and other supervisory officers.

Our programs will contain numbers of sufficient worth to pay Boards of Education to send representatives to hear them. Organizations of principals will be encouraged to do the same. The inspiration and education will be worth more than the expense to these organizations.

Above all, we are united for professional advancement. Our problems have long been in need of the kind of collective study that we propose to give them. Problems of almost every other field of educational endeavor have been more carefully studied than have our problems. Now we have decided to set forth the results of our own studies. We have some of the Nation's greatest educators in our ranks, and we believe our task to be second in importance to none other.

THE ELEMENTARY-SCHOOL PRINCIPAL FROM THE VIEWPOINT OF THE SUPERINTENDENT

DAVID B. CORSON, SUPERINTENDENT OF SCHOOLS, NEWARK, NEW JERSEY

The principal discussed in this paper is the man or woman placed in charge of an elementary school in either a suburban or urban community to

manage the school and to supervise the instruction given in the classrooms. He is the responsible head and not merely the teacher of the highest grade with incidental duties as an administrator and with negligible influence over the instruction given in classes other than his own. Nor is he a nominal principal free, mayhap, from teaching a class, but giving the major portion of his time to executive rather than educational work.

Superintendents agree that there are two distinct kinds of work which the elementary principal should perform in order to make a good school—one administrative and the other educational. They acknowledge that, because the school is becoming larger and ever larger, particularly in the great cities, and because the management of it is becoming more and more difficult, due to the complexity of the problem, the administrative duties are engaging too much of the time and thought of the principal and that the pedagogical duties are deprived of their rightful attention. He is in danger of becoming the school manager, but the office of principal connotes more dignity and better professional preparation. It is based upon a nobler conception than any managerial activity alone implies. The principal should be the dynamo of the school, the source of educational power. He should see the work in its largest aspects. He should be the unifying force through pedagogical knowledge, insight, and conviction, making everything else a means to the great end of educational leadership.

No one denies the importance and value of administrative skill. If anything, the leadership in mind tends to place it upon a higher plane than it now occupies. It is a matter of common knowledge that much of the executive work of the principal is petty and routine and professionally debilitating, requiring familiarity with the details of the school, common sense, and judgment, it is true, but less vital than it ought to be.

The chief officer of a great business house or of an institution of any importance is under the necessity of administering his trust with some regard to cost. This is not required of a school executive. Even if it be assumed that one of his functions is to manage his school with the relation between expense and results in mind, there is so little attention given it that the matter is more theoretical than real. With the increasing cost of schools, custom should be changed and a method should be devised whereby a principal should have more actual responsibility for the expenditure of money. In doing this, care should be taken not to attempt solely to save money, but to have the ratio between cost and efficiency more and more satisfactory. Herein is a possibility for executive skill of a high order, and its exercise tends to make administrative work a real aid in the attainment of leadership of outstanding character.

The principal should be a leader in his supervision of the instruction. Here is where his knowledge of education, its aims and methods and means, is most needed. He should be a good teacher and an exemplar of the best in teaching. His skill as an instructor will do as much as any other one in qualification in winning his rightful place. To teach is not all of a principal's work, but it is the most fundamental in that all else must be con-

ditioned upon his ability to lead the teachers among whom his work is done. It secures confidence, coöperation, and effort on their part. His presence is not always necessary, for his influence will be felt in every classroom. His energy and wishes and ideals are influential and effective in numberless ways. The teachers will aim to reach his standards; they will work for his approval; they will value his commendation; they will grow in professional spirit. He recognizes and appreciates the good in their work, knowing the difficulties, but is frank in his suggestions for betterment wherever it is possible. In a school where teaching skill of a high order prevails, it will be discoverable that the principal has developed it. Of principals it may truthfully be said that "as the principal so the school." It is the principal who should radiate courage, firmness, moral stamina, who should breathe the breath of life into a school and make it a living spirit. A school that is not a living spirit but only a building with an indifferent personnel following a deadening routine reflects the ideals of the principal as well and makes clearer the truth, when contrasted with another school having a principal of stronger inspirational power.

Educational leadership of the principal may be shown not only in his association with the teachers of his school, but in his relation to the superintendent. This may be aptly stated as somewhat similar to that of the Federal Union and the States—the respective States have powers and prerogatives, arising from their local sovereignty; the Nation has other powers and prerogatives which are exercised for the benefit of all, the National Constitution and the laws and treaties made thereunder being the supreme law of the land. Likewise, the superintendent has authority and jurisdiction over the whole school system, and his policies, designed for the good of all, should be the dominating thought and influence in the schools. The principal should know these policies and should seek to make them effective. He is the representative of the superintendent in certain respects. This does not mean that he shall be a subservient nonentity, for he has jurisdiction and powers all his own. The two fields are different but one includes the other. The principal should have reasonable freedom. He should have the right of initiative, provided it is in harmony in a broad way with the policy of his official superior. He should have the opportunity of leadership. The schools are not autocracies, although the practices of some great city systems appear to make them such. Whatever is wrong in methods of teaching, or of discipline, or in results achieved should be placed squarely upon him. He is the commander in his building. He should be able to command. He should be supported, if worthy, in the command.

One of the specified requirements of a principal in a modern school system is to pass professional judgment upon teachers, the same being recorded in an official rating filed in the office of the superintendent. Such ratings are necessary, because there must be some record of a teacher's work available. Merit schemes of all kinds, where professional men are engaged in large numbers, as in engineering, or hospital service, are made to insure fairness and justice. With some teachers there is resentment against any rating

plan. Efforts have been made by superintendents to remove the irritation and misunderstanding which it has caused, but they have not been wholly successful. Because of this feeling among teachers, principals often fail to give a true and just rating; this causes inferior teachers to become fixtures in the schools. Some teachers are able to create disturbance and to becloud the issue so successfully that it is the path of least resistance to give them a high rating. Another reason is that there was misconception of the purpose of efficiency records when they were first introduced.

A principal, before giving a rating, should become so familiar with the work of a teacher that it is possible for him to furnish conclusive evidence of the teacher's ability and skill, or the lack of them, to secure satisfactory results in a proper way. The rating should be the judgment of the principal, given without sentiment, favoritism, or personal feeling. There should be explicit reasons for rating a teacher high or low, and they should be so clearly convincing that any unsuccessful teacher cannot evade the issues raised or explain away unfavorable judgments. Unless this be so the principal has failed in the performance of one of his most important duties. His reaction in this matter is a reliable index of his professional capacity and fitness. Enfolded in it are all the possibilities for progress and success of his school.

The inclusion in the program of studies of the expressive subjects—that is, art, music, domestic art, domestic science, manual training, and physical training—somewhat threatens the authority of the principal and somewhat challenges his leadership. For the supervision of these arts a new officer called the supervisor has been employed. In many places there are supervisors as well of academic subjects and the kindergarten. Although this is true, still the principal should be fully accountable for the instruction and inspiration in all the subjects and in every department. Divided responsibility weakens the school and injures the standing of the principal in the eyes of his teachers.

Supervisors find it necessary to hold meetings with the teachers of their respective subjects or departments in order to secure effectiveness in the teaching body. Directions for teaching and official explanations of the courses of study are thus given to the whole group of teachers. Unless principals attend these meetings they are at a disadvantage in discussing the subject or subjects with their teachers. Frequent misunderstandings and not a little friction are caused by this condition. It may not be convenient for the principal to attend all meetings, but a method should be found to furnish him the information and instruction given the teachers so there may be unity of effort and no ill will engendered.

The question, "What is the principal's relation to the supervisor and of the supervisor to him?" is often asked. The answer is not so evident as in the principal's relation to the superintendent, especially in the case of supervisors of the special subjects. Only upon reflection is it clear. These so-called special studies, because they have not been and are not now a part of general education, require special training. Some of them are taught by

special teachers in the school, and, because the principal lacks training in them, he may shift the responsibility for their supervision wholly on the supervisors. That should not be. He may not know the subject-matter or the technique of a given subject in detail, but he is under obligation to inform himself sufficiently in order that he, with the assistance of the supervisor, may perform his task. The supervisor's function is therefore advisory. The relation between the principal and the supervisor may be such that the principal has confidence in the supervisor and does not accompany him in school systems where supervisors make such visits for inspection, preferring to receive a verbal report with criticisms, suggestions, and recommendations based thereon before the supervisor leaves the building. That is a reasonable solution of the problem—cordial personal and professional coöperation of supervisor and principal.

These considerations suggest the whole matter of the qualifications of the principal. Since he is one of the essential trinity in educational leadership—teacher, principal, superintendent—it is not too much to require that he be a person of broad scholarship, of professional training, and of personal power and fitness. To these qualifications as a minimum must be added those of experience in handling people and the wisdom which insight and reflection beget. Such a person does not spring Minerva-like into being but grows and develops with the years. There are many principals who began as teachers, became head teachers, then principals, at first in small communities then in larger communities, and finally in the large cities, developing and ripening with their expanding responsibilities.

No one will seriously question the desirability of adequate scholarship for the principal. He should know well not only the subjects taught but should have the general academic equipment for admission to any profession. Scholarship gives a view of the field of learning which develops insight and creates scales of value. He should possess it, for it stimulates interest, commands respect, brings the experience of the past to bear upon the present, and gives freedom of action and sanity of judgment to its possessor. Of two principals one with and the other without scholarship, there can be no question as to the greater worth of the first in comparison with the second, experience and personal fitness in each having about the same weight.

The professional equipment of the principal is necessary. He must know the field of education, its science, its art, its history, its purpose. He must have the practical sense of the business man and the finesse of the diplomat combined. Knowledge of the science of education enables him to call that which is valuable to him in his work from many sciences, such as ethics and psychology; knowledge of the art of education gives him the technique of the educational process; the history of education makes him familiar with the accomplishments of the past as well as the theories and the tremendous influences and movements that have affected educational practice and development. This equipment is as essential to the principal as is that of mathematics to the engineer, of a knowledge of *materia medica* to the physician, of the methods of procedure and of jurisprudence to the lawyer,

or of exegesis and homiletics to the clergyman. Such professional attainment will create a professional attitude toward his work, and help to make him an upstanding, confident, clear-seeing, and efficient professional man.

The personal fitness of the principal is equal in importance to that of his other qualifications. It is often the weakest of the three elements in the making of an efficient elementary principal. It is axiomatic that he should have vigorous health, for an invalid or a misanthrope is seriously handicapped and not likely to be a stimulating influence. He should have a sane attitude toward life, comprehending it in a broad, tolerant, cheerful spirit. He should have the training in manners and in personal and social habits which will enable people to classify him at once as a gentleman. He should have convictions about truth and the eternal verities that will make him balanced and stable and worthy. He should possess that blessed thing called character which means, at least, tolerance, poise, urbanity, and strength of will. His personality, the composite of physical, mental, moral, and spiritual health, should be such that all the world may rise and say, "This is a man."

The possibility of educational leadership on the part of the elementary principal calls for a resumé of some of his rights, powers, and duties. All of these may not be legally secured everywhere to him by statutory enactment, but if they are not they inhere in his position. He has the right to be protected against the uncertainties of politics or of changing majorities in the controlling boards. He should be secure against personal animosity and vindictiveness on the part of an individual member or members of the board of education who temporarily may have the influence to annoy and to harass him and even to cause his dismissal. This right of tenure should be given after a probationary period of not more than three years, in which time the principal should have demonstrated his ability and fitness as an educational leader. The fact that he may become inactive or indifferent or inefficient after obtaining his tenure is not a valid reason for denying him this right. There should be found means to relieve school systems of principals who have ceased to function as they should. The competent principal has the right to a salary commensurate with the dignity and value of his work. Until recently the salary has been wholly inadequate, but an aroused public sentiment has caused more satisfactory salaries to be paid. The office should be rated not as a subordinate, but as a professional one, requiring superior resources and initiative and professional skill and judgment. On this basis should the remuneration be determined. The third right is that of provision for disability and old age in the form of a disability or age retirement allowance. It is just that the beneficiary should help to sustain a fund, payments being compelled by law. His service entitles him to participation by the State in the fund to the extent that he and the State share, on an equal basis, in making this provision. With permanent appointment, with certainty of income commensurate with his responsibility, with sure provision for disability or old age, the principal would have secured to him the independence and freedom from worry which the accumulation of money from a gainful occupation provides.

The powers of a principal should be clearly defined and generally recognized. They should be such that he has authority as well as responsibility. His jurisdiction is that of the school, the unit of school administration, and his powers should be sufficient to enable him to control and govern the school, to enforce all rules and regulations of the Board of Education, and to carry into effect the requirements of the superintendent of schools.

This comprehensive statement of a principal's powers may be made specifically to cover concrete conditions which may arise in the administration of the school. The weakness at the present time is that the authority of the principal may be unpleasantly and unreasonably attacked by dissatisfied and unreasonable patrons or critics. The state of public opinion does not yet assume that the principal has powers and that his action may be within them. The presumption appears to be in favor of the critic who can sometimes damage a principal's reputation and influence without a rebuke. The remedy lies in a widespread recognition of the powers of the principal so that pettiness, or prejudice, or malice cannot injure him.

The duties of a principal are multitudinous. The great danger is that the lesser and relatively unimportant may absorb his time and dissipate his strength and influence. Again, the increasing size of city schools tends to enthrone mechanism and formalism. In our great city systems there is much clerical work to be done; in fact, we are in an age of *quantitative* education. We measure education in units and credits, we survey, we devise questionnaires and collate the answers thereto, we test and examine pupils, we investigate plans and methods, we write plan books, we collect statistics bearing upon every phase of school administration, every subject of the curriculum, every characteristic or qualification of pupil, teacher, or principal. This quantitative ideal taken in connection with the effort to control large numbers of people from a central office, the formalizing of methods—all tend to mechanize and to devitalize schools. It may be useful; it may be necessary to some degree; it may even be valuable in its illuminating effect. It must, however, be within reasonable limits. Clerical work should be done by clerks. Investigations should be limited to fruit-bearing varieties. The principal's chief duty is to supervise and inspire and lead his school. He must find a way to relegate these quantitative functions of his office to others, reserving his thought and action for the larger, broader, supervisory work that shall make his school a forceful and an inspiring center of educational life.

Educational leadership may further be shown in the relation of the principal of an elementary school to the parents of the children and to the community. Leadership will insure support of his policy and confidence in him as a disciplinarian. Without it, the school will be hampered greatly. The first means of acquiring this support is through the management of the school itself. The principal can by wise, tactful, firm, and just treatment of pupils and teachers secure the order and system which command approval and commendation. A man inherently strong will do this almost unconsciously, but if lacking in such native endowment, he should seek persistently

to acquire it. There will be given in the homes of his pupils descriptions of his conduct and methods, and his suggestions and advice will be repeated and discussed, and upon these reports opinions and general estimates of him will be formed. The reflex is shown in the attitude and behavior of the children. If friendly, success is assured; if otherwise, failure is the result, shown either in indifference or antipathy, open or covert. This indirect contact with the parents is admittedly the most fundamental and lasting in its effect. It can be and should be supplemented by a direct association by the principal with parents in order that they may form their opinion of him at first hand. It is an advantage to the principal to live in the neighborhood of his school if he can do so, and to be a part of the community life. He may be a member of the athletic or literary or some other type of club and thus make himself an influence and power. In all his social relations he is unconsciously effecting the same end. This direct relationship should be more definitely augmented by bringing the parents into an organization having for its object the cultivation of the interest of parents. With it as the center of attention and concern, acquaintance with the principal and with his aims and ideals is certain.

Some objection to a Parents' Association is made because of the burden of work entailed in preparing programs for the meetings. While such preparation does require extra effort, the return for the labor is so well rewarded that it is justified. It may be regulated by showing the work of the school in the form of model lessons, essays, debates, gymnastics or calisthenics, and an address designed to inform the people about the school or about some phase of education. As different groups of children pass through the school different persons will be in charge of this organization and different people will profit by the study of the school and its work and by the diffusion of information about education that will be made. No better agency can be found for the development of the public opinion in favor of the school and of education in general. Each school should have such an association, which should be duly recognized as essential to the welfare of the school. The elementary principal can possess this powerful auxiliary for his work, if willing to make the extra effort to arouse and hold the parents. It is conceivable that this larger service may have tremendous possibilities. The guilds of the middle ages and the labor unions of the present day are types of what parents' associations may become. True, they will not have the cohesive power of these organizations, because the motive for their existence is less impelling, but if each school had such an organization and these organizations were federated it is possible that their influence on public education would be great.

Some elementary principals are prone to complain that they do not hold the place in public esteem that the clergyman, or lawyer, or physician holds. It is claimed that at public meetings they do not have seats of honor as other leaders of the community have. A *Phi Beta Kappa* man, a teacher in a high school, recently related his experience on an Atlantic liner coming west a few years ago. He was, for the first few days out, an accepted

member of a small group of gentlemen, holding his own in games and discussions. In a conversation inevitable because of the friendliness established, each man told of his business and of his material success in life. From this point of view the teacher was the least successful. In relating the incident he spoke of the change in manner which the announcement of his work caused in the other men. They became less friendly but formally polite, and before the voyage ended he had ceased to be a member of the group. It may be asserted that this incident is not typical or that these men cannot escape criticism for their snobbery. No one, however, will deny the desirability of recognizing the principal as a leader and a man among men. True, he must deserve it because of devotion to his profession and of manly qualities. It is also true that the public must place a higher estimate upon his work as a part of National and social life and not regard it merely as an incidental in the lives of children. A change of attitude is slowly but surely taking place. The principal can hasten the process by contact with his community, by quietly and modestly magnifying his work in every legitimate way. He must realize, as we all must, that "it is not in our stars but in ourselves that we are underlings," and by outstanding leadership bring the community and society to accord the respect and recognition and honor due him and his work.

DEVELOPING THE ELEMENTARY SCHOOL AS A SOCIAL UNIT

IDE G. SARGEANT, PRINCIPAL SCHOOL NO. 10, PATERSON, NEW JERSEY

Lord Bryce and other thoughtful observers of American every-day life have pointed out the dangers threatening our National life, through our rapid growth in wealth, industry, and population, unless that along with this marvelous development in material riches we can build, as a carefully adjusted counter-balance, a community conscience which will insure the same high sense of honor, on the part of each individual, in regard to public needs, public expenditures, and public affairs generally, as is now shown by our best people in their private affairs. Each citizen must develop a willingness to assume his part of the public burden, an acquaintance with the public needs, a sense of his personal obligation to the community and the same alertness to see that he has met this obligation as he shows in his private life between man and man.

In the old days when the Nation was largely rural, men met in small groups in town meetings, or other political divisions, passed ordinances and legislated for districts with which they were perfectly familiar. They were also acquainted with each other and knew each other's qualification for a given position. But with the coming of vast industries and congested populations our people lost this intimate knowledge and personal acquaintance with municipal questions and the qualifications of their fellow townsmen. With the loss of the personal touch with public questions and their

fellowmen, went also a loss of interest in public affairs. Because of this the management of municipal affairs in many American communities has become a disgraceful orgy of extravagance and waste and reflects severely upon our national intelligence. The remedy is to get back to a community unit small enough to enable its citizens to know its needs and know each other. Just as in the Union we are finding that the Nation is too vast to allow a complete knowledge and efficient handling of certain problems and consequently have delegated them to the individual States, so in the municipal group we must have divisions small enough to permit of an intimate knowledge and an alert interest. This group will develop its local leaders. A conference of the leaders of the various groups in a city will give that city a community spirit and a community intelligence which will do away with the evils afflicting so many of our communities.

For this community unit the public school of a district is the logical center. The building and its equipment is owned by the municipality. It is convenient of access. It is the center of an area sufficiently limited in extent to enable all its residents to know it in all its parts. The principal in his school administration is non-partisan and non-sectarian. All can meet him on an equal basis. The parents and children are accustomed to coming here as to no other place in the community. The school has the confidence of all the people to a larger degree than any other institution. It is theirs. It is their money that built it. It is their money that runs it.

Why, then, has the school not played a larger part in bringing into being the better community life so much to be desired? For several reasons: First, because we have paid such niggardly small salaries, that we have not been able to secure the services of principals of sufficiently large ability to envision the possibilities within their grasp. Too many of our principals lack energy, ambition, and the broad aggressiveness which the position demands. Many of our principals are too provincial, have too narrow a conception of their work and are slaves to the so-called 3-R's. In their loyalty to tradition and a false notion of ethics they have sacrificed the big opportunities of life.

Too many of our principals belong in the cloister and not at the head of a big public school. They lack red blood. They are not good mixers. They are timid. All big business knows that publicity is the life of trade. But many of our principals shrink from giving their schools publicity. They consider it unethical and not professional. Yet these same principals denounce the public's indifference to school matters. People are not generally interested in things of which they have no knowledge. Many principals pride themselves on taking no part in politics and are absolutely colorless on questions that arouse other citizens to a white heat. This is wrong. The principal should not be an offensive partisan or a tactless hothead, but he should be the best versed man in his district on current politics. In no other way can he command the support for his school to which it is entitled.

A second big factor in preventing the proper development of the school as a social unit has been the petty restrictions imposed upon principals by

boards of education and superintendents. The principal has been burdened with class teaching, denied clerical assistance, housed in a building-making community work practically impossible and in some instances denied the use of the building for community work when a suitable building existed.

A third obstacle in the way of developing a virile, social community spirit has been the multiplicity of agencies attempting this work. Instead of centering all this work under an intelligent, forceful head at the school, one familiar with all the ins and outs of his district, and able to coördinate the various activities effectively, we find various agencies working in the district with little knowledge of what others are doing with the consequent duplication and waste that always results from an attempt by several agencies to do what should be done by one. In short, in our methods we have been using the shotgun where we needed the rifle.

Assuming that the principal has the requisite ability and training to be at the head of a large school, he is the one best fitted to direct the various activities which will give us a broader and better community life. He should be the ablest teacher and the ablest supervisor in his building, but it should be in the sense of the expert. Much of the detail must be done by clerks and assistants. Like the manager of a big manufacturing or mercantile plant, the principal must be able to organize, coördinate, and inspire his force to do the big job at hand. The principal should rarely play the dictator as a community leader, but rather the part of the lookout and the skilful man at the wheel. If this is done tactfully, he will have all needed help from those in his school and in his community.

Perhaps I can best illustrate what should be done to make a beginning in developing a school toward a social unit by relating what has been done at Public School Number 10, Paterson, New Jersey. In 1908, we organized a school Alumni Association and later an Improvement Association, the latter partaking of the nature of a parent-teacher association. The Improvement Association meets the second Wednesday and the Alumni the second Friday of each month. Committees of the associations for different activities meet several times a week as the need arises. Sometimes it is only a conference in my office between the officers, citizens, and myself.

At the time these organizations were formed our building was very poor. Rooms with light and floor space for twenty-four children were crowded daily with ninety-six. We had no school assembly or gymnasium. Our people were discouraged and felt nothing could be obtained in the way of relief, as my district is an industrial one and our children represent over thirty different nationalities.

Through the efforts of these organizations backed by a progressive mayor, Board of Education, and Superintendent, we were able in September, 1918, to move into a new fifty-room building, which was commended by Dr. Strayer in his survey as one of the most completely equipped school plants which he had examined.

The first step in making a social unit is to begin with the children. Our school nurse has her regular daily hours in school, with other hours for

visiting the homes or the mills if need be. Our baby welfare nurse has her regular hours in school for a clinic to which mothers come for instruction in feeding, dressing, and caring for the little ones. The rest of her time is consumed in visiting throughout the district, advising with mothers and prospective mothers. This nurse is able to confer with and aid about two hundred mothers yearly.

The school dentist, with a completely equipped office and an assistant, is employed full time in attending to the children in our part of the city, six days in the week, twelve months in the year. A fully equipped gymnasium, with male and female directors, is in charge of the physical instruction of the children and adults from 8:30 A.M. to 9:15 P.M. The night classes for men and women in the gymnasium have cleared the loafers off the corners and given the younger element wholesome instruction in wholesome surroundings. This, supplemented by a weekly dance in the gymnasium and moving pictures in the auditorium, provides entertainment free from vicious surroundings. Many of our women attend the dress-making, millinery, and cooking classes with profit to themselves, and the men make many useful articles of furniture in the manual-training shops. Boy Scout troops and the Junior Patrol do much to train the younger ones in law and order. Different social groups—as Lithuanians and Italians—have a night when they are responsible for the program of an evening's entertainment for the community. Besides the night classes, we have a dramatic club and other societies of a special nature.

There has also been the personal service which has led many to look on the school as a protective as well as an educational agency. When flour suddenly jumped from \$10 to \$14.25 per barrel, we placed 350 barrels at \$11 a barrel in the homes in the immediate neighborhood of the school. When many families were unable to get sugar we secured a shipment of 40,000 pounds and rationed it out according to the number of children in the families. When a shyster had buncoed one of our men out of his Liberty bond and the wife complained to us, we sent for the shyster, and after much bluster he returned the bond to the rightful owner. When a woman who had paid for coal in July, and in December, with a sick baby in the house, finding herself without coal for three days, because the dealer would not deliver any, complained to us, we called on the coal dealer, who sent her coal within two hours. I could enumerate many instances of the sort. What enables us to secure quick action? Publicity. We have a committee which gives the bald, honest facts to the press if the wrong is not righted. It is pretty well known that we will do it; it is also known that this committee will fight if milder methods do not prevail.

In this support of our community needs we number lawyers, contractors, railroad men, manufacturers, and day laborers. The millionaire and the small wage earner have shown a fine spirit of coöperation. We realize we have made only a beginning, but we feel sure that much better things for us are just within the shadow awaiting further community action.

THE SPECIAL TEACHER IN THE GRADES

WILLIAM WADE WALTERS, PRINCIPAL OF THE ASHLAND SCHOOL,
ST. LOUIS, MISSOURI

In the Ashland School every teacher specializes in some department of school work. As the interests of the teachers have centered upon fewer educational activities and have been extended over a much longer period of the development of their pupils they have tried to find out all that is useful and possible to know about their special subjects and the best methods of teaching them. They have ceased to think of just so much ground to be covered in a period of ten or twenty weeks and have come to follow with a much more intense interest certain phases of the growth and development of the personality of their pupils through a period of two to three years.

The older pupils stay in school better and enjoy their work more from year to year. The special teacher knows how to get the best out of a pupil that comes to her the second or third year in the same educational activity.

There are many theoretical objections to specializing in the grades. These objections do not seem to stand the test of thoughtful, careful, sympathetically guided experience. Instead of a narrowing effect upon the character and efficiency of the teacher, it tends to broaden her scholarship, improve her pedagogy, increase her zeal, and make her more efficient in the proper stimulation and guidance of the pupils with whom she associates for a longer period of time. Since all education is for the purpose of development and desirable modification of the personality of the pupil, we do not try to make any distinction between instruction and moral influence and training. But the experience of years has shown that the personal influence of the special teacher with a daily contact of forty-five minutes lasting over a period of years is much better than that of the general teacher who is with the pupil several hours a day for only a few weeks.

Some have feared that the special teacher would not work harmoniously in the supervised activities. Practice has proved the opposite to be true. The departments of drawing, music, penmanship, and physical education have found their supervision easier and more effective with the special teacher, for the special teacher is more appreciative of the help of the supervisor. The efficiency of the principal and all visiting supervisors is much greater with a corps of specialized teachers than that of a school that assigns to every teacher a little of everything in the curriculum.

The special teacher and specialized classroom equipment afford great advantage in the furnishing of educational instrumentalities. In the senior division of the organization of the school there are fourteen classes and fourteen teachers. For this division only one room is furnished for history and one for geography instead of seven for each. Only one room is equipped for fourteen classes in drawing and one for penmanship instead of fourteen for each. There are only two gymnasiums instead of fourteen, only two music rooms instead of fourteen, only two rooms for arithmetic, two for language, and two for reading. The equipment for the fourteen classes is very much better and more economical than under the non-specialized plan.

With special teachers better and more scientific methods of instruction have developed even more rapidly than the demand for more and better instrumentalities. A teacher devoting all or most of her time to one subject finds much more available material in the homes and community life near the school than is possible for the teacher of many subjects. This tends to make the work of the school less artificial. It tends to make the work in the school function out of school, to socialize instruction, to influence conduct, to modify personality, to make of the child a better citizen, to develop character. We know that our specialization has helped in all this. We could not turn back to the non-specialized school.

Social democratic class organization—Our classes range in numbers from a minimum of thirty-six pupils to a maximum of forty-eight pupils. Most classes have from forty-two to forty-five pupils. There is but one class in the care of a teacher except for brief periods during emergencies.

The school day is divided into seven periods of forty-five minutes each. The work of the day is divided into seven divisions. Above the third grade no two divisions of the day are devoted to the same subject. Pupils take art and penmanship on alternate weeks; so that there are eight organizations of each class for different kinds of work. All organizations of work are for five days per week, although in some we combine two activities to make up the work for the week. Grammar, composition, and spelling are put in one division. Geography and nature are grouped together, and music and social welfare work make another five-period unit.

In each of these eight divisions of the educational activities of the school the three boys and the three girls who rank highest in personality and in efficiency in the subject in hand are selected by class and teacher as team captains. The ranking boy captain and girl captain are class leaders for the one period and subject. The remaining boys are organized into three carefully graded teams. The girls are organized in the same way. Pupils assist in all organization and ranking. This gives a fourfold ranking for all classes in each of the eight divisions of the work, making thirty-two different ranks for each class. If all had the desire and ability to lead it would be possible for every pupil in a class of forty-eight to become a captain in one of the eight organizations. The actual number who do become leaders during a half-year period varies considerably with different classes. More than half of every class are captains all of the time; and those who can never win a captaincy are given other responsibilities, all that they can carry.

The captain and the members of each team assist the teacher in the ranking of the members of the team at least twice each quarter. The fourth and ninth weeks of each quarter of ten weeks are known as contest week. During the third and eighth weeks of the quarter each team is carefully ranked, and two or three of the poorest workmen of the first and second teams are required to defend their titles to a place on their teams. Two or three of the best in the second team are allowed to contest for a place on the first team. Two or three of the best on the third team are allowed to con-

of thought to another at will, purposeful thinking, and the ability to effectively follow up the solution of a problem when other interests are pressing their claims for attention;

(6) Such training in citizenship as will best develop worthy citizens of a progressive social democracy, with powers and habits of initiative and self-direction, self-restraint, responsibility, coöperation, leadership, and those companionable qualities that characterize desirable members of social, educational, and industrial teams, clubs, societies, and other organizations and institutions of coöperative welfare; and

(7) The well-rounded growth and development and desirable modification of an individual personality, whose activities will bring rich returns of welfare and satisfactions to himself and to those with whom he lives and works and plays.

The socialized school at work—Our social democratic organization of pupils into carefully graded teams with many leaders has been described. I have given an account of the coöperative departmental organization of the teachers. In addition to the social relations of teachers to their pupils and to one another, as already indicated, they are organized among themselves into many coöperative units. In this, also, the democratic idea of alternate leadership is practiced. No teacher in the school works alone. Every teacher belongs to more than one coöperative group. Every teacher exercises leadership and carries responsibilities with other teachers. The teaching corps is much more thoroughly socialized than the classes of pupils.

At 8:10 to 8:15 A.M. the general officers of the school begin to arrive and assume posts of duty in playgrounds, basements, and hallways. These officers are thirty in number and are elected from the three or four highest classes of the school. At 8:30 all these officers are on duty, and gongs sound in basements and hallways announcing that all pupils are welcome to all parts of the building. Teachers and pupils are expected to be in advisory rooms at 8:45, though pupils are not legally tardy until after the 9 o'clock gongs. At 9 o'clock the work of the first forty-five minute period begins.

The period from 8:30 to 9 is a very busy time. There is the assembling of twelve hundred pupils through eight different entrances. Teachers, general officers, class leaders, captains, special officers, and a host of others go about their duties in a businesslike fashion. If it is Tuesday morning three employees from the public library are with us. Books are being gathered and stamped and laid out for new distribution. The Tuesday issue has averaged about eight hundred books for several years. As each class gets its turn to go to the library during the day its reading teacher comes to meet it and act as advisor and guide in the selection of books for home reading.

Within the classrooms and in the gymnasiums and playrooms each class at 9 o'clock takes up the work where it left off the day before. All or most of the teams of a class may have work left over from the day before. If so, each team goes about its business without waiting for directions, assignments, or supervision of any kind. It is possible that the teacher may call

the attention of the entire class to some new business or to finish some preparatory work left from the day before or to hear a report that is of interest to the entire class and has been prepared by one of the teams. Two or three of the six teams may have had work assigned them near the close of the last period. These teams devote themselves quietly to individual work, each pupil doing the work in hand unaided or reaching the limit of his resources in the attempt. Two or three other teams may go at once into conferences for which they prepared the day before. Some team may ask the teacher to review with them some work they have been preparing to present to the class.

The teacher inspects the work of individuals and teams, examines and instructs individuals when necessary, calls the class from individual and team work to class work when the coöperation of all is necessary or of more importance than the work of smaller units. Most time is given to individual work by the pupils and individual instruction by teachers. The next larger share of the time is given to team conferences and other coöperative work of the members of teams. Class work gets the smallest share of the time. The best teachers use the least amount of time in class work. We never forget that self-activity is the only means of developing or modifying personality, the only education. We have practically eliminated passive listening. When the class listens it is to something relating to work just completed or to be taken up immediately. We have given up the attempt to educate a child by requiring him to listen to the teacher and other pupils ninety-nine one-hundredths of the time he is in the classroom and to get his education at home of evenings.

JUVENILE DELINQUENCY AS A SOCIAL FACTOR IN THE ELEMENTARY SCHOOLS

OLIVE M. JONES, PRINCIPAL OF PUBLIC SCHOOL NO. 120, NEW YORK CITY

If I chose, I could stand here for more than my allotted time and make you laugh at stories of boys, labeled bad, who have in the last fifteen years passed through Public School No. 120, New York City. I could tell you of Philip, who could lick any teacher, or "tru-nty" who tried to take him to school, and ended in bringing in two little fellows by the back of the neck to get the same treatment that had subdued his bravado. I could tell you of another Philip, who went out with a quarter to buy my lunch, was gone two hours, during which he invested my quarter in "extras," and returned with the lunch, the change of the quarter, and over a dollar profits in his own pockets.

But I want to get you to believe with me that the problem of juvenile delinquency is a social problem of far greater importance than any other social problem affecting our community life. I want your help in making teachers and principals realize that discipline is not keeping order. We have just issued a Teachers' Handbook in New York, which says on this subject of discipline: "Discipline does not mean keeping order. Many a poor

vention of much adult crime, the study of the problem becomes the business of the average citizen.

The best way to bring home to the average citizen the community responsibility is to urge him to study the causes of juvenile delinquency.

Before listing these causes, I desire to say with great emphasis that they are *causes*, to be regarded as such only, to be removed, and to receive scientific and organized care. They are *not excuses* by means of which we can put the blame on the Creator or on society or on Government, and shrug our own shoulders free. They are *not excuses* which are to make us pity the delinquent child and forgive his wrong-doing, without taking steps to teach him self-control, and how to overcome his defects, to rise above his delinquencies of birth or circumstance.

The majority of treatises of causes of juvenile delinquency and the majority of persons seeking to find the causes have been too apt to regard their work as completed when they have discovered and stated the cause. The majority of people who read these statements of causes rest satisfied that they have found the explanation of the thing which displeases them and seem to think that because they have excused the wrong-doer and generously forgiven his wrong-doing, he will forever after be good!

The truth is that: (1) Stating the cause, however accurately and scientifically it be done, does not remove the cause or provide a remedy; (2) Removing the cause does not at once remove the effect of the cause. Habits, established by long practice through a child's first eight or nine years of life, no matter what the cause, will continue long after the cause has been removed and will require careful attention and definite training before right *habits can be substituted*. Recognition of the cause, unless followed by proper treatment, reminds one of the physician who is a good diagnostician but whose efforts at cure leave his patient a prey to greater ills than he previously knew; (3) For the treatment of cause of juvenile delinquency, we do not need new laws and new machinery so much as we do need an effective, efficient administration of the laws and machinery already existing. More than all do we need coördination and coöperation among all the agencies engaged in child welfare. It is a shameful reflection upon all concerned that, in this work above all, jealousies, ambitious aims, religious differences, class distinctions, financial inability are ever permitted to interfere with the best interests of even one delinquent child.

Stated simply and classified as determined by my experience for sixteen years, the causes of truancy and delinquency lie: First, in the schools: (1) By putting unfit and unwilling children through the same training as other children; (2) By lack of sympathy on the part of teachers; (3) By lack of disciplinary power on the part of teachers; (4) By large classes and large schools, preventing proper care of the individual child. This last condition is greatly on the increase since the Great War; (5) By failure to meet racial differences by appropriate modifications of the course of study and methods of training; and (6) By insufficient or improper provision for the enforcement of compulsory education laws.

Second, in the streets: (1) By lack of play space; (2) By unemployed youths and men; (3) By gangs and "Fagins"; and (4) By moving pictures, more particularly the posters outside of moving-picture theatres; (5) By cigarettes; and (6) By gambling.

Third, in the homes: (1) By inefficient or indulgent parents; (2) By working mothers. The absent mother, the mother absorbed in business, the breadwinner-mother cannot train children; (3) By widowed mothers; (4) By step-parents; (5) By broken or unhappy homes; and (6) By parents uninterested in or ignorant of their children's right of education and of the State's right to demand that children be educated.

Fourth, in social conditions: (1) By housing conditions; tenement conditions and frequent moving, with necessary changing of schools and consequent lack of steady habits; (2) By racial differences; (3) By immigration. Chiefly because large groups of immigrants have been permitted to colonize in sections of New York City and perpetuate their foreign customs and language; (4) By cupidity of employers who use child labor and thereby tempt children to remain out of schools. The worst offenders in this respect are not large concerns but the small shopkeeper, the man who wants a package carried, the wagon driver who wants a temporary helper, and the like.

Fifth, in childhood nature: (1) By conditions incident to adolescence—ages 9 to 16 years; (2) By rebellion against restraint unwisely or unduly imposed; (3) By temperamental difficulties and inherited tendencies; (4) By desire for spending money.

Sixth, in physical condition: (1) By peculiar personal appearance which leads to ridicule, nicknames, feelings of repulsion among adults, loneliness and loss of playmates; (2) By partial deafness; (3) By speech defect; (4) By crippled condition; (5) By sight defect; (6) By other physical disorders not evident to the observer; and (7) By nervousness and excitability.

The order in which these physical causes are listed here is not accidental, but deliberately chosen as indicating their importance. Scarcely anyone realizes the torture experienced by children with a peculiar personal appearance. A lad whose face was drawn and crooked on one side was most repulsive in appearance; he was shoved off by older people, including parents and teachers, and was tormented by other boys until he became a tornado of resentment. He used to carry a pocket mirror, and whenever he was unobserved he would pull at his face, trying to straighten it. His mother saw him one day, came to school and told his teacher, a wise, kind, and gentle woman. He had really very fine eyes, and his teacher told him so, and gradually led him to believe that his eyes would make people forget his face if he made his eyes attractive by good thoughts and good nature.

The partially deaf child suffers worse than a totally deaf child because he so often hears wrong and because he becomes suspicious of all sound. The child with speech defect suffers from the ridicule of his mates and the impatience manifested by adults over his inability to express himself in speech. The crippled child and the child with sight defect suffer especially from the inability to share naturally in the play of other children. The child suffering

of space-binding beings. He has offered up to his god of individualistic success a bloody sacrifice of not only the finer qualities of his own generation, but of much of the good which should be the heritage of his progeny. He has measured even the value of his own attainments by standards which are degrading in their beastliness. He has depressed man from the plane of a being "made in God's image" and "a little lower than the angels" to the level of an animal with vague longings for "a place in the sun."

Social and political sciences have adopted this fatal premise from older organizations of knowledge. The President of the United States in a recent speech said in substance, "As long as man remains preëminently self-centered, there can be no universal peace, there can be no disarmament, there can be no alleviation of human suffering. Wars will continue as long as human nature remains unchanged." This is right in part. However, it is not human nature that must change; it is man's conception of human nature that must alter. Man must learn that only through the application of the principles of coöperation with his fellows can his ultimate destiny be approached. Time proceeds in an arithmetical progression; humanity has the possibility of developing in a geometrical progression. But individualistic ideals, war, disease, and other forces growing out of man's false premise in respect to his own nature, have interfered with man's time-binding properties. If it were not for this, civilization would be eons ahead of where it is today.

But what is the significance of these facts to the elementary school and its course of study? The worth of this conclusion to elementary education lies in the fact that the problems of the school may be approached with a new method, in a new spirit, and with a new point of view. No reorganization of any department of the school can be attained unless a modified ideal of the purposes of the school is formulated. The old ideal of becoming educated (so temptingly held out to the scholar in days gone by) in order to attain material success in life is rapidly disappearing and is being replaced by the concept of social service.

While the ideal has changed progressively, the organization of the subject-matter to which the pupil must react remains practically static. In form, it is distinctly individualistic, recognizing only slightly the relationships between the different courses. In fact, there exists no course of study, but a multitude of courses of study, which do not recognize that growth in knowledge may be latitudinal as well as longitudinal.

The curriculum of the present elementary school apparently appreciates not the principle laid down in the greatest book of knowledge in the world, "The wisdom of the ages is my wisdom, there is but one wisdom."

To the child in school there appears to be little coördination among his studies. He does not acquire power or knowledge, but he takes subjects.

The student's knowledge, gained outside the school and before he enters, is much more highly socialized than that which he secures through formal instruction, because it relates almost entirely to his needs and the uses of those with whom he comes in contact. When the young child presents himself at school, he possesses, barring the meager knowledge and develop-

ment which his pre-school days have given him, two things full of potentiality—the native ability which he has inherited [probably no greater than his progenitors] and the power to improve upon the work of his forefathers. To what end thus to attain his greatest possible growth in ability in order that his creative power may be such that not only are the factors through him preserved and developed which are essential to his particular civilization, but also that his improvements may be handed on to succeeding generations. And the import of all this to the course of study in our schools is that the subject-matter to which the pupil reacts must be so organized that it offers the greatest possibilities for these purposes. This will require foresight as well as insight on the part of those whose task it is to prepare the course of study for the school.

In addition, it carries with it the implication that material once useful to society at earlier periods, but no longer of service, must be eliminated. It goes further and indicates clearly that knowledge which may be needed only under special and unusual circumstances should be organized into such form as to be available to pupils when an actual need for such information arises, and not continued as required subject-matter in our courses of study. The innate capability of children to respond to educational stimuli is not without bounds. Therefore it is an offense against society and an unfair limitation of the individual's right to function his greatest degree, if the time and energy of youth is wasted upon the non-essential.

Consequently, two standards of judging the value of the curriculum may be established. In an interrogatory form they are: (1) Does the course of study present the greatest opportunity for developing the creative power of the pupil? (2) Does the subject-matter contain within it all elements necessary to the requirements of a present and future complex society and no more; and are these elements indicated in order of their relative importance?

The development of creative power is named first because it must be recognized that as an end in education it must share equally in importance with the acquisition of essential knowledge. Creative power finds scope for its activities not only in physical fields, but also in those realms in which man endeavors to express his highest aspirations—literature, music, and art.

It is proposed, therefore, to exercise this faculty through a series of highly socialized topics or projects which will have as an additional mission the unification of the courses of study. While making an approach from the standpoint of human interest, this does not break down the continuity and coherent organization of subject-matter which is apparently at present necessary to the presentation of certain subjects, such as history.

The projects fall roughly into three groups. Venturing the danger of confusion, the terms applied to types of life are here used to designate projects.

(1) Energy-producing and preserving projects, those having some chemistry-binding attributes, such as the production of food, obtaining shelter, and the like.

(2) Space-binding projects, locomotion or transportation.

(3) Time-binding projects, music, literature, art, and social service.

sary subject-matter already incorporated in the course of study. However, it does to a certain extent emphasize some of the more important elements, from a social point of view, in each of the courses. It does present definite factors through which a super course of study may finally be created which will act as a centripetal force, drawing together the now dissociated courses of study. But, above and beyond all, it opens up a wealth of opportunities for the exercise of the pupil's creative faculty, to the end that mankind may become more human and that society may attain that normal rate of progress established for it by the inner law of its growth.

THE ELEMENTARY PRINCIPAL AS A PROFESSIONAL LEADER

C. E. MARSTON, WOODLAND SCHOOL, KANSAS CITY, MISSOURI

Out of the scientific discoveries and inventions of the past century has come a new economic world and with it a new social order. Since the school exists to satisfy the demands of society, its curriculum, methods, and administration have undergone sweeping changes. Present tendencies indicate ever-increasing social and industrial complexity. Human adjustment is largely a process of education. New demands are met through specialization. The farmer is no longer a blacksmith, carpenter, tanner, weaver, and soap maker; the barber is no longer surgeon and dentist. It is a far cry from the day when the village cobbler made the shoes for his community to the modern factory where several hundred men work on a single shoe but supply a world market. Time was when an Icabod Crane was pedagogue, farmer, chorister, and sometimes minister or lawyer. But just as modern machinery with its enormous output has crushed many trades, so rising academic and professional standards have crowded out of teaching "the Jack of all trades."

With the development of the science of education and growth of skill in the art of teaching, our profession has reached a higher level. The superintendent is now an educator instead of an administrative member of the board of education. The high-school principal has rapidly acquired authority and responsibility because of the great extension of higher education among the common people. With uncertain status the elementary principal is now recognized. Will he continue to be an upper-grade teacher, a visiting principal, or become an important unit in the school system? At present it is difficult to determine the actual work of elementary principals. Few are trained in supervision, and it is safe to assume that an overwhelming majority devote their time to petty details of a clerical and administrative nature. In the words of an eminent educational authority, "Ofttimes he becomes little more than a mere unskilled, unprofessional, odd-job man engaged in oiling the places in the machinery which have a tendency to creak."¹ His first duty is to improve instruction. In order to do this, he

¹ Babbitt, *Elementary School Journal*, January, 1920.

must find time for thinking, planning, and supervising. He must delegate routine duties to others. It is his job to get work done rather than do it himself. Dr. Alexander has shown how this can be done. The principal will then cease to be an inspector and become a co-worker with his teachers. His power and influence with them will depend on his fitness. If he cannot detect weakness in teaching and suggest the remedy; if he cannot demonstrate how the work is to be done, he lacks the professional ability to be a leader of progressive teachers. The political favorite who often masquerades as principal is usually lacking in education, vision, and moral responsibility.

One of the best tests of professional leadership is the ability to professionalize teaching. Evidence of this is seen, first, in the willingness of his teachers to diagnose their teaching by standard tests and apply remedial measures; second, by their interest in intelligence tests and vocational guidance; third, by their eagerness to secure constructive supervision and a rating of their ability; fourth, by their desire for growth; and fifth, by their professional ethics.

The principal should encourage the spirit of investigation. Society is forever being reconstructed; the science of education is in its infancy; hence, it is the part of wise leadership to stimulate teachers to experiment. It is this scientific attitude that distinguishes our best schools.

Professional leadership may be directed, first, in strengthening the school system and, second, in the training of teachers in service. Each of these in turn will be discussed.

A superintendent, whose administration is loyally supported, will be glad to improve the school service by using the mental energy and professional ability of his principals. The principal is closest to the work, and, if his educational attainments, professional training, and successful experience fit him to render valuable assistance, the superintendent will not be slow in making use of it. The elementary principal should be an authority on some school subject; able to construct a part of a course of study and write bulletins on subjects of interest to the entire system. He should participate in local, State, and National educational gatherings and contribute to pedagogical magazines. He should be able to advise with the architect in the construction of buildings. He should be the best judge of apparatus and supplementary material for his school. He should be competent to render unbiased and scientific advice on general school policy if asked to do so. Through him the public should learn what the school is doing that is worth while, to the end that they will appreciate and support it. He should take an active part in the social life of the community.

In teacher training he should be a sympathetic but critical supervisor; an inspiring and constructive leader. Since he reaches the pupils indirectly, his greatest responsibility is in directing and training his teachers. He should be the embodiment of a teachers' college. From him should emanate right educational aims; true social and psychological principles and mastery of the fine art of teaching. He should himself be a splendid teacher. The

inspire his teachers. Like General Sheridan, he should turn defeat into victory, or like Kipling's sergeant, who worked the "everlasting miracle" when "he drilled a black man white, he made a mummy fight."¹ Unless a principal has this power of "arousing the divine life imminent in every human soul," he lacks the personality of a great leader.

The author of the statement, "As is the principal, so is the school," recognized that a school has a soul that is dominated by a leader. The character of a principal's school is an expression of his ideals, vision, and philosophy of life. We can measure in part his work as a supervisor, but who can even estimate his influence on the lives of others? His is the most human profession and the most far-reaching in its results. We should never forget that spiritual forces are the greatest in life. The inspiration of the principal to pupils and teachers is his greatest contribution as a professional leader.

SECRETARY'S MINUTES

BOSTON MEETING

FIRST SESSION—Monday Afternoon, July 3, 1922

VISITATION AS A MEANS OF DIAGNOSIS—George Rugg, Principal of the Quinsigamond School, Worcester, Mass.

THE RATING OF TEMPORARY TEACHERS AFTER A SINGLE SUPERVISORY VISIT—Rose A. Carrigan, Principal of the Shurtleff School District, Boston, Mass.

INFORMAL TESTS AS A MEANS FOR THE IMPROVEMENT OF INSTRUCTION—Clifford Woody, Director of the Bureau of Educational Reference and Research, University of Michigan, Ann Arbor, Mich.

THE VALUE OF INFORMAL TESTS—William F. Butler, Principal of the Belmont Street School, Worcester, Mass.

Wednesday Afternoon, July 5, 1922

Joint meeting of the Departments of Classroom Teachers, Elementary Education, Elementary School Principals, and Kindergarten Education, and the National Conference on Educational Method. See program under the Department of Elementary Education.

Thursday Afternoon, July 6, 1922

USING THE RESULTS OF TESTING—Jessica Marshall, Principal of the Newton School, Toledo, Ohio.

INTELLIGENCE TESTS AS A BASIS FOR RE-CLASSIFICATION—Benjamin C. Gruenberg, Principal of the William T. Harris School, Manhattan, New York, N. Y.

THE MEASUREMENT OF TEACHING EFFICIENCY BY MEANS OF STANDARDIZED INTELLIGENCE AND EDUCATIONAL TESTS—Albion U. Jenkins, Principal of School No. 2, Paterson, N. J.

FINDING THE INDIVIDUAL—THE SUTHERLAND METHOD OF INDIVIDUAL EDUCATION—Margaret H. Smith, Principal of the 61st Street School, Los Angeles, Calif.

¹ "Pharaoh and the Sergeant," McClure's, Vol. IX.

Friday Afternoon, July 7, 1922

Business Meeting

In the absence of the President the meeting was called to order at 2:15 P. M., in the assembly room of the Girls' Latin School, by Miss Katherine D. Blake, of New York, Vice-President. In the absence of the Secretary, Miss Sara L. Rhodes, of New York, was appointed secretary pro tem.

The chairman asked for a list of the States present. They comprised Alabama, California, Louisiana, Massachusetts, Michigan, Minnesota, Missouri, New York, Pennsylvania, Rhode Island, Washington, and Vermont.

The matter of a program for the next meeting was introduced.

Miss Olive M. Jones, of New York, referred to letters received by the President, Mr. Powers, which indicated several lines of interest.

Mr. Longshore, of Kansas City, moved that the classification of studies in schools be a subject of study, suggesting that consideration be given to the relation, simplification, and correlation of subjects. Motion seconded and carried.

Mrs. Peixotto, of New York, stated that the Boy Scouts are seeking to secure co-operation with the schools and that the Department of Elementary School Principals would be the appropriate channel through which the matter could be handled.

Mr. Severson, of Minneapolis, suggested that the subject of visual education be taken, with the study of scientific data to determine its value and application. Miss Jones added that Mr. Searly, in investigating, had discovered that no less than three affiliated associations had the matter in hand, and suggested that a committee be appointed to bring together these three groups and all other interested groups. Such an effort would be certain to be approved by the Executive Committee.

The Treasurer, Mr. Courtland Davis, presented a brief report, not complete, because not all outstanding bills had been met. The report of the Treasurer was accepted unanimously.

The report of the nominating committee was the next business called for. A discussion ensued, regarding the present constitutional provision that the committee present two names for each office.

In the absence of the chairman and two other members of the nominating committee, the following report was presented by Mr. Kottinger, of Oakland, California: For president, Leonard Powers, Port Arthur, Texas; Worth McClure, Seattle, Washington. For first vice-president, Katherine D. Blake, New York, New York; Thomas Agnew, Jr., Bayonne, New Jersey. For second vice-president, W. T. Longshore, Kansas City, Missouri; Mary Morris, Denver, Colorado. For third vice-president, Mrs. Jessie Fink, Grand Rapids, Michigan; S. O. Severson, Minneapolis, Minnesota. For recording secretary, Mary V. Reisse, Philadelphia, Pennsylvania; A. B. Collins, Boston, Massachusetts. For corresponding secretary, Julius Dorsey, Dallas, Texas; Florence Holbrook, Chicago, Illinois. For treasurer, Courtland V. Davis, Norfolk, Virginia. For director, John W. Anthony, Pittsburgh, Pennsylvania.

The following action was taken by the meeting regarding the above report of the nomination committee:

It was moved, seconded, and unanimously carried that the report presented by Mr. Kottinger for the rest of the committee, be accepted and filed, and that, in the absence of several members of the committee, the vacancies be filled by the appointment of three other members, and that the committee retire and after consideration, report one name of a candidate for each office, to be acted upon as the committee report for the election.

The three members added to the committee were Grace C. Swan, Worth McClure, and Abby Porter Leland.

The committee (Mr. Kottinger acting as chairman) then reported the following list of candidates. These were unanimously elected as the officers for the ensuing year: For president, Worth McClure, Seattle, Washington; for first vice-president, Anna L. Force, Denver, Colorado; for second vice-president, Thomas Agnew, Jr., Bayonne, New Jersey; for third vice-president, Elizabeth Arlett, Oakland, California; for recording secretary, Mrs. Jessie Fink, Grand Rapids, Michigan; for

lic opinion and social policies and in the management of the machinery necessary to make them effective. With reference to such an institution as education the ideals and programs adopted must have broad foundations in the will of the common people and the machinery used must respond to that will. The problem before us, then, is not to determine whether democracy shall exist in education but how can we best guarantee that it shall exist and be made effective. More specifically, what are the relations between the public and its schools and among the responsible social groups within the school that will best promote democracy in higher education?

Before attacking the specific questions at issue it is necessary to lay solid foundations on which to build. Many errors and much acrimony might be avoided if the protagonists of different policies would keep clearly in mind two fundamentals: first, the distinction between democratic machinery and democratic action, and second, the relations of mutual dependence existing among the various social groups concerned in higher education.

With reference to the first of these fundamentals it should be borne in mind that democratic machinery and democratic control do not necessarily coincide. The success of a democratic society depends in no small degree upon harmony between the institutional mechanisms adopted and the ability and willingness of the people to use these mechanisms. Direct democratic devices may and probably should lead to democratic control but again they may, and often do, not. The essence of democratic machinery is popular suffrage; but if the ballot is not regularly and intelligently used the machinery plays into the hands of interested parties. Thus arises the boss system so frequently found in our politics and the necessity of such reforms as the short ballot and commission government, not for the sake of limiting democracy but the better to get at the will of the people. In a college or university faculty if the group intelligence is not reached by a popular ballot, or the sense of responsibility is not sufficiently aroused, a veiled autocracy may rule as well as in city government. For example, in a university faculty where interests are diverse, personalities are not well known, and individuality is stimulated, concern over general problems may be so scant that in a popular ballot a solid block of ten per cent of the total voters can easily control action in all except revolutionary cases.

On the other hand, the central feature of democratic control is that the will of the people be enforced. In large, unsocialized, or indifferently motivated groups authority has to be delegated. Thus has arisen representative government. If the representative is responsive to the will of the people it is no less democratic than the direct ballot; in fact, where the issues are technical, or complex, or interest is spasmodic, representative machinery is likely to enact the will of the masses better than more direct methods. The genius of popular suffrage inheres in personality choices and in checking up general principles and permanent policies. Detailed programs and administrative complexities require the services of the representative who is somewhat expert if democratic machinery is to be effective.

One of our problems, then, is to determine the type of social machinery most likely to produce democratic results in each of the issues involved.

In regard to the second fundamental, sound thinking demands a clear vision of the mutual relations existing among the five social groups concerned in higher education. These are: the public, the board of control, the administrative staff, the teaching corps, and the student body. No significant policy in colleges and universities can be properly grounded which does not take into consideration the nature, function, and interests of each of these groups. Many a controversialist waxes eloquent in favor of a program that is false because his personal equation leads him to magnify his own group at the expense of one or more of the other groups. Most of us are familiar with extremists in each of the groups who not only ignore but hold in contempt all of the other groups. Let us briefly analyze this social background.

At the extremes of this list are two general groups, the public, or social clientele, which provides the facilities of education and must assimilate the product, and the student body to be educated. If we were considering the primary problem of democracy in education we should have to start with the will and interests of these two groups; but we are here concerned more directly with the secondary problem of maintaining democratic relations among the actively controlling groups of the collegiate body. With the specific caution that college men, by virtue of the personal and class equation, are apt to overlook the sanction of these larger and more general groups, we can relegate them to the background of our discussion.

Next to the extremes come two selective groups: the board of directors and the faculty. The board, representing the social clientele of the schools, whether political, religious, or philanthropic, is a body of men chosen supposedly for strength of personality and general interest in education. They are not, and should not be, educational experts but usually exhibit the best lay intelligence in educational affairs. Having been chosen as they most generally are by mass methods, they represent mass opinions and provide mass checks upon the tendency of highly selected groups to be over-technical and to drift off the central path of progress into tangential byways. The masses move slowly and spasmodically but they keep to the main road and it is never safe in a democratic society for an educational institution to lose the check that a board of education may and should provide for expert leadership.

The second of these selective groups is the faculty, an aggregation of experts, each technically trained and highly specialized. They are selected primarily on the basis of education rather than personality, for academic achievement rather than general ability. On the whole they represent scholarship rather than adaptability, thoroughness rather than breadth, intensive culture rather than common sense. As a result they are intellectually contentious, fuse into a mass rather slowly, and are in continual danger of losing contact either with the student body, or the social clientele of the school, or both. Intense devotion to their work and a lack of popular appreciation produce sensitiveness and self-absorption and detailed

census without too much cost in time and good-will. Hence wide faculty participation through direct methods will be limited by the extreme specialization of its members and the narrowness of interest which characterizes the specialist.

7. In a democratic society avenues of contact and mutual influence must be kept open between the institutions of higher education and the general public. Intensity of specialization on the part of faculty members requires that this service be performed mainly by administrative officials who are equally responsive to internal and external influences.

With emphasis upon the fact that sound thought requires continual reference back to the social background outlined above a tentative application of the principles set forth may be made to the leading controverted issues. While attempting this I am fully aware of the differences of opinion to be encountered and the possibility of error; but if the logic of the social situation in which our institutions of higher learning are imbedded seems to justify the trend of present-day practice that trend is likely to persist whether with or without our professorial recognition and consent. I have no thesis to uphold with reference to any issue but shall try to follow the principles where they lead. The brevity of this paper forbids detailed treatment, but it is to be hoped that later discussion will elaborate the arguments.

The first of the specific problems to be faced is that of administrative and faculty appointments.

At the head of this list is that of president. Since the board of trustees representing the supporting public meet only occasionally and render voluntary service most of the authority vested in them by the founders is delegated to the president. He becomes their responsible agent and they will naturally be held accountable for his selection. Such an authoritative position calls for talent that can be discovered only by consultation and research, and this can be done intelligently only by a small group. Hence, if the board be a large one, the preliminary canvass must be delegated to a committee. But the president has large executive functions within the institution and the faculty are also interested in his selection. Moreover their technical knowledge of the situation ought to enable them to render valuable assistance. In a large faculty this assistance cannot be rendered *en masse* but should as in the board be delegated to a small committee. It would seem to meet all of the requirements of the principles above enunciated if the nominations were made by joint action of a committee of the board and one of the faculty and the election be made by the board in full session.

With reference to deans the situation is more complex. In large measure the deans are assistants to the president and therefore should have the sanction of the board acting for the public. But likewise and in equal measure they are agents of the faculty in the particular schools they represent. Hence they should also have faculty sanction. Their qualifications, however, would seem to be too technical for board selection and too re-

sponsible to the public to be trusted to faculty selection. This is particularly true in State institutions and others with large and specialized schools. Moreover a combination of general faculty and board action is unthinkable to one who knows the eccentricities of each. Under such circumstances some agency must be found that is able to consult with and understand the desires and needs of both board (representing in this case a specialized public, such as the legal or medical), and the particular faculty concerned. To me this seems to point unmistakably to the president as the appointing power. If a check upon executive authority is desired both board and special faculty might be called upon to ratify the selection; but since the president, to be successful in his administration, must ultimately satisfy both groups there is some danger that the effort to provide the check might complicate governmental machinery without adding either democracy or efficiency to the results.

Beyond the deans, that is, in the selection of specialized faculty members, the board can take no intelligent part. The qualifications previously suggested require technical understanding possessed only by the thoroughly trained; hence faculty appointments must be left to some combination of president, deans, and department members. Possible combinations are too numerous for brief treatment, and since the opinion of all concerned is usually sought under any form of choice, few cases arise to produce controversy.

The next specific problem leading to controversy is that of salaries and budgets. Quite naturally the extent of the budget will depend upon the social clientele of the school and the larger policies concerning it will be formulated by the board and its representatives, particularly the president. The internal distribution of funds is of interest and significance both to the board and the faculty but cannot be worked out in detail by either. This is evident from the fact that both maintenance and salary funds for each department, school, and division of the college or university will affect every other. Not only will money spent in one part of the institution be unavailable in another but each professor's salary affects, to some extent, the budget as a whole. No other phase of institutional management calls for a more comprehensive and detailed insight into the general function and comparative value of each phase of its work than the distribution of its budget. Hence whatever may be the feelings of individual members of the board and faculty, and we are here concerned only with the faculty, the maintenance fund and the salary schedule are administrative matters and must be handled by administrative machinery.

It is conceivable that in large schools such as the college and engineering schools in a university an elected consultative committee of faculty members might serve a desirable purpose. Likewise in small departments increases and promotions might be agreed upon by soviet methods. But on the whole both human nature and practice in other institutions indicate that general participation by faculty members in budget making is impracticable. If justice is to be obtained by individual faculty members it

with confidence that the principles enunciated are in harmony with social tendencies outside academic circles and that the increasing democratization of society and the enlarging size and complexity of our institutions will tend more and more to force colleges and universities to adopt forms of government found effective in older and more adaptable social institutions. We can no longer, even if we choose, cultivate remoteness and exclusiveness and for the sake of the cause we represent, we must not close our eyes to effective methods that will increase our contribution to general culture and social progress.

ADVANTAGES INVOLVED IN EXTENDING THE SCOPE OF FACULTY PARTICIPATION

JOSEPH A. LEIGHTON, PROFESSOR OF PHILOSOPHY, OHIO STATE UNIVERSITY,
AND CHAIRMAN OF THE COMMITTEE ON FUNCTIONS OF FACULTIES
IN UNIVERSITY ADMINISTRATION, AMERICAN ASSOCIATION
OF UNIVERSITY PROFESSORS

The fundamental problems and general principles of faculty participation in university government have been presented admirably in the comprehensive address by Professor W. R. Smith. I do not dissent from the general tenor of his address, which seems to me to be in harmony with the principles enunciated in the report of Committee T of the American Association of University Professors; the lion's share in the preparation of which report naturally fell on me as chairman. I would add one principle. I think that the students should have a consultative part, through duly chosen representatives, both in matters of discipline, and in discussion of broad educational policies underlying the fashioning of curricula. In the latter regard, I am much impressed by the good judgment embodied in the recent recommendation of the "student's curricula committee" at Barnard College. I believe that serious-minded students have ideas in regard to courses and curricula, which it is good to give respectful attention to. We professors are all in danger of cerebro-sclerosis.

The advantages that may accrue from a fuller participation in university administration by faculties, working mainly through representatives, seem to me to fall chiefly into three categories, which indeed interpenetrate. These are:

Improvement in the mutual understanding, and consequent good-will, of trustees, administrators, and faculty members. It goes without saying that all three of the chief agencies in the conduct of universities are aiming honestly at the advancement of education and learning. I may have been unusually fortunate in my academic relations. I have never known personally a trustee, nor even a president, who was not honestly and wholeheartedly concerned for the advancement of education and learning. I have heard of trustees that pushed personal and party advantages to the

injury of education. I have heard, more than once, of presidents that were self-exploiters, of others that were lineal descendants of Ananias and Sapphira, and of some that were both. I have never known in an intimate, personal way any of these scalawags.

The ill will, mutual suspicion, misinterpretation of motives and aims that I have known have arisen, in every instance, from lack of mutual knowledge. The educational blunders that have been made by trustees and administrators, even most of the personal injustices that have been wrought on the teachers, have arisen from ignorance—the fruitful mother of misunderstandings and conflicts. When trustees and presidents have embarked on unwise educational policies, it has been due to their inability to see the implications and consequences of such policies; an inability that might have been removed by sitting down with competent and disinterested members of the faculties and threshing things out over the cigars. I have known many cases in which blunders have been avoided, and right policies established, by informal conference. Injustices done to individuals are largely of the same origin. There is an obverse to this matter. If trustees and presidents always knew how incompetent some of the teachers were, there would be some shaking of dry bones in the valley of decision. I feel strongly that it is a paramount duty of faculty members to keep the teaching staff up to the highest possible point of efficiency. On the other hand, faculties should, through their own representatives, always have a voice in estimating the efficiency of their fellows and subordinates. Teachers should never be dismissed, nor their promotion held back, on the basis of back-stair gossip conveyed by irresponsible, prejudiced, and ignorant persons to trustees and administrators. We are all fallible, but surely the best judges of the quality of a teacher and scholar are his confrères.

The second category under which improvement may be expected is in *the personnel of the faculty*. It will conduce to increased self-respect, joy and efficiency in his work, when the professor can feel that, notwithstanding the inevitable multiplication of administrative machinery and his own individual remoteness from the supreme power—the board of trustees—he is recognized to be a real participant in the determination and execution of educational policies, not a mere wage-earner employed to do his stint under the direction of an autocratically placed departmental superintendent; whether head of the department, dean, or president, or all of these. No one is worthy of the profession who does not regard his calling in the same light in which every honest minister of the Gospel regards his—namely, as a spiritual vocation, essential to the stability and improvement of human civilization. A church which treats its minister as its hired servant, paid to do its bidding and prophesy smooth things, is on the way to being an institution of the Devil; and a university which regards its teachers as hired and paid to teach what any class or sect may think it wants taught, is a spiritual fraud, a sham, and a mockery of the sacred cause of truth.

We professors are called to the high, difficult, and holy vocation of

nourishing and augmenting that light by which alone associated mankind can walk with reasonable surety in its journey through time—the light of wisdom, which is fed by knowledge, enlightened good-will and moral courage. We, in greater measure than any other group of public servants, are the custodians of the great tradition of humane civilization.

Our vocation it is to transmit to the youth the best insights of the past in order to help them, the oncoming torch-bearers, to bring these insights, enlarged, if it may be, by our devotion, to bear on the present and impending problems of Human Good. Unless we are to have an effective voice in the control of the institutions through which we serve, this holy calling will be lamed. We must bear in mind that a university, like any other social institution, is not an end, but an instrument, an instrument for the progressive, perfecting of man in society. We need the best minds and the most virile characters, in this calling. We shall not get them, or getting them, shall warp and thwart them, unless faculties have an effective voice in determining institutional policies.

Moreover we *need* this responsibility, this duty, in order to save ourselves from the ever-imminent danger of becoming mere inhuman and un-social specialists. The two most insidious temptations of our calling, as I see it, are: (1) The danger of developing, from our constant relation to immature and docile minds, an authoritative and dogmatic attitude. We are prone to speak *de haute en bas*, to become crotchety and doctrinaire. Salvation from this danger will come through keeping alive the spirit of research, and the humble-minded sense of our own ignorance in the presence of the vast mysteries of the realms of nature and man. (2) The other danger is that of regarding one's own subject as the most important one, and of disregarding the universe of learning in its relation to civilization in its totality. There is no one of us that does not need frequently to probe and debate such questions as these:

A. What are the best organizing and guiding principles of higher education, liberal, vocational, and liberal-vocational?

B. What is the value, for the conservation and progress of civilization, of my subject and of the other subjects?

We all need, for our own soul's health, and for the health of the university, to think individually, and to debate collectively, on the philosophy of education. We all need to be challenged, and awakened frequently, to consider and reconsider educational policies in the light of principles. It is the duty of *every* university professor to think on these things. He will be stimulated to do so by having a more effective part in the determination and execution of educational policies.

We have been passing, in this country, from the traditional Yankee who could teach anything, to the narrow specialist who knows one thing and neither knows nor cares for anything else. It may be that I am prejudiced since, as a philosopher, my only specialty is the universe; but I feel strongly that much of our specialized teaching and research is being done on too narrow a basis—that a specialty begun in callow youth, built up on shallow

and narrow foundations, and pursued without regard to its relations to the whole universe of knowledge, is pursued blindly and ineptly; and that it tends to turn its practitioners into mere mechanical fragments of men. As for the poor students on whom your partisan and blind specialists operate, I can only say, God help them! I have come into contact with specialists who seem to be injuring the minds of their students and injuring the cause of higher education. Society has the good right to ask, as it is asking, what is the human good, the social value, the use to civilization of your specialists?

The third advantage of more faculty participation arises from the second. We are servants of society. Our special service is to be the agents in transmitting, to the generation that is to carry on the work of civilization, those social principles, scientific methods, spiritual insights and values, ideals of social conduct, by which society is perpetually renewed and advanced, through the transmutation of the natural man into socialized rational and spiritual personality. We can serve as transmitters of culture, only in so far as we become awakeners and quickeners of the living spirit—the intelligence, the feelings, and dynamic impulses of youth. Every method and content of liberalizing education is part of the process. Education is the continuous process of spiritual regeneration, of mental and moral new birth. We are engaged, in our American democracy, in the high and hazardous adventure of educating every son and daughter of man, in order that they may become fit participants in the coöperative effort to carry on and improve civilization. In no other time or state has this immense enterprise been undertaken on so universal a scale as here and now.

Two dangers threaten its success: (1) mechanization and (2) a low mediocrity in aims and achievements. These dangers are really two aspects of one danger. For the immensity of the task before us, its costs in money, materials, and human effort, seem best met by more organization and standardization, by more quantity production, by goose-step, mass instruction. We face the danger of a machine-like regimentation, from necessary increase in administrative organization. Our classes grow ever larger, our institutions more unwieldly, the clamor for tangible results more insistent! We lecture to crowds, and we pass in to the Registrar's office stacks of credit slips. There is great danger that we shall forget the individuality of the student; forget that the work of education is the re-orientation, the re-organization, of an individual soul, by living intercourse with another individual soul. If education is not this, it is as sounding brass and tinkling cymbal. We stand in jeopardy every hour of becoming parts of a soulless mechanism turning out mediocre results, handing out stereotyped stuff, and receiving back just sufficient fragments of it to enable us to ease our consciences into signing credit slips.

If we professors are not to succumb to the rule of mechanical mediocrity, redeemed only by mole-eyed specialization, we must become more independent, more courageous; we must be able to function more fully as

dynamic personalities in the classroom, the faculty meeting, and the committee. We must feel that we have a good right to be listened to on all the concerns of higher education.

Just now one of the most baneful tyrannies is that exercised by the boosters for, and patrons of, gladiatorial athletic performance, as the chief social end of a university. A professor who would stand out against this prostitution of education to "Roman holidays" is apt to be dubbed an academic pedant.

The economic status of our profession is still too low to attract enough men of vigorous personality. A professor who does not inherit or marry a competence must still face, not simply narrow circumstances, but poverty that harasses him and hampers his work; that often prevents his having, for his own use, a sufficient library; that shuts him out from associations with competent men in other fields that would broaden him; that hinders him from refreshing travel; that often keeps him worried over the fate of his wife and children should he die before the children are able to earn their own livelihood and take care of their mother. So long as, by statute and ordinance, university professors have only the legal status of employees in open shops, only a small portion of vigorous individualities can be expected to enter the profession. Not enough able men will be willing to sacrifice, even for the joys of teaching service and research, the prospects of personal autonomy and economic competence. The relatively low social status of our profession is chiefly a consequence of its legal and economic disabilities.

If it be true that, for reasons given above, the present personnel of our profession lacks as a whole the vigor, independent courage and professional consciousness necessary to bring about a more effective recognition of its value to society, and the value of a deeper and humaner social wisdom, will it not be a risky adventure to entrust to professors a larger measure of self-government and university control? Does it not seem like telling a man to lift himself out of a quicksand by pulling on his own belt?

But we shall not get a higher average of personnel unless the conditions are changed and made more attractive. We have been moving in a vicious circle, and we must take the plunge. Every adventure in self-government is a big risk. But surely here the prize is worth the gamble! And there is no other way. If faculties are now given a larger measure of participation in university government, in many cases professors will make fools of themselves. If they are denied a larger measure of participation, we may expect the persistence of the present proportion of timorous dolts and solemn asses. There is your dilemma! Better give us the opportunity to make bigger fools of ourselves and learn to be more dynamic men and women!

Greater participation of faculties in government, I urge then, not in order that we may feel that we boss the job, or may earn more money with less work, or may set ourselves up as a privileged class, immune from criticism. We are servants of society, and we must ever stand ready to render an account of our stewardship. I urge it on the ground that, without a

full measure of participation, we shall lack the courage and power to do our best work, lack the will and insight to prove sternly all nostrums, to weigh carefully all changes, to sift the specious from the genuine in education; shall lack the incitement to function as dynamic personalities; and that we shall fail to bring that measure of wisdom, courage, and energy to our tasks, without which higher education becomes a department store affair or an industrial concern, and without which democracy cannot be saved from the tyranny of the crowd and from the crudity and low mediocrity in aim and standard which threaten it all the time. "If the blind lead the blind, they both shall fall into the ditch." If we professors are not alive in wise insights as well as in special knowledge, in vision as well as in technical expertness, in courage and initiative as well as in routine faithfulness, American society will not become, what time's wheel of fortune now offers it the chance to become, the foremost standard-bearer of a new, fine, just, and more humanely rich world civilization. In brief I rest the plea for greater faculty participation on the call of the hour to our universities to be the nurturing grounds of leaders who will guide western civilization out of its present dark hour into the promised land of a world at peace, a world wherein peoples are chiefly engaged in the generous emulation of increasing the participation of human kind in mental sanity, moral balance, the joy that comes from intelligent self-fulfilment and social harmony.

I verily believe that never before in the history of man has so glorious an opportunity and so heavy a responsibility been laid on institutions of learning as are now laid on American schools, colleges, and universities. I believe that the future of human civilization rests more on what American schools, colleges, and universities may do in the next fifty years than on any other single type of social institution.

We need the biggest men and women, those of largest vision, more powerful mental initiative, fullest knowledge, and ripest wisdom in the university chairs. We need much bigger men in our chairs than in the administrative offices or on the board of trustees. The world is ripe for the harvest, but the laborers are too few and too weak. Shall we get professors of the mental and moral stature that we need? We shall not, unless they can have an effective part in the conduct of their institutions. A professor serves humanity through serving a nation by means of an institution. Every true professor must be a thoroughly equipped, large-minded humanist. If he is this, he is surely fit to participate fully in the government of his institution. If he is not this, he is not fit to be a professor. During the past fifty years or so our colleges and universities, and especially our great State universities, have been passing rapidly from the status of personal brotherhoods or communities of learning and inquiry into large-scale, highly-organized, educational industries. This passage has been roughly parallel with the passage of the United States from domestic and individual industry to the highly organized factory system, efficient in cheap quantity production and facile distribution. I fear that there is all too much truth in the charge that our so-called higher educa-

tional system is becoming a complex and high-gearred machine for quantity production and facile distribution.

In the large-scale industry the most important, best paid, and most powerful members of the concern are the presidents, directors, departmental managers, division superintendents, and foremen.

In the organization of higher education a fatal parallel obtains with the large-scale industry. The administrator, president, dean or director, is valued more highly, paid better and receives more recognition than the vital and inspiring teacher, the profound scholar, the original thinker. American society has transferred the standard of values that holds in large-scale industry to a field that is, in essence, beyond the reach of mechanism and superintendence by rule and measure. For education and research, from top to bottom, is a spiritual process; its essence is the enkindling of mind by mind, in living personal communion, supplemented by communication of spirit to spirit through the printed page.

We have thus experienced a baneful transvaluation of values—a confusion wrought by the transfer of forms and values from regions where they belong to a region in which they do not belong. Thus, there has come to pass a relative depreciation of the real work of the teacher, the thinker, the scholar. Naturally the uninstructed public regards the administrative superintendent of the educational machine, the educational manager as the most important man in the system.

Notwithstanding our much vaunted democracy and individualism, we Americans are too subservient to the crowd-mind, and too prone to over-value organization. We are lacking in a keen sense of the social and cultural worth of strong individuality, of personality rich in intellectual and spiritual qualities. American society will not go forward in humane civilization, either through the blind urge of the mediocre crowd-mind or through the mechanical efficiency of elaborate organization. If America is to be a leader in the work of civilization we must combine the qualities of a genuine mental and spiritual aristocracy—an aristocracy of great minds and strong characters, inspired with the spirit of service of the highest cultural values—with a democracy which means equal opportunity for every child to achieve his best possible; which means, in turn, a career open to every talent.

The universities should be the genial mothers of all the higher talents. They should even be the genial mothers of genius—places where, in the sciences, arts, letters, philosophy, social administration, and statesmanship, our most richly endowed youth will find the intellectual and spiritual food which will enable them to develop, to the highest point of preparation for the service of society, their own God-given individualities.

The universities cannot be the genial mothers of the best equipped, fullest, and ripest individualities; they cannot train the right types of leaders until the professorate is restored to its rightful place. Not until we have more effectually recognized that the teacher, the scholar, and thinker—the professor rich in knowledge, wise in insight, and strong in personality—is the real heart of a university; I say, not until our society

recognizes this principle, and gives to the professorate a better status, a more adequate income, and a fuller part in governing the university, can the university fully achieve its mission. In the modern world there is nothing that moves, beyond the blind forces of nature, but *thought*—*thought* increasing in intensity, persistence, clear-sightedness, all-sidedness, and harmonious coherence. The progress of civilization is measured by the increasing control of *thought* over the blind forces of nature and the raw passions of human nature—a control gained by persistent interrogation, observation, experiment, and the creative synthesis achieved by the intellectual imagination of scientist, artist, scholar, and statesman. Thought lives and achieves results only through the medium of strong, full, harmonious personalities. To nurture such personalities, for service through leadership, is the paramount purpose of the universities. How can they fulfill this purpose if their vital business of teaching and research be not conducted by great personalities? How can a professor become or continue to be a strong, wise, vitally-minded personality if he be treated as a hired employee who has no effective part in the determination and control of the policy and personnel of his university? To become a strong personality one must be both free and responsible—free to suggest, to criticise, to initiate, and responsible to society for what he says and does.

Department of Immigrant Education

PROGRAM OF MEETINGS

OFFICERS

President—WILLIAM C. SMITH, State Supervisor of Immigrant Education..Albany, New York
Secretary—GRACE M. SHEPHERD.....Warrensburg, Missouri

FIRST SESSION—MONDAY AFTERNOON, JULY 3, 1922

AMERICANIZATION—WHYS, WISE AND UNWISE—Owen A. Hoban, Special Justice of the Court in Massachusetts, Gardner, Mass.
SOCIALIZING THE METHOD, CONTENT, AND PROCEDURE—Ethel Richardson, State Director of Immigration for California.
HOW SHALL THE PROBLEM OF THE IMMIGRANT MOTHER BE SOLVED?—Clara B. Springsted, Assistant Superintendent of Schools, Amsterdam, N. Y.

SECOND SESSION—WEDNESDAY AFTERNOON, JULY 5, 1922

EDUCATION FOR CITIZENSHIP—Albert Shiels, Teachers College, Columbia University, New York, N. Y.
THE DEMOCRATIC AWAKENING IN ADULT EDUCATION: AN OPPORTUNITY—Frank P. Graves, State Commissioner of Education, Albany, N. Y.
A NEW LITERARY TEST FOR VOTING—Alfred E. Rejall, Chairman Regents Literary Test Committee, New York.
OUTSTANDING ACHIEVEMENTS—PRESENT DIFFICULTIES—
FROM THE VIEWPOINT OF THE STATE—Robert C. Deming, Director of Americanization, New Haven, Conn.; Charles M. Herlihy, State Agent for Americanization, Boston, Mass.
FROM THE VIEWPOINT OF THE SUPERINTENDENT—William McAndrew, Associate Superintendent of Schools, New York City.
FROM THE VIEWPOINT OF THE CITY DIRECTOR—H. E. Stone, Erie, Pa., and M. J. Downey, Boston, Mass.
FROM THE VIEWPOINT OF THE TEACHER—Hazel R. Porter, Stamford, Conn., and Lillian P. Clark, Columbus, Ohio.
GENERAL DISCUSSION.
BUSINESS SESSION.

THIRD SESSION—THURSDAY MORNING, JULY 6, 1922

Pemberton (Boston Harbor)

Chairman, B. Preston Clark, Vice-President of the Plymouth Cordage Company, Plymouth, Mass.

DEVELOPMENT OF FACTORY CLASSES IN MASSACHUSETTS UP TO DATE—George F. Quimby, Service Secretary, Associated Industries of Massachusetts.

REPORTS OF INVESTIGATIONS INTO FACTORY CLASS PROGRAMS IN—

(1) A LARGE TEXTILE CITY—Margaret Bruyn, American Bosch-Magneto Company.

(2) AN INDUSTRIAL TOWN—Thomas F. Power, Assistant Superintendent of Schools, Worcester, Mass.

(3) A CITY AND A TOWN OF DIVERSIFIED INDUSTRIES—Caroline Whipple, New York State Department of Education, Albany, N. Y.

DISCUSSION—Led by Margaret J. Burnett, Supervisor of Immigrant Classes, Delaware.

THE INDUSTRIAL CLASS SITUATION IN DETROIT—Frank Cody, Superintendent of Schools, Detroit, Mich.

Luncheon—Pemberton Inn

Chairman, E. E. Bohner, Associated Industries of Massachusetts

Speaker—Wentworth Stewart, Boston, Mass.

FOURTH SESSION—THURSDAY AFTERNOON, JULY 6, 1922

FOREMEN'S FORUM: PERSUADING EMPLOYEES TO ENROLL IN FACTORY CLASSES—Presented by several foremen from representative industries.

IMMIGRANT PUPILS: HOW I HAVE BEEN HELPED BY FACTORY CLASSES—Two immigrant pupils.

QUESTION BOX.

SUMMARY AND OUTLOOK—John J. Mahoney, Supervisor of Americanization, State Department of Education, Boston, Mass.

AMERICANIZATION—WISE AND UNWISE

OWEN A. HOBAN, GARDNER, MASSACHUSETTS

Before I say anything to you about the details of the Gardner experiment, in order that you may get it as we see it, I shall talk a little about fundamentals.

There is a story of recent vintage which is in line with a little point I wish to make. It is of an Irishman who was very active in ward politics. Coming home one evening, he burst into the house where his wife was waiting for him for news from the battle, saying, "Mary Ellen, the foreigners are driving us out of the country. I have just been down to the ward meeting, and there were five nationalities there. There were the Lithuanians, the Polacks, the Greeks, the Dagos—Begorrah there were five of 'em, there were the Lithuanians, the Polacks, the Dagos, the Greeks—Begorrah, I can't think of the other one."

"Maybe," says Mary Ellen, "'twas the Americans you were thinking about."

"It's true for you, woman; I forgot all about them."

Now, that situation could be duplicated in any large manufacturing city or town in the northeastern part of this country, east of the Mississippi River and north of the Mason and Dixon line.

There are probably over fifteen millions of people in this country, ten years of age and over, who were born outside the territorial limits of the United States, and upwards of five millions of these can neither read nor write in the English language. In 1915, in Massachusetts alone, there were 346,000 persons who could not read and write in the English language, and of these 118,000 could not read or write in any language.

The situation would not be quite so bad if these good people were distributed evenly among the population. But they are industrial workers for the most part, and congregate in the large manufacturing cities and towns, where they live together as national groups, speak their native languages, read a native language press, adhere to their native customs and traditions, and actually live among us as nations within the nation, out of

touch and time and tune with the hopes, aspirations, and progress of American life.

That is not all the problem. The immigrant is a human being. He is usually pretty nearly grown up when he gets here, brings with him the traditions of generations behind him, with the age-old animosities and antagonisms of Europe, and he sets them up here, in miniature, in the cities and towns of the country. The national antipathies, animosities, and the quarrels of Europe can be duplicated in a small way in any large manufacturing city or town of the eastern part of the United States. The attempt of Poland to impose its authority on a part of Lithuania has stirred up our Lithuanian and Polish neighbors so that they are not getting along very well. Up in Gardner the Lithuanian Catholics do not go to the Polish Catholic church, but come over to my church, because they are in the minority. The quarrel of Sweden and Finland, over the sovereignty of a few islands in the Northern Baltic, has resulted in antagonism among the people of these nationalities here. So you could, I believe, duplicate in this country, in any metropolitan population, the age-old quarrels of Europe which laid the foundation of that terrible world war into which all civilization was drawn.

The first thing to do when a man is to get religion is to convict him of sin. We have not to be satisfied that we have a problem in our community or State; we have got to be assured that that problem is real; and then be convinced of the necessity of setting up the machinery to eradicate it, if it is worth while to do so. The first question that comes into the mind of a man who has not thought of this problem very seriously is, "Well, what of it? What if these people are here in these numbers? What do we care about it? They have been coming here since 1882 or 1883. Why not let nature take its course? If they want to be Americanized, they will Americanize themselves in their own way."

Well, the first answer to that is: It is politically wrong. The genius of our institutions is such that they depend for their successful operation on an intelligent public opinion. We make laws here by the force of public opinion. The legislature of this State has written law after law upon our statute books through the influence of public opinion. The President of the United States, the Governor of the Commonwealth, and the Mayor of the city are all public servants, and they execute the law of the land under the guidance of public opinion. They are chosen by the suffrage of a sovereign people.

Now how can you have intelligent public opinion in a commonwealth when 346,000 of its people cannot read or write the English language or properly exercise the right of franchise, and when 118,000 of them probably could not understand anything that was announced as a law or proposed as a public program?

It is a political anomaly for fifteen million, or five million, or any number of people in a country like ours to be shut out by reason of a language

barrier from participating in the development of the political life of the nation.

It is socially wrong. It is wrong not to set up social contacts, between yourselves and your alien neighbors, to get into their hearts and have them get into ours, so that we may realize together the hopes and aspirations of a common social existence in the community.

There is a teacher friend of mine who has been teaching English to foreigners. An old Polish woman came into her class, sixty-nine years of age, too old to successfully learn English. The teacher was kind, and encouraged her all she could for awhile; but she made poor progress, and finally the teacher said to her, through an interpreter, "Don't you think it is going to be a hopeless task for you to get this English language so that you can ever use it to advantage; aren't you rather discouraged at the progress you are making here?" The old woman put her hand inside the bosom of her dress and drew out a letter written in English, upon stationery furnished by the Y. M. C. A. to the American Expeditionary Forces in France, and answering through the interpreter, she said, "Here is a letter written to me by my boy not long before he was killed, while fighting in the United States Army in France. It has been read to me a hundred times, by my neighbors and friends, but I don't believe they are telling me all it contains, and I shall never be satisfied until I have read that letter in English myself."

The social value of that mother to the city of Quincy, where she lives, and the value of all such mothers in the world to their communities, cannot be estimated in dollars and cents. I doubt if there is anybody in Quincy who knows of her life and love except that New England country school-teacher who is still trying to teach her the English language.

It is economically wrong. A man who employs a great number of aliens asked one of them to drive him home one evening in his automobile. John jumped into the car with his employer and started up town at about thirty miles an hour. Coming to a bad curve, where there was a sign posted, "Slow Down, Blow Your Horn," John continued on around the curve at the same speed. "Can't you read that sign?" asked his boss. "No, me no understan', me can't read," John replied. "How do you get along, driving this car?" said his employer. "Oh, me careful," said John. The Commonwealth of Massachusetts has licensed that man to operate that automobile on the highways of this State, making him a danger to himself and a menace to every lawful traveler on the highway, due to his inability to read the common warnings posted for the protection of his life and the lives of others.

Now use your imagination about such a man working in a factory where there is an elevator with a sign on it, "Danger, Don't Open This Door"; or a tag on a piece of mechanism, "Oil This Machine Once a Day"; or where the cost system requires him to put a time check on a card; and you will have some idea of the losses to industry in this country in employing men who cannot read and write the English language.

The only thing which prevents these good people from joining in the political life of the country, bars them from social intercourse with us, and which keeps them from making the fullest possible economic contribution to industry and business, is the barrier of language which Nature has raised up between them and the rest of the people in this country.

Political, social, and economic considerations, if no other, ought to stir us to take immediate, active interest in the solution of this most intricate and fascinating of our domestic problems.

Having decided that we have a foreign language problem and that it ought to be solved, the next question is, Can it be done? Many people say, "What is the use?" These people are merely clods of the earth, country people, born on farms, come here ignorant; what is the use of wasting time and money in educating them? It can't be done."

The mind of man is essentially the same today as it was in the day of Moses. True, Moses didn't have a telephone, electric lights, or a Twin-Six. He didn't have woman suffrage, or an eighteenth amendment. But, if these things had been in existence in his day, I've no doubt that he could have given Central hell because he didn't get the right number, could have driven the Twin-Six through the Red Sea, apologized for his forty-year opposition to woman suffrage, and raised a thirst even in the desert.

The average man, of any race, has the mental capacity to understand the institutions man has erected on this continent for the government and development of society. The co-mingling of the races on the battlefields of Europe taught men to understand that differences of race, language, or religion, have nothing in the world to do with the capacity of the human mind to grasp and hold firmly to a great truth.

The homely virtues—love of home, love of offspring, love of country, charity, purity, and honesty—are as well-known in the frozen North, the Orient, or on the sands of the desert, and quite as frequently practiced there, as they are in Boston. Men the world over are capable of exemplifying in their lives all the virtues we think so necessary to good citizenship. Race, language, or previous political conditions cannot and do not prevent it.

All we have got to do is to have a little good-will in the matter, go out of our way just a little, lay our hands on the shoulder of the immigrant and bring him into contact with our life, and we solve the problem.

How do you do it? Simple enough. There isn't anything mysterious at all about it. It is just developing points of contact—social, educational, political, and economic—with the alien within our gates; approaching him with a little neighborliness; getting the knowledge of our language over to him; telling him the story of our country, and laying on him the mantle of our common citizenship.

That was our problem, up in Gardner; and this is the way we went at it. We started away back in 1900. I have the figures, but I will not read them now, because they are lengthy. We started in 1900 with the evening schools. With that large alien population up there, all the people we could get interested in the idea of learning the English language were one hun-

dred, and some of them were not even aliens, but Americans who wanted a little improvement. So we dribbled and drooled along, with 110 the next year, 155 the next, and 268 the next year. With the year 1907 there came to the schools in Gardner a man from Manchester, New Hampshire, Ralph Fitz, assistant principal of the high school, who took charge of the night schools. He found that the night schools were not getting things done in the right way.

Some of the men were anxious to become citizens of the United States; and so, outside of school hours, at odd times, at the factories and other places, he got them together, made out first and second papers of citizenship, put them through their paces to pass the Federal test, and was instrumental in helping them to become citizens of the United States.

The night school record, under Fitz, went from 303 up to 557—just by showing a little interest in the alien.

Then the war came on and calls for troops were made, and we found there were 700,000 men in the draft who could not read or write English; and of the men who went from Gardner some could not understand "Halt," "Fire," "Load"; some could not read an order. We began to wake up, and with other people, make up our minds that we were going to tackle the matter in a proper way. We set up an Americanization program which has for its purpose—

First, to break down the language barrier which prevents us from communicating our ideas to our alien friends and prevents them from communicating theirs to us.

Second, to lay on their shoulders the mantle of citizenship.

Third, to instruct them as fully as possible in the patriotic traditions and history of this country, and relate that history and tradition, if we could learn how to do so, to the history of their native countries.

Finally, to give them a night school that provides further opportunity for self-improvement. We have a vision of a great auditorium in our town, to be erected as a memorial to the men of all races who gave their lives under our flag to make the world a better place to live in, in which we can assemble our alien neighbors, on Polish night, or Swedish night, or Italian night, and there let them give expression, dramatic, literary, musical; in their own language, or ours, make their cultural contribution in their own way to the town of Gardner.

We must contemplate building up in the alien a love for this country, without asking him to lose his love for anything that is decent and good in his own.

In making out that program and attempting the Americanization work in Gardner and conducting the night school work, under the twenty-five or thirty teachers trained by Mr. Mahoney and his assistants, we have discovered that teaching the alien is a somewhat different job than we thought.

One night-school teacher, not well equipped to handle the work labored long and patiently with a fine-looking, fair-haired alien, using common,

ordinary beads, on a rod, moving two beads over, then two more beads over, and trying to teach him that two and two makes four. This young fellow went away, and never came back. A year or two later one of us happened to meet him on the street and asked, "Didn't you once go to the night school?"

"Sure," he answered, speaking English as we hear it most spoken.

"What did you give it up for?"

"Why," said he, "I went down there and that teacher tried to teach me that two and two are four. That disgusted me! it was insulting. I am a graduate of Gutenberg University, a civil engineer, and I have forgotten more about mathematics than she ever knew."

We found out, if you please, that our alien friends knew the facts of nature, of mathematics, and of science, and that we were insulting the intelligence of a great many of them, by trying to teach them some things of which they knew more than we did ourselves. So we changed all that. Now we have a special corps of teachers, with special textbooks. We try to have every one in the schools feel they are not being belittled, but are being helped to be more useful to themselves and to us. In a word, appreciation, instead of depreciation, is the guiding principle which controls the approach we are trying to make to the alien's heart and mind.

We made a survey of the town, with a view to locating all non-English speaking adults. First we took a street list, and by checking it with the voting lists discovered that a great many of the people living in our town were not voting citizens, and whenever possible found out the reason. We discovered two or three streets on which there did not live one single, solitary citizen of the United States; we found other streets in which the percentage of non-citizenship was 90 per cent, 80 per cent, 60 per cent. We went to every factory in town and discovered how many non-English speaking people there were there, and how many they had employed there who could not read and write English, and got their names. Then we went to the pastors of the churches, had sermons preached, and had the story of the Americanization plans and purposes communicated to these people. We went to the manufacturers and induced them to coöperate, by opening schools for their employees in the plants, and thus prepared to gather the aliens into our schools.

We have now in operation in that little community of 16,000 people, 30 factory classes, teaching English and citizenship, with 420 people attending these classes two days in the week, after they get through their day's work. In this slack time, when the men in the factories are working but three days a week, we have school just the same; and if there is no work, the men come to school at the factory, whether the factory is running or not.

If there are any absences from the factory school, we make note of the fact, take the names and next morning some one goes to the house to find out why John Zobeiski didn't come to school. Whether it is a school for Americanization or a school of the ordinary kind, in the church, at home, or anywhere else, it is going to fall down unless you have a thoroughly good

follow-up system. All the alien needs is a little encouragement, to keep him on the job; but if we don't have somebody follow him up all the time, the night school closes.

We have two mothers' classes, one in the Young Woman's Hebrew Association, the other for French Canadians. We have a class for men in the French Canadian Club. Most wonderful of all, we are negotiating, at their request, with the Finnish Socialist Club, about setting up an Americanization school for the club.

We have tonight in the schools of Gardner, in Americanization alone, 620 people; and 906 people, all told. You may be sure that we are gratified; but we are not satisfied. I have the confidence to believe that some day Gardner will be a community where every man will be able to say that at some time in his life he had an opportunity offered him to become a citizen of the United States. We intend to make it impossible in our community for any alien to ever say he was not given a fair chance in the United States of America, by the town of Gardner.

Well, is the game worth the candle? Is it worth doing? What do we get out of it? That is a perfectly practical, New England question. What do we get out of it?

Next to the matter of doing something for the other fellow, have you thought of what these alien friends of ours represent in the world of men? Every nation, in the beginning, has some fundamental principle which determines the extent of its contributions to the world's welfare. In Palestine it was religion; in Greece it was culture; in Rome it was law; and the history and the development of our own country clearly demonstrates that in America it was the enfranchisement of mankind. There is no nation, certainly no civilized nation, with a history so barren of great event or stirring movement calculated to affect the thought and manners of mankind but has contributed something at least to the sum total of the world's welfare. The last immigrant who landed on Ellis Island today is potentially the greatest man of his race.

The population of this country represents a cross-section of the peoples of the earth. Men of every race, from every clime, are here, each bearing the peculiar gift of his people—their culture, art, music, law, literature—ready and willing to lay it on our altar. Have we received the gift in the spirit in which it should be accepted? Have we not been passing by our alien neighbors, without much knowing or caring who or what they are or have? I am afraid so; and we have been missing glorious opportunities of self-improvement by a social contact with men who represent much that is good and true and beautiful in this world of ours.

I am going to take the liberty of introducing to you some of your fellow-citizens and ask if you do not see in them something you have never seen before.

First, let me introduce Jean Baptiste Le Blanc, French Canadian citizen, who came out here thirty or forty years ago from old Quebec, to work in the mills at Lowell, Lawrence, or Fall River; brought out here his peculiar

parochial system, lived by himself with his few friends and neighbors, because he was shut off from the rest of the community by a language barrier.

It is very convenient, I know, to think of him and others like him as nothing but workers in the factories, spinners and weavers in the mills, dwellers in the tenements. Why not think of them in the terms of the second generation—as great lawyers, merchants, bankers, judges upon the bench, governors of States? Why not think of them in terms of their great history? The great-great-grandfather of Jean Baptiste Le Blanc sailed into the waters of St. Lawrence Bay, and founded the trading settlements at Quebec and Montreal long before there was a permanent English settlement in New England. One of his ancestors paddled the birch-bark canoe which bore Champlain out on to the waters of that beautiful lake which bears his name. Another ancestor was a “voyageur,” a “coureur de bois,” who went with Father Marquette through the Great Lakes, down the Illinois River, the Mississippi, up the Missouri, and was present at the naming of St. Louis, St. Joseph, St. Paul, St. Mary’s, names which mark the spots in the wilderness where Christian missionaries raised the cross of Christ toward heaven for the salvation of a heathen race. You don’t know your fellow-citizens unless you know Jean Baptiste Le Blanc.

Let me present John Anderson and Olof Erickson, fair-haired, blue-eyed, pink-checked sons of the North, Swedish and Norwegian citizens. Of course, we used to think of them as nothing but “gobs” in the navy, workers on the fishing fleet, or “lumpers” around the docks. But that is not quite fair to these two wonderful peoples. Why not think of them in the terms of what they really are? There is not a man in this hall who would wish to display his ignorance of modern literature by admitting that he had not read his Ibsen. Their ancestors were the Vikings of the North, sailors of the seven seas, discoverers of Iceland, founders of its unique republic, explorers of the Virginia Capes, builders of the round tower, five hundred years before Christopher Columbus was born.

Let me present to you John Druzinski, modern Polish citizen. Oh, what a terrible time his people have had; run over, trampled down, held in subjection for hundreds of years; Germany trying to poke the German language down their throats for forty years, and they surviving and becoming more Polish than when this began! Copernicus, discoverer of the heliocentric system, was a Pole, born in Cracow. Who has not heard of Kosciusko, and Count Pulaski, aide-de-camp to Washington; and is not the greatest musical genius of the age none other than Paderewski, first president of the Polish Republic?

Let me present another group: Luigi Limbardo and Alexis Cosmopolis, modern Roman and Athenian citizens; “the glory that was Greece and the grandeur that was Rome.” I know it is easy to think of the Italian as the “wop” and the “dago,” that shovels in the trench, crawls under the river, labors on construction work, and fills the columns of the sensational newspapers with his Saturday-night brawls. It is easy to think of the Greek as the push-cart man, who gets in your way when you drive down the avenue in your Twin-Six.

But the little Italian boy, shining your shoes at the station, has been on the Grand Canal at Venice, has seen the beauty of Florence, and stood awe-inspired before the majestic grandeur of Rome. There may be coursing in his veins the blood of Virgil, Horace, Cicero, Michael Angelo, or any one of the thousands of those who bore magic Italian names; and who knows but that the little Greek is a descendant of Homer, Alexander, Plato, Socrates, Pericles, or of any one of many mighty Greeks? These people were civilized, had law, organized government, art, music, letter culture, and a place in history, when your ancestors and mine were barbarians in the forests of Northern Germany, or offering human sacrifices to an unspeakable god in the swamps of England or Ireland.

Finally, let me present to you Solomon Levy, Jew of Jews, from Russia, Poland, Austria, or God knows where. Has any race ever been persecuted as his has been? For nineteen hundred years the hands of men who ought to have known better have been against him. Oh, I know it is very easy to think of them as raggickers, and junk dealers, and offensive persons in the dining cars. But why not think of them in the terms of their achievements?—the greatest bankers in the world, the greatest merchants in the world, the greatest manufacturers in the world—a race which produced, in Abraham, the greatest single leader any people ever had, and in Moses the greatest lawyer. Out of the loins of this race came the light and hope of the world. They belong to the very best of the human family. Their ancestors stood on the hills of Jerusalem and communed with God.

These and many others I have no time to mention are our fellow-citizens. All we need to make them what we would like to have them be is vision, tolerance, and a little money. They come, as we do, from the hand of God, and they go, as we do, to the grave. Why not join hands with them, and by coöperating with them, build up on this continent what this country really ought to be—the greatest republic the world has ever seen?

SOCIALIZING THE METHOD, CONTENT, AND PROCEDURE

ETHEL RICHARDSON, ASSISTANT STATE SUPERINTENDENT, IN CHARGE OF
IMMIGRANT EDUCATION, SACRAMENTO, CALIFORNIA

In the history of the world there has probably been no more eventful period than that through which most of us have lived who are attending this National Education Association convention. We have seen evolution and revolution, industrial, economic, political, and social. We have watched the world change from hand-made to machine-made. There is no field of adventure, endeavor, or thought in which there have not been great discoveries. There has been no change which is more significant, for the future of society and civilization than the recent developments in the field of education. We are fortunate to be living, teaching in an age when we can see the dawn of an era of a real education as important as the

Renaissance. Leaders of thought for many years have been attempting to intrigue the common sense of educators by showing them psychological reasons for teaching a child by developing *him* rather than by developing subject matter. For the most part their words fell on deaf ears. It is only in our own time, under the leadership of John Dewey, that we have begun to find the relationship, better still the oneness, of education and life.

With the increasing complexity of existence, and the surprising development in the facilities for disseminating knowledge, the volume of human experience to be transmitted from one generation to the next has so expanded that selection becomes necessary. Since the entire body of knowledge, skills, and attitudes, the cumulative possession of the race, could not become the heritage of each individual, there developed a need for wide differentiation. For that part of education which is to be obtained in the school, we have been compelled to evaluate, appraise, and often discard what was once regarded as indispensable. We have come to recognize that the importance of any bit of knowledge is not implicit but depends for its value on its usefulness to the particular individual who employs it. Hence the method of passing on human experience from one generation to another has changed from pouring in facts to making possible the contact with those facts at a time when the individual feels a need for them and can make them a part of his own development in order to put them to social use. The student has ceased to be passive; the classroom and the teacher are merely the environment in which he can experience a richer and more intense life.

America is striving to create a democracy and therefore wants education that does not produce docility. Education for a democracy demands that the product of the schools be not a good pupil but a good citizen, with a capacity for wise judgments and independent decisions. Much is said lately about the business of the schools being the production of citizens. That may be true provided no narrow idea of the State is maintained. It is the business of the schools to create environment for richness of life which "depends upon the tendency, what one does, has to suggest succeeding activities." It is the business of the school to give opportunity to those who attend it for achieving completeness and integrity, not through showing them *what* to think but through showing them *how* to think. It is not the business of the school to determine the pattern or the cast, or to set up any limitations for its pupils in order that they may fit any particular theory of education or the State. When each individual is developing to his own greatest capacity, the State can be without fear for its citizenry.

These in brief are the broad educational principles to which the school is attempting to reshape itself. The recognition of a theory, however, or the logical rightness of a principle, is vastly different from discovering the vehicle by means of which the principle can be made to function, particularly when the application must be made to so large and long-established an organization as the public school. All the machinery and equipment of the schools has been devised toward another end. All the arrangements of

the schoolroom and the teacher are predicated upon the idea of pupils as plastic and passive, molded by a superior being who in every instance is better able to decide, to make choice or judgments concerning both their immediate and remote needs. To find specific ways in which this hide-bound system could be bent to carry out the accepted principles has been the task of all the great teachers of our generation. The fact that the devices and methods which have been suggested as a means of effecting the practical application to the classroom of these general principles of work have been seized upon by the superficial as an end in themselves, by no means lessens the importance of the contribution. Unintelligent teachers have misused valuable methods because they failed to understand their purpose, but they have sometimes cleared the way for intelligent use of the same tools by the more discerning who regard each device as a step towards the discovery of another which will be more effective.

Among the methods that have been proposed to give the child greater opportunity to gain experience rather than learn facts, the most important are the project and the socialized recitation. A wealth of material can be found on these two subjects, written both by those who have followed scientific methods and those who are eager to use "catch words" as substitutes for thought. The significant principles which the project method attempts to embody are (1) that learning must be an accompaniment of pleasurable activity, and (2) that the activity must have purpose in the mind of the individual. Provided these two conditions are present the individual can make the efforts of the school room a part of himself. The socialized recitation is in a sense an aspect of the project method.

The most successful projects are those in which groups of children are engaged together, sharing one another's experience and each profiting by the successes and failures of the other members of the group. Once such a vital project is undertaken the teacher becomes a less important factor in the classroom. She is there for reference and consultation, but not for all the initiative and leadership to be displayed. This is equally true whether the project be of the more manual sort, such as making a doll's house, or whether it be mastering the English vocabulary concerned with the doll house, or a drill which would make possible the dramatization of a story written about the doll's house. Whatever the project, its success depends upon the self-activity of the pupils.

This is as far removed from the first interpretations of the socialized recitation, where one child was substituted for the teacher and followed the old question and answer method with less technique than the teacher, herself, might have done. In the real socialized recitation each individual contributes as much as his native capacity permits, and himself selects from the body of available facts whatever is pertinent to the undertaking in hand. Moreover, there are implications in the project method which lead the group from the somewhat artificial surroundings of the school room into the world outside. This project, as Kilpatrick says, "A unit of the worthy life." Charles Pendleton, of the University of Wisconsin, says

that the recitation as usually conducted is a failure because "it fails to establish a microcosm resembling the real world outside." In contradistinction to this, "The socialized recitation is not entirely a modified recitation, or any recitation in the conventional sense, but a substitute as a class room procedure. It becomes an attitude of the school. It is not a method, but a point of view."

Under the old system we had courses in hygiene and sanitation in which the pupil learned from a book certain facts with regard to the spread of disease, or the necessity for proper disposal of waste. As facts, it was possible for information to remain entirely outside the experience of the child and to have no valuable effect whatever upon his behavior. With the project method certain children in the high school will be led to make certain discoveries whereby hygienic living will assume importance to them. This might be through becoming aware of the fact that the part of the school grounds used by their own class was less or more tidy than the other part of the school.

Becoming conscious of a condition is a step toward assuming some responsibility with regard to it. It would soon be easy to lead the class to a study of causes of sanitation and insanitation, which apply to the school and from that to the neighborhood and the city. In such a project each child would find his own place as his interest dictated. Without a combined effort of the entire group the project would fail and the interplay of knowledge gained would be infinitely greater than the experience of any individual. It is through relationships of this sort, as Dewey says, that "The whole is greater than the sum of all its parts."

Much experimentation and a considerable amount of writing has been done on this subject in the field of the education of the child. Little application, however, of either the general principles enunciated above or the methods by which those principles can realize results, has been made concerning the education of the adult. Here, partly because little specific training has been offered to teachers, and partly because the subject matter is as yet undetermined, the most archaic methods still prevail. This is particularly true with reference to the education of the immigrant; in the first place, because that education concerns itself (1) with the problem of teaching languages and the languages are the most intrenched of all the subjects in the curriculum. This is due to their classical tradition and the theories of formal discipline which much of our language study has used as a bulwark. Nevertheless it remains clear that there is as much, if not more, need for reform here than in the education of the child. Professor Albert Manbridge, of England, Chairman of the World Association on Adult Education, said that it is now clear that adult education is out of its swaddling clothes; that it requires material with peculiar qualities of freshness, directness, and simplicity not found in textbooks—"the end of adult education is more than bread and butter satisfaction." He would give a course on broomsticks if it would create hunger for higher things.

It still remains for some one to devise means for more experimentation

in this field so that educational theory can be applied to the night school curriculum for foreign adults. The night school has two fundamental tasks or rather there is one problem which incorporates within itself a lesser problem: namely, making possible free communication between the foreign-born and his American environment. Establishing such communication in its largest aspect, is the orientation of the individual in the social group. In a lesser way it is giving him the tool which makes that orientation possible for the first medium of communication is the common language. In this the teaching of English to the foreign adult differs from modern foreign language-teaching in the secondary schools or universities. If the aim of the latter has been to establish a closer relationship with the people of the language studied, the methods pursued have not revealed that aim. On the other hand, all of the assistance which the directors of immigrant education have had in attacking the inadequate character of the teaching has come from such scanty material as can be found on the subject of methods of teaching a modern language. In the beginning either the means which were used to teach Latin and Greek, or those employed to teach reading to the primary children, were found in practically all of our night schools. An impetus, given by the war, to greater expansion of the night school program came at about the same time as the revolution in the traditional methods of teaching French or German or Spanish in the high schools. As with the project method, mere devices, formulated by the modern language specialist in an effort to discover a more natural method of learning a language, have been seized upon by the poorly trained teacher of adult immigrants as a carry-all for teaching English.

The larger benefits of the project method and the socialized recitation, gained by those who understood their use, have never been shared by the school for foreign adults. Even where the teacher has eliminated the *bête noir* of language instruction—namely, oral reading and grammatical presentation, she still maintains her place as the dictator rather than the companion of her pupils. After visiting English classrooms all over America I find that the old discarded system still prevails in most instances—a little effort at desultory conversation, and then the book. Sometimes the book is a lesson specifically written around the interests of the group. Oftener it is the text prepared with little science and with no relation to the particular class. The real purpose of the school is forgotten—the establishment of modes of communication between the foreign adult and his American life. The dictatorship of the teacher prevents that one activity which would contribute to the accomplishment of this real purpose—namely, practice in the art of speaking the language.

All language teaching in his native tongue for the American child has been encumbered with over-emphasis on reading and writing. The capacity for fluent oral expression, which is probably the acid test of education, is the possession of very few. The necessity, therefore, for assiduous effort in discovering a classroom procedure in which as little as possible of the valuable time shall be absorbed by the activities of the teacher and as much

as possible given to the class, is obvious. Beyond this, it is important that the time devoted to the activity of the pupil will have purpose for him which will give him a desire for self-expression and will eliminate self-consciousness. Probably the poorest place in the world to teach a language is in the ordinary schoolroom. There is so much more involved in language teaching than the acquisition of new symbols for old concepts. There is the entire past experience tied up to the old symbols. They carry an emotional connotation which has more to do with the meaning than their exact relation to the imagery which they may call up. Therefore, to attempt to substitute a new symbol unstrengthened by the habits and attitudes of the past in an atmosphere devoid of interest and most suggestive of hard work, makes the task almost impossible. The foreigner comes to his English class motivated by a tremendous need for the new language. That is his only asset and the only point of contact between him and the teacher. All the other factors are against his learning. The strangeness of his surroundings, the inappropriateness of the school room, and the entire disturbance of his emotional life render him unfit for the learning process. Therefore, the teacher's most important task is to create in that classroom an atmosphere in which the pupil loses not only his sense of fatigue and shyness, but his belief that he has come to undertake a task. The whole idea of a task must be removed. If it is true that a child learns most while engaged in pleasurable activities, it is infinitely more true that a foreign adult can supplant the language which has often been the most cherished possession of his race only when the acquisition of new speech habits is secondary to his participation in absorbing social intercourse. Specifically how this is to be done is a matter for much experimentation and long striving. In theory, at any rate, we have abandoned all that content of material which does not bear a direct relation to the everyday life of the foreigner. We have furthermore established a pedagogical principle that in learning a language, hearing and speaking should precede reading and writing. Therefore, all of our better teachers are devoting a larger amount of time to talking, and less and less to reading and writing.

In its many modifications the Gourin method of developing language in series with the emphasis on verbs has become our most common vehicle for language teaching. It has undoubtedly served a splendid purpose in offering one way of using oral English with real method instead of the casual conversations, which were the first reactions against classical procedure.

On the other hand, if used very much it completely destroys the naturalness of the group and is particularly objectionable in that it emphasises the teacher-pupil relationship. So long as this relationship prevails, there will be little or no expression on the part of the pupils of their immediate needs and desires, or of the degree of satisfaction which those desires are receiving in the classroom.

This paper does not pretend to offer a treatise on the methods of teaching English. This subject has been so well covered in the chapter by Dr.

Goldberger in *The Schooling of the Immigrant* that further discussion is unnecessary. We are concerned here, not so much with the technical presentation as with those classroom attitudes which make possible the functioning of the technique. Certain definite rules may be followed with success: (1) Let the pupil determine and express his own needs; (2) Serve the pupil's immediate needs rather than those more remote, even though the latter be more important; (3) Provide a regular channel through which the pupil's expressed desires may come to the teacher; (4) Establish a method by which the pupils can test their own progress; (5) Find a substitute for the play situation in which children learn a foreign language so easily; and (6) Have activities in the school that will carry over into the life outside the school.

1. A special study should be made of each pupil as he enters the school room. The arrangement found in many night schools is the usual questioning concerning name, address, and other categorical inquiries which have little to do with the causes for the student's attending school, or with the things which he hopes to accomplish. This accounts in large measure for the inadequacy of the grading in most of our schools. In many instances, there is no one free to make this fundamental examination of each student. It is, therefore, very important that every night school have a principal whose main concern is not with record keeping, and other clerical work, but with the social relations of the pupils. In many instances it will be necessary to use an interpreter and carry on an extended interview, perhaps over several evenings, before a student is properly classified. When such classification is made it may be possible that there will be no grade where the particular service desired can be rendered. In this case, it should be the duty of the principal to give the necessary individual instruction to satisfy the wants of the newcomer.

2. A night school which is teaching the English language in general, and not supplying the particular lack which the student recognizes will not keep the student long enough to interest him in the aims which the school has determined upon. Dewey says, "A man must know many things which seem useless to a child: teach a child what is of use to him as a child, and it will take all of his time." This is just as true, perhaps more true, in the teaching of a foreign adult. If we teach him what he needs at the **moment, the meeting** of that need will create other needs to be satisfied.

3. It is not enough to determine upon the classification for each student as he enters. There must be a permanent arrangement for him to make his wants known. This can be done where a night school council, made up of representatives from each class, meets regularly with the principal and teachers to discuss the classroom activities, suggest new material in which the students are interested, and to report on devices which have been used and found helpful in increasing the speaking ability.

4. It has been discovered that the child learns more readily when he understands the purpose behind each task and acquires each new skill as a tool in the successful completion of a self-initiated activity. It is all the

more important, therefore, that an adult mind should not be expected to waste time doing things without knowing the reason. Children are always happy to check on their own progress and to discover their increased power. Provided the proper conditions are created, the adult is much better fitted than the child to measure his own progress.

During the past year a most successful class has been conducted in an evening school where the students fully understood the teacher's methods and cooperated with her in making them a success. It had been previously determined by the teacher, through careful experimentation, that the average night school student could increase his vocabulary at the rate of about six new words a day, and could increase his capacity for correct usage by not more than two new problems of grammar or syntax. Just what this vocabulary would be was determined by a careful study of all the members of the class, with the help of the interpreters. Lessons of a theme character were then prepared, incorporating that vocabulary. Members of a class prepared questions outside with which to test one another's ability to use the acquired vocabulary in new combinations, and to test their own understanding of the idioms which the structural problems involved. This selfcorrective intercourse was so stimulating that fear of losing the daily apportionment made the attendance on the class almost perfect, and where absence was necessary an effort was made to get the new lesson before returning. In the same way the students reported their increasing ability to make themselves understood in specific situations outside the classroom, and asked for assistance in saying correctly those things which they had said with difficulty.

5. To find a substitute for the play situation in which the children learn a language so easily is by far the most important point in the procedure and has to do with making the language a part of the individual, rather than an awkward tool whose use he can never learn.

The problem is simple enough when it comes to the child. When a non-English speaking child enters the first grade it is entirely within the power of any teacher to remove his handicap and make him at home in the strange language. In the light of this fact it is unfortunate that so many children sit through one, two, and even three years of their school life understanding little or nothing of the activities which are taking place about them. Unlike the adult, in the beginning the child has no motive for learning English. His mother tongue has supplied all his wants up to the time he enters school. It is the business of the teacher to supply motive. She can do this only by creating a situation where he is desperately anxious to talk and where his mother tongue will not communicate his ideas. This is the play situation.

Although the adult has all the motive for talking—his presence in the schoolroom being assurance of that—the classroom seldom supplies the stimulation which the toys and games can give the child, and the consequent self-forgetfulness is never achieved. So long as the English is used as an exercise for acquiring language facility the foreign adult will never get the "feel" of the language (*sprachgefühl*), which is the essence of all real understanding.

Just how this is to be accomplished with the adult is difficult to say. It comes nearer accomplishment in those schools which are highly social in character. I, myself, never saw it so well achieved as at one school where all the pupils were acting as host to the pupils of a neighboring school who had been invited, with their teachers, to spend the evening and visit classes. An effort was made to have each school interpret itself to the other school by the spontaneous expression of the student. The visitors were not only newcomers to the community, but to this country. All of them were young Greek boys, and their hosts were Italians. Each class in the school acting as host, had prepared a dramatization of some problem which its members had had on first coming to America, and they were bent upon pointing a way to their guests by which their own difficulties could be avoided. This led to the Greek boys recounting some of their own experiences, particularly with regard to the problem of employment in which they had all had much the same misfortune. After such consultation it was agreed that both schools would set about to find ways by which these trying situations could be eliminated. The sympathetic sharing of experience, and the new companionship, as well as the prospect for working together, overcame many language difficulties while presenting language problems for future solution.

6. When such an atmosphere can be created in the schoolroom it is not difficult to obtain a close relationship between the schoolroom and the community. It is in the achievement of this last aim that the implications of the fundamentals of adult education are carried. So long as the night school is merely a group of classrooms, organized ever so efficiently for the teaching of language, it has met only the smallest part of its public obligation. It is the business of the night school to create an environment in which the pupil can live an American life. It is often said of us that in spite of our effort to be a democracy, we have as yet organized no institutions which are training for democratic living. The most flagrant violation of this ideal is in our penal institutions, where we are rather training men and women to be good prisoners than to be good, responsible citizens. In a measure less obvious but none the less real, our evening school, although it claims to offer training for citizenship, seldom makes any contribution toward the greater participation of its students in American life.

Three fundamental changes will be necessary before we can have this enlarged conception of the night school:

1. Citizenship can no longer be narrowly conceived as preparation for passing naturalization examinations. In many cases this has nothing to do with citizenship, whatever. The skill required to meet this test must be added after the student has become an American in everything but word. The ordinary naturalization class is the poorest place to train for citizenship. The students, strained to memorize all the required facts, are in no mood to be interested in the larger aspects of the question. It would be like asking a college student, on the day before his final examinations, to spend his time in drawing up a constitution of self-government for the student

body. The citizenship education in the night school should begin on the first night the pupil enters the school.

2. The content of the language education of the foreign adult, once he is beyond the very beginning stages, should cease to deal with trivial suggestions used for language exercises, and should concern itself with the larger ideas which are interesting to adult minds.

3. The night school teacher should have broader contact with the foreign people, on the one hand, and the American community, on the other. To make specific the meaning of these three suggestions I shall have to draw my illustrations from California, because it is the only field with which I am sufficiently familiar.

(1) In order to make the night school a less scholastic institution and to have it a real part of the life of its students, many of the schools in California have been organized as a club. This club undertakes all the responsibility of running the school. The Cosmopolitan Club of Berkeley, which is now eight or nine years old, is one of the most successful organizations of this type. Here the teachers and students are integral parts of the same body, each rendering the service for which he is most fitted. There is a committee of the students on attendance, which follows up absentees and keeps strict report on the reasons for leaving school. There is another committee on school activities, which has representatives from each class. This committee makes suggestions concerning new courses of study and keeps those courses which are in progress close to the interests of the student body.

There is another committee on entertainments which, with a committee from the neighborhood, plans the Friday evening community night which has become a regular part of the club's activities. Through the initiative of the club, the speakers on all important subjects have been obtained from the University and elsewhere. When a question directly relating to all of the men in the school is brought up, it is often necessary to have lectures in several languages. Every public occasion and holiday is utilized to the full, including those festivals and holidays belonging to the nations of the various countries represented.

Other schools have more nearly realized within the school walls a semblance of the world outside by increasing their contacts and extending their services to groups which are not interested in the English and Citizenship classes. Millinery, sewing, cooking, drama, dances, and folk games of other countries, when properly organized as neighborhood activities rather than classes, make the school the important center of the life of a community. The difficulty of most of this extension work in the past has been with the way it was set up. A class in dressmaking may be a woman's sewing club or it may be merely a class run by a teacher. The spirit and the attendance will quickly show which type any particular group represents.

(2) As soon as the vocabulary of the foreigner is large enough to enable him to use his English for other things beside the acquisition of more English, the class should concern itself as much with the content of English

as with the technique of modern language teaching. Whether it be speaking or reading or writing, both vocabulary and facility will grow through interest in the subject matter. In a large number of our night school classes, we find the intermediate and advanced groups spending their time reading Fifth Grade histories and Seventh Grade geographies, which are without interest to the adult. Here is the best opportunity in the night school for the use of the project method. Several interesting projects carried out in schools in California this year have proved their value not only as general education but as methods of teaching a language.

One excellent history project came from a study of the life of Columbus. A school club, largely Italian, was interested in utilizing Columbus Day for one of its regular entertainments in order to show the bond between Italy and America. It was decided that a play would be given dramatizing important events in the life of Columbus and the discovery of America, in which each class would take its own part. The most advanced class prepared the material which the beginning class carried out. In the other groups, committees were appointed who looked up particular events and reported on them, and after the study had been carried on for some time a play committee was selected to write a dramatization. History, geography, and citizenship were all taught by this project, as well as considerable understanding of the use of libraries for reference.

Another project carried on by a country school began with interest in the problem of water supply for that district. This was an irrigated district to which the water had been brought many miles. The study of the principles of irrigation and the reasons for regulations wiped away a great deal of local dissatisfaction and led to an investigation of large projects, such as the Colorado River and even the Panama Canal. In the course of the study, comparisons were made of water supply in California and in the home country, and a splendid opportunity was made for a talk by the farm adviser on proper care of the land with reference to water. Beside the County Library, the students were forced to consult the State Library, the State Department of Agriculture, the University, and several departments at Washington, in order to understand the whole question. Some of the findings of this class which would be useful to all the farmers in the district were reported in the night school paper.

The night school paper in a new form has become another valuable project in the language work. Whereas these papers once contained compositions by the students, which no one but the students or his friends would be interested in reading, they now serve as a valuable text for classroom work, carrying items of interest to the whole community. This method of preparing their own reading material has been particularly valuable in the country. In fact, where a number of country schools are maintained under the same supervision, they have served as a medium of communication and have set up a friendly feeling between the various districts through which they are distributed.

In another school district in the country, where taxes had become burden-

some and the thrifty Portuguese were rebelling, the class undertook a study of the uses to which their tax money was put. Without giving the details of the numerous heated discussions and consequent search for new facts, the total result of this effort was the carrying of school bonds after they had been lost in three previous elections.

The Labor Movement for workers' education in both England and America challenges the public school to reorganize the content of its adult education to matters which are more mature and which involve all of the present-day problems. When one visits a class of young Italian women in New York City, all of whom have been in this country but a few years, and finds them studying the history of the organization of society in order better to understand their own industrial relations, one is somewhat chagrined at the childish pabulum which the public schools are offering. If men and women want such education when they pay for it themselves, they undoubtedly will prefer it when it is furnished from public funds.

(3) All of the problems of the night school are more nearly met when the night school's relationship to the world outside is explicit as well as implicit. In California it has been possible to make that relationship more substantial through the employment of the full-time teacher of adult immigrants, of whom there are now more than a hundred. So long as all of our immigrant education is done by teachers whose day schools are their principal profession, it will be difficult for the school to make sufficient contact with the outside world to make much impression on it, whether that world be the native America or the foreign community. Practically every school district, whether it be the large city or the rural community, has the services of this interpreter of the school. Her first task is to know thoroughly the foreign-born people living within the radius of the school where she is employed. This means knowing large numbers of people in a friendly way, understanding the attitude of their leaders, and being accepted herself as a leader. In the second place, she knows the American community into which the foreign-born resident must ultimately be inducted. She understands conditions in the civil, political, and social life of that community. She knows the forces which can be utilized in bringing about a closer union between the foreign-born and native-born.

In the city districts this teacher is usually known as the home or Americanization teacher. She has a definite assignment to one school. There, she is responsible for organizing and teaching mother's clubs and classes, for creating a more wholesome environment for the boys and girls above school age, and for organizing the night school. Many boys and girls of native parents are entirely uprooted from their social groups, because they have lost the respect for their home and hence belong to no nationality. They are sorely in need of assistance and have been little considered in most citizenship programs. In many instances this teacher is also the principal of the night school, so that her daily contact through the neighborhood results in a well-attended school.

In the rural districts this teacher is employed by the high school which has in its union a large number of elementary schools, often at great distances from the high-school building. As director of immigrant education for the high school, the teacher is responsible for organizing an evening school in each elementary school in the high-school union where there is a large foreign population. Her territory is large and scattered, so that it is necessary that she make these local night schools as independent as possible and although she employs and supervises the teachers, she attempts to make the responsibility for the growth and development of the school rest upon the community.

Whether in the country or in the city, through the effort of these teachers, a number of concrete accomplishments may be noted, all of which have contributed to vitalizing the night school and making it a part of the social life of its students. In one city, there has been organized a night school board which acts as an adviser to the city supervisor of immigrant education. This board is made up of leaders of the various nationalities represented in the city, and a number of the night-school principals. As a part of the general plan, many local schools have advisory boards which work with the principal. This board is made up of people from the neighborhood who can make useful suggestions concerning the night-school program, and representatives from each class in the school. The local boards are also represented on the city board. This has made a wonderful channel for the ideas and suggestions which the foreigner himself has to make about his own education.

One such city advisory board arranged for a beautiful pageant of the nations. Because through their work during the year the foreign leaders had become better acquainted with their own groups than they had ever been before, and because the Americans knew where to turn for help, the finest display of old-world art was collected. More than that, artists and people with all kinds of special ability were discovered. The city is beginning through this effort to know itself.

The night schools with this advisory board are given unusually interesting publicity in the foreign newspapers, because in a sense it is the foreigners themselves who are running the night schools.

Another plan which has been found useful in bringing the night school students into touch with an American institution, has been the arrangement by which a local newspaper carries an article twice a week upon some important item of current events, written in English which the foreigner can understand, about a subject in which he is interested. An effort is now being made to have these articles prepared each week by a different class and to have some member of the class take them to the newspaper office and make the arrangements.

As all studies of methods of Americanization have pointed out that the best work is done by the foreign organizations themselves, the full-time Americanization teacher devotes considerable attention to strengthening the life of the native groups and giving those groups American contacts.

In one place—this is particularly significant because the nationality is Mexican, a people generally believed to be hard to organize and uninterested in education—the local teacher was able to revive a society which had been inactive and was responsible for obtaining for the Mexican community a church for which they were clamoring. After numerous efforts to have the church established for them, they built it themselves, devoting their Saturdays and Sundays to the work. As a result, they have a charming stone edifice which would put to shame the ugly frame structures so often built in new countries by native Americans. After the church was built, a club house was undertaken for a meeting place for education classes. This club house is now in constant use. A well-baby clinic occupies it in the morning, mothers' classes and club for young mothers meet in the afternoon and the recreational club activities for the younger Mexican boys use it in the evening. The night school outgrew the club room and was moved to the school. The real reason for moving to the school, however, is interesting. The board of directors of the club said that non-club members should not be deprived of the opportunity for education, and although they were all welcome to the classes they would probably come to a school house more freely, since it belonged to everyone.

In another school a Mexican club put up a building for the use of the school because the school house was too far for the women to walk. This again was undoubtedly due to the activities of the full-time Americanization teacher.

One night-school principal has made it possible for the neighborhood to educate the school, as much as the school educates the neighborhood. This principal has kept his evenings free so that he can maintain an information office for the neighborhood. With the help of the home teacher, he has advertised that the school will be an information service station to which anyone who cannot speak English and needs help may come. Thousands of people have come to him for every sort of assistance. A record is made of the questions that are asked him and this is used in his upper classes as the text for their citizenship work. As far as possible he utilizes people of the neighborhood to solve the difficulties, thus increasing their own independence. Almost every social and civic organization in the city has been called upon at some time for assistance and in consequence the school is well known far and wide.

The most complete example of using the adult immigrant education forces for community organization is found in one neighborhood in Los Angeles. Here the school appointed one teacher who was to work out a plan of civic education which would reach a much larger number than are ever inveigled into attending night-school classes. On a theory that the best type of civic education comes from engaging in a civic activity, the teacher set about to discover some activity of that sort in which the people would be interested. In order to inform herself and to know what was necessary about their interests, she spent six weeks in studying her neighborhood. She interviewed more than 100 people who had some position of

leadership, as well as making friends with countless others from whom she got some expression of opinion. In the end, she discovered that a large number of people wanted to read books and papers in their own language without going to the public library in the center of the city.

As an initial effort, therefore, she had a committee of the leaders call together the whole neighborhood to undertake obtaining a library. All of the steps in the process, from circulating petitions to the final interview with the city librarian and the city council, were taken by the people themselves. Offers were made in the neighborhood to supply the necessary attendants and thus a young woman was discovered who had formerly been a librarian in the city of Prague, at this time working in a shirtwaist factory, who was glad of the opportunity to renew her contact with books. The building used was a small house on a city playground, and the equipment was built in by the neighborhood carpenters. In spite of the skepticism of many in authority during the first half year after it was installed, this library had the largest circulation of any deposit station in the city. What the people had worked for they were glad to use. The solidarity of the people brought about by working together for a common cause made possible many later achievements.

At one time committees canvassed the neighborhood for talent, listing everyone who claimed to be able to do anything by way of entertainment. As a result of this survey came a drama club, an orchestra, and a chorus. The drama club has since been able to finance other activities of the neighborhood association. In two ways, after a year and a half of substantial growth, the organization showed its strong civic character.

At one time there was a plan to remove the playground which had developed under the protection of the neighborhood organization. A delegation immediately appeared before the city council and, although interpreters were necessary to make the explanations and although technical phraseology such as "juvenile delinquency" could not be used, it was made perfectly clear to the city council that with a playground children were well occupied and without it they got into very serious difficulties.

At another time, when the schools were campaigning for a \$17,000,000 bond issue, the most successful and best attended of the campaign meetings was held under the auspices of this neighborhood organization.

HOW SHALL THE PROBLEM OF THE IMMIGRANT MOTHER BE SOLVED?

CLARA B. SPRINGSTEED, ASSISTANT SUPERINTENDENT OF SCHOOLS,
AMSTERDAM, NEW YORK

The statement "America will be as strong as her women" is popularly accepted but not often thoughtfully and seriously applied to the immigrant mother. Why should it be? What demands will its application make upon the educational authorities of the country? How shall these demands be met?

If America's strength is to be tested by her women, why regard the immigrant mother as a special problem? First, because she represents between one sixth and one fifth of the total number of women 21 years of age and over in the United States, and in New York State one third of the total number of women 15 to 44 years of age.¹ Second, because it is a generally accepted fact that the birth rate among foreign-born women is considerably greater than among native-born women. According to a comparison of the birth rate of native-born and of foreign-born white women in the State of New York during 1916, made by P. R. Eastman, of the Division of Vital Statistics of the New York State Department of Health, the birth rate of native women in New York State is so low that it is undoubtedly as low or lower than that of France, and the birth rate of foreign-born women is almost twice as great as that of native women.² Reports from Utica, New York, indicate that 60 per cent of all births in that city are to foreign-born women, although the foreign-born population represents only about 25 per cent of the total population.

Third, because the proportion of illiteracy among foreign-born women is 16.7 as compared with 0.5 among native-born women of native parentage and 0.4 among native-born women of foreign or mixed parentage. The need of overcoming illiteracy for the sake of the mother, for the integrity of the home, for the welfare of the community, and of the State, should be apparent to every thinking person. The necessity of overcoming it in States which have literacy qualifications for voting as in Massachusetts and New York has now become imperative. One mother, a citizen, although non-English speaking, expresses her need of learning the language as follows:

"I am the mother of three children and I cannot speak English yet. I was in a mother's class for a few months. That is why I feel very glad to learn English. I am especially eager to learn, because I am an American citizen like my husband. That is why I think that I could not behave like a true citizen if I do not receive at least some instruction in the language and the customs of the United States."

Another claims her right to the same advantages offered her children and her husband: "The mothers should have the same chance to learn to speak and write English as the men and the children. Some of the mothers are voters now. More of us will be soon. We have a right to an education. Our children are ashamed if their mothers cannot speak, read, and write English. Is it good for the United States for the children to think they know more than their mothers do?"

Fourth, because the inability of many immigrant mothers to *speak* the language of this country is a serious handicap to them in their homes and

¹ According to the 1920 census, the total number of women 21 years of age and over in the United States was 29,483,150; the total number of foreign-born white women 21 years of age and over in the United States, 5,570,268; the total number of women 15 to 44 years of age in New York State, 2,591,453; the total number of foreign-born white women 15 to 44 years of age in New York State, 829,446.

² A comparison of the birth rates of native and of foreign-born white women in the State of New York during 1916 by P. R. Eastman, Division of Vital Statistics, New York State Department of Health, Albany, N. Y., page 3.

in securing contacts with the social and economic world about them. The husband picks up an understanding and speaking knowledge of English on the street, in the trolley, and in the shop; the children learn English in the public school; but the mother is isolated in her foreign environment and often seems to be helpless in securing opportunities to acquire the language. She hears her husband and children speaking a language strange to her, she feels them growing away from her, she finds herself scorned by her English speaking neighbors and sometimes she has the cruel experience of being ridiculed by her own family. One mother expresses her embarrassment as follows:

"When we come in this country my children learn very quick English. To us foreigners do not appeal to our thought so easy then to our children. When they ask some questions we do not explain them. Some children say, 'Oh, Mother, why are you so bad, you do not explain to us?' They are too young to understand we are not bad. We are sorry for our miserable life. We look strange to our own children."

Another mother, who was invited to join a mothers' class in her neighborhood, thought the matter over very carefully and finally said: "Yes, me wanta study English. Sammie (a boy of 9) come home from school and speak English. I tell Sammie to do something for me. Sammie say: 'Me no understand Yiddish.' Sammie run away. Me wanta learn English. Me wanta keep Sammie home."

This little story suggests the whole problem of home discipline and of juvenile delinquency as a result of weak home discipline.

Mr. Bernard J. Fagan, of the Children's Court, New York City, gives the following statistics to show the possible relationship between the inability of the parents to speak English and juvenile delinquency:

Last year out of 15,000 children who were arraigned in the children's court, city of New York, there were referred to the probation department of the court for investigation and social analysis, 6621 children. This included all classes of offenses. In tabulating our statistics on nativities, we did not separate those arraigned for delinquency and those for improper guardianship.

The summary of the tabulation shows:

Native-born children, native-born parents.....	1971 or 29.8 per cent
Native-born children, foreign-born parents.....	3899 or 58.8 per cent
Foreign-born children, foreign-born parents.....	751 or 11.4 per cent

I have no hesitation in saying that the inability of foreign-born parents to speak English is responsible for a large contribution of juvenile delinquency in this court.

The foreign-born mother often has the control of the family budget, a very important consideration. It is she who must decide between essentials and non-essentials, between a fancy lamp and cooking utensils, between a victrola and enough coal to keep the family warm, between staying in a damp, poorly lighted basement or moving to a bright sunshiny little flat.

The health of the family depends to a very great extent upon the choice, preparation, and serving of food. The foreign-born mother finds some difficulty in choosing and preparing fruits, vegetables, and other foods which are strange to her. She needs assistance in learning English to do her

own marketing, advice as to proper substitutes for foods which she has used in the homeland and cannot secure here, lessons in common measurements and exchange of money. It is a decided advantage for a mother to be able to do her own buying. She will be far more thoughtful and economical than her inexperienced children and she will have more time than her busy husband.

In times of sickness the immigrant mother needs to have some one to direct her to the clinic, to explain about the public health nurse, to go with her to a reliable physician, and to assure her that the hospital is a safe place for her to send her child. The idea that a person never comes out of a hospital alive is quite prevalent among foreign-born persons.

The immigrant mother's difficulty in caring for her children properly, in knowing what to do when they have minor ailments, in preventing death from serious illness, is due, in some cases at least, to her inability to speak, read, and write English and her consequent lack of knowledge of sanitary and health regulations. Mr. Eastman's statement that:

"Altogether the alien mother's loss exceeded that of the native mothers' by more than five in a hundred—and that whereas three children died to every ten native mothers, six died to every ten foreign mothers," shows the necessity of helping to overcome every factor, including illiteracy and inability to speak English, which contributes to the high rate of infant mortality among foreign women.

Since foreign-born women represent one sixth to one third of our total population of women, since the number of children given to them to prepare for future citizenship is notably greater than the number of children of native mothers, since foreign-born women are seriously handicapped by illiteracy and inability to speak English in making the most of themselves, for their own sakes, for the sake of their families and the welfare of the State, since it is unreasonable to impose a qualification for voting upon citizens without providing those citizens with the means to meet that qualification, immigrant mothers demand the special consideration of educators. So long as immigrant mothers who occupy such an important place in our national life, remain untouched by our educational system, just so long will our boast of a free, public, universal education for all who can utilize it remain a theory untried, unpracticed.

But are the schools not doing their part in providing evening and day school classes with teachers especially trained to instruct foreign-born adults, both men and women? They are doing much in making such provision, but they cannot reach immigrant mothers in large numbers, because in many cases the mothers cannot leave their homes, or neighborhoods to go to school for instruction on account of small children, who need their constant care and on account of overwhelming household duties. For such women school authorities should extend educational facilities to homes or neighborhood centers. As Mr. E. C. Hartwell, superintendent of schools in Buffalo, has well said: "Those who cannot come to instruction should have instruction brought to them. The issue is too important to allow

narrow conservatism on the part of the school or city authorities to interfere with the organization of outside classes."

The immigrant mother in industry offers another problem. In New York State over 25 per cent of the women work and earn money and nearly one third of these women are employed in the manufacturing and mechanical industries. In this group 3.4 per cent of these women are classified as semi-skilled operatives.¹ Although there are no statistics available the conclusion that to the group of semi-skilled or unskilled operatives belong the majority of foreign-born women in industry is justifiable. Their work is usually monotonous, unremitting, and deadening to the spirit, because it lacks appeal to interest and creative sense. Some of these workers, charged with the upkeeping of a home in addition to their industrial work are in no condition, after the grind of a long day to put the house in order, provide food and clothing for the family and otherwise administer to its needs. Can they be expected to go out to evening school classes? Should they have classes in their homes? Obviously not. The only way to reach these women is through factory classes on part or full time of the employer during the regular working day and *not* at the noon intermission or after hours in the afternoon or evening.

There are few educators or laymen who do not acknowledge the value and even the necessity of reaching the immigrant mother, but the expense of the undertaking has been a serious obstacle. Those who have been vitally interested and actively engaged in mothers' classes have struggled to put them on the same financial basis as evening school classes, but they have not usually succeeded from the bare financial point of view. Home and neighborhood classes *are* more expensive than evening school classes, but here as elsewhere, the more important task is the more expensive one.

In consideration of the expense it is interesting to note that in Syracuse, New York, one of the first cities of New York State to have home and neighborhood classes for foreign-born mothers, the average number of pupils met twice a week by a full time paid teacher was 58. The individual attention which the women receive in the small group often makes it possible for them to progress as rapidly by two lessons a week as they would by four in a larger class. This item needs to be kept in mind in considering the expense of mothers' classes, although it cannot be represented by figures.

According to the latest reports from the New York State Department of Education, the *per capita* cost of instruction in home and neighborhood classes has been established at \$.17 per pupil hour. Utica's is \$.178 as compared with \$.148 for evening school classes. Mothers' classes in Syracuse cost \$.23 per pupil per hour on the basis of the average number belonging and \$.26 on basis of average attendance, while evening school classes cost \$.16 per pupil per hour on the basis of the average number belonging and \$.23¹/₂ on the basis of average attendance. The figures for night school do not include cost of janitor service, heat, and light.

¹ Consumers' League of New York, Monthly Bulletin for May, 1922, Vol. I, No. 5.

With these facts and figures, which represent actual experience in mothers' classes, is it not possible, is it not imperative for school authorities to arouse their communities to the problem and necessity of solving it? If our educators everywhere were possessed of the consuming flame which burned within the breast of Mary Lyon until Mt. Holyoke was a reality and which was expressed in her words: "Everything that ought to be done, can be done," then would our public educational system become truly democratic, truly universal, and free to all who can utilize it.

That all mothers' classes should be under the direction and supervision of public-school authorities is our aim. But in the meantime, until public opinion is aroused sufficiently to support the instruction of the immigrant mother and until boards of education have seen the light and are ready to follow it, the volunteer unpaid worker and the privately paid worker will have an important rôle to play.

Public spirited, socially minded women have responded intelligently and whole-heartedly to the call for volunteers in mothers' classes and many an immigrant mother will rise up to call them blessed. Incidentally the service to themselves in gaining a saner knowledge of social conditions, a deeper understanding of human nature, and a more truly sympathetic outlook toward other human beings has been of no small account. Albany had at one time the honor of reaching the largest number of mothers through volunteer teachers of any city of the State. Sixty-seven women met 385 immigrant mothers at least twice a week for instruction in English, marketing, shopping, and home making. Their work was under the direction and supervision of one full-time specialist whose salary was paid by the State Department of Education.

New York City is just now proving to the rest of the country what *can* be done when the public-school system cannot secure the funds to carry on this work. A special emergency committee composed of representative men and women has undertaken to see that the mothers' classes, which were organized by the State Department of Education and carried on from 1918-1921, are maintained and allowed to grow. The aims of the committee are:

1. To engage well trained and experienced specialists to devote full time in selected districts where the most backward and tradition-bound racial groups reside.
2. To work out in these newer fields with the immigrant women careful scientific studies of the best type of classwork needed, both as to method and subject matter, as well as the most convenient and successful places for accomplishing desired ends in English, citizenship, and home making arts. The specialists in each district will organize and teach their own classes and coöperate in every way with all city agencies working in this and allied fields.
3. The Committee aims to serve all racial and religious groups alike and to work in close coöperation with the Department of Education in the City. The places selected and the types of work conducted will be known by all of the specialists under the city with whom the Committee's workers desire to coöperate to the end that no overlapping of effort will be possible.
4. As only a limited fund is now available for the Emergency Committee, the spring work will be conducted in five or six districts where the city does not have classes.

5. The standards for the selecting of the teachers engaged by the Committee will be such as will meet with the approval of State and City requirements, with the hope that after a few years when the "Emergency" may terminate and the City be able to finance similar work, it may be taken over by the City Department of Education.

But this is only an emergency committee as the name indicates. The problem of the immigrant mother will never be solved until instruction for her becomes an integral part of the public-school program and until it is organized, directed, and supervised by public-school officials as its importance demands that it should be. "The life of the community must be drawn from the self-sacrifice and the coöperation of all the human beings that compose it; in every political, economic, and social arrangement the public interest must overrule the private; the material and the spiritual resources of the Nation must be used for the common good."¹

EDUCATION FOR CITIZENSHIP

ALBERT SHIELS, TEACHERS COLLEGE, COLUMBIA UNIVERSITY,
NEW YORK CITY

One outstanding conclusion that impresses the student, as he observes the many societies, organizations, and individuals that are engaged in the work of assimilating our foreign-born residents is that although they all seem to be following the same signpost they have yet very different conceptions of their common destination.

Current professions and practices suggest considerable disagreement on certain fundamental questions. To take but a few as examples: Is assimilation a procedure involving direction or compulsion, or is it determined by the subjective feelings and desires of the foreign-born themselves? Is citizenship significant as it implies character and right action in relation to the State, to the family, the vocation, and the community, or is it rather a pledge of political allegiance, or the possession of a body of information? Is the demand for first papers to be dependent upon an immigrant's desire, or should he be pleaded with, cajoled, or threatened into asking for them? Shall the Americanization program be determined by the enthusiast who sees the problem primarily in its legislative terms, or by him who believes that study should precede action, and that pledges, oaths, and information are significant only as they rest on the earnest desire to become a citizen and to undertake the citizen's responsibilities.

Questions like these bear directly on the issue. There is another question, however, which is frequently brought into discussion that provokes much confusion, because, though profoundly interesting in itself, it bears little or no relation to citizenship training. I refer to the comparative desirability of different immigrant races. The qualities of various races are, it is true, germane to problems of immigrant education, and to this aspect

¹ "The Equipment of the Workers," published by St. Phillips Settlement Education and Economics Research Society, Sheffield, England, 1919, page 27.

a later reference will be made. But whether or not the Italians of the nineties are superior to the Irish of the sixties; whether only Nordics are desirable; Alpines questionable; or Mediterraneans objectionable, are matters which though of supreme importance in determining a policy of immigration yet have little to do with the assimilation of those already here. The builder whom circumstances compel to construct a house of stone wastes no time examining the merits of wood or steel for the same structure. We must keep clearly in mind that the problems of immigration and assimilation are wholly distinct. We are now inquiring only what education is best adapted for the fourteen millions now resident in the United States. Our opinions or theories on the merits or demerits of one race or another we may retain as we wish; however we may differ, as teachers we can agree that the work we have to do is now laid out for us.

It is true that the public schools touch only a small part of the fourteen millions. But this is not to say that they are not being educated every moment of their day. Does this education concern us? The answer lies in educational history.

There was once a time—it yet survives in many places—when the schools considered the schooling of children as a separate five-hour daily process, laid out without respect to the pupil's home, his associations, or his peculiarities. In good schools that time has long since passed away with the result that mere instruction has been displaced by real education. In teaching the adult alien progress has not yet been so rapid.

It is becoming fashionable to say education for citizenship is a National question—that it applies to everybody and that therefore the education of the immigrant is but a piece of a single problem. But not everybody realizes how profoundly true the statement is—how completely certain principles that have been evolved in the education of children apply to all learners and therefore to these adults—how consistently the development of better methods in teaching them is pursuing the same pathway.

The schooling of foreign-born adults a few hours a week seems but a patch to the larger educational scheme for children with its elaborate aggregation of texts, its splendid organization, and its armies of teachers. But these few hours, these unsuitable benches, these inadequately trained teachers, this insufficient revenue are but the repetition of an old story—and a change is coming.

Therefore, the enlightened teacher of the foreign-born, however poor the pay or casual the employment, is realizing the necessity of knowing more about a better education for immigrants. It is two-fold, conscious and unconscious. Two distinct forces are at work: American influences and influences among the foreign-born themselves.

Among the American influences we should know at least the kinds of organization and the varieties of effort, not as statistical information, but as material suggesting what to do and, it may be added, what to avoid. In the work of private organizations are fine examples of coöperation between native and foreign-born leaders that the schools would profit in adopting;

there are examples of unconventional organizations during hours and in places more attractive to the adult learner than the typical school classroom. The best libraries have tried some extraordinarily effective methods of education, largely because of the freedom most librarians enjoy. Again there is a more general recognition of the need of using the language in giving the immigrant information on things he cannot understand during the painful process of learning English well worth a trial in the more formal program of the schools. There are other things among the activities of Americanization organizations less worthy of imitation—propaganda for a cause, and extraordinary belief in external forms, a painful indifference to racial susceptibilities. Of these evils unfortunately no single group has a monopoly.

But it is the unconscious American forces that are the most effective. The immigrant's experiences in shops, mills, and factories; the kinds of housing not infrequently forced upon him; the type of recreation afforded; the attitude of the American community, whether of welcome, patronage, intolerance, or openly expressed prejudice. These things the teacher cannot control, but in a measure he can neutralize them. Certainly he should be aware of them.

Concerning the influences operating among the foreign-born there are, among the conscious factors, his press and his organizations. They afford us a glimpse of what the foreigner desires, and these we shall discover are important things to know. We have need of understanding the peculiarities of the extreme radical movement; the coöperative activities; the church influences. Not less important among the unconscious influences is the fact of segregation—its causes, its effects.

To ask for a knowledge of all these things would appear like an extraordinary demand, but the teacher need not know every race. His is a local problem. It is extraordinary the sense of confidence and adequateness which comes to the teacher who knows the influences and experiences that affect a group of foreign-born in their American daily life. Even if he be poorly paid, his labors attain in his own eyes a new dignity and a new value.

In this complex of educational influences is the teaching that goes on in the school itself. It is natural that when education for the immigrant was initiated the educator, before considering the psychology of the learner or the spirit or method of organization, should first have concerned himself with the curriculum. Very appropriately the first teaching was of the English language, and in this instruction our efforts have proved the most successful. The immigrant as a rule desires to learn English and this response has been met by an intensive study of methods of instruction that has greatly improved the quality of teaching. Unfortunately the popular interpretation has led to unfounded assumptions that all immigrants without respect to age can and should learn English so as to use it habitually. Another error has been the insistence upon the exclusive use of English in instruction; a theory quite sound when teaching the language, but obvi-

ously absurd when applied to the newcomer for content subjects like civics, history, or social customs.

Aside from English early attempts were made to teach civics by giving information on the organization of government and the qualifications and functions of officials even to details in which the new arrival, unless he already had a considerable educational background, would have little immediate interest. Since that early and depressing period two new advances were made: the first, a modification of the curriculum, the second and more profound, a revolution in the curriculum as determined by the psychology of the learner.

The first modification expressed the reaction against the deadening lessons in political organization, and appeared in the guise of American history. To make these lessons in history more interesting the foreigner was regaled with the sufferings and triumphs of the Pilgrims, the heroic exploits of the Revolution, the naval victories of 1812. Then was added a study of the map of the United States, and then a few more or less stirring biographies—Miles Standish, William Penn, James Otis, Daniel Webster, and other heroes of our history. There was in some schools a provision for teaching American principles and institutions. Had there been a clear cut conception of these principles a great step forward might have been made. But whatever the reason, any consideration of them was for the most part honored in the breach.

It is possible that the suggestion for a better knowledge of pupils grew out of a single biography—that of Lincoln. It was the name of the great leader—himself an example of greatness from humble beginnings—that seemed to inspire a genuine enthusiasm. Lincoln was a name the immigrant knew. The name is familiar to the European peasant. It fitted into his thinking. It rekindled his enthusiasm. It was the personification of the American spirit. The grain of suggestion which this enthusiasm evoked seems to have blossomed.

Today the curriculum in citizenship no longer begins with the names of senators, the difference in legislative, executive, and judicial branches, or the names of former generals. It consults first the immigrant's own interests. We are beginning to apply to the adult immigrant the old lesson long since learned in American education for children. We are considering not what we think the immigrant ought to know, but what he himself wishes to know—where he can place his labor; how he may protect his savings and his health; insure his own security, and obtain for himself the American comforts he sees others have. It is not the sort of knowledge that can be easily arranged into a general curriculum, for it must be locally applied. The future course in citizenship for the foreign-born, however it may provide for a discussion of general truths and principles will bristle with local applications as they fit their vocational and social as well as civic needs.

Even a superficial familiarity with the immigrant's background—and this includes the history of his country, his political experiences, his educa-

tion, his national feast days, and his racial characteristics—will bring the teacher and pupil more closely together. A casual reference to a national anniversary is an open sesame to the foreign-born learner, who will appreciate it as an example of extraordinary insight, profound knowledge, and deep sympathy, especially if the teacher be not of his own race.

It is recognized that not all Americanization workers will agree that the interest of the immigrant should guide educational procedure. There are two fundamental conceptions of Americanization. Both of these conceptions agree in emphasizing loyalty to America, to our Government, and to the Constitution. One of them, however, goes further. Its idea seems to be that the sooner the immigrant forgets his language, his racial culture, and pride in his ancestry, the better it will be for our country. The other view is that America will profit to the degree that the foreign-born immigrant endeavors to conserve the best of his old civilization so as to contribute it to the enrichment of our own.

Such cultural qualities as those of industry, thrift, thoroughness and energy, the love for color and laughter, the folk lore and folk songs, the pride in ancestral history, in a word all that is fine in life tend, alas, to disappear too quickly in the drab life of the immigrant settlement unless effort be made to save them. Moreover, although a race have potentially the power of finer achievement, the immigrant is forced by the pressure of his labor to think of elemental things. He has little time to contribute to the country more than the work of his hands. Culture, so far as it involves leisure, needs later opportunity for fuller blossoming.

The immigrant should learn English. On the other hand his American-born child should know at least one language beside his own, for youth is the golden time for learning. If the boy learns the language of his fathers his relation to his home is strengthened. If the child knows not the one language nor his parents the other the home is divided and parental authority wanes.

It is worth remembering that social control is a matter of social sanctions among which respect for the parents is important. If the child is isolated from the parents, if he does not speak their language and is indifferent to their feelings one great social sanction is removed. Because a child attends public school and learns lessons of patriotism and allegiance, he does not thereby get the American background which only the American home can give. He will get this as he matures, but it develops slowly. In the meantime no corresponding social sanction replaces the one which estrangement from parental authority and dignity have denied him. It is a perilous adventure, this breaking of old sanctions.

Our enthusiasm may have misled us. We do not need more Americans as much as we need better Americans. America will benefit by integrating into its life not so much things that are foreign as things that are good. These include the best in every nation. The process of transfer is delicate and comes not through books or packages, but through people. The boy or girl who understands all the customs, language, and traditions of his

father's people, who respects them and has learned the value of the best among them, need not the less be a sterling and enthusiastic American boy with an uncompromising loyalty to his own country—America. On the contrary some of us think he would be an especially useful American because his peculiar equipment and knowledge would enable him as he grows older to contribute the culture of other nations to his own, whether that culture were in the domain of science, art, or philosophy. Certainly we can conceive that an American boy or girl so endowed would be an infinitely more valuable citizen than one who has lost the traditions of one country and yet lacked the background of the other.

The American teacher, whether of children or adults, native or foreign-born, may well fix in mind the distinction between the fundamentals of Americanism and the interpretation that has been put into it by vociferous patriots always ready to impose upon the rest of us their own special brand of Americanism, prone to credit their ideas to the Fathers, though it is doubtful whether the Fathers would always be able to recognize the offspring attributed to them. Let us remember that some very un-American things may be uttered even when the band plays loudest and the National standard waves most vigorously. It is un-American to despise the humble workers of society in which the immigrant plays so large though not exclusive a part; it is un-American to weaken a child's faith in parental authority; it is un-American to forbid a man to read in the only language he can understand; it is un-American to take advantage of a foreigner's ignorance to exploit him in industry, to discriminate against him in his housing; it is un-American to impose private opinions on one's neighbors; it is even un-American to try to improve people or change them by force, for one fundamental of Americanism is that men should work together—that we work not for people, but with them.

The making of citizens is not an immigrant problem only. Yet more important is it to preserve American principles for ourselves when we talk of Americanizing the immigrant. If, as has been proposed at Washington, the press is to be regulated and licensed because it is in a foreign language; if there is to be a system of government registration of individuals; if methods and devices of police supervision are to be introduced like those that have been the plague of life in European aristocracies—all under the guise of assimilation—the cost to ourselves is too high. Once initiated it will become easy to extend these pernicious practices to American citizens, however alien they are to our American institutions. Many of us believe that these measures are altogether unnecessary, and that we need exercise only ordinary care in enforcing the existing law determining the admission of immigrants. One thing is sure: Such un-American proposals will but provoke antagonism and retard assimilation. Persecution, even though it be but petty persecution, does not bring people more closely together.

We wish the foreign-born to learn our language, adopt our standards, and admire our institutions, even to identify themselves with us as fellow

Americans. For a century we have been engaged in the work of making citizens of these foreign-born arrivals, largely by observing American theories and applying American principles. Until the war we had been too optimistic; since then we have swung the pendulum and have sought to modify our *laissez faire* methods by more energetic efforts towards Americanization. Unfortunately instead of depending on a more intensive interpretation of our own principles, some of us have gone to Europe to learn there the lessons of assimilation—the methods of Compulsion, Segregation, and Special Regulation. Such methods have failed lamentably in making loyal citizens. Their only success has been in compelling an unwilling and sullen conformity that could not conceal the sense of social or political repression. When the opportunity arose the flames of political antagonisms burst forth. Why should we in our eagerness hurry this process of assimilation which works best as it works slowly, which succeeds only as it reflects a voluntary desire? Why should we concern ourselves with methods that have failed among other nations? Americanization is a simple theory in its elements. Let a man get social justice; let his education be significant in his own eyes; let him learn, however slowly, what a wonderful country he lives in; let the consciousness seep into him that he counts for something; that if he behaves decently he will be treated fairly, and the great majority—Latin, Semite, or Slav—will be integrated into American life. Once the connection becomes well settled, progress will be accelerated.

Give the immigrant American treatment. If he be a normal person he will respond in kind.

THE DEMOCRATIC AWAKENING IN ADULT EDUCATION —AN OPPORTUNITY

FRANK P. GRAVES, COMMISSIONER OF EDUCATION FOR NEW YORK STATE,
ALBANY, NEW YORK

In this country we have embarked on a policy that is absolutely unique in the history of civilization; we have determined to give to each and every one all the training of whatever kind he can possibly utilize. We have done this deliberately, despite the gloomy predictions of other nations, in the firm belief that it will not only produce the most nearly perfect development of the individual, but will best promote the welfare of society by enabling it to secure the benefit of all its human resources. Accordingly, we have come to hold that every one should be offered the training that will best suit his educational needs.

Acting on this principle, we have for some time been providing in our school systems for all varieties of intelligence. Not only have we arranged for all types of defectives, delinquents, and dependents, but are now slowly coming to afford opportunities for gifted and supernormal children. But there are striking gaps in our American theory when we come to deal with

those past the compulsory age, whom, in contrast to the others, as implied in the title of this discussion, we may consider as "adults." There are a large number of young people who leave the school as soon as the law permits, and a tremendous mass of older people whom the law seems never to have reached. Out of twenty-five pupils of school age, only ten complete the eight grades and but two finish the high school, while less than three quarters of our pupils have the benefit of schooling up to fourteen, and much less than one half of the young people between fourteen and twenty are in schools of any kind.

The proportion of illiterates and of aliens among our adults, as estimated from the statistics taken during the war, is still more disturbing. To judge from the examinations given in our army camps, approximately one quarter of our people are unable to read an English newspaper or write an intelligent letter, and from twelve to fourteen millions, more than one eighth of the population, are foreign born. Even more serious are the revelations concerning the intelligence of our people. If we can trust the estimates made by Dr. Robert M. Yerkes in the Report of the Psychological Examining Board in the United States Army, almost one half (47.3 per cent) of the white men in the draft, native and foreign-born, proved, through intelligence tests, to be morons; that is, while adults, to have a mental age of seven to twelve years. This is appalling but we pile Pelion upon Ossa in our problems, when we turn to the statistics of foreign-born. Here we find that, while persons of inferior intelligence among the native Americans form twenty-two per cent of the group, there are forty-six per cent in the case of the foreign element as a whole, and sixty, sixty-three, and seventy in the case of the natives of Russia, Italy, and Poland, respectively.

Let us first of all stop once and forever the flood of illiteracy and inferior intelligence from Europe, and admit only the foreigners who can strengthen our stock and ideals. We shall have difficulties enough in maintaining our standards, with the handicap of our own home-made morons, and the assimilation of the weaker foreigners that we have already received.

By means of intelligence tests and vocational guidance, it is now possible to approximate the place in life that should be occupied by each of us and thus greatly increase the welfare of all. And it is known that we cannot hope to predict from what stratum of society our genius will arise. We must, therefore, seek the most efficient means of detecting and training him wherever he may be found. We have now, to a certain extent, succeeded in providing for him through differentiation of the work in the elementary school and in the variety of elections and options in the high school, and, west of the Alleghenies, he may obtain a higher education in almost any line with little or no financial resources. But, in spite of this provision, there still remains the problem of furnishing a training for those natural leaders, who, through straitened circumstances, want of interest in the ordinary school course, or accident of location, have been prevented from securing the education that would develop them best and enable them to accomplish the most for society. The opportunities furnished for them at present in

the evening courses, both in extent and variety, are quite inadequate. Occasionally one of the intellectual leaders has shaken himself loose from his surroundings and after maturity has obtained a higher education, but he has had to achieve this through some private foundation. And this service should not be limited to private education. It should be the effort of all proprietary institutions to render themselves unnecessary. They may perform duties to which the dear public has not yet aroused itself, but if there is any function of education that requires attention, it should be made possible to carry it out under public auspices. As a whole, every sort of adult education must be provided by evening or day classes, by long or short courses, and through training adapted to the abilities, interests, and needs of the person not now provided for in the public system. And this must be done, not at the expense of the training of children under fourteen, but through a separate and distinct appropriation for the purpose. Neither phase of our public education can be neglected.

OUTSTANDING ACHIEVEMENTS FROM THE VIEWPOINT OF THE STATE

ROBERT C. DEMING, STATE DIRECTOR OF IMMIGRANT EDUCATION,
NEW HAVEN, CONNECTICUT

May I here briefly summarize the achievements in immigrant education in Connecticut during the past year, nor will I differentiate between the achievements and the difficulties; the difficulties were occasionally transformed into achievements.

1. The responsibility for Americanization or immigrant education was placed squarely upon local educational authorities that the great illiteracy in the State could be reduced.

The body-politic was educated as far as possible through leading civic organizations as to the real meaning of the work.

2. Teacher-training institutes were held in many places, a course given at the Danbury Normal School, and a six weeks' course at the Yale Summer School. There will be no lack of trained teachers in this State.

3. Coöperation was asked for and obtained from all organized groups of races, interests, and needs, and many of influence were converted to the need of great activity and skill in this branch of education.

4. The State system of the Department of Americanization was highly organized through courses of study, new methods, circular letters, group conferences, and State conferences.

The remaining "difficulties" might be summarized as follows:

1. Financial.
2. Understanding of the actual work done under the name "Americanization."
3. Receiving the complete and *scientific* coöperation of industry, according to a definite program.

OUTSTANDING ACHIEVEMENTS FROM THE VIEWPOINT OF THE SUPERINTENDENT

WILLIAM MC ANDREW, ASSOCIATE SUPERINTENDENT OF SCHOOLS,
NEW YORK CITY

The president of this department, W. C. Smith, asks me to sum up experiences on the festival side of this work.

A large association of citizens in New York organized themselves under the name "America's Making" last year to work for national unity. They formulated their aims thus:

Purpose—America's Making is a festival and exhibit celebrating the contributions of immigrant races to the development of this republic from the earliest times to the present. It aims to impress the great idea of American unity and the broad meaning of the national motto "E Pluribus Unum." It designs to teach the later immigrant, as well as all people, his respectable share in our material and civic prosperity, to remove unbecoming condescension of earlier toward later immigrants, and to dislodge the new immigrants' consciousness of such condescension. It aims to promote the civic equality proclaimed in the original document of our nation, the Declaration, and emphasized by leading Americans from 1776 to the present. It intends an increase in the spirit of brotherhood and good will; an abatement of racial animosities aroused by the World War. It proposes a closer relation between public education and the large problems of citizenship. It plans to promote a more perfect American union, an increase in the blessings of peace, of prosperity, and of the general welfare.

The association invited societies, schools, churches, libraries, museums, and citizens. Contributions to American life were grouped according to the lineage of our citizenry:

Dutch	Swedish	Jewish	Greek
English	Danish	Italian	Lithuanian
Scottish	Norwegian	Polish	Portuguese
Welsh	German	Czecho-Slovakian	Rumanian
Irish	Magyar	Jugo-Slavic	Near Eastern
French	Finnish	Russian	Far Eastern
Spanish	Lettish	Ukrainian	African

The project included an exhibit of historic objects, portraits, painting, and sculpture, commemorating characters and events, pictures, sketches, and cartoons, models, industries, with workmen, motion pictures, arts, crafts, foods, games, etc. There were also representations by means of processions, spectacles, parades, dramatic action, music, dancing, athletics, games, ceremonials and pageantry, showing the racial origins of the historic material, cultural, civic, social, economic, industrial, educational, and artistic wealth of the Nation.

The festival ran for two weeks, mornings, afternoons, and evenings.

As a result of our experience, the committee who had charge of it are agreed that the festival side of citizenship ought to be celebrated at frequent intervals. Every town should have a civic centre with a permanent exhibit of the contributions of the various races to the making of America. Every town should have a civic festival every year aiming to make us acquainted with the artistic, musical, and other cultural wealth which comes from our composite form.

The tendency of Americans of various descents to attend only on the night when their own contributions are shown defeats the larger purpose of the movement and should be modified by putting on three or four groups at every performance.

The amount of talent available even in small cities is astonishing. It should be capitalized in favor of better neighborliness amongst us.

The participation of the schools extended a whole year. It involved an intensive study of American history from a new angle. Schools are giving shows every term. Many of the performances are nonsensical vaudeville. To direct the dramatic and spectacular instinct to the form of a great patriotic epic is not hard and is well worth while.

Our committee wants the induction of new citizens into American life accompanied by pageant dancing and song. We don't want war to have all the banners, ceremony and music, leaving education and citizenship the drab affair it often is.

We believe the pursuit of happiness, long ago proclaimed as one of the aims of our government, should be exemplified by every city in popular festivals centered around a civic idea.

OUTSTANDING ACHIEVEMENTS AND PRESENT DIFFICULTIES FROM THE VIEWPOINT OF THE CITY DIRECTOR

H. E. STONE, ERIE, PENNSYLVANIA

This Department of Immigrant Education is, in my judgment, one of the big outstanding achievements in the Americanization movement. It means much to the city director to know that the work he is engaged in is considered of sufficient importance to receive recognition by the National Education Association.

In the main the outlook for Americanization is good. A nation-wide organization of informed, courageous, and unselfish workers is being built up. Method and content are quite well developed. In some cities trained directors of Americanization and experienced teachers of adult immigrants are "doing the job" and doing it well.

There are, however, some dark shadows in the picture. A wave of suspicion, prejudice, and intolerance seems to have spread over the country—religious, racial, social. This, together with congressional stupidity, makes difficult the efforts of those who are working to mould attitudes and ideals, to develop love for this country and its people. Lack of obedience to law and the bad example of native-born leaders in certain cities also serves to nullify classroom teaching about the duties of citizens.

Right here I take the opportunity to register my opposition to two proposed Federal measures, the Johnson bill and the Shortridge bill. They are unnecessary and unjust. It will be another outstanding achievement if they fail to pass.

Concerning the work in Erie I have little to say, except to bear testimony that, thanks to the work of Mr. C. C. De Witt, of the Ford Motor Company, and to the efficient service rendered us by Mr. Castle and Miss Jones, of the Division of Americanization, Pennsylvania Department of Public Instruction, we have built up a corps of efficient teachers who have worked faithfully and enthusiastically.

It has been my good fortune to direct the Americanization activities continuously in Erie for the past five years. The outstanding feature of our work has been its continuity and the large number of coöperating agencies. Worthy of mention are the Americanization socials conducted through the help and coöperation of the Parent Teacher Associations and the Woman's Club of Erie. On some evenings as many as four thousand native and foreign-born residents mingled together and learned to like each other.

About two years ago we formed a city-wide Americanization committee to succeed the superintendent's committee of one hundred. Valuable reports have been made to this committee, and encouragement, help, and advice received from it.

In closing I want to emphasize the necessity of "keeping everlastingly at it," and of making sure that our actual service exceeds our lip service. The arm chair, the flat-top desk, and the speaker's platform are not where we do our real Americanization work.

It is our duty to educate the educators—to awaken school administrators to a realization that Americanization is more than just "a branch of the night schools." Let Americanization cease to be a "side show." In every American city where there are thousands of non-English-speaking adult foreign-born residents it deserves ample consideration by administrators and support by school directors. It needs a place in the main educational tent.

OUTSTANDING ACHIEVEMENTS AND PRESENT DIFFICULTIES FROM THE VIEWPOINT OF THE CITY DIRECTOR

M. J. DOWNEY, DIRECTOR OF EVENING SCHOOLS, BOSTON, MASSACHUSETTS

In common with other speakers I find it almost impossible to draw a line of demarcation between achievements and difficulties. They tend to merge, one into the other. Difficulties beget achievements, which in turn bring forth new difficulties. Then, too, accomplishments which are undoubtedly outstanding achievements in communities where Americanization work has been but recently organized, have become in other communities mere routine tasks, long-established and well-recognized parts of the regular school program. Boston, for example, has been conducting evening schools for over half a century and day classes for adult immigrants for over a dozen years. We are fortunate in having had and in still having the unqualified approval and the generous support of all the members of the

School Committee. We receive all the money we request or need. Our appropriation is never curtailed and our term is never shortened. Boston will provide a teacher and will furnish books and supplies in any section of the city at any hour of the day or evening in school buildings, factories, stores, settlements, or elsewhere, if the accommodations are suitable for instruction purposes, whenever there is a call for instruction in English or citizenship on the part of fifteen resident immigrants. Our day-time classes and our evening classes held in places other than the regular evening schools have, since 1916, been conducted by a type of organization called the Day School for Immigrants. This school was served during the year just closed by six full-time instructors and forty part-time instructors. If there is one achievement more than another that is unique or outstanding in Boston's work with immigrants, it is the organization and development of the Day School for Immigrants.

We have been fortunate, too, in securing the cordial coöperation of practically all agencies interested in immigrant welfare, such as the city of Boston Committee for Americanism and the Americanization Committee of the Chamber of Commerce, the Federation of Jewish Societies, the Women's Municipal League, the Federal, State, and municipal officials, the press, and the leaders and organizations of the foreign-born.

As the result of a recent conference of the School Committee held upon request of representatives of certain of these agencies, the Director of Evening Schools was authorized to expend a substantially increased amount of money for publicity next year, to arrange for two courses of training for teachers of immigrants, and for a special examination for persons desiring to qualify as teachers of immigrants, to employ attendants for children in mothers' classes, and to assign the Assistant-in-Charge of the Day School for Immigrants to assist in the organization and supervision of new classes for immigrants.

May I say just a word about the part which the Commonwealth takes in immigrant education? Massachusetts was the first State and for a long time the only State to require the attendance at evening school of illiterate minors between sixteen and twenty-one years of age. In 1919 Massachusetts enacted the so-called "Americanization Act" by the provisions of which the Commonwealth has obligated itself to reimburse cities and towns for one half the cost of instructing immigrants over twenty-one years of age. I cannot forbear, even though but a moment of time remains, to take this occasion to pay my tribute of praise to the efficient management, the sound judgment, and the able leadership of the man who has been intrusted with the responsibility of administering the Americanization Act, Mr. John J. Mahoney, who has contributed so much to the success of Americanization work in Massachusetts.

I should like, also, to congratulate his successor, Mr. Charles M. Herlihy, upon his well-merited promotion, to assure him of our cordial well wishes for success in his new position and of our sincere hope that it may be but an earnest of future honors in store for him.

OUTSTANDING ACHIEVEMENTS AND PRESENT DIFFICULTIES FROM THE VIEWPOINT OF THE TEACHER

HAZEL R. PORTER, DIRECTOR OF AMERICANIZATION WORK,
STAMFORD, CONNECTICUT

In order to report and represent the entire teaching force, in so far as possible, I have consulted with our own evening school teachers in Stamford and with many in different parts of the State. It is interesting to note that a difficulty in one section becomes an achievement in another.

The first and greatest difficulty is that caused by the attitude of many American people. In many towns it is found impossible to secure adequate appropriations. This brings low salaries for teachers, leading in turn to non-interest in special training. The social barrier is still high.

Most of our teachers are in the day school five hours or more each day. They regret that there is not time to know home conditions of both day and evening pupils better.

Large classes with the ever-present difficulties in grading have caused many difficulties in holding attendance. If the classes were smaller, leaving time for more individual attention, this problem would be simplified.

Vacations at Thanksgiving, Christmas, and Easter have been the cause of loss of pupils.

Requests fall into the following classes: (1) Material for mixed groups; (2) Detailed course of study for substitutes and inexperienced teachers; and (3) Type examination to standardize work.

The teachers who have taken special courses to fit themselves for adult work report that a great difficulty is experienced in raising standards when many experienced teachers without training are teaching adults. They hope for a stricter plan of certification.

Teachers who have worked in both day and evening schools report that they have a broader and deeper sympathy with home conditions, and secure much better home coöperation by knowing the parents. The bond of sympathy between adult pupil and teacher overcomes misunderstandings of American Government and institutions. Through coöperation of civic agencies adult pupils have learned more about the agencies working for civic betterment, a step in advance for community citizenship. Modern methods have increased the desire for more knowledge.

Parents who attend school lengthen the school life of their children. Work among women (especially in neighborhood groups) has raised the family standards by raising the mother's place in the family. The interest in home and neighborhood classes on the part of the women is increasing. One of the greatest achievements is the broadening of the term "Americanism." Teachers appreciate opportunities for special training.

Miss Marguerite Hickey, field agent for our State Department of Americanization, is conducting what she calls an experiment. From time to time delegates are sent from towns to a conference meeting. The State is districted to facilitate the work. The conference is conducted in three

sections, each section in charge of a round table leader. The outline followed by beginners, intermediate, and advanced groups is as follows: (1) Problems, (2) methods of solution, (3) conclusions, and (4) suggestions and requests.

The chairman reports to the field agent and the suggestions are acted upon. Suggestions from teachers are always welcomed by the State Department. Model lessons for special occasions were requested and were supplied.

The coöperation secured between the State and the teaching force has been productive of much good, both to the schools and the teachers. They feel that this is no longer an experiment, but an institution from which they may obtain help as well as to which they may contribute.

OUTSTANDING ACHIEVEMENTS AND PRESENT DIFFICULTIES FROM THE TEACHER'S VIEWPOINT

LILLIAN P. CLARK, DIVISION OF AMERICANIZATION, STATE DEPARTMENT OF EDUCATION, COLUMBUS, OHIO

In 1922 the teacher of adult immigrants has achieved many of the aims so carefully laid down for her. One needs only to examine the specimens of pupils' work in this splendid exhibit to realize how much the technique of teaching adults has been developed through her application of the principles given her by her practical leaders.

At this time, I prefer to speak of her greatest handicap. In spite of her personality, for I think we all agree that personality plays a greater part in the teaching of adults than in the teaching of children, in spite of her special training fitting her for her specialized kind of work, and in spite of her experience, that most valuable asset, the teacher of adults is given little recognition as a teacher by the educational forces. She has none of the privileges of regular teachers and is usually considered an "extra hand," so to speak, in grave danger of being "let out" at the first sign of "hard times."

There seems to be no uniform law regarding certification which fixes her status among teachers. True, certificates are issued when a special course has been taken and passed. Such a certificate is not a license to teach any more than a diploma from a university, for example, is a license for a doctor to practice medicine. I am in favor of a provisional certificate based on training, to be succeeded by a permanent certificate based on training and a definite length of experience.

Under the present conditions, the teacher of adults has no binding contract (she is usually considered in the same position as a substitute). She has no definite length of term. She may be working three months or eight. How much time can she afford to devote to special training with such an uncertain outlook? Furthermore there is no uniformity of qualifications. When the demand is great, many teachers are added to the teaching staff on the strength of their day-school experience, a condition which tends to greatly decrease the effectiveness of the practical program sponsored by this Department of Immigrant Education.

Experience in teaching adults is by no means considered on the same basis as day-school experience. I should like to cite three instances of this as they occurred in my own State.

1. In trying to fix the salary of a supervisor in a large city it was necessary to determine the length of her experience. She had taught eight years in this particular kind of work, during which time she had devoted two years of full-time work to Americanization. Her other six years were considered as one and she entered the service on the basis of three years' experience.

2. Another supervisor was applying for a life certificate and lacked two weeks of the necessary time of day-school experience. She had been supervising for several months, teaching many demonstration classes, which would have aggregated much more than the required time. The Board of Examiners refused the application on the grounds that there are no *definite qualifications* for an Americanization supervisor and no credit can be given for such irregular experience.

3. One city in the State had been issuing certificates rather generously and the State department insisted on examinations for all teachers not holding State certificates. The order was then issued that all special teachers who were also day school teachers were exempt. Such a condition as this developed—many successful teachers of adults with experience varying from two to twenty years were required to take examination, while their more fortunate and sometimes less efficient and totally untrained friends, who happened to be day school teachers, were entirely exempt.

I don't know how much this problem affects the several States represented here, but I do know that to continue the work so well begun, we have reached the point where the status of the teacher must be defined and her position must be strengthened. For the teacher who loves this kind of work, who is devoted to the ideal of better citizenship, who is willing to study the attendant problems, and who is trying to perfect the technique of teaching, I should like to make this plea: Let us set into motion the forces which will bring about a uniform system of certification, based on training and experience; make the qualifications as rigid as you like, but make them definite; make the certificate provisional at first if you choose, but eventually it must be permanent, so that the teacher of adult immigrants may assume her rightful place in the educational world.

OPENING REMARKS

B. PRESTON CLARK, VICE-PRESIDENT, PLYMOUTH CORDAGE COMPANY,
NORTH PLYMOUTH, AND MEMBER EXECUTIVE COMMITTEE OF
ASSOCIATED INDUSTRIES OF MASSACHUSETTS

We shall this morning listen to reports dealing concretely with different phases of Immigrant Education. As a member of the Associated Industries of Massachusetts, it is a pleasure to preside at this conference, because it makes clear the mutual desire of the manufacturers of Massa-

chusetts, and of the Educational forces of the State, to work in close co-operation for the common good.

I am not an educator, just a business man, and I cannot hope to tell you men and women anything you do not already know. The most I can hope to do is briefly to express what I believe to be in the minds and hearts of us all, as to what immigrant education really is.

If an immigrant is a person who has come from some foreign land, and if education is the bringing out of the latent powers of a person, then immigrant education is the bringing out of the latent powers of all those who have come to us from foreign countries. This is hardly broad enough. I would like it to include the bringing out the capacities of all those who spring from immigrant stock.

This definition includes every one of us here today. The only native-born American is the American Indian, and he, poor chap, is mostly dead. We who are here today are many of us Anglo-Saxons. Being one myself, I think they are pretty good people, but there are lots of other good people too. We Anglo Saxons have our limitations, and one of them has been that, being a strong race, we have been too sure of ourselves, sometimes too arrogant. We must get over it.

We Anglo-Saxons came here first, we have contributed much to American life, and shall contribute more. But we are not the whole push. We are today a nation of forty races, and we all have much to learn from one another. We must in fact learn from one another if we are to be a united people. The stars on our flag I like to feel stand for these races as well as for the States.

One of the greatest missionaries I have ever known, Howard Bliss, of Beirut, Syria, said that the true missionary tried to exchange the best that we have with the best the other races have. It is a thought we may well bear in mind in immigrant education.

As President Lowell, of Harvard, said so splendidly, "The American is not a finished product. He has been in the making ever since the first white man set foot upon our shores, and he will continue to be in the making so long as streams of foreigners pour into our land. Americanization does not mean moulding them to an already settled type, but the blending together of many distinct elements. No one of the peoples that have come from Europe to our shores is devoid of qualities that can enrich our common heritage, and some have already contributed greatly thereto."

One of the purposes of teaching English is surely that through a common language we may the better understand one another.

It has been my happiness to live my life among all sorts of people. I did a ten-hour day, and at one time a sixteen-hour day in a Massachusetts mill.

The nineteenth century was remarkable for many discoveries, many inventions. The great discovery of the twentieth century in this country will, I believe, be the latent capacities of these forty races under free American conditions. The world has never seen what these people could do under such conditions.

In some small way, it is given to each one of us, to help to bring out these latent capacities in ourselves and in others. It will not be done by programs alone, though there must be intelligent planning. It will largely be done through making a vision which we all share in common, real in golden fact, through such wise and loving personal work, as you who are gathered here this morning, and thousands more like you, are doing from week to week and from month to month. In such work let me wish you all Godspeed.

DEVELOPMENT OF FACTORY CLASSES IN MASSACHUSETTS UP TO DATE

GEORGE F. QUIMBY, INDUSTRIAL SERVICE SECRETARY, ASSOCIATED
INDUSTRIES OF MASSACHUSETTS

Three periods—There have been three distinct stages of development in immigrant education in Massachusetts factories. The first factory classes, so far as I have been able to learn, were established in Cambridge in the plant of the Boston Woven Hose & Rubber Company as early as the year 1906. The factory English class movement then, with us, is at least sixteen years of age. Yet in Massachusetts we sometimes talk today as though the factory class idea were new. We may be justified in speaking this way because it really has only recently begun to come into its own in the educational program.

Who started these first classes? Back in 1906 and earlier, the Cambridge Y. M. C. A. was in the habit of holding noon-day meetings in the factories of Cambridge. The promoter of these meetings noticed that many of the people in attendance apparently could not understand what was going on or much of what was said. There was an evident need to break through the language barrier. The management of the Boston Woven Hose & Rubber Company was willing and classes for instruction in English were established. Some five years later, when I first visited these classes, the management had established a rule *requiring attendance* on the part of non-English speaking employees. More than 100 men met in these noon-day classes and were taught by Harvard students—social service volunteers—whose principal equipment comprised a set of “Roberts’ Lessons” and a blackboard propped up against a pile of rubber hose. (I am pleased to say in passing that there has been an almost unbroken line of instruction in this plant during the last sixteen years. This present school year, for the first time, the Y. M. C. A., and the management of the industry have turned the classes *entirely* over to the Cambridge public schools.) The first stage was therefore, one of private vision, private initiative, and private experience. During the next decade following this experiment similar projects were tried by the Y. M. C. A. and other private agencies in other cities.

During this same period industrial management was giving more intelli-

gent attention to labor relations and developing better means of handling labor problems. New management departments were brought into being in the larger industries which were variously called, "Welfare," "Employment," "Service," "Industrial Relations" departments, and the like. Some industries conducted English classes for their immigrant employees as one of their service activities, usually using foremen as instructors and drawing their meagre supply of text materials from widely scattered sources, supplemented by subject matter of immediate employment interest. This marked the second phase of immigrant education in Massachusetts factories as a definitely industrial project.

The third stage is the one in which we now find ourselves with public education in direct charge aided by the coöperation of industrial managers and of voluntary organizations. It may be well, at this point, for us to examine some of the stepping-stones in the progress from an entirely private endeavor to a public enterprise.

Development—In 1918 the Executive Committee of the Associated Industries of Massachusetts, realizing that thousands of non-English-speaking aliens were employed in our industries, assigned two staff secretaries to the task of helping provide educational opportunities for such employees. The effort was made in the faith that it would be good business as well as good civics. There was no publicity, no blare of trumpets. These secretaries quietly and earnestly went to the plants where the managers were ready to be shown what could be done and how best to do it.

At about the same time, in the early days of the World War, the State Department of Education in Massachusetts, recognizing the real need for publicly promoting immigrant education, engaged the services of Charles F. Towne. I remember going up to the city of Lowell in the winter of 1917-18 and there witnessing an experiment in factory classes which Mr. Towne had established. He had trained some foremen and developed them into emergency teachers. The management entered whole-heartedly into the project and saw to it that the non-English-speaking workers gathered regularly into rooms especially built for the purpose. There were no two ways to it. All the employees in that plant must *know English*. There was a war to be won and that plant was going to do everything possible to prepare its employees for their largest possible share in that war!

Similarly a regular drive was made elsewhere on the factory class idea during the war period. Public schools began to take a real interest in this phase of immigrant education. Everybody was talking about "Americanization" and the need for "100 per cent Americanism"—and the interpretations thereof were myriad.

The Washington conference in 1919—You will remember the big conference held in Washington in May, 1919, under the auspices of the Federal Bureau of Education. The industrial people at that conference were asked to formulate the principles which should govern industrial Americanization, so-called. When we counted noses we found that among the more than four hundred people at the conference there were only twenty-two

of us representing industry. We recognized the absurdity of any attempt on the part of such a small group to speak for industry or to formulate a statement of principles. This group, however, agreed to call a National conference later for the purpose of studying the whole question of "Americanization in Industries." Because of the interest of the Associated Industries of Massachusetts in factory English classes our industrial friends from the other States rather insisted on coming to Massachusetts.

The Nantasket conference in 1919—The conference was consequently held at Nantasket in June, 1919, just three years ago. About two hundred delegates came from ten industrial States. Out of the widely varied experiences and tremendous differences in points of view, two of the planks adopted by that conference of *industrial* representatives were, I think, fundamentally correct. One resolution was "That instruction in English for non-English-speaking people should be carried on in coöperation with the public educational forces provided those forces are prepared and will assume the responsibility." And we, then and there, pledged our aid in our respective communities to bring about this coöperation. A second statement was "That we, as a representative group of industries, unanimously disapprove making naturalization a condition of employment and recommend that every community establish at least one school for citizenship." That was pretty good work for a group of *industrial* people in such a time of stress and patriotic hysteria.

That same summer, 1919, a new and important State law became operative. It is called the "fifty-fifty" law because it provides that at the expiration of each school year, on the approval of the Department of Education, the commonwealth *shall pay* to every town providing instruction for adults in English and the principals of American citizenship in conjunction with the State Department of Education, one half the amount expended for supervision and instruction by such town. (There really isn't any more effective way of getting things done or a new proposition put through than to offer to pay half the bills—unless you pay all of them!) As John Mahoney went up and down the State telling the school boards of the various cities and towns about this program for immigrant education he soon discovered that the Associated Industries was at work on the factory class end of the program. Coöperative effort was suggested. Since then there has been cordial team-work between the State Department of Education and the Associated Industries of Massachusetts in the development of factory classes.

The Plymouth conference in 1920—In September, 1920, these two agencies jointly conducted a conference at Plymouth, for the purpose of formulating and developing the procedure in immigrant education which might best be pursued by the public schools and the industries working co-operatively. The representatives of the schools and industries adopted a statement of principles which recognized the need of better educational facilities for removing the language barrier; which declared that employers should help the schools reach the non-English-speaking immigrants employed

in the industries; which reiterated that "the education of the immigrant is a public function and wherever possible should be carried on by public-school authorities in accordance with the plans formulated by the State Department of Education" following the provisions of Chapter 69 of the General Laws (the "fifty-fifty" law); and which urged the appropriation of enough money to get the job done well.

In recognition of the fact that the education of the immigrant is a *public* function and that the industries should coöperate with the public authorities in every reasonable way, Mr. Charles A. Andrews, who was at that time president of the Associated Industries of Massachusetts, said at Plymouth: "As our program for the education of children has developed we have found that assistance on the part of the home is necessary, but we have never turned over to the home the administration or execution of the educational program. Now as we take up the question of the education of the adult, who is a factory worker, we may well conclude that we need the assistance of the factory, but we must never conclude that we shall turn over to the factory the administration and execution of such educational program as is devised for the adult. Public authority must devise and execute the program. The place of industry in the scheme is to give its assistance to the public educational officers in carrying out the program."

Practical procedure—The Plymouth conference did not stop with a mere statement of principles. It was agreed that these principles should be interpreted in terms of definite procedure which should assign specific duties to the public schools and equally specific duties to industry. These are the definite steps recommended: First, that the schools (1) accept provisions of Chapter 69, of the General Laws, Sections 9 and 10; (2) appropriate enough money to get the job well done; (3) provide for classes in industries whenever organized; (4) provide a director of immigrant education; (5) train and supervise teachers; (6) provide suitable text material (including motion pictures); and (7) organize courses of study.

Second, that the industries (1) conduct preliminary study to learn the extent and nature of the problem; (2) centralize responsibility in a plant director or committee or other effective agency; (3) recruit classes; (4) provide satisfactory school accommodation; (5) establish an efficient follow-up; (6) provide incentives; and (7) collaborate in training teachers and in providing special text material.

These last seven steps had been found to be effective as industry's best procedure in the joint project by which public-school classes are conducted within industrial establishments. For this reason and this reason alone, these seven steps were adopted at Plymouth as industry's job in the Massachusetts program.

This program outlines an ideal situation—the normal, best, all-around arrangement or set-up. Obviously, adjustments must be made to fit the particular industries in certain communities where the ideal set-up is clearly out of the question. Other speakers this morning will doubtless tell us how well the plan has worked when fully tried, or how poorly where some important steps have been omitted by one side or the other.

Selling the Plymouth platform—We were not content to let the Plymouth Conference end with the adoption of this statement of principles and procedure. We realized that the whole program would have to be sold to the schools and industries in the various cities and towns in our State. We were anxious to translate the findings of the Plymouth Conference into action. A real barn-storming campaign was conducted. Miniature "Plymouth Conferences" were held in many places, conducted jointly by schools and industries. Everything looked rosy when the bottom dropped out of business with a bang and the serious period of industrial depression set in. In spite of that fact, however, I am glad to be able to say that the factory class movement had sufficiently passed the early experimental stage to prove its worth and the Plymouth Conference and the follow-up of it had generated a momentum which did not stop. At the same time the schools in the various cities and towns were being organized to handle the program. Many full-time school directors of immigrant education were getting into action. These factors all helped the factory classes overcome the adverse conditions of business which necessitated the discontinuance of many other industrial employee activities.

Statistics and public responsibility—You will remember that the *industrial* people at Nantasket declared for the assumption of public responsibility in English instruction, recognizing that elementary education is not the business for which industries are organized. And then the Plymouth Conference of *school* and *industrial* people likewise declared that the education of the immigrant is a public function and that industry's part is to "Avail itself of the educational facilities offered by the public schools and to cooperate in every feasible way to perfect these facilities." A brief review of the statistics shows the extent to which these principles have been accepted and adopted.

Years	Number of classes	Directed by Y. M. C. A.	Directed by industry	Directed by public school	Enrolment	Number different cities and towns	Number different industries
1919-20..	304	30	83	191	4267	40	99
1920-21..	380	5	68	307	5241	40	105
1921-22..	368	1	1	366	5316	39	97

Massachusetts has clearly accepted public educational responsibility in factory classes. Private agencies and the industries which had managed classes themselves have been willing to give the factory classes over to public-school supervision and direction almost as rapidly as industrial managers have become convinced that the public schools were in a position to adequately do the work. The generous attitude shown by industrial secretaries of the Y. M. C. A. in thus releasing work which they had pioneered and built up is worthy of particular mention as being entirely public spirited. Some secretaries went even further and introduced school directors to industrial managers, thus helping these directors to a good start.

Present status—Where are we and whither headed? From the foregoing it is obvious that we have *not reached thousands* of immigrant employees that ought to learn our language. We are encouraged, however, by the

fact that there were enrolled in the factory classes this past year over a thousand more adults than the total number found in all kinds of classes for immigrants in this State some four or five years ago. The progress to date, at best, can only be considered as a start in the right direction.

We are facing certain problems which must be solved before we can make much further headway. Obviously the task just now is to keep our present hold. The time, so far as business is concerned, is not opportune for any rapid extension of factory classes anywhere. Employers who have not already been sold or converted to the idea are hardly in a mood today to consider new projects. Their business worries are too numerous.

It may be difficult for us to secure money enough to enlarge our program. City councils are engaged in the popular pastime of paring school appropriations just as business concerns are, of necessity, practicing rigid economies. (Of course we all believe in economy if it does not hit *us* or the *activities in which we* are interested harder than *we* or *they* deserve.) The point is that the factory English class enterprise must continue to prove of value if it is to hold its place in the school program or as an industrial activity.

I was encouraged recently when the new President of the Associated Industries, Colonel Charles R. Gow, said that he still believes it very important for the Associated Industries to do whatever it may, even at a sacrifice, to promote the cause of immigrant education among immigrant industrial employees.

One of our problems is in our own thinking. Do we as workers in this part of the educational field think of factory English classes as a *regular* part of the immigrant educational program, or do we, perhaps, consider it a fad born of the war and likely to soon be forgotten? If we are a bit uncertain in this regard ourselves it is quite likely that we are not doing enough to acquaint citizens generally with the results of factory English class efforts. We must have public opinion with us else we may not be allowed to grow—or even to live at all.

Business is bound to improve. I believe the tide is already turning. Let us hold our own now and keep in trim ready to go out to meet the better times that are coming. Are we ready to bring into line the local school committees that have not yet adequately organized to offer educational opportunities for adult immigrants? Are we prepared to convince industrial managers who do not yet see the wisdom of having such activities within the industrial plant that there is a business value in English instruction? In other words, do we believe sufficiently in the goods which we have to sell? Our school supervisors or full-time teacher organizers must be good salesmen before they can exercise as good organizers and administrators. They must continue to win their way by demonstration and by appeal to reason and not by any assumed authority of position.

Under the restrictions of the 3 per cent immigration law now in operation very few new, green immigrant workers will arrive. There will therefore be a growing tendency on the part of industrial managers and others to

believe that factory English classes are no longer necessary. We must convince such people that we only desire opportunity as long as there is a real need for the work. We must, at the same time, not allow ourselves, or any one else, to be fooled by the smattering of English spoken by immigrants who are still illiterate in our language.

English as a means to an end—We ought to bear in mind in our factory classes that a knowledge of English is, after all, only one factor in the process of becoming an American citizen. Through factory classes we can give the immigrant employee the very help which he may need to fit himself into the industrial organization as well as into the life of the community. Without English he is at a loss when he tries to engage with his fellows in various employee activities. With English he can feel much more at home. With English he can more readily rub elbows with older Americans. That is surely one of the objects which we should seek to attain through English class instruction. The teacher, by taking a personal interest in her pupils and by devotion to her work, actually does help to develop a better spirit within the plant in which her classes are held. Anything which helps promote good-will within industry is worth while not only for the industry, but also for the community in which pupils reside. The factory classes are undoubtedly promoting preparation for wholesome citizenship.

Recapitulation—The value of factory English classes to pupils, to employer, and to community has been proved—in time of peace as well as in war—and in foul business weather as in fair. The cordial positive statements of industrial managers in answer to a recent inquiry surely put them on record as in favor of continuing factory classes. The interesting statements made by pupils at graduation exercises show that real developments in mind and heart have been made. We believe, then, that factory classes will remain as a part of the immigrant educational program in Massachusetts.

Whatever success this movement has had has been due largely to five factors: (1) Good sound legislation—the State matching its dollar with the dollar of a city or town. (2) A definite program, as worked out in joint conference at Plymouth. (3) Capable educational leadership organizing just enough, and not too much, school machinery in State and local communities. (4) Interest and assistance of industrial managers—the employers of immigrant workers. (5) Coöperation of business and industrial organizations like the Associated Industries of Massachusetts, both State-wide and local in operation. I commend these factors to your conference as essential in any public educational enterprise which seeks to help the adult immigrant worker make his best contribution to America as a capable citizen in the workshop, in the home, and in the community.

REPORT OF INVESTIGATION INTO FACTORY CLASS PROGRAMS IN NEW BEDFORD, MASSACHUSETTS

GERTRUDE BRUYN, AMERICAN BOSCH MAGNETO CORPORATION,
SPRINGFIELD, MASSACHUSETTS, AND JOSEPHINE D. MASON, SUPERVISOR OF
IMMIGRANT EDUCATION, SPRINGFIELD, MASSACHUSETTS

*City of New Bedford—Location—*Situated, as New Bedford is, on Buzzard's Bay, eighteen miles from the track of all ocean coast-wise commerce passing outside of Cape Cod, and within seven miles of the line of all vessels passing through Cape Code Canal, 185 miles by water to New York, and fifty-seven miles by rail to Boston, it is not surprising that this little but important whaling community has grown into a large textile city, now being the fourth city in the State.

*Population—*New Bedford between the years 1900 and 1910 increased its population 33 per cent and between 1910 and 1920 doubled it again. In a city where the packets come directly from the foreign shores and unload their cargoes at its port it is no wonder that out of a total population of 122,000 at the present time there are 35,000 foreign-speaking people. More than 13,000 besides these are foreign born of English speaking races, bringing the percentage of foreign born up to approximately 35 per cent of the whole. As in most textile cities the French Canadians figure prominently, and are excelled only by the Portuguese, who number about 16,000. The Polanders, Russians, Greeks, and Syrians then follow on to add fairly representative national groups. Of the 67,000 native born it is interesting to note that almost 50 per cent are native born of foreign parentage, and 15 per cent more are of mixed parentage. That the problems of illiteracy in English and the training to citizenship are extremely important ones may be seen from the fact that 20 per cent of the foreign-born population, or 8 per cent of the total population, are non-English speaking. And only one third of the foreign born over 21 years of age are naturalized. This might be regarded as extremely significant from a political point of view.

*Industries and trade—*While the world is the market for the products of the industries of New Bedford, the fact that within a radius of 400 miles there resides a population in excess of 30,000,000, shows clearly its advantageous position in the domestic market. Cotton and silk manufacturing heads a long list of industries, including tools, twist drills, dies, silverware, rope, cordages, shoes, and paper goods. While the city owes its early growth to the whaling industry, it now enjoys the reputation of being the largest cotton-goods producers in the world and standing second in the number of spindles. The capital invested is reported to be more than \$125,000,000. The twenty-seven corporations, financed by local men, operate sixty-eight mills, and employ more than 40,000 people, representing a pay-roll of \$64,000,000 during the year 1919.

*General situation in regard to Americanization work—Attitude of the public—*Classes in immigrant education were started in New Bedford

three years ago under the auspices of the Young Men's Christian Association. They were started in three of the industries where they are now being held under the Public School Department. Credit should be given to the Y. M. C. A. for the valuable pioneer work which they did and also for the fact that, when the School Department realized that the schooling of the adult immigrant was a public function and undertook this as one of its definite policies, the Y. M. C. A. recognized the value of the public-school-trained teacher and so withdrew from this field of its many activities. The industries, on the other hand, had seen the good that came to the industry through the teaching of English, and therefore welcomed the coming of the School Department.

Attitude of the School Department—That more than ordinary interest has been shown by the New Bedford School Board is evinced by the fact that last year they appropriated \$25,000 for Immigrant Education, which is 2 per cent of the whole school appropriation. That the foreign-speaking people have responded to the opportunity offered them to attend classes in English is shown by the fact that there have been 15 classes held in foreign clubs with an enrollment of 291 persons, eleven classes held in community houses with an enrollment of 185 persons, and twenty-two classes held in the churches where the foreigners attend with an enrollment of 457 persons. Can there be any question as to the eagerness with which the foreign born welcome the opportunity to learn the language of America?

Attitude of industry—General policies—The immigrant problem in a port like New Bedford is so extremely apparent that it requires no talking points or salesmanship course to point out to employers that the Americanization classes are not only desirable but essential. The problem of citizenship does not seem to trouble the minds of the employers, which is illustrated by the fact that there were no citizenship classes held in any of the industries during the past year. The reason for this may possibly be that this is only the second year that systematized English classes have been held, and therefore a large number of employees have not had the matter brought home to them with sufficient force to cause them to secure even first papers. Citizenship classes, consequently, would best be beside the point until next year.

However, the teaching of English is regarded as purely a business proposition. The elimination of the interpreter is a labor and time saving device, as well as a money saver, and appeals to the executive as a means of cutting the cost of production just as the cutting of all overhead costs appeals. Therefore, the attitude of industry has for the most part been one of 100 per cent coöperation. In the very few industries where the results of the classes have been poor, it can be attributed not so much to the lukewarmness of the management as to their methods of selling the idea to the overseers, who were the media through which they worked.

During the year 1921-1922, Americanization classes have been held in twelve industrial centers, representing seventy-one classes, and totaling

872 pupils. This is a 100 per cent increase over the previous year, which year marked the beginning of work by the Supervisor of Immigrant Education under the School Department, when there were thirty-one factory classes with an enrolment of 315 pupils. Besides these pupils from the industries it must be remembered that 1569 of the foreign-born of New Bedford come under the compulsory attendance law. Just how many of these are employed in the industries, it is impossible to state.

When the work was organized by the present supervisor there were fifteen industries approached regarding classes, only three of which seemed indisposed. Three of the remaining twelve industries, had voluntarily taken up the matter with the supervisor and asked for classes. One of the mills unwilling to coöperate made a statement that they did not care to interfere with the personal affairs of their employees, such as pleasure or education. They felt that they paid them for their work.

Present working conditions—While none of the industries engaged in Americanization work are at present producing normally, all but one are within 90 per cent of normal production. In the case of the semi-successful classes there was rather a subtle admission that they would like to have the excuse of abnormal times to shield them, but in spite of whatever failures there might have been, the apology of small forces and periodic lay-offs could not be offered.

Personnel in charge of Americanization work—In only two of the mills approached are there employment managers, or personnel directors. We trust that it has been in spite of this fact and not because of it that the Americanization work was least successful in the two plants which were supposedly progressive enough to have a specialist in the employment department. In two mills the classes were operated under the supervision of the nurses or first aid departments. One case worked out very well because one of the nurses there was employed as a Portuguese interpreter who aroused much enthusiasm. In the other mill, the experiment fell flat. The balance of ten mills placed the supervision of this work directly under the superintendent or assistant superintendent who in turn communicated with the overseers. As most of the classes were organized by rooms, this was proved to be the logical way in which to work.

Employment policies—If a concern in New Bedford should attempt to adopt the policy of employing only English-speaking races, as many plants in other cities do, it would soon find itself confronted with a terrific labor shortage and be forced to abandon the policy. Therefore, the source of supply is almost limitless, and the employment policy that of hiring anyone, Bohemians or Bravas, Canadians or Czechs, Polanders, or Portuguese. The recording of statistics seems to be the least of the troubles in the cotton mills. If anyone wished to arrive at a definite figure, it would be necessary to conduct a regular investigation into the employment records of any one plant and list the foreign-born therein. Further information than this would be impossible to secure as no statistics are kept of the number without papers, or with first papers, or naturalized. In only one mill visited

was there any policy of hiring citizens rather than non-citizens, other things being equal. In most of the mills citizenship is not a requirement for employment. The reason for failures to keep up-to-date files on the civil condition of employees is the obvious one of its being almost a super-human task. The circumstance of an employee who calls himself Govoni in one place, goes by the name of Picard in a second, and changes to Smith in a third, would be too difficult to trace. The employment departments do not even attempt to keep the addresses up-to-date.

From conversations held with the superintendents of the various mills it might be concluded that about 40 per cent of the total employees of mills where the classes have been held are foreign-born. Portuguese, including those from the island of Brava, are always predominant, then Polanders, French Canadians, and Irish combine to make up the larger part of the working force. The majority of them are literate in their own tongue.

Methods of showing interest—Whenever a management has manifested a willingness to have the classes organized, it has matched that willingness with the same spirit of coöperation in providing and equipping the school-rooms. In all but three instances, classes were held in the workrooms of the factory, which were always clean and attractive. Two mills erected separate small buildings solely for the purpose of Americanization work, and one mill provided a room in a near-by tenement block for the purpose. It has been the custom for some representative of the management to be present at either the beginning or closing meeting of the class, or both. The superintendent always spoke at the closing exercises when the diplomas were presented; in one mill the members of the class were presented with Ever-sharp pencils. During the period of lay-offs one company has put itself on record as being in favor of retaining all the people at work who were attending Americanization classes.

Classes—Possibly there are some present who will be interested to know just how classes were started in the industries in New Bedford. (1) The supervisor interviewed the agent or treasurer of the mill, told him her proposition, finally convincing him that immigrant education was the one thing needed to make his mill a complete success. (2) The agent or treasurer introduced the supervisor to the superintendent, who in turn was convinced of the worthiness of the proposition. (3) In some instances the superintendent called together the overseers and the supervisor explained to them this joint proposition of the industry and the school department. (4) The overseers made a survey of their departments, finding any men and women who wished to avail themselves of this opportunity to learn English. (5) These prospective pupils reported at a central place where they were met by the supervisor and teachers. (6) The classes began. In other instances it was not found necessary to have the overseers' meetings but the superintendent or the person directly responsible for the work directed the overseers to recruit the classes. In the organization of the classes it seemed to make little difference how the recruiting was done provided some one person was responsible for it.

In talking with these superintendents of the mills the general feeling seemed to be that the value of these classes in English to the industry was sufficient to warrant the overseers asking the non-English-speaking people to attend the classes. This does not mean in any way compelling them to do so, but simply using the "gentle persuasion" of one in authority.

In 12 industries there were 71 classes and an enrolment of 872 persons, an average of twelve persons in a class. In these twelve industries there were classes numbering 25 for women, with an enrolment of 250. Whenever the numbers would permit, grading was done. In general, the teachers used the State themes supplemented by the Goldberger and O'Toole books. No special lessons for a particular industry were used. The percentage of the non-English-speaking persons attending the classes compared with the number of employees varied from 1 to 50 per cent, the average being probably about 20 per cent. Of this number a few attended evening school. However, probably 80 per cent of them would have attended no class at all had there been none provided for them in industry. The number of classes in the individual industry varied from 2 to 12. As has been stated, these classes were all held in places provided by the industry. There is such an excellent spirit of coöperation on the part of the industry that the superintendents are willing to enlarge the school-room facilities, to build, or to do anything that may be needed to help make these classes even more successful another year. No expense apparently will be spared. Each class was held twice a week, on the employees' time, either between 12 and 1, or between 5 and 6. All the women's classes were held between 12 and 1. In these industries the employees are allowed to eat their lunches while they are working, thus giving them the full hour for their classes. In one mill it was found difficult to arouse any interest among the women until a teacher of their own nationality, Portuguese, was found, then the women flocked to the classes.

The follow-up is done through the overseers. A list of absentees is given after each class, by the teacher to the overseer. In some instances these are followed up, but in many instances, not. The superintendents themselves agree that the follow-up work has been the weakest spot of this whole project. Probably one reason for this weakness is that sometimes the overseers spend little or no time in looking up the absentees. In one or two mills, the teachers themselves arrive at the class early and go through the department where the classes are held and encourage the pupils to attend. To make this important part of the work effective it is necessary for the overseers to spend a little time in looking up their men. This, however, the superintendents feel is time well spent.

The attendance in the classes varied from 60 to 99 per cent, the average being about 80 per cent. No special devices were used to keep up the attendance. The men and women were most enthusiastic about these classes, feeling very grateful to the School Department and the industry for providing this opportunity for them.

Too much cannot be said about the necessity of having specially trained

teachers for these classes. In every instance the men whom we interviewed said that they felt the greater part of the success of the classes was due to the fact of having these trained teachers. The pupils themselves paid great tribute to their teachers. The classes seemed adequately supervised. Conferences with the teachers were usually held by the supervisor at the industry where the teacher had her classes, either preceding or following the hour of appointment.

To summarize—Besides the 71 classes in industry with an enrolment of 872 there are 15 club classes, enrolment 291; 11 community classes, enrolment 185; 22 church classes, enrolment 457; and 38 evening-school classes with an enrolment of 840. This gives New Bedford 157 classes for adult foreigners with a total enrolment of 2645, an enviable record for any city.

A few generalizations may not be out of place here to show why immigrant education has been so successful in this textile city: (1) A large number of foreigners anxious to learn English; (2) a group of industries realizing that these classes promote a feeling of good-will and understanding between the employer and employee, and anxious to help in teaching these foreigners English; (3) a school department ready to appropriate sufficient money to insure the work's being well done; (4) each class with a specially trained teacher in charge of it; and (5) an extremely competent supervisor with energy and personality that are bound to make the work a success.

REPORT ON FACTORY CLASSES IN SOUTHBRIDGE, MASSACHUSETTS

THOMAS F. POWER, ASSISTANT SUPERINTENDENT OF SCHOOLS,
WORCESTER, MASSACHUSETTS

Southbridge, Massachusetts, is a town of approximately 14,000 population, 4000 of which is foreign-born.

In a factory class which has passed the experimental stage, in so far as it has been maintained for four years, are sixty pupils, sixteen of whom are women. This class meets twice a week for one hour, on Monday and Thursday, for a period of eighteen weeks, entirely on the employees' free time. The employees quit work at a quarter of five and begin school at five o'clock. This avoids what might be a long pull home in all kinds of weather with consequent doubt or hesitancy about going out again in the evening. The session is of such length as not to interfere with garden work in the spring—namely eighteen weeks. In so far as the hour of the sessions is advanced to five o'clock, this is an excellent attempt to solve some of the old problems which have caused the ups and downs of the evening schools.

Two public-school teachers are employed in this plant, one of whom has had twenty-eight years' experience in immigrant education, the other seven

years; both have had training courses in immigrant teaching. Recreation rooms equipped by the company are used. Such equipment—large chairs, good electric lighting system, large-size tables—probably help to account for the greater percentage of attendance than usually obtains in evening classes for immigrants held in grade school rooms where the seats and desks are small and the lighting more or less inadequate, since most school buildings—especially those now used in foreign sections—were not properly lighted when built because it was not expected that they were to be used evenings. What artificial light there was was merely an aid to the natural light of day.

The classes in Plant W were recruited by foreign-language posters and by the members of the preceding year's classes. Regular attendance was maintained by follow-up work by an officer of the employment department.

No special lessons for industry were prepared. The aim was for general English for the purpose of general improvement of the individual, which reacts in general improvement on the job. In this plant the teachers give assistance in filling out naturalization papers, but no class in preparation for naturalization is conducted in the plant. Employees who wish to attend such classes go to the community classes in the evening schools.

Attitude of employment manager—1. The interest and oversight of them does not interfere with production and recruiting does not take much time.

2. Not over 25 per cent of our foreign language speaking men attended these classes, but no compulsion was used.

3. The pupils have shown themselves to be worthy of promotion.

4. Public-school teachers held the interest of the employees.

5. The classes will be continued next year.

Follow-up work on the part of the foremen does not take an average of five minutes daily. The foremen in this particular plant comment favorably upon the noticeable improvement of the pupils.

Attitude of the employees—They are interested in learning English and do not attend only because of the company's interest in their learning English. The students have expressed approval in various ways of the help given them and they have helped in recruiting classes.

Attitude of the officers of this industry—"These classes have promoted good-will and a better understanding between officers and employees. They have helped to reduce the number of injuries and accidents to the foreign-born. They have helped the use of the first-aid department by the foreign-born. They have helped safety campaigns and recreational programs by better understanding on the part of the foreign-born, but there is a little uncertainty as to helping directly or indirectly to reduce the waste of material." The management believes that the English classes are one more connecting link between the employer and the employee. Most of the foremen whose employees attend the classes find that they can make themselves more clearly understood. The foremen feel that production

was increased by the men's understanding their orders better. While no figures are available showing the reduction in accidents to the foreign-born and since only 4 per cent of the total number of employees are in these classes, it is difficult to say with certainty if accidents have been reduced because of these classes. However, "we have every reason to believe that those who attended the classes can more readily read notices and signs."

"In general," says the management, "This work, along with other welfare work, tends to draw the different nationalities together, therefore creating a better feeling among the employees."

The management of this plant believes that industry can assume some civic responsibility in the work of Americanizing the alien, also that the employee who cannot read and write English is more of an accident risk than the man who knows English.

Case O—Case O is an organization of 171 pupils attending class wholly on their own time. Eighteen of the 171 are women. In this plant, also, the experimental stage in factory classes has been passed. May, 1922, marked the end of the fourth year. The classes meet twice a week for one hour each on a Monday and Wednesday, or a Tuesday and Thursday combination. The hours are from 5 to 6, or 6 to 7, or 7 to 8 P. M. The term is eighteen weeks.

Here, again, we have a practical demonstration of the conducting of an evening school immediately after work for those who live at a distance and who probably would not go to evening school on account of distance, but in addition we have classes for those who live in the immediate vicinity of the works. The latter are enabled to go home at ten minutes of five, which is the closing hour of the works, have supper, and return to class at six o'clock. Others return at seven o'clock. This seems to be a flexible organization. It probably was based on an intention to meet the varying conditions of home life after work. Here also the public-school teachers give the instruction and assist in filling out applications for naturalization. The classes meet in lunch rooms, classrooms, and the dispensary. Experience of the teachers in immigrant education varies from 4 to 20 years, all except one having had a special training course.

We find here a most original device for recruiting classes. A committee, composed of representatives of the different nationalities, known as the Company School Board, advertises the classes in the foreign-language newspapers, by making foreign-language posters, and, in other ways, giving assistance in recruiting. Regular attendance is maintained through coöperation with the foremen. They frequently visit the classes and report to their department heads the results of the visit.

Job English is taught by means of specially prepared industrial lessons. An elaborate social and industrial program marked the closing exercises.

The attitude of industry in this plant—An executive officer testified as follows:

1. The interest and oversight of these classes by officials of the industrial plant does not interfere with production.

2. Though no form of compulsion was used in recruiting students, about 25 per cent of our foreign-born employees who need instruction in reading and writing English have been persuaded to attend classes.

3. Some of the pupils have shown themselves worthy of promotion.

4. Public-school teachers held the interest of the employees.

5. The classes will be continued next year.

6. We regard our Americanization classes as of rare value in our labor policy of developing personal relations with individuals. These classes establish personal contacts with an element of the labor force that we find difficult to reach otherwise, not only with men and women who work for the company, but also with their families, which is a further advantage. These good results seem to be lasting. Even after the men and women have completed the course they continue to talk over their problems with our employment department. We have supplemented the school with affidavit service to the foreign-born, who wish to bring their women and children over and establish homes in this country, and also aid in naturalization matters.

In regard to the more tangible value of the school, our production department counts an understanding of English as an important essential to instruction by foremen in quality production. In fact, 37 men with more or less experience, have been laid off in one department during the past six months for insufficient understanding of English to learn their work, and yet nearly all of them can understand the language somewhat. In view of this situation, we have prepared a set of lessons teaching "job English," aided with objects and photographs. We believe these courses will more than justify their expense under this plan.

There are now a fair number of boys and girls and young men and women, of superior intelligence and character, recently arrived from foreign countries, and relatives of our workers, idle because we cannot employ them. We are admitting these, finding them quick learners.

The above statement was written by the treasurer of this plant which employs approximately 3000 hands, to the treasurer of another plant who had asked for information on the value of the work.

It is highly probable that many executives will raise the question, "What is the value of Americanization classes to my company during the period of depression?" This executive says, "I believe these classes are worth their cost to the company. First, because they help the foremen to get these people to understand English. In fact, the foremen were consulted in advance and suggested ways for making the course help production. Second, the absence of overtime work, a strong competitor of this school, makes the present period of depression an ideal time to accomplish results with a large number of cases. Third, the competition for jobs is leading many to attend voluntarily who would not otherwise be taught. Fourth, it is a most extensive and the least expensive form of individual and personal contact with the more unskilled workers which the company has. The Americanization classes in the company have been fine factors in our labor policy for three years. Fifth, it is a means of expressing our "family" labor policy. Sixth, just now, during the depression, the school is a form of consideration for employees. We have invited employees laid off to continue their attendance and they are doing so. The school attendance has held up, even now, to 90 per cent of registration. Seventh, it is a good way of getting into close contact with the idle during the depression and is, therefore, a form of insurance of labor supply of the more desirable type.

Attitude of foremen—They feel that their part in training workers for

quality production is made easier when their workers understand what is said and meant. Believing that their employees should know English to do good work and having been shown by experience that recruiting employees for classes does not take much time, and that following up absences is not an annoyance, they are reported as "sold" to this factory class idea for non-English-speaking employees.

Attitude of foreign-born employees—They are reported as showing an interest in learning English. It seems to me that there is good evidence of this in the fact that they maintained such a high attendance in classes that were held after a hard day's work or in the classes that amount to an evening school organization, namely from 6 to 7 and 7 to 8 o'clock. In various ways they have expressed their approval of the help they received.

Commenting upon the closing exercises, the educational director says, "The demonstration of the work on the part of the pupils, the observation of the labor force at their best by the foremen, the informal social mingling, and the presence of the families of the workers, prove valuable in our labor relations. These features are long remembered by the pupils and in our minds seem to attach a personal halo to the concern."

Here then has been presented evidence from industry, answering the question, "Why should industry coöperate?" We find industry offering a place of meeting that removes excuses for the men's not attending evening school because that evening school is too far away. This is evidently recognized as an extension of the school system which is helpful in the assimilation of the foreign-born, which is as much a problem of industry as it is of the school system, because industry as a potent force in our economic order has been compelled to get employees who, unfortunately for this country, have an obstacle in the form of the foreign-language.

What does the School Department ask of industry in this work of helping to assimilate the millions so necessary to our economic order? In brief it is this—a place of meeting; about four hours' work annually on the part of one employee in recruiting and organizing classes; an average of five minutes daily for following up absences; coöperation to the extent of recognizing the work by allowing teachers to go over the plant to find material to use; with a final request that the foremen and the superintendent look in on the class occasionally. The rest may well be left to the school department.

REMARKS ON FACTORY CLASSES

FRANK CODY, SUPERINTENDENT OF SCHOOLS, DETROIT, MICHIGAN

In Detroit we group many extension classes of all kinds under the head of factory classes; for instance classes in the city prison, various foreign clubs, churches, Board of Commerce branches, and the like, as well as classes in industrial plants. Last winter they showed a registration of 1127, an average membership of 676, and an average attendance of 452.

Our experience with classes in industrial plants covers only about ten really successful cases; this, in spite of strenuous efforts to make factory classes a large feature, and in spite of a favorable attitude on the part of factory managements. Our experience has led me to believe that it is almost as difficult to hold school successfully in an automobile or other factory as it would be to make automobiles successfully in a school.

We find factories by turns too busy or not busy enough. (a) Too busy, because when times are good, double and triple rotating shifts prevail or else constant overtime is the rule. Attendance at class therefore fluctuates to an extreme degree (McCord Manufacturing Company, two Studebaker plants, American Radiator Co., etc.); or else the factory is so crowded on production that no room is available (for example, Penberthy Injector Company, where classes were held with the men standing about in a noisy workroom). (b) Not busy enough, because when times are bad the factories close down almost entirely (Sulphite Pulp and Paper Co.) or in retrenching they close out all welfare activities and leave the classes orphans (Solvay Process Co.).

All the plants mentioned above have had successful classes, but they at best led a fitful existence and the work done was far inferior to that done in regular night school.

Our policy, formulated in the light of the above, is (a) Freely offer the service to industries and conduct classes in every case requested; (b) But also establish night schools convenient to every workman and maintain some day classes for men on night shifts; and (c) Seek the coöperation of industries in getting their men into the regular night schools and try to interest them in keeping check on their employees' attendance.

SOME FACTS ABOUT FACTORY CLASSES

1. The management is often favorable to classes but the detail devolves upon already overworked subordinates of lower ideals who fail to push things.
2. The largest experiment in private conduct of factory classes (Ford's) was finally given over as not worth the expense and effort.
3. Factory classes cost us eleven cents per student hour, which is just what our average for all schools is. On the whole, it is cheaper to run factory classes than similar classes in schools. The accomplishment is less, however.
4. Factory classes do get some pupils who would not otherwise go to school. They reach their widest usefulness in communities where no night school program is provided and in small communities where most workmen live near the factory.
5. Factory class teaching should always be controlled and paid for by the school authority. Otherwise amateur methods are probable.
6. Attendance should be voluntary.
7. It is usually a mistake to pay workmen to go to school, though the Solvay Process Company got fair results by going 50-50 with the students.

Department of Kindergarten Education

SECRETARY'S MINUTES

OFFICERS

President—MARION S. HANCKEL, Supervisor of Kindergarten and Primary Grades.....Richmond, Virginia
Secretary—NINA C. VANDEWALKER, Specialist in Kindergarten Education, Bureau of Education.....Washington, D. C.

FIRST SESSION—WEDNESDAY AFTERNOON JULY 5, 1922

Joint meeting of the Departments of Classroom Teachers, Elementary Education, Elementary School Principals, and Kindergarten Education, and the National Conference on Educational Method. See program under the Department of Elementary Education on page 809.

SECOND SESSION—THURSDAY AFTERNOON, JULY 6, 1922

The Department of Kindergarten Education convened in regular session at 2:30 o'clock at Arlington Street Church, Boston, Massachusetts. The meeting was called to order by the president, Miss Marion S. Hanckel. The general topic for the session was CHANGING CONCEPTIONS OF THE KINDERGARTEN. To this was added the topic THE NURSERY SCHOOLS OF ENGLAND. The following program was presented:

- CHANGING CONCEPTIONS IN PRACTICE AS THE OUTGROWTH OF NEW INSIGHT—Catherine R. Watkins, Supervisor of Kindergartens, Washington, D. C.
CHANGING CONCEPTIONS OF KINDERGARTEN SUPERVISION—Ella Ruth Boyce, Supervisor of Kindergartens, Pittsburgh, Pa.
CHANGING CONCEPTIONS OF TEACHER TRAINING—Luella A. Palmer, Supervisor of Kindergartens of Greater New York, and President of the International Kindergarten Union.
THE NURSERY SCHOOLS OF ENGLAND—Grace Owen, Manchester University, Manchester, England.

A business meeting was then called, and the minutes of the Des Moines meeting read. The report of a committee appointed to formulate a new constitution was then presented by the chairman, Miss Lucy Wheelock, of Boston. The chief item in this was lengthening the term of the officers from one to two years so as to make a greater continuity of work possible from one year to the next. The report was adopted and the department voted to recommend the adoption of the constitution to the Delegate Assembly. The president then mentioned some projects that need working out which could be worked out on the new basis. One of these is the working out of a promotion card from kindergarten to first grade, and from first to second. Another was the collecting of material for a circular on "A Day's Work in Kindergarten" to correspond to that published by the National Council of Primary Education on "A Day's Work in a Primary Room."

The president then called upon Miss Anna H. Littell, of Dayton, Ohio, chairman of the Nominating Committee, for her report and she presented the following names: for president, Miss Alma L. Binzel, College of Agriculture, University of Minnesota, St. Paul, Minn.; for vice-president, Miss Julia Wade Abbot, Bureau of Education, Washington, D. C.; for secretary, Frances Kern, Western State Normal School, Kalamazoo, Mich. The report of the committee was accepted, and the meeting adjourned.

THIRD SESSION—FRIDAY AFTERNOON, JULY 7, 1922

This was a Song and Story program prepared by Miss Mary C. Shute, Boston Normal School, Boston, Mass., and presided over by Miss Shute. The following program was presented:

A GROUP OF SONGS BY THE KINDERGARTEN GLEE CLUB—Miss Olivia B. Hazelton, leader.

A GROUP OF STORIES BY MRS. JOHN W. CRONAN.

A GROUP OF SONGS BY MISS DOROTHY FAIRBANKS.

A GROUP OF STORIES BY MR. JOHN W. CRONAN.

NINA C. VANDEWALKER, *Secretary*.

CHANGING CONCEPTIONS OF THE KINDERGARTEN AS THE OUTGROWTH OF NEW INSIGHT

CATHERINE R. WATKINS, SUPERVISOR OF KINDERGARTENS,
WASHINGTON, D. C.

The heroine in one of our recent novels exclaims: "Everything's breaking up, and everything's turning into new shapes and colors. And I love it." Whether this be our attitude toward change or not, we know that to say today that any department of human activity is changing is simply to state that it is part of the great stream of modern life, that it has been caught up and affected by the mighty forces which are at work, and, therefore, that it is a necessary factor in the new world which is so rapidly evolving out of the old.

That our own particular field of activity is changing should, therefore, be a cause of thankfulness, rather than of regret, for if it had remained untouched it would mean that the great movements of today had passed us by as outgrown and useless, that we were to have no part in shaping the course of the vast onward stream of progress.

The attitude which each kindergartener takes toward these changes will determine the extent and the character of her individual contribution to present-day thought and practice. It is but natural that we should find in these attitudes the two extremes which mark every new movement. One group going forward eagerly, thoughtlessly, welcoming any change in the spirit of youth, which rejoices in the new simply because it is new, and quickly adopts any fad which appears above the horizon; the other group refusing to face the new, shutting itself away from all that threatens beloved and familiar tradition, and willing, like the figures which Dante portrays, to walk forever with their faces turned backward.

I feel that the one unailing safeguard against these two extremes, which prevents on the one hand the disaster of too rapid advance, resulting in weakness and failure, and on the other the equally serious disaster of arrested progress, is the attitude which constantly seeks for the foundation upon which the new rests, which asks "why this change," and refuses to adopt the new until its basic principle is known, tested, and approved. Whenever a change in practice cannot be defended by some such knowledge it rapidly descends to the level of device or fad—adopted because it seemed the popular thing to do at the moment.

We face today changing conceptions of kindergarten practice because the kindergarten, as a system, has become an integral part of the great whole

of education and, therefore, reflects all the forward movements in modern pedagogy and psychology in the changes which distinguish the modern kindergarten from the older, traditional type. Some of these changes are now so universally accepted that they are unquestioned as a part of kindergarten practice—such as greater provision for school-room hygiene, large play apparatus, active games and rhythms for balanced physical control, and enlarged play materials, all of which have come because of increased knowledge of physiology and hygiene. There are other changes, however, which are more radical and which are so recent that many of us are still in the throes of passing from the older, traditional usage to the more modern ways. The most significant and vitally important of these changes are those which affect the methods of teaching, the curriculum, and, more incidentally, the materials we use.

It seems hardly necessary to say that the introduction of the project method in education has been the direct cause for these changes, for it has revolutionized our teaching and necessitated a thoroughgoing revision of curricula. Its adoption by many was on a somewhat superficial basis at first, hence there was much confusion and misinterpretation. It was so easy to go into a schoolroom where the project method was being used and take back with one only its superficial features, and then go back to work to try out the new method without seeing at all that the utilization of children's purposes, which is the core of the project method, was the application to the educative process of the discovery of new laws—the laws which control learning and which can no more be ignored, if we look for normal growth, than can the laws of the physical organism.

This finding out of conditions under which learning takes place is one of the most valuable insights which psychologists have contributed to education in the past decade and the project method is its direct outgrowth. I take for granted that these laws are too well known to you to require any definition here.

It is because these laws are operative wherever there is "whole-hearted vigorous activity" that we have this new method in education which makes the planning and carrying out of purposes by the children the unit of school procedure. We must remember also that this method has been brought into the schoolroom, not only because it provides the conditions under which learning takes place, but also because it is in harmony with the life outside the school, giving the children an opportunity to develop the qualities which society demands today—self-reliance, initiative, and efficiency. Nor is the ethical element forgotten, for these laws hold consciously before the teacher every phase of conduct—the feeling and the willing, as well as the thinking; also, all the controls of conduct, not knowledge alone, but habits, attitudes, and appreciations. These are not new goals to us as kindergartners, nor should the great fundamental principle of the project method be new, but rather an evolution from the past, a re-interpretation of our own fundamental principle of development through self-activity. Modern psychology is but confirming the doctrine of "learning by doing"

when it gives us the laws controlling the "learning," and places its seal of approval on the "doing" or purposing.

It may seem strange that with so familiar a principle so much confusion and misinterpretation should have arisen in its practical application, but I think that the real trouble has been that the purpose and meaning of the project method was not understood. Unfortunately the terms "free choice of materials," "free schools," "free days," were so commonly used that many were misled into mistaking freedom for the end and aim of the project method, instead of simply a necessary condition for the working out of individual or group purposes. I know that there are many who honestly feel that they are adopting a progressive method in education when they are simply turning the children loose among a lot of materials. There can be free choice of materials and at the same time only aimless dawdling, poor habit formation, and absolutely no unit of work demanding either individual or group thought for its accomplishment.

Another mistake which has arisen out of the honest desire to leave the children unhampered has been the absence of proper leadership on the part of the teacher. It was thought that all purposes must originate with the child himself in order to secure the interest, the undivided attention, the proper "mind-set" necessary for real learning.

So much emphasis was placed upon the child's own idea that there was grave danger of leaving him fastened within the limits of his narrow personal experience, with the great world before him to re-conquer as best he could. We failed to see that the question was not one of who originated the purpose, but of whether the child so appropriated it that he was "easily drawn into it," making it his own and giving to it his whole-hearted interest. Not only may the teacher suggest, but as the foremost companion of the children, as their leader, she must frequently provide the situation which will motivate desirable purposes. As Dr. Kilpatrick says, "there are times when the teacher must set the stage."

The adoption of a method which acknowledges the important place which children's purposes should fill in education has meant also a thoroughgoing revision of curriculum, for we cannot retain a formally organized course of study, more or less externally imposed, and at the same time allow the subject matter to develop in relation to children's present needs and interests. The change from a curriculum logically organized from the adult point of view, which includes not only a definite arrangement of subject matter but also of materials, to a curriculum which is fluid, changing, growing out of the responses of children to their experiences, has been as difficult as the change of method and has led to the same extremes, for method and curriculum are inherently related.

In many instances practice lost its content value; children were left to select and arrange their own projects in any order which appealed to them; and there seemed to be no objectives in the teacher's mind toward which she was directing the children's progress.

This was no fault of the project method but simply a failure to keep the

two aspects of curriculum-making balanced—the children's native tendencies, interests, and impulses, on the one hand, and on the other the great racial heritage which we hold in trust for them and to which they are entitled. To defraud the child of this inheritance by fastening him in that which is "immediately stimulating and obvious only" is, in the words of Dr. Bonser, "assuming a responsibility little short of criminal." This record of what the race has thought, felt, and achieved must ever be the relatively permanent factor in curriculum making, not for the grades only but also for the kindergarten, and must be the same for all. The changing factors and the "detailed approaches" to these permanent values can safely be left to the individual teacher to work out with her particular group, but I feel very strongly that there must be in the kindergarten a general plan, a flexible type of curriculum, which will hold consciously before the teacher the valuable life objectives; to help her to know in what direction she should lead; to be her guide in selecting and organizing the children's purposes; and to enable her to recognize their "leading on" possibilities. So shall we escape the danger of waste in time and effort, so shall we provide an equal opportunity for each child and preserve a right balance. Since we know today that child and curriculum are not mutually opposed, that the child's experiences differ only in degree, and not in kind, from those of the race, we ought to be able to keep him steadily moving forward from his narrow, personal world into the large life of the race with all the wholehearted interest which insures true learning.

And now just a few words in regard to the change of materials, for they are very closely bound up with changing conceptions of practice. There are many who seem to feel that it is impossible to use the newer methods without discarding all, or nearly all, of the Fröbelian materials, even in their present enlarged form. It is true that these materials cannot be presented, as formerly in a logically arranged sequence, advancing according to a definite organization, since this would be wholly contrary to present-day psychology, for we know that our adult logical cannot become the possession of the child by any method of imposition or transfer; that his logical must be built up step by step by successive experiences. But to change the way of using materials does not necessarily mean to change the materials themselves, unless they do not lend themselves to the newer methods or are in some way detrimental to the child's development.

We have been using the project method for several years now and we have not found it necessary to discard the old materials, even the much discussed and doubtful tablets have been eagerly used at times by small groups of children who were interested in working out designs. Aside from all their former uses and interpretations, I know of no other group of materials as well adapted to little children, as rich in possibilities, as varied in properties, and as stimulating to the child's creative powers as are the Fröbelian materials. I do not, however, hold them as a closed series, for I would add to them toys, large floor blocks, and any supplementary materials which the children's purposes seemed to demand. But I would

keep the latter type of material as supplementary, not as primary, so that our equipment would not be loaded with a lot of heterogeneous supplies or miscellaneous scraps.

In regard to all these changing conceptions of kindergarten practice, I feel that we are true to the Fröbelian principles and spirit in proportion as we are true to the best interests and the highest development of the little child of today. If this means guiding our practice by psychologic insight unknown to an earlier age, we cannot but accept, and be obedient to, the newer vision, realizing that the great educational leaders of the past were likewise obedient to the highest which they could see. The clearer light of today may be changing some of our past practices and correcting some of our interpretations, but we must not forget that it is also throwing into stronger relief and extending into far wider fields many of the truths which Fröbel, with marvelous intuition, embodied in his system. Among these are surely his fundamental principle of self-activity and his insistence upon the simultaneous development of the three-fold nature of the little child. Standing upon this sure foundation, we should face the future with confidence and with hope.

CHANGING CONCEPTIONS OF KINDERGARTEN SUPERVISION

EELA RUTH BOYCE, SUPERVISOR OF KINDERGARTENS, PITTSBURGH,
PENNSYLVANIA

The topic of the afternoon is expressed in a form which shows both wisdom and insight, since it carries a double implication which is in the very heart of the kindergarten movement. For on the one hand it indicates the permanence of the kindergarten—one feels that here is recognition that in the kindergarten is something deep, vital, and enduring, and on the other hand it recognizes that the kindergarten possesses the characteristics of all living things, in that here is also change and growth.

This has not, perhaps, always seemed true. For undoubtedly the kindergarten went through a long phase in which there seemed to be little or no change. Many people, both within and without its confines came to think of the kindergarten in terms of painted circles, checkered tables, gift sequences, occupations, and little else; in other words, in terms of material and mechanical elements rather than in terms of an animating idea.

Slowness of development in the biological world is an indication that the final attainment in the scale of life is to be high. May it not prove true that its long germinating period is the source of the present strength and the future hope of the kindergarten?

And now I come to the first responsibility of the supervisor. It is to keep in touch with progress in education. She should first of all keep herself fully informed as to what is going on. I feel it is important that

she should not be over eager for change for its own sake—she must realize that movement is not necessarily forward—so while keenly observant of newer developments, she should not be first to adopt them. Her mission is rather to use the developments of others when they are proved.

The newer conception of the kindergarten then, as I see it, means that we are now making the attempt to base what we give to children upon those insights which actuated Froebel when he devised the instrumentalities which we had come to accept as *the kindergarten*.

Can we express in a few words what the kindergarten has always tried to give children, and what it is still trying to give them? Will these three words convey the idea—experiences, opportunities, interpretations? Can we not put under these headings everything we have ever found in the kindergarten or that we find there today? Where then lies the difference? Just here. Formerly we accepted as criteria for deciding what should be the experiences, opportunities, and interpretations given children those things which had been formulated for us, with the inevitable result of exalting these specific things, and of forgetting that the only real criterion is the reactions of children. Thus many a reluctant child was dragged through sequences, because the kindergartner believed this was a valuable experience, failing to realize what all modern study is proclaiming so vigorously, that except the child, himself, and of his own interest is participating, there is no experience. Thus the kindergartner was more concerned with devices by means of which she might decoy the children through particular activities than she was with his real attitude toward them. Today we are trying to make our approach from a different angle. I do not call it a new angle, for it is my firm conviction that it was the Froebelian angle of approach, that of the play interest of the little child.

To many this does not mean the elimination of any of their treasured instrumentalities, but where they remain they do so only because they justify themselves in the light of this, the true criterion. In other words we are turning from a formula as our guide, to a principle. I would not be misunderstood here, as meaning that the kindergarten has ever failed to use principles as its guides, but what I do mean to say, is that, in the past these principles have been used to justify the formulated thing which we were giving to children.

It will be at once apparent that this new conception affects supervision vitally. When a supervisor was firm in the faith that there was virtue in particular things, and felt sure that it was for the best interest and development of little children to do certain things, her work was comparatively simple. Here were concrete things to be done, with something tangible by which to judge results. Today, with the emphasis in the kindergarten world upon free organization which shall permit the children's choice to affect the daily procedure, the supervisor has a vastly more complicated problem, for what she must do is to help teachers to develop, not skill in method, but judgment, a much more subtle and more delicate thing. Thus it was at one time, comparatively easy to say how many Third Gift exer-

cises a group of children ought to have than it is today to answer such questions as "How long shall I let Mary string beads?" Those who have courage to try it out are coming to realize that there is much more hope that Mary will blossom from bead-stringing into something more interesting, as creative self-expression, than there is danger that she will become arrested upon bead-stringing; though even that need not wholly daunt us, since it might merely indicate that Mary's level of æsthetic appreciation is that of many more mature people who find their highest joy in some form of mechanical hand-work. So it seems to me that where formerly there was need of faith in a particular form of organization, now there is needed more faith in childhood; and as the supervisor was largely the source of the one so must she now be the chief inspiration of the other.

Then there is danger today that standards of work will not be maintained—that we may indeed lose sight of the fact that there are such things as standards. Under our present usual type of free organization, a kindergarten may be a happy, comfortable place, with children busily at work, and yet fall far short of what it ought to be in that the children are not working up to their maximum capacity, and cannot therefore grow as they might. Many a kindergartner with her thought concentrated on freedom for her children fails to recognize that there is no bondage so heavy as that of ignorance, or inefficiency, or narrowness of vision. One compulsion in accepting the call to bring freedom to children is to help them to develop power along all lines—power of control over materials, control over their physical movements, over their interests as well as self-control. It must fall to the supervisor's lot to see that this vision shall not fade.

And as supervision now calls for deeper faith and clearer vision, so it calls for greater courage. Reorganization is a real adventure, and when it is done as leader in a band of earnest workers it demands real courage.

I am leaving until the last what is the most important thing I have to say about supervision, namely, What is the deepest obligation of the supervisor? There is a wide-spread feeling, and I believe a dangerous one, that demands for teachers the same freedom for self-expression that is being given children. While undoubtedly, unless the teacher feels that her work is a form of self-expression which brings her joy, there can be no satisfaction to any one concerned; the fundamental truth is that no teacher is in the classroom, no kindergartner is in the kindergarten, primarily that she may enjoy self-expression. She ought to choose to be there because she finds it her best medium, but in doing so she chooses a situation already created, not for her, but for the children. So the supervisor's chief obligation is to the children, to see that they get a certain type of opportunity. As a by-product, she is naturally interested in the welfare of the teachers, but this should never be her first consideration.

Much misconception of the supervisor's work and practically all criticism of supervision as supervision is based on failure to recognize this function of the supervisor. She is usually spoken of, whether in praise or blame, in terms of her teachers. Or in going to the heart of any criticism

of supervision made by teachers, it will usually be found that it is made, not in terms of the children's interests but of the teacher's predilections. We find a striking example in music in the kindergarten. A kindergartner, herself insensitive to beauty of tone, may stimulate her children to a vigorous form of singing, which it can be easily demonstrated to her is producing in the children, voice habits which are unmistakably bad, and probably permanently harmful. Yet she will resent any suggestion by a special supervisor tending toward improvement in tone.

We tend strongly toward those things we most enjoy doing and do most easily, and we are told that learning proceeds in this fashion, and in this fashion only. But in any work with children, the important thing to consider is what the children enjoy most and do most easily.

As a matter of fact, this point of view is one to which teachers respond with wonderful interest once it is presented to them. It makes them less concerned with their personal, individual desires and concentrates their interest upon a wider problem than that, nothing short of sharing the molding of the oncoming generation. It changes entirely the relationship between supervisor and teacher in that it makes it not that of an autocrat directing others, but that of co-workers with a common purpose.

Furthermore the supervisor is not only responsible, but she is under obligation to all the children under her supervision. There is a possible type of office or faculty supervision in which the supervisor offers help through classes and demonstrations to teachers who are entirely free to apply for it. This could hardly stand were it not linked with a rating system whose effect would be to eliminate those teachers who showed no voluntary interest in growth. In that case its final effect would be the same, though its method of reaching that effect would be less direct.

To sum up, the supervisor should always hold before herself the necessity for deepening her faith, for widening her vision, for strengthening her courage. Armed with this triple might she should judge herself in terms of what she is able to secure for all the children in her group, with and through the group of teachers.

CHANGING CONCEPTIONS OF THE KINDERGARTEN IN TEACHER TRAINING

LUELLA A. PALMER, SUPERVISOR OF KINDERGARTENS, GREATER NEW YORK,
AND PRESIDENT OF THE INTERNATIONAL KINDERGARTEN UNION

Within the past decade the curriculum of training schools for kindergartners has changed greatly. Not only have new courses of study been introduced but the content of such courses as were previously given has been much modified. Most of this modification is in line with the changes taking place in all training work and these changes are due to the new and clearer view of the scope of education and of the function of the teacher. In a recent *Teachers College Record*, Ellwood Cubberly stated this new

view as follows: "The teacher herself must be thoroughly conscious of the ends towards which she is working that she may gradually build up in the minds of the youngsters the ideals, hopes, aspirations and beliefs which will form the warp and woof not only of their lives but of the nation as well." The scope of education extends over the training for citizenship as well as individual efficiency and the teacher must strive consciously to influence the character and creativeness of her pupils.

The new concept of education as training to fit an individual to cope successfully and happily with life situations has necessitated a reorganization of courses and methods in all normal schools. Children in a democracy must be aided to acquire the knowledge and habits which will enable them not only to become self directive but to endeavor to improve the conditions which they encounter. Teachers who are to stimulate such progress can no longer be mere instructors; they must be guides and leaders. This new idea of the function of the teacher calls for a new type of training.

The character of this training must be such that qualities of inspiring leadership are developed, and knowledge must be provided which can supply wise guidance. Since the teacher is consciously to educate through her personality, more stress must be placed upon her own personal attributes, she must be fitted to live and be, what she wishes her children to live and be. Attention must be paid to her physical development, her posture and grace; to her manners, poise, and courtesy; to her method of speaking, her voice and tone; to her mode of thinking, interpreting and reasoning; to her interest in art, literature, music, science, nature; to her attitude towards her work, her honesty, independence, sympathy, helpfulness. The knowledge which she will need in order to be a wise guide is not only a grasp of subject matter such as formerly was required, but also an intimate practical knowledge of the child and the means by which he assimilates subject matter and forms right habits towards it. A teacher must have a working knowledge of the ways in which children of differing temperaments may be led to enjoy the acquisition of knowledge and so develop the habit of desiring it; in other words a teacher must learn to give such an emotional accompaniment to the presentation of facts that they are converted into dynamic ideas. Teaching is no longer considered synonymous with instructing, and a more intelligent, more cultured type of person must be selected for the position of teacher.

The principal changes in training schools which have resulted from the acceptance of the newer ideas of the function of the teacher have related to (1) higher scholastic requirements for entrants, (2) longer period for teacher training, (3) introduction of courses to influence the teacher's own habits and interests, (4) change of content of courses dealing with subject matter to admit of considering its acquisition psychologically by the child, (5) more courses dealing with the child and his development, physically and socially as well as mentally, (6) courses dealing with measurement of individual differences of mental capacity and of normal steps in development and with the formulation of scales of attainment.

In training schools for kindergartners there is an added feature which is a direct effect of the new movement. Kindergarten training schools have been turned into training schools for teachers of young children. Since education is development, it must grow out of the past experiences of the individual and is therefore necessarily a continuous process. As there is no decided break in a child's interests and capacities at the sixth year, it seems folly to educate one teacher to teach children in the limited period between four and six years of age while another teacher is being trained to teach children during the longer period when they are changing more rapidly between six to twelve years of age. The first teacher becomes overspecialized and the second teacher must spread her study over too long a period of development to grasp it thoroughly. Another reason for enlarging the scope of the training schools for young children is the realization that children between four and eight years of age have similar characteristics and interests, similar methods can be used and the same qualities are desirable in a teacher throughout this period. The result of the new understanding of childhood is that there are few schools devoted entirely to the training of kindergartners, they now include the grades, kindergarten, first and second years. Some even train for the third and fourth years also. There is a danger of extending this training over too long a period; the play methods of the kindergarten may be carried too far or the more formal methods adapted to the third and fourth years may be carried down into the kindergarten according to the temperament of the teacher.

The effects of the changes general in all training schools have been felt in the kindergarten-primary training schools. (1) The students who are admitted to such schools are required to be graduates of a four-year high-school course. The day has long passed when agreeable manners and love for little children would enable a young girl to pass the entrance requirements to become a kindergartner.

(2) One year was the length of time spent in the early training classes and most of it was occupied in practice teaching. For many years all schools of standing have required two years for a diploma course and at present the third year is a requirement in most progressive institutions. In September the entering students in the State normal schools of New York State will be required to take a three-year course for graduation. The same may be true in other states but I have not had time to investigate the matter. There is a prospect that the fourth year will be added in the near future bringing the training of teachers up to collegiate rank. This will be required irrespective of the grade to be taught.

(3) To influence a teacher's own habits and interests such subjects are being introduced into the training school curriculum as physical culture, English composition, voice training, literature and music for appreciation, choral singing, sociology, civics and similar subjects. These aid in cultivating a teacher's own personality and help him in interpreting his environment more broadly. They prepare a teacher to become a direct influence through example on the conduct and interests of the pupils.

(4) The new point of view has resulted in a change in the content and character of various courses. For instance handwork is now often given under the title of "Play Materials"; formerly it was listed as "Gifts" and "Occupations," words understood only by the initiated. Originally the materials of the kindergarten were considered unique, with the subject matter logically arranged inherent in their form; the materials were studied as things in themselves. Now the child's experiences and interests are considered first. Selection and improvement are then made upon the basis of what will appeal to him and at the same time provide wise guidance towards permanent social values in knowledge and skill. The characteristics of much of the material technically called gifts and occupations do appeal to the child and educate him at this period but the values derived from their use are seen to be values in the psychological development of the child rather than in his logical grasp of their properties. Teachers are now trained to see handwork as means through which right habits of study can be formed and mental organization take place.

(5) A large share of the time is spent in studying the child, as an individual and in relation to general education. His physical development is studied and the general laws of health, his acquisition of subject matter and the laws of learning, his group activities and social adaptation, his experiences and the effect of heredity and environment. Hours are still devoted to the intensive study of the Mother Play and other Books of Froebel but other hours are employed in the study of History of Education, Methods of Teaching and Primary Methods. Froebel's writings still have a large share of attention because they relate particularly to the best methods for young children.

(6) The subject of tests and measurements is being introduced. It is difficult to formulate standards and scales for young children, the results which they attain are so crude that improvement seems hardly measurable. The subject is still in its beginning particularly as it relates to young children yet the kindergarten-primary training schools are considering the subject so that the young teacher may be prepared to understand the trend of educational effort, be ready to aid in putting it on a scientific basis and to adopt results intelligently when they are worked out.

The character of the new type of training is such that the period spent in the training school is necessarily lengthened. An endeavor is being made to encourage the teacher to think independently, to be able to interpret children's motives, to learn how to analyze a classroom situation, to be resourceful in meeting it, to respond quickly, to adapt her methods to her particular group, to go to the best sources to get the criteria for judging her work, to have professional pride in doing her best. As courses of study are no longer detailed plans for daily work but mere outlines which suggest the ground to be covered during the term, a teacher must be ready to accept more responsibility in planning the work for her particular class. More intelligence, creativeness, and adaptability are required on the part of teachers.

The "Case Method" in teaching has great value in showing training students the relation between specific details of practice and the principles underlying them. There will never be time enough to discuss all of the incidents which arise in actual observation and practice. Some way must be devised of presenting the most typical instances and judging and weighing them. The Case Method seems to provide the best means for study of typical details and for classroom discussion. This will never take the place of first hand observation nor of practice teaching, it will never develop *habits* of teaching, but it will give insight upon which intelligent practice can be based. When we realize the great value of this method in the training of teachers, we will begin a systematic compiling of typical data.

As in all progressive movements there is danger of going to an extreme. The change in kindergarten-primary schools presents no exception. The dangers which I have seen are such as the following: (1) In an effort to give a wide knowledge of a subject, too little attention is given to the specific subject matter needed to guide the children at the particular period. For instance I have known a young teacher who could give the principles underlying the selection of a good story and who could tell stories very well but she had never been shown how to select stories to adapt them to a certain stage of mental development. (2) Other training students are taught to follow the child to such an extent that they lose the power of guiding. They may be very skillful in interpreting the desires and activities of the children but they do not know how to emphasize, or put into the situation, anything which would make it more educational than if they were not present, they do not know how to contribute to the children's experiences nor how to aid in organizing their expressions. (3) Other young teachers have been encouraged to watch the children and let them experiment, to such an extent, that they do not feel the necessity of making their own plans. They allow chance to determine the activities of the children rather than, by foresight, arrange for valuable educational situations. (4) Other students have been allowed to consider any response on the part of the child as educational. They have not been given criteria by which to judge the relative value of results. They have not learned the difference between mere activity and activity which indicates distinct advance. A balanced training course must give a general view of education, of children, of subject matter and methods, but it must not neglect giving knowledge of the particular changes in activity most educational at the particular period.

A teacher must be trained to realize her new place in the community, she must endeavor to function in the spiritual evolution of the race. Good teachers have always done so, but it must now be realized as the conscious ambition of all. Teachers must be what they wish their children to be; education must be through actions as well as words,—the first is more potent. Education must be accomplished in an economical and effective way, the interests and desires of the child must be multiplied into education

through the example and intelligence of the teacher. She must inspire as well as instruct. And the trainer of teachers may well pray, "God, give us vision, give us sympathy, give us a divine passion that shall burn away our prejudices and shall make us fit to lead"—to lead the leaders of little children.

THE NURSERY SCHOOLS OF ENGLAND

GRACE OWEN, MANCHESTER UNIVERSITY, MANCHESTER, ENGLAND

The aim of the nursery school movement is to make available for every child the best we know of the right physical conditions and care, the right training, and the most favorable opportunities for intellectual and social development for the critical period between babyhood and school life.

The need for such an institution as the nursery school is often questioned. Is not the ordinary life of home, it is asked, sufficient for these very early years of life? I want to take this opportunity of reminding you of the facts which have brought England as well as other countries to the serious conclusion that there is indeed a need for nursery schools, and that the National system of education, if it is to be placed upon a sound foundation, must provide at its base for the nursery school.

The institution of medical inspection of all school children in 1907 brought to light a mass of preventable physical defect in children at the age of entrance to school, that is at five years of age. It was found that malnutrition, adenoids, rickets, unsound teeth, and stomach troubles were already undermining the health of large percentages of the children, while the rate of mortality of children between one and five years of age in 1908 was 16.81 per thousand as against only 3.36 in children between five and ten years of age. These facts above pointed to an intolerable condition of things—for where physical defect can be forestalled, it is surely the worst kind of waste to allow it to appear and get established—and then to spend large sums of money later on in trying to eliminate it. Thus it became recognized that there was an urgent need for State action that might secure for every young child proper physical care—as a great preventive measure against physical defect.

The need of nursery schools was felt in England also to express a reaction against the unsuitable conditions of the Babies' Classes of Infants Schools, which have always included children under five. A great many people would have liked to solve the problem merely by turning the "babies" out of the infants' schools and providing for them no longer—but the majority of those most competent to judge, as is shown by the Report of the Consultative Committee of the Board of Education, in 1908, recognized that though any kind of formal instruction for very young children was either futile or harmful, the right kind of mental environment is no less important for them than physical care—that it is as easy to do lasting harm to the developing personality of a little child through mistakes or neglect as it is to allow

him to become the victim of physical neglect or disease. Since 1908, the work of modern psychologists has served but to deepen the conviction that as regards sensitiveness to environmental influences, the importance of this period of life—two to five years of age—is second to none that succeeds it. Its possibilities and dangers are borne in upon all thoughtful parents and teachers with every year of experience, while it is true that we become more and more self-restrained in our attitude towards the little child, and more and more conscientious as to non-interference with his spontaneous activities, nevertheless, the policy of *laissez-faire*, so commonly advocated, becomes more and more impossible. Rather it becomes ever clearer that the nursery school is needed to take its place beside the home in helping to provide the most favorable mental environment, and that no skill, care, and effort to this end can be out of place.

Lastly, we have in England faced the fact that though nursery schools might or might not be desirable if all homes were ideal, the modern situation as to the home conditions of a large proportion of very young children contributes an urgent demand for just such an agency. The employment of women in industry so widely encouraged during the war, brings with it the dangers of child-neglect and the abuses of "child-minding." Housing conditions are often appallingly unsuitable for little children. To a lamentable extent they are not enjoying even the proper space and fresh air which are surely their right, and which are considered elementary conditions in every nursery school. Again, children are suffering incalculably from well-meaning ignorance in parents. Not poverty, but ignorance, has been responsible for a larger part of the physical defect in young children, and the deficiency in early home training which prevails. The conditions of town-life also has deprived a considerable proportion of our children of that contact with nature which should be the rich source of ideas and feeling for every child.

Therefore the Education Act of 1918 included a clause which gave power to every local education authority to establish and maintain nursery schools within its area, and also provided that approved nursery schools already in existence should receive an annual grant up to the amount of 50 per cent of its expenses. In the case of a nursery school receiving grant, representatives of the local education authority were to join the managing committee of the school. It should be noted that under this clause, no local education authority is obliged to establish nursery schools, and no parent is obliged to let his child attend and the development of the movement now depends on the strength of public opinion in each area.

The nursery school has been given a place in our National system of education. It sets out to provide for children between the ages of two and five:

1. Favorable physical conditions—Not only as regards buildings and an open-air life—but also—diet, clothing, physical activity, rest, and medical supervision.

2. Skilled care and training undesirable habits—Through workers naturally gifted and suitably prepared.

3. Fruitful experiences—Through the provision of a garden, through music, stories, pictures, toys, games, occupations, and the simple community life in which they gradually take part.

It seeks to provide an environment which the little child may readily make his own, to which he will reach easily, developing his own powers through it, and within which he may achieve a considerable degree of freedom. All this, it aims to carry out in close coöperation with the home. The child is not taken out of the home in any real sense, rather his home life is extended and enriched. It is one of the most important aspects of the work of the nursery-school superintendent to build up the right relationships between the nursery school and the homes it serves. The nursery-school superintendent and the mother must work hand in hand, and there must be unity of spirit between them as to the management of the little child if the more permanent possibilities of the work are to be realized.

The keynote of the nursery-school movement is perhaps the endeavor to establish an institution which shall in itself meet the demands of health, education, and social relationships for this particular period of life—namely, two to five years of age. So far we have had day-nurseries, dealing with the necessary conditions of physical health and coming to the assistance of mothers going out to work—we have had kindergartens which take the child at four—and emphasize development through play; we have the work of social settlements which seek to raise the standard of home life. The nursery school is concerned with all this work as it affects the period stretching from babyhood to school life; and because of this it contains in itself great possibilities both for the individual child and for the community as a whole. It claims that for the best interests of the child this unity is desirable and necessary, and in order to carry it into effect, it has been necessary to devise a special training for the nursery-school superintendent which shall secure a comprehensive outlook with regard to her work. She must receive a practical training in hygiene through work in hospitals or welfare centers. She must assimilate the best of our modern methods of educating young children, and she must be put in contact with neighborhood life. Only so, can we, as I believe, secure for the nursery-school movement the most fruitful results.

The immediate need is for the establishment of experimental nursery schools which shall be given every chance of working out as fully as possible the underlying ideas of the movement.

In England, a score of nursery schools are being supported by the State, and though progress is very slow, it is sure. Miss Margaret McMillan, whose pioneering work is known everywhere, has recently extended the scope of her experiment in London. Miss McMillan stands firmly for the open-air life for young children, with results so encouraging—both winter and summer—as to make the most reluctant agree that newly-built nursery schools should be open-air schools.

In Manchester, a nursery-school policy has been adopted by the education committee, which took over the Mother Training College, and opened

a Demonstration Nursery School in connection with it in 1919. There are two other nursery schools in Manchester receiving grants—and a system of nursery classes is being developed in connection with the public schools of the city. A special supervisor also has been appointed with reference to nursery schools and classes.

The Derby Education Committee has established a fully equipped nursery school, and it is doing excellent work.

It has been with the deepest interest that we in England have heard of the beginnings of a nursery-school movement in the United States—and at a time when progress seems slow with us—it is an inspiration to hear of the work begun in Detroit, Boston, and New York. I need not say with what keen interest we shall watch developments on this side of the Atlantic. It is my privilege to bring heartiest good wishes and sympathy from English workers in the same glorious cause.

Library Department

SECRETARY'S MINUTES

OFFICERS

President—SHERMAN WILLIAMS, Chief of School Libraries Division, Department of Education.....Albany, N. Y.
Vice-President—GRACE D. ROSE, Public Library.....Des Moines, Iowa
Secretary-Treasurer—MARGARET E. ELY, Public Library.....Chicago, Ill.

BOSTON MEETING

The Library Department of the National Education Association held its annual meeting at Boston with the Association, July 5-7, 1922. There were three afternoon assemblies, July 5, 6, and 7. At these the following programs were given:

Wednesday Afternoon, July 5, 1922

HOW SHALL ADEQUATE LIBRARY SERVICE BE ESTABLISHED WHERE IT IS NOT NOW DEVELOPED?

(a) IN THE SCHOOL—Martha C. Pritchard, Teachers' College, Detroit, Mich.
(b) IN THE LOCALITY—Sarah B. Askew, Public Library Commission, Trenton, N. J.

(c) IN THE NATION—Joy E. Morgan, Washington, D. C.

LIBRARIES AND RURAL SCHOOLS—Florence M. Hale, Augusta, Maine.

THE CONSOLIDATED RURAL SCHOOL LIBRARY—Ruth E. Drake, Chazy, N. Y.

LIBRARIES AND LIBRARIANS—Sherman Williams, Albany, N. Y.

Thursday Afternoon, July 6, 1922

HOW THE LIBRARY HELPS THE FOREIGNER TO MAKE HIS AMERICAN CONTRIBUTION—Ernestine Rose, New York, N. Y.

EFFECTIVE COÖPERATION BETWEEN THE PUBLIC LIBRARY AND THE PUBLIC SCHOOL—Bertha M. McConkey, Springfield, Mass.

THE DAILY NEWSPAPER IN SCHOOL—O. S. Rice, Madison, Wis.

THE SPIRIT OF LIBRARY SERVICE—Mrs. Edward Carter, Port Arthur, Texas.

STORY-TELLING, ITS RELATION TO LITERARY APPRECIATION—Edith C. Parker, Buffalo, N. Y.

THE PUPILS' CONTRIBUTION TO THE SUCCESS OF THE SCHOOL LIBRARY—Mary E. Hall, Brooklyn, N. Y.

Friday Afternoon, July 7, 1922

Joint Session with National Council of Teachers of English

BOOKS FOR BOYS—A. B. de Mille, Winthrop Highlands, Mass.

OPPORTUNITIES IN JUNIOR HIGH SCHOOL WORK—Laura Grover Smith, Los Angeles, Calif.

THE STIMULATION OF HOME READING—Helen Cosgrove, New York, N. Y.

TRAINING FOR SCHOOL LIBRARIANS—Ruth Tobey, Terre Haute, Ind.

THE CHILD'S OWN READING—Frederic G. Melcher, New York, N. Y.

LIBRARY WORK IN NORMAL SCHOOLS TO FIT STUDENTS FOR THEIR WORK IN TEACHING—Mary E. Richardson, State Normal School, Geneseo, N. Y.

A library luncheon was held at the Hotel Vendome on Thursday. At this there were a number of five-minute talks on library topics. The luncheon was followed by a social hour of general discussion of individual problems.

There was an attendance of about 150 at each meeting, general discussion followed the papers when time allowed, and there was opportunity for interchange of ideas among librarians and teachers present.

At the business meeting preceding the July meeting the officers for the next year were elected. They were as follows: President, Martha C. Pritchard, Teachers' College, Detroit, Mich.; Vice-President, Mrs. Edward Carter, Port Arthur, Texas; Secretary-Treasurer, Della Frances Northey, State House, Indianapolis, Ind.

The Library Department organized as to membership this year and now has a total of 181 members. Any member of the National Education Association or employee of institution which is a member of the National Education Association may join the Library Department on payment of a fee of 50 cents.

HOW SHALL ADEQUATE PUBLIC LIBRARY SERVICE BE ESTABLISHED WHERE NONE NOW EXISTS IN THE NATION?

JOY E. MORGAN, MANAGING EDITOR OF THE "JOURNAL OF THE NATIONAL
EDUCATION ASSOCIATION," WASHINGTON, D. C.

It is to the things that have not been done rather than to achievements of the past that this subject points. It is not necessary to review the splendid ideals of the men and women who founded the free public library in America or to describe the wonderful service which notable libraries are rendering their communities. It is not necessary to review the work of the American Library Association during the War, although it constituted National recognition of the importance of library service. Neither is it necessary to evaluate the standards that have been set by library organizations for school and public libraries. These are significant achievements. They point to a time when the Nation will face the problem of making library service genuinely universal as it has faced the task of making elementary education universal.

Under our system of government the *control* of education is placed entirely in the hands of the States. Yet there is not a single State in the Union which does not have compulsory school attendance. This highly desirable result has been achieved by force of example and by the publicity which has been given comparative studies in education. Compulsory school attendance without free library service is an absurdity. The one implies the other. It is for the library to conserve the high purpose and the ideals of work and life which schools exist to create. Possibly the public school makes a more direct appeal to the community than does the public library because it deals daily with the children of the community. But, looking at the matter broadly in the light of the complexity of our life, the public school is hardly more essential to the perpetuity of our National ideals than is the public library. The amount of education that can be given during a brief period of eight or even twelve years is too small to guarantee effective citizenship. These years can only lay foundations. The Nation

cannot afford not to build upon these foundations. Maintained intelligence is no longer a luxury for the individual, for the community, for the State, or for the Nation. Our political, social, industrial, commercial, and economic life all require a sympathetic understanding of current happenings and a mastery of the sources of reliable information vastly greater than has been necessary in years gone by.

According to every indication the future will demand maintained intelligence even more sternly than has the past.

The demand for intelligence is implied in the new world leadership that has come to America in the years since the War. It is implied in the enlarging use of the automatic machine which results in a rapidly increasing leisure. It is implied in perfected means of communication and transportation. Merely to mention the telephone, the motion picture, the talking machine, the automobile, the airplane, and radio is to suggest the vast extent of the new forces that are playing upon our boys and girls, that are transforming the lives of adults, that are calling for increasing mastery of information and surer educational backgrounds for the great mass of the people. These inventions and those that are certain to follow promise for the common man and woman opportunities and responsibilities that but a short time ago were the exclusive privilege of royalty. Unless the energy of the human race is to be dissipated in frivolity and fruitless overstimulation the common man and woman must be equipped to *live*, must be trained to earn and to demand the finer and better things of life. The key to these things is education and the door thereto is the library.

No other single educational agency has in proportion to its cost greater undeveloped possibilities than the free public library. The standard set by the American Library Association calls for a dollar per capita as a reasonable expenditure for public library service. This would require over a hundred million dollars for the Nation. The latest figures available indicate that less than twenty million dollars is being spent for such service. In other words, a great public service which at so slight a cost may be made to touch and quicken every phase of community life and activity has been developed to less than one fifth of its reasonable efficiency. There are vast areas that have not known the benefits of the free library; there are thousands of communities which have libraries that carry the name without administering in any effective way to the dynamic interests of the community. There are city libraries that do certain types of work surprisingly well, but which are so limited in funds that they are able merely to scratch the surface of their educational opportunities.

The American public library will not have reached its full development until its service is as universal and as near at hand as the grocery store and the motion picture hall. To bring about such a development is not only a local problem and a State problem; it is a National problem.

The social, economical, industrial, and political bonds which unite our several States grow stronger year by year. The division of powers between States and Nation has proved generally wise and as applied to education it may be expected to continue. The educational leadership of the Nation

is overwhelmingly committed against Federal control of education. It is equally overwhelmingly committed to frank and full recognition of the responsibility of the Nation for the education of its citizenship. The Nation cannot *control* education, but it must *encourage* education. Only through such encouragement can it improve the quality of its citizenship and protect itself from the destroying influence of ignorance and superstition.

The legislative program of the National Education Association as embodied in the Towner-Sterling Bill has brought forth much discussion of the Nation's responsibility for education. Men who are familiar with the situation at Washington are confident that it is only a matter of time until the essential provisions of the Towner-Sterling Bill will be enacted into law. Perhaps before we are aware education will have primary recognition in the President's Cabinet, and there will be Federal subventions to encourage the States in the improvement of certain phases of education. It may take a year, it may take two years to bring about this achievement, but when it comes we shall wonder why so important a responsibility was not sooner assumed by the Federal Government.

When education receives primary recognition in the Cabinet of the President, there will follow a period of reorganization of the educational activities of the Nation. The divisions and activities of the new Department of Education will be defined. When that time comes the librarians of the Nation must be ready to act. They must be ready to present to the Secretary of Education a program for the Federal encouragement of libraries. The library forces must have agreed upon the basic principles that underlie such a program of library development and must have a committee of men and women who stand solidly for those principles and who are free to work for them. Such a committee could enlist in behalf of its program the support of many organizations throughout the Nation and of many leading citizens who stand ready to do battle in behalf of public education.

Such a committee would, in the first place, need carefully to define its scope in order to avoid activities and ramifications that would dissipate its energy and influence. Such a committee should be charged with the single and responsible task of determining what measures the National Government should take to encourage the development by the States of genuinely universal free public library service in charge of professional or trained librarians. Questions of technique, of management, and of organization within the library and within the State should be held in abeyance. They will find ready solution when the first and larger problem has been met. The libraries which are directly maintained by the Federal Government should not come within the jurisdiction of such a committee. They constitute a separate problem, no more related to the primary problem of universal library service than West Point is related to elementary public education.

Having defined its scope, the committee might well consider what measures should be undertaken by the Federal Government to encourage uni-

versal library service and how the Government may best be induced to undertake those measures.

Two possible activities of the Federal Government with relation to libraries are investigation and Federal subventions for their encouragement. Section 5 of the Towner-Sterling Bill provides for investigation in specified fields, including (*a*) illiteracy, (*b*) immigrant education, (*c*) public school education, (*d*) physical education, (*e*) preparation of teachers, (*f*) higher education, (*g*) such other fields as in the judgment of the Secretary of Education may require attention and study. Free public libraries should also be specified. Perhaps this change can be brought about before the bill is reported out by the committee.

The importance of having libraries specified lies in the fact that the items specifically mentioned in the bill would first receive consideration by the Secretary of Education as a possible basis for the organization of his department into divisions. There should certainly be a division of libraries charged with the responsibility for the investigation of problems relating to the development, financing, organization, and administration of libraries in the various States and localities. This field has been so greatly neglected that there is not in Washington a single trained library worker devoting himself to the investigation of the basic problems of public library extension. Such systematic investigations as have been made have been conducted by persons not trained for the task and not primarily interested in public library development.

It is not possible to estimate the enormous loss to education that has resulted from the failure of the Government to bring persistently to the attention of the Nation the best library experience of the various States and localities. Neither is it possible to estimate the impetus that would come to libraries in consequence of the studies that might be made by the Federal Government. That the influence of such studies would be great is indicated by results that have been achieved in other fields of public activity where careful investigations have been made by experts.

Having pointed out the function of the library as an agency for insuring intelligent citizenship, the Federal Government should assume its share of the burden. It should encourage the States in the promotion of libraries by means of subventions or grants of Federal aid. The arguments in favor of such subventions are based on the same precedents and needs as the arguments in favor of Federal aid for the removal of illiteracy, the Americanization of foreign-born, physical education, the training of teachers, and the equalization of educational opportunity. In fact it is possible, even probable, that a part of the money appropriated for these other objects would be used by the several States for the promotion of libraries, particularly in the promotion of the work of libraries in Americanization.

However, the library is so distinctly a separate institution charged with a unique function in the scheme of education that it should receive separate recognition and encouragement. Such encouragement need not be large—possibly a million dollars annually at first—but its ultimate effect would

probably be greater than that of any similar amount spent by the Federal Government.

These are the two most important problems that would logically come before a committee charged with the development of free public libraries on a national scale. Having stated them clearly and having gathered ample facts and precedents, the committee would be in a position to state its conclusions and to enlist in support of its program the organized librarianship of the Nation, along with educational and civic organizations generally. The free public library has always made a strong appeal to citizens of unusual public spirit.

America has produced no institution more characteristic of its democratic spirit. The free library stands for equalized opportunity for maintained intelligence. It stands for good citizenship and for all the best in life. It represents the spirit of freedom that founded America. It is a fitting memorial to the Nation's self-made men who frequently through books have caught the spark of inspiration that has been the soul of their leadership. The library can magnify manyfold the influence of the elementary school, the high school, and the university. As librarians, as educators let us point with just pride to our great libraries in city and in university, let us point also to those other great libraries that are serving people in the small towns and on the farms, but let us not forget the tens of millions of men and women—often in isolated places—who in vain wait for the inspiration and the guidance that more fortunate ones enjoy. Let us not in our own plenty pass by on the other side.

LIBRARIES AND RURAL SCHOOLS

FLORENCE M. HALE, AUGUSTA, MAINE

In 500 of the one and two-room rural schools of Maine we have School Improvement Leagues comprised of parents, teachers, and pupils working together for school improvements, notably school equipment. Through this organization permanent libraries have been started in many of the schools and good books added from time to time. Perhaps the greatest help our rural schools have received in the line of library facilities is the splendid system of traveling libraries which exists in our State. While we are waiting for a library to be established permanently in each way place, this travelling library is helping to educate a whole generation of country children in the love of good books. The travelling library idea in our State had its beginnings in the minds of some of our progressive club women who saw the need of making good books accessible to the people of the way places and to the children of the rural communities. In 1899, twenty-one such travelling libraries were made a part of the State Library equipment and were sent out at request over the State. In 1914 the calls had been so insistent that 171 sets were necessary to fill requests and last year 581 such sets were sent out from the State Library. I could

spend a much longer time than is available for this whole paper in describing the many lines of community service which these travelling libraries have rendered, but I must keep closely to my particular subject of the rural schools. In passing, however, I must say that one of the largest calls for these libraries, according to the library organizer in charge of them, is in the remote lumber camps of the State.

Another feature of travelling library service that may prove suggestive to other workers in this field is the benefit that has been wrought by placing the travelling libraries in summer resorts. Each book bears the stamp of the State Travelling Library and in this way news of the work is spread. Summer visitors have become interested and in some communities these summer people have maintained library stations for the use of residents in the winter time and have made it possible for several rural schools to have travelling libraries of their own. In one fishing village where the village and the schools have thus been enabled to secure the best kind of reading matter, the State librarian tells me that this broadening influence of good books has resulted directly in the starting of a forward movement and in the development of a community spirit. The Maine Federation of Women's Clubs and the Colonial Dames each year give a considerable amount of money which is to be given to remote schools selected by the State Department of Education and the State librarian working together.

The plan of the travelling library for rural schools is as follows. There are in the State Library different sets of books available for schools. In each set there are fifty volumes. Printed lists of the titles of books in each set are sent out upon application. The school may select from these lists the set whose titles most attract the pupils and teachers. A fee of \$2.50 is required to obtain the library of 50 books—or 5 cents apiece. This fee includes all charges of packing, expressage, and the like, and the library may be kept six months and renewed upon request. The books are carefully selected for listing—there is a “juvenile” list which covers the needs of the ordinary rural school—there is the so-called “children’s” list especially appropriate for young children. Then there is the rural high-school list made up about as follows: books dealing with history 10—science 10—English 10—fiction, poetry, drama 10—miscellaneous (war books, sociology, biography, travel).

In putting up the matter of the service of the travelling library to our last legislature in the hope of securing increased financial aid, our State organizer in speaking of the school demand said, “While we have been able to supply nearly all types of demands with a slight wait on the part of the applicant we have been totally unable to cope with the demand on the part of the teachers of rural schools who clamor for the juvenile sets for the children in their charge. Last spring saw thirty of these applications unfilled owing to the lack of books. For example on June 1 there were on file 12 applications for these sets for September use and as the bulk of our demand comes in October there were certain to be many disappointments. Three or four years ago these sets sent out to the rural

schools did not in four times out equal in book circulation what they do at present after having been out only twice." You will be glad to note that in response to this appeal, the 80th Legislature recognized the value of the work of extending library facilities to the remotest corners of the State by appropriating \$20,000 for the work of this extension department alone.

Another valuable service to our rural schools of the travelling library idea is the professional library for rural teachers themselves. This consists of sets of twenty-five volumes each of the best professional books available and is obtained by the payment of \$1.25 per set of twenty-five and may be kept six months. It is a common custom for several teachers in a rural community to unite in obtaining one of these sets and then by exchanging. The cost of reading the best books in their field becomes, in this way, nominal only. Where the teachers do not themselves have such a set, it is the custom of some of our rural superintendents of schools to keep a set of these professional books constantly on hand and as they drive from school to school to leave one with each teacher. On the next visit these books are simply exchanged from teacher to teacher and thus the good work goes on. If any of you sometimes believe that the days of Lincoln when one good book was a precious possession are days wholly of the past, I wish you might have my place some day as I ride about over the rocky hills of Maine with these earnest young superintendents and see the joy of many a rural teacher in little schools, sometimes ten and fifteen miles from a railroad, when the superintendent passes her the one new book. One such teacher said to me, "I just look forward to Superintendent B's visit, because I know he'll always bring me some fine book."

From our State library any rural school may also obtain post-card collections, victrola records, or any single desired volume upon payment of postage only.

The above are some of the ways in which rural supervisors and librarians are working together for the love of good books and the inspiration that they bring. In closing, as one outside of the immediate field of expert library workers, I must express to you the appreciation of the school workers for the great service you are rendering to education throughout the country. The increasing movement for trained library workers in every community is one of the most hopeful movements for community spirit and character building of this generation. In my own State, our State Librarian, Dr. Dunnack, and his force are considered an indispensable part of our educational system. Much of the success of the travelling library movement which I have herein described is due to his vision and to the executive ability of the travelling library organizer, Miss Stewart, from whom I have obtained the figures used in this study. Let us then, long-time lovers of good books, our unfailing friends, continue to work hopefully together to spread the inspiration of such friendship to those way places of the earth so remote that oftentimes human comfort and helpfulness may not always be at hand.

THE CONSOLIDATED RURAL SCHOOL LIBRARY

RUTH B. DRAKE, LIBRARIAN OF THE CHAZY CENTRAL RURAL SCHOOL,
CHAZY, CLINTON COUNTY, NEW YORK

Education is our greatest rural problem today for upon the boys and girls attending rural schools rests the responsibility of making country-life the solid foundation for future democracy. The consolidated rural school movement, which is rapidly becoming national in scope, proves the significance of the centralization of educational facilities in relation to the community, State, and Nation.

A well-equipped and well-selected library plays an active and an important part in the life of the rural school. The time is approaching when each State will consider such a department an indispensable feature of every consolidated school. The librarian in charge, trained in educational as well as library methods, will be employed for full-time and possess a status equal to that maintained by the head of any other recognized school department. To be thoroughly efficient she will portray not only a love for and understanding of childhood, but a genuine interest in rural life and an eagerness to share in the solving of its problems.

A committee of the National Education Association has prepared a valuable report, "The Standard Library Organization and Equipment for Secondary Schools," and is, I understand, now working on a similar report for elementary schools. A guide to the standard library organization and equipment for consolidated rural schools would be extremely timely and useful, and I hope this matter may be taken into consideration at the present meeting.

The organization of a library in the modern rural school has its peculiar problems. Since the consolidated school usually registers children of grade and high school ages, the library must combine elementary and secondary features and serve as a book laboratory for the entire school. Perhaps a brief outline of the methods employed in a model rural school in New York State, which methods could be adapted for use in the average consolidated school, may be of interest. In the school under consideration, a reading-room, centrally located on the first floor of the main building, is open each school day from 8:30 A.M. until 4 P.M. This is equipped with a professional library for the teachers, an adequate reference collection for upper grade and high-school use, current periodicals of general and departmental interest, and a carefully selected elementary library. Tables and chairs are provided sufficient to accommodate at one time one-fourth of the total school attendance. To supplement the book collection, slides, pictures, and clippings are featured. A combination stack and work-room adjoins the reading-room.

"Library periods" for pupils in the elementary department are considered a part of the regular school curriculum, each class spending an entire period weekly in the library according to schedule. A corner of the reading-room reserved for the youngest patrons is made as alluring as possible

by the arrangement of a fascinating collection of selected pictures and posters as well as books. Children in the first two grades assemble in small groups around a low table especially constructed for their use and the librarian not only assists them to an appreciation of the attractive picture-books and primers but instructs them in the proper care and handling of books. Soon after entering school they are able to sense, to a certain extent, the "library atmosphere." Grades three to eight, inclusive come to the library weekly by classes during school hours where they receive instruction in the use of books and libraries, do any reference work previously assigned by their teachers, obtain a book a week for home reading, and look at the current magazines and papers. The selection of all books is supervised by the librarian who aims not only to create a love of reading and a taste for the best in literature but to induce a choice of books from which the readers may derive profit and inspiration as well as pleasure. The librarian's familiarity with the school curriculum and coöperation with the teachers make it possible to help the pupils select books which directly supplement the work of the classroom. It is hoped that this correlation brightens the daily routine and broadens the youthful vision.

In working out the plan with grade pupils, it has not yet been found desirable to give school credit for home reading, though the Youngstown¹ (Ohio) plan is followed to the extent that every pupil is required to submit reports on books read. This information is valuable for, thereby, the librarian not only obtains the child's viewpoint on his reading but also has on file a complete and accurate record of the type of literature read by each individual. Reading circles are encouraged, and certificates issued by the State Department of Education are granted to those who have satisfactorily completed the reading of a definite number of approved books. Vacation reading is possible since the library is open one afternoon a week during the summer months for the use of all pupils who care to take advantage of the opportunity.

It has been found that a centralized library for the grades in the consolidated rural school is as important, if not more important, than the high-school library. If children in the early years are not educated to appreciate the possibilities of self-advancement through the use of the library and do not have the preliminary training which introduces them to the public library as a means of continuing their education after leaving school, they are deprived of one of the richest endowments of life. Since many children in the rural districts leave school before they reach the high-school age, an opportunity for specialized library training must be presented to them before the completion of the elementary course.† Teachers do not have time to take charge of classroom libraries since their programs are usually filled to the brim. For the same reason, the children do not have an opportunity to satisfy their love of reading during school hours. On account of the fact that the majority of them are transported to and from

¹ Wheeler, J. L. Home Reading with School Credit. *Library Journal*, September 1, 1920. v. 45, pp. 679-682.

their homes in busses which leave promptly at the closing hour, it is not possible for them to linger after school in the classrooms to choose or enjoy their books. If they go to specialists for their music, art work, or gymnastic training, why is it not as necessary to go to a specialist for so important an accomplishment as reading!

High-school pupils are permitted to use the library before and after school and during school hours whenever they have a free period and wish to do reference work, read, or glance at the daily papers and current magazines. Standard reference books and a well-balanced collection of works pertaining to literature, fine arts, industrial arts, household arts, science, agriculture, travel, history, and biography are provided. The librarian selects with care each year volumes necessary to keep the library thoroughly up-to-date, so that it may meet the increasing demands of teachers and pupils. Material aid is given in the compilation of supplementary reading lists and the reservation of books on special topics to be discussed in the classroom. College and university catalogues are on file for the use of those students contemplating higher education. Vocational books, covering all fields, are available, so that pupils desiring to train for a special trade or profession may obtain practical assistance.

As a special feature of the work with the English Department, instruction is given in the use of books and libraries and a limited number of pupils showing adaptability for literary work are allowed to help in the library after completing a short apprentice course. They are able to render valuable service to the librarian in the matter of shelving books, mending, and the mechanical preparation of books for the shelves. In this way it is possible for the librarian to have whatever assistance she needs in order to accomplish the daily routine of her department. The pupils also derive much benefit from the experience.

The library not only serves the pupils of the school but also the administrative officers, teaching staff and other employees connected with the institution. School laws, blue-print drawings of school buildings and grounds, and periodicals, such as *The American School Board Journal*, are on file for the use of the Board of Education. The principal calls on the library for catalogues of other schools, professional books and journals, educational reports and proceedings and publishers' catalogues from which trade information may be obtained concerning textbooks which may be ordered for school use. Educational journals, as well as books are provided for the teachers so that they may find it easy to inform themselves of modern tendencies which concern their profession and read for profit as well as for pleasure. The resources of the library are introduced to each member of the faculty individually.

Since the consolidated school is, in many instances, the center of the community, the library has an unusual opportunity to exert its influence. While it is not advisable, especially in localities which support public libraries, to allow the public to use the school library, it is possible to reach the community through the children. The school library should be a

stepping-stone to the public library, and members of the younger generation, if properly trained to know and appreciate books will, in the future, demand adequate library service for their communities. Through the influence of the library, National community honor and loyalty are fostered and deepened and through the inspiration of books it is possible to create a living faith in country life, such as Norman Gale so beautifully portrays:

Here in the country's heart where the grass is green,
Life is the same sweet life it e'er hath been,
Trust in God still lives; and the bell at morn
Tolls with the thought of God o'er the rising corn,
God comes down in the rain and the crops grow tall,
This is the Country Faith—and the best of all.

LIBRARIES AND LIBRARIANS

SHERMAN WILLIAMS, CHIEF OF SCHOOL LIBRARIES DIVISION, DEPARTMENT OF EDUCATION, ALBANY, NEW YORK

In a democracy like ours in the long run public opinion is certain to control, therefore it is of the utmost importance that we have an intelligent public. It is not enough that it be honest, well intentioned, and proper spirited. It is not enough that the people are unselfish, that they love their neighbors as themselves. It is not enough that they possess all the virtues of humanity and none of its vices, if they are not intelligent. It is not enough that they mean well. They must be intelligent enough to be able to act well.

It is proper that people be taught arithmetic, history, geography, and other subjects usually studied in school, but all this may be done and the people still not be intelligent in regard to the relations that should exist among men regarding what should be done or avoided to secure general welfare in homes, communities, and States, and to the betterment of humanity generally.

To bring this about the people must in some way come to have a fair general understanding of elementary social science. It will be a long time before our schools will accomplish this very fully. What should be done in the meantime?

Our pupils should be trained to form the reading habit, and led to make use of a public library in order that their after-school education may partially make good what they failed to acquire in school.

It is well to try to see that all are well educated while in school, that every one has at least a good high school course, but we all know that the possibility of bringing this about belongs to the somewhat remote future. We know that the great majority of pupils will never graduate from a high school. We know that a majority will leave school and go to work quite early in life. We know that they may, and that many will, take an active part in governmental affairs.

We should see to it that they realize that their schooling is very meager and that they should continue their education as long as they live. They

will do this anyway; they can hardly avoid it. But the kind of education they will secure will depend upon the make-up of the individuals and upon circumstances and conditions. The newspapers will be an important element in their education, but they are of necessity hastily written, and are more or less superficial. There is not time to make them otherwise. Magazines that are published only once a month can, and usually do, give their writers time to prepare articles with considerable care; but even these cannot compare with books written by those who have taken months and often years to prepare themselves for their work, some giving the results of a lifetime of study and observation.

We should so train children that they may know where to go for the best books on all subjects and to have a desire for the best. All the agencies mentioned are important. We must rely upon newspapers for matters of local interest, for a hasty glance at the affairs of the world. One must rely upon magazines for a fuller treatment of matters of immediate interest than newspapers can give. But it is through books alone that we may have the best thought of the world on matters of enduring interest.

We need to keep clearly in mind that ours is not primarily a department of school librarians, or public librarians, but an organization that is devoted to the task of making it possible for every one in our land to have easy access to a free library. Whether this be done through school libraries, public libraries, State libraries, county libraries, traveling libraries, or any combination of such libraries, is for each State, county, or locality to determine for itself. We should hold tenaciously to the general proposition that some provision should be made whereby every one may have easy access to books, leaving each State, or locality, to determine the methods best adapted to its conditions.

It is important that the relations between the school and public libraries be clearly understood, not merely by librarians and library trustees, but by the general public as well. It is not at all clear that they are understood today. Until those relations are understood there will be more or less working at cross purposes, and more or less confusion in the mind of the general public.

Let us at the outset try to recognize that the school and public libraries are the two parts of a whole, and while each may help the other, and should do so as far as may be practicable, that neither can do in a satisfactory manner the work of the other. The problems that each has to deal with are quite distinct from those of the other.

The school library deals, or should deal, chiefly with children, while the public library should be most concerned with adults or pupils who are approaching adult age. This does not mean that the school library may not sometimes properly provide to some extent for the adults in the district, or that the public library may not do some very effective work with children, but that in the main the school library should confine its interest to children, and the public library to those who have finished the common school course.

The school library has for its main work that which is a teaching propo-

sition. It is to train the children to love to read that which is worth while. This it is possible for the school to do. It is not possible for the public library to do it to any considerable extent. Taking the country as a whole it is not probable that one half the children, while attending school, ever go to a public library, and certainly the public library cannot do much for those who never go to it. If the children all went to the public library the librarians would be utterly overwhelmed. There would be a great lack of librarians, room, and books.

All the children go to school. They have to do so, therefore it is at least possible to reach them there.

In the schools there is room for them all, and teachers for all. There is time to do the work that should be done. It is quite feasible to give the children the training needed to lead them to acquire a love for good reading. There is no lack of teachers for this work, though there is a lack of teachers who have had the right kind of training for it, and it is likely to continue as long as there are very many people who think and say that this work can be done by the public library, a work that it cannot possibly do, as has been shown. When the public library attempts this it not only fails, but to a considerable extent it hinders the school from accomplishing the work that it might easily do.

What is the work of the school library? Primarily to act as a feeder for the public library, through training children to love to read that which is worthwhile so that they will make use of the public library both for pleasure and for instruction as long as they live. It should train the pupils so that they will know how to use the public library intelligently, incidentally it should train the children to use a library to supplement the study of geography, history, English, science, and other subjects taught in school.

To say just how this work should be done is outside the province of this paper. Library and educational journals, and addresses at educational meetings, suggest any number of devices for doing such work. As to which device is best depends upon many varying conditions, teachers, facilities for doing the work, public sentiment, and other matters. We certainly must have clearly in mind what the outcome of such work ought to be, for without it we cannot make any real headway.

There should be a sufficient number of public libraries so that there may be one within reasonable distance of every one. These libraries should be supported by public tax the same as the public schools because they are free educational institutions. Public libraries are the only institutions that can satisfactorily serve as continuation schools for any considerable number of people. They furnish the only school for the adult immigrant that is open to any considerable number of them. It is only through the public libraries that the great majority of adult immigrants can become acquainted with our history, our government, our ideals, our hopes, our desires, and our ambitions. Only those who know these fairly well can really become Americanized.

What is the work that the public library should do? First, it may aid the school library, which seldom has enough books. The public library

may relate itself closely to the school library and the school librarian. It may loan books to the school library. It may send members of its staff to the school now and then to talk about public libraries and their use. It may through its wide experience suggest to teachers books worth reading, books for themselves and for the children. There may well be held from time to time joint meetings of teachers and librarians to discuss matters in which they should have a common interest. It may make pupils feel at home when they first begin to use the public library.

HOW THE PUBLIC LIBRARY HELPS THE FOREIGNER MAKE HIS AMERICAN CONTRIBUTION

ERNESTINE ROSE, NEW YORK CITY

My paper is conceived from this angle and in this spirit. A suggested new coin for America: on one side, the Statue of Liberty, in one hand a book, in the other a cake of soap; on the other side, a line of stoop-shouldered immigrants with burdens on their backs.

We have considered what "Liberty" typifying America thinks of these immigrant figures—what she has to offer them. Let us consider now what they think of America, what they have to offer her. On these considerations hangs, to great extent, the future of our country.

Its base is Anglo-Saxon, but the superstructure will be Mid, Eastern, and Southern European—that is, New York is made up of foreign cities; Poles and Germans in middle West; Jews in every line of life and effort.

Politics, commerce, music, and art are permeated by "foreign" influence. What then have these races to offer?

What is expected of a loyal citizen? Honesty in work, obedience to law, an intelligent vote, his sword in time of war. Are these all?

More subtle qualities of devotion, generosity in civic life, constructive expressions of individuality, self-sacrifice, courageous adherence to ideals, all these helped to make America.

Are the immigrants giving her these qualities? That they have them to give, the artistic life and wonderfully constructed civilization of Europe testify. If they are not offered to America, we must ask, "Has America given opportunity to the immigrant for the development of these qualities?" What are the institutions interpreting America to the immigrant? They include: (a) Church, often foreign; (b) Police court; (c) School; and (d) Library. The school is thought of as the most universally efficient American agency. But less than ten per cent of children go beyond the grammar grades, and less than two per cent go to college. Moreover, school does not touch the older immigrant. The library is the most universal and democratic public institution in potentiality. It makes no distinctions and erects no bars of race, color, creed, or age.

The New York Public Library, where my experience has been, is typical. Consider three branch libraries there: Webster Branch in the

Bohemian section, Seward Park in the Russian Jewish Ghetto, and 135th Street in colored Harlem. In Webster, there is a Bohemian department presided over by a Bohemian, where there is the largest collection of Bohemian literature outside of Prague, and where also there are paintings and other forms of art from Bohemian lands. This place is an intellectual centre for the neighborhood.

The same is true of Seward Park, but here the whole district is Russian Jewish, so the library must as a whole serve for a centre. Many assistants are Russian Jews and there is a large Yiddish collection.

At 135th Street there is a growing collection of books not only on race questions, but on Africa and Africans. There are also colored assistants here.

In each case, opportunity is offered for growth and expression of originality, peculiar gifts, and aptitudes. This, far from militating against the Americanizing process, aids it. Loyalty is developed, opportunity for giving is offered. Those who would never learn English come to get books in their own language and stay to "get the English," hence the gulf between generations and civilizations—a great danger to American life—is being bridged.

Moreover, it is to be remembered that the libraries are primarily American, in their generous spirit, in the majority of assistants, and in the overwhelming majority of books.

The most, the only efficient method of bringing the foreigner into American life is to offer the opportunity for a wider and freer expansion of his personality and abilities. Such an opportunity the library has to great degree.

Americanism is not a structure built 300 years ago into which must be crowded ever-increasing numbers, incompatible and restricted, but a road which we started to travel 300 years ago, and in which we are being joined constantly by all the races of the world, each with its own contribution, which we need.

EFFECTIVE CO-OPERATION BETWEEN THE PUBLIC LIBRARY AND THE PUBLIC SCHOOL

BERTHA M. MC CONKEY, ASSISTANT SUPERINTENDENT OF SCHOOLS,
SPRINGFIELD, MASSACHUSETTS

No two educational agencies are so closely akin as the public library and the public school, and there is already a good degree of coöperation between them in certain favored cities. This coöperation might everywhere be closer and more effective; libraries in the smaller cities and towns are often poorly equipped to render much needed service to the schools. The children in these communities too often think of the library as a repository for story books rather than as a source of information. They know nothing of its resources and it has never become a positive factor in their lives. On the whole, librarians seem to be more disturbed by this state of affairs than

are teachers. It is evident that the rank and file of teachers should come into closer touch with the librarians of their communities, that they may help in the solution of some of the problems. On the other hand, it would be well if every librarian were an active, interested member of the National Education Association, fully conversant with its aims and proceedings, for every librarian is a teacher the effectiveness of whose work depends largely upon his knowledge of the trend of education. He must know what the schools and colleges of the world are doing and how and why they are doing it, or he cannot adequately meet the demands of his position.

The problem of effective coöperation between these two allied branches of public service should receive the earnest attention of librarians, school superintendents, and teachers everywhere. It would be well if every superintendent of schools should arrange for at least one meeting each year between the teachers of the city or town and some member or members of the library staff. At this meeting a teacher or principal representing respectively the elementary, the junior high, and the senior high schools might profitably outline the probable needs of these schools for the year, stressing new viewpoints in education and noting the outstanding elements of strength or weakness in the previous year's library service. Some representative of the library might in return review the situation from the point of view of the library, outlining any contemplated changes in plans, calling attention to certain valuable library bulletins, and referring teachers to books of recent issue and vital interest. Very few libraries do enough of this sort of book advertising. Merely allowing book bulletins to lie on library counters in the hope that they may be picked up by teachers is insufficient. Marked bulletins should frequently be mailed to schools with the request that they be given a place on the bulletin boards or that they be brought to the attention of the faculty in teachers' meetings.

The new impulse in education tends to encourage children to "dig out" for themselves needed information. Pupils working out projects in social groups are seeking to verify their impressions and to make some contribution that will help carry things forward to a successful issue. They are therefore discovering their need for the library. It is the psychological time for intensified coöperation between teachers and librarians since they have, or should have, an equal interest in meeting this new demand on the part of pupils for access to sources of information.

Where branch libraries are located in schools, the problem is comparatively simple. But where books must be furnished, on demand, from one or two centers, the solution may call for the services of a boy and a delivery car. Why should not teachers be supplied with stamped and addressed envelopes and blanks upon which they may note the project or projects under way or about to be undertaken in a class or a school? By return mail they could be advised of helpful reference books available for use on the subjects indicated. A telephone message with the subsequent dispatch of the delivery car would then quickly meet the demand and the work of the schools be greatly advanced. Delivery service should not, however,

be permitted completely to take the place of visits by pupils to the library, as it is very desirable that children should not only learn the way to the building, but should be taught by the librarians themselves how to use the files and reference books.

Classroom loan libraries mark an advance in practical coöperation, and this service should be made more nearly universal. Its purpose is to supply classrooms with graded collections of books that pupils will enjoy reading, rather than with reference books or books that are informing but dull. The reference book service should not displace the classroom library service but should be a separate feature of the coöperative program.

No summer playground should be without library facilities of some sort, and it is encouraging to note the growing interest in this direction. The playground instructors and librarians in each community should together work out a plan for as liberal a distribution of books as possible during the summer season, and children who are regular patrons of the playground may well be encouraged to take home books for the use of the adult members of their various households as well as books for their own reading.

The promotion of vacation reading affords a wide field for effective coöperation between school and library, and many teachers throughout the country are ably seconding the efforts of librarians to establish a close relation between the library and the children during the summer vacation.

By encouraging library clubs among school children, teachers and librarians are establishing new contacts with one another. These clubs have grown to such proportions in some cities, notably in Cleveland, that special supervisors of school library clubs are in charge of the work. I do not know the qualifications of these supervisors, but if they are trained teachers who have also had a librarian's training, they can do a great deal for the cause of liberal education.

Readers are made, not born, and the distractions of present-day town and city life gravitate against the cultivation of the habit of reading worthwhile books. The newspapers, the magazines, moving pictures, and the light, brief novel absorb the reading time of too large a percentage of the educated public, and there is need for much of the sort of work that is being done by the library club leaders who are bringing to the attention of groups of enthusiastic children the great pleasure and profit to be derived from an acquaintanceship with good books.

Library club supervisors might well be paid jointly by school and library boards since their work is closely related to both library and school.

There should be library service of some kind in connection with every public evening school and Americanization center. A well-lighted reading room should constitute a feature of evening school and Americanization centers, and the neighborhood should be made welcome there. Expensive! Yes! but greatly needed as an aid in forwarding the work in Americanization. Books in all the languages of the quarter, as well as many books in English, should have a place on the shelves at these evening centers.

Exhibits of various kinds under the direction of the library should have an important place, and there should be demonstrations of the more simple scientific principles and their applications to daily life—these in addition to picture shows and popular lectures on books and their contents.

Still another problem calling for coöperative action is that of supplying schools with material for visual education. The educational value of pictures has in the past been rather stupidly overlooked. Children have long known that the most instructive features of a geography are its pictures, and it must be a source of some satisfaction to them that their teachers are now adopting their point of view in this regard. Moving pictures, stereopticon pictures, and stereoscopic photographs are all important as educational assets, but the sketches, photographs, etc., that are so universally available today constitute a mine of wealth upon which teachers should make constant demand.

Comparatively easy as it is to secure suitable pictures for illustrative purposes, no teacher or school can collect and mount enough of the best of them to meet the needs of present-day instruction. The public library, therefore, should be the great storehouse for these pictures. In order to get a good running start in the direction of a sufficiently large collection for school use, some enterprising librarians have sought the coöperation of women's clubs, chambers of commerce, and interested friends. Many people are glad of the opportunity to contribute old copies of the *Geographic* or other magazines or out-lived children's picture and story books, rich in illustration. One library founded its school picture collection upon a gift of old copies of the *Chatterbox* and *Geographic Magazines* and the *London Graphic*.

The mounting of the collection upon cardboard or heavy building paper need not strain the resources of the library staff if an appeal for help with the task is sent out to women's clubs or the girls' and boys' scouts. Mounting bees might well become a recurrent feature of the library year.

All pictures should be of good size, 2 x 4 prints being taboo. It should be remembered that the pictures are for class use and that they are of little value if very small. Portfolios of two or three sizes should be provided in which to send the pictures out when they are called for. These holders should have a pocket for the library charge card. The fine for lost pictures should be very small and should be submitted at the end of each year to the superintendent of schools for payment by the school board, since the aim is to encourage, not discourage, the widespread use of pictures as a means of education.

For the enrichment of these educational picture collections, librarians should not hesitate to cut up entire books or to sacrifice a book in order to secure even one or two especially desirable pictures.

It is becoming evident that there should be in every library a supplementary supply of stereoscopic pictures that may be loaned to schools for the illumination of certain texts. The wisdom of multiplying indefinitely individual school collections of stereopticon slides is open to question. Widely useful collections of such slides are unduly expensive in view of the fact

that they are not in constant use. The space occupied by a collection of any size is also an item, and the incompleteness of individual school collections limits their usefulness. I question, therefore, whether it is not one of the provinces of the library to serve as a distributing center for all stereoscopic photographs and slides required for schools.

The cost of the service rendered the community by the school and the library is steadily increasing, but the thoughtful will not complain of mounting costs if these great educational agencies serve more people year by year and serve them better. The time is ripe for a concerted effort on the part of teachers and librarians to the end that unnecessary duplication of effort, equipment, and space may be avoided in the interests of true economy and improved service. These National Education Association conferences afford the best possible opportunity for mutual discussion and enlightenment. They are markedly coöperative in spirit, and each year they are bringing us nearer the ideal interchange between school and library that is our ultimate goal.

THE DAILY NEWSPAPER IN THE SCHOOL

O. S. RICE, STATE SUPERVISOR OF SCHOOL LIBRARIES, STATE DEPARTMENT OF PUBLIC INSTRUCTION, MADISON, WISCONSIN

It is of interest in connection with my topic that the first English newspaper printed in America was issued in the city where we are now meeting. This was in the year 1690, and the paper was entitled *Publick Occurrences, Both Foreign and Domestic*. It was to be issued once a month, but oftener if "any glut of occurrences" happened. It was printed on three two-column pages of a folded sheet, seven by eleven inches, one page being blank. The paper was immediately suppressed by the authorities and so the first issue was also the last. Fourteen years later the *Boston News-Letter* appeared. It was published by the postmaster and "by authority" and so was permitted to survive.

It is a far cry from these struggling attempts at journalism to the cry of the modern newsboy as he heralds the latest daily "uxtra" in this and other cities today. Every day thirty-three million copies of daily newspapers are sold to the people of the United States. Estimating that, on the average, each copy is read by two persons and making allowance for many who read more than one paper, we have a total of some sixty million people who, as it were, each day are saying, "Give us this day our daily paper."

Twenty minutes per day is a low estimate of the daily time spent by the average reader on newspaper reading. This gives a total of twenty million newspaper hours per day; or, enough to keep two million people busy reading ten hours per day.

Eleven billion copies of daily newspapers are issued annually in our country. The aggregate of printed matter in this total is at least equal to that in six billion books.

What of the influence exerted by this vast aggregate of newspaper reading? As much as fifty years ago a prominent essayist said: "The daily press furnishes nine tenths of the subject matter of conversation." If, perhaps, that was a somewhat exaggerated statement then, it surely is close to the truth now. Thomas Jefferson is often quoted as having said: "If I had to choose between a government without newspapers and newspapers without a government, I should prefer the latter." Some recent writer has truthfully said: "It is difficult to imagine how the social reforms that distinguish the age could have been realized without the aid of newspapers."

Paraphrasing what Melville Stone, in his *Fifty Years a Journalist*, says of the Associated Press, we may say of newspapers in general: "On the accuracy of the newspapers the people of the United States depend for the conduct of their various enterprises, as well as for the facts on which to base their opinions of the activities of the world."

Our dependence on the daily press was well illustrated by Professor Bleyer in an address last year before the students of the Medill School of Journalism when he said: "If the American people were to decide by ballot tomorrow upon the merits of the threatened railroad strike, they would have to decide almost solely on the basis of what they have gleaned in the last ten days from the newspapers."

Newspapers are the greatest single influence on the course of events which are determined by public opinion. Parallel with the great services of newspapers run the possibilities for doing harm. Every agency for good has its possibilities for evil. Power can be applied destructively as well as constructively.

The necessarily great haste with which newspapers are prepared accounts for many of their misstatements of facts. The itch for "scoops" detracts from the reliability of the daily press. Some one has said, newspapers used to be satisfied with having the last word, now they are even more concerned to have the first word.

Powerful political interests use the newspapers as much as they can for propaganda purposes. This at times makes their political news unreliable and the editorials misleading. However, the number of really independent newspapers, politically, has greatly increased in the past few years. In order to increase sales, sensationalism is often employed. The trivial is magnified. Things of more importance but of less popular interest are relatively ignored.

The great cost of issuing a daily paper makes the commercial feature a dominant one. Especially is this true of the advertising. In 1880, the newspapers of the United States received for subscriptions and sales \$49,000,000, for advertising, \$39,000,000; that is, ten million dollars less for advertising than for subscriptions and sales. In 1919, the receipts for subscriptions and sales were \$205,000,000, for advertising, \$408,000,000; that is, twice as much for advertising as for subscriptions and sales. In view of these figures, it would be too much to expect that the effort to secure advertising would not at times wrongfully influence the editorial policy.

Notwithstanding these and other adverse influences, the great majority of news articles and items in newspapers are reliable and the editorials as a rule are written to promote worthy objects. Of some newspapers this is, of course, much less true than of others, while, on the other hand, it is decidedly an understatement of the merits of some of them.

That newspapers have their "seamy side" is but a feature in common with all of man's institutions and agencies. That this is the principal and almost the only side, as Upton Sinclair, in *The Brass Check*, would have us believe, is as far from the truth as would be the unreserved denunciation of theaters, politics, or the legal profession. The real status, services, and disservices of the press are well given in Bleyer's *The Profession of Journalism*, a collection of articles by various writers which appeared in the *Atlantic Monthly*, and including a discriminating introduction by the editor.

Due to the immense influence of newspapers, their faults are of great public concern. To protect society against the evils of colored news, suppression of legitimate and important news, and the cunning propaganda of "doped" headlines and cartoons and other expedients for wrongfully influencing opinion, various remedies have been proposed. An endowed newspaper has been advocated by a number of influential writers. These argue that such a paper would be relieved of the temptation of bowing to the wishes of advertisers, partisan politicians, or others with axes to grind, and would be free to serve the truth at all times. Publicly owned newspapers have been proposed and to an extent tried out. Treating news agencies as public utilities is suggested by many. Better and more stringent libel laws are favored by others.

Whatever of merit may be connected with these proposals, it must be kept in mind that a plan for improving the press which amounts to government censorship would merely substitute one great evil, historically proved as such, for a number of lesser evils. Besides it would conflict with the guarantee of freedom of the press provided in the first amendment to the Constitution. Even an endowed newspaper might come to be controlled by special interests.

But why should discussion of this subject, almost without exception, concern itself only with what can be done to improve the newspapers? This is not half the problem. Improvement of the readers as readers of newspapers is far more to the point. Furthermore, improving the readers as such will lead to improvement in the newspapers. For, in the last analysis, the reading public determines the quality of the press.

Here the schools can do a service of vital importance to society. By training young people to be intelligent and discriminating readers of daily papers, much will be done to increase the good results of newspaper reading to a maximum and to reduce undesirable effects to a minimum. This will require not only that the daily newspaper shall come regularly to the school, but also that a definite and comprehensive course in newspaper reading be given in the upper grades and in the high school.

By the time pupils reach the upper grades they will have had consider-

able experience in reading newspapers. This gives the necessary background for the course. During the course in newspaper reading, all the instruction and exercises should be directly connected with daily papers to which the pupils have access at the time. There is here an opportunity of teaching and training under ideal conditions. The pupils will have had the necessary preliminary experience, they will have access to the thing studied at the time it is being studied, and they will continue the use thereof throughout life.

This pedagogically perfect situation is so unlike most conditions in teaching that teachers are likely at first to be confused as to how to proceed. The lack of any such instruction when the teacher was a pupil adds to this paradoxical hindrance. We have here an added reason for a carefully planned and definite course of study in newspaper reading, with accompanying concrete exercises. Without such provision, we shall have only another of the useless "snap" courses with which teaching is at all times more or less afflicted.

First, we must select the topics which are to be treated in the study of the daily newspaper. These would include: (1) Analysis of the contents into news, editorials, information about the paper itself, advertisements, market reports, and weather forecasts; (2) analysis of news articles into headlines, lead, and details, with consideration of the part played by each both when used legitimately and when "manipulated"; (3) general news and classified news; (4) local, State, National, and foreign news; (5) editorials; (6) how news is gathered, including the news agencies, such as the Associated Press, the United Press, etc.; (7) how newspapers are made; (8) how to read newspapers, with special attention to judging the reliability of "news."

In this series of topics, with the related sub-topics, there is sufficient material for serious and practical study of the daily newspaper. If the instruction is made concrete throughout, with practical exercises as a large part of it, we shall get results which will please the pupils at the time and which will prove to be one of the most valuable contributions of the school course.

This presupposes that sufficient time and a sufficient number of class periods will be allotted to the course. Simply hurrying on and dragging the pupils through "by the ears," as it were, would be worse than useless. In order that the newspaper lessons may be given the time necessary without the necessity of disturbing the daily program with an extra class, they could well be given in the civics class or in the English class, with both of which classes their subject matter is closely related.

As an illustration of practical exercises, may be mentioned the making of newspaper clippings and mounting them on bulletin boards. Groups of pupils in turn daily clip and mount significant news, timely editorials, and other contents of the daily papers. This may be started in the class on the newspaper, but should be continued after the course of lessons has been completed. Credit for the work with clippings, in proportion to merit, should be given in English or some other related subject.

The high-school course on the newspaper would differ from that in the upper grades mainly in being more advanced in the treatment of each topic. For example, in the upper grades the service of the news agencies would be explained and a general idea given as to how they gather the news and distribute it to the daily papers. In the high-school course, each agency would be given considerable attention. Certain pupils might be asked to find all the information they can relating to the Associated Press and report to the class; other groups would report on the United Press, the Federated Press, and the leading foreign agencies.

The use of magazines in current events classes is now much in vogue in the high schools. This is closely related to the work with daily papers. One of the most effective correctives of wrong impressions gained from the daily papers is discriminating reading of reliable magazines. Especially important for this purpose are weekly periodicals issued especially with a view to giving accurate information of current events.

Lessons on the newspaper are beginning to appear in high-school English texts. The lessons in such books, however, are likely to be from the standpoint of teaching the correct and forceful use of English; this is a good justification for the inclusion of such lessons. Training pupils how to read newspapers for the purpose of accurately knowing what is taking place which has a bearing on their lives is quite a different matter and needs radically different treatment.

Both in the course for the upper grades and in that for high schools, lessons on the daily newspaper are included in manuals issued by the Wisconsin State Department of Public Instruction. It will require some time, however, before such lessons, even with that impetus, will be given as well and as universally as the lessons on traditional subjects.

But, say the spokesmen for "the defence," the school curriculum is already overloaded. Here you come with another subject, a last straw with which to break the camel's back.

This brings into the discussion the matter of relative values. If it is more important, for example, that a pupil spend a full year on algebra, which he will never use after he leaves school; if it is more necessary that he muddle his brain with intricate points of technical grammar beyond his mental reach; if it is more needful that he learn scores of things in school which he will probably forget after leaving it (or before leaving it); if it is of greater concern that such things be given all available room in a crowded curriculum than it is to train pupils in the use of the greatest agency of the times for enlightened public opinion—the daily paper, which they will daily read—then we must of course keep the daily newspaper out of the school and out of the course of study.

But, if the school is to prepare for life, as educators have for decades affirmed and now assert more emphatically than ever, then the daily newspaper should come to every school with pupils far enough advanced to read it and lessons on the newspaper should be given to the end that the people may be trained to ascertain the truth relating to the times in which they live, the truth which is necessary to make and keep them free.

THE SPIRIT OF LIBRARY SERVICE

MRS. EDWARD S. CARTER, LIBRARIAN, HIGH SCHOOL, PORT ARTHUR, TEXAS

When Chairman Williams gave me the choice of my topic, with a librarian's true instinct to seek the best, I chose the "Spirit of Library Service," for did not the Master Teacher who came that man might have life and have it more abundantly say, "It is the spirit that giveth life"? The purpose of the library is to contribute its part to the more abundant life. The accomplishment of this purpose is commensurate with the spirit of service rendered. You are familiar with the psychological law that knowledge plus feeling determines conduct. Substitute for our library law coöperation plus conviction determines service and you will have the point of view in this paper.

The method of library service is essentially that of coöperation. The best barometer of the library is the desire and ability of its staff to coöperate with individuals, institutions, and organizations.

Now for the second factor of our law—conviction. A digest of the faith, philosophy, and experience of librarianship for the past twenty-five years converges into the growing consciousness, the conviction that the library functions over and above all other educational factors in enriching the human life with (1) The best perspective of the past; (2) The best mastery of problems of the present; and (3) The best prophetic vision of the future.

Individual service—The librarian should go to her service as to sacrament because her tools give to her more than to any other workman the truest perspective of the past. This lore is her leverage in serving the needs of the individual in (1) Information; (2) Recreation; (3) Inspiration.

Information—"Where shall wisdom be found?" Where is the place of understanding? Where can we procure this heritage that is more precious than rubies? Our answer, fellow workers, is, "Go to your public library and find it in books." "All that mankind has done, thought, gained or been is lying in magic preservation in the pages of books." "Books are the storehouse of knowledge, the record of civilization, the fulcrum for the lever of progress." "They are the precious life-blood of master spirits embalmed and treasured up on purpose to life beyond life." The librarian's privilege is to reveal this heritage to the wonder-loving mind of the reader.

The reader is continuously seeking the solution to some problem. The question may be one of family relationship, finance, or the correct method of using a silver service at a formal luncheon. Books point to the efficiency short-cut in every problem—mental, physical, or spiritual. They prevent useless experimentation and show how to secure quickly the useful and to concentrate intensely upon the practical.

Recreation—The library outranks the moving-picture show, the vaudeville, and the city natatorium in the quality of its recreational service. An

erstwhile Board member of the institution I serve once said to me in part, "The library is the reservoir of my recreational hours. The earth is big. I would see it. Strange men live. I would know them. Other lands are. I would visit them. Strange customs prevail. I would understand them. The library is my magic carpet. In an eyeflash I ride the surf of Honolulu. I round the world in eighty seconds. I travel from Greenland's icy mountains to India's coral strand. Adventures strange with men, with beasts, with elements safefold me from hunger, strife and famine. The library is my open sesame. I speak the magic words and doors fast closed by time are opened and I talk with those who are but never were. The characters of fiction come and go at my merest whim. The library is my Aladdin's lamp. Space and time vanish. Genii appear to do my bidding, be that the rebuilding of the eternal city or the tower of Babel. The library is my Jacob's ladder to give wings to my imagination and set my fancies free."

Inspiration—"The poet is the best benefactor of society. The soldier fights for his native land, but the poet touches that land with the charm that makes it worth fighting for, and fires the warrior's heart with energy invincible." The recent war proved that men are still willing to give their lives for ideals. The library is the custodian of the traditions of justice, equality, liberty, and democracy as recorded by statesman and poet.

The library gives the reader vision. He comes to a true perspective of life. He realizes that history repeats itself, that to look backward carefully and studiously is to look forward successfully, that through a knowledge of what has been one may grow a prophetic sense of what is to be.

Social service—Aside from service to the individual, the library co-operates with institutions and organizations in the dissemination of knowledge. These twain, the librarian and the book, serve as an open sesame for problems educational, social, and civic.

Educational—My conception of the ideal relationship that may exist between the public school and the public library is beautifully expressed by Elbert Hubbard in that part of his autobiography which explains his Roycroft organization. He speaks of this coöperative plan which begets a high degree of personal diligence, a loyalty to the institution, a sentiment of fraternity and feeling of permanency among the workers that is beneficial to all concerned. "Each worker calls it Our Shop and feels that he is an integral part of the whole. The Roycroft idea is one of reciprocity—"you help me and I'll help you." Mr. Hubbard continues, "We will not be here forever. Soon Death, the kind old nurse, will come and rock us all to sleep and we had better help one another while we may; we are going the same way but once; let's go hand in hand."

And so it is that the public school and the public library are going the same way. They both have to do with the education of the people. Both the school and the library are an integral part of education. The difference is one of scope and intensity. The school has to do intensively with the education of the child during the first twenty years of its life,

while the library touches the educational development of the individual from the cradle to the grave. Inasmuch as both the goal and purpose of the library and the school are practically identical, should they then not walk hand in hand in mutual faith, mutual trust, and mutual confidence?

The effort of the Public Library at Port Arthur, Texas, and the public school to work together in book engineering has been made possible by the coöperation of the board of education, the superintendent, and the faculty. This coöperative spirit may be briefly summarized.

1. Passes and permits are issued to the maximum of thirty students for each of the eight periods of the school day. All students have free access during the noon hour and from 4 to 6 P.M.

2. Through the coöperation of the head of the English Department, the library becomes a laboratory for intensive study in current periodical literature during three weeks of each term. Each student of the High Junior class is assigned thirty stories, autobiographies, essays, dramas, and letters. The reading is supervised by his English teacher.

3. An annual lecture is given to the senior classes by the librarian, preparatory to selection of topics and materials for their graduation essays.

4. Reserve shelves are prepared upon the request of any teacher.

5. Depository libraries of 1200 and 800 volumes are maintained in the English and history departments of the high school. These branches are operated upon the same plan as the public library under the supervision of members of the senior class. This plan has many advantages: (1) Teachers are able to personally supervise all reading; (2) The library through these channels serves an indefinite number of pupils; (3) Pupils may procure reference material during the transition periods; (4) The teachers can check upon students who are not reading.

6. Branch library collections from 1500 to 4000 volumes are operated in the grammar schools. The school librarians are members of the public library staff.

7. Each student above the fourth grade has his library period each day.

8. Pupils promoted from the grammar grades to the high school have a "journey through the library." They are shown the floor plan, the card catalog, the class arrangement of books, etc.

9. Heads of departments assist in the selection of books.

10. Students in arrears with the library may receive neither promotion certificates nor diplomas.

11. Teachers may not draw pay checks at the close of the year until they have in hand an O. K. slip from the librarian.

12. Each class in the high school is given a lesson on how to use books.

13. The librarian makes a monthly and an annual report to the superintendent covering circulation statistics, usage of books by pupils, references procured, new books of interest to schools, etc.

14. The board of education and the superintendent are given a list of the names of teachers using the library and the number of books read.

15. The history department coöperates with the library through a

certification scheme for high school history reading, similar to the Youngstown (Ohio) plan.

16. During Children's Book Week, a lecture is given to each library period and to teach auditorium period. Posters, stickers, prizes, and the usual publicity methods are carried on through the schools. The English department conducts questionnaires and vocabulary tests.

17. The library closely coöperates and correlates with the Port Arthur Business College. Dictation lessons and auditorium lecture materials are furnished by the library.

Librarians are more and more stressing the knowledge of book-using skill. They are becoming professors of books. Should you grant me the liberty of prophecy, I should say that within the next few years training in the knowledge and skill of book usage will be a prerequisite to certification and will take its place among the minimum educational essentials of all time. In man's brief span of three score years and ten, all knowledge comes through contact with nature, with books, and with people. The librarian serves with the conviction that "Education consists not in attempting to master all there is to know, but in mastering the knowledge of how to find information on any topic when it shall be wanted."

Cultural—The library is not only educational, but it is also cultural in its sphere. The close bond of sympathy and service that has always existed between libraries and women's clubs is too patent for us to pause for more than a moment in the discussion. The library recognizes its debt of gratitude to women's clubs for their support and development of the library. At Port Arthur, Texas, the close coöperation between the clubs and the library may be briefly summarized:

(1) The chairmen of all program committees of the Department of Federated Clubs assist in the selection of books; (2) Books used for program purposes are purchased and circulated by the library; (3) References and materials for club papers and addresses are collected by the Library Club—a student organization; (4) Materials desired for yearbook and annual programs are arranged and placed at the disposal of the program committees. These committees meet at the library; (5) The librarian is a member of and attends as many club meetings as her work permits; and (6) The president of the Department Club automatically becomes a member of the Library Board.

Civic—One of the greatest opportunities for mutual exchange of service, teamwork in service for the common good exists between the library and civic organizations, Red Cross, Hospital, Men's clubs, Campfire girls, Boy Scouts, etc. Among the important features of the institution which I serve are the channels opened for us by the American Red Cross, opportunities for service to merchant marines, and coöperation in community pageantry.

One of the great values of books is the therapeutical value. Librarians have found that one of their greatest opportunities for service is through branch collections in their city hospitals and sanitariums.

Industrial—It is too frequently thought that libraries have to do only with ideas and ideals. They have also a very practical value. Large industries are more and more realizing that there is a very tangible benefit in increased skill and power of the library-using laborer. Wherever libraries can extend their influences through industries they are blessed. In our city the library and industries coöperate in the following ways:

1. The composition of the Library Board is something unique in the development of library administration. The members of the Board, representing as they do civic administration, technical, school, industrial and business interests, indicate the harmony that should exist between the various interests of the city in their mutual acquaintance and mutual action. Inasmuch as every man is a member of the Board by virtue of his office, all vacancies are filled automatically.

2. The Texas Company subscribes for twenty-five technical and scientific periodicals annually for the library. Refineries also donate files of scientific and technical materials.

3. The refineries post bulletins and notices to encourage library usage.

4. The head of the Chemical and Engineering Departments assist in the selection of all technical and scientific books.

5. A branch library is maintained in one department of the Texas Company for women employees.

Spiritual—All of you are familiar with the service which the library renders in spiritual uplift, through coöperation with the Ministerial Association, churches, Sunday schools, young people's societies and leagues. Every Christmas, Thanksgiving, Mothers' Day, Easter program gets its inspirational idea from the library. The Triple Entente (the librarian, the reader, and the idea) constitute the alchemy of prophecy and vision of things pertaining to the future. Library service is not a simple elemental thing; it is a synthetic process as is harmony or beauty. One receives this idea and that; one is interested. Suddenly there is a fusion. Dry bones stir; the soul lives. Do you recall that Emerson said, "One single idea may have greater weight than all the labor of all the men, animals and engines for a century." The librarian in bringing the right persons and the ideas awakens the souls of men. Through ideas and ideals men come to realize that the foundation of progress is spiritual, not material.

"I gave a beggar from my little store of wealth some gold,
He spent the shining ore and came again and yet again
Still cold and hungry as before;
I gave a thought and through this thought of mine
He found himself the man supreme, divine,
Fed, clothed and crowned with blessings manifold
And now he begs no more."

We must have the two-fold vision of both a Martha and a Mary. Above all we must remember which is the better part. Just as in the physical world gravitation is more powerful than the planets which it holds together, and radium is more wonderful than the masses of matter which

it has power to remove, even so the spiritual uplift is our supremest sphere. Personality, flowering into intelligence through ideas and ideals, is the supremest marvel of the Universe. "Ignorance is the curse of God; knowledge the wing wherewith we mount heavenward."

STORY TELLING: ITS RELATION TO LITERARY APPRECIATION

EDITH C. PARKER, STORY TELLER IN THE BUFFALO PUBLIC SCHOOLS,
BUFFALO, NEW YORK

Many books have been published on the subject of story telling, and many story tellers of recognized worth are filling educational positions throughout the country, but all do not approach the subject by the same road. Their aims differ according to their personal revelation.

Some feel that the aim of story telling is to emphasize ethical points and lines of conduct, others use it as a point of departure in teaching nature study; others use it as an aid in teaching history, or biography, while others think its artistic and literary value is sufficient worth for its being.

Now I do not intend to discuss the relative merits of these differing aims; each is supported by reputable advocates. I shall simply state my own point of view. I believe that story telling has for its primary object the presentation of the great literature of the world, in such a manner as to make the strongest and happiest impression at the time when it will have the greatest appeal.

Unfortunately children do not select for themselves the great literature of the world for their reading. The subject matter is removed from their own experience, and there is little to arouse their interest. But the story teller may take some great masterpiece and choose from it some dramatic incident, which if it is told artistically and sincerely will awaken a dramatic joy that is amazing; the emotional response will be sufficiently strong to carry many of them out to find that book and read that story for themselves.

When the first cycle of stories from the Illiad and Odyssey were told to the seventh and eighth grade children in the Buffalo public schools, great numbers of them went to the libraries asking for books from which they could read the stories of the siege of Troy and the adventures of Ulysses. The only way a person may know the genuine from the counterfeit in literature is through experience; through intimate, sympathetic intercourse with the best literature, and story telling is an opening wedge to that end.

Of course the time to begin training children in the appreciation of literature is at the beginning. The average child brings to the kindergarten a real literary background. The beautiful lullabies, the mother-goose classics, have not only familiarized him with rhyme and rhythm, but with the conventions of literary diction as well. For does he not say: "Curly

lock '*wilt thou*' be mine" and "The North wind *doth* blow" and "*Mistress Mary*, quite contrary." It is sad that such an excellent beginning should not be continued and the standards maintained.

Very often this is so, and we find the kindergarten and primary teachers following Mother Goose with the beautiful poems of Robert Louis Stevenson and Christina Rossetti, and these followed in turn by some well-chosen folk tale that has been worn smooth by the centuries—folk tales that are frequently models of form and containing all the essentials of a good story—action, suspense, climax; leading the child away from the common place into a delightful world of fancy. But unfortunately this is not always true. The teacher with her adult point of view gets in the way, and her desire to teach and instruct, to pour in authentic information through every possible channel, leads her to select stories for the matter rather than the form, and the result is that she is presenting stories with no literary value. She does not realize that she may be laying a foundation for the child's future taste in literature.

After a child has been taught and preached at through stories or books; and after he has had to read certain required books and write about them, learn meaning of words from poems and find certain data about the author, which he ought to know, he has often had quite enough of literature to last him for the rest of his life. Frequently children have looked at me apprehensively when I was about to tell them a story for the first time and some have had the courage to ask: "Will we have to write about it?" But when I have assured them that they had only to listen and enjoy the story, they settled down to do that in a most thorough manner.

In arranging stories from the classics, great care should be exercised to choose the version that has the greatest literary value and charm, and to maintain so far as possible the style of the author. Then when the child comes to read that book there is a certain familiarity which makes it easier for him to go on. Some stories, where the form is as important as the matter, should be read to the children, that is unless a story teller is able to tell a memorized story with ease and charm. Such stories are Kipling's "Just So Stories."

As a matter of fact, a good story, well chosen, appropriate to the age of the children, may include the points desired by the teacher of ethics, nature study, history, geography what you will. But stories chosen for these ends should always be made to pass the standards required by good literature.

EDITOR'S NOTE—Miss Parker's remarks were supplemented by stories from Kipling and Stockton.

THE PUPILS' CONTRIBUTION TO THE SUCCESS OF THE SCHOOL LIBRARY

MARY E. HALL, BROOKLYN, NEW YORK

Twenty years ago a library could run very easily without help of pupils. Now, it is impossible to run satisfactorily without their help.

Occasionally school libraries are started by pupils. In two schools this was done—Adams Grammar School, Lexington, Massachusetts, had but ten books. It had a lighted closet. This the pupils used to store the books which they bought from the proceeds of candy sales and special parties. They used the adjoining corridor for a reading-room which the manual-training department equipped with tables and chairs. Gradually all library furniture was supplied by individual pupils. Again in a Junior High School in the South—Huntington, West Virginia—there was an interesting project worked out. The public library was unable to handle the school needs. An English teacher decided to work up a library by means of the project method. This is described in the *Journal of the National Education Association* for December, 1921.

The problem in the Girls' High School, Brooklyn, New York, was the rapid growth. It was a question of attracting at first; immediate results followed efforts along this line. Therefore the need arose for extra assistance in the administration, and the library established what is known as page service. The number used is eighty students a year. The teachers record the number of periods of service given which is kept as a record of service to the school. At the close of the year there is a special talk given by some celebrated speaker especially for the pages.

In the Boys' High School, Brooklyn, they have boys' squads, and at the Morris High School they also have a library service group.

The students advertise the library and bring in the newcomers and ask for special books. They recommend books in the Girls' High School, and a file is kept of their comments on books they have read.

The pupils give books to the library in the Girls' High School instead of silver cups. They are inscribed, and are much more attractive than the usual gift. They also present furniture and luxuries which cannot be secured otherwise. All this is a very joyous service.

BOOKS FOR BOYS

A. B. DE MILLE, WINTHROP HIGHLANDS, MASSACHUSETTS

The problem of sound reading for boys has been attacked by every teacher, but for most of us, I fear, the final solution is far away, and we must be numbered among the "inheritors of unfulfilled renown." In the half-hour placed at my disposal today, I should like to offer some suggestions based upon experiment, as a modest contribution to an important subject.

Of the value of good reading there is—or ought to be—no doubt; here all educational authorities are at one. But when we come to the explanation of what is meant by “good reading”—what books ought to be put in boys’ hands, we find a marked—almost a hostile—difference of opinion. The opposition engages itself all along the line: it discusses not only the “what,” but the “how” and the “when.” Shall it be the classics, the great books, that stand preëminent? Or shall we say that the modern boy is bored by *Ivanhoe*, *David Copperfield*, or *The Pathfinder*, and should follow the bent of his own tastes into easier fields? How should he read—under guidance, or at his own sweet will? We all remember Ruskin’s advice about browsing in a library; yet what kind of fodder will be sought by the boy who reads cheap magazines and haunts the movies? Of his own accord will he ever set foot inside a library? When shall he read? On every side we hear the calls of athletics, of home affairs, of social functions—not to mention the exhaustive demands of the curriculum.

And through the shouting and the tumult that interesting creature, the boy, to whose ultimate good it is all directed, goes his cheerful way like Kipling’s midshipman—“diverse, undulating, and irresponsible.”

How are we to reconcile these differences? Before coming to speak about the books themselves let us look for a moment at some underlying needs of the situation. What the boy will read is almost wholly a matter of habit and environment. Our effort should be to form the habit and provide the environment. How can this be done? In the large private schools, particularly throughout the east, the problem presents fewer difficulties, since the careful supervision both in school hours and outside makes possible a direction of reading which in general is wisely and beneficially exercised. In the public schools we have to take into account some serious obstacles. There is the huge heterogeneous school population, increasing year by year, the crowded condition of the classrooms, the lack of library facilities for this great section of youth, the numerical inadequacy of the teaching staff, the complexity of the curriculum, the lure of all sorts of outside interests—the automobile, the club, the theatre, the magazine. The way, certainly, is hard to find, and yet, if we admit the value of reading, some way must be found.

What is the best way, then, to form habit and provide environment? The best way, perhaps, has not yet been discovered, but one way may be outlined which has the elements of reasonable success.

Let us first define our terms. By “boys” I mean normal young Americans of high-school age—the home-grown supply, to whom the English language is natural and who have at least some ideas and traditions growing out of books written in that language. By “books” I mean the fiction or miscellaneous material that such boys may be influenced to read outside the regular school hours. The problem is how to turn boys towards sound books for amusement and recreation, even for help.

The initiative rests fairly and squarely upon the shoulders of the teacher of English. In the almost complete absence of home training or influence,

he is the only one who cares. If reading be worth while, it is he who must show the way to form the habit; he must organize enthusiasm, both among his boys and among his colleagues. He is hard pressed—if he is conscientious, he does more work than any of his fellows; he labors, like Arnold's weary Titan, under the too vast orb of his fate. Yet he must shoulder one burden more. If he uses his chances, however, this burden soon will become no burden at all.

We must assume a teacher of English who is an enthusiast about books. For this teacher three things are necessary; not only enthusiasm, but sound knowledge; not only sound knowledge, but the ability to read well. Armed thus, he begins the attack. His classes are made up of alert young minds, and for a certain number of hours every week he has them at his disposal. The routine work, of course, is insistent; but he seizes five minutes at the end of a period for a bit of reading which has no connection with the required work. He picks up, let us say, Conrad's *Typhoon* and reads a paragraph or two about the coming of the storm. Next day, he follows up this beginning with a few stanzas from Masefield's *Story of a Roundhouse*, as an example of stirring poetry written by a real sailor-man, who tells what he has actually seen. After a few experiments of this nature, the enthusiast inserts a delicate wedge. "I don't know," he says, diffidently, "if any of you care about reading, but if you *do* we might get together for half an hour now and then. I have some books that might interest you." There will be some response, if only from motives of curiosity, and it will go hard if he cannot build something upon these beginnings.

But this is only the first step. There is an idea prevalent among school boys that reading, as distinguished from study, is a pleasant vagary of the English department. The duty of the teacher is to show that it strikes much deeper; that books are concerned with life in general, and not only with that section committed to the charge of the English department. To this end he seeks to enlist the coöperation of his colleagues.

He goes, then, to his friend of the history department and after be-moaning with him the incapacity of the average pupil and the hard dealings of the College Entrance Board, he makes his suggestion, walking delicately, like Agag in the Bible. "Do your boys carry on any outside reading?" he says. "Certainly, as much as they have time for," is the suspicious response. "Because," proceeds the English teacher, "I saw a book the other day which I thought might possibly be in line with their work. It was called *Scaramouche*, and the scene is laid in the French—" "O, *fiction!*" rather scornfully. "I hardly think they would find that useful." At the end of half-an-hour's hard work, the English teacher pledges himself to make a list of some sound historical novels, and the history man promises to look them over.

Next he seeks out the palatial abode of the Science department. Some natural tears he sheds as he notes the exhaustive and gleaming array of apparatus without which no self-respecting science department would

consent to carry on its work for a moment, but he dries them as his colleague bustles up, brimful of energy and exhaling a fine full flavor of chemicals. "Splendid equipment you have here!" says the English teacher.

His friend glances round disparagingly. "Fair—fair," he remarks, "But what we really *need* is—" (you know the list).

After some desultory chat in which the intruder gallantly tries to conceal his lack of scientific small-talk, he puts forth his feeler. "I suppose your boys don't find much time for outside reading." "Well—no, they don't." The scientist is perfectly frank about it. "They have so much real work to get through that they can hardly be expected to take time for the unimportant things."

"There were two books that I happened to notice recently," continues the other, "the *Life of Edison* and the *Chemistry of a Candle*. They ought to be more or less in line with your subject." The man of science involves himself in a mist of vague good-will and retires to his retorts and test-tubes, while the English teacher seeks his unimposing classroom.

Doubtless there are many schools where coöperation is welcomed—where departmental jealousy is unknown and the lamb lies down happily with the lion. Coöperation in some degree we must have if we are to create the kind of reading environment which is right for the boys. So many books of literary value have a direct bearing upon the work of departments other than English that they, no less than the boys, will profit if they can be brought to see the value of reading for reading's sake. The boys will gain some notion of the immense field of good literature; the other department will learn something about the practical value of English reading.

Reading for reading's sake—how many of us really believe in it? It is unpractical, you say; it is not good pedagogy; it produces no definite results. Now "pedagogy" is a word that I am very much afraid of, so I shall let it respectfully alone. For the other objection it may be said that reading for reading's sake is both practical and definite—but its dividends are not immediately payable. Isn't this the root of our objection? Isn't it true that we are over-anxious to get immediate results, "reactions," and the like? That we baulk the end half-won for the instant dole of praise? Do we not risk losing the deeper and broader results—the power which is not matured in a moment—because our vision is obscured by the glamor of the immediate foreground? Don't our boys miss something, because they regard books as guides and philosophers rather than as friends?

There is a great gulf fixed between what a boy reads and what we think he ought to read. Anyone who has boys growing up in the family knows how eagerly they absorb the modern Oliver Optics, the emasculated dime novels which have superseded the fine old crusted Nick Carter of our own youth. Here are a few titles that show the sort of thing—some of them, I regret to say, were found in my own family. The Motor Boys' Club at Golden Gate, or a Thrilling Capture in the Great Fog; Submarine

Boys; Square Dollar Boys; Range and Grange Hustlers; Pony Rider Boys; Boys of Steel; Battleship Boys; Circus Boys; and Automobile Girls. The real objection to these books is not that they do harm, but that they do no good. Their perspective is all wrong. Vice is still punished and Virtue triumphant, just as used to happen in the dear old dime novel days, but the whole thing is out of key with real life. Yet they are less obviously out of key than the old style of book—and that perhaps is where the harm comes in. Moreover, they are monotonous, and they act as a drug upon the youthful mind. A course in these books will check the development of sound taste. They are widely read by boys, and their reading, if unchecked, leads either to the abandonment of reading altogether, or to the selection of extremely undesirable material as the boy grows older.

So much for what the boy reads. What we think he ought to read brings us at once to the core of the subject. The matter presents itself to me under three sections, and so I hand it on to you: (1) How shall the boy read? (2) When shall he read and (3) What shall he read?

How shall the boy read?—Should the boys have definite guidance, or should they be left to themselves? It would seem that what we have just said about the natural taste of the average boy shows the need of some kind of leadership—what kind depends so much upon the type of boy and the quality of the teacher that it is difficult to lay down any definite rules. For the average boy, probably definite guidance, but limited requirement, would serve the purpose. And guidance may be perfectly definite, yet veiled, suggestive, incidental, so as not to frighten the most motley-minded youth; all boys, like the majority of older human beings, enjoy most what they think they do not *have* to do. But, be it said again, without a teacher who is himself widely read and enthusiastic, the matter will not proceed very far. If he is widely read, there is not much limit to what he can do. For boys respond, for instance, to the pure beauty of literature, if only it be adequately and sympathetically presented to them. I have seen a group of western school-boys—a most unpromising company—held motionless while they listened to the opening of Aeneas' tale of the Fall of Troy—"Infandum, Regina, jubes renovare dolorem," "You command me, O Queen, to renew my memories of unutterable grief." I have seen a class of fourteen-year-old boys look grave over Antony's beautiful lament: "O mighty Cæsar, dost thou lie so low . . ." The thing can be done, under competent leadership—and it is well worth doing. Let us have guidance, then—veiled, if need be, under a teacher who is himself a bookman.

When shall he read?—Here, of course, we meet the time limitations which form so serious an obstacle to our advance. Time? Where are we to get it? Modern educational systems encourage a schedule which is packed to the limit, and the three "R's" (of which, mark you, Reading comes first) are swamped under a list of studies, required and elective. Sometimes it almost seems as if any one who has a panacea to try, or a pet project to foist on the long-suffering child, can get it adopted if he has perseverance and a slogan. But this is beside the point. Time is the

question. As for time within the school period, we can only fight for it, using as the basis of our argument the fact that sound reading tends to produce sound minds, that sound minds are not easily stampeded—they will weigh, and balance, and draw reasonable conclusions—in a word, they will *think straight*. As regards time outside the school hours, we must organize the interest of the boys so that they will take time for reading which ordinarily would be given to some less worthy thing.

What shall he read?—To this question, although it is perplexed by several complications, it is possible to give a definite answer. The list¹ which has been distributed at this meeting presents some suggestions. It is not a final list; it does not lay down any law; but it does possess the value conferred by actual experiment inside the classroom and out. The books have all been tested, at various periods, with boys of good—not exceptional—ability. Upon this list one may turn boys loose, I think, with but little guidance; from it they will derive both pleasure and profit. The books should serve as a general guide, and while they form part of a series which is capable of indefinite expansion—especially in the direction of recent fiction—yet as they stand they should be found usable.

The list contains but few recent titles. There are two reasons for this. In the first place, boys will read recent fiction anyway; it can take care of itself—there is no object in making any appeal in this direction. In the second place, recent books lack what must be considered from our point of view, an important limitation—they have not stood the test of time. The books cited on our list have been read and enjoyed by generations of boys—all of them most remarkably like the boys who throng our classes today.

The insistence upon the modern in literature, which colors more or less of our teaching at the present time, has been commented upon by Professor Brander Matthews in the following words:

There is no more patent absurdity in our education today here in America than the devout attention we are paying to contemporary literature. Our schools and our colleges and our universities have little enough time to acquaint students with the masterpieces of literature, with the works of the great men of old. If teachers cannot provide students with a knowledge of the abiding traditions of literature, with an understanding of the underlying principles of the art of letters, where are these things to be acquired by the young? The fleeting fashions of the moment do not need to be expounded and made plain in the classroom; they can be got from the nearest news-stand. . . .

It cannot be said too often and too emphatically that what is contemporary is four parts temporary, and that what is up-to-date is certain swiftly to be out of date. Then why study the ephemeral? . . . Why waste our time in criticism of the minor men of today when the major men of yesterday and of the day before yesterday are awaiting valuation and revaluation?

The criterion laid down in the selection of books for this list was a simple one. (1) They must be popular with the young. That is, they must have passed the examination of frank and unbiased boyish criticism. (2) They must have literary merit. The books on this list all are written in good clear style, show knowledge of plot construction, and evince

¹See list at end of address.

views of life which may be shot through with adventure and excitement, but which are never distorted.

If we believe at all in literature as a living and moving force, we must be ready to bear witness to our faith. *Any* boy can read the cheap magazine, the cheap school story, the rehash of Jules Verne or H. G. Wells, which reveals to an observer the pirate's lack of knowledge, of good taste, even of the ordinary canons of rudimentary art. But we must not be content with what any boy can read.

By all means, I should say to my boys, cultivate a love of good books—make yourselves book-lovers. You will gain much besides mere amusement. You will gain mental strength and moral tone. Your daily work in after life will draw upon reserve stores which you are laying up unconsciously by your contact with great personalities. Hours of loneliness will be to you unknown, so long as you are within reach of books; you will have congenial companionship—and the better the books the better the company. The book of travel will open up new realms for you, in your own country or in the uttermost part of the sea; in the heavens above or in the waters under the earth. The biography will introduce you to good men and true—brave soldiers and far-wandering navigators—great hearts that you are the better for knowing; the novel and the drama will stir your imagination and your emotions deeper than ever plummets sounded. Does this sound fanciful? Perhaps so. Yet it seems to me that the whole experiment is worth a careful trial.

SUGGESTIVE LIST OF BOOKS FOR BOYS

COMPILED FOR THE NEW ENGLAND SCHOOL LIBRARY ASSOCIATION

This list is neither exhaustive nor final; it is intended to be a guide for those who are interested in the question of sound reading for boys of high-school age, and to serve as the basis of further experiment. It is the outgrowth of tests extending over a number of years; all the books cited have been submitted to frank schoolboy criticism.

As the "classics" normally form part of regular school work, it was judged best to omit them from a list of "outside" reading. The few recent publications included are those which were found especially well adapted to the purpose in hand.

School life—

Tom Brown's Schooldays, Thomas Hughes.
Vice Versa, F. Anstey.
The Hill, H. A. Vachell.
Jeremy, Hugh Walpole.
The Tennessee Shad, Owen Johnson.
The Jester of St. Timothy's, Arthur S. Pier.
Stalky and Co., Rudyard Kipling.

The sea—

Mr. Midshipman Easy, Captain Marryat.
Tom Cringle's Log, Michael Scott.
Two Years Before the Mast, R. H. Dana.
Moby Dick, or the White Whale, Herman Melville.

The Cruise of the Cachelot, F. T. Bullen.
 A Year with a Whaler, W. N. Burns.
 The Wreck of the Grosvenor, W. Clark Russell.
 The Captain of the Kansas, Louis Tracy.
 Captains' Courageous, Rudyard Kipling.
 Dory Mates, Kirk Munroe.
 Out of Gloucester, J. B. Connolley.
 Youth, Joseph Conrad.
 The Nigger of the Narcissus, Joseph Conrad.
 Naval Occasions, "Bartimeus."
 The Mutineers, C. B. Hawes.
 Lost Ships and Lonely Seas, R. D. Paine.

Travel and exploration—

In the South Seas, Robert Louis Stevenson.
 Mystic Isles of the South Seas, Edward O'Brien.
 Through India and Burmah with Pen and Brush, A. H. Fraser.
 Across Australia, Spencer and Gillan.
 The Old Transport Road, A. Melrose (South Africa).
 South! Sir Ernest Shackleton.
 Journal of Captain Scott.
 (The two preceding books deal with the South Antarctic Continent.)
 Four Years in the Arctic, Donald MacMillan.
 Voyage of H. M. S. Beagle, Charles Darwin.
 Policing the Plains, R. G. McBeth (Canadian Northwest).
 Campfires in the Canadian Rockies, R. Hornaday.

Locality—

(Books in which the setting has a special significance.)
 Old Times on the Mississippi, Mark Twain.
 Roughing It, Mark Twain.
 The Virginian, Owen Wister.
 Robbery Under Arms, Rolf Boldrewood.
 The Raiders, S. R. Crockett.
 Black Rock, Ralph Connor.
 Doctor Luke of the Labrador, Norman Duncan.
 The Mirror of the Sea, Joseph Conrad.
 The Blazed Trail, Stewart Edward White.

Animals—

Wild Animals I have Known, Ernest Thompson-Seton.
 Bob, Son of Battle, Alfred Ollovant.
 Grayfriar's Bobby, E. S. Atkinson.
 Black Beauty, Anna Sewall.
 Jock of the Bushvelt, R. Fitzgerald.
 A Dog of Flanders, Louise de la Ramee.
 Rab and His Friends, Dr. John Brown.
 The Call of the Wild, Jack London.
 Lad—a Dog, Albert Terhune.
 Scally, Ian Hay.
 The Bar Sinister, R. H. Davis.
 Wild Brother, W. L. Underwood.
 The School of the Woods, R. Long.

Adventure—

King Solomon's Mines, H. Rider Haggard.
 Soldiers of Fortune, R. H. Davis.
 The Prisoner of Zenda, Anthony Hope.
 The Wings of the Morning, Louis Tracy.
 The Great Impersonation, E. Phillips Oppenheim.

Historical novels—

(The dates indicate the approximate periods in which the action takes place.)
 The Count of the Saxon Shore, Alfred Church.
 Close of the Roman Occupation of Britain. 412.
 Hereward the Wake, Charles Kingsley.
 The Last Stand of the Saxons against the Normans. 1070.

- Richard Yea and Nay, Maurice Hewlitt.
 A Study of Richard I, the Lion-Hearted. Some period as *Ivanhoe*. 1190.
 The White Company, Sir A. Conan Doyle.
 England and Europe at the Beginning of the Hundred Years' War.
 1360-70.
 The Cloister and the Hearth, Charles Read.
 Dawn of the Renaissance—Europe. 1470-80.
 The Black Arrow, Robert Louis Stevenson.
 England Just before the Wars of the Roses. 1480.
 Westward Ho! Charles Kingsley.
 The Reign of Queen Elizabeth. 1560-88.
 Master Skylark, John Bennett.
 Shakespeare's London. 1600.
 Old St. Paul's, Harrison Ainsworth.
 The Plague and Great Fire of London. 1665-6.
 Lorna Doone, Richard Blackmore.
 Western England and Monmouth's Rebellion. 1670-90.
 Henry Esmond, William Makepeace Thackeray.
 Early Eighteenth Century; Reign of Queen Anne. About 1700-13.
 The Seats of the Mighty, Gilbert Parker.
 Struggle of France and England for Canada. 1750.
 The Scarlet Pimpernel, Baroness Orczy.
 French Revolution. About 1793.
 The Broad Highway, Geoffrey Farnol.
 Social Life; Late Eighteenth Century.
 St. Ives, Robert Louis Stevenson.
 Napoleonic Wars. About 1800.
 Rodney Stone, Sir A. Conan Doyle.
 Early Nineteenth Century—the "Regency." 1810.
 Ramona, Helen Hunt Jackson.
 California in the "Forties."
 On the Face of the Waters, F. A. Steele.
 Life in India—the Indian Mutiny 1857.
 Uncle Tom's Cabin, Harriet Beecher Stowe.
 The South before the War.
 Red Rock, Thomas Nelson Page.
 The War and the Reconstruction Period.

Humor—

- Huckleberry Finn, Mark Twain.
 Three Men in a Boat, Jerome K. Jerome.
 Many Cargoes, W. W. Jacobs.
 Spanish Gold, George Birmingham.
 Abroad at Home, J. L. Street.
 Nonsense Novels, Stephen Leacock.
 Three Men and a Maid, P. G. Wodehouse.

Miscellaneous—

- Everyday Adventures, S. Scoville, Jr.
 With the Men Who Do Things, A. R. Bond.
 Romance of Modern Inventions, Archibald Williams.
 Flame, Electricity, and the Camera, Geo. Iles.
 Thomas Alva Edison, S. A. Jones.
 Chemistry of Common Things, R. B. Brownlee.
 Half Hours with the Stars, Mary Proctor.
 Buccaneers and Pirates of Our Coasts, Frank R. Stockton.
 Home Radio, How to Make and Use It, A. H. Verrill.
 Harper's Aircraft Book, A. H. Verrill.

Short stories—

- The Outcasts of Poker Flat, etc., Bret Harte.
 Soldiers Three; The Day's Work; Puck of Pook's Hill, Rudyard Kipling.
 Main Travelled Roads, Hamlin Garland.
 Pierre and His People, Sir Gilbert Parker.
 The Adventures of Sherlock Holmes, Sir A. Conan Doyle.

The Four Million, O. Henry.
Thirty Strange Stories, H. G. Wells.
Tom and I on the Old Plantation, Archibald Rutledge.
Tales of Our Coast, "Q."
Ghost Stories of an Antiquary, M. James.

Poetry—

(Experience with the following selections has shown that it is possible to interest normal boys in good poetry in a normal way.)
The Ghost Heath Run (Reynard the Fox), John Masefield.
The Story of a Roundhouse, John Masefield.
Collected Verse of Rudyard Kipling.
Tales of the Mermaid Tavern, Alfred Noyes.
Rhymes of a Red Cross Man, Robert Service.
Modern American and British Poetry, Untermeyer.

The following books have been found useful for boys who wish to write for their school papers, or who are interested in writing generally.

The Short Story, Albright.
Short Story Writing, Barrett.
The Plot of the Short Story, Phillips.
Self-Cultivation in English, Palmer.
A Study of Prose Fiction, Bliss Perry.
Essentials of Poetry, Cross.
Handbook of Poetics, Gummere.

OPPORTUNITIES IN JUNIOR HIGH SCHOOL LIBRARIES

LAURA GROVER SMITH, LIBRARIAN OF THE VIRGIL JUNIOR HIGH SCHOOL,
LOS ANGELES, CALIFORNIA

The Junior High School Library plays its part in the general scheme of the junior high school plan, it works for the same objectives and shares the same opportunities. As is well known, the plan originated in California, and was first worked out as feasible in Los Angeles. There are at present eight schools of this kind in the city, two are ready for next year, and five more are to be built from the last bond issue. The librarians in all high schools rank as teachers and are subject to the same laws governing salaries, vacations, and retirement.

As some of you may not be familiar, other than theoretically, with the junior high school plan, I may be pardoned for using the various "objectives" as a series of texts.

Retaining ninth grade children in the Junior High School is to start them far on the way to a higher education, and has prevented the exodus at the end of the eighth grade which was formerly a discouraging feature. *This saving of children for the higher schools is perhaps the first great achievement of the plan.* To accomplish this, it was found necessary to vitalize education. The library has aided in this, by direct reference work and in supplying illustrative material of all kinds, making the daily lesson a picturesque thing, a reality based on things that are.

For example, in the study of geography there is infinite material about the great natural and artificial water-ways of the world, the commerce of countries and the way people live. Geography is no longer only a glib

recitation of the capitals of the world, with maps of wavy ocean lines and series of parentheses for mountains. We have to compete with the movies in the way of visual education, and the school librarian should be as keen a gatherer of facts as the editor of a newspaper, and as efficient in presenting them to her voracious readers.

The Junior High School age is what my mother called "the apple core and book age." There is no other time in life when reading gives such keen pleasure, and no other time in life when education can be so pleasantly disguised as these three junior high school years, the seventh, eighth, and ninth grades.

Besides, reading the inevitable and desirable stories, this is the age when a child glimpses gallant and high-minded living by reading biography—the story of General Gordon Hawkes "Hitting the Dark Trail," "Roosevelt, the Happy Warrior," and many others. He learns of interesting experiences by reading "Ten Thousand Miles with a Dog Sled," "The Story of New England Whalers," "The Romance of Aircraft," and something of science in Mitton's "Story of the Stars," and acquires a new angle on mathematics, in Dr. Smith's "Number Stories of Long Ago." He sees great events afresh in Hall's "High Adventure," and in achievement what can be more fascinating than the Curtis book "The Flight Across the Atlantic."

The junior high school provides a better provision for the gradual transition from the elementary to the high school. It was found that the average eighth grade child was too young physically and mentally for association and competition with older boys and girls. Ninth-grade children who remain in the junior high schools make a better showing in the tenth grade, having had one more year of individual supervision. Entering the seventh grade is the first "grown up" step in a child's life, therefore, this year of encouraged reading is of great benefit to the child; he is still young enough to be guided.

It does not often happen that a boy does not care to read, but occasionally one does not, and if he can be persuaded to read one book, and the choice has been a happy one, a reader has been made, and life has been made more interesting for not only that boy, but his group.

In this transition age, the librarian must supplement the card catalogue. No matter how many analytics are made, she is still a librarian plus the card catalogue, and in the high school it may be and should be, the card catalogue plus the librarian. John and Mary become Mr. Brown and Miss Jones in the high school, but in the junior high they are still little boys and girls, and must be helped to think—the librarian is building bridges all day.

Another objective of the junior high school plan is the adapting of the course of study to the individual needs of adolescent youth. The library aids in this by supplementing the usual course of study and suggesting ways of adapting new material. In connection with the new note in education, the possibility of the "beyond average" child advancing along individual lines is assisted by the librarian's oversight of his reading. As there are

men and women who attain more culture and acquire more general information, so there are children with a like facility, and added opportunities should be furnished them.

The normal group of children quite naturally find the average in books, and as we have the super-normal, we have also the more or less subnormal group, with its claim for special books.

One of our greatest pleasures is working with the English teachers—we seem to have much in common and reach the same objectives by much the same roads. I recall one teacher who teaches the children to love the books they are required to read. Her class was reading a Shakespeare play when one of the little girls came in to find out, what “Love lies a-bleeding” was. With some research we found it was a flower. The class had been finding the flowers mentioned in the play, and in that way had learned to know the background of beautiful old gardens and the hedges and woods of England, which Shakespeare looked upon.

In connection with the coöperation of the departments of the schools and the librarians, the junior high school librarians of Los Angeles have recently compiled a list of books of about 1800 titles which I think is the first one definitely arranged for this new departure in schools. It shows the gradual approach from the elementary to the high schools with the necessary overlapping at each end. The preparation of this list was a revelation of the individuality of our various junior high schools. The classification was divided among us, and we proceeded to put on the list the books we thought useful. There was great difference of opinion, and in this way, we were able to arrive at a somewhat basic list, by a process of elimination and addition. It is a limited list, many of the best books we have are not in it, but it is at least tentative and suggestive, and because compiled by a group is general in character.

The possibility of enforcing more suitable discipline for children of the ninth-grade age is obviously an advantage in the junior high school. In this, the library also functions with the school. The librarian has many ways of reaching the child, and is frequently able to give a bit of kindly advice, which a boy will accept. The fact that she has been able now and then to help him over a rough spot in his studies makes him sufficiently grateful and appreciative, to be willing to accept a suggestion as to morals and manners. The library being a place of special privilege, it is easy for the librarian to point a moral by withdrawing the library privilege.

There is no doubt about the library and concentration—as a boy said to me one day “When a boy is reading, he is just as good as dead.” I know of nothing that diverts a group of reading boys except the arrival of the *Radio News*. If I pass through the room with the latest number, they rise here and there like fish to bait, asking for the first privilege. Likewise, when I have a number of new books, both boys and girls seem to know it by subconscious mind and find their way to the shelf, almost in a trance.

I wonder what there is about bound volumes to make them so delight-

ful—I remember when we were children, the old volumes of Harpers were enchanting. Our school children read the bound volumes of the National Geographic, Popular Mechanics, Outlook, and Literary Digest, with as much pleasure as they would stories.

"Exploratory Opportunities" is the somewhat generic phrase familiar in Junior High Schools that defines opportunities made for the side excursions of the child's mind. It is the age of ideals, of dreams, of imagination, of experiments, and a constructive sense which is mixed with a love of adventure. This mind traveling would not be possible without the library. In these magic years the child finds himself in a great field with freedom to wander—a few years later his vision narrows with the definite aims of life and successful education must go in paths. As some have said this is the age one teaches children—a little later one teaches subjects.

Our scientific magazines are torn into shreds and tatters—we take *Scientific American*, *Popular Science*, *Popular Mechanics*, and *Radio News*, and at the end of the month, there is nothing left to bind, but all that scientific information has found its place in the active minds of the children, and we take extra copies for binding.

Still another objective, in the Junior High School, or perhaps advantage better expresses it, is a social one. Teachers are able to come nearer the children, and so nearer the parents with children of this age. Our library is the common meeting-ground—1100 children are assigned to the library twice a week, and may come for special reference at any time with permission from the teacher. Consequently we know them very well, having met each one at least twice a week during the seventh, eighth, and ninth grades.

Whether a child is conscious of it or not, there is a continuing influence, and he must, with no effort on his part become a reader of books. Such systematic exposure to the atmosphere of books, must leave a permanent impression. School libraries are feeders of the Public Library, as an army of trained readers go out from the schools each year.

The parent-teachers in our school have a friendly feeling for the library—every year they give a tea in the large room—about the time our new books are on display. I am usually asked to talk a little on our work and the books. The consequence is, that the mothers realize something of the collateral influence the library has in the school and are reassured as to what and why their children are reading. The reaction from this is that I have many requests as to what books are good for Johnny's birthday and Christmas presents.

This so-called pre-vocational age is the time of reading and formulating ideals. Not that these children are being pledged to certain vocations—they are simply having spread before them the range of human activities. There was a pre-vocational survey made in our school recently with the interesting revelation that more than half of our 1100 children expect to go to college and a large proportion have decided on professions implying a college education.

All Junior High School librarians have children as assistants, and in addition to the five periods of work each week, one period of instruction along this general outline is given, on the structure and history of the book, simple classification and the card catalogue, magazines, and the Readers' Guide—the dictionary and encyclopedia, special reference books, and something about the editors, publishers, and libraries of the world. After a lesson on simple classification and a talk on the card catalogue, one of the boys came to me and asked "Was Callimachus anything like Dewey?" I confessed to knowing something about Mr. Dewey but nothing about Callimachus. He, however, informed me that "the guy Callimachus was the librarian of the great library at Alexandria and made a classified catalogue of the books," which afterwards I learned is all we know of its priceless treasures.

Our lesson on the dictionary revealed many surprises and delighted the class—especially about the retirement of old and the making of new words—aviate, nose dive, hangar, shoot, camera, and now, broadcast, jamming the ether, and hook up. Real estate agent and insurance agent have recently been scrapped, and the dignified insuror and realtor taken the place. Hike and joy-ride are in the last Funk and Wagnalls dictionary—the latter gravely defined as "a ride taken in some one else's automobile, usually at a high rate of speed."

Another of my boys, so his father tells me, thinks that the library economy would be greatly improved, if the publisher would stamp the classification number on the back of the book and on the title page when it is published! This opened endless possibilities. The publishers might send the skeletons of their books to a committee of the American Library Association, who would classify them as is done in the book list—and how it would simplify everything if catalogue cards could accompany each book! That is too much to dream—but the fact of the boy thinking of it was interesting.

At the suggestion of one of our teachers we are starting something new, a teachers' library class. They come at the lunch hour and have their lunch in the library, and we talk about library things, the classification, and brush up on the card catalogue, about our magazines and recent articles, something of publishers and editors, library news, and late books. In this mutual interchange we are helping each other, and next year we think it will develop into an interesting symposium with an occasional outside speaker. Each term we hope to have, perhaps, four or six of these meetings.

It is a sensitive age with children "where the brook and river meet." The librarian who is obviously not over the child, as one who is trying to make him work and marking him for the ability to do that work, has another kind of influence and a grave responsibility. To paraphrase—what a child readeth so he thinketh.

It is a shining opportunity to be in at the character moulding of children. One sees beautiful expectant youth with eyes toward an unseen goal—as he attains it he will receive the gifts of wisdom and understanding, the knowledge of good and evil, and on the way will write his own page in the Book of Life.

THE STIMULATION OF OUTSIDE READING AMONG HIGH-SCHOOL PUPILS

HELEN W. COSGROVE, INSTRUCTOR IN ENGLISH, HORACE MANN SCHOOL,
TEACHERS COLLEGE, COLUMBIA UNIVERSITY, NEW YORK CITY

What children, especially children of high-school age, shall read outside of school and how they shall be encouraged to read more and better books are questions that are challenging every one at all interested in children and books. Mine, naturally, is the teacher's viewpoint, and I should like to present to you for consideration, and possibly discussion, some conclusions I have reached in regard to the stimulation of outside reading among high-school pupils. First, the purpose of reading is fun and more fun; second, the major purpose of an English teacher is to make reading fun, and in order to do this she needs to be a book expert; third, the way to stimulate children to read is to help them find fun and more fun of an increasingly higher type.

First, the purpose of reading is fun and more fun. I have used the word "fun" purposely instead of our more academic term "pleasure." Can you remember when you first read Robinson Crusoe, or Little Women, or David Copperfield? Wasn't it fun to live with the characters, to laugh when they laughed, to cry when they cried, to do brave deeds or have thrilling adventures? Didn't you ever rise from extreme poverty to the epitome of luxury, overcoming innumerable obstacles with an Alger hero; or go through innumerable colleges with a Patty or a Frank Merriwell? Haven't you fought battles with Ivanhoe, walked to the guillotine with Sydney Carton, mourned the lost gold with Silas Marner, and rebelled with Carol Kennicott, or agonized with Alice Adams? Wasn't it fun? On the other hand, can you remember when you first looked up all the new words in the first three chapters of "Treasure Island," studied the paragraphs, bisected the chapters, and trisected the plot until the joy was gone out of it? How you gradually came to build a wall between the books you read in school and those you read by yourself for fun? The last situation is undoubtedly exaggerated, but the fact remains that children do regard reading in school and outside of school as two entirely separate activities.

In the early part of May candidates for admission to Horace Mann in the following year present themselves with their credentials for examination, and members of different departments meet them and question them, to find out if they are fitted for the work of the department in that particular grade. Among the candidates last year was a little girl, aged fifteen, whom we will call Marjorie for convenience, accompanied by her mother. When I asked, "Do you like to read?" I got an enthusiastic affirmative. "What do you read?" "Good books, the classics," came in affected tones accompanied by approving smiles from mother. "What do you mean by good books?" Marjorie started to explain, but her mother interrupted, "Aren't you acquainted with the classics? I should think it was your place to know," and launched into a lengthy description of the complete set

of the World's Best Literature, which she had just purchased. Later, when Marjorie handed in her written work I had a chance to ask another question. "What do you read just for fun?" Her face brightened. "Oh, my brothers' books, the Boy Scouts Series, they're great; and I just love Swiss Family Robinson. *Ivanhoe* is great, too. I like knights and fighting." Then she added "That is a good book, too."

That term "good book" I somehow find objectionable. It has an insincere, snobbish connotation and suggests an arbitrary separation into sheep and goats. It doesn't seem to me culture is as simple a thing as having read a certain list of standard books, the Five-foot Bookshelf of advertising fame, for instance. It seems to me that the essential thing is an honest taste for reading just books, and a good book will be a matter of self-determination on the part of each individual. It is a term very much qualified by the time, place, and person. For little Johnny from East One Thoity-thoid Street, coming to me in the summer session, "*The Motor Boat Boy*" was a very good book. He could think and talk nothing but boats and motors, so we thrilled over Jack and his pals on the motor boat where something happens on every page. We agreed that thrilling things happen on the sea and I suggested "*Captains Courageous*." For two days there was silence. Then came remarks. "Gee, that fellow likes boys, don't he? Did he write more stories like that?" I had to admit no more sea stories just like that, but put several volumes of Kipling in easy reach. However, near the Kipling lay a volume of Terhune, "*Bruce, a War Dog*." That went the rounds and the cry was for more animal stories. The hope would be that the Motor Boat Series was a thing of the past and that he was ready for a classic, but he probably wasn't. However, those boys found their books sincerely good, and tested both books and authors by a safe and honest standard—their nearness to life.

Academically we may raise our eyebrows at Zane Grey, but he has given many an eastern boy his only acquaintance with cowboys and ranchers on the western plains. John Fox, Jr., has made many of us who might never have the privilege or opportunity know the mountain folk of the South. Mark Twain has left none of us unable to experience the feelings of a real live harum-scarum boy. If breadth of mind means the taking into consideration of other points of view, then these books certainly widen the experience. Honore Willshire's "*Enchanted Canyon*" may fall short in many respects of becoming a classic, but the reader is entertainingly informed about the Grand Canyon and about a great deal of the work of the Department of the Interior. History books can give all that, but you know that facts, situations, and problems that form the background of a gripping story are more real and consequently more lasting.

Seeing one of Ralph Barbour's books on the desk of one of the boys in the summer school, I asked, "Why do you always read Barbour's books?" "Because I like the fellows in them," came the answer. "Why do you like them?" "Because they always play square. They do the right thing." Sam and a great many others are at the point where they like their heroes

perfect, and the villains must always be properly punished. From that point of view actions are judged; but the very fact that the young readers begin to judge actions, even from so obvious a standard, is a point in favor.

I do not mean by all this that I do not make any distinctions between books. I most certainly do, and I think the fun in the game for the teacher is helping the child to find those distinctions, but I have come more and more to believe that if we are going to stimulate children to better and better reading, we must meet them on their own level whatever it is, and help them climb up. My girls of three years ago put the case rather aptly and the phrase still clings in the classes. After a time they began to dub many books that were reported on "ice cream stories," and explained the phrase by saying that some books were very nice while they lasted, but they left only a flat taste afterwards. So we began to look for books that had the fun of the "ice cream tale," but which in addition gave us something fine and real beside. Some of the booklists prepared by those classes, I think, show that some at least are climbing up to pure, intellectual fun in reading.

Is there any one who hasn't had the experience of being asked all in five minutes, "Where can I find some good sea stories? I like books with lots of fights. What's the name of a good detective story? My mother says ghost stories aren't good for me to read. Why not? Did you ever read any of Ethel Dell's books? Who wrote some good stories about the French Revolution?" I think it's a not unusual occurrence for many of us, and it is the reason for my second contention—the English teacher needs to be a book expert.

It goes without saying that we must love to read and have read much, and that our reading must be catholic. I'd like to add here, if I may, a very necessary postscript to an English teacher's background, I think it may well be a prayer—"Dear Lord, let me never forget the books I read in my youth, classic or no; and let me never forget the thrill of a first attack on a thoroughly good story." For if we have forgotten the first joy of "Tom Sawyer" or "Treasure Island," can we ever share it with a group? An English teacher can't afford to let good stories become old stories.

"Keeping up with literature," when 100 wide-awake girls set the pace, I find is no small task, though I had thought that I read quite a little. With limited time, then, what is the best way to know all the available material? There are many aids that I'll name over, though probably most of them are familiar: The publications of the High School Librarians' Association; the A. L. A. "Booklist"; "The Children's Bookshop Lists" (published by the Women's Industrial Union, Boston); the "Boy Scout List"; individual lists of various schools which one gathers from one's locality. Let me say in passing that such lists are primarily for the teacher and not to be placed promiscuously in children's hands.

Current literature is just as important "to keep up with," especially when one considers the number and popularity of magazines published. One class of thirty girls last March reported over 100 magazines read in

their homes. Of course it is impossible to know and read all, but one should have the monthly habit of dropping in at the library and reading the best standard ones. Other helps for keeping in touch with the newest in literature are the book reviews in the papers (Saturday edition of the *Evening Post* and Sunday *Times* and *Tribune* in the vicinity of New York); book reviews in magazines, such as the *Atlantic's Bookshelf*; book ads in magazines, where full reviews and quotations from reviews are frequently given; publishers' catalogues; and lastly, the *Booklist*, published monthly by the A. L. A.

Now, for the third point. How is one going to help children to find more and more fun of an increasingly high type? Three years ago I started in my present position, and one of the first questions raised in my fourth-year or Sophomore classes concerned outside reading. Was I going to require outside reading? How many a month would I require? Would I post lists? What kind of written reports did I want? One of the very few instructions I had received as a new instructor was "encourage them to read." My experience in the past with posted lists and lengthy reports had not been too satisfactory. To the first question I countered, "Aren't you all reading anyway?" "But those don't count," was the answer. "Why not? Why shouldn't they?" Would I count them? Before I could consider an answer, "Let's not have reports; let's talk about them instead," came. And so what amounted to a book forum started, in which we mutually discussed the books we'd read and tried to pass on the best of a story that had thrilled us so that the rest would want to thrill too. It was in this connection that the phrase "ice cream story" started after a number of best-sellers, so-called, had proved thin and flat discussion material, and of a remarkable sameness. Gradually through the free, and sometimes alarmingly frank, discussions, standards began to evolve, which, though they did not prevent or cure light reading, caused it to be evaluated almost invariably at its true worth.

Most of the success of this beginning venture with outside reading, I lay to the fact that the first book on the list for class study in that year was the "Tale of Two Cities," which is most admirably adapted to group discussion, and that, after all, is only the kind of conversation we all like best. The class work almost invariably colors the outside reading somewhat, if not in type, in author. For instance, the fire of revolt in Dickens' tale led to more stories of that period—"The Reds of Midi" and "The Scarlet Pimpernel," even to some reading in Carlyle's history, which I slipped on to the class reserve shelf; spread out into stories about France and by French authors; and eventually was replaced by reading of dramas, because the class work had marched on through some Shakespeare, "The Rivals," and "Beau Brummel," by Fitch. That in turn gave way to the making of short-story bibliographies when our class book was "Atlantic Narratives" (second series).

Since we were spending so much time and thought on this reading the need arose for some way of keeping track of it in order to give credit.

The regulation library card was finally adopted as being most convenient for the girls and for me. It was easy to check and easily taken care of, for many girls began to keep individual lists in card boxes. At first it was filled out bearing the following heads: Title, author, setting, characters (important only), plot (one sentence), and comment. Very soon, however, it came to bear beside title and author, only the comment, the argument being that was the vital part anyway.

What I have just described of one group was more or less typical of the others, for of course the idea spread and has persisted. To have the reaction the same is to expect what we all know is impossible in dealing with human beings; but the principle of free and informal discussion in class groups has remained. Instead of individual lists, with a posting from time to time of class lists, this year each class kept a box in which all the groups filed their cards for the year, and that box was accessible to any member who wished a suggestion for something to read. One group this year introduced the discussion of movies and plays the members had seen; another became interested in the writers of the books, an interest that led into reading biographies; still another freshman group, having become interested in the word "bibliography" pursued the making of bibliographies for several months. The discussions that attended this interest and the resulting widespread reading were gratifying. That same group started and conducted during this year a circulating library which they called the green vegetable department, in contrast to the guaranteed canned goods to be procured in the school library. Need I say the books were largely modern? The initiation fee was a book; one borrowed them at five cents a week.

Although the group work just described was the biggest single part of the problem of outside reading, there were many other helps, all of which you are no doubt in the habit of using. An illustrated edition or an especially well bound edition of some story brought into class and talked over, rarely fails to bring a response and creates in many a desire for ownership. A reserve shelf in the library, or in some easily accessible spot if the school has no library, is another help. Finding a shelf of interesting books, relating to a class discussion, right at hand frequently starts an interest that might never have come to life if one had to hunt the shelves over to locate material; and the interest is later often voluntarily pursued.

Before leaving the point altogether, I want to say an especial word about poetry. Young people frequently have an aversion to it as being difficult to understand, but that doesn't happen if they hear it first and learn to like it that way. For adults even, poetry is best read aloud, and where read silently the one who is enjoying it is constantly aware of its aural qualities. So if we would have poetry on their book lists and shelves it is my belief we must read it aloud and have it read beginning with those in which the rhythm is strong and the story easy, like Noyes's "Highway Man," Kipling's "Ballad of East and West" or "Gunga Dhin." Collec-

tions such as "Poems of Action," Jessie Rittenhouse's Anthologies, or "One Hundred Narrative Poems" (Lake Classics) are good for desk and reserve shelf. Poetry, more than any other type of literature, it seems to me, requires of us that we meet the individual on a common level, make the joy and the fun most apparent, and climb up with him.

The big point then that I would like to make in this connection is the one I stumbled on by accident. The most successful way to stimulate reading by children is to get into the fun with them, thrill with them, laugh with them; help them carry on and carry on with them the kind of conversation we all enjoy most—a give and take of opinions of the books we read and the plays we see. That is what they are going to be doing when they leave school rather than analyzing paragraphs and outlining plots. So I would like to conclude with the ideas with which I started: the purpose of reading is fun and more fun; the major purpose of an English teacher is to make reading fun, and in order to do this she needs to be a book expert; the way to stimulate children to read is to help them to find fun and more fun of a higher type.

TRAINING FOR SCHOOL LIBRARIANS

RUTH TOBEY, TERRE HAUTE, INDIANA

In the development of school libraries, one factor looms large—the necessity for a well-trained, able person to administer the school library. The committee on Library Organization and Administration of the National Education Association has given us standards for the qualifications and professional requirements which are necessary to produce this well-trained, able person. Its report states that the librarian of a high school should have a college or university degree and one year post-graduate library training in an approved library school, that the librarian of a junior high school should be a normal-school graduate with college or university training in addition and be a graduate of an approved library school with special training in children's work. These are admirable standards and we should work for their adoption wherever possible. In some States it is useless to urge their adoption, for the qualifications for teachers are not that high. In those States one cannot expect the school authorities to insist on these requirements for their school librarian, even were there an adequate supply of qualified librarians to be had.

Furthermore, there are many small high schools in communities with no public library, or, at least, no adequate one, where the school authorities are awake to the possibilities of a school library and eager to institute one or improve the one they already have. But their school funds do not permit them to hire a thoroughly trained full-time librarian.

What can be done to meet such a situation? Being in the work I am interested in what normal schools are doing and can do for high schools and grade schools in the small communities with no adequate public library facilities and with no funds for a full-time highly qualified school librarian?

Are we going to let things drift and see the school stenographer or an especially bright high-school graduate take charge of the library, or are we going to prepare teachers and prospective teachers to take part-time jobs as school librarians? If the latter, what can the normal schools require of these students?

In the first place, we can substitute for the library-school course recommended by the committee technical courses covering cataloguing, classification, library economy, book selection and evaluation, use of reference books, indices, and library helps, care and loaning of books, equipment and administration of a library, and how to instruct children to use and enjoy books and libraries, given by a competent library staff.

Granted that the students in these classes will go into small school libraries as part-time librarians, the instruction in these subjects should not only be limited to the scope of school library work but all the processes taught should be simplified with the idea of a small library in mind. By eliminating non-essentials, the handicap of the shorter time given to this work will be diminished.

In the second place, the normal school should give credit for practice work in the library field, this to consist, first, of reference work with children, and any other phase of library work in the children's department under the supervision of the normal librarian who has charge of the work with the children, and, second, of practice in teaching the use of books and libraries to the children of the training school.

As to academic requirements, the fact that the librarian is part-time teacher will insure the minimum State requirements for teachers. But the mere diploma is not enough, the choice of subjects that lead to this diploma is very important. In the first place, what courses in education will help the prospective librarian?

Her work in education should include a study of methods, first of all, not only that she may intelligently meet the teachers on professional grounds, but that she may be able, for example, to correlate the teaching of Readers' Guide with the work in civics and history, that she may make the library a vital part in the various project problems undertaken in her school. Then she should study curricula, for in order to administer her library successfully, she must know the curriculum of the modern school and especially her own.

Literature is, of course, another subject of primary importance. Authorities are generally agreed that literature is the best major for a teacher-librarian, for teaching literature and administering a school library go together logically. In this literature work a course in children's literature is highly desirable. Whether a junior-high school librarian or a high-school librarian, a knowledge of the folklore, fairy tales, fables, and heroic stories of all ages is essential for a thorough appreciation of literature.

History is another subject, the knowledge of which is necessary for the efficient school librarian. And as history these days is taught with an emphasis on economic and social problems, courses in economics and sociology should be required. Child psychology or educational psychology

is a course generally required of all prospective teachers and is another fundamental subject for the librarian.

I can hear many of you say—this is all very well but how can you require all these subjects of people who already have so much required work to take in order to get their teaching certificate? This is a problem and a rather difficult one at that. But if there is any virtue in teacher-librarian courses, is not this the time to study what should be included in such a curriculum and then, in the event of changes in the general normal school curriculum, put in our plea at the proper moment for an adjustment whereby these subjects can be required?

I am strongly convinced that in normal schools are many opportunities for the solution of problems relating to curricula of school librarian courses, for the teacher's viewpoint and knowledge of educational technique so necessary for our school librarians, is there, right at hand.

THE CHILD'S OWN READING

FREDERIC G. MELCHER, CHAIRMAN OF THE "CHILDREN'S BOOK WEEK"
MOVEMENT, NEW YORK CITY

If there is truth in the saying that there must perpetually be a race between education and catastrophe, we will all agree that it is the children who must be groomed for the race. Opinions may differ, however, as to the regimen to be offered to the young people, the character and theory of coaching, and also as to the value of children's own theories of preparation. The catastrophe which is to be avoided is not wholly food shortage, but, what we fear even more, a lessened vision or a decreased faculty of leadership.

A short time ago I was visiting a Western library and was to be shown a collection of books that had been gathered for a Children's Book Week display, a collection to show how much foreign countries had contributed to our reading heritage. While the bookcases, which were in the back of a lecture room, were being opened, I heard a teacher talking to a University Extension Division about Browning's life and education, emphasizing the fact that Browning's education had been personal and informal and not in class groups. This, the teacher thought, gave new emphasis to the old saying that the ideal education consisted of Mark Hopkins at one end of the log and a pupil at the other. If there is any pedagogical saying that gives me continued irritation, it is the Mark Hopkins' anecdote—the argument that only by individual tutoring can genius be developed. Such conditions of teaching will never exist, and one wonders whether we must forever consider our class groups as a handicap to effective education. I could not but think as the teacher spoke, that if there had been children in the room instead of advanced students they could have turned to those book shelves and found a way to every part of the globe, to every literature, to every type of writing. Surely with such chance for individual en-

thusiasm and development as can come from open-shelf reading, there need be no fear of levelling, or that bright minds must be pulled down to the speed of dull ones.

If we can but develop in our classes the *habit* of general reading while we are teaching the ability to read, there need be no handicap to individual growth. Turn for example to the book-list on the ballot for the Two-Foot Book Shelf, which has been in your hands today. Cannot a future leader of national affairs get inspiration from "The Hero Tales of American History"? Cannot the boy with the pull of the sea in his veins get some sense of its power from "The Cruise of the Cachalot"? Cannot the girls who are to be our home-makers get some conception of the fineness of real home life from "Little Women"? Or cannot the future business man see more clearly the characteristics of good human judgment in such a volume as "The Autobiography of Benjamin Franklin"? Open-shelf reading in school might be called the cafeteria method where we put some reliance on the taste and palates of those who come by the table. It is for us to see that the menu is balanced and that the cooking and ingredients are good.

This morning's papers record prominently that this Conference has gone on record in favor of an International Educational Congress to be held next year, a congress which will emphasize anew the binding power of schools and of books. Perhaps the ground work for such a getting together of nations has already been laid in the children's reading. Are not the picture books of Boutet de Monvel, of Caldecott, or of Larsson giving the children an insight into the ways of other countries? Are not stories such as "Heidi," "Pinocchio" or "The Story of Mankind" giving them knowledge into lands afar? Are not the older ones through such books as "The Three Musketeers," "David Copperfield," or "Lorna Doone" getting some conception of the lives of other nations? and will not these open-shelves of the literature of other nations grow steadily until our children shall have become internationally minded and internationally tolerant? This school book-shelf will not only grow in its own capacity but also through the school's ever increasing contact with the book collections of the public library and of the growing interest on the part of both schools and libraries in the increase of home book collections.

In order to increase the coöperative power of the different groups interested in the increase in reading Children's Book Week was first developed. In four years the movement has grown to be of national importance among all those who work with children, and has also increased the genuine interest of the boys and girls themselves. It was four years ago, at a convention on this same Copley Square, that Franklin K. Mathiews, chief librarian of the Boy Scouts of America, first suggested this plan. It was my privilege to help in its development by having close contact with booksellers and librarians, and a personal interest in the matter as a parent. The book publishers of the country, who are leading the world in the amount of intelligent interest paid to children's needs,

were from the start actively coöperative and supplied the larger part of the funds needed for supplying material and covering the office expense.

We are asked sometimes why such an effort should be encompassed in a "Week." There is a little feeling today that "weeks" are not so effective medium as once they were, but it should be remembered that while we all want the increase in children's reading to be a year-round growth, still it is impossible to capture the public's attention through the newspapers over a long period. In a "Week" it is possible to get all interested groups together and to introduce into the event some of the play spirit that will dramatize the idea in the minds of parents and children. November is selected for the date because the new books are out in greater numbers at that time and new books are stocked in larger quantities and a fresher display seen at that time, for the Christmas season is just ahead, the best time to get increases made to children's home libraries.

Children's Book Week has certain characteristics as a promotion effort that I should like to emphasize. In the first place the plan has complete flexibility: the Committee in charge, which is made up of representatives of many interests, has no fixed program for all communities, and any idea that will work is a good idea to encourage. The Committee is able, by its circulars, to pass the good ideas from one place to communities where it can be of increasing value. Each year we need new suggestions and plans to give new aspects to the movement. In some communities they call the occasion "Good Book Week" so that the older boys and girls do not feel excluded. In some cities the movement takes on a full community aspect, in others it is only one section or group that gets started to use the occasion to its full advantage. Secondly, the movement stands for no standardized list of children's reading, although it encourages the publication of lists by any competent organization. It would not be well to crystallize into any one list of titles the whole effort to increase reading, and certainly no one is competent to draw a definitive list. Children's libraries will grow by the attention to old titles and to new, to imaginative literature and to informative literature. Parents need concrete suggestions when their interest is aroused, and for that reason lists are of great value.

Thirdly, this movement does not wish to be labeled as an uplift movement with the present stigma that sometimes attaches to that name. The Committee might have used for its slogan Better Books in the Home. That is really the purpose. But the wording More Books in the Home keeps it from falling under suspicion of the children themselves. Wherever there is discussion of children's reading, there is discussion of *better* children's reading, and only where there is no discussion do "wooden" books get their chance. Again, the movement has stood for a program that would supply a background of publicity for local efforts; to the best of their ability, the central Committee tries to inspire attention to children's reading in newspapers, magazines, among the critics and columnists, on magazine covers and by lectures. Such general publicity creates the atmosphere in which local efforts can thrive. If more could be done to

bring good lecturers or authors or authorities on children's reading or parents themselves to the platforms during the week of November 12, great good would be accomplished.

Again, the Committee tries to supply concrete material that will enable local groups, schools, libraries, or book stores to draw the public to the problem of children's reading. The Jessie Willcox Smith poster, designed for the first campaign, is still in active use, because still the most effective weapon we have. This poster, of which I am sure you have seen reproductions, gives the feeling of the delight children can have in growing up among plenty of books. Fifteen thousand of those posters will be distributed this year; in similar form it is made in postcard size and sold at the nominal price of 50 cents a hundred for the use of local committees. We also send out streamers, thousands of circulars, suggesting plans for the celebration. A favorite suggestion has been the building of Thomas Bailey Aldrich bookcases, of which a sample is in the next room. This bookcase is a replica of one in the old memorial house in Portsmouth, the working plan supplied by Mrs. Aldrich's kind interest. Boys and girls will be interested to make such cases for their own walls.

For the continuance of this work organization has been necessary, and the Committee has permanent headquarters at 334 Fifth Avenue, New York, with Miss Marion Humble in charge of the work.

Interesting programs have been arranged of plays with book characters, or costume parties with many children dressed after the people in their favorite books. There have been competitions in essays on reading with prizes, perhaps, of books offered by local stores. There have been competitions in lists of books, some times lists of what the child actually has at home. There have been competitions in poster designing or book plates. Samples of such book plates, which were made in Providence, are on exhibit. Again there have been authors' lectures, usually in the school assembly hall or in library lecture rooms. Women's clubs have put the subject of children's books on their programs, ministers have talked to Sunday Schools. From our headquarters, teachers can get material and suggestions. Any teachers who wish to turn this annual observance to their school's advantage will find that they can get coöperative interest, not only from the libraries, but from women's clubs, Sunday Schools, booksellers, boy scouts, and other groups. It is usually easy to get moving-picture houses to put on a book film and to flash an announcement of the week. In these and in a score of other ways, the interest in books can be dramatized.

We should not forget also that by creating a greater audience, we are also creating literature itself, for the creator of literature is drawn out by the appreciation of literature, the author needs the audience as well as the audience needs the author.

*LIBRARY WORK IN NORMAL SCHOOLS TO FIT
STUDENTS FOR THEIR WORK
AS TEACHERS*

MARY E. RICHARDSON, LIBRARIAN, STATE NORMAL SCHOOL,
GENESEO, NEW YORK

The normal school is the crucial point for improving the school library conditions of the State. It should send out graduates with a clear and high ideal of what a modern library should be and do. We librarians should see to it first of all that our students associate during their normal-school course with the kind of library we wish them to imitate in the public schools.

We cannot be too careful what kind of library our students have access to during their normal-school course. We must give them an ideal toward which to work and that ideal must be as high as possible. I am afraid it is still true that superintendents and principals need to be convinced that the library side of the school is of as great importance as any other side of its work. In talking with the principal of a Maine high school just after a new building had been erected—a very fine building with all kinds of provision for progressive school work—the principal admitted to me that he had searched the country over for expert advice before completing the plans for most departments in the new building, but had assumed that any room would do for a library. The result is that there are not proper facilities for the librarian's work to be done, there is not provision for a library classroom, or committee work for the students, and nearly every period there are many students sent away from the library because of lack of room. We should make our students familiar with the pamphlet, *High School Libraries*, by Mr. C. C. Certain, so that if they are in a town where a new building is to be erected they can at least recommend this pamphlet on the needs of the school library. By doing so, some of these errors may be avoided.

A few years ago a normal-school librarian had to be her own judge of whether her library was of the type necessary to give an ideal to the students which should have the right result on the schools of the State. Now we have a measuring-stick for normal-school libraries which ought to do much toward unifying the normal schools of the country and also toward raising the standard of our libraries. The National Education Association Committee, of which Mr. Kerr is chairman, has worked out some excellent standards to guide us in measuring our own libraries. So we no longer have to guess as to whether or not we come up to the requirements. There may be some points in this report with which we do not agree, but at least we have a measuring-stick and can find out what our weak points are.

Let us make sure that every student who goes out from a normal school has acquired unconsciously a clear, definite, and high ideal of what part the library should play in the schools of today, just by associating for two or three years with a library which is functioning as the center of the school system.

Second, we should give students clear and definite instruction in how to use their own library intelligently, and without loss of time. Every student who comes into the school should be given such instruction that he can find his way around the library without the help of the librarian. He should be able to locate all the tools of the library, such as the card catalog, the reference books, the Reader's Guide, the picture file, etc. In fact, he should be made to feel perfectly at home in the library during the first week of his school year. We sometimes ask each student to make a plan, locating all the tools mentioned above, and then follow this with a problem which requires the use of the card catalog and involves a slight understanding of classification. Teaching the use of reference books is a necessary part of "getting to feel at home in the library."

Another part of this course which is not so generally given is directing the students how to teach children in the grades about the use of the library and library tools. After getting their own background the students are prepared to answer the question "Just what of all this should be put in the first grade, the second grade, and the like?" For we believe that there is no place in the whole school system where it is so important to teach the use of the library as in the elementary grades. We believe that a child finishing the eighth grade should be able to find for himself in any public or school library all the necessary material on a given subject about which he may wish information for business or for pleasure. We believe that every child before finishing the eighth grade should have formed the library habit, so that he goes almost intuitively to the library for help when he wants information on some subject or has leisure time he wishes to spend.

Beginning with the first grade let us consider what the main lesson is that we will put into each grade. In the first grade, teach the children the care of books and the reason for learning to be quiet in the library. In the second grade, make the connection with the public library, teaching the children to go there for books which they would like to take home to read. Teach also the use of the table of contents. In the third grade, give preparatory drills for the quick use of the dictionary, and drill on the use of an index in a book, reviewing the table of contents. In the fourth grade, teach a little of classification, and emphasize the use of a dictionary as a reference book. In the fifth, teach the use of the card catalog; and in the sixth, teach the use of the atlas and the World Almanac. In the seventh and eighth grades, the children are ready to study such reference books as *Who's Who* and *Who's Who in America* and the quotation books—*Bartlett and Hoyt*—the *Brewer* reference books, and to learn how to use the *Readers' Guide to Periodical Literature*. From the fifth grade through the eighth, the encyclopedia, the *World Book*, is useful. Thus, at the end of the eighth grade, as has already been stated, children will be able to go to any library, find for themselves material on a given subject, and, in short, will have the equipment to carry on their education through the public library.

Our next responsibility is to send out teachers who are lovers of children's books, who know thoroughly and through actual reading the best

of children's literature. In some normal schools there is provision made for courses which give just the instruction and training necessary to do this.

The home reading of the child is of the utmost importance in the child's development of character. Only recently have we come to appreciate how large a part in the formation of character guidance in the reading of the young plays. No one can doubt this who has had the experience of watching the growth of character of an individual child, under the influence of good books, from a little savage with no tastes but for eating and sleeping and fighting to a civilized boy or girl with ideas of right and wrong and ideals of truth and honesty and beauty. What better method could there possibly be of teaching a child high ideals and strong, clean morals than through good children's literature?

Yet, a teacher who has not a first-hand knowledge of the books for children has a serious handicap when she tries to guide their reading. So one aim of a course like this is to familiarize student teachers with the best in the world of children's books—teaching them how to discriminate between the good and the bad, and also how to study into the child's tastes and ability in order to recommend the right book to the right child at the right time. One writer says, "Without doubt there is a most favorable time in every child's life for the reading of each book, and if offered to him at just the right age, it appeals to his nature with peculiar power even to the extent of setting him on fire. . . . There would be wonderful economy of effort if the books selected for children were always given them at just this time."

Another aim of this course is to teach student teachers how to introduce a book to children in such a way that the children will be interested to read the book, and at the same time not give enough to detract from the child's enjoyment in reading it.

Still another aim is to give the student teacher a background of the history of children's literature and an understanding of various classics for children. Such a background increases the teacher's interest in the books and adds to his enjoyment of the books themselves.

The real problem here is to conduct the work in such a way that the class will come sincerely to love the books they are reading or re-reading, and become so saturated with the right atmosphere that they will unconsciously radiate among children a love of the best children's books. After a brief study of the development of children's books from the Horn Books, Battledores and Chap Books to the books of the present day, it is well to take up books in groups and have each student read just as many from each group as is possible. We have found a very good group of books to take up first, one which makes an easy transition from the book the grown-up enjoys to the book a child enjoys, is the group which may be termed "Books about children, but interesting to adults." I do not know of any better way to acquire the child's point of view in reading and to developing an enjoyment of good children's books than to read such books

as Frances Crompton's *Gentle Heritage*, or Dorothy Canfield Fisher's *Understood Betsey*, or Myra Kelly's *Little Citizens*.

A lesson on children's classics may well come next. A discussion of what makes such a classic is profitable. The King James version of the Bible, Homer's *Odyssey*, Chaucer's *Canterbury Tales*, Spencer's *Fairy Queen*, Malory's *Morte d'Arthur*, the best of the Shakespeare plays, Robinson Crusoe, Gulliver's *Travels*—all of these are great because they combine simplicity with strength. "They are true to life, skilful in expression, are imaginative, and are universal in their appeal.

In the course of study for normal-school pupils in literature for children, published by the Newark Library, we find this in regard to the classics: "(1) They acquaint him with the best literary models—that is, with those books in which the words are full of imaginative suggestion, and are perfectly fitted to the theme and the theme is true to life. (2) They help him to understand and interpret his later reading. All literature is filled with turns of phrase, figures of speech, direct quotations and illusions taken from the Bible, Shakespeare, and in less degree the other classics. (3) Childhood is the language period. It is only through familiarity with books in which words are used to mean exactly what the author intends . . . that the child learns to understand words alike in their exact and their true meaning, and to use them with precision and skill."

From this group of books we are ready to go on to the other groups—such as books of humor, including Lear's *Nonsense Rhymes*, Burgess, Goops and How not to Be Them, and Lively City o' Ligg, Alice's *Adventures in Wonderland*, Benson's *David Blaise and the Blue Door*, Thackeray's *Rose and the Ring*, Hale's *Peterkin Papers*, Stockton's *Rudder Grange*.

Other groups are poetry, natural science, books of travel, and adventure, true stories of heroes, history stories, animal stories, and fairy tales.

Throughout the course, we try to inspire in the student's confidence that a good child's story is equally fascinating to an adult. If we can influence a teacher to love children's books we shall have done something which will react favorably toward the child under her care. When she has actually read and enjoyed the books we want all children to know and enjoy, we may be quite confident that the influence on children's reading will be good.

If we normal school librarians can do these good things—see that the students associate, during their years of training, with the finest kind of a modern library, teach prospective teachers how to use their own library, and any library, intelligently and without loss of time, instruct them how to each children in the grades the use of a library, and so teach children's literature that our teachers will both know and love the best of children's books—then our work will have been worthwhile, for normal-school students are soon to become the teachers of the children of the Nation, and when we burn an ideal into a teacher's consciousness, we are influencing the life of a nation.

Department of Music Education

OFFICERS

President—OSBOURNE MCCONATHY, Director of the Department of School Music, Northwestern University.....Evanston, Ill.
Vice-President—C. A. FULLERTON, Director of Music, Iowa State Teachers College.....Cedar Falls, Iowa
Secretary—MARY MCKAY, Supervisor of Music.....Elgin, Ill.

SECRETARY'S MINUTES

FIRST SESSION—WEDNESDAY AFTERNOON, JULY 5, 1922

MUSIC IN THE RURAL SCHOOLS—Thomas L. Gibson, State Supervisor of Music for Maryland; Evelyn C. Perry, Supervisor of Music, Buzzards Bay, Mass.; and John R. Kirk, President of State Teachers College, Kirksville, Mo.

The Boys' Glee Club, of Revere High School, composed of nineteen voices, sang six songs illustrating "average results with average material in an average high school."

At the business session which followed, a nominating committee was appointed to report on Thursday. This committee consisted of Samuel W. Cole, Massachusetts; Miss Garver, Ohio; William B. Kinnear, Larned, Kansas.

Mrs. Frances E. Clark moved that a committee be appointed in interest of greater recognition of music education by the Department of Superintendence. The motion was carried, and a committee, consisting of Mrs. Frances M. Clark and Samuel W. Cole, was appointed to report on Thursday.

SECOND SESSION—THURSDAY AFTERNOON, JULY 6, 1922

PRESIDENT'S ADDRESS—*School Music and the Community*—Osbourne McConathy, Northwestern University, Evanston, Ill.

A MODERN VIEWPOINT OF MUSIC EDUCATION—Ernest A. Smith, Superintendent of Schools, Evanston, Ill.

THE NEW AMERICA: A PROGRAM OF FOLK SONGS OF VARIOUS NATIONS (including songs of Italy, Brittany, Canada, England, Ireland, Kentucky Mountains, Negro, and Russo-Jewish)—Constance and Henry Gideon, Boston, Mass.

Business Session

At this session, the Nominating Committee appointed the following officers: For president, Glenn H. Woods, Oakland, Calif.; for vice-president, Teresa Armitage, Chicago, Ill.; for secretary, Mabelle Glenn, Kansas City, Mo.

The following resolution, framed by the Committee on Consideration of Music by the Department of Superintendence, was read and adopted:

In the interest of music as an educational force of growing value in the school curriculum, and in order that the importance of the subject be brought more prominently to the consideration of leading educators and the public in general. *Be it resolved*, That this body, the Department of Music Education of the National Education Association, in convention assembled, request the Department of Superintendence to include in its general program next year an address on music as an educational force, by a leading authority.

MUSIC IN THE RURAL SCHOOLS

THOMAS L. GIBSON, STATE SUPERVISOR OF MUSIC IN MARYLAND,
BALTIMORE, MARYLAND

Rural schools defined—The discussion of this subject in its general attitude is based on public education as it is organized in my own State. In Maryland all one and two-teacher schools located in rural communities

and conducting classes in the elementary grades are regarded as strictly rural schools.

It might be inferred from the wording of this subject and its assignment to the section before which it is presented that the teaching of music in the rural schools is a problem all its own and one to be worked out on principles differing from those relating to music in city and consolidated schools. In its practical application there may be some difference, but fundamentally we believe the problem is the same in all elementary schools. When time allotment for recitations, experience of children, training and experience of teachers, and material equipment for the teaching of music are taken into account, the problem may be, and usually is, a different one in the rural school from that in the consolidated school. When the character of the subject, however, and the natural endowments of children are considered, the problem, we believe, is fundamentally the same in all elementary schools regardless as to whether they are rural, suburban, or city.

A discussion, then, of the problem in the rural schools should take into consideration (1) The time allotted for the study of music; (2) limited musical experiences of rural children; (3) amount and character of content; (4) experience acquired through this content; (5) training of rural teachers in music; (6) material equipment as an aid in the study of music; and (7) technical study incident to song study.

The rural school program in Maryland provides for class study of music a minimum of 65 minutes out of a school week of 1800 minutes. This does not include, however, music during opening and closing, or any special exercises, of which music may be a part. A tentative course in music has been placed in all our rural schools, and in this course the seven grades are divided into two groups for the music lessons. Grades one, two, and three constitute the primary group and the other four grades, the grammar group, classified, respectively, as Groups A and B. It is believed that the grammar group may receive valuable musical experiences from listening to and taking some part in the music taught to the primary group, so that the grammar group receives in class actually 65 minutes of music study each week.

These 65 minutes for music do not, in my personal opinion, give enough time to this subject, when compared with 545 minutes given each week to reading, 225 to arithmetic, 195 to language, 80 to writing, etc. In making this comment, however, we must not forget that the children receive valuable musical experience in school in addition to that obtained from class drill. As a matter of fairness also, in making a comparison of the time allowed for music study with the time allotment for other subjects, it should be remembered that while to reading, for example, 545 minutes per week have been allotted, this time must be divided among four or five classes, and that in music the entire school is taught, in most instances, as one class. The necessity, also, for a greater amount of individual attention in other subjects must be recognized and considered, and, furthermore, that reading

is the most important of the subjects taught must be fully accepted. With all this in mind, it is my opinion still that at least one hour each week, in addition to the 65 minutes, should be used in all rural schools for the purpose of giving the children, through the phonograph, or some other available means, just such musical experience as they have been deprived of during their rural childhood.

As a rule, suburban and city children have had, in both their homes and schools, more musical experiences, and particularly during their most impressionable years, than rural children can have. They hear music almost every day and evening, in their homes, in the Sunday Schools and churches, at the theatres and movies, and on many civic and social occasions, and learn to recognize and to express both rhythm and melody with joy and skill almost as soon as they learn to walk and talk. On the other hand, rural children as a class, are more or less vocally awkward and deficient in rhythmic feeling and expression. With a large number of our rural children this awkwardness in voice and movement is pitiable. It is evident in their walk and talk; in their oral reading and attempt at singing; in their shyness, self-consciousness, and barrenness in social life.

The two factors to be kept in mind in determining upon the experiences which should come through music in the rural schools are the song and the child. The song is the content of the subject. It is to be used so that by its use it will furnish valuable emotional experiences, develop the power of careful, sensitive aural attention, and give skill in the correct use of the vocal organs. The procedure is not that of teaching the song for the sake of the child's learning it, but rather to teach it for the sake of the experiences the child will acquire in learning it. The emotional reaction has been advisedly placed first among the experiences to be brought through music to the child because of the interest awakened through the feelings. The sense of hearing is more likely to be in perfect tune and the vocal chords are more likely to give out richness of tone when they are both stimulated by the emotions. It is in the realm of the emotions that music has its great value and the experiences which may be given children through song are among the finest and most fundamental, we believe, in the entire scheme of education. Is it not largely through the human voice and the medium of emotional language that this experience is imparted? Every mother and every good teacher possesses this power. It is found in the Mother Goose melodies, in the Twenty-third Psalm; in Handel's *Largo*, in Wagner's *Pilgrims' Chorus*, in Brahms' *Cradle Song*, in the *Ave Marias*, in the simple mother hymns and prayers, in *Boy of Mine*, and in the *Long Trail*; it is in *America the Beautiful* and in *My Country 'Tis of Thee*; it is in Foster's folk songs and Nevin's and MacDowell's beautiful classics; it is in the *Sermon on the Mount*, and I have often wondered if there was not divine power in the *voice* as well as in the words of the Master when "He opened His mouth and taught them saying." I am quite sure there were emotional expressions, charitable, chaste, comforting, convincing, compelling, lifting toward heaven, in the *voice* of the Son of Man. And the

children in the elementary schools, whether they are rural or urban, can understand the spiritual meaning of these things, and it is for things similar to these that I would plead for one hour more each week in the program of the rural schools. It will come some near day, I believe, in our plan of education.

In our Maryland tentative course of study in music for the elementary schools, our aim is to require pupils who have gone through the seven grades to be able to sing at least fifty songs in correct voice, a few of which are easy two and three-part songs, and one third of which the pupils can sing correctly from memory. It is also our aim to have the pupils able to recognize, from hearing them played or sung, some thirty additional musical compositions, and to be conscious of certain elements in each composition from which it is recognized. The content is to be so varied in character as to include patriotic songs, folk songs, some standard sacred music, easy classical selections, a few wholesome popular songs of the past and present, and method songs in various keys, measure-rhythms, and scale intervals.

In the organization of the music teaching for all elementary schools in Maryland, outside of Baltimore city (which has its own school administration), we have proceeded on the principle that music should be regarded as one of the regular elementary subjects to be taught and that eventually all elementary teachers should be trained in the teaching of elementary music as they are trained to teach other elementary subjects, under the same direction and supervision given to other subjects. With this end in view, a course in elementary music was prepared the past year for our normal and summer schools. This same course has been placed also in the hands of all elementary teachers as a guide for the teaching of the subject. Our State Department of Education regards thorough and intelligent supervision as one of the most important factors in elementary education. The county in Maryland is the unit for both administrative and professional direction, and a new school program looking to more complete supervision in every county was enacted into law by the Maryland State legislature of 1922. By this legislation, there will be next year a supervisor of the elementary schools in every county, and, in addition to this, where the body of elementary teachers reaches a certain number, there will be one or more helping teachers, whose work will be somewhat similar to that of the supervisor. It is expected that in the near future, both the supervisor and the helping teacher will be prepared to supervise the teaching of elementary music as a regular elementary subject. There is another factor in the training which the elementary teachers of Maryland receive that gives promise for better trained teachers in this subject. The time is rapidly approaching when no teachers will be employed in the elementary schools of Maryland who are not graduates of our normal schools, or who have not had an education equivalent to a normal school course. Only graduates of four-year high schools are now enrolled as normal school students in Maryland and, in practically all the four-year

high schools, music is taught and will, beginning with the next school year, be carried on under a definite course of study. The outlook for the teaching of music in Maryland is indeed encouraging. When all our rural teachers are graduates of a four-year high school and have in addition a two-year normal school course with definite early musical training in the elementary grades, continued through the high and normal school courses, when they have all this and then work under the direction of experienced supervisors and helping teachers, as they will in Maryland, may we not expect that this subject will receive the attention its value demands, and in the way the best professional thought may direct?

Music has been defined as an art, as a language, and it may be defined as a science. For its values in school and life, it appeals to me as being chiefly a language, and a language that all may understand and use. It had its beginning back in the early experiences of the race. From the beginning of language up through the centuries, the individual, the social and racial group, the State and National units, each has had its slogan, motto, proverb, poem, song, and hymn for emotional expression. Into these have been woven experiences of the past and from time to time a new vision and a profounder faith in the future. Individual morale and social, racial, and National unity require these binding and directing expressions. To feel their finest effect and greatest power, they must be said and sung. Vocal expression has been standardized, popularized, emotionalized, and beautified by putting it into song form; namely, a melody in foot and phrase rhythm in the major or minor mood, which form may embrace the entire realm of varied human emotion. This statement applies to both vocal and instrumental music, since the former is set to poetic language and the latter complies with poetic form. It is purely an aural language, if indeed there can be any effective language other than that which primarily comes to children through the sense of hearing. It is a language which takes on strong individual, social, and racial characteristics and is a means of preserving and handing them down as a valuable heritage of future peoples. It has in it an emotional tonic that leaves no injurious reactions, but serves as a most healthful stimulus. Much of all this can be had from the teaching of a carefully selected content of song, and songs form the real content of this subject in the elementary schools.

It has been stated elsewhere in this paper that the best musical instrument that the school can have is the correct singing voice of the teacher, and if all our rural teachers had this acquirement, they could teach music in the absence of all other instruments. But even to the teachers who possess the correct singing voice, there are other instruments and material equipment which may be used in valuable ways. On the other hand, when a teacher believes she does not have any singing voice, and a few are lacking in this respect, then a phonograph with an appropriate stock of records is probably the first and best instrument to provide. Steps have been taken by promoters of this instrument to have phonographic records made which will substitute in the lack of a teacher's correct singing voice, with, however,

a limited amount of success up to this time. It is difficult to secure in a record just the right quality of voice and a properly combined tempo and pitch for children to imitate. Even if these qualities were satisfactorily recorded, there still is the difficulty of using a machine with anything like the same degree of reactions which the voice of the teacher can have. However, with the improvements that no doubt will be made in these respects, the phonograph will then be an indispensable aid to the teacher who does not have a correct singing voice. In addition to its use for imitation singing, it has other valuable uses to every elementary teacher. The most valuable keyboard instrument for the school is the player-piano, which may be used either with or without the player attachment. Unfortunately, on account of the price of this instrument, it is not within the reach of many rural schools. The most practical and satisfactory keyboard instrument for most rural schools, when all things are considered, at the present time, seems to be the small folding reed organ. Other valuable equipment are the pitch-pipe, staff ruler, and music in printed form for the grammar-grade children. It is necessary also to have available blackboard surface for illustration and class drill on the interpretation of the eye symbols of music.

There is an honest difference of opinion among teachers as to when children should take up the study of music through the eye symbols of tone, pitch, key, and measure signatures, note values, etc., for skill in sight reading. There is, on the other hand, unanimous opinion that music is heard rather than seen, that it is a tone language, and that the first and most important procedure is to give children much experience in hearing music and rendering it by imitation. It has been verified over and over that with skilful teaching most children can be taught at an early age to read at sight elementary music. It is not a question, however, of whether they can be taught to do so, but rather a question of whether there are other things of more value in music to the children in the elementary schools. It is my opinion that most of the time for music, in the rural schools, should be used in training the children to sing well many appropriate songs, to listen attentively and intelligently, to appreciate good music and to form a preference for the best in music. Sight reading is an indefinite term. There are few, if any, perfect sight readers, and very few who even approach or ever will approach perfection in the sight reading of technically difficult music. Learning to read simple, elementary music, however, is not a difficult feat for most children, but all along it is a gradual learning process as the score grows in difficulty. Just on this point the music teacher often goes astray by striving through repeated drill to make sight readers, rather than to give children real musical experience. It is my opinion that only a small proportion of the time scheduled for music in the rural schools should be spent in learning to read music from its eye symbols, and that this should be done almost wholly from blackboard drill, using sections of the music already learned by imitation as exercises for this drill work. To this drill I would add intelligent eye observation of the printed score when it is played on the phonograph, by having sections of the score

written on the blackboard, and occasionally by having the printed score in the hands of the upper grade children.

The question of the value of sense impressions and through which of the senses the most valuable impressions are received is a very vital one and especially so in this day of the movie film, the clavilux, and all the schemes for an appeal through the eye. Is there not the danger of over-estimating the value of the eye appeal and forgetting that it is very largely through the human voice, and through this medium only, that children receive and retain the best that the adult can give? The human voice is really a living and divine thing and it has been through the voice and musical sound, the real and only language of childhood, that the mind and emotions of the child have been most deeply touched.

More and more of the rural school children are having the advantage of a high-school education in Maryland, and this fact should be kept in mind when considering a course in this subject for the rural schools. The skill in the use of their voices, their appreciation of good music, their familiarity with a number of good things, and their elementary knowledge of the meaning of the most common of the eye symbols, all establish a musical basis on which to build in the high schools for a more technical study of the subject, on a credit basis, by those having special musical talent. On the other hand, the large number of rural children who will not enter the high schools shall have been given a basis for appreciation and some means of bringing joy to themselves through their own singing and through the power they have acquired of listening to good music with intelligence and pleasure.

The rural school should be a distinctive social as well as an educational center, with the school itself as the center, contributing indirectly, however, to the good of the adult community. Rural children especially need the social, civic, and character training which very properly may be given in connection with anniversary and holiday occasions, and there is no other school subject that can be made to contribute more to this training than can an appropriate repertory of song material. The rural teacher has a special opportunity in this field. She should have the children learn each month songs which relate to the features of each recurring season, to historic and holiday anniversaries, and to community affairs held in her school. *Indeed, it is my belief that just such things should largely guide the rural teacher in selecting the music for the entire school year. For example, there is no holiday season more generally celebrated, or looked forward to with greater interest by all ages, classes, and races, than is the annual recurrence of the Christmas time. The music which has come out of the *Christ-mass* season, in the form of carol, cantata, oratorio, anthem, and hymn is a heritage of immeasurable value, ministering much toward and promising more of "Peace on earth and good will to men." This season, as well as several others, is the teacher's rarest opportunity to get into closest sympathy with both the children and their parents through the school music activities.

To sum up this rather brief discussion, the following vital points should be kept in mind:

The subject is fundamentally the same for the rural school as for the more closely graded consolidated school. It is different in the former only in time allotment for recitations in the musical experience of rural children, in the training and experience of many of our rural teachers, and in the material music equipment of most of the rural schools.

The time allotment should be not less than 120 minutes of each school week. Part of this time should be given to purely listening rhythmic exercises.

Since the rural children have had little opportunity for acquiring musical experience before they enter school, the most important initial step for the teacher is to furnish them this experience.

The procedure is to bring emotional reactions to the child, through song content; to develop the power of careful sensitive aural attention; and to give skill in the correct use of the child's vocal organs. The song is the content, first, last, and all the time, in this procedure.

During the seven or eight years in the elementary grades, the children should learn to sing well from fifty to seventy-five songs, one third of which should be memorized, and should hear twenty-five more for the mere pleasure of knowing how to listen intelligently to good music. This song content should include patriotic and folk songs, some standard sacred music, a few classic selections, and a practical list of simple method songs, and a few wholesome popular songs.

Elementary teachers should be trained in the teaching of music as they are trained to teach other elementary subjects. Supervisors and helping teachers should be able to supervise and direct the teaching of elementary music.

In its values in school and life, music is a language, emotionalized, standardized, popularized, and beautified, and should be regarded as such.

Necessary musical material equipment for the rural school are the phonograph, with a stock of carefully selected records; a keyboard instrument in correct pitch; a pitch-pipe; staff-ruler; blackboard space; and some printed music for the upper grades. The best instrument, however, is the correct speaking and singing voice of the teacher.

Technical study of music is to be only elementary and incidental to song study, and based on the songs learned. This technical study should be given by drills and illustrations on the blackboard, and by having pupils observe with intelligence the printed music score when it is rendered on the phonograph, piano, or sung by the teacher.

The human voice, in its use, is a living and divine medium of communication, and the aural sense the one through which deepest and most lasting impressions are received by children.

Music training contributes to both school and community interests and is one of the strongest factors in unifying and socializing both the school and the community.

MUSIC IN THE RURAL SCHOOL

EVELYN C. PERRY, SUPERVISOR OF MUSIC, BUZZARDS BAY, MASSACHUSETTS

Music in rural schools, a most interesting phase of my work in public schools, varies greatly and depends largely upon the teacher and her preparation, the methods used, as well as the different community conditions.

One of the most difficult of all schools is that of the country village, which needs the strong hand and good judgment of an experienced teacher rather than that of a young, inexperienced person. From actual work in such a school, both as teacher and supervisor, I have been able to see both sides of the situation and have watched the growth under supervision and seen excellent results.

We hardly appreciate the amount of good and moral uplift, as well as musical education, that can be obtained from the victrola in rural schools; the possibilities of such an instrument are unlimited.

Appreciation alone deserves much of our time and consideration, but it is rather the other side of music in these schools which I desire to present you—namely, teaching these village boys and girls to sing and to become somewhat independent singers.

To illustrate, let us take a school with six classes or grades. The songs for general singing may be taught the school as a whole during the morning exercises, just as any general instruction may be given them. Divide the school into two groups—Grades 1 and 2 form the “B” group—Grades 4 and 6 the “A” group. If there are more grades in the school, Grade 4 may be the “flexible” one and be allowed to recite with both groups, thus giving support to the little people and also learning much themselves from the older ones.

Time allotment is a serious problem in these schools of more-than-crowded programs. Four “12-15”-minute periods during a week are possible, however, alternating the recitations of the A and B groups.

Songs for general singing are many and varied and may be chosen by the teacher. Two books (Books I and II) of any course are preferable to a “one-book” course.

The work of the B group consists chiefly of rote songs—with syllables by rote and song study of several—chosen from Book I; that of the A group—the technical terms of staff rotation and sight reading songs to illustrate from Book II with two-part work, when possible. In fact a Grade 5 outline is generally followed with these people. Much depends, as I said before, on the ability of the grade teacher, and surely if she does not possess the average amount of musical knowledge, she falls far short of her privileges in those country schools, where she stands as the model in so many ways to her pupils.

Alternate songs and exercises each year, thus keeping material from becoming too familiar.

Although merely an outline, this gives a general plan of work in music as used in my outlying schools and has produced some gratifying results.

SCHOOL MUSIC AND THE COMMUNITY

OSBOURNE MC CONATHY, NORTHWESTERN UNIVERSITY, EVANSTON,
ILLINOIS

The discussion of relationships between school music and the community is not new. My apology for introducing the topic at this time lies in my desire to present one phase of the subject which, as far as I am aware, has not as yet been discussed at these meetings—namely, the responsibility of the school as musical advisor to the family.

Heretofore the topic of this paper has been construed to mean the manner in which school music study might be projected into community life by means of entertainments, operettas, choral concerts, orchestra and band performances, music memory, and other musical contests, and so forth. Or possibly the topic has led to a discussion of evidences of music interest in the homes, the recital and concert halls, and other musical events brought about through the music activities in the schools. We have also heard discussions of the place which the up-to-date music supervisor should occupy as a stimulator and director of community music activities, even suggesting that in the future our profession will become broadened into that of city or community music leader. Possibly still other thoughts are suggested by my topic, but I shall dismiss them all for a brief discussion of the thought above outlined.

Assuming that the object of public-school music is to stimulate, elevate, and guide public taste and interest in music, we cannot fail to realize that a close relationship between school music and home music is highly desirable. That the American people are musical, or at least that they insist upon an enormous amount of music in their homes, is amply shown by the amount of money annually spent for home music. Possibly this manner of measuring the extent of musical interest on our homes may seem unworthy, but, after all, the American standard of dollars is a pretty accurate indication of American interest. We are told upon good authority that more money is spent annually upon music education in this country than upon all higher education combined. That is to say, if all the expenditures for high schools, colleges, academies, normal schools, universities, technical schools, theological schools were combined, the sum would be less than that spent annually for music education. This does not include the expenditures for concerts, opera, recitals, the music trades and manufactures but represents music lessons alone.

At first thought this statement seems impossible, but when we stop to consider the situation, its possibility becomes apparent. In almost every family except the poorest, some of the children are given music lessons for at least a part of their lives, and in most families which we know, several children are studying music at the same time. These lessons are not items of small expenditure, either, but, per capita, amount to a very considerable sum.

The question which I would here bring to your consideration is, do we,

as a Nation, as a community, as a family, get the value of the enormous sum spent in giving our children music lessons? Is it not quite possible that much of this money does not represent value received?

How many families have bravely started Johnnie or Jennie on a course in music, only a year or two later to give up the task which obviously has become hopeless. Of all the Johnnies and Jennies that begin music study, how many continue to a point that enables them to even partly fulfill the hopes and wishes which first prompted the fond parent to start them on their musical way? How many parents are quite clear just why the child should be sent to a music teacher and just what results should be expected?

In many homes the story begins in some such manner as this. Father comes home some evening and at dinner mother casually remarks that Jennie's mother, across the street, had told her that Jennie had just begun taking music lessons. This casual approach is merely a pleasant method of leading father to agree that their own son, Johnnie, should also take lessons, a proposition to which father agrees with a vague feeling that it is expected of him, but a much more vague idea as to why it should be done. Then the question arises as to a teacher, and mother suggests that Miss Williams, the elderly unattached daughter of the recently deceased minister, plans to give lessons and thinks that it would be so nice to send Johnnie to her. Just how well Miss Williams is prepared to help Johnnie, how well trained a musician or teacher she may be, seldom enters into any careful consideration. She is known to have studied, perhaps she plays the church organ—at all events she needs the help.

Johnnie sets out to his task nobly promising to practice faithfully. But very soon mother finds that unless she follow the proceedings quite carefully and persistently, Johnnie misses lessons and escapes practice with remarkable consistency. Soon each daily hour of piano practice is a period of forcing and urging and policing, until finally mother's and Johnnie's patience are both exhausted and the lessons come to an inglorious end.

Of course the parents had no intention of making a professional musician of Johnnie. This they explain most carefully to Miss Williams, letting her understand that they merely wish the boy to play for his own pleasure and the enjoyment of his friends. Miss Williams is soon convinced that there is no danger of professionalism in Johnnie's young life, but that discovery has little effect on her mode of procedure. She was instructed along a certain line, and Johnnie must tread the same path. If by any chance Johnnie's or mother's persistency lasts until Miss Williams marries or moves, then the next teacher inevitably will assure the fond parents that the course pursued by the young musician has been all wrong, and that he must begin all over again. Not infrequently this experience occurs several times until even a really musical child becomes thoroughly discouraged.

My story is not an exaggeration, but is repeated times beyond number all over the country. I am here raising the question as to whether or not some means of musical guidance could be instituted under the auspices of our public schools. Is there not some way to determine whether Johnnie is

adapted to piano? Maybe in putting him at that instrument a potentially excellent violinist or cornetist or clarinetist is spoiled. Maybe a potential music lover and concert supporter is made to detest music. Is the piano the only approach to fuller acquaintance with music? Moreover, is the type of lessons which Miss Williams gives the right approach to piano playing for a vigorous young American boy or girl?

Our schools are rapidly developing a technic in child study, in vocational guidance, and the study of the musical capacities, tastes and talents of children should do much to prevent the haphazard lack of method now prevalent in starting children on their musical studies. Such procedure should be helpful not only to misfits in music training, but also in the discovery of talent.

My plea is not for the training of talented children alone, but I would urge the study of children to the end that the training of each individual child might be so conducted that music would play that part in his life which would bring to the child the greatest measure of happiness. Some children should learn to play, some to sing, some to listen, some to professional perfection, some to amateur accomplishment, but each to that point where music would fill its finest place in his life.

But it is not alone in determining the type of music study to which the child is adapted that the modern educator might well turn his studious thought. Our studies of teaching in general, our specific studies in all that concerns the learning process, ought to enable us to so organize all branches of music teaching along lines in conformity with the best modern pedagogical principles. That a very large part, if not most, of the present-day teaching of music is not in accord with these principles must be apparent to the trained educator. The unfortunate thing in this connection is that all but the very fewest educators are not sufficiently acquainted with music to apply their general knowledge of the laws of teaching to this particular subject. Moreover, educators apparently have seldom given any thought to the subject of music, even to those phases that appear as usual parts of our school curriculums. The matter of teaching instrumental music has probably never occurred to them as a field for their thought, investigation, and study. But I respectfully protest that the vast interest in music education shown by American parents, as demonstrated in the private music teaching all over the country, challenges the best efforts of our educators to place such instruction on a sound pedagogical basis.

A MODERN VIEW-POINT OF MUSIC EDUCATION

ERNEST A. SMITH, SUPERINTENDENT OF SCHOOLS,
EVANSTON, ILLINOIS

From the official head of the Women's Music Clubs of America there has lately sounded a startling challenge and prophecy in the statement, that the hope of the nation for universal music culture rests upon music in the

public schools. This involves a vast responsibility. How is it being met?

Bulletin No. 9 U. S. Bureau of Education, 1921, shows voluntary reports from 359 high schools of thirty-six States which offer music courses. Music is named as a possible subject in all State courses of study, but made compulsory in only six.

If the common schools shall meet adequately their task, they must recognize that music as a school subject belongs to all the children of all the people. Not the same sort of instruction will be given to all pupils, for the recognition of individual differences is a cardinal tenet of present-day pedagogy. To be sure some intensely zealous musicians maintain that the fundamental harmonies are potentially present in almost every person, awaiting only to be heard or to be sung. Yet the question will very naturally arise in the mind of the interested, ambitious parent, how can I find out whether my child is musical. It may possess a good clear voice, have a keen sensitive ear, a lively imagination and a bright intelligence. These are all important contributory qualities, but they do not comprise the full equipment of the gifted musician.

On the other hand the child may not have shown the slightest concern for vocal or instrumental performances. It is possible that a favorable attitude to music is deeply hidden; no special stimulus has opened an avenue of expression. The latent musical instincts of the child are the legitimate province of the public school, just as much as is the reasoning faculty or the sense of color and of form. Modern education aims to recognize the potential possibilities of every child and seeks to draw these out. The school of today does not conceive its purpose to be to fill a void, but to lead forth what is latent and innate.

Music education then takes account of the native stock of each boy and girl. This must be done patiently, broadly and scientifically. The second grade is not too young an age to have a survey made of the group. The general singing ability of each pupil can be noted by the room teacher. His standard of mental attainment is shown in the school subjects, if the intelligence quotient is not estimated. His sense of rhythm is reported upon by the teacher of physical education. The fourth factor in the study of the individual is supplied by a questionnaire concerning musical heredity, home and social environment, degree of interest shown in music. As a result of this tentative survey choices are made of certain children who are invited to take free instruction in piano in the third grade.

In the classroom of the Evanston, Illinois, elementary schools it is discovered that the children have fallen into three groups, the actively musical, the passively musical and the negative. For the talented the piano is selected as the best medium by which the capable child will learn tone relationship. A lack of interest and failure to progress will bring a discontinuance of instruction. The lessons in piano continue through the fourth and fifth grades. For the two groups of the passively and negatively musical, chorus singing and appreciation are prescribed. Not until after the fifth grade is the listening course assigned as the only requirement for the few positively unmusical pupils.

In addition to the early preliminary survey there has been in operation for four years a program of psychological investigation of the native musical characteristics of every child in the fifth grade. First, there are the five fundamental experiments in the classroom of listening to a series of Columbia records on the victrola. Their purpose is to throw light on the problem of the innate capacity of each child by determining its degree of discrimination in pitch, time, intensity, consonance and musical memory. These tests were worked out in the laboratory of the University of Iowa by Professor Carl Seashores. Their application to the Evanston Schools has been made by the Department of Education of Northwestern University under its director, Dr. Elmer E. Jones, and Professor Osbourne McConathy of the Northwestern School of Music. These five basal experiments measure the average musical quotient.

Not many pupils grade one hundred per cent in their recognition of pitch, time, and intensity. In consonance, the sensing of the true chords, a larger diversity in the feeling for harmony is revealed. In the test for musical memory it often occurs that while the ear is fairly accurate, the voice is not able to reproduce correctly what is heard. The Evanston experiment has indicated that those children who make an average grade of seventy-five per cent belong to the tentative group of the musically talented. Their number runs about twenty per cent of the entire fifth grade.

The significant educational contribution made in connection with this Illinois school system arises in a third series of tests, where the pupils visit the Northwestern laboratory to have the specific qualities of their musical capacity gauged. A dozen and more measurements are taken which reveal the abilities of the child for entering vocal or instrumental courses. There are sensory and motor tests. One of the machines, the tonoscope, was invented by Professor Seashores, the others have been devised by Director Jones and President Walter Dill Scott, of Northwestern. For those who are possible candidates for the orchestras there are tests for left and right hands in rapidity and precision of movement, in dexterity and grip. Auditory and visual reactions are accurately measured. Free and controlled rhythm as interpreted by the pupil are graphically recorded to the hundredth of a second from an electric tuning fork upon a small revolving drum. In the tonoscope the vibrations of the child's voice mechanically raise or lower a flame for each sound wave. A revolving card-board disk carries rows of punctures upon which the tone is registered. As the sound is made, the holes on the disk corresponding to the tone seem to stand still, the other dots moving and tending to blur. Thus the pupil *sees himself sing* and the teacher has an exact measure of the tone.

In addition to the musical tests, the intelligence quotient of each child is also calculated. The individual chart having been completed and drawn, the supervisor is fully equipped with data for his campaign with the homes. Letters are sent to the parents, giving the ratings of the candidate, which are interpreted from the showing in motor and sensory reactions, as indicating that it would be advisable for John or for Mary to

take lessons on the violin, the cornet, the piano or other instrument. It is announced that free instruction will be given in the schools at the hours named and the parents who desire to avail themselves of the lessons are asked to notify the music department. In Evanston in 1921-22, 13 per cent of the total enrolment in four grades received free instruction. This was an increase of 60 per cent over the previous year. Two thirds were pupils in piano. Of the remaining one third, 60 per cent were pupils in violin.

Have all the embryo artists been discovered? The answer is, not with exactitude. But the special music teaching has been done with intelligence. Many gratifying incidents in the discovery of unusual talent and the larger development of obvious musical ability are being registered. Scores of children begin to take special private lessons, their public school instruction having pointed out the field. The various school orchestras are built up readily from ambitious, competent players. A musical card index is kept for each child, giving the record of work and appreciation through the seven grades.

A survey of 1921 estimated that of 2500 pupils from the first to the eighth grades, 565 were taking private lessons at a yearly cost to their parents of \$81,370. The outlay for music teaching of all pupils is but a small fraction of this figure. There is the *tradition* and the inclination in the homes to have music as a subject a special study for the children. The Evanston schools by their program of musical tests supply some share of scientific guidance as to the aptitudes of these young people. It has been a modest effort in coöperation in a community that has a sincere devotion to the universal art of music and maintains a civic association for its development.

Vocal instruction has received in the schools such attention as is appropriate to the voices of six to fourteen years of age. The upper grades sing yearly in the widely known North Shore Musical Festival. There is careful training in the fundamentals and the pupils upon promotion are ready for the more mature choral work of the high school. Musical appreciation begins with listening lessons in the second grade and a course is outlined for the years following. Music memory contests are entered with enthusiasm and have been of signal assistance. The aim is to awaken and secure an inner musical consciousness. There is the sound educational method of having the pupil work out something for himself, to be able to hear inwardly, to know melody, rhythm, and harmony.

The instrumental work is of necessity introductory, the basal principles being laid. From group work, the more talented pass on to special instruction. A musical atmosphere is created. The child experiences a joy and gains a confidence. He knows something of self appreciation. He is being trained in self expression. He is in a way to become productive and original. The aim of musical education in the public schools of America must be to produce children trained in the broadly cultural and appreciative side of the art, using band and orchestral training, vocal and

instrumental instruction as tools for it. This will give the child versatility in the art. Our teaching must develop adaptability and initiative, the creative faculties.

No matter how Americans may betray their different ancestry by looks, accent and temperament, yet back of these distinguishing marks they possess a more or less similar something in speech, appearance and thought which stamps them as American. An international musical language is an impossibility. We possess our distinctive national ideals and feelings. How shall they receive adequate musical expression? Not through negro spiritual and songs, not through Indian music, not through the transplanted folk songs of Europe. Music is a creative, not an imitative art. From the foundation supplied in the public schools by devoted scientific and artistic teaching the generation is arising that will create an American music.

Department of Normal Schools

SECRETARY'S MINUTES

OFFICERS

President—W. P. MORGAN, President of the State Teachers College.....Macomb, Ill.
Vice-President—A. J. MATTHEWS, President of the State Normal School.....Tempe, Ariz.
Secretary—ROBERT I. ELLIOTT, President of the Nebraska State Teachers College.....
.....Chadron, Nebr.

The first session of the Department of Normal schools began at 2 o'clock on Wednesday afternoon, Room 116, Simmons College, with President W. P. Morgan, President State Teachers College, Macomb, Ill., presiding. The attendance was unusual and most encouraging to the officers.

After a few preliminary remarks by the President, Dr. Wallace W. Atwood, president of Clark University, was introduced and gave an excellent address on the subject, What Shall the Geography of the Grades Include? This was followed with an address by Robert M. Brown, of Rhode Island College of Education, Providence, R. I., on Objectives in the Teaching of Geography. The last address was given by Douglas C. Ridgley, Professor of Geography, State Normal University, Normal, Illinois, on Geography for the Rural Schools.

A hearty discussion followed.

President W. P. Morgan announced the appointment of a nominating committee, consisting of the following: John A. H. Keith, chairman, J. G. Crabbe, D. N. Cameron, and J. A. Pittman. An invitation was extended to all to attend the banquet in the evening. Meeting adjourned.

The banquet, given under the direction of the Massachusetts State Normal School Teachers' Association, was well attended, there being over two hundred present. Roy Leon Smith, president of the Massachusetts State Normal School Teachers' Association, presided and introduced the toastmaster, W. P. Morgan. Dr. John W. Withers, dean of the School of Education, New York University, gave the principal address. This was followed with short talks by Dr. J. G. Crabbe, G. E. Maxwell, Dean Russell, and Frank W. Wright.

The second meeting of the Department of Normal Schools was on Thursday afternoon, July 6, with W. P. Morgan, presiding. The first address was given by Frank W. Wright, director of Elementary and Secondary Education and Normal Schools, Boston, Mass. This was followed by an address by George H. Shafer, principal State Normal School, Willimantic, Conn., and with a third address by John L. Alger, president Rhode Island College of Education, Providence, R. I.

All three of the addresses were well received and thoroughly discussed by those present.

Dr. Keith, chairman of the nominating committee, announced the recommendations for 1922-23 as follows: for president, J. C. Brown, State Teachers College, St. Cloud, Minn.; for vice-president, Joseph Rosier, State Normal School, Fairmont, W. Va.; and for secretary, Ernest Silver, State Normal School, Plymouth, N. H. The report was unanimously accepted. Meeting adjourned.

ROBERT I. ELLIOTT, *Secretary*.

WHAT SHOULD THE GEOGRAPHY OF THE GRADES INCLUDE?

WALLACE W. ATWOOD, PRESIDENT OF CLARK UNIVERSITY,
WORCESTER, MASSACHUSETTS

When children come to the study of geography, they are enthusiastic research students; they love to know more about the people of this world; their powers of imagination are keen; and if the study of the actual living conditions in the various natural environments of the world is taken up in a dramatic way, so that the children study each habitat as a home of people, the knowledge of geography will come as readily as the rules of play, and the information thus gained will remain with those children because of the vital interest in that information at the time it was obtained.

Later in the upper grades when a more systematic and well-organized study of geography must be included in our curriculum, the work should have a sound, scientific basis. We need organization of our geographical information. In no subject in the elementary school curriculum is there a greater abundance of information. The problem of the teacher is that of selection and organization. Within the last few years we have come to recognize, along with leading geographers in many European countries, that the natural or geographic region should be the unit of study. Each region should include a portion of the earth's surface, throughout which the geographic conditions which influence life do not differ greatly. The study of geography becomes a study of man's effort to adapt himself to the environmental conditions, and to re-adapt himself as environmental conditions change. The study of one region after another leads to frequent comparisons, to the emphasis of contrasts, to the fixing in the memory and understanding of the child of the differences in geographic conditions in the different parts of the world. The natural regions become complementary; one developing as a manufacturing region, another an agricultural, one a mining district, and another a grazing land. Exchange of commodities becomes necessary; domestic and foreign commerce develop; and world relations soon grow out of these complementary conditions in the different geographic regions of the world.

The study should then prepare the child to a sympathetic and intelligent interest in the different peoples of the world, leading to a broader and broader point of view, and in the end to a greater citizenship. No subject in the elementary-school curriculum can so appropriately present to the children the accurate living conditions in the different parts of the world, and geography should take the responsibility of awakening and developing an intelligent and sympathetic interest in our larger national and international problems.

OBJECTIVES IN THE TEACHING OF GEOGRAPHY

ROBERT M. BROWN, RHODE ISLAND COLLEGE OF EDUCATION,
PROVIDENCE, RHODE ISLAND

At one of the meetings of the Association of American Geographers, representatives from the Continental and Commercial National Bank of Chicago, the American International Corporation of New York, and the Simmons Hardware Company, of St. Louis, told of the need of young men trained in the rudiments of geography. The plea was not that men should be so trained as a subsidiary line in vocations in which a knowledge of geography is useful if not essential, but it was made for the general body of students who had any expectation of entering business. As an illustration, one of the speakers stated that a pamphlet on Egypt recently distributed throughout his city told of 14,000,000 Egyptians engaged in agricultural pursuits who were using the crudest implements and that there was a rich field for more modern products. A manufacturer was stirred by the opportunity and sent a cargo of spades of American pattern to Cairo. As these did not sell readily in the Egyptian market the manufacturer was forced to bear his losses, and he probably resolved never again to engage in foreign trade. Part of the trouble with the spade market in Egypt was the fact that the barefooted Egyptians could not use the American spade with its sharp metal top, but the greater share of the difficulty was the lack of money and credit of the bulk of the 14,000,000 Egyptians. This is a typical case: It illustrates the tendency to treat foreign trade as it all the conditions in foreign lands were similar to those existing in the United States. An elementary teaching of geography if properly conceived and executed should have led the Chicago manufacturer not necessarily to know off-hand that the Egyptians wore no boots and had no money, but to know that foreign customs were more frequently than not different from our own and that he would be wise to investigate the market before he shipped his wares. Furthermore, a proper grammar school training in geography should have taught him how to make this investigation—if indeed it had not already given him the facts of it. If this lack of any functioning of the school geography with the affairs of the world is widespread, and recent experiences seem to assert it is, it is time for a thorough change in the aim of our teaching—along lines which a small group of geographers have always urged, but which more potent forces have not carried to fruition.

In an address recently, President Faunce told of a consignment of American cereals shipped in the usual pasteboard cartons arriving at the port of Singapore and exposed to the heavy tropical rains being completely sodden with water. When later he spoke of this and suggested another method of packing for such climates, he was told that the way to pack cereals was in pasteboard containers and the inference was that that was all there was to be said on that point.

We in this country are a contradiction of desires. In the slogan of the

politicians we both "point with pride" and "view with alarm." We see our foreign trade decreasing and we make no effort to revive it, although we mourn the loss. We read with concern that European trade is driving our merchants from the markets of the world; we regret it in words only and in the same breath we fear entangling alliances. Frequently we insist that we are sufficient unto ourselves; that the intricacies of world affairs are beyond our consideration; that we can live easily within our own borders; that all this stir about foreign markets is too remote from the pathways of the average man; and that as a whole the citizenry of this country have no contact with these things. In early days this would have been presented to you in parable but today in this particular, facts so crowd in upon us that it is not easy to select from the abundance. A mid-western town a few years ago refused to accept an invitation to a conference on foreign trade on the ground that its trade was entirely local. It bought its raw materials for its factories and sold its manufactured goods within the limiting area of a few States. It produced goods of which in this country, we manufactured a surplus of about 10 per cent and this surplus we sold in Europe. Eight years later the European markets were closed—no other foreign market had been developed and the 10 per cent surplus had to be floated in this country. This surplus became a competing product in the sale territory of the mid-western town and in course of time one of its factories closed its doors because our foreign markets were gone. This is but a sample of the attitude of many trade organizations: they cannot see that there is any foreign trade for them unless they are themselves selling to foreign markets; yet in the case of the mid-western city their entire market depended directly upon a successful continuance of foreign trade. The members of that commercial organization were in dire need of a good grammar school training in geography—such a training as their geography had not given them, but which we as leaders should insist that the young people of this country obtain. We are teaching much geography without a vision, a geography of facts and names, and not a geography of utility. It will take a tremendous jolt to awaken the people to their responsibilities in this regard. In pre-war days, the Consular Reports filled pages of their daily issues in explaining the inadequacy of our knowledge of foreign markets; the inattention to conditions of transportation; and the disregard for the needs of foreign people. A stupid and unexcusable conceit reigned which could neither be penetrated by advice nor roused by diminishing orders. Those were the days God winked at; now he calleth every man to repentance.

A second objective is the study of the peoples of the earth. The general ignorance of other races and what is worse, the obstruction to progress which this ignorance engenders is a very serious menace to the promotion of world affairs. There are many definitions of the word "race," and many ideas diverse and contradictory rush to the mind when the word is mentioned. I am talking of race as a social ritual; into which a man is

born and out of which he rarely emerges. I have not time to defend my definition, but an understanding of it explains our attitude toward the immigrants who come to our shores and is intricately associated with all true Americanization efforts. It offers one a solace when his evenings are disturbed by the noisy demonstrations of our Italian people in celebration of a fiesta; when foreign flags fly in our streets in memory of some alien holiday; or when a group takes sides against us on issues involving the land of their birth. It should double our efforts to make the children of these—born in our own social ritual—truly American. I like the story of the boy of Italian parentage who, during the war, refused to take punishment from his father on the ground that "we Americans are not going to be licked by any foreigners." And I condone the practice frequent in our public schools of classing as Portuguese, Italian, and the like children born under this social ritual of ours.

To know the races of the earth or to know those with whom we have contact is a duty which every person in a land of so diverse a character as ours should meet. We ignorant are fertile ground for the propagandist and many a voter has been unconsciously misled by a half truth attractively stated. Whether we like it or not, we have not the choice of being or not being involved in foreign affairs. We are involved and will be increasingly so. There is no greater safeguard to hasty and ill-advised action on the part of a country of wide franchise than an intelligent electorate. The I. Q. of the American is said to be lowering, because of the influx into the body of great numbers of middle and lower-class people from other lands. It is not comforting to contemplate this; but with the more rigid immigration rules of the present, especially the restrictive measures, we can take heart if we undertake our task with courage and intelligence. The foreign people to a large degree bring their prejudices with them; their lives have been ones of suppression; one of the greatest tasks of our schools is to teach the children of these immigrants to be constituents of an amalgamated group, and not partisans of an isolated one. There are many lines to be pursued, and here geography, well conceived, should be of vast help. It should give to them the background of the ideals of the land of their fathers; and not less so the aspirations of other lands equally as well. The study is not one of capitals and boundaries, exports and productions, but one of development of a nationality under the peculiar environment. And not only do these children of foreign parentage need this, but children of native parentage need it as much. Americanization of foreigners is well enough, but an intelligent American public is the greatest step toward Americanization. Of course, if Americanization means what Russification or Germanization meant, we can get along with a deluded public; but I take it that this is not true. It has been confidently stated that the Conference for the Limitation of Armaments had every promise of failure before the actual meeting took place, because of the rabid anti-Japanese propaganda which was being inoculated into the public. The telling blow which Secretary Hughes struck on the opening day drove this from the public press and the Conference was little hampered afterwards by this

feeling. But why should the American public be subjected to this; why should not the public schools prepare the pupils to know Japan and the Japanese well enough to decide for themselves? Count the number of times in recent years that foreign policies have been decided by the propaganda of a few rather than the thought of the many; and you will be almost persuaded that we have another Potsdam among us.

Again we have in our magazines the beginnings of serious warnings concerning backward peoples of the earth. Two books have appeared, one on the menace of the Islam world and the other on the threat of the suppressed peoples, and both probably tend to overstate the conditions. One half a billion people of the earth are classed as advanced peoples and one and one quarter billion as backward peoples. The menace of these one and one quarter is the theme of these books. Only by a just and equitable dealing with these can we avoid some clash. They are realizing their strength in numbers and some unscrupulous yet powerful leader may be able to bring these people to fighting pitch and to throw again the world into chaos. The only insurance against such a calamity is to so befriend these backward people as to render them unwilling and so to develop their resources for them as to make it unprofitable for them to create turmoil. This cannot be done by teaching a superficial classification of races in our schools. The equipment of most of our generation concerning the people of the earth is of the most meager sort and to a large degree vicious. We can recite that mankind is divided into the white, black, yellow, and red races; and, with our shoulders back, we continue that the white race is civilized and the others uncivilized and savage. A man who can tell only that the Chinese wear queues, constrict their feet, and let their finger nails grow as a sign of gentility is not adequately prepared to maintain the open door in China or discuss the Shantung question; but that is what most of us are doing. Nor is he competent to consider the menace of the backward peoples if his only picture, as an inheritance from his geography, is the Circassian Beauty of marvelous head-dress. None of these things is important or necessary; most of them are irrelevant and lead to a vicious thinking. In many cases the teaching of races has developed into a discussion of fashion and should be classed with the Godey's Ladies Book style of literature rather than geography. We need a knowledge of peoples in their environments; of the Japanese of such a character as to show how in their peculiar physical setting, they have developed their ideals and aspirations, their nationality. We do not need to know the individual or exotic specimen; we need to know them collectively as a people.

The commencement addresses brought to our attention this need; and if commencement addresses were potent in shaping public opinion, we have the greatest hope that the steps which I am urging are on the way to fruition. Secretary Hughes in his Ann Arbor address emphasized the need of a sound public opinion, declaring that untruths concerning the peoples of the earth are the greatest present hindrances to the country's foreign policies.

The third objective is based on conservation. We have long lived in a profligate country and our adjustments to a world in stress are slow. We have boasted of our land of plenty, our asylum for the down-trodden of Europe; and our ability to give them liberty of mind and body.

The last of our free land is gone; our cattle ranges are being restricted; extensive agriculture is giving way to intensive cultivation of the soil. The new generation must face a new day; not a day of wasteful extravagance, but a day of careful measurements of resources.

The last Census recorded that there were 100,000 less people in rural communities than there were in 1910; and 10,000,000 more people in continental United States: a 10 per cent decrease in food producers, and a 10 per cent increase in consumers.

The United States Geographical Survey informs us that many here will see the depletion of our petroleum preserves.

We have been using our forests at the rate of 40 cubic feet of wood per acre per year and growth is only at the rate of 12 cubic feet per acre per year.

Great plans are being presented to Congress for a Trunk Power line between this city and Washington, which has for its primary argument the conservation of coal and the utilization of water power.

Yes. We are facing a new day. What are we to do about it? Shall we continue to listen to youngsters, drone out the unrelated facts of wheat and lumber and fish? Or shall we induct them into the problems of production as it affects a world ready to starve or be easily fed according to its intelligent decision?

These are the objectives for the study of geography which I am presenting to you. I have purposely omitted one or more commonplace ones and I have refrained from arguing a place in the sun for geography, based on purely academic reasons.

There is a great need for the knowledge which a proper study of geography offers. This need is not apparent to the teacher whose main object in her work is completing a prescribed course or finishing a textbook; nor is it patent to the supervisor whose attention is on set courses and not on the world about us.

The public schools should face the demands of today and tomorrow in its geography program and not the conditions of yesterday. This work appears to me as simple as it is desirous.

Why spend millions on a merchant marine and allow our young people to grow up ignorant of foreign markets? Why send a million or more men into Europe to end the militaristic threat of a deluded people, and make no attempt to dispel the delusion of our own people? Why turn all the available departments of our government to the task of conservation and utilization, and make no attempt to keep pace in the schools with these necessary and intimate problems of livelihood?

GEOGRAPHY FOR RURAL SCHOOLS

DOUGLAS C. RIDGLEY, CLARK UNIVERSITY, WORCESTER, MASSACHUSETTS,
FORMERLY OF ILLINOIS STATE NORMAL UNIVERSITY, NORMAL,
ILLINOIS

The previous discussions have presented geography from the view point of the course of study and of objectives in teaching geography. These viewpoints look out upon the entire field of geography and upon the relation of geography to all pupils whether in city or in rural schools.

In this discussion, we are asked to point out some of the opportunities in rural schools for the effective teaching of geography. The local environment of the school in the open country, is widely different from that of the school in a large city. Each, however, has its advantages as well as its disadvantages in the concrete presentation of the subject of geography to boys and girls of the elementary school. The teacher of the rural school and the teacher of the city school, each has an ever-present abundance of geographic materials in the local environment with which to make vital connection between the geography of the textbook and the actual work-a-day world in which the pupils are living.

In order to appreciate what geography may offer to the boys and girls of America, it is necessary to keep in mind the progress of modern education in general, and the progress in modern school geography in particular. In an effort to have the school contribute more and more fully to the welfare of the individual, and to enable him to coöperate in a helpful way with those about him, geography has its unique contribution to make.

Geography has always been a study in which man's relation to his natural environment has had a place. At times, the study has seemed to deal with places without definite effort to associate the places with fundamental relationships existing between the region and the activities of the people living there. At other times the study has seemed to lead to an interesting investigation of the activities of people in various regions of the earth without a keen appreciation of the powerful influences exerted by the natural environment on the activities under consideration. In recent educational progress, students and teachers of geography have turned more and more to the point of view that geography is to interpret to boys and girls, the relationships existing between the ordinary, every-day work of mankind and the natural environment in which people live in all parts of the earth.

This relationship may first be brought to the pupil's attention in the study of home geography, for here the human activity and the natural environment are matters of first-hand observation. Under the direction of a skilful teacher of geography the relationship between these two factors becomes readily apparent, even to pupils of the third and fourth grades. In the study of more distant regions, a concrete, first-hand knowledge of the geographic relationships of the home locality is of great value in gaining an appreciative understanding of other regions. These geographic

relationships of the home locality may center in the open country with its wealth of natural environment and its essential connection with the city or, on the other hand, these relationships may center in the city with its wealth of human activities, and its vital dependence upon the open country. Frequent and direct comparison of the geographic relationships of the home locality with other regions of our own and of foreign lands, will aid in developing ideas necessary for intelligent citizenship in America, and in the World. The teacher in the rural school has an exceptional opportunity to develop the study of geography by means of illuminating comparisons with the region best known to the pupils.

In order to see the possibilities of the teaching of geography in the rural school, it is desirable that the teacher have clearly in mind the factors of the natural environment which are unquestionably geographic in their bearing, the kinds of human activities which are closely related to man's environment, and the relationships which are strongly geographic in character.

The natural environment in which the people of the world are living may be considered under nine categories: location, climate, surface features, soil, water supply, ocean, minerals, plants, and animals. The human activities of the world may be grouped under three categories: economic, social, political. The twelve topics of this enumeration include basic materials for all of the natural sciences and all of the social sciences. These topics may be treated separately, and fully, without touching the subject of geography. It is the special province of the teacher of geography, however, to select from these two great groups of subjects the large, simple, outstanding facts and show the relationship existing between them.

These relationships are ever-present, fully operative, and readily appreciated in the local environment of every rural school. The region in the neighborhood of the rural school thus becomes a laboratory in which to develop definite, concrete geographic concepts, to test by comparison the geographic facts of distant regions, and to make the study of geography reach beyond the covers of a book.

Let us now turn to the opportunity thus offered to the teacher of the rural school and see how the materials at hand may be used. We shall assume, that a course of study in geography will follow the same large units of study whether for rural schools or for city schools. We shall assume, also, that the great objectives to be attained in the study of geography are suitable alike for pupils of country and of city. We wish merely to examine how the teacher of the rural school may use effectively the materials at hand in developing the course of study and in attaining the objectives of good geography teaching. For this purpose, we shall select from the list of the geographic factors in the natural environment a few topics which may readily find concrete presentation in rural schools.

We shall first consider *climate*, one of the most far-reaching controls of human activity in the world. This control is fully appreciated even without any theoretical knowledge of meteorology. The facts of temperature,

moisture, and winds are self-evident. The relationship of man's activities to these climatic controls is concretely illustrated in every locality. The teacher of the rural school has the opportunity of discussing with the pupils these relationships as they arise. They need to be brought definitely and concretely into consciousness in order to be appreciated in their local influence and in order to appreciate the climatic controls in lands, having a very different climate from that of the region in which the school is located. In times of wet weather when farm operations are delayed, or in times of flood when heavy losses occur, the teacher may help the pupils to understand that such conditions occur at many places throughout the world and that people plan great systems of drainage to lessen the destructive effects of too much rain; that bridges must be built high enough and strong enough to withstand the highest floods which may occur. In times of dry weather when crop yields are less than usual, or in severe drought, when lack of rainfall results in serious crop losses, the local situation may be discussed and the application made to other regions of the earth. The desirability of a well distributed, moderate rainfall for the home locality gives a basis for concrete thinking about the geographic conditions in extensive areas of the earth.

We may next consider *surface features* of the land. This topic may be dealt with concretely in the immediate locality of every rural school. An examination and a discussion of the actual relief of the land in the school district, and as far beyond as the experiences of the pupils have carried them, is well worth the time and effort required as a means of carrying the subject of Surface Features beyond the covers of the textbook. Teachers and pupils may see that in their own locality the land relief compels the expenditure of much money and labor in draining swamps, and that the improved condition of the soil and the large production of crops year after year yield a handsome return for the effort. They may see that the upland ridges have a poorer soil and yield smaller crops than the more nearly level tracts between. They may see that the slope of the land has led the farmers of the locality to use certain portions of their land for crops, other portions for pasture, and other portions for woodland. Such concrete observation of local relief and a discussion of the relationship of this local relief to the actual work of the families to which the pupils belong, lays a sure foundation for correct thinking concerning distant regions which can be known only through pictures and reading.

A definite study of the plant life and animal life of the region about a rural school and their relation to the work of the neighborhood, will yield valuable results in the study of geography. A good starting point in this study is that of the native plant life and the wild animal life of the region and their relation to the work of the Indians who occupied the region before the coming of white men. We may then show the advantages of substituting cultivated crops for native forests or open prairie, and the advantages of raising domestic animals in an agricultural region. The very existence of mankind is so directly dependent on plants and animals,

that these factors of the local environment in any agricultural region, are now dependent on man's own work. A study of the kinds of plants and animals in the locality of the school and the reasons for their selection in this region aids greatly in understanding the local geography. A clear notion of the geographic controls of the plant and animal life of the home locality gives a concrete basis for the study of the plant and animal life of other regions of the world. A keen perception of the home situation enables the pupils to see that it is just as natural for the Laplander to raise reindeer as it is for us to have horses and cattle; that it is just as natural for the Chinese to raise rice as their chief bread stuff as it is for us to raise wheat.

Another factor of the natural environment of wide application in geography, is that of location. Pupils may be led to discover that much of the work of the region in which they live is dependent in a very large measure on the location of their home on the surface of the earth. They may be led to see that the location of the home region with reference to the equator determines many things: the length of day and night throughout the year; the sun's path through the sky; the time of year when each season comes; the differences in the seasons; the kinds of crops that they may raise; the kind of clothing which they may wear. They may see that their location with reference to the sea has direct consequences on the industries of the locality. The location of the home region with reference to altitude, with reference to relief features, with reference to transportation lines, cities, and markets may be definitely worked out and applied to the ordinary activities of the people of the neighborhood.

Let us now consider what such a treatment of the geographic materials in the locality of a rural school may accomplish for the boys and girls of American rural schools:

1. It will give them a keen appreciation of the fact that the progress of their own community has been determined in large measure by the use that has been made of the gifts of Nature.

2. It will enable them to see that all people everywhere are constantly, and necessarily adapting themselves to the rural conditions of the region.

3. It will show them that they would necessarily live very differently if they were in a region with a natural environment strikingly different from their own.

4. It will lead them to see that people everywhere are very much like the people of their own locality in the fact that all people are endeavoring to get as good a living as possible from the natural environment in which they live.

5. It will give them a more wholesome attitude toward the peoples of other countries, and of other races, as the study leads the pupils to see more clearly the common traits and common aspirations of all peoples.

6. The rural school offers unsurpassed opportunities for teaching geography with a concreteness that will insure to the youth of rural America an elementary mental grasp of world relationships among people

and among nations. This concept, through wide and well directed observation and reading in after years, will enlarge into a firm and comprehensive mental grasp of national and world affairs. Thus, will geography contribute its share in enabling the boys and girls who are trained in the wholesome environment of the open country, to become worthy citizens and capable leaders in the economic, social, and political affairs of their local communities, their State, the Nation, and the world.

THE ELEMENTARY CURRICULUM AS PRESENTED IN NORMAL SCHOOLS

F. W. WRIGHT, STATE DIRECTOR OF DIVISION OF ELEMENTARY AND
SECONDARY EDUCATION AND NORMAL SCHOOLS,
BOSTON, MASSACHUSETTS

Fitting it is that a portion of this great conference should meet to consider the problems of teacher training. Less than ten miles from where we are convened can be found a building marked with this inscription: "This building was used as The First Normal School in America. Opened with 3 pupils, July 4, 1839." An appropriate day and place for laying the foundation of a movement so vital to the life of our Nation. Here Horace Mann established the principle that teaching was both a science and an art and required training and skill for its successful performance.

With the lapse of eighty-three years since the opening of this first State Normal School in Lexington, Massachusetts, the fundamental importance of Horace Mann's statement that common schools will never prosper without normal schools becomes increasingly apparent. This first State normal school, opening with three students, has increased to 167 State normal schools enrolling 80,000 students.

Notwithstanding the rapid growth of this type of educational institution, the field of the State normal school is much larger than it has yet been able to occupy. With less than half of the 700,000 teachers of the Nation possessing any special preparation for the important duties of their work; with an approximate annual demand for one hundred thousand new teachers and an output of but eighteen thousand trained teachers each year, it is clear that the normal school has not even approximately met the end for which it was established—the training of an adequate supply of teachers for the public schools. With thousands of children on part-time on account of inadequate housing; with teaching groups running to fifty, sixty, and even more; with scores of thousands of teachers with not even a full high-school course as preparation, we are in need of more trained teachers than can possibly be produced by our institutions established for that purpose, and as at present maintained.

The public seems to have been lulled again into a false sense of security with reference to a situation that was much under discussion a year or two ago—namely, the shortage of teachers. We need a new definition of

teacher shortage as a means of again arousing public interest in a situation that should no longer be so complacently accepted. There will be a teacher shortage until each child of school age is in school for a full day, in a group not larger than thirty-five, and taught by one who has had at least two years of professional training beyond the four-year high-school course.

More important than any of the ten points by which the school systems were recently measured by the Russell Sage Foundation is the single outstanding factor of teacher training. We shall not know whether Montana is in first place, Massachusetts in ninth place, or Pennsylvania in twenty-first place among the States of the Union in the efficiency of her school system until we determine the degree to which her teachers are trained, and such information is included and properly weighted in a National school survey. Indeed, a recent study of this factor by Dr. Burgess, affecting fourteen States, established an index number for teacher training in these States that is most suggestive and illuminating.

In his last published work, *Modern Democracies*, James Bryce says, "Democracy is based upon the expectation of certain virtues in the people, and on its tendency to foster and further develop these virtues. It assumes not merely intelligence, but an intelligence elevated by honor, purified by sympathy, and stimulated by a sense of duty to the community. It relies upon the people to discern these virtues and to choose their leaders by them."

That a democracy, founded as Bryce has here set forth, can long endure without a vigorous and broadly applied educational policy, is to expect what, by the very nature of things, cannot be. A nation cannot be free and ignorant at the same time. A wide diffusion of educational opportunities is essential to an intelligence elevated by honor, purified by sympathy, and stimulated by a sense of duty to the community. If, as Dr. Spaulding recently said, we are a nation of sixth-graders, taught largely by tenth-graders, we have need to give careful thought to education in a democracy as the index of our future National strength and character. The outstanding task of American education is that of training and bringing into the schools of our democracy teachers fitted for their high task—teachers who are scholarly, professional, and devoted to the public service.

The term, normal school, as used in this paper applies to an institution that requires for admission the completion of a full four-year secondary course, and which offers a professional course at least two years in length. I find that this is not the accepted definition in all parts of the country. On the one hand, we find institutions that are quasi-secondary schools, and on the other, we find such terms as teachers' college, normal college, junior college, and senior college associated with what we once called normal schools. I fear that we are in grave danger of creating confusion in our own minds and in the minds of the great lay public who support our institutions in our apparent desire to abandon the term, normal school, in naming our teacher-training institutions. This term may not be accurately descriptive of the institution we serve, but it has the virtue of meaning something very definite in the minds of the people.

It has never seemed to me to be the true purpose of the normal schools to serve either as secondary schools or as liberal arts colleges. I sometimes fear that, after having, in most States, raised these schools out of serving as secondary schools with commercial, college preparatory, and other courses, no one of which was specifically designed as preparation for teaching, we are in danger of leading them into the mist by having them serve as junior and senior colleges. We are in need of a clear reassertion of the real purpose of the normal schools if they are to rise to their full stature and occupy the important place that is theirs to claim.

In commenting upon the tendency in some States to offer in teacher-training institutions, courses of college and non-professional character, the sixteenth annual report of the Carnegie Foundation for the Advancement of Teaching says: "There is no intention in what is said here of disparaging the junior college movement either as an outgrowth of municipal secondary education or as found in separate institutions; it is intended to urge emphatically what experience has made clear beyond question, namely, that a sound school for teachers must have its own exclusive curricula and student body, its own staff of teachers, its own buildings and equipment, and its own independent budget and administration for the reasons that hold good for every form of advanced professional training."

Inspection of some of the curricula of recently established teachers' colleges and, indeed, of some of our normal schools, leads one to believe that not always, or fully, have we realized that the sole function of teacher-training institutions is to train teachers. A catalog of the curricula offerings in these institutions would be long and varied, and would reveal some subject matter that even the most elastic imagination could not include within the range of the curricula designed to prepare teachers for public elementary or secondary schools.

Claim can here be made that our so-called teachers' colleges (recently called normal schools) are designed to train teachers for the secondary schools. Doubtless this is an important function of these institutions, as is revealed by a recent limited survey conducted by F. L. Whitney, of the University of Minnesota. This survey shows that 507 graduates of 3 typical State normal schools with a two-year course, and one typical teachers college with a four-year course began their first year of service as follows: Of the graduates of normal schools with the two-year course, 95 per cent taught in the elementary school; of the graduates of the teachers' college with a four-year course, 89.9 per cent taught in the high school.

I wish to state at this point, however, a firm conviction that in lengthening our courses to four years in either normal school or teachers' college we should guard against the impression that the four-year course is for teachers in secondary schools only. Increasingly, public opinion will demand four years of post-secondary training for teachers in the elementary and junior high schools as it now does for the senior high school. For years, some Massachusetts State normal schools have offered a three-year course in addition to the standard two-year course, and a premium is placed upon graduates of this course by committees seeking teachers.

The time may not be far distant when we shall pay teachers upon the basis of preparation and successful experience, irrespective of the grade or year in which instruction is given, as is now done in a few cities, notably Denver. Then can we hope for a compulsory four-year professional course for teachers in all grades of our public schools from the first through the twelfth.

Broad training is essential to teaching in any grade or year of the public school. Too long have we believed that the teacher in the primary grades could be qualified on a lower plane than the teacher in the high school. Indeed, one might venture the opinion that pupils in the high school can better withstand the evils of poor teaching than those in the early elementary grades.

In planning our teacher-training curricula we should constantly ask ourselves the question: What are these young people to be called upon to teach? I sometimes think that the question uppermost has been: What, as post-secondary students, ought these young people to study? It may seem that these two questions are so closely related that they have the same answer. The curricula of the public schools and not of the liberal arts colleges should be the center of gravity in the preparation of the curricula of our teacher-training institutions.

How far short some of us have fallen is revealed in the answers to a questionnaire recently sent out from Clark University. Replies were received from 75 normal schools, distributed through 32 States, and give the geographic preparation of 5497 recent graduates, as follows: 15.7 per cent had no geography in normal school; 39.4 per cent had a single course of 12 weeks; 24.9 per cent had a single course of 18 weeks; 17.7 per cent had a single course of 24 weeks; 12.0 per cent had a full year.

When we recall that almost none of these graduates made geography a subject of study after leaving the elementary school, we see the significance of a sound course in the content and method of geography in the normal school. Since this subject is now given graduate study in the university, there is little danger that, properly presented, it will fail to arouse the interest of students in the normal school.

In the light of the foregoing data, Edward Yeomans' description in *Shackled Youth* of a teacher of geography may not seem so extreme as at first reading. He says, "She chose geography because she might just as well teach that as anything, and she seemed particularly good at remembering the boundaries of things and principal rivers. She cares considerably less for geography, *per se*, than she does for a book of Hall Caine. Its importance consists in the fact that she can make a living teaching it to children."

Whether similar investigations dealing with other important subjects in the curriculum of the elementary schools would yield parallel results in our normal schools, one cannot say. If they did, one might feel reasonably sure that graduates of normal schools or teachers' colleges, where such conditions obtain, would make a sorry task of teaching hygiene, history, or

arithmetic. It is more important that we feel reasonably sure what our graduates will do when confronted by a group of children in fifth-grade arithmetic than that they be able to exude wisdom on the psychology of number or be able to operate the slide rule. Nor will it suffice to state that they have studied college algebra in the normal school or teachers' college. Splendid it is if our teachers of arithmetic can have advanced training in mathematics, but this should not come in the normal school at the expense of method.

Our problem, then, in preparing curricula for teachers in the normal school seems to be that of so presenting the curriculum content of the pupil in the public school to the student in the normal school or normal college on a level sufficiently high to make the work professional to the highest degree. The normal school should not teach arithmetic, but should teach teachers to teach arithmetic.

As is suggested in the monumental report of the Carnegie Foundation on the Normal Schools of Missouri, instruction in normal schools should not consist merely of review of subjects in the elementary or secondary schools, with appropriate methods and devices, but should be a professional treatment of the whole subject, which will clarify the understanding of the teacher in training, and deepen his appreciation of the subject. Proper presentation of a subject in the normal school should include a knowledge of the processes of the subject, an understanding of the mental processes involved, and some study of the genetic development of the subject and its various applications. Subjects are to be made professional in treatment through proper selection and organization of material, by the adaptation of the material to teaching, and by utilization of the experience of the normal school student in learning as a means of throwing light upon his problems in teaching. To quote from this report: "The initial skill of teachers sent out from the normal school depends, in no small measure, upon the teaching to which they have been subjected."

If we are to send into the schools teachers professionally trained, we must professionalize the subject matter they are to teach. In doing this we shall find no subject in the elementary curriculum beneath the dignity of a teacher-training institution.

In placing the emphasis in teacher-training curricula for the elementary school we should keep clearly in mind the major points of emphasis in the curricula of the secondary school where our teachers in training received their preparation. The report of the U. S. Commissioner of Education for 1917 shows the following distribution of time in American secondary schools: Foreign language, 17.5 per cent; English, 22.3 per cent; mathematics, 17.5 per cent; history and civics, 13.5 per cent; biological sciences, 5.8 per cent; physical sciences, 7.6 per cent; vocational and practical arts, 6.8 per cent; drawing and vocal music, 11.2 per cent.

A survey of 184 rural high schools chosen at random in New York, carried on by Professor Works of Cornell University, showed that 44 per cent of the pupils' time is given to the study of languages, including

English, or almost 21 per cent, excluding English. Approximately 18 per cent of his time is given to mathematics as compared with 11.2 per cent given to all the natural and social sciences, including American history and civics. The pupil in the typical small high school in New York State gives as much time to the study of foreign languages as he gives to the natural sciences, agriculture, and the social sciences combined, according to Professor Works' findings.

The important place that the social and natural sciences are to play in the years that lie ahead dictates a policy of giving a large and important place to these subjects in the preparation of teachers. American history and civics, professional ethics, the elements of economics and sociology, nature study, hygiene, gardening, agriculture, and practical science, afford a background for instruction in the normal school that will carry over into the elementary school.

When many of our secondary schools give as much time to Latin as is given to all of the biologic sciences and American history and civics combined, and as much time to modern foreign languages as to the physical sciences, economics, sociology, agriculture, home-making and shopwork combined, there is need to shift the center of gravity in the curriculum of the normal school away from the traditional and academic and into the social and scientific if the six or eight years of preparation following the elementary school are to give us teachers who can train this generation of children for the important responsibilities that face them.

That English should be the centre of the elementary curriculum is obvious. I do not mean that we should spend our time in correcting the speech of normal school students, or in teaching them the elements of good form in writing letters. When we have the courage that we ought to have we shall admit to our normal schools only those who can pass a thorough examination in at least the elements of literature, who can express themselves accurately and with some fluency in both speech and writing, and who can spell the minimum vocabulary of a high-school graduate. There is more important work for the normal school to do in the field of English than to serve as a correctional institution. A thoroughgoing course in literature for children, dramatization, story-telling, oral and written composition, library study, and spelling content and method, offers a wide enough field for an elementary course in the normal school longer than two years.

The normal school that would best serve the public schools of today is the normal school that in its curricula gives proper place and attention to physical education, with all that that term connotes. Twenty-eight States now have compulsory physical education laws in one form or another. No State-wide program for physical education can be effective, however splendid the law creating it, unless the normal schools of that State see the tremendously important part that they must take in carrying the program forward. We have made it clear to our recently appointed State supervisors of physical education in Massachusetts that the State normal schools

are to receive a large share of their attention. A two-weeks' conference of all of the teachers of physical education in our State normal schools and our State supervisors of physical education will open next week at the summer session of one of our normal schools, as will two summer schools of physical education for supervisors and classroom teachers, under the direction of our State supervisors. The normal schools must teach physical education and not be satisfied with formal gymnastics as the supposed means of caring for the health of the students in attendance.

If we are to become a nation of intelligent consumers, more attention must be given to the fine and practical arts in the preparation of teachers for our public schools. Drawing and handwork, music, the elements of home economics and shopwork must be given their proper appropriation and time allotment in the curricula of the normal school.

Among the new developments of our curricula for State normal schools in Massachusetts is a course in professional ethics. There is now in process of printing a bulletin setting forth the work of a committee appointed from our faculties for the purpose of preparing such a course. After two years of discussion and trial of the material, it has taken somewhat definite shape. Here, it seems to me, is a point for emphasis in the preparation of teachers. Both the medical and legal professions are developing codes of ethics. No body of public servants with the intimate social contacts of the teachers in our schools should be without a set of guiding principles in doing their work. Time should be found in our normal school curricula for the development, possibly through projects, of the ethical responsibilities of our profession.

The occasion does not demand that a catalog be here given of the several units of study that shall make up the elementary curriculum in normal schools. Specific reference has been made to three or four that seem especially significant in the light of present educational tendencies. It has been urged, however, that we have methods courses in the curriculum of the elementary school, together with such courses of a cultural and professional nature as will give breadth and depth to the teacher's preparation. That has been, and is, the conception we have in this State of the duty of the normal school in preparing teachers.

With this conception in mind, a significant piece of democratic curriculum making has been going on in the State normal schools of Massachusetts for the past three years. Eighteen committees were appointed by the Department of Education and a steering committee of three principals for the distinct purpose of revising the elementary curriculum. Preliminary reports were made at the end of the first year, at our second annual State conference of normal school instructors. Mimeographed copies of each report were distributed and departmental conferences held. After a year of trial in the several schools, the reports were revised and presented for further discussion at our third annual conference. These reports are being used as a teachers' and students' manual in the normal schools. Each graduate will carry a copy away for her use as a teacher, a sufficient supply

of each having been printed for a five-year period. After further revision, three additional reports are now in process of printing, including the report on professional ethics, already mentioned. It is our intention eventually to print all of these committee reports as the basis of the elementary curriculum in our State normal schools. To be sure, we shall keep them under constant revision and use them with sufficient elasticity to give free scope to the initiative of our most ambitious instructors.

As a means of interpreting this work in curriculum making, special investigations have been carried on for the past two years in the field of intelligence testing, with group and individual applications. Special committees are at work on the project method and on educational measurements in the training school. Our annual State conference makes an excellent clearing-house for these committee reports.

Any curriculum to be effective must be under constant study and under constant revision as to detail. The survey of the curriculum from within affords the best means of appraising its value. In Massachusetts we have in our State Normal School Teachers' Association an effective agency for assisting in this work. This association, since its formation three years ago, has, in conjunction with the Department of Education, set for itself each year some distinctly professional task. Through the efforts of this association, and in the light of our own present experience in curriculum making, we hope to keep not only our elementary curriculum, but all of the curricula in our State normal schools abreast of the needs of the schools for which our teachers are being trained.

SUBJECT MATTER IN THE TEACHERS' COLLEGE CURRICULUM

GEORGE H. SHAFER, PRINCIPAL OF STATE NORMAL SCHOOL,
WILLIMANTIC, CONNECTICUT

For some years now we have been talking in spots about professionalizing the teachers' college curriculum. In the more recent literature we come across a still more specific term—namely, “professionalized subject matter.” Now to those of us who did not experience the birth pains in producing these expressions, they give the impression of a specific, they convey somewhat the odor of a nostrum. “Professionalized subject matter”—it sounds so much like peptonized milk. It must contain some magical element, some potent for which ordinary subject matter is merely a vehicle or perhaps a sort of filler.

But then these are only superficial impressions for which perhaps we ought to ask the good Lord to forgive us and we ought instead to be thankful that the teachers' college as a democratic institution shows signs of life and health and that there are those who are giving their best energies in trying to comprehend and to define the immediate necessary steps in its adaptation. The fact of the matter is that these expressions which I have

just mentioned are tremendously significant both in their general purport and in their specific meanings. They indicate that the teachers' college is becoming conscious of itself and of its objectives and that it is beginning to take itself seriously as an independent institution. It is no longer to be a mere expedient in a system of examinations for teachers' certificates, nor is it any longer to try to stand under the shadow of the liberal arts college and borrow whatever of glory it may from that institution. These expressions are the symbols of a declaration of independence. Hereafter the teachers' college is to shine by its own light and it is to make its appeal for public support on the ground that it has a tremendously important function to perform in the general scheme of education and it will demand that it be allowed to perform that function unobstructed.

Education is both preventive and constructive. The public supports education for the same reason that a city supports an effective water system, fire department, and streets. These things are necessary for the life and growth of the city and for the comfort and convenience of every inhabitant. Education is a National necessity. It gives individuals and nations the light necessary to appreciate the values of life and the power to control those values.

The effectiveness of public education depends upon the teacher. The teacher occupies the strategic position. He is the one who must direct the experiences of the learner so that life controls may result. The teacher must be the artist, not the artist's tool. He must appreciate life values. He must have as clear an understanding as possible of his particular function besides the technique of his profession.

It is the function of the teachers' college to select—and I say select advisedly—to select young men and women of adaptability and to guide them as far as possible into the appreciations and controls of professional values and technique, always bearing in mind that professional values include life values for the ultimate objectives of teaching are found in life values. Strictly professional values are a means to an end. Life values are ultimate values. Human beings must learn to control natural and social forces for the welfare and happiness of individuals and of groups of individuals. It is these life values that children must learn to appreciate and control. The content of the curricula of our schools, history, geography, sociology, citizenship, economics, literature, mathematics, is the intellectual resultant of the experiences of the race in its efforts to gain control of life values, and its purpose is to lead the oncoming generation into such experiences as will make it possible for them most effectively to gain control of life values in their generation.

Now if teaching is to be effective, teachers must have a fair control of life values, but they must also become conscious of the functions of specific subject matter in bringing about these controls.

Here is where the work of the liberal arts college and the teachers college overlap. It is the function of the liberal arts college to give control of life values but it would be neither practical nor economical to make all

students conscious of the values of specific subject matter in bringing about these controls. The student in high school or college takes subject matter for granted. It is not so essential that he should know whence it came nor how it effects its purpose. It is sufficient for him that the purpose is accomplished, that he acquires the knowledge, forms the habits, and establishes the attitudes which are essential to control life values. The teacher, on the other hand, must not only acquire these controls as such, but he must also learn to view subject matter, arithmetic, geography, literature, as an instrument of control. One may think effectively without knowing how he thinks, without even knowing that he has a brain, and that the thinking process is connected with it, but if he is to direct thought processes in others he must know the nature of a thought process. The teacher must not only gain life controls by his reactions upon subject-matter—he must also learn to test subject matter for its control values, and it is this added function which differentiates the subject matter courses of the teachers' college from those of the liberal arts college. This, I take it, is the meaning of professionalized subject matter.

The course in arithmetic, for instance, should not only aid to give the student control of arithmetical situations in life, it ought also to make him conscious of the specific values of arithmetical processes in controlling life situations. To be more specific, the teacher ought not only to be able to use the multiplication table effectively—he ought also to know something of the nature of the table as an instrument, how it was evolved, and what function it serves in the process of computation.

Again, the subject matter courses of the teachers' college are differentiated in their specific content. Courses intended for elementary teachers cover the content of the elementary curriculum while courses intended for high-school teachers cover the content of the high-school curriculum but always on a plane adapted to the maturity and ability of the students, and always primarily aiming at the control of life values by the students. The reason that review courses as offered in normal school in the past were so abortive was because they did not yield intrinsic values. They did not yield a broader outlook on life, more extended knowledge, habits and attitudes more adapted for the control of life situations. They set up an artificial end, regarding subject matter as so much dead stuff to be accumulated and then doled out in small doses to children.

It is the practice in some of our teachers' colleges at the present time to make subject matter courses carry the extra load of specific technique all on a very meagre allotment of time. Such courses do not meet the needs of prospective teachers in gaining control of life values. They may be effective as methods courses but they can yield very little of other value. These courses, when given exclusively, remind one of a certain characterization of Fletcherism, "It matters not what you eat, nor even whether you eat anything, so long as you chew it well." It matters not what you know nor even whether you know anything so long as you can teach it by the latest method.

In summary, let me say that the teachers' college is becoming conscious of itself as an independent institution having a full-sized job to perform. It ceases to be an enigma. It is neither a secondary school nor a liberal arts college, it is simply a teachers' college.

My sole purpose, in the short time allotted me, was to raise the question of the status of subject matter courses in the teachers' college curriculum. Such courses seem to me to be absolutely indispensable. They are differentiated from somewhat similar courses offered in liberal arts colleges in two ways: (1) While their fundamental purpose is to yield life controls they should also yield the point of view of subject matter as a means of control, (2) In the kind and variety of courses offered by the liberal arts college the sky is the limit. The purpose of the teachers' college is specific and restricted and subject matter courses should yield those life controls which all individuals should possess together with those more specific controls which are necessary for the particular class of service which the teacher will be called upon to render, always remembering that these controls should be acquired on the highest possible level.

Courses which involve subject matter only from the point of view of method are totally inadequate to yield those life controls which are an indispensable part of the teacher's equipment.

THE PRACTICAL NATURE OF AN EDUCATION FOR TEACHING

JOHN L. ALGER, PRESIDENT OF RHODE ISLAND COLLEGE OF EDUCATION,
PROVIDENCE, RHODE ISLAND

An education designed for the training of teachers is of necessity practical.

1. It is based on mastery of the fundamentals—a mass of educative material usually accepted as the visible mark of an educated person, but too often neglected in the haste to enter new fields of learning.

2. It begins with an analysis of the process of learning. The student of the art of teaching becomes proficient also in the art of learning.

3. It is more than a study about something. It carries with it at all times the practical application of the study. Students must learn to do and to be as well as to think and to know.

4. Its subject matter has to do with the ideas and ideals of every-day life.

5. It develops initiative, resourcefulness, and leadership.

6. It gives an art that is essential in all professions. Whatever one wishes to accomplish with or through others, he is successful in securing the desired results in proportion as he knows how to teach.

7. It carries with it an assurance of success, not merely in the realm of study, but in making one's way in the world.

8. It gives a preparation for most significant usefulness in training the rising generation for citizenship, a profession that challenges the finest qualities of character and culture. No other calling offers greater opportunity for service to one's own generation and to the generations of the future.

Department of Physical Education

SECRETARY'S MINUTES

OFFICERS

President—ETHEL PERRIN, Assistant Director of Health Education.....Detroit, Michigan
Secretary—WILLIAM BURDICK, M. D., Director of Public School Athletic
LeagueBaltimore, Maryland

FIRST SESSION—WEDNESDAY AFTERNOON, JULY 5, 1922

- RURAL GROUP ATHLETICS AND WHAT IT MEANS—Daniel Chase, Supervisor of Physical Education, State Department of Education, Albany, N. Y.
THE PLACE OF PHYSICAL EDUCATION IN THE COUNTRY SCHOOL PROGRAM—E. W. Broome, Superintendent of Montgomery County Schools, Rockville, Md.
THE RELATION OF PHYSICAL EDUCATION TO SOCIAL HYGIENE—Benjamin C. Gruenberg, Assistant Director of Educational Work, U. S. Public Health Service, Washington, D. C.
THE TEACHER'S PART IN SCHOOL MEDICAL INSPECTION BASED ON A JOINT EXPERIMENTATION BY THE DETROIT PUBLIC SCHOOLS AND THE DETROIT DEPARTMENT OF HEALTH—C. M. Elliott, Special Education Department, Detroit Teachers College, Detroit, Mich.

SECOND SESSION—THURSDAY AFTERNOON, JULY 6, 1922

- BEHAVIORISTIC HELPS FOR PHYSICAL EDUCATION—Dudley A. Sargent, President of the Sargent School of Physical Education, Cambridge, Mass.
PURPOSES OF THE COMMITTEE ON WOMEN'S ATHLETICS OF THE AMERICAN PHYSICAL EDUCATION ASSOCIATION AND ITS PROGRESS UP TO THE PRESENT—Cynthia M. Wesson, Instructor in Physical Education, University of Wisconsin, Madison, Wis.
PHYSICAL EDUCATION PROBLEMS IN THE INTERMEDIATE OR JUNIOR HIGH SCHOOL—Bessie L. Barnes, Director of Physical Education, Brookline, Mass.

RURAL GROUP ATHLETICS AND WHAT IT MEANS

DANIEL CHASE, SUPERVISOR OF PHYSICAL EDUCATION, STATE DEPARTMENT OF EDUCATION, ALBANY, NEW YORK

The city problem in play and athletics is one of large groups and small spaces; the country problem, one of large spaces and small scattered groups. The up-to-date city has partly solved its problem by "intensive cultivation." Its available play spaces are usually carefully graded and marked out for games, equipped with play apparatus, and supervised by trained leaders who know how to keep large numbers active and happy and know the social and educational value of play activities.

The country has made little effort to solve its play problem, assuming that the country child, having the great out-of-doors to play in, needed nothing more. *Work* has been frequently substituted in the life of the children and necessary play opportunity entirely neglected.

Attempts to assemble country children and grown folks for general play and recreation have been undertaken spasmodically here and there by

churches, schools, and community organizations, such as the County Y. M. C. A., Farm Bureau Agents, and the like.

Where individual leaders have had the vision and the courage and have been willing to expend the energy needed to overcome the prevalent rural inertia, the Grange Field Day, the Sunday School Picnic, the School Play Day, the County Athletic Meet have come to be annual events looked forward to with eagerness by all the youth residing in these fortunate localities. To have but one a year of such good times is a meager ration, yet many boys and girls in the open country are denied even this amount.

New York State and many other States are trying to change this condition through the schools. State Laws requiring physical education in all schools have been enacted, and rightly interpreted to include organization of play and games as well as formal gymnastics and instruction in the care of the body. Every school child is now having some time each week devoted to supervised recreation as a part of his school training. A fourth "R"—*Recreation*—has been introduced into the education system of the "little, old, red school house" as well as in the new consolidated, township school. Frequent exhibitions and field days are held.

Country people are slow to pay out money for "new fangled" notions in school work, or in any kind of community welfare or so-called "uplift" effort, until convinced that the proposition is of real benefit, and they need in some sections to be further educated to the possibilities and values of this new training for their boys and girls before they will give it the necessary whole-hearted financial backing.

They still need to be shown in many sections that physical training is not physical *straining*, and convinced that active play is a necessary part of normal growing and living. Workers are greatly needed to help teach the regular teachers how to do their part—the biggest part of the actual work—by teaching them the activities to be used, by explaining the way to a more abundant physical life. They must show how games and play and athletic sports may help train the future rural citizens in the ability to work together, to live together as good neighbors, to have a richer, happier life, as well as a longer one. The power to coöperate is most easily acquired during adolescence through team play. This ability is frequently lacking in rural people, because the play training was left out of their education.

The "back to the land" movement will also be bettered by this "stay on the land" effort. For a practical way to get young people to want to "stay in the country" is to give them a chance and show them how (and what) to "play in the country." Whatever makes the social life of country boys and girls more satisfactory, will help offset the lure of the city. Young folks want to be where there is something going on. The thing to do is to have more worthwhile, attractive things going on in the country, play activities suited to the needs and desires of country boys and girls, "indigenous to the soil," as the specialist would say. Competition is important but hard to secure when schools are of varied sizes and widely separated. The group athletic contest is one method of securing this valuable competition.

What is a rural group athletic contest? It is an athletic contest which every rural school can enter, and in which the small school has the same show as the large.

"Is this possible?" you say. Certainly, and very easily explained. In the last two years several thousand rural schools in New York State have participated in this form of contest.

We required in each school competing eighty per cent of the pupils over eight years of age to take part in three simple events testing their athletic ability, then scored the results on a percentage basis. Then we divided the total scores made, by the number of contestants, and got the school score on a percentage basis also. A school with forty pupils over eight years of age, had thirty-two official contestants. The results of these thirty-two may have totaled sixteen hundred (1600) points which divided by thirty-two gives fifty (50), the score for the school. The school with ten pupils over eight, had eight official contestants who may have earned four hundred and forty (440) points. Four hundred and forty divided by eight equals fifty-five, the school score. That is, the small school won from the large by having the highest percentage of physical ability, 55 to 50.

"Yes, but what events did you use and how could you score on a percentage basis?"

The basic events tested running, jumping, climbing, and throwing ability! We adapted the events to meet conditions in the unequipped country school, a beanbag was the only absolutely essential piece of equipment outside of an ordinary watch with second hand, and a ladder or bar of some kind for chinning. Oh, yes, we did have to have a small piece of rope to tie across two trees for the "toss and catch" test for girls and something to measure distances in the jumps, but these things are within the reach of any teacher at almost no expense.

You say, you can't imagine what events were used?

Here they are! *For boys*—(1) Fifty Yard Dash; (2) Standing Broad Jump; (3) Chinning the Bar. *For girls*—(1) Fifty Yard Dash; (2) Bean Bag Throw for Distance; (3) Toss, Run, and Catch.

"How did we score points?" We established a minimum of performance and called it zero, then credited everything better than this mark up to a maximum record, which was one hundred (100) points. We had two divisions, pupils under the eleventh birthday were juniors, over the eleventh birthday, seniors.

For example, a senior boy jumping three feet eleven inches would score *no* points, but for every inch he jumped better than three feet eleven inches, he would make two (2) points, up to eight feet one inch or more, which record would give him one hundred points for the event. No one was allowed to score more than 100 points in any event.

We had a scoring standard for each event. The junior standards being lower than the senior. For instance, in the broad jump, every inch over two feet five inches would score two points for a junior boy.

We encouraged individuals to do their best, because every effort added

to the school's score and we also awarded individual honors as follows: Any pupil winning or exceeding the honor standard, 50 points, in each and every event was recorded as having passed the test with honor (H). Any one winning or exceeding 75 points in each and every event was given high honor (HH), and for 100 points highest honor (HHH). Local school made proper provision for announcing individual honors.

Pupils who won honors had the privilege of wearing the State physical ability honor emblem, if they cared to purchase it. We gave no prizes except written certificates of award sent to schools with highest scores in each supervisory district and county.

We divided the schools into sections according to number of teachers to make competition even more fair and gave awards in each section. Section 1 comprised school districts with not more than two teachers. Section 2 comprised school districts employing more than two teachers but having no academic department and no special teacher of physical education. Section 3 consisted of school districts maintaining an academic department but employing no special teacher of physical education. Section 4 consisted of school districts having more than two teachers and no academic department, but which employ teacher of physical education. Section 5 comprised districts with academic department and special teacher of physical education.

The three winning school districts in each section were determined by the district superintendent, and championships announced for the district. The record of these schools was then forwarded to State Department of Education, and the county and State-wide championship determined and announced.

By this plan it is possible to have dual athletic meets between widely separated schools, each conducting the events on the same day or during the same week, and exchanging results by mail or telephone. It arouses interest in the boys and girls, and among their parents as well. Every pupil likes to know how his strength or ability matches with someone else's, and every parent, how his boy or girl stands in comparison with others. But this method shows also how the total ability compares with the total of some neighboring community. You see the possibilities at once. We may eventually have contests between States on a nation-wide basis.

THE PLACE OF PHYSICAL EDUCATION IN THE COUNTRY SCHOOL PROGRAM

EDWIN W. BROOME, SUPERINTENDENT OF MONTGOMERY COUNTY SCHOOLS,
ROCKVILLE, MARYLAND

Life in the country provides for physical activities. Boys and girls are active. Country life is largely physical labor. Boys and girls find many "chores" to do. This is thought by many country folks to be sufficient physical training, thus making unnecessary any effort in the school. It is not so. Physical education includes values that cannot be built up through

such uncontrolled and unorganized activity. Physical education, along with other values of education, must be developed in the spirit in which it will be used. This places it in the country school program.

Physical education must mean more than physical development. Un-directed physical perfection is not enough. It must be possessed for ends of service socially, otherwise its use will be controlled by standards of strategy—the basis of animal behavior—rather than standards of control that are ethical and a product of the cortex. Physical development is a choice individual possession. An educated individual must be adjusted socially and the more perfectly educated, the more perfectly adjusted socially. Physical perfection is not a possession outside this adjustment. It is within it and must serve its ends. The school being a democratic and social institution must find place for the development of physical education that shall be saturated with ideals of conduct and standards of physical behavior in keeping with the nature of the school as an institution. Without this provision the physical may be perfected by some good fortune, but not brought within the safety zone for civilized society. "Physical is a means not an end."

Physical education as an accomplishment is built up as a direct physical change. It cannot be realized through knowledge about it. The fresh air to benefit the body must get into the lungs, not the head. It is a by-product or result of certain right practices and habits of physical living. The school cannot stop with merely furnishing information, however necessary information may be to knowing the habits and practices needed to produce the proper physical life. Habits and practices must be carried out, of course, as individual undertakings; in addition to this, they must be tied up in such situations as will impress, if possible, the social significance of physical education. Physical education is both an individual and a social benefit. It must be developed in an individual way and at the same time adjusted to serve not only the individual but society. Without a place in public education there can be no adequate assurances that these functions will be realized for country boys and girls. Ideals, attitudes, knowledge of facts, and practices must have a part in physical education.

The country schools of Montgomery County, Maryland, have been provided with the services of a trained physician for the individual examination of pupils and with a nurse for follow-up work. The schools have stressed health chores and health habits among the pupils. Homes have been stimulated to coöperate with the school in encouraging pupils to carry out the health habits. School programs have provided for recreation and physical exercise with supervision in the school day. Appropriate games for the different grades have been inaugurated through the Public Athletic League. Inter-school contests have been provided for the various seasons. Hot lunches have been started in the rural schools. A county-wide athletic meet has been held each year, under the management of the Public Athletic League of the State. All of which follow well-established procedure in health education.

The Gaithersburg High School in the county has conducted through the

high school pupils an annual athletic meet for the one- and two-room rural schools. The pupils of the high school have acted as coaches, visiting the local rural schools and directing the preparation for the meet. The schools have stressed the values to be realized through physical education. An annual Health Week has been designated by the Board of Education. The principals of the schools in conference formulated a program of values in connection with the Health Week and Athletic Meet to include—

1. *Health*—(a) Tags for each pupil. These tags should be distributed one to each pupil, on Monday and worn by the pupils during the entire week. The name, age, height, and pounds the pupil should weigh should be written on the card, as indicated by the spaces on the card.

(b) Health chart for each room. The chart should contain the names of all the pupils of a room. It should be hung up on Monday. Each pupil should check each day during the week, under the various headings, if the habits mentioned have been practiced for the day. At the end of the week each pupil will have checked as many times for each column as he has practiced the habit during the week. Each pupil should check each day the columns he is entitled to check and not wait to check for several days at a time.

All charts are to be mailed to the office at the end of the week. Every emphasis possible should be put on "health habits" during the week. The hygiene classes should devote entire time to "health practices" during the week. The athletic meet coming on Saturday should be used to stimulate the observances of the health habits in order to be in fit condition to do the best in the events.

2. *Athletic meet*—A. How may the schools build up the standards needed? The standards must be built up and *accepted* by the group of pupils through the regular teaching service factor of the school. Standards must be established before the time when they are to control conduct, for conduct not controlled by standards will most likely impress lessons through the penalties incurred. History, civics, literature and other content subjects, and school activities, should be used in building the standards during the school life in all grades. After the group accepts a standard, the "pressure" from the group is the best incentive to any individual member to live up to the standard.

The conduct in games and in the competition between representatives of different groups shows how the established standards are functioning. It is a sort of try-out occasion. It is what happens in conduct that is most important, not what is talked of and ends in words.

Each group (or school) should evaluate its conduct, practiced during the contest, after it is over to see if there are any controls of conduct that need further emphasis and attention, in order to make sure of the right sort of conduct in life. The habits of conduct formed will probably continue in the citizenship activities through life.

Any irregularities noticed should first be called to the attention of the individual or group to make the correction or amends necessary, which they most likely should wish to do on their own initiative.

It is as a last resort that the irregularity should be reported to the committee, director, or referee in charge. When an irregularity is called to the attention of any one, it should be done in the spirit of helpfulness to the person practicing the irregularity and *not* in a spirit of condemnation of the person or group. It should also be accepted in the same spirit and highly appreciated.

C

THE RELATION OF PHYSICAL EDUCATION TO SOCIAL HYGIENE

BENJAMIN C. GRUENBERG, ASSISTANT DIRECTOR EDUCATIONAL WORK,
UNITED STATES PUBLIC HEALTH SERVICE

Physical education and social hygiene have a common origin in the conflicts between the native impulses of the human organism and the requirements of social living.

Living in our highly complex civilization is not compatible with the automatic preservation of the health of the organism. Perhaps savagery is also incompatible with health, but neither we nor the savages are concerned about that. Our mode of living is so far out of harmony with the basic instincts and activities of the untrained organism that special steps have to be taken to satisfy the impulses and at the same time maintain the moving equilibrium of social relations.

With relative security from the dangers which beset the primate in a state of nature, and with relative certainty of food supply, there are lacking both the opportunities and the stimuli for those activities of the chase and of escape from enemies which involve so large a part of the muscular and nervous mechanism. The exercise which we do have may mean excessive overwork for some, with highly specialized activities that insure an unbalance. On the emotional side, the characteristic war neuroses showed how far we have advanced from dealing with dangers, whereas the typical anxiety neuroses of peace show the extent to which fear and worry are undermining our health and morale.

The food which we eat, over-refined and predigested, contributes to the unbalance by modifying taste, dulling sensation and perhaps by withdrawing essential elements from the physical income.

Our capacity to draw upon reserves without immediate discomfort or suffering makes possible gradual depletion and exhaustion through the over-stimulation to which we are exposed. Even rest and sleep must be taught.

From every angle it may be shown that spontaneity is either impossible because directly obstructed, or disastrous because not suited to the artificial environment. A "natural" life is out of the question, since sociability is quite as inveterate as the other cravings of the species. Hence the necessity for "physical education" as a conscious attempt on the part of society so to condition or modify the conduct of its members as to insure a greater

degree of health than would otherwise result from unguided modes of conduct.

The Mississippi State Code defines physical education as "such supervision and training of the children in physical and health activities as will insure progress toward maximum physical and mental efficiency, in a wholesome environment. Results of the work should be measured not by the brilliant accomplishments of a few but by the steady advancement of the entire body." But when we attempt to define health, I wonder sometimes why we link it with physical education. For health means wholeness, and is a relative matter. It is the degree to which the functions and needs, the desires and activities and impulses and satisfactions are unified, adjusted to one another, and adapted to the requirements of the environment. There is no health in overdeveloped muscles that have no work to do; there is no health in the mastery of a difficult technique under compulsion, with no desire to use it. The object of health education should be the whole organism and all of its feelings and conduct.

Moreover, it is coming to be generally recognized that the aims of physical and health education are basically social, notwithstanding that our efforts concern the individual. In its pamphlet on health and physical education the U. S. Chamber of Commerce promulgates the idea that "physical education presents the greatest opportunity the Nation has of developing National power." To what end that power is to be used is not discussed; but that the processes of physical education have a social significance cannot be questioned.

Now social hygiene also rests on a recognized incongruity, and is an effort to discover a mode of life that will reconcile the nature of the organism with the nature of society. On the side of sex as on the side of hunger and self-seeking, being "natural" is incompatible with being a member of the group; and the group cannot be escaped for it derives from equally "natural" impulses and needs.

In all education we seek to discover such substitutes for spontaneous activities, which are manifestations of native impulses, that are both satisfying to the individual and acceptable to the community. In physical education we started out to exercise the muscles whose neglect had begun to show deleterious effects in industrial, commercial, and professional occupation groups. It would undoubtedly be possible to work out a set of formal calisthenics and gymnastics that would give every muscle in the body an adequate and balanced amount of exercise, from the view-point of physiological need. But such a program we already know would be futile, since it would disregard an equally essential element of that wholeness—namely, the emotions. Indeed, we have already begun to develop a technique that takes the primitive impulses into account; and the increasing use of games as against gymnastics points to the further utilization of the emotions in the health program.

We are finding substitutes for those activities which would normally and spontaneously satisfy the fighting impulses, as in athletic contests and

organized games. Through the same instruments we are finding substitute satisfactions for the desire to receive recognition. We utilize rhythm in dances and drills. We construct solid foundations in concrete experience for the ideals of loyalty, coöperation, service. These are coming to be the commonplace principles of physical education.

We find that a great many of the impulses which we thus exploit and educate into socially acceptable forms of expression are also constituents of the sex life. The desire to be noticed, for example, is quite as much a part of the sex complex as it is of the ego development, and it becomes particularly conspicuous during adolescence. It is probably in its origins related to the courtship activities of our ancestors. We may use it in physical education as a part of the motivation in establishing training-regimen and other regulations that are presumably conducive to efficiency in athletic display. The element of combat is also found in sex interest and sex rivalry; and this too may be satisfied while being integrated with the other impulses into socially usable standards and ideals, such as fair play, chivalry, loyalty, honor, on which the physical education program already lays increasing emphasis.

If the view is sound that education consists of establishing as substitutes for primitive modes of action and expression such artificial or cultivated forms as are satisfying to the individual and acceptable if not always positively useful to the community, then we should be finding such substitutes through other than athletic or physical prowess. And indeed many of the elemental impulses and emotions related to sex are already finding educative expression through music, art, oratory, dramatics, and so on. One of the difficulties of any health education program comes from the fact that whereas health implies an integration or unifying of the functions and desires and interests and activities, our educational work is carried on by highly specialized individuals, each of whom is required to fix his attention upon his own element in the organism's life without much regard to what others are doing. And this partial outlook is not confined to academic teachers, specialists in mathematics or history or chemistry. Thus, in the coöperative attempt to formulate the aim of the "Physical Development and Maintenance" curriculum for the Los Angeles High School, Dr. Bobbitt has adopted tentatively a set of general assumptions and principles among which we find the following:

(1) Physical development and training will be the center of interest of the physical training department. Social training will be incidental. (8) The entire thirty hours of the pupil's week at the school's plant should be utilized as physical training opportunity. (9) The total program of this school should be utilized as fully as practicable for physical training purposes.

What is implied in numbers eight and nine? The physical conditions of the school plant should as a matter of course be in complete accord with the health requirements of the pupils and teachers—the ventilation, the lighting, the adjustment of seats and desks, the cleanliness, the sanitary

arrangements, the temperature and moisture controls, the sequence of subjects and activities must all be planned with respect to the health of all. Moreover, the pupil's contacts with the plant and its operations should be such as to impress him with both the need for attention to the physical factors in health and the standards in these respects which our science has established for us. Beyond this is implied a conscious and continuous co-operation of all the teachers in the observation of standard practice with respect to posture—sitting, standing, walking—with respect to breathing, personal cleanliness, avoiding possibly infectious contacts, maintaining emotional poise and control, and other routine elements of the day's work that can affect the physical and emotional well-being of the pupils. All who are interested in health or physical education would welcome intelligent and wholehearted coöperation of teachers and janitors in the ways suggested.

But what is implied in number one of the assumptions? That every teacher has his specialty; and that whatever emerges from the educative process beyond that specialty is a matter of relative indifference to him. Perhaps that is too extreme an interpretation. The teacher of mathematics who considers his contribution to moral education incidental is probably not indifferent to his moral influence. But the point I wish to emphasize is the need for more deliberate and more systematic coöperation among the specialized teachers, because both for the sake of the individual and for the interests of the community the integration of the varied experiences to which the child is exposed is one of the most urgently needed aids that schools and teachers can give.

From this point of view it becomes necessary for the physical education teacher whose relations to the pupils and whose appeals are both more direct and more fundamental than are those of most other teachers, to take into account the various aspects of the pupil's nature and development, and the social conditions to which his life must be adjusted. In other words, the social side of health, the integrity of the social body, becomes a legitimate, an urgent concern of the health teacher. We have already assimilated into our teaching the elements of bacteriology and their practical application in the prevention of communicable diseases. Instruction regarding the venereal diseases cannot longer be evaded. But social hygiene has more to accomplish than combating these diseases. If we should tomorrow find a sure cure for gonorrhea and for syphilis, and if we should the next day discover certain prophylaxis through vaccination or other treatment, we should still have with us the problems of utilizing the sex impulses in life without bringing about the disasters and social ill-health represented by prostitution, by illegitimacy, by broken homes, by sexual perversions, by rakes and prudes, and by many infantile fixations and transfers to unhappy and anti-social forms of conduct. Just as we expect the whole of the school program to contribute to the personal health and adjustment of the individual, we must expect the physical education department to contribute to the emotional health and social adjustment of the pupils.

PURPOSES OF THE COMMITTEE ON WOMEN'S ATHLETICS OF THE AMERICAN PHYSICAL EDUCATION ASSOCIATION AND ITS PROGRESS UP TO THE PRESENT

CYNTHIA M. WESSON, INSTRUCTOR IN PHYSICAL EDUCATION, UNIVERSITY OF WISCONSIN, MADISON, WISCONSIN

As I understand it, I am here not to present to you a pet theory, or even the working out of a problem. Our problems are most of them still before us and still to be worked out. But I am here rather to bring before you the facts regarding the development of the work of the Committee on Women's Athletics of the American Physical Education Association, a development in both past and future which is of vital interest to all those who are connected with work in physical education for women.

As regards the history of the committee: the original committee was appointed several years before the war. Under the chairmanship of Miss Elizabeth Burchenal sub-committees on basket ball and field hockey were organized. During the war, since so many members of the committee left their regular occupations for government service of one kind or another, the work of the committee came practically to a standstill. At the time of reorganizing the committee Miss Blanche M. Trilling, Director of Physical Education for Women at the University of Wisconsin, was made general chairman, and she has brought together a committee of men and women prominent in physical education, representing colleges, schools, and normal schools in many sections of the country. Under her two new sub-committees have been organized: one for swimming with Miss Eleanor Demming, Director of Camp Miramichi as chairman, the other for Field and Track Athletics with Miss Katherine Sibley, director of physical education for women at the University of Syracuse, as chairman.

At the national convention of the American Physical Education Association at Detroit the first week in May, 1922, Saturday morning was given over to the section meetings on men's athletics and women's athletics, and the situation in regard to women's athletics was presented by Miss Trilling and her sub-committee chairmen to nearly 500 people interested in this particular field. Miss Trilling opened the meeting and brought out the general situation. At this time she made it quite clear that the committee realized that women's work in athletics lagged far behind men's work—that the women, however, were moving slowly advisedly, being determined if possible to avoid the difficulties which have developed in men's competitive and spectacular events. The committee's aims as outlined by her, are to set up standards, compile records, and to be a general clearing-house for the various questions that confront those dealing with girls' athletics. But underlying all this is a great desire of the committee to be a central body working always along educational lines, and considering the interests of the mass of students, rather than the pride of college, school, or nation in the accomplishments of a few.

The rest of the Detroit meeting was given to the different sub-committees and it seems logical to present the information brought out at that time under the four sub-headings of field hockey, swimming, basket ball, and track athletics. The chairman of the sub-committee on field hockey summed up the development of the hockey situation. The main points being the co-operation of this committee with the newly formed United States Field Hockey Association. One set of rules is being published jointly by this committee and the national association; so that the difficulties which have arisen in basket ball may be avoided in hockey. Our committee cannot claim any credit for the other work of the United States Field Hockey Association, but for those who are interested in the development of the game, I want to give a moment to them. The formation of the national association was the direct outcome of the increased interest in hockey created by the visit of the English team last autumn. This association has as active members, local hockey associations which are made up of at least three clubs—Boston, New York, Philadelphia, and Michigan being already organized. Besides this the association has allied members in the form of school and college athletic associations. By keeping these associations and their members in touch with the general situation, it is hoped to help carry over the habit of playing the game after school or college into ordinary life, since the way in which most of our girls drop much of their athletic activity the moment they leave college is one of the weakest points in our athletics for women. One more activity of the U. S. F. H. A. seems worthy of comment, and that is their committee on coaches. This committee has arranged with the English Association for a number of English coaches, who are to come to America this autumn without pay, but whose expenses will be met by the places where they coach. By means of this committee, colleges, schools, and clubs can procure an English coach for one week or more—which would be quite impossible without a central committee arranging details.

The plans regarding getting out a swimming guide were presented by Miss Eleanor Demming, chairman of the sub-committee on swimming. It was decided to include the work already done by the Association of Camp Directors on swimming standards and life-saving work. Various other things were also decided upon to be included in the guide, such as the standards for different age groups, valuation of the different parts of dives for judging competitions, and the development of endurance in swimming.

The section on basket ball was led by Miss Helen Frost, of Teachers College, New York, since Miss Florence Alden the chairman could not be present. In this section particular rules and changes were discussed. There is always a desire among a minority for developing a game of basket ball which will be less limited by restrictions. This minority could not help feeling that it was having a fair hearing at this meeting and that if the time was ever ripe a more liberal game would develop. At the present time when so many high school teams are coached by men instead of women, there is a real danger of removing restrictions and one feels that the committee is working along safe and sane lines for the benefit of the majority.

When we come to the situation on field and track athletics, there is by no means fair sailing. In the first days of the general committee there was a desire on the part of some members of the committee for a sub-committee on track athletics. To quote Miss Trilling at Detroit: "No sub-committee on track athletics was appointed because it was recognized that track was not an event which made as wide an appeal to girls and women in general as the other activities did and because it was felt that group activities were better." The result of not having a sub-committee on track appointed, was the formation by Dr. Stewart, of New Haven, of the National Women's Track Athletics Committee, which has never had any connection with the committee of the American Physical Education Association. Not long before the Detroit convention, word came that the Amateur Athletic Union had been requested to consider taking over the control of women's track athletics and that they were sending out a reprint from the *New York Herald* of April 9, reporting a meeting to discuss this plan. At the same time the constitution of the Federation Sportive Feminine Internationale came to view and also plans for taking a team of American women to compete in an international track meet to be held in Paris this August. The problems arising from these developments seemed most serious to the committee and the following resolutions were passed not only by the committee itself, but were later submitted to the section meeting and unanimously passed by it. The first deals with the control of women's track athletics by the Amateur Athletic Union and is as follows:

Since the Women's Committee on Athletics of the American Physical Education Association is convinced that the American Physical Education Association is the only logical organization to direct the policies in women's athletics, it goes on record as disapproving of any affiliation with the Amateur Athletic Union with relation to athletics for women.

The second is in regard to the proposal to take a track team to Paris this August, and reads:

The Committee on Athletics for Women appointed by the American Physical Education Association, representing the entire country, feels very strongly against participation by American women in the Field and Track Meet in Paris to be held during August, 1922. We feel that Field and Track for Women is in its infancy in this country, that it is so little organized, that no team can be properly chosen as representative of the United States.

These two resolutions reflect quite clearly the general attitude of the committee. Its aims are not to develop spectacular contests and international meets, so much as to encourage the mass of girls throughout the country to take part in sports for the real benefit which may be gained from them as recreative and health-building activities. We think that probably the A. A. U. having discovered a good deal of opposition to their control of women's track athletics will let the matter drop. Whether our committee can adequately handle the situation depends, as Miss Sibley the chairman made quite clear, on the coöperation of everyone working with women's track athletics. In regard to the Paris meet, it seems that in all probability a team will go over to compete. We are entertained more

and more frequently by photographs in our Sunday papers, entitled "Hurdling in perfect form, in try-outs for the international meet" or something to that effect. We wonder if the public is growing bored with ordinary athletic pictures and must now have the added interest in the contestants being women. The latest development, and I bring it up only to make the situation quite clear, is the circulation of the "Constitution of the National Women's Track Athletics Association" giving physical directors an opportunity to join for their respective institutions. Under "objects" we read:

1. To coöperate with the Women's Athletic Committee of the American Physical Education Association, College Athletic Associations, the proposed Athletic Federation, and other similar bodies to encourage, standardize, and control track athletics for women in the United States.

2. To demonstrate the value of intra-mural and inter-school competition under strict control; by sectional meets, telegraphic meets, etc., emphasizing the educational and competitive values rather than the spectacular.

3. To coöperate with the Federation Sportive Feminine Internationale in the study, standardization, and participation of track athletics for women throughout the world.

Since the second and third objects are directly opposed to the aims of the committee of the American Physical Education Association it seems hard to see how the first can be sincere.

We are finally confronted with the question: "Can we keep our athletics for women really for the good of the mass of girls and women, or are the few to furnish entertainment for the crowds in the grandstands? It is only by the help and support of all those who have the best interests of physical education at heart that we can even attempt to do this.

Department of Rural Education

SECRETARY'S MINUTES¹

CHICAGO MEETING

OFFICERS

President—ERNEST BURNHAM, Normal School.....Kalamazoo, Michigan
Vice-President—J. C. MUERMAN, Bureau of Education.....Washington, D. C.
Secretary—MABEL CARNEY, Teachers College, Columbia University.....New York City

FIRST SESSION—MONDAY AFTERNOON, FEBRUARY 27, 1922

Leadership and Achievement in Rural Education

PRESIDENT'S ADDRESS—RESOURCES IN RURAL EDUCATION—Ernest Burnham, Director of Rural Education, Normal School, Kalamazoo, Mich.

SOME UNSOLVED PROBLEMS OF RURAL EDUCATION FROM THE VIEWPOINT OF SOCIOLOGY—E. C. Lindeman, State College, Greensboro, N. C.

LEADERSHIP OF THE COUNTY SUPERINTENDENT IN RURAL EDUCATION AND COUNTRY LIFE—Charl O. Williams, Superintendent of Shelby County Schools, Memphis, Tenn.

ANNOUNCEMENTS AND PRELIMINARY BUSINESS.

SECOND SESSION—TUESDAY AFTERNOON, FEBRUARY 28, 1922

The Rural High School

THE OBJECTIVES OF PUBLIC EDUCATION IN AMERICA—Thomas H. Briggs, Department of Secondary Education, Teachers College, Columbia University, New York, N. Y.

THE SMALL COMMUNITY HIGH SCHOOL—E. M. Phillips, State Inspector of High Schools and Director of Vocational Education, St. Paul, Minn.

PROBLEMS AND METHODS IN THE ORGANIZATION OF RURAL COMMUNITY HIGH SCHOOLS—F. P. O'Brien, University of Kansas, Lawrence, Kans.

THIRD SESSION—TUESDAY EVENING, FEBRUARY 28, 1922

The Rural School of Tomorrow²

CONSOLIDATED SCHOOLS OF THE MOUNTAINS, VALLEYS, AND PLAINS OF COLORADO—C. G. Sargent, College of Agriculture, Fort Collins, Colo.

EDUCATION IN ITS PROPER ENVIRONMENT—Mary E. Sabin, Principal of the Consolidated Rural School, Chazy, N. Y.

A RURAL TEACHERS' PLATTSBURG—A. O. Thomas, State Superintendent of Schools, Augusta, Maine.

FOURTH SESSION—THURSDAY AFTERNOON, MARCH 2, 1922

This session was held in conjunction with the County Superintendents' Section of the Department of Superintendence with E. J. Tobin, Superintendent of Cook County Schools, Chicago, Ill., presiding.

¹The proceedings here given include all proper additions and corrections and record the official program of the Department of Rural Education exactly as it was rendered at this meeting.

²Each of the following discussions was illustrated with motion-picture films.

SOME CONTRIBUTIONS OF THE NEW YORK STATE RURAL SCHOOL SURVEY—J. E. Butterworth, Professor of Rural Education, Cornell College of Agriculture, Ithaca, N. Y.

QUESTIONS AND DISCUSSION.

GENERAL BUSINESS MEETING AND ELECTION OF OFFICERS.

SECTION MEETINGS

On Wednesday afternoon, March 1, five sections of the Department of Rural Education met simultaneously and presented the following programs, each of which were followed by business meetings.

Section I—State Supervisors and Inspectors of Rural Schools

Chairman, J. Virgil Chapman, Department of Education, Frankfort, Ky.
Secretary, Annie Reynolds, Department of Education, Madison, Wis.

THE IMPROVEMENT OF TEACHERS IN SERVICE: (a) Through Teachers' Institutes—Georgina Lommen, University of Minnesota, Minneapolis, Minn.; (b) Through Supervision—James R. Grant, State Supervisor of Rural Schools, Little Rock, Ark.

A STATE PROGRAM FOR SUPERVISING INSTRUCTION IN RURAL SCHOOLS—John M. Foote, State Supervisor of Rural Schools, Baton Rouge, La.

TRAINING SUPERVISORS FOR RURAL SCHOOLS—W. S. Dakin, Regional Supervisor, Hartford, Conn.

Section II—County Superintendents and Rural School Supervisors

Chairman, N. R. Baker, Superintendent of Jefferson County Schools, Birmingham, Ala.

Secretary, Amalia M. Bengtson, Superintendent of Renville County Schools, Olivia, Minn.

THE USE OF TESTS AND MEASUREMENTS IN RURAL SCHOOLS—L. J. Bennett, Superintendent of Miami County Schools, Troy, Ohio.

REAL SUPERVISION FOR RURAL SCHOOLS—J. S. Hoffman, Superintendent of Hunterdon County Schools, Flemington, N. J.

THE CURSE AND CURE OF THE COUNTY SUPERINTENDENCY—Ellen B. McDonald, Oconto, Wis.

THE COUNTY UNIT PLAN OF HIGH-SCHOOL CONSOLIDATION—A. L. Harman, Superintendent of Montgomery County Schools, Montgomery, Ala.

Section III—Rural Normal Directors

Chairman, H. A. Bone, Illinois Normal University, Normal, Ill.

Secretary, Etta Christensen, Normal School, Kutztown, Pa.

THE OUTPUT OF NORMAL SCHOOL GRADUATES ENTERING THE FIELD OF RURAL TEACHING—Charles E. Benson, Southeast Missouri State Teachers College, Cape Girardeau, Mo.

REPORT OF THE SECTION COMMITTEE ON THE PREPARATION OF RURAL TEACHERS—The chairman or a member of the Committee.

FINDINGS AND RECOMMENDATIONS OF THE NEW YORK RURAL SCHOOL SURVEY ON THE STATUS AND PREPARATION OF RURAL TEACHERS—W. C. Bagley, Teachers College, Columbia University, New York, N. Y.

CONTENT AND CHARACTER OF THE COURSE IN RURAL SOCIOLOGY FOR RURAL NORMAL STUDENTS—H. W. Foght, Principal of the Northern Normal and Industrial School, Aberdeen, S. Dak.

BUSINESS MEETING.

Section IV—Vocational Directors and Rural Extension Workers

Chairman, C. V. Williams, Professor of Vocational Education, State Agricultural College, Manhattan, Kans.

Secretary, Maud Sheridan, College of Agriculture, Fort Collins, Colo.

Junior Extension Work

- JUNIOR EXTENSION WORK AS DEVELOPED THROUGH THE PUBLIC SCHOOLS—W. J. Wright, State Leader for Boys, Cornell College of Agriculture, Ithaca, N. Y.
- JUNIOR EXTENSION WORK AS DEVELOPED INDEPENDENT OF THE PUBLIC SCHOOLS—Josephine Arquist, State Leader for Girls, College of Agriculture, Ames, Iowa.
- PRINCIPLES AND POLICIES OF THE FEDERAL GOVERNMENT IN THE DEVELOPMENT OF JUNIOR EXTENSION WORK—George E. Farrell, Assistant in Boys' and Girls' Club Work, Department of Agriculture, Washington, D. C.
- GENERAL DISCUSSION—Led by E. G. Kelly, State Agricultural College, Manhattan, Kans.; Z. M. Smith, State Club Leader, La Fayette, Ind.; Amalia M. Bengtson, Superintendent of Renville County Schools, Olivia, Minn.
- BUSINESS MEETING.

Section V—Village and Consolidated School Principals

- Chairman*, C. C. Swain, State Teachers College, Cedar Falls, Iowa
- Secretary*, Thomas J. Smart, University of Kansas, Lawrence, Kans.
- PRINCIPLES INVOLVED IN THE INTERNAL ORGANIZATION AND ADMINISTRATION OF VILLAGE AND CONSOLIDATED SCHOOLS—George A. Selke, Rural School Inspector, Department of Education, St. Paul, Minn.
- A CONCRETE PRESENTATION OF WHAT THESE SCHOOLS ARE ACCOMPLISHING—W. H. Ray, Superintendent of the Tipton Consolidated School, Tipton, Iowa.
- THE PROVISION OF ADEQUATE HIGH-SCHOOL FACILITIES IN VILLAGES AND RURAL DISTRICTS FROM THE VIEWPOINT OF A PATRON AND TAXPAYER—L. L. McShane, Shawnee Mission Rural High School District, Merriam, Kans.
- THE FINANCIAL ASPECTS OF SCHOOL ADMINISTRATION IN SMALL AND MEDIUM-SIZED HIGH SCHOOLS—A. K. Loomis, Superintendent of Schools, Hiawatha, Kans.

GENERAL BUSINESS MEETING OF THE DEPARTMENT

At the general business meeting on Thursday afternoon the following action was taken:

- (1) A Committee on Constitution under the chairmanship of Amalia M. Bengtson, of Minnesota, proposed several minor changes in the by-laws which were readily accepted by the members present and made a part of the governing rules of the department. The most important of these revisions increased the Executive Committee by the addition of "enough members-at-large to equal the number of section chairman" and provided further that these members-at-large should hold office for three years, one third of the number retiring each year.
- (2) The Committee on Constructive Studies under the chairmanship of Norman Frost, Peabody College, Nashville, Tennessee, recommended three topics for investigation by the general department—namely, A comparison of instruction in one-teacher and consolidated rural schools, rural school attendance, and the rural-school curriculum. Committees on these subjects were authorized and have since been appointed and started to work.
- (3) Resolutions for the department were presented by M. S. Pittman, Ypsilanti, Michigan, and finally approved and adopted. It was also voted to accept the offer of Mrs. Katherine M. Cook and have these resolutions multigraphed and distributed by the U. S. Bureau of Education. This has since been done.
- (4) The report of the Secretary as presented at this time traced the rapid development of this new department, set forth its most urgent problems, and emphasized the necessity of coöperation and employed service in meeting these problems. Financially the department came out even this year for the first time in its history with a small balance in reserve.
- (5) A special report on the *Journal of Rural Education* was then made by the business manager, H. W. Foght, Aberdeen, S. D., and pledges for securing about five hundred new subscriptions were advanced by the various members present.
- (6) The report of the Committee on Nominations was next received resulting in the election of the following officers: for president, C. G. Sargent, Agricultural

College, Fort Collins, Colo.; for vice-president, Amalia M. Bengtson, Superintendent of Schools, Renville County, Olivia, Minn.; for secretary, Mabel Carney, Teachers College, Columbia University, New York; for treasurer, William McKinley Robinson, Junior-Senior High School, Orleans, Vt.

The following members-at-large of the Executive Committee were then elected and the meeting adjourned:

EXECUTIVE COMMITTEE—*Members-at-Large*—Ernest Burnham, Normal School, Kalamazoo, Mich.; Charl O. Williams, Superintendent of Shelby County Schools, Memphis, Tenn.; Lee L. Driver, Department of Education, Harrisburg, Pa.; Katherine M. Cook, Bureau of Education, Washington, D. C.; and H. W. Foght, Normal School, Aberdeen, S. D.

PRESIDENT'S ADDRESS—RESOURCES IN RURAL EDUCATION

ERNEST BURNHAM, DIRECTOR, DEPARTMENT OF RURAL EDUCATION,
WESTERN STATE NORMAL SCHOOL, KALAMAZOO, MICHIGAN

Resources in education are money, organization, technique, personnel, and social control. Rural education is not, comparably with urban education, well capitalized in any of these resources, therefore the inquiry which this discussion presents.

National, State, and local financial resources have been successfully united in a Nation-wide progressive program for the rebuilding of the country roads. In my State \$14,500,000 will be available for roads in 1922. Of this amount the Nation pays \$4,000,000, the State \$8,500,000 and the counties \$2,000,000.

Rural education has greatly benefited by the coöperation of the Nation and the States in a fairly adequate financing of adult and industrial education through the extension work, the experiment stations, and the land grant colleges. For some years now this combined aid by State and Federal money has percolated into many high schools in support of certain vocational subjects, and assistance has reached some of the younger children in the boys' and girls' club work.

"The public is beginning to realize that to urge higher education as more fundamental than universal elementary education is to deny the fundamental principles of democracy" (Bagley). And that, "It is equally subversive of these principles to provide educational opportunity for the older children and to ignore the needs of the younger ones" (Vandewalker).

Vocational and industrial education did not become a conscious necessity along with special professional preparation, and it is well that the public support of special education for the worker, so long withheld, should now be made up in good measure.

Is it not equally just to ask that the long standing obviously inadequate financing of elementary education, especially in the country, should be made up by a great generous, coöperative participation by the Nation, the States, and the counties in an attempt to solve our problem, formerly altogether too greatly localized?

The adequate financing of rural elementary and secondary education is a National as well as a State and a local necessity. Any effort to superimpose vocational education upon inefficient elementary and secondary schooling must prove abortive. In order to insure maximum returns from investments of public money in vocational and college education more money must be secured from every available National, State, and local resource and spent with the greatest possible effectiveness, proportionally to the places which need it.

The money problem in rural education is commended to the consideration of our great administrative and business statesmen in the hope that they may make proof soon of sufficient power in thought and capacity in legislative leadership to integrate the total possible budget that America has for all education. Leaders in research in rural education and certain special efforts for rural advancement have available the funds of the great foundations, notably the money administered by the General Education Board and the American Council on Education. These funds constitute a large supplementary financial resource which will be used to the great advantage of rural education. The General Education Board beginning twenty years ago has already made an investment of more than \$3,000,000 in the improvement of the knowledge and the practice of farming and related activities, largely in the South. Projects of research, experimentation, and demonstration in rural education are given due consideration by the administrators of these funds.

The service rendered by the National Red Cross, more than half of which is in small communities; by several bureaus of the Federal Government in health, child welfare, and other educational propaganda; and by endowed and tax supported independent and State institutions of higher learning, part of whose effort bears directly on rural life—all of these educational services direct and indirect must be accounted in any attempt to get at the financial resource in rural education.

The problem of getting a square deal for rural education in the public money appropriated for State Normal Schools and for University Schools of Education calls urgently for solution. Boards of control and the executive administrators of these State institutions of higher education who allow State funds which have been assessed on all taxable property of the State and paid by all the people for a State-wide purpose, to be disproportionately absorbed in use to the greater advantage of either city or country, though not intentionally unfair, are certainly weakly dishonest.

This problem has become only gradually defined in public opinion, but outstanding National, State, and institutional leaders see it clearly now and are reiterating it in plainer terms. The past should be appreciated and any wrong in it must be forgiven, but let no man think, whatever the security of his present position and power, that he will ultimately escape that consensus of public disapproval which descends on weakness in public service.

The money resource for rural education should have the full bearable

share, which local economic conditions will permit, paid locally in order that local proprietorship, initiative, and satisfaction may be enlisted and conserved. The States should bear their necessary supplementary share, and devise schemes to distribute it to serve the special and emergency, as well as the general needs of localities. The Nation should come soon to acknowledge the righteousness and the necessity of bearing a proportionate share in the financial support of all public education. The discrimination shown in extending National aid to certain backward fields of education will lose the justification of necessity, but the necessity for National financial participation in general public education is present and will be permanent.

Organization as a resource of strength and economy in education, always obviously important, has been raised to the significance of an endowment in the past twenty-five years by the work in research and in authorship of groups of students and leaders.

Their working method is critical analysis, and their constructive suggestions call for differentiation of needs and agencies in order that the whole situation in any unit of control may all come into conscious view. Whether this total view has been gained in National, State, institutional, or more local educational situations, the vision carries a challenge to intelligence and to patriotism to which both laymen and professional leaders, who have any spunk, respond.

Since 1911 there has been a Division of Rural Education in the Federal Bureau of Education, and gradually such a differentiation of function has grown up in most of the State departments. This official evolution plainly indicates a division of rural education in the National Executive Department of Education, which is forthcoming.

Under date of March, 1921, the Federal Bureau of Education classified twenty-one States as having the county unit, and recognized four or five others as having made some beginning with this form of school organization. The Bureau said that Alabama, Delaware, Florida, Kentucky, Louisiana, Maryland, Wisconsin, New Mexico, North Carolina, Tennessee, Missouri, Utah, and four counties in Georgia have the county unit in the stronger form. In this form county school authorities constitute the dominating school administrative agencies; the county is a considerable contributor to public-school support; the county board of education is given power to arrange district boundary lines, to select the county superintendent, and to exercise control directly or indirectly in the matter of selecting teachers.

The Bureau enumerates the following States as having the weaker form of county organization: Arizona, Arkansas, California, Georgia, Mississippi, Ohio, South Carolina, Texas, Virginia, and Washington. This weaker form of county unit organizations is characterized by the continuance of the district system to such an extent that the district authorities predominate, but some important functions partaking of the nature of county organization are given to county authorities. Montana, Nebraska, and Oregon have provided for county organization in modified form and have made the

application of the law a matter of local option. In some other States beginnings have been made where county boards are provided for one or two functions.

The Missouri County Unit Law was signed by the Governor in March, 1921. The gist of it is given here as an illustration of many of the best present ideas on the subject.

Providing for county-unit organization of rural schools, creating a county board of education of six elective members; empowering said board to appoint county superintendent of schools and necessary assistants, to contract with teachers after their selection from eligible lists by local district boards, to have supervision over school property within county school district, to change boundary lines of local districts and combine such districts, to maintain high schools, to prepare annual budget, to control annual levy of forty cents on the hundred dollars in the county school district which levy may be increased by the voters, to borrow money and issue bonds as provided by law, to make rules for the government of district schools, to furnish needed supplies, to select textbooks and at its option furnish free textbooks, and to discharge existing indebtedness of local districts; exempting from the operation of this act all districts maintaining high schools of the first-class; requiring county boards to report annually to State superintendent; regulating State aid to independent districts and county school districts; providing that on July 1, 1922, the title to school property within county school district shall pass to and be vested in said county district, except sixteenth sections and funds derived therefrom; authorizing independent district, by vote of its qualified electors, to become part of county district, and authorizing part of a county district by like procedure, to become part of an independent district with consent of voters of said independent district and of county board of education; providing that local school districts and district boards shall retain all existing privileges and powers except such as are specifically given in this Act to county school districts and county boards.

This brings into the service of rural education a form of organization which will presently develop an informed lay control and a trained administrative and professional leadership. Such informed laymen and prepared school men are not now to any considerable extent available for this work, but it is one of the primary functions of reorganization in education to make possible that length of tenure, that breadth of responsibility and the salary necessary to enlist and retain the services of educated and ambitious men.

Time does not permit adequate reference to the States not heretofore mentioned. In New England the town form of school organization includes the relatively small percentage of rural population with the urban or suburban groups to a great extent, and strongly centralized State control has also been operative. In the States having the local district system and the township district many progressive districts have been developed by local citizens, by township and county officials, and through consolidation.

Consolidation introduces large new items of expenditure for transportation and for high-school service. The local districts, except in the most prosperous and wealthy communities, cannot bear the greatly increased tax rate involved and must be liberally aided from State appropriations. This is being done through the States sharing in the transportation expenses and in the budgets for buildings and teachers' salaries. In spite of many obstacles to be overcome, consolidation offers a defined and a tested objective

for progressive organization. It constitutes the best expression of that necessary larger unit in public-service function, of which the rural public is rapidly becoming aware.

Organization in rural education is gradually shifting from a predominantly political to a professional service basis. In the meantime, the best things have been achieved and are likely to be by taking advantage of both the politics and the school needs in State and local cases. The immediate future offers as many political as professional victories in rural education, and the victors are equally honorable. In either case strategy is not a sin and to win is not wrong. In the words of C. J. Galpin, "The wise man sees the present but he perceives and believes in the future. The present he yields to, but he will not yield to the point of surrendering the future."

Accrediting the contributions to progress which organization in education has already made identifies it not only as a great resource in itself, but because together with the money resource it opens the way for the utilization of two other great sources of progress: technique and personnel.

Technique in education is derived slowly and expensively through decreasingly uncritical experience, until the inertia of ignorance is overcome to such an extent that supervised, analyzed, and experimental experience is here and there set up. Rural education has not seemed to present, until very recent years, any adequate challenge to the technician, probably because education everywhere was largely a rule-of-thumb undertaking, and nowhere more so than in the country.

Isolated workers have from the beginning solved many of the technical problems of the multigraded rural school, but no effective aggregation of their achievements has been recorded. However, there is a study now in progress under the guidance of the State Department of Education in Illinois, which has sufficient scope, ideas, and clarity of record to give promise of valuable results. The experiment in Porter District, Kirksville, Missouri, is standing the test of time, and in technique of both school and community work makes a real contribution. These and similar efforts constitute a great National service.

A future resource in rural education will be in adapting the best ideas in administration, psychology, supervision, and teaching derived from experience, experiments, and reflective research in any field of education to use in this field. That the pioneering in this work is already well under way in many counties, in State departments of education, and in a slowly but definitely increasing number of State institutions of higher learning is shown by the following facts and ideas:

- Representative county superintendents throughout the Nation responding to the inquiry "What are the best things you are doing now?" answered:
1. Having all school buildings put in a sanitary condition and kept that way.
 2. Organizing local play days in coöperation with larger communities.
 3. Introducing standard tests particularly in reasoning and comprehension.
 4. Holding group meetings of teachers to present methods and new ideas

and to stimulate study classes among teachers. 5. Pushing consolidation and rural high schools, with 250 more country than city children in high school, although my county seat has 4000 more people than the rest of the country. 6. A county program calling for effective community work. The school must try to reach each patron and perform some service. 7. Prompt and careful attention to correspondence and visitors as to information sought. Systematic filing system and keeping of records in the office. 8. Put the high-school work formerly done in eight schools into three with three full-time Smith-Hughes men, also have three part-time men teaching agriculture in the smaller Junior high schools. 9. Constructive supervision by tests, score cards, notes of visits and group round-table teachers' meetings. 10. Coöperating with the county Red Cross in introducing hot lunch, the study of dietetics, and a health program.

Rural education agents in many of the best State departments are bringing current progressive ideas into use. Three replies to the question: "What are the best things you are doing?" are quoted: First reply—"Inaugurating and executing a definite program for supervising instruction in rural schools by (1) demonstration teaching, (2) showing how to teach pupils to study, and (3) using educational and mental tests to (a) measure the progress of pupils, (b) establish objective standards of attainment, (c) make comparisons with other schools, (d) diagnose individual and class needs and inaugurate remedial teaching." Second reply: "Pushing standardization by State aid, now have 6181 standardized schools; paying for transportation of pupils from schools too small to be effective; aiding districts that have high tax levy and low assessed valuation; stimulating education by offering additional aid to superior schools; offering unusually liberal building and transportation aid to consolidated schools; assisting isolated children to attend school by individual aid of \$50, paying the tuition of non-resident high-school pupils, thus aiding the village high schools and providing secondary schooling for every rural child; enforcing a uniform standard of elementary-school completion by State examination." Third reply: "First—Training county superintendents in service by (1) helping them to carry out a two-year program of supervision; (2) encouraging them to emphasize with teachers one phase of school work for a year—for the first year, reading; second year, language, this to be done through frequent group teachers' meetings, circular letters on the subject emphasized, and the use of language scales and reading tests; (3) getting them to realize that the improvement of instruction is their first and biggest responsibility; (4) getting them to keep the needs of the schools before the public through newspaper publicity and frequent community meetings, and (5) helping them to establish a rural demonstration school in every county. Second—Speaking, whenever possible, in community gatherings on the needs of schools, local, county, State, and Nation."

Answers to questions of content of course of study and various technical problems in rural education are being sought and taught in 128 of 144 State normal schools reporting from forty-four States. Sixty-two of these

schools have distinct departments of rural education, and seventy-five State Normal Schools have rural demonstration and training schools. Nineteen of the twenty-nine State universities answering had courses in rural education, with the bulk of their enrolment in summer terms, but eight have established courses running throughout the year.

Three independently endowed colleges of education reported work in rural education. In Chicago University 32 students were enrolled in two courses last summer. Not much is being done in the regular year. No graduate students are preparing theses in rural education. In George Peabody College for Teachers, Nashville, Tennessee, a four years' course in rural education is provided under the direction of a trained specialist in this field, and there are five faculty members teaching college and graduate courses in rural education. In Teachers College, Columbia University, 254 different students were enrolled last year, including the summer term, in courses in rural education. Eight doctors' dissertations in rural education have been completed there in the past fifteen years, and four such dissertations are being written this year.

The general and special, local and National educational journals are presenting much excellent material about rural education, likewise the daily newspapers and the weekly periodicals; and during the last three years the popular magazines published 465 titles about rural education and closely related subjects. Leading publishing houses are asking for books of real merit in this field, and a few such books are appearing. In Cornell University and in the State Universities of North Carolina, Wisconsin, and other States some illuminating researches in rural sociology are being published. *The Journal of Rural Education* published by this department bids fair to bear comparison with any of the technical journals in special fields of education.

The survey presented in the foregoing paragraphs is sufficiently itemized and inclusive to yield adequate evidence of the derivation, refinement, and application of a rapidly improving technique in rural education.

There are in round numbers 360,000 persons now engaged in professional work in rural education, and approximately 100,000 laymen are directly involved in it to some extent. Probably quality is more significant than quantity in any attempt to evaluate personnel as a resource in education, but in spite of the irregular academic and professional standards which obtain for the 350,000 of the rank and file of country and village teachers, they possess in large measure the potentialities of youth and growth with which to make response to the many means coming into use for their general growth and technical preparation.

County superintendents of rural schools; teachers of rural teachers working in local and State normal schools and as helping teachers in counties; extension teachers working as county farm agents or home demonstration agents, and as club leaders; official and professional National and State agents of rural education; and persons teaching college courses in rural sociology and rural life (a mailing list of 414 such persons is available)

make up an aggregate approximating 10,000 persons who constitute the leadership in rural education.

Is it too much to ask that this great field in education, which has an active National personnel of 360,000; 10,000 of whom have character maturity, and experience or other preparation to justify them in places of leadership and power, should become self-conscious and take account of itself? This differentiating self-consciousness is not to make rural education a provincialism and a side-show, it is rather to lift it into intelligently vivid public appreciation in order that it may be reincorporated in honest proportion and true perspective in great State and National programs of democratic education.

To take advantage of personnel as a resource in rural education the entrance for both the rank and file and the leadership must be made more attractive by being made more difficult. As the intellectual and professional levels for work in every field of rural education are raised, self-respect and satisfaction will increase, until leadership capacity will be identified earlier and more fully developed. The present potential leadership is doubtless far greater than the paltry three per cent whom position identifies; through money, organization, and evolution in technique a far greater number of places, in which an enriched experience and stimulating personal contacts which nourish growth, will be derived.

With the elimination of the competition of the unfit, the superficial character of the fitting of the so-called fit will come into closer scrutiny and be improved, until presently in the ranks of both lay and professional workers that positive confidence which sustains itself in thought and action in comparison with the best workers in all human enterprise will be demonstrated. This will inspire every individual in the fellowship and in the leadership of rural education with distinctness, clarity, and grip of purpose; then a great thing will happen, natively endowed men and women will rise from our ranks by experience and severely critical preparation to real intellectual distinction and to invincible moral stamina. Such a fellowship and such a leadership have been lacking, and they are today greatly needed as resources in rural education.

Principles underlying and determining the selection of the content of curricula will then be made plain; theses stating control ideas in teaching, supervision, and administration will then be intelligibly written; and appreciations so intimate and sincere that a novice may feel them will be achieved. Then money, organization, and technique will get their true identity as means to an end, and they will be united to advance this end by the human control of an adequate leadership.

Such a leadership will successively invoke the richest resource which rural education or any other great public enterprise can have in a democracy—social control. Social control is that thing which Kipling meant when in writing about the sinking of the *Lusitania* he said, "A force invincible received that blow." It is to this same invincible force that rural education must make its final appeal.

Child-welfare clinics and enforcing the use of milk from tuberculin-tested herds makes not only parents but the public as well, aware of and ready to demand fundamental health requisites. A great war emergency forces a quickened public intelligence about seductive social diseases, and these diseases become legal disabilities which disgrace and socially ostracise their victims with the relentless severity of a consensus of disapproval. Likewise the searchlight of present-day scientific itemization of facts and conditions in education with increased facility in putting the whole situation vividly in public review, are resulting in a much more direct and compelling appeal for social control in education.

In turning to social control as its greatest resource rural education has an undoubted advantage in that for educational purposes the rural situation has all the potentialities of superiority. The small community was the type-maker of our American democracy and it is today the chief conservator of that type. In the simple but fundamentally inclusive life of smaller groups of people, children and youths slowly but surely elaborate their lives into something like a total possession of humanity. Their lives are nourished by Nature, by parental and other adult companionships, and by an intuitive perception of an infinite plan as it constantly evolves before their eyes. Their danger, and oftentimes their doom, is that isolated contemplation blights them with inertia. Thus their lives may stop at the perceptual level and a great conceptual understanding of life be denied them.

Public inertia is the chief obstacle in rural education. Social control is slowly but surely changing this characteristic from rest or slow advance into accelerating progress. Eight million country children from their location of natural educational advantages, escaping that inertia which has caught and held back many, hail with delight a new day. In this new day more money, better organization, truer technique, a worthier personnel, and the invincible force of a social control which unites all these resources for maximum service is saving for them their richest American birthright, the wealth of a free and an adequate education.

SOME UNSOLVED PROBLEMS OF RURAL EDUCATION FROM THE VIEWPOINT OF SOCIOLOGY

E. C. LINDEMAN, PROFESSOR OF SOCIOLOGY AT THE NORTH CAROLINA
COLLEGE FOR WOMEN, GREENSBORO, N. C., AND EXECUTIVE SECRETARY
OF THE AMERICAN COUNTRY LIFE ASSOCIATION

I perceive in this gathering and in the subject which I have chosen to discuss a most wholesome sign of the future. When we come to the final analysis of a social problem, it invariably becomes evident that the ultimate solution lies in some form of enlightenment or education. By the same token, when we arrive at the terminal interpretation of the process of education we stand face to face with the problem which is foremost in the mind of the constructive sociologist. The logic of this circumstance points

unmistakably to the future fellowship of the social science specialist and the educationist. It is my most earnest hope that this coalescing of mutual interests will dominate the future progress of rural education so that, hand in hand, the sociologist of rural persuasion and the educationist of rural vision will devote themselves with spiritual as well as scientific zeal to the task of elevating the educational opportunities of those who live on the land.

My discussion deals with problems, problems which some of you may have solved to your satisfaction, but problems which nevertheless demand careful statement and painstaking analysis if progress is to be rational and sure. I do not, myself, presume to have arrived at conclusions which are completely satisfactory. In regard to most of the issues which are here raised, I think that I might say in paraphrase: I still see through a glass darkly, but, thank Heaven, I see.

The five problems which I desire to bring to your attention may be epitomized in the following terms:

1. Should there be a vocational concept in the curriculum of the elementary grades of the rural school?
2. Should the rural school teacher perform community services?
3. Can equalization of educational opportunities proceed in such manner as to prevent pauperization?
4. Does the consolidated school enforce new community alignments which consciously or unconsciously overlook the social advantages of old neighborhood or community groupings?
5. Is there a relationship between rural migration and intelligence?

My purpose in discussing these issues from the sociological point of view is, not to point to a new approach, but rather to combine various approaches in order to form a social whole; in short, to indicate the social significance of questions which have already received your continued and earnest thought.

1. *What place should the vocational concept hold in rural education?*—The answer to this query hinges upon two primary concepts—namely, the function of education in general, and the relation between agricultural practice and rural life. Rural education must be interpreted as indicating elementary education. Secondary education is, up to this time, so largely centered in cities and towns that it has little environmental rural significance. Hence, rural education means general education from the first to the eighth grades. Disregarding for the moment the fact that secondary schools attract so small a portion of the pupils who have completed elementary education, and assuming that secondary education is within the reach of the majority of pupils who have the mental capacity to perform its tasks, what is the function of rural education?

The two schools of thought representing varying answers to this question may be designated as: (1) Those who hold that education must fit the pupil for life; and (2) Those who hold that education must fit the pupil for a particular kind of life interpreted vocationally. The former insist

upon an educational content which performs five definite services: (*a*) It equips the pupil with the tools of communication such as reading, writing, and numbers. (*b*) It acquaints the pupil with the history of the human race, its trials, failures, and its successes; (*c*) It interprets the pupil's place in social organization through local, State, National, and international forms of social control; (*d*) It acquaints the pupil with the economic processes and resources which combine to form his material or physical existence; (*e*) It interprets the pupil's possibilities of usefulness and enjoyment in life in terms of his bodily freedom, lack of disease, participation in healthful and zestful activities, and physical adaptation to a changing mode of life.

With an equipment of this sort, the pupil is theoretically prepared to cope with the problems of life. Reading, writing, and arithmetic furnish him with the tools wherewith he may secure intercourse and communication with his fellowman. Literature, history, and the industrial arts furnish him with the ideals, motives, forces, ideas, and aspirations which have brought the human race to its present status. Civics and current events throw light upon the pupil's significance as a member of social groups. Geography, in its broadest sense, interprets for the pupil the physical or material basis of life and man's relation to the material universe. Hygiene, physical education and recreation bring the pupil's body into relationship with the wholesome life process.

An education of this type is essential to all children, whether they happen to have been born in cities or in the open country. Beyond this point, variations in educational content depend upon: (*a*) The extent of the influence of natural economic laws in determining vocational choices; (*b*) The opportunities for choosing vocations prevalent in the community where the school is located; (*c*) The extent of the economic pressure behind the students, which determines how much further time may be utilized in education before wage-earning must begin; (*d*) The extent of private industrial enterprises in providing training in vocations; (*e*) The rapidity with which occupations evolve into standardized forms regulated by automatic machines; (*f*) The theory of the prevailing political philosophy in regard to the state's right and compulsion to enter the field of preparing skilled workers for private enterprises.

In short, if natural economic laws work toward an equilibrium in vocations, if the community produces more children than can be absorbed in its own industries, if pupils can enjoy no more education beyond the elementary grades, if private industries are not furnishing adequate training for their demands, skilled vocations are likely to be more or less permanent and not automatic, and if the political philosophy of the day sanctions to the State's interference in the affairs of private industrial enterprise—if all of these conditions exist, then vocational education may begin with a thoroughgoing sanction. Many of these conditions do prevail in certain areas, and vocational education beyond the primary grades has produced positive and measurable results.

The advocates for vocational contest in the rural-school curriculum, even in the elementary grades, rest their case on such arguments as: (a) Children form their vocational choices or, at least, prejudices before they reach the high school; (b) The secondary schools are now, and are destined to be, largely city institutions; hence, their influence upon students will be in the direction of city life; (c) Through the study of agricultural processes and practices, the pupil will be led to appreciate the worth of agriculture as a profession; hence, he or she will be more likely to choose an agricultural vocation; (d) Country populations are obviously being depleted; one of the chief causes for the migration from country to city is the city-minded teacher, the city-minded textbook, or, in short, the rural school with no direct or distinct rural appeal or emphasis; and (e) The materials for agricultural education are round about the rural school; since this is sound pedagogic theory, the school should make use of these materials.

The numerous other reasons for this standpoint in rural education need not be mentioned before an audience made up of rural education specialists.

To answer the initial query in sociological terms involves a series of conclusions which shall be enumerated in categorical fashion:

(1) The vocational concept in general does have a place in the program of rural education. That place is to indicate to the pupil the necessity of tools of communication as means of enhancing one's earning capacity; to indicate to the pupil the inexorable law of producing in order to live; to indicate to the pupil the relation between human progress and man's productive energies; and to enable the pupil to accumulate such information concerning vocations as will enable him to make a wise choice for the highest use of his own capacities.

(2) The vocational concept interpreted to mean that the rural school should include in its curriculum courses of study dealing with the science and practice of agriculture is, sociologically, unsound. Neither the family nor the State should exercise prejudice or force in determining the child's choice of work in the world. The choice of a life work, as well as the choice of a lifemate, are matters of too grave import to place in the hands of leaders who guide the thoughts of impressionable youths.

As modifications and elaborations of the above dogmas, permit me to point out several other considerations with which the sociologist is deeply concerned:

(a) The vocational concept should be clearly distinguished from the environmental concept in education. To use the environment of the countryside as a background, as a setting, as a basis for interpreting the several branches of general education, is not only good pedagogics, but also good common sense, and good social theory. The mathematics of the home and the farm are excellent points of departure for the study of mathematics in general; but they should be used as points of departure and not as ends in themselves.

(b) There is a distinction between agriculture as a vocation and country life as a mode of living; this distinction should have deep significance to

the rural educationist. There is no reason for doubting that agriculture, like all other industries, will continue to be more and more dominated by the machine. The grain harvester which now cuts, bundles, threshes, and bags the wheat is a forerunner of what may happen when agricultural practices are more fully mechanized. This process will come about inevitably when the food needs of the world make it necessary. On the other hand, living in the country is likely to continue long after machines do most of the work on the farm. What the farmer of the future needs is an education which will enable him to live a full life in the country. In the past, the farmer who has been most successful in a material sense has not been inclined to remain in the country to enrich his community's life. As soon as he is possessed with the purchasing capacity, his social wants begin to expand; in order to satisfy these wants the successful farmer has invariably migrated to the city where social needs are being met. [In this connection, may I suggest the study of Korzybski's theory of the incongruity between the rate of application of the physical and the social sciences as explained in his book called *The Manhood of Humanity*. If the student is able to divest himself of the questionable mathematical pretensions of this reference, he will be immeasurably benefited. His statement in barest condensation is this: That the physical sciences proceed according to geometric progression while the social sciences proceed according to arithmetical progression. Hence our wars, revolutions, and halting progress.] The future farmer will need to be a manager or enterpriser of capital; in addition, if he is to reside in the country and promote a high type of family and community life, he will need to be fully endowed with those higher and non-vocational attributes which go to make up culture. The eight grades of the common school are none too long for laying such a foundation. And, what is more, the rural boy and the rural girl will have in such an equipment a foundation for a satisfactory life in any occupational situation in which the future finds him or her.

(c) The country-life problem of the United States is not likely to find its solution in any form of paternalistic occupationalism. That problem is not now, nor has it ever been, acute because of shortage of population. What the rural areas of America need is not increased numbers but increased quality of the inevitably decreasing numbers. Additional information in regard to the science and practice of agriculture will be needed. This should be supplied by reason of the farmer's demands through established agencies of education of a secondary or higher nature.

2. *Is the rural school teacher to be regarded as a specialist in education with certain community functions imposed upon him or her, or is the rural school teacher to be regarded as a promoter and organizer of community affairs with education as only one of his or her functions?*—This inquiry does not adequately express the nature of the problem here involved. Perhaps it can be clarified by separating the query into several constituent parts:

(1) Is there to be a decrease of emphasis upon the teacher's function as a specialist in education?

(2) Is there to be an increased emphasis upon the teacher's function as a community organizer?

(3) Is the teacher to combine both functions in an equal degree?

(4) Or, will it be necessary in the future to increase the specialization of the teacher and bring into existence another official to be known as the community organizer or secretary?

(5) Or, in the event of consolidation of rural schools, is it likely that such schools will have on their staffs a person specially trained to promote and organize community activities?

(6) Or, shall the rural school be designated as the institution for training local, resident leadership for the promotion and organization of community activities?

The first approach to this inquiry, sociologically, must be made in terms of the law of the division of labor. The past teaches us that this law has well-nigh universal implications. In every sphere of life in which progress can be measured it will be observed that individuals and institutions have diminished the number of their functions and have become more adept in a narrower field. There seems to be no reason to doubt that this law is applicable in the sphere of education. In fact, it may not be too daring to state that in a modern, progressive community any institution which attempts to increase the number of its functions is almost sure to be in the first stages of pathology.

But, this query cannot be dismissed by merely stating an abstract law or principle. There is, as everyone connected with rural schools well knows, an insistent demand that the rural school engage upon certain community tasks which are only secondarily educative in nature; or, if educative in nature, these projects are intended to educate the adult and not the child. This demand comes from many quarters—from agencies with rural programs to promote, from officials of county, State, and Federal governments, from commercial institutions, from school authorities, and, last and not least of all, from farm folk themselves. It is a demand so insistent and so persistent that it must be answered in terms of both principle and practice.

Nor can the question be evaded by the citation of the so-called "exceptional teacher in the exceptional school located in the exceptional community." Contrary to the well-known maxim, exceptions do not prove rules; they merely indicate the immaturity or the incompleteness of the rule.

In the case of the one-room rural school there can be little argument. Until such schools receive adequate support to employ a highly-trained teacher to teach the children in a well-equipped school, it is absurd to insist upon the school performing additional community functions. Not one third of the one-room rural schools of the present are able to provide sufficient time and attention to teach the fundamental subjects of education adequately. When this function, which no one will deny is the fundamental and primary one, is adequately performed, it may be time to begin discussing the ways and means whereby the teacher may be trained and expected to render

community services. And, when communities have reached the stage when such provisions are made, such communities will obviously have reached the plane of willingness to provide leadership for the more general community activities.

The consolidated rural school may employ specialist teachers. In a community which employs from five to fifteen teachers, provisions may be made for employing at least one teacher whose subject matter and whose community services are compatible. Three general principles may be induced from the foregoing:

(1) The law of the division of labor, if applicable to the sphere of education, indicates that the rural teacher of the future will inevitably become increasingly a specialist in education and decreasingly a community organizer or promoter. [This statement must not be interpreted to mean that the educational specialist is also to be an individualist in approach or in method. On the contrary, the best specialist is he who knows how to integrate his speciality with the social process. To the wise teacher, the school group presents a phase of social process; the entire teaching process may and should be a social one.]

(2) The nearest that the one-room rural school may come to fulfilling the office of a community center is to permit the use of the school property for community purposes, to encourage and stimulate all community projects, to contribute to the general welfare of the community, and to extend educational opportunities to those whose education has been handicapped. All of this, the school may best achieve by becoming the highest type of educational agency possible.

(3) The consolidated rural school or the rural high school may perform community services provided adequate provision is made first for the dispensing of its educational function. These services will succeed best if a special teacher with special training is employed, such teacher to have ample time for the special activities.

3. *Can equalization of educational opportunities proceed in such manner as to prevent pauperization?*—Theoretically, and from the standpoint of National economy, it appears that equalization of educational opportunity is a sound policy. In addition, National economy and the current theory regarding the distribution of income makes it appear that elementary education at least should be supported by funds coming from local, county, State, and Federal sources. Equalization of educational opportunity implies that a community, a county, or a State with inferior economic resources may rightfully expect assistance from the larger unit of which it is a political part; such assistance is usually gauged in terms of the standard of education prevailing in the best areas or the average standard.

A review of the literature on rural education covering the past four or five years reveals the fact that this sort of equalization has been supported by the leaders. In fact, it seems to me that a good case may be made out for the statement that the movement looking toward educational equalization originated among the rural educational groups. Inasmuch as there is

now ample precedent for such equalization, both insofar as individual commonwealths and the National Government are concerned, it seems probable that this end may also be achieved.

From the viewpoint of social theory, the following questions need to be raised in connection with this issue:

1. Is there any evidence to indicate that Federal and State aid to local units has tended to keep those local units from exercising their highest efforts in meeting their own obligations or in raising their own standards? In other words, does aid from the outside stimulate the local community to higher efforts on its own part, or does aid from the outside lower the community's will to improve itself?

There are evidences on both sides. I have in mind one community whose educational needs were endowed by one of its wealthy citizens at a time when it seemed entirely unlikely that this community would ever approximate metropolitan proportions. However, the rapid industrial expansion of the early part of this century affected this community so strikingly that its size went beyond all preconceived bounds. The endowed educational system was found to be inadequate. The citizens were suddenly confronted with the new experience of paying taxes for school purposes. They resented the implication, and the past ten years have been years of bitter struggle between the few leaders of this community and its population—still antagonistic toward school taxation.

On the other hand, Federal aid for States establishing colleges of agriculture and the mechanic arts appears to have stimulated this form of education in a most unusual degree. Good social theory has come to the point of insisting that philanthropy which does for the individual what he might have done for himself is degrading. Is it possible to determine what a community might do for itself? What are the factors involved in such determination?

First of all, there is a psychological factor. A community which has once been in poverty, or which has a poverty heritage may go on thinking itself too poor to provide adequate education long after it has become affluent. We have such an example in one of our commonwealths. For well-nigh fifty years this State was in actual want for adequate economic reserves; it was continually on the borderline of poverty. Political campaigns usually hinged on the issue of taxation. Slowly, in fact, so slowly that the phenomenon was imperceptible to most of the citizens, this State became wealthy. There were only three or four other States in the Union whose incomes exceeded those of this once "poverty" State. In the meantime, while this State was among the first five States in the Union in economic income, it was also among the lowest five States in the Union in educational opportunity offered to its children.

What did this State need? Obviously, an educational campaign which would indicate unmistakably and forcefully the correlation between economic resources and education. Such a campaign is now going in this State with results which, to the older inhabitants, are amazing. In one

year this State appropriated more money for educational purposes than in the entire one hundred and twenty-five years of its previous corporate existence.

Without burdening you with too much detail, permit me to suggest that there is a possibility of devising formulae whereby educational equalization may proceed with a far greater degree of scientific justice than present proposals warrant. Such formulae should include: (a) A coördination between Federal and State aid and the *per capita* wealth of the local area; (b) In rural territories there needs to be a coördination between educational opportunity and the status of agricultural practice; (c) Land-owning and home-owning factors may also be subject to integration in these formulae.

In brief, it should be possible to devise a plan of Federal and State aid for the equalization of educational opportunity which would operate on a rising or diminishing scale in ratio to the indices mentioned above; if this can be done, there can be no doubt concerning the ultimate social benefits to be derived from equalized education.

4. *Granting the one and two-room rural schools can in a majority of cases be eliminated because they have passed beyond their period of adaptability to modern demands and, further, that the consolidated school is the ideal for the future, what are the sociological implications of the consolidation process?*—Consolidation of two or more traditional school districts in one larger or consolidated area is a process which involves such factors as: (a) The factor of communication or transportation of pupils to and from the school, including roads, climate, et cetera; (b) the factor of taxable property, or ability to provide adequate economic support for the newer and larger plant; (c) the location of the school in relation to existing political units; (d) the location of the school in relation to geographic and topographic conditions; and (e) the social factor which is concerned with traditional neighborhood or community groups in which the school as a social or cultural institution has in the past played an important role.

Only one of these factors will be isolated for consideration—namely, the last mentioned. Before proceeding to this, however, may I presume to suggest that it may be possible to devise a non-rigid formula including the above factors in such manner as to throw light on the desirability, the possibility, and the location of a consolidated school? For purposes of discussion, I should suggest that the following formula might serve as a point of departure:

c = desirability, possibility and location of consolidated school.

a = communication, with numerical weight of 25.

b = taxable resources, with numerical weight of 40.

c = politico-geographic factor, with numerical weight of 10.

d = social factor, with numerical weight of 25.

The formula then would appear to be: $C = a + b + c + d$. This is, of course, a crude way of stating what is as yet a crudely-formed proposal to add scientific weight to the consolidated school movement.

What effect does consolidation have upon old and established neighborhood or community groups? Are these groups broken down after consolidation? Do they re-assimilate in smaller groups, or do they re-assimilate in the larger group with the new school as the center? In cases where this larger type of assimilation is observable, are there also certain back-eddies of separatist groups which refuse to be assimilated?

These queries deserve attention. There are evidences that the consolidated school has, in the past, given too much weight to a single factor—namely, the desirability of the improved educational facilities for the children. I grant that this is the most important factor, but there should be means of discovering how the other factors may be coördinated in such manner as to insure better social integration, assimilation, and, hence, progress subsequent to consolidation. I must leave the inquiry with the hope that some method will be devised in the near future which will make it possible to conduct certain studies which will cast light upon these problems.

5. *What is the rural social significance of the factor of intelligence as measured by current tests?*—I doubt whether there is now available sufficient data upon which to base any conclusions in answer to this inquiry? I do believe, however, that it would be a worthwhile effort to study such material as is available with a view toward continued observation and study. This implies something far more significant than current mental tests which reveal certain superficial mental reactions; the word 'intelligence' is here used to describe something far more important about the human mind than the mental-age tabulations with their beguiling appearance of mathematical precision.

It appears to me that there is, for example, reason to expect that such studies would reveal a distinct relationship between intelligence and rural migration. Size of family, family limitation, economic status, occupational tendencies of rural migrants—these and numerous other factors might be illuminated if we could have scientific data based upon intelligence norms.

Do the least intelligent remain in the country? Or, do the most intelligent migrate? Does the prevailing status of agricultural practice present an intellectual challenge sufficiently strong to compete with other challenges which come to the alert and intelligent? Some have assumed that the teaching of agriculture in the rural school would tend to keep boys and girls on the farm. We now know that the increased utilization of the machine will make it unnecessary to retain the old ratio between rural and urban populations; we next want to know what force will keep the most intelligent on the farm to lay the basis for the future rural culture.

To state this question is tantamount to asking for the central and the crucial touchstone of the philosophy of modern life. There is, of course, no single force which will keep the most intelligent on the farm; a satisfactory social structure will, however, present a balance of forces.

Agriculture will lose its drudgery aspects in proportion as its practices lift man from direct hand-contact with the soil, or, in other words, in pro-

portion to the application of machinery to agricultural production. During the first stages of this mechanization of farm practice, many will be intrigued by its fascinations. But, curiously enough, and here is the paradox against which we all must be warned, as machinery comes to be more and more perfect and automatic, the brains of man receive less and less challenge. The operator of an automatic machine does not need rational or thinking capacity. Obviously, farm practice will never become quite so automatic as industrial or manufacturing practice, and yet we must look forward to a close approximation. No, the future intellectual challenge of the country cannot be safely left to the machine.

But here I must depart from scientific principles and accept the role of the prophet, dangerous as that may seem. My faith in the future is not a faith in "things" but rather a faith in the spirit of man. To me it appears, as clearly as such a far-off event can appear in an hour of cynicism such as we now live in, that the future intellectual challenge of the world is to be looked for in man's expression of his expanding social regard in a democratic environment. The kingdom of heaven on earth is to be a social process in which the aristocracy of the intellect and of the spirit shall transcend the petty rewards of our present mechanical inventions and exploitations. May the country people be the first to grasp this vision and to lead us out of this morass of materialism onward into the promised "inbrothering of man."

The next and last problem of rural education which has been of particular interest to me is related to the newly-awakened consciousness among American farm women. It appears to me that there are distinct evidences of a veritable revolution in sentiment among the women of the countryside. Farm women are speaking in a new tongue, and their words have the ring of a new conviction and a new determination. A portion of this new consciousness may be accounted for as a belated expression of the general awakening of women everywhere during the past decade. Whatever its causes, it seems to me that the fact is discernible and ought to have significance to rural educators.

How may the newly-released aspirations of the farm women be turned into the channel of rural school progress? I do not presume to suggest to you, who are experienced in the task of relating public sentiment and opinion to educational promotion, how this shall be done; I merely point to the existence of a new and a powerful force which is at your disposal. If this force can be appreciated and utilized it will do more for rural educational progress in the next decade than all of the other forces combined. For, the heart of the rural mother is centered in her children. Through them she is destined to express the vision and the worth of her citizenship.

Although this has been an essay dealing with problems to be solved, I cannot bring it to a close without expressing to you my hopes for the future of rural education. Among the hopeful signs are: The splendid character of the leaders of the movement; the expanding interest in rural education manifested by such rural organizations as the American Country Life

Association; the high grade of investigation and educational experimentation now going forward in rural areas; and, finally, the fact that those of us interested in this inspiring problem are broad enough to disagree without bitterness, to coöperate without thought of personal glory, and to perceive in diversification of theory the living pulse of progress. "Where people laugh and agree, progress weeps." With us progress must be sure since we do disagree, but we do laugh.

OBJECTIVES OF SECONDARY EDUCATION

THOMAS H. BRIGGS, TEACHERS COLLEGE, COLUMBIA UNIVERSITY, NEW YORK

Education has been so generally accepted in the United States as a necessity that the public is more likely to approve anything bearing the label, especially if traditional, than to realize the basis of its justification and to demand results in terms of its purposes. The only reason why school taxes are levied on parents and non-parents alike, why education is offered free of charge, why children from six to fourteen are compelled by law to attend school is that in some way each individual may be made better able and more inclined to contribute to the welfare of society.

Education, then, is an investment, not a generous gratuity. And as with any other investment, returns should be expected and demanded both by those who furnish the raw material, that is, the children, and also by those who pay the cost of operation. In our organization the cost of the school is paid wholly or in the largest part by the local school district. It follows as a matter of course that the school should make returns first of all to the betterment of the local community and only after this obligation is satisfied to the State.

The interests of the local and the larger units of interested society fortunately have much in common, but at the same time there are differences, and failure to recognize these differences often results in a contribution by the weaker community to the stronger, a contribution that still further weakens the former while making still stronger the latter, which has paid little or nothing for the preparation of its assets of new citizenry. Instances are numerous of rural and semi-rural communities heroically taxing themselves to furnish an education which sends their youth away to the larger cities. It may be cogently argued that the major cost of education should be borne by the State or even by the Federal Government, but at present it is not. The result of the present general practice of the schools is that many communities have generously taxed themselves with consequent impoverishment of the local society.

The remedy is not that schools should be less liberally supported, but rather that they should be so organized as to return profit primarily to the community that pays the major cost of the investment. Objection to this proposed emphasis is likely to come from parents who have a desire that their children shall be prepared for life in the larger world, a desire that

may be creditable to parental affection and ambition. But it is hardly reasonable for them to demand or even expect that their neighbors shall make a heavy contribution to this end when it assuredly will result in making the local community a worse place in which to make a living and to enjoy life.

Differences between the purpose and the practice of elementary and secondary schools have not been clear in the history of education in the United States, nor is there evidence that we have in the past been greatly concerned in the matter. Though largely influenced in early times by undemocratic practices in European schools, our present organization and much of our subject-matter are the result of compromise rather than of conscious development on accepted definitions and principles. It is now proposed that education in the United States has three clearly conceived phases: elementary, intermediate, and higher, each with its own functions and purposes, all consistent with the obligations to return profit to the State through the development of the individual.

The elementary grades shall furnish the common training necessary for all children in a democracy "regardless of sex, social status, or future vocation," and by means of this training shall bind together future citizens by common knowledge, prejudices, ideals, and aspirations. With the longer school year, better buildings and equipment, trained teachers, and supervision, modern schools can accomplish these two ends in six years better than the older ones with traditional means and indefinite purpose could in eight or nine. Doubtless schools could contribute even more in a longer time, but before the law permits children to withdraw and the investment of education to cease it is desirable to attempt other aims, which are characteristic of the intermediate period.

For this intermediate period junior high schools, accepting children from approximately twelve to fifteen years of age, have been instituted and are being widely adopted both in urban and in rural communities. The five major purposes of the junior high school are: First, to continue, and so far as it may seem wise and possible, and in a gradually diminishing degree, common, integrating education; second, to ascertain and reasonably to satisfy pupils' important immediate and assured future needs; third, to explore by means of material in itself worth while the interests, aptitudes, and capacities of pupils; fourth, to reveal to them, by material otherwise justifiable, the possibilities in the major fields of learning; and, fifth, to start each pupil on the career which, as a result of the exploratory courses, he, his parents, and the school are convinced is most likely to be of profit to him and to the State.¹

The last unit of local education is the senior high school, which shall furnish increasingly differentiated education always promising returns to the community and suitable to the capacities, interests, and most probable needs of the groups of pupils attending. The Commission on the Reorganization of Secondary Education, appointed by the National Education

¹ Briggs: *The Junior High School*, page 26.

Association, recommends that "secondary schools admit, and provide suitable instruction for, all pupils who are in any respect so mature that they would derive more benefit from the secondary school than from the elementary school."

The Commission also recommends that the following be considered the main objectives of education: Health, command of the fundamental processes, worthy home-membership, vocational effectiveness, citizenship, worthy use of leisure, and ethical character. Although these objectives should be sought by all educational units, the high school has a peculiar opportunity and obligation because of the maturity of its pupils as compared with those in the elementary grades and of their number as compared with those in the colleges. Some of the objectives, particularly the command of fundamental processes, have long been emphasized by all schools; but reflection will show that acceptance of the seven as the chief objectives greatly widens the conception of education and imposes obligations on every subject to seek each of them consciously and consistently so far as it is possible. The recent report of the Committee on Science Teaching¹ to the Commission reveals to an extent how the several sciences can accomplish far more of the desirable ends of education than they are accustomed to do.

In a general sense the objectives of secondary education are identical in junior and senior high schools, whether urban or rural; but specifically they vary as local conditions differ. Pupils in all communities must know and conform to the fundamental laws of health, for instance, but food, sanitation, human contacts, and physical exercise may differ much in two localities and in consequence necessitate wisely differentiated courses of study. In the past the rural and village school has too commonly adopted educational plans prepared by city schoolmen for urban conditions, thus unconsciously but no less surely contributing to the migratory urge and weakening the communities that sought through education to strengthen themselves.

A safe guide for any school that desires to justify itself is first of all after ascertaining what are the desirable activities in its community, to help the people to do them better; and second, to reveal to them higher types of activities of all kinds—in health, in home membership, in the worthy use of leisure, and so forth—and to make these so desired that they will be sought after. Along with being directed by these aims the school should so far as possible organize every course so that it is profitable to the extent to which it is pursued. One month of mathematics should be worthwhile, even if the pupils pursue the subject no further; one lesson in science approximately one-fortieth as valuable as forty lessons. These principles courageously and consistently sought can be applied far more frequently than one would at first thought suspect; indeed, they are already common in such subjects as physical exercise, English literature, expression, civics, and general science. A most revealing and stimulating program is inevitable if one, for the moment disregarding traditional practice, makes an

¹ U. S. Bureau of Education Bulletin, 1920, No. 26.

inventory of the activities desirable and possible in his community, whether they are commonly practiced or not. This program will contain many elements of the traditional courses of study, but it will not only make those that are retained more meaningful but it will also introduce new elements which common sense shows are of equal if not of greater importance.

Great emphasis has during the past decade very properly been placed on vocational training, for the old school had largely neglected this phase of education. What the State needs is not bookish men with poor health, not men skilled in vocations but weak in a sense of civic responsibility, not men trained to enjoy leisure but lacking in ethical ideals; what the State needs is a citizenry prepared as far as possible for full, rounded life of service and happiness.

A consideration of the current tendency of education, especially of that for rural schools, raises a strong inquiry as to whether the emphasis should not now be placed more on preparation for home membership, civic responsibilities, and the wise use of leisure time. Without in any way detracting from the obvious need of a mastery of facts and processes, of vocational efficiency, or even of health, it may reasonably be urged that none of these matters is of great moment unless it makes possible and makes probable the happiness of the individual and the happiness of those about him. Nothing has here been said of ethical character as an independent objective, for what is ethical character but the inevitable result of the other objectives attained and coördinated?

It must not be assumed that these paragraphs are presented without an appreciation of the valiant and laudable efforts that have been made here and there to improve rural education, to adapt it to community needs, and to justify it as a wise public investment. It is not in ignorance of these efforts but because of them that one gains a vision of the education of a not far distant future. Emboldened by results already accomplished and guided by simply stated principles justified by common sense, the administrators and teachers of rural schools have before them an opportunity as extensive as its satisfaction is assured.

THE SMALL COMMUNITY HIGH SCHOOL

E. M. PHILLIPS, STATE HIGH SCHOOL INSPECTOR, ST. PAUL, MINNESOTA

1. The need for it:

- (1) Keeps rural community children in school until eighteen years of age.
- (2) And thereby enables them to secure the training and the knowledge necessary if they are to hold their own in the competition between rural and urban communities.
- (3) Prevents the development of a peasant caste in America.
- (4) Assists and is the chief agency available in creating for the small community desirable standards—intellectual, æsthetic, ethical, and spiritual.

- (5) Provides the training needed for intelligent participation in public affairs—i. e., *good citizenship*.
2. Desirable characteristics of the small high school:
- (1) Modern building as to heat, light, ventilation, seating, toilets, attractive site and grounds, play ground equipment.
 - (2) Modern equipment, including gymnasium, auditorium, laboratories, moving picture apparatus, piano, works of art.
 - (3) A school head, elected by a school board that knows enough to let him run the school until he is dismissed for inefficiency.
 - (4) A school curriculum free from slavish imitation of the city school.
 - (5) The best teachers that good salaries will attract.
 - (6) A school year of at least nine months.
 - (7) Auto bus transportation for every child living more than one mile from the school.
3. Extra-curriculum activities:
- | | |
|----------------------------|-----------------------------------|
| (1) Music— | (3) Public speaking— |
| <i>a.</i> Glee club. | <i>a.</i> Declamation. |
| <i>b.</i> Orchestra. | <i>b.</i> Oratory. |
| <i>c.</i> School band. | <i>c.</i> Debate. |
| (2) Athletics— | (4) Club work. |
| <i>a.</i> Foot-ball. | (5) Community improvement— |
| <i>b.</i> Basket-ball. | <i>a.</i> Roads and bridges. |
| <i>c.</i> Base-ball. | <i>b.</i> Parks. |
| <i>d.</i> Field and track. | <i>c.</i> Landscape gardening. |
| <i>e.</i> Tennis. | <i>d.</i> Law and order. |
| | <i>e.</i> Farm and home projects. |
4. Extended use of school facilities by the entire community:
- (1) The auditorium and gymnasium.
 - (2) The laboratories.
 - (3) The library.
5. All publicly supported schools have one, and only one legitimate aim—to make good American citizens.
6. The sources of maintenance funds for the small high school:
- (1) The burden too heavy for the small community to bear alone.
 - (2) The strain of a property valuation tax on farm lands is excessive and unreasonable.
 - (3) The remedy to be found in—
 - a.* Large State support.
 - b.* The substitution of an income tax for the prevalent property tax.

PROBLEMS AND METHODS IN THE ORGANIZATION OF RURAL COMMUNITY HIGH SCHOOLS

F. P. OBRIEN, UNIVERSITY OF KANSAS, LAWRENCE, KANSAS

In dealing with this subject a definite and specific treatment of methods in rural high-school organization has been requested by the committee making the assignment. Accordingly I shall make no further apology for discussing actual situations within the range of my own contact and experience in the organization of rural high schools in Kansas. It will be necessary, first, however, to present certain facts and situations as a background for the treatment of problems very real and definite with reference to the rural community high school. The central theme of this talk will deal with the desirability and feasibility of using a combination of democratic procedure and scientific direction such as differ quite markedly from the prevailing methods employed to accomplish the organization of this type of high school.

First, let me remind you that the rural community with its distinctive problems of the social and educational type predominates in Kansas as in the neighboring States of the Middle West. The State of Kansas has an essentially rural population. There are no large cities within its borders. In order to credit the State with a fair number of cities Kansas has formulated its own definition of a city. Any town having a population of 250 people is called a city of the third class. If its population reaches 2000 it becomes a city of the second class. A population of 15,000 makes the city one of the first class. The State has eleven of these cities. But less than one fourth of its people live in communities as large as 10,000. If rural population is defined as by the U. S. Census Bureau so as to include those residing in towns of less than 2500 population, then 65 per cent of the State's population is in the rural class.

Here, as elsewhere in this country, during the past two or three decades, the very remarkable extension of opportunities for secondary education has been evident. Kansas has made several attempts to provide high-school advantages for the rural boy and girl. These efforts have found expression in the legislative form and, as often happens, some of them have been of importance only as temporary or transitional measures. The county high-school law in Kansas was based on the idea of taxing all property in the county for a county high school which should be open to all high-school students in the county. The township high-school law represented the application of a similar idea to the township as a unit. The Barnes high-school law was a still further attempt to provide county aid under certain restrictions for any high schools giving instruction to students outside of the high-school district.

These movements culminated in the rural high-school law of 1917, by which it is possible for any group of contiguous school districts or parts of districts to organize for high-school purposes regardless of county, township, or district lines, and thus form a rural high-school district.

The popularity of this plan for providing equal opportunity in secondary education for those living in rural districts is evident from the fact that the rural high-school type of organization has spread over the State almost like a contagion. During the period of less than four years in which the law has been in actual operation more than 200 rural high schools have been established. But there has been no general direction or counsel in the organization of this type of school throughout the State, and many of these schools should never have been organized in the way they have been.

As a consequence of this rapid multiplication in numbers and the lack of competent direction in its development, the rural high school in Kansas has been the victim of mistakes, numerous and serious. A majority of the districts have organized with a valuation far too small to support an adequate high school without feeling too much the weight of the resulting tax burden. A large number of these schools have an enrolment so small that the social contacts and influences expected of secondary education are impossible. Another result of the small enrolment in these schools, 25 per cent of which have less than 25 pupils and 65 per cent less than 50 pupils, is that the *per capita* cost of instruction is high, even exceeding \$400 a year per pupil in some schools. The usual instruction difficulties that characterize the small high school are all present. The job does not attract and hold the better teacher or principal. There is not much variety of instruction offered in these small schools. Extra-curricular activities are often negligible.

Up to a recent date, with approximately 200 rural high schools organized, not any had been classified by the State Department as of "A" grade; and only five per cent of them were as high as "B" grade. The "D" grade of school and those which are in the unapproved class still include the larger number of the rural high schools in that State. In short, many of these schools handicapped by their smallness of enrolment and restriction of opportunity are giving an inferior grade of instruction at an excessive cost. These communities are paying for what they do not get, and the time may not be far distant when the people will ask, "Where has the educational leadership of the State been hiding?"

While the high-school buildings in which these schools are housed are almost uniformly new, their lack of adaptation for the functions for which they are intended usually disclose what the school board and the architect did not know about the standards and functions of such a building. Often a tremendous and permanent price in loss of educational facilities has been paid for the saving of five or ten thousand dollars in the original cost of one of these buildings. Recently when a Senior in architectural engineering at the University asked me to direct him to a first-class rural high school building in the State that he might study it, I was compelled to say that I knew of none truly answering that description that had yet been built in the State.

These buildings most often are planned and constructed without advice or counsel of anyone competent to judge the adequacy of the provisions in

terms of present and future educational needs of the district and the acceptable standards of modern school construction. Since these buildings are relatively permanent structures and since the errors of construction are sometimes as permanently fixed as are the buildings, the most serious feature of the situation is the fact that future generations of boys and girls will be the victims and pay the price of the shortsightedness and short functioning of such construction. The problem then is twofold, first to provide direction for insuring a better type of organization, and secondly, to discount as far as possible, the mistakes already made. But how shall this be done? How indeed shall we lay hold of the principles of democracy and give them direction so as to make them function in the development of the rural community high school?

The prevailing method of organizing the rural high school district follows the line of present expediency and early accomplishment. The people of some town probably select the site which they desire and determine how much of the nearby farming population they can outvote. The proposed boundaries of the new district are then drawn so as to include and exclude territory in keeping with that idea. Forty per cent of the enumerated voters must sign a petition for such a district. A majority of the votes cast will carry the proposition. The farmers say, with considerable justification, that they are "railroaded" into the new district to help support the town school. They are not made to feel that it is their school and their school problem. They are not asked to do any thinking. They are asked to accept. No time is spent on community education with respect to the project that concerns these people so directly. There is more of feeling than understanding involved on either side. A study of such principles as the advantages of a larger district, how the functioning of a high school is related to the size of its enrolment, the right selection of location, the probable demands ten years hence, the attributes that characterize a better grade of high school, how the type of building will condition the school's activities and the highly essential matter of securing community coöperation and unity of effort in the project, receives no consideration or attention. Such a study should from its very nature be regarded as fundamental before the community is persuaded to invest its money in any high-school organization.

A procedure so opposed to democracy in method and spirit as is the prevailing practice certainly implies (1) that the proposition treated in this manner does not possess enough merit to recommend it very strongly; (2) that the people to whom it is addressed do not possess such intelligent or reasonable attitude, as will enable them to understand or accept the facts when presented; or (3) that the promoters do not have much confidence in their own ability to present the facts with clearness and force. Of course, it may sometimes indicate a lack of confidence in the practical service of that more democratic and perhaps slower procedure of community discussion and education, which should be preceded by a competent investigation of all the factors involved. There seem to be many who are willing

to make the end justify the means. It is evident however that there is a growing sentiment against making the end justify the means in organizing a district of this sort. The latest session of the State legislature has made it possible to disorganize a district and at the same time it provided the procedure for accomplishing that end.

Assuming that in any community a high school is to be organized, then the all-important question to be considered is what kind of high school it shall be and by what method organized? At this point the process should take precedence. It may determine how great will be the usefulness of the organization when it has been accomplished. It will often be the part of wisdom to delay the final organization at least a year or two and even longer if necessary in order to be more assured of getting what is really a community high school rather than something imposed upon the community without its first being made ready to accept and use it. This will mean the greater expenditure of energy in getting the community to want the best available school and to prize right standards. The community may require such an arousing and unifying of purpose that in certain respects it becomes an altogether different community. The chief agencies to accomplish such change should generally be sought in the community itself with others working more successfully through these agencies. Let us now face the question whether such methods are subject to practical application.

The general situation in the State with reference to the rural high school was as described, when certain school districts in Johnson County, located near Kansas City and the Missouri State Line, applied through the county superintendent of schools to the Bureau of School Service at the University of Kansas, to aid them in their attempts to provide high-school facilities for their boys and girls. It was found that from 14 districts in that part of the county 140 students were attending six different high schools. The territory includes four small towns, two of which rank as Kansas cities of the third class. Both of these were maintaining high schools ranked in the lowest class that is approved for doing four years of work. They were small and expensive as well as inferior. One of these small towns which supported its own high school and received students from the surrounding districts was carrying a tax levy of 25 mills—due mainly to the expense of their high school and the smallness of the district. The other high school was offering less and costing less.

It will be noted that the expressed desire for assistance arose primarily from the pressure of taxes rather than from any dissatisfaction with the inferior schooling offered. It should also be stated here that these 14 school districts had little in common except contiguity of territory and the lack of good high-school facilities. I would not have you think that it was a homogenous population where unity and community already existed. Many rivalries, suspicions, and dissensions were found there. The farmers were awedly suspicious of the motives of the small townspeople. Many Kansas City commuters having little contact with the local resident population lived in a portion of this territory. Keen rivalries and jealousies

existed between some of the small towns. The Catholic and Protestant elements of one district were in active opposition, even going so far as nominating rival tickets in their local elections. The color line prejudice also was present. Some of the districts had a considerable number of colored residents, thus causing other districts to express opposition to any closer association between the districts. Added to these factors of division one found the influence of the substantial farmer type—sometimes unmarried—who feels no special need of good schools and who believes most heartily in that sort of educational organization which costs the least to operate.

The Bureau of School Service was authorized at a joint meeting of the School Board representatives from these 14 districts to make a survey of the high-school needs in that territory and present recommendations to that group of representatives. The approval of this plan by the representatives present was mainly a formality with some of the members. Indeed, there were some members present who had decided without investigation what should be done and they were inflexibly disposed toward any other solution of the problem. But the attitude of the majority prevailed, and the survey was authorized.

In making this study of the high-school needs, Mr. Smart, professor of rural education, at the University of Kansas, and myself visited all elementary and high schools in the territory and secured the necessary information first hand from these schools or from the official records of the county. The county superintendent of schools was invited to accompany us on all visits. She gave coöperation and assistance at every stage of the work, and performed an important part at some critical points.

The making of this study involved among other considerations an inquiry into the high-school needs of these districts, the high-school population—both present and prospective, the right size of high-school district for the community, the kind of high school needed, the ability of the territory to support such a high school, the distribution of students and the best location for the high-school building, the size and cost of building required, the courses of study, and the teaching staff.

The data gathered soon made it clearly evident that one central high school was the best way of providing for the high-school needs of these districts. It was found that the whole territory would form a desirable high-school unit. The total valuation of this territory was more than ten and one half million dollars. The total school enrolment, including high school, was approximately 900 pupils. The greatest length of such a high-school district would be about 10 miles. The current school levy varied in these districts from .6 of a mill to 25 mills, showing how unequal was the educational task to be met in the different districts. While the actual high-school attendance in these districts was 140, the upper elementary school classes had enrolments from 75 to 90 pupils. With the prospect that perhaps sixty of these pupils would each year finish eighth grade and enter a first-class modern high school rightly located, it seemed plain that

the central high school would soon have an enrolment of at least 200 students without taking into account how a superior high school would attract more people to the community. There is a strong probability that the population of the locality will increase considerably in the next ten years because the commuting distance from Kansas City makes much of the territory desirable for homes for commuters.

A carefully prepared map showing the territorial distribution of the high-school students and another one for the elementary-school pupils showed that the population centers for both groups were almost identical. This center was also very near one of the two electric lines which cross these districts, but it was more than a mile from the limits of the nearest town.

This information and other tabulated data were all presented by means of large wall charts in making the report of this investigation to the school-board members and school patrons. Mimeographed copies of the charts were also distributed. It was the chief purpose of this report to give the school-board members and others the feeling of a self-discovery of the facts as they studied these statements. That it was successful seems certain from the kind of responses secured. As an illustration, the correct location of a central high-school building was never seriously brought into question after the center of school population was clearly shown on a map of the territory—and this in spite of the fact that the representatives of one of the districts were opposed to any site outside of their own town.

The economic advantages of this location for a rural high school were also observed in the fact that the concentration of population would come within the three-mile zone. As the transportation charges are not paid by the high-school district within the three-mile zone such charges would not be imposed on the high-school district for more than 25 per cent of the pupils if the building were located at the territorial center of the school population.

With reference to the type of high school to be recommended, the inquiry was made to include (1) the occupations of the pupils' fathers, (2) the pupils' expressed choice of life work. The resulting tabulations showed the diversity in kinds of vocational interests found in those districts and the varied instruction demanded for the pupils in order to provide a fair degree of equality with respect to educational opportunity. It was discovered that in this particular rural community only 25 per cent of the pupils have fathers who are farmers, dairymen, or gardeners. An analysis of the vocational choices of 748 pupils in the elementary school showed that 16 per cent wanted to be farmers or dairymen; 2 per cent more wanted to raise flowers, poultry, or live stock; 12 per cent voted for a business career; 13 per cent had selected callings that demand mechanical training; 15 per cent preferred professional lines; many girls mentioned homemaking and teaching; and others did not express a choice of life work. While there is nothing final about these percentages they do indicate clearly the amount and kind of diversity of vocational interest represented.

It is also significant that 91 per cent of these elementary-school pupils said "yes" they were going to high school if possible; 5 per cent were not sure; 4 per cent said "no." Unless such evidence is entirely disregarded the high school which makes adequate provision for these pupils must offer several different courses of instruction, including business, agricultural, general or scientific, homemaking, and teacher-training courses. To these would certainly be added physical training. A rural high school offering these courses would require a teaching staff of at least twelve teachers and a principal to care for approximately 200 students.

These conclusions were presented to the members of the school boards at a joint meeting held about three months after the meeting at which the survey was authorized. An analysis of the building provisions that would be demanded for that kind of a high school, an estimate of the construction cost of such a building, and the probable operating costs were also presented. The estimates showed that the school for 200 students could be operated as recommended and also a building costing \$150,000 paid for in ten years on a levy of 3.5 mills if such a rural high-school district were organized. This is less than the average levy paid for the rural high schools now found in the State. All effort was centered on giving the people a good school for high-school purposes. Reduced expense or cheaper provisions were not recommended at the expense of quality. No high-school building in the county nor very many in the State could reach the standards of the building recommended here. Teachers' salaries were estimated higher than the average paid anywhere outside of the larger cities of the State. Only an "A" grade of high school was ever admitted to consideration with reference to this project. The larger valuation of the larger district made all these things available for a moderate tax levy. The possibilities of the larger high-school district quickly appealed to a majority of the people.

The organization recommended to the school board representatives was without a near rival in the State, among rural high schools, with reference either to size of the district valuation or the size of high-school enrolment. Few, if any, were in the same class with reference to grade of school, size and character of teaching staff, or adequacy of building provisions. The idea of basing the organization on a careful study of the whole situation also marked a departure from what had previously happened in determining this type of school.

When the report of this survey had been presented to the school-board members meeting in joint session it was referred by them to the separate districts for the purpose of hearing and discussing it. One or both of the authors of the report and the county superintendent of schools visited district meetings in each of the fourteen districts, upon invitation. Not all of these audiences were sympathetic. But the proposition for a central rural high school seemed to gain strength and support as the people came to understand it and to feel that it was their responsibility to decide what kind of high-school opportunities they wanted for their boys and girls. It was truly a campaign of education of the people. All views were given a hear-

ing and discussed. These meetings often lasted until late in the evening.

Soon the elements of opposition asserted themselves, led by those who knew what they wanted long before the survey was made. They proposed a division of the territory into two or more high-school districts. A petition hastily prepared and signed by approximately 600 names was presented to the county superintendent asking approval for the organization of a smaller district of this sort. It was quickly discovered that the promoters of the movement had managed to include two thirds of the total valuation and one third of the high-school pupils of the proposed large high-school district. A protest signed by more than 900 names was promptly sent to the county superintendent stating that the boundaries proposed in the petition would forever preclude their children from securing the advantages of a first-class rural high school and asking the privilege of a public hearing. Here is exemplified a faith in democratic method. They asked only a fair hearing. These people had already begun to think in terms of quality of instruction and the kind of opportunity offered by a high school. Their request for a hearing was granted.

This meeting was held in the court-house at the County Seat, twenty miles distant, but the court-house was filled for the hearing by people who opposed the limitations and unfairness of the smaller district. Forty of the original signers of the petition for the small district had already asked to have their names stricken from the petition. The merits of the whole proposition were fully presented and discussed. The interests of the larger high-school district were represented by a committee of three citizens.

In her decision the county superintendent refused to approve the petition for the smaller district because it was so manifestly unfair in its boundaries. In this decision she stated plainly that she would be disposed to approve any rural high-school district within this territory which provided educational opportunities that were fair and equitable for the boys and girls; and that this condition would demand:

1. A fair division of educational responsibility (according to the school population).
2. A fair and equitable distribution of the valuation in proportion to the responsibility assumed.
3. Encouragement of the highest type of school that it is reasonable to expect.
4. Provision for the most likely future needs and development.

The people had become aroused and they had been definitely informed so that they knew the high-school needs were real ones based upon an actual study of the situation. Following this demonstration of interest by the community and the decision rendered by the county superintendent a unity of purpose was apparent among these people to secure the kind of high school recommended for the young people of that community. The petition for the organization of all the territory into a rural high-school district was duly signed and approved. The committee in charge prepared a twelve-page booklet of questions and answers relative to the

organization proposed. It was a fair and convincing presentation of the needs, location, kind, and cost of such a school. A double-page map of the district was included and the advantages of the larger district were made plain. This booklet of information was mailed to every home in the territory before the date for the election on the organization of the new district.

Two propositions came up for decision at the special election held in September, one on the organization of the rural high-school district, the other on the issuing of bonds for the new high-school building needed. Both propositions were approved at the election. More than 2000 of the 2800 registered voters recorded their votes at this election. This happened in spite of the fact that many of the commuters to Kansas City were not able to vote because the polls were closed at six o'clock, before they could reach the voting places on returning home. Here was a striking demonstration that the people respond when they are really informed and led to feel both that the responsibility is theirs and that its importance is great.

The new district was given the name of the Shawnee-Mission Rural High School because of the fact that the territory is located chiefly in Shawnee and Mission townships of Johnson County. The three members of the school board of the new district were elected at an election called for the purpose in November. The authorized bonds were then sold. Without delay this Board purchased twelve acres of land near the center of high-school population as a site for the new building. Architects were employed and set to work. Their plans were subjected to the criticism of the men who made both the survey and the recommendations for the building. The county superintendent also was consulted. This building promises to be a model of its kind among school buildings of the State. The educational features of the building have received as careful consideration as have the architectural features. This is indeed a new departure in the planning of small town and rural school buildings. The architects have been much concerned about how they could make the building better serve its educational functions. The board has sought this kind of service.

Other efforts have been made by the opposing minority to arrest or prevent the organization of the Shawnee-Mission Rural High School, but the gratifying fact is that the community has been so well informed by the program of community education that it knows what kind of high-school provision it wants for its boys and girls and it will not easily be led from its determination. This distinctive rural community high school in the State is an evidence that the application of democratic procedure in the development of better high schools is not a visionary theory, but if rightly directed, it is a practical method of getting desirable results in rural high-school organization.

CONSOLIDATED SCHOOLS OF THE MOUNTAINS, VALLEYS, AND PLAINS OF COLORADO

C. G. SARGENT, COLORADO AGRICULTURAL COLLEGE, FORT COLLINS,
COLORADO

Since all of our schools are not like those described in this address, we reluctantly admit that in Colorado we are still struggling with the "District" system, adopted by our State a half century ago and changed in no important respect since its adoption. Each rural district is clothed with just enough power and authority to have as poor a school as it pleases. Each is as jealous of its "inalienable" rights as if it were a sovereign State instead of a fragment of a township. Each is as ready to fight to perpetuate its imagined "independence" with all the defects of its organization as one of the so-called republics of Central America. And instead of being one of our most democratic institutions, as it has long been called, it is very undemocratic, and if carried to its logical conclusion, as has been done in many instances, it becomes individualistic.

We still have 2000 weak and inefficient rural schools, for the most part of the one-room variety, and with buildings of the traditional type, suited only to pioneer conditions such as are suggested by the spinning wheel, the ox-cart, the cradle, and the flail, implements unused since the days of our grandparents. Many of these are still taught by young and untrained, or poorly trained teachers, and 60,000 country boys and girls, children whose parents are citizens of the United States, live in these districts. Many of these do not even complete the eight-year elementary course, poor as it is, while but few of these who do graduate from the eighth grade ever find their way to some town or city high school, for the entrance of which they have not been prepared, there to get their first experience in a real school, and to get at least a little inspiration to start them on their long and difficult struggle for an education.

Now with this frank admission no one should accuse me of trying to give the impression that all of our rural schools are as fine as those we are soon to describe, although most of them might and could be.

Our State-wide campaign for rural-school improvement is scarcely ten years old, yet within the brief span of a single decade we have abolished some 500 weak and otherwise inefficient rural schools, and have already replaced them by 168 good consolidated schools that provide a graded elementary and most of them a strong four-year high school.

These new schools are found in forty out of our sixty-three counties and are well distributed over the State. Some forty of them are found in the non-irrigated portion of eastern Colorado, sometimes referred to as the Great Plains section. Eighty or more are found in the fertile irrigated valleys of the South Platte and Arkansas river basins and their tributaries along the foothills. Some are in the high mountain valleys in the southern and extreme western part of the State and some of our best ones are located at an elevation of 7600 feet above sea level, one reaching approximately

8000 feet! One is near the base of Mt. Blanca where the railroad and the auto road cross the Sangre De Cristo range of mountains, named and made famous by the early explorations of the Spaniards.

Another is securely tucked away in the mountains, "Out on top," where the surface of the land is rough and broken and where the roads are merely mountain trails, where the families that live farthest away are compelled to move into their own winter cabins erected on the school grounds of forty acres acquired for that purpose just before the deep snows block the roads for the winter, while children who live nearer break trails and come on horseback and still others go on skis over four feet of snow. This school is miles from a railroad, surrounded by the most difficult natural obstacles of any consolidated school the writer has ever seen, where only stouthearted and the most courageous scions of the original pioneers would even attempt to live, to say nothing of attempting to build and operate a consolidated school, to erect a substantial and modern teacherage, and establish a real community center with electric lights, moving pictures, wholesome entertainments, secure for themselves a United States Post Office, install a telephone exchange, and create a community out of a few scattered cattle ranches on land that but a few years ago supported nothing but sage brush and scrub oaks.

Still another is found in the canon of the Arkansas River, just above Royal Gorge, only a few miles from three noted mountain peaks, "Harvard," "Princeton," and "Yale," that are a part of the Great Continental Divide. This is certainly the last place on earth where one would expect to find a consolidated school.

Some counties have made wonderful progress in the reorganization of their rural schools by the consolidation of districts. Weld County leads the list with twenty-five fine consolidated schools already established and has equally good opportunities for a dozen more. El Paso County comes second with seventeen located along the mountain divide that separates the waters of the South Platte and Arkansas rivers and in the plains portion of the eastern part of the county. Logan County is third in numbers with fifteen, nine of which serve as branches of the Logan County High School.

Rio Grande County surpasses all others in the per cent of its children that attend consolidated schools. This county has consolidated all of its rural schools, except two with a combined enrolment of thirty, into four of our largest and finest consolidated schools. Approximately 99 per cent of all the children in Rio Grande County attend completely graded consolidated schools with four-year accredited high schools—a record that perhaps cannot be equaled by any other county in the United States.

These are a few examples of the wonderful results already achieved by our consolidation campaign. The rest of my time will be taken in showing three reels of moving pictures of some of our finest consolidated schools.

EDUCATION IN ITS PROPER ENVIRONMENT

MARY E. SABIN, PRINCIPAL OF THE CHAZY CONSOLIDATED RURAL SCHOOL,
CHAZY, NEW YORK

In the extreme northeastern part of New York State, only a few miles from the Canadian border, in the broad valley of Lake Champlain, is the little village of Chazy. Here in this remote region is located, through the generosity of a big-hearted man, probably the most wonderful rural school in America. This school is the expression of an ideal which grew in this man's mind for many years—an ideal of service, of self-sacrifice, of untiring effort, of steadfast purpose to provide for the country children of this locality educational opportunities equal to those enjoyed by their more fortunate brothers and sisters in the city. He saw clearly and has never allowed himself to forget that the only hope for America's future is in the education of its young people and that over half of these are country boys and girls.

Americans are often criticised as seeking only wealth and industrial and commercial efficiency. But when wealth is poured out to secure for every child in America the educational advantages that should be his, and when all the wonders wrought by modern science in its applications to the mechanisms of life are drawn upon to surround young people with opportunities and experiences, are not these material appliances filled with a deeper meaning and is not matter really transmuted into mind and soul?

All this has happened in Chazy. The building and equipment are the best that thoughtful care and painstaking attention to detail can make them. Expense has not been a primary consideration. The growth of the school has not been hampered by restrictions imposed by reluctant taxpayers or by calculating board members with political ends in view. If the future stability of the country depends upon education, then it also depends upon the multiplication of schools like this in every countryside. There are few men like the one mentioned, willing and eager to devote time and money, to make personal sacrifice in order to give this great boon to their communities, but there are in most places—even in rural sections—two or three men, or a group of men, who working together could make such a gift if once they could be induced to see the wonderful results possible from such an investment and if they could be given a taste of the deep and satisfying pleasure that comes from the happy gratitude of little children. Such a gift, unrestricted in its use, added to the amount regularly raised by taxation in a consolidated district, would secure the building and equipment, not equal to that in Chazy perhaps, but infinitely superior to what is now offered in the little one-room country schools.

Two things are necessary to make a school a success. When buildings have been built and equipped in the best manner that the contributory community can afford, the work is only half done. Now must be secured and welded into a unity, the group of well-trained, earnest, devoted teachers, who are to make use of what has been provided. There are thirty-

two teachers in the corps of the Chazy School, an enthusiastic, coöperative group. Those who visit the school and comment on one or another feature of it are always told that what is being done there is possible anywhere else. All that is needed is a clear vision of the ideal school, a willingness to sink self in service and a generous spirit of coöperation. What seem like miracles are possible when people work together to make an ideal come true, without thought of self-aggrandizement, with joy in the work because it is worthwhile, and with some little realization of the fact that if such opportunities could be made the heritage of every child the whole world would be revolutionized.

In the past, experienced teachers have been reluctant to take rural positions. This is true no longer in consolidated schools like the one at Chazy. With excellent salaries comparing favorably with those offered in large cities, with a well-organized and progressive school system where coöperation and harmony are the rule, with opportunities for professional and cultural advancement offered under the auspices of the school, and last, but not least, a place to live which is both comfortable and homelike, with an opportunity for congenial social life, teachers are eager to secure positions in the school and anxious to retain them.

Much could be said about the building with its period rooms; its auditorium seating one thousand people and containing a pipe organ, a Simplex motion-picture machine, and a well-equipped stage; the two swimming pools, the suite of rooms devoted to Health Service, the laboratories, the music room, the library, and the laundry. All afford much interest to the visitor and are worthy of description, but perhaps a better idea of them can be obtained from the school film than it is possible to give in words. Certain activities should be mentioned, however, which it is difficult to portray by means of pictures.

The school was organized at first on the usual 8-4 plan. That is being gradually changed into the more modern and satisfactory 6-3-3 arrangement. The elementary course of study is enriched in many ways. Music, drawing and hand work, project work in agriculture, elementary science, poem and picture study, swimming and gymnasium floor work, shop and household arts—all find a place in its elastic plan. In Junior and Senior High School the most important courses offered, since this is a rural neighborhood, are the Agricultural, the Industrial Arts, and the Household Arts Courses. The school film will make plain the emphasis placed on these subjects. Every means is used to render this work attractive and profitable and to impress its practical value upon young people, most of whom will spend their lives in the country.

Many people assert that the work of the rural school should be kept distinctly vocational in character; that country children should be trained specifically to be farmers and home makers. It may be recalled that in a set of resolutions formulated by the Department of Rural Education at the Atlantic City meeting, this sentence occurs: "We stress the importance of a rural-school curriculum, broad in its social content, rich in its cultural

resources” The Chazy School is a hearty endorsement of that statement. Music is one of the most cultural subjects, and much attention is given to it throughout the elementary and the high school. Another vital cultural influence is found in the school library. Every child has a library period once each week. A love of books is inculcated and books to love are placed within easy reach. Will not rural life be freed from its loneliness and isolation when books and music are an intimate part of the life of each family?

The evenings have ceased to be empty in the little country homes since the Chazy School opened. Here is the son with his 'cello or flute, the young daughter with her school violin, and perhaps, as is the case in several families, an older sister who is taking piano lessons in the school studio and can accompany the others; around the table are the younger children with books brought from the school library, which even grandmother is reported to enjoy. The children are fresh and rosy with health for they have been in the school pool today and have had a hot and nourishing lunch in the school dining-room. The father is interested in the report brought back from the school on the milk sample submitted for testing. The making over of a dress for some member of the family is made easier by the advice given by the Household Arts teacher. Even the little one whose weight is below normal is being helped by the nutrition work carried on by the school nurse. There are evenings when all the family go in one of the big school busses, which is driven at night free of cost by the bus driver as his community service, to the school auditorium to listen to the big organ, to see motion pictures, to attend evening classes, or, as was done a week ago, to hear the recital given by the senior orchestra, composed of fifty young people ranging from the fifth grade through high school. More than nine hundred fathers, mothers, and interested friends filled the auditorium while their children gave a program of which any adult orchestra might be proud.

The little one-room country school cannot disappear for many years, if it ever entirely does, but that fact should not prevent our earnestly striving to give to as many country children as possible the greater advantages of consolidated schools like the one at Chazy. That every child shall receive these benefits is but simple justice. Fortunate indeed will be the country child who adds to all that he inherits of those God-given gifts, fresh air, health, the beauties of nature, the greatest gift that man can bestow, a good education.

You do not need to be converted to this belief. The people back home are the ones. This picture will convince them of the desirability of such a school. Facts and figures will convince them of its possibility. A vigorous campaign conducted by enthusiastic and courageous teachers supplemented by the showing of such a film as this must arouse any doubting community to believe that education in its proper environment is the heritage of every American child. Surely that community will be animated by a spirit of emulation to aid you to make the Chazy Central Rural School a dream come true in every section of this land.

A RURAL TEACHERS' PLATTSBURG

AUGUSTUS O. THOMAS, STATE SUPERINTENDENT OF PUBLIC SCHOOLS,
AUGUSTA, MAINE

Unless we can solve the rural-school problems within the next ten years and give the boys and girls of the farm a square deal in education, we had about as well turn over the food producing resources of America to a peasantry content to live without educational facilities, culture, and refinement. The farm is the greatest surety bond of the nation.

Today a young man and his wife will not go into the country willingly for a career, knowing if they bring up a family they shall not be able to give their children the right sort of educational advantages. When we can make our country schools as good as the city schools, we shall be able to conserve the best life of the Nation.

In the early days of our country there were a number of pioneers, the log cabin, the ox team, the scythe, and the little old neighborhood school. The log cabin has given place to the modern homes which dot our land. The ox team has given place to the automobile and airplane. The scythe has given place to modern machinery, but the fourth pioneer is still with us.

There are communities which have begun to solve in reasonably satisfactory measure this difficult problem, but there is no reason why it may not be solved universally. Consolidated schools, standardization with properly trained teachers will revolutionize rural school interests in most localities.

If we make the country school as good as the city school we must have a new type of building, we must have gymnasiums, libraries, agricultural museums, art rooms, music rooms, shops, laboratories, and diversified courses of study. In the consolidated school the welfare of the children must be conserved by adequate facilities for transportation.

Maine is undertaking to solve the problem. Our initial effect is with the teacher. The legislature has given us a special fund which enables the commissioner of education to select one hundred outstanding teachers who meet the standards set up and place them in special training for rural leadership. Three classes have already been trained. They know country life conditions, they know the language of the farm, they know the progress of rural school improvement. These teachers have all of their expenses of transportation and board paid while in training. They are hired by the towns to teach the school, and at the end of the year the State gives them a bonus of 25 per cent of the salary they have earned during the year. We have teachers who are drawing \$1700 a year for country school teaching. They are revolutionizing sentiment and working miracles in their localities.

We can solve the rural problem, but we need the elixir of life. Maine needs five million dollars to build her country schools and the rest of the states a proportionate amount. That amount judiciously expended for equipment would make the country schools as good as the city. But the time will come when we shall spend as much money for a schoolhouse as

for a machine gun, as much for a teacher's salary as it costs to discharge one, as much for a school system as it costs to build a battle ship.

THE TEACHERS' INSTITUTE AS AN AGENCY FOR TRAINING TEACHERS IN SERVICE

GEORGINA LOMMEN, UNIVERSITY OF MINNESOTA, ST. PAUL, MINNESOTA

Historical sketch—The Teachers' Institute as an organized agency for training teachers in service is distinctly an American institution. It was founded by the early advocate of educational democracy, Henry Barnard, who has aptly been called the Nestor of American Education. As a training agency its appearance was simultaneous with that of the first normal schools of the Nation. Mr. Barnard had implicit confidence in the worth of the institute and counted no professional or personal sacrifice too great for the success of his experiment, even to the extent of personally financing the organization in its early history when the legislature failed to respond to his requests for appropriations for its maintenance and extension.

Stated in Mr. Barnard's own words, quoted from his delightful educational journals, the original purpose of the institute was to provide opportunity for review of the common subjects, to give acquaintance with successful methods of teaching and school management, and to stimulate teachers to self-improvement. In its concept, then, the teachers' institute aimed to serve the individual teachers as abbreviated professional training courses.

Mr. Barnard's successful efforts in Connecticut prompted Horace Mann to establish the institute in the commonwealth of Massachusetts, and later Mr. Barnard carried the plan to Rhode Island when he became the chief educational administrator of that State.

Two unique features stand out in the Rhode Island plan. Mr. William G. Baker, a successful teacher, was employed by Mr. Barnard to conduct a demonstration school for the institutes of the State, which he accomplished by moving his school of twelve pupils about from place to place in a covered wagon. From this incident it appears that demonstration teaching and supervised observation are the professional innovations of another generation than our own. Mr. Barnard planned, moreover, to disseminate educational publicity through the joint meeting of citizens and teachers at the evening sessions of the institutes. Educational tracts and essays intended to rouse the public mind to the necessity for State-supported school systems, as opposed to the rapidly developing system of parochial and private schools, were distributed and discussed at these meetings. There is an element of democracy in this early practice of taking the public into the confidence of teachers and administrators which is full of possibilities for this day when we are asking ways and means of further democratizing the cause of public education.

During the present decade general dissatisfaction has been expressed with

the purpose, the conduct, and the lack of practical bearing upon results in classroom practice on the part of the teachers' institutes. It is urged by those who express this dissatisfaction that the agency is an anachronism which has been displaced by the more adequate professional training provided by normal schools and later by expert supervision in the several States. However, with one half of the Nation's teachers equipped with less than a four-year high-school course, one tenth of the rural teachers having nothing more than the completion of the eighth grade, but two per cent of them normal school graduates, and only one tenth of one per cent with special training for rural teaching, this argument against the necessity for the continuance of the institute is not valid at this time.

It is true that in many sections of the country county and local administrators accept the limited possibilities of training offered by any "short-cut" scheme as a substitute for the longer terms of more adequate training; it is true that many institute programs are haphazard, lacking in purpose, content, and method; that too often it requires no responsibility for participation on the part of the teachers in attendance; and that very often the content and method are stronger on the side of didactics, entertainment, and educational stimulation than in information of a truly professional character. All of these criticisms are valid, but the responsibility for these weaknesses should be placed upon unprogressive administration, not upon the institute per se.

These well-deserved criticisms have succeeded to the extent of placing the teachers' institute as an in-service training agency on the professional firing line. With these conditions in mind the following study of the institute was undertaken in the hope that its inadequacies might be revealed, its worth vindicated, and its real evaluation in terms of professional service might be determined.

The study reported in this discussion is based on the information received in response to inquiries sent to the chief educational administrator in each State. The response was unusually hearty, an indication that educators are beginning to assume the responsibility for coöperative effort in attempts to evaluate educational practices. This generosity in response makes the report as fairly representative as it is possible to make such a study, forty-seven States having kindly forwarded reports on the information requested.

THE ADMINISTRATION OF THE TEACHERS' INSTITUTE

Legal status—It is interesting to note at the outset that in spite of the rather wide-spread dissatisfaction with the agency as it now serves, the institute is still continued in some form in forty-four States. Of the entire number of States reporting, thirty report its maintenance *by law*, eight States *recommend* its support by law; four States are *authorized* by law to employ the institute in effort to improve the profession within the State; and three States no longer maintain the institute as a type of teacher-training agency.

Terms employed to designate the agency—In the form of inquiry submitted to the States the following list of terms were suggested as covering the possible types of teachers' organizations and meetings: Teachers' Institute, Teachers' Conference, Teachers' Convention, Teachers' Meeting, Teachers' Short Course, and Teachers' Training School. This list was intended to cover all forms of organization where elementary teachers, supervisors, and administrators convene for more than a day to consider questions of professional interest and to receive stimulus to professional advancement. The replies indicate that twenty-eight States still utilize the original term as used by Henry Barnard and Horace Mann, Teachers' Institute; six States reported a preference for Teachers' Association; four use the term Teachers' Meeting; and three States designate the organization as the Teachers' Conference. One State, only, reported the term Teachers' Convention.

Units of administration—The county unit of organization and administration is the most common form, being employed in thirty-four States, three States employ township units for meeting and administration, five States maintain only the annual State convention of teachers, one State alternates district (or State) meetings in the odd-numbered years with the State-wide meeting in the even-numbered years, and one State employs the State sectional meeting.

Attendance—Of the thirty States requiring institutes *by law*, twenty-six require attendance on the part of teachers, and of the eight States recommending the institute as a worthy agency, three require the attendance of all teachers for certification and renewal of certificates. In thirteen States teachers are permitted to exercise volition with regard to attendance.

Character of programs—In a day of extreme specialization and departmentalization of the teaching practice it is to be expected that the character of work provided by the institute program will be of a differentiated nature if it is intended to serve as more than an opportunity for social integration, but the reports indicate that of the entire group only sixteen States provide differentiated programs for the trained and untrained attendants; in all other States only programs of a general character and interest prevail. It appears, then, that this practice justifies one of the current objections made to one phase of the institute conduct. It is ever difficult to enlist the sustained interest and attention of teachers to a prolonged meeting based on generalizations. The educational field is so weighted with specific problems requiring attack that it would seem easy to meet one of the objections commonly made to the character of the institute program by making provision for the consideration of problems of a more special nature for at least a half session each day. It may not, however, be amiss at this point to urge the greater democratization of elementary teaching through the joint meeting of grade and rural teachers in a coöperative deliberation of the problems common to the Nation's elementary schools at large, regardless of urban versus rural situations. We need concerted effort to obliterate the social cleavages drawn even in the teaching profession; the

welfare of the profession depends now upon the elimination of lines of differentiation in professional as well as in social status.

Maintenance of institutes—Among the various plans for financing these professional gatherings, eleven State departments maintain the entire expense of their promotion; five States require the teachers of the State to defray the expense of instruction by payment of fees for this purpose and by the utilization of portions of certification fees; six States maintain the cost of these training agencies by county board appropriations; eighteen States combine support from the State departments of education, county board appropriations, and teachers' fees.

Instructional staff—The corps of instructors are enlisted from all possible sources of professional talent; State universities and colleges, privately endowed colleges, State normal schools, high-school superintendents, local supervisors, and demonstration teachers. Of the entire number of States but eight require particular qualification and fitness for the service other than success in teaching. Five States report *careful selection* of instructors from the practical field, and eight States delegate the entire responsibility for choice of instructors to the initiative of the county superintendents.

As a correlative agency engaged in the professional training of teachers, it was expected that a high degree of coöperation would be shown between the State normal schools and the county superintendents in their contingent territory, but the replies show that just one half of the States make *no* effort to coördinate the interests of the teachers in the field with those of the nearest institution engaged in the special task of creating teaching ability. Herein lies a serious defect. No educational agency in the State should be so sensitive to the immediate needs of teachers in the service as should be the State normal schools. It is a serious criticism of any normal school to be so engrossed in its internal problems as to neglect its professional opportunity to extend generously its best contributions to the communities which are ultimately to become its field of support and patronage.

Place of the educational expert in the teachers' institute—The annual local institute is an excellent opportunity for the educational expert's contribution to the solution of practical educational and social problems. With reports, interpretation, and discussion of the current investigations in the field of educational science, the expert may find a fruitful field from which to enlist allies and aides for the problems of experimentation and investigation. One of the most potent justifications for the annual local convention of teachers lies just in the opportunity which it provides to acquaint teachers in service with the year's development in the field of educational research and professional advancement. Much benefit may come from providing on each institute program a place for the stimulation of interest, even in the rural schools, in problems of experimentation and investigation as a result of sympathetic understanding of what the educational experts are purposing and effecting.

Preparation of corps for schedule—To the end that instruction in the institutes may be selective and of sufficient uniformity to integrate the out-

standing educational needs of the State, seven States maintain preliminary schools of instruction for the instructional staff preceding the opening of the institute sessions. At this time State policies are formulated, instructional abilities of the staff are carefully organized, and they are assigned to best meet the assortment of local needs as indicated by county superintendents or teachers' committees. This plan commends itself as an immediate facility for improving the quality of instruction afforded by the agency, and it is to be hoped that its merits may be extended to a large number of States.

Conductors—Thirteen States report the local county superintendent of schools conductor of the county institute. This presupposes the qualification of educational scholarship and power to provide professional stimulation; eighteen States report the employment of high-priced conductors not always chosen on merits of professional ability and real contribution to the service.

Salaries—There is much to be said in favor of the leadership of local administrators, supervisors, and successful teachers, as opposed to the employment of silver-tongued enthusiasts from afar. The high salaries paid these officials could often be more wisely spent in the engagement of successful teachers and supervisors who are really making progress in particular fields. Among the salaries reported for institute conductors the range lies between \$10 and \$60 per day, while the range for instructors lies between \$50 and \$100 per week; the discrepancy is manifestly unprofessional.

Cost of institutes—The cost item of the institutes has been irregularly reported, and it is difficult to estimate even approximately. A few of the outstanding responses only can be included in this brief report. The State of Georgia employs five full-time supervisors at an annual salary of \$3000 each, with five assistants at \$1500 each, who devote their entire time to institute instruction and supervision; Arizona appropriates \$500 per county for defraying the institute costs; Indiana estimates the aggregate annual cost of institutes to the State in instructional salaries and teachers' wages while in attendance approximately \$265,000, an expenditure that merits results in educational progress. Cook county, Illinois, has substituted community educational campaigns for institutes of the older type, as a stimulation to teachers and the public. One hundred sixty-five community moonlight meetings were held the first week in October, 1920, with P. P. Claxton, F. G. Blair, and A. E. Winship in attendance for the entire circuit of meetings. The estimated cost of this effort to provide impetus to the common schools was \$84,600.

Thirteen States reported amounts equal to and in excess of \$10,000 annually expended for the promotion of teachers' institutes. Any educational agency involving so large an expenditure of capital must assuredly render unmistakable returns on investment or properly be delegated to the professional discard.

Season of institutes—Twenty-two States confine their sessions to the fall

season, from September to December; nine States have summer sessions usually provided for in connection with summer sessions of the normal schools; one State conducts spring and fall sessions; and one State conducts winter sessions in January and February. The most common length of session reported was from three to five days (twenty-eight States); five States maintain 10-20 day sessions; and eight States hold sessions of but one or two days. The months of August and September were reported as the most favorable time in which to secure expert representatives from the leading educational institutions and as the season least interfering with school attendance.

State versus local direction—Twelve State departments report the formulation of the institute programs in the State office and their application uniformly throughout the State; twenty-one State departments solicit and prefer suggestions from county superintendents and supervisors as to local needs. Only four of the entire number reporting make provision for progressive units of work arranged on the rotation plan and covering several seasons. Intensive work on one or two subjects for one year, with a careful comparison and checking of results in the follow-up work, has much to commend its consideration and is a present deficiency of the institute work which needs constructive attack. The three-year schedule of one State concentrated effort on geography, nature study, and their allied arts during the first year; the second year's institutes spent their entire time on history, civics, and health; and the third year was given over to English and penmanship. This plan effectively meets the criticism so often advanced, lack of unity and singleness of purpose in the character of programs provided for experienced teachers especially.

Supervision of institute sessions—Sixteen State departments report some sort of supervision of work done in the institutes. Perhaps in this very lack of leadership and supervision lies one of the serious causes of the institute's failure to function in the classrooms. Intelligent and coöperative supervision could do much to obviate the current criticisms of inadaptability of instruction, failure to meet local needs, lack of organization, and the absence of professional growth.

DISTRIBUTION OF DEMAND FOR INSTITUTES

	In States Requiring Institute by Law	In States Recommending Institute by Law	In States Authorizing Institute by Law	Total
Demand steady -----	12	1	2	15
Demand decreasing -----	8	2	--	10
Demand increasing -----	8	5	2	15

It is most interesting to note after the above summary of facts the psychological frame of mind toward the institute on the part of those responsible for the reports. Of the States requiring the institute by law, eight States report the demand increasing, and eight States report the de-

mand decreasing. In the group of States making the agency possible by law, one State reports the demand steady, five report the demand increasing, and two report the demand as decreasing. These facts indicate the teachers' institute as a training agency of steadily increasing serviceability, a very surprising report in the face of currently expressed criticisms.

Teacher participation—In response to the inquiries as to the character and the degree of teacher initiative and participation in the conduct of the institute, the investigation bears out a justification for one of the most fundamental criticisms of the present institute work—namely, that teacher participation in the definition of aims, purposes, activities, and achievements has been of minor character. Eight States report participation on the part of local teachers in the consideration of time and place of meeting and in the suggestion of problems for attack. Seven States indicate that local teachers have opportunity to express a choice as to instructors and the nature of the problems to be considered; thirteen States report some form of committee activity of a sort, but no State specifies the organization of committees for the investigation of curriculum problems, the standardization of materials and methods, interpretation of standard test and measurement results or consideration of the professional problems. The vital above problems makes them worthy of intensive consideration and the character of the above problems makes them worthy of intensive consideration by the teachers themselves as the agents most intimately concerned with their adoption and development. Obviously, the absence of teacher responsibility and participation in these respects has greatly affected the desultory application of the fundamental principles developed during the session, for from few sources did we receive commendable reports on the character and quality of follow-up results of the institute work.

Twenty-five States reported some demonstration teaching in the institute by local teachers, which is a most encouraging type of local initiative. Teacher contributions to entertainment features of the program and to exhibitions of local school products were the most generally reported forms of participation.

DISTRIBUTION OF FREQUENCIES IN TYPE OF TEACHER INITIATIVE AND PARTICIPATION IN INSTITUTE ACTIVITIES

Assistance in preparation of program.....	13
Choice of time and place of session.....	8
Choice of instructors.....	7
Discussion of problems involved in program.....	7
Demonstration teaching	25
Entry and exhibit of school work.....	25
Entertainment of institute attendants.....	28
Committee organization [functions not specified].....	13
Committee investigation and reports on curriculum and standardization..	0

The need for educational publicity was never greater than at the present time when new social policies are in the shaping. Yet the inquiry concern-

ing the convention of school officers and parent associations in conjunction with the teachers' institute brought a distinctly negative reply. Eleven States, only, provide for joint meetings of teachers, parents, and school officers once during the year, preferably at the time of the institute session; thirty-four States have made no effort to this effect, but thirty-six States enthusiastically affirmed the feasibility and the possible advantages of such coöperative meeting annually. We need concerted good-will, sympathetic understanding, and joint action on the part of all the patrons and citizens interested in the welfare of the cause of common education in America.

Functions of institute rated—The study made provision for securing a definition of the fundamental character of the work now being undertaken by the institutes. The comparative ratings of the six most commonly accepted functions rated by forty State administrations arrange themselves in the following descending evaluations: (1) To give instructions in methods of teaching; (2) to inspire professional idealism; (3) to develop *esprit de corps*; (4) to provide local administrative and supervisory forces with opportunity to promote and unify local plans for the educational program of the year; (5) to acquaint the local teaching body with the progressive tendencies in elementary education as shown by the scientific investigation of educational leaders; and (6) to give instruction in subject matter.

TABLE I—*Functional Distribution Scale*

	1	2	3	4	5	6	Mid-score
1. Instruction in subject matter.....	3	3	5	2	2	14	5.5
2. Instruction in special methods.....	9	10	5	3	5	1	2.0
3. Unification of administrative and supervisory plans.....	7	5	7	6	4	2	3.0
4. Development of <i>esprit de corps</i>	6	10	6	3	6	1	2.5
5. Acquainting teachers with results of scientific progress in education.....	0	5	4	6	7	5	4.5
6. Inspiration of professional idealism.....	12	4	7	6	4	1	2.0

It is interesting to observe that, with the exception of the emphasis given to instruction in special methods of teaching, the original functions of the institute—namely, of actual instruction in subject matter and stimulation to self-improvement, have given way to the more ephemeral functions of inspiring to idealism and development of *esprit de corps*. Granted that professional idealism and *esprit de corps* are prime essentials in any program for educational progress, the comparatively high value set upon their functional character clearly affords a justification for one of the most outstanding criticisms of the present organization of the teachers' institute: its failure to function in practical results in the classroom.

Constructive suggestions—Among the vital suggestions offered for the

improvement of the institute, none appear more important than one calling for the reorganization of the type from that of the Chautauqua to one more nearly resembling a school of investigation and study of local needs and problems. Corresponding to this suggestion for reorganization of type is that of making the occasion a time and place to federate professional and civic interests for the definition of local educational problems, discussions of possible solutions, and for practical standardization of results.

The brevity of the present institute sessions, from three to five days in most of the States, and its inherent lack of organization for attack on real problems of local character, permit an attitude of non-participating passivity on the part of teachers which too often precludes the hope of productive returns from the session in actual schoolroom practice. Its present tendency to operate on a level of inspirational and emotional appeal does not guarantee intensive follow-up attacks on problems of classroom instruction and management.

The institute should assume the function of organizing local teacher initiative for more purposeful attention and effort on curriculum building, consideration of the more vitalized methods of teaching, such as the problem and project methods, and the extension of possibilities for professional growth through organization of local groups for study and the discussion of specific problems.

In the concluding query as to whether the teachers' institute as an in-service training agency is worthy of continuation and on the whole professionally justified, thirty-two State administrators responded affirmatively and seven responded negatively. This proportion would indicate that the institution still maintains some element of service to the profession. The heavy draft made upon the teaching force in the time of war has seriously delayed the day of higher standards of professional qualifications for rural and elementary teachers everywhere, and the necessity for continuation of the institute as a temporary in-service training agency, however inadequate, is evidenced above.

A STATE PROGRAM OF INSTRUCTIONAL SUPERVISION

JOHN M. FOOTE, STATE SUPERVISOR RURAL AND ELEMENTARY SCHOOLS
FOR LOUISIANA, BATON ROUGE, LOUISIANA

Under the leadership of the State Department of Education, Louisiana is now inaugurating and executing a program of instructional supervision. The movement had its beginning several years ago, but only within the last three years has it made definite progress. The great majority of the supervisory officers and teachers are now taking part. A brief statement of the purposes of the program, the activities which it embraces, and the means by which results are being insured may be of service to those who are daily confronted with problems that arise out of supervision. The importance

of formulating such a program for the guidance of supervisory officers and teachers cannot be too strongly emphasized.

ADMINISTRATIVE AND INSTRUCTIONAL SUPERVISION DISTINGUISHED

There are two kinds of supervision commonly practiced over the country; first, that which is primarily administrative in character, and second, that which has to do with instruction. The first provides the facilities for education, exercises general control over the school system, and sees to it that the schools operate under reasonably favorable conditions. The second is concerned directly with the teaching performance and the conditions affecting it. It deals with teachers, pupils, the course of study, and the activities that grow out of the classroom work. The purpose is to improve instruction. Administrative supervision is as old as American education; instructional supervision is yet in its infancy. The first has well-developed standards of excellence, while the second is still in the formative stage. Administrative supervision usually receives attention because it is more obvious, is easier to execute, and is more spectacular. Instructional supervision is more specific, requires more intensive study, greater technical skill, and a more intimate knowledge of child life, of subject matter, and of instruction.

INSTRUCTIONAL SUPERVISION

Purpose—It is recognized that the purpose of instructional supervision is to secure efficient results in the classroom. The realization of this aim requires (1) the maintenance of standards of instruction on a level with the best prevailing practice; (2) such interpretation and application of the course of study as will insure to every pupil the opportunity of securing a well-balanced education; (3) directing the work of teachers so as to carry out the educational policies adopted by the school board and the superintendent; (4) providing opportunities for the further education and professional growth of teachers in service. Success in the attainment of these essentials depends upon the supervisor doing three things: (1) Becoming a thorough student of subject-matter, methods of teaching, and classroom requirements; (2) centering his work around the teaching performance; and (3) recognizing that he exists solely for the benefit of the teachers and pupils under his direction.

The coöperation of teachers—The first important objective in instructional supervision is the enlisting of the hearty coöperation of the teaching staff. A sympathetic, intelligent, and helpful attitude is absolutely essential for success. Sympathetic understanding and wholesome coöperation must prevail on both sides. Teachers should be led to realize at the outset that the supervisor visits the schools for the purpose of helping the teachers and that the interests both of teachers and supervisors are identical—namely, the improvement of classroom instruction. The supervisor makes his contribution to the education of the children mainly through the teachers and should enter freely and sympathetically into their daily problems so that the

combined efforts of teachers and supervisors will prove effective. The entering wedge that will secure the enthusiastic coöperation of the coldest and most indifferent teacher is the actual teaching of the class, the giving of a test, or the engaging in some live schoolroom activity by the supervisor who will then invite the teacher, after the dismissal of the pupils, to enter into a discussion of the particular objects attempted in the classroom. When a spirit of mutual understanding and effective coöperation has been established between supervisor and teacher in the instruction of children then, and only then, can substantial results in instructional supervision be accomplished.

The course of study—Responsibility for interpreting and applying the course of study so as to satisfy the needs of the children being educated devolves upon the supervisor. He is to some extent responsible for the organization of the course of study. Assuming that the course is a sound educational document, that it contains materials and methods of instruction in keeping with the best thought and practice of modern authorities, and that the references for teachers and children are carefully selected, it becomes at once a most valuable instrument for use as a basis for supervision.

Supervision on an objective plane—Scientific studies in education have progressed far enough for supervision to be raised from the realm of opinion and casual observation to the plane of objective measurement. Instructional supervision can at least be based on the results of educational and mental tests, supplemented by age-grade studies. The first factor determines the results of instruction in comparison with established standards, diagnoses class and individual needs, and may be used to determine the value of particular methods of procedure; the second ascertains the mental age which may be used as a means of determining the promotion and classification of pupils; and the third shows the rate of progress of pupils through the grades in comparison with the expected progress. It is essential that supervisory officers measure the efficiency of their schools in terms of known standards. In doing this the results of the achievement tests and the age-grade data are the two most significant factors.

The recitation period—The time-honored recitation characterized by multitudinous questions, brief or monosyllabic answers, and meager preparation by the teacher must yield to the review-assignment-study-test recitation. This type of recitation places emphasis on very definite assignments, directed study, and testing to determine whether the lesson assigned has been mastered or not. The recitation period should be a learning period.

Demonstration teaching—The supervisor is expected to become thoroughly familiar first, with the content and organization of the several subjects taught, and second, with the best prevailing practice in teaching these subjects. With this background he should proceed to give in the presence of teachers demonstration lessons. These lessons should illustrate the organization of the material and the best methods of presenting it. No other activity is so effective in developing in the teaching staff the teaching procedure desired by the supervisor. It is not necessary that such lessons

be model or perfect, but they should be carefully planned and should demonstrate the use of well-organized material presented in accordance with the proper methods of teaching that apply to the subject taught.

Teachers' meetings—The county institute or group meeting of teachers is a means of improving teachers in service that has been commonly used for many years. Its effectiveness has been very much lessened because of the emphasis upon theoretical discussions too far removed from the actual teaching process. A marked change is taking place in the programs of the teachers' meetings. The "high brow" academic, stilted type is being supplanted by the kind that centers around the material to be taught and the best method of presenting it. For example, a two-day institute may devote practically all of its time to the subject of reading, another to supervised or directed study, another to spelling, and so on. Such meetings are now the rule. Teachers fully approve programs of this kind, because they offer definite help in doing better teaching. The teachers' institute when so conducted becomes an effective means for improving instruction.

Directed reading—The supervisor may make a valuable contribution to his primary purpose by directing the reading and study of his staff along the lines that bear directly on his program for supervision. To do this successfully, requires more than a professional library in the superintendent's office and carefully prepared bibliographies. These are necessary, it is true, but the need of self-improvement through directed reading must be brought closer home to the teachers. Raise questions that must be answered. Create situations that require reading before they can be solved. Occasionally tell a teacher frankly her method or practice is erroneous and then tell her where to find a full treatment of the subject, or, better still, place a book or magazine directly in her hands giving the necessary information. Teachers will study and read when they are placed in situations that demand help; otherwise, the majority will not. The need of such activity by the teacher must arise from the work of the supervisor. Many of our supervisory officers are proceeding as here suggested with splendid results.

Judging the teaching staff—Judging the members of the teaching staff is one of the difficult responsibilities devolving upon the supervisor. So far no emphasis has been placed upon any objective means of arriving at judgments. Training, education, growth, personality, conduct, general teaching ability, et cetera, have been and are still the factors that govern in forming this judgment. Score cards and the measured results of instruction have been used to a limited extent as a basis for judging teachers. While fully recognizing the merits of score cards and educational tests we must raise serious questions as to the advisability of using either or both for judging teachers. Any supervisor who does so systematically will have but little time for more urgent duties. Educational tests should be used to measure the achievement of pupils, teaching situations, and the like. Their use as a measure of teachers would interfere seriously with this primary purpose.

These principles and activities constitute the State program of instructional supervision adopted for guidance in 1919. Under the direction of the State Department of Education, these factors have been emphasized during this period. Fortunately, our school machinery is centralized in two units, the parish and the State. This is a condition that admits of the adoption and rapid execution of any educational program that may be agreed upon.

Summary of accomplishments—Summarizing the accomplishments in terms of the activities employed, they may be pointed out as follows:

1. Teachers and supervisory officers coöperate fully.
2. A new course of study has been prepared and is in use. In this work supervisors and many teachers took part according to their abilities. It represents an effort to place in the hands of teachers a document containing the best material, method, and bibliographies bearing upon the several subjects taught.
3. The effort to place supervision on an objective basis has progressed to such a point that supervisory officers hesitate to talk of the accomplishments of their schools in terms of personal judgment. Instead, they refer to the standing of their schools as measured by this or that test. Tests are now commonly used over the State to measure classroom results. Educational and mental tests must be given high rank in our plan for supervising schools. Nothing is quite so stimulating as an interpretation of the results of a test. It places the teacher and pupils in a situation where excuses are useless—as a result, they work zealously to meet the objective standard set.
4. No activity in the schools is bringing such pronounced results in the improvement of instruction as the demonstration of good teaching through demonstration lessons. Under the leadership of the members of the Department of Education, many of the supervisory officers over the State are now giving demonstration lessons in the presence of teachers. Such lessons are carefully planned and usually represent sound pedagogy and well-organized material. Our experience proves that the demonstration lesson is effective in breaking down the barriers of suspicion and prejudice often exhibited by teachers. It commands respect and attention, it wins sympathy and confidence. It invites the teachers to join in constructive criticisms; it stimulates and directs them into a more thorough study of the problems they are constantly meeting.
5. The inspirational, theoretical, “salt-and-pepper” institute has been supplanted by the type whose programs are built around the materials and methods of the several subjects taught.
6. Under the stimulus of this program and the suggestion of selected bibliographies, supervisory officers are now readers of several of the best National journals and many of the best books of recent publication. Many teachers are following their lead.
7. Supervisory officers are not encouraged to use any objective method

in judging teachers. The time may come later when methods of this kind can be recommended.

Who are the supervisory officers and why can the educational forces of a whole State become actively engaged in the execution of a program in so short a time? First, the leadership of the State Superintendent is wise and forceful and his assistants are very active in field work over the entire State in carrying out the policies of the Department. Second, the parish superintendents and supervisors, a competent, trained group of school people, have accepted the program and are energetically and enthusiastically engaged in its execution.

Experience has demonstrated that organizing and presenting a program for the guidance of the school interests is essential to the success of instructional supervision on a State-wide basis. A supervisor without a program has no point of departure and no destination.

TRAINING SUPERVISORS FOR RURAL SCHOOLS

W. S. DAKIN, REGIONAL SUPERVISOR, HARTFORD, CONNECTICUT

The history and present status of supervision training can be disposed of in a few words. A study of conditions and facilities in leading educational training institutions throughout the country indicates that beyond a few elective courses in supervision no concerted effort to train for rural school work is being made. One school director even disputes the need for such training in view of the fact that the consolidated school is absorbing the one-room districts. Another director states that politically chosen county superintendents have no interest in special training.

That there is no demand for this training must be admitted, but knowing that there are 200,000 one-room schools it must be likewise admitted that not in one generation will their elimination be effected. The problem facing us today is not that of discussing specific courses of training, but it is rather to adopt an entirely new policy in our campaigns for rural improvement. Far too long we have sent into the field leaderless squads of high-school girls. These immature young persons we have urged to re-direct community life. We have told them that they must liberalize the rural mind; must discipline refractory youth; teach the farmers' wives to cook and dance; initiate the men into the mystery of crop rotation, and, in general, revolutionize country life.

Safely entrenched behind office desks or college walls we have cheered on these brave young teachers. When they failed, we have reinforced them with more bulletins and pamphlets, but nevertheless our long-distance paper barrage could never take the place of actual leadership in the field. This policy of absentee directorship has failed. We must train and put into the field leaders, women as well as men, who can devote their entire time to the field work. Supervision, service training of teachers, public

education meetings, and conferences must be carried on by properly trained and selected persons in direct contact with parents, teachers, and pupils.

According to the best available statistics there are in our United States something over 400,000 rural and village school teachers. Nearly nine million children attend these schools—two million more than in the city. The most optimistic students of educational affairs dare not affirm that 25 per cent of these teachers are under expert educational supervision. When attempted, supervision in these schools is apt to be but a feeble replica of city organization with its plague of paper-work and super-official direction.

At least 300,000 of these rural teachers then are under no supervision other than the financial and clerical oversight of county **superintendents** and district boards of laymen.

The best city practice seems to require at least one supervising principal for every twenty or thirty-room building. Frequently he is reinforced by a group of special subject supervisors and an assistant superintendent. Imagine these same twenty or thirty rooms separated and isolated over some seventy-five square miles of open country, and one may have a fair idea of the difficulties of supervision in rural communities. Granting, however, that thirty teachers comprise a supervision unit, it will be seen that to direct these 300,000 rural teachers the services of 10,000 supervisors would be needed at once.

To secure candidates and train them is the most urgent problem facing our State education leaders. Propaganda for consolidation, for the elimination of small districts, for higher teachers' salaries, for improvement of buildings, better health conditions, better attendance, must move slowly, if at all, until there is in the field an active force of trained, non-political educational leaders.

Although the law of supply and demand is operative in public education and all other agencies for social improvement, it is sometimes forgotten that the demand frequently must be created. To say that the supply of supervisors will come when there is a demand, and then to sit back and wait will never bring about improvement.

Parents and citizens will not realize that supervision increases a teacher's efficiency twenty to thirty per cent, that it can raise the standard of scholarship and lower the retardation of pupils, that it can in a short time increase the general educational level of a community. Citizens will not believe these things until they are demonstrated, but when once convinced they become loyal supporters of supervision and insist upon having it for their schools. Our experience in New England has shown that the people are quick to appreciate skillful direction of schools after it has been tried in their own districts.

A source of supervision candidates may be found in the rural teaching corps itself. Abundant material exists if the incentive and the means for training are offered. Supervision of schools by college-trained city men and women will seldom be successful. Such a personnel is never permanent. It has no background of experience. It is inclined toward reproduction of city plans.

The training of rural supervisors cannot be left to chance, or to the hit or miss possibilities of elective courses in colleges and summer schools; first, because such methods secure the wrong type of person; second, because such training as may be offered is usually impractical since it is under conditions that preclude the right point of view and adequate practice.

The training of public-school teachers is admittedly a function of the State. Just so, the training of public-school supervisors must be a function of the State. The need is too imperative, the conditions too highly specialized to be left to routine recruiting with no directed training of such officers.

The way to start supervision is to begin. Briefly then, it is recommended that States having a large rural population—and what State has not?—shall start at once an expansion of their rural-school departments and through rural-school inspectors, now usually attached to every State office, select promising candidates and organize courses in field training. When near a university or normal school, extension courses can be utilized and in all instances directed summer courses should be required of beginners.

Commence with small groups of promising men and women candidates, grant them nominal salaries and traveling allowance. Working fields can be secured by offering free supervision to communities electing to accept it. Working agreements may be made through county superintendents or through voluntary associations of school district trustees. In this way small groups of contiguous districts can be secured for supervision practice. Dr. Pittman's experience as described in his "Zone Plan of Supervision" well demonstrates the possibility of supervision under such conditions. Unless the demonstration of supervision is conducted on a plan to permit intensive work, its essential values will not be evident. Far better to have one or two examples of intensive supervision in a county than to have two men acting as assistants to the county superintendent and attempting to spread their services over some two or three hundred schools.

As candidates prove capable, they can be certificated and efforts made to induce adjacent districts to form supervision units. State aid, where possible—as in Massachusetts one half, and in Connecticut, Vermont, and New Hampshire the entire salary—will depend on circumstances. Experience has shown that once a few of these districts have been successfully established and sufficient publicity given to the work many parts of the State will ask for supervision and will be willing to pay for it, thus starting a demand that will soon attract candidates and establish supervision as a constantly growing force for educational betterment.

A further result has been the willingness of towns in supervised areas to seek and support larger and larger State aid appropriations. Aim to equalize rural and city conditions.

Maine with its State-aided, summer trained leaders; New Hampshire with its full-time, State paid, rural supervisors; New Jersey with its full-time, State paid helping teachers, not to mention centralized aid in other States, demonstrate the possibility of extending supervision through central management.

Instead of circular letters from the State superintendent, there can be in the field men who can hold meetings in every little schoolhouse and district. Instead of the annual inspection and inspirational tour of a county superintendent or State inspector there can be house to house canvasses and wayside conferences throughout the year to create sentiment for better teachers, better equipment, and better schools. The rural supervisor in the field—his own field where he is responsible—is the man to create the demand for better things.

So much for the general plan. The training of these supervisors must be almost entirely field work. We must assume, of course, as with teachers, a minimum of general education; let us say a full high-school course, and at least two years of college or two years of normal school, and two or three years experience as a teacher in elementary schools. In many places, the standard may be four years of college. During field training, it has been found desirable to have supervisors take advantage of extension courses at nearby university centers. These extension courses together with the summer training courses should preferably be devoted to: (1) General theory of education; (2) educational psychology including measurement; and (3) economics and sociology.

The field work must be organized and directed by the State department. The best agencies for reaching the supervisor are: (1) Frequent district conferences; (2) carefully prepared circulars dealing with the assigned exercises and prescribed field work, including (*a*) investigation, (*b*) measurement, and (*c*) reports on specific conditions; (3) courses of professional reading varied according to needs and abilities of individual men; and (4) best of all, personal visitation by the State inspector or his agents in which entire days can be spent with the supervisor visiting schools with him, attending his teachers' meetings and committee meetings, planning and holding with him educational rallies for parents and citizens.

When possible, the supervisor should be given some responsibility from the very first. This can be done by assigning to him, under the direction of the inspector, the supervision of a small group of teachers for whom he must plan the meetings, make regular visitations, and write out notes of criticism and direction.

The response of candidates to this training will vary with individuals. A man or woman educated in a rural school and not too far removed from its experience by age, will soon become useful and in a year's time may take almost entire charge of a district. Even in such cases, direction of his work should continue for at least another year and then, with occasional inspections, he is able to handle a supervision district of from twenty-five to thirty-five teachers.

Field training, however, must never be considered as completed. New problems are constantly arising and through conferences, professional readings, and assigned studies, with the advice and encouragement of the State department, the rural supervisor will find that his professional growth may continue indefinitely.

Training of this sort, furthermore, appeals to school patrons. They realize that it is practical. They have confidence in its responsibility since it is backed by the State department. Such a feeling makes it possible for the rural supervisor to put forward and carry out policies impossible under a plan of isolated, independent supervision where everyone is for himself and no concerted plan can be promoted over a large area.

To conclude, first, supervision is the most effective method of starting permanent improvement in rural schools today. Second, its establishment must coincide with the promotion of a concrete program for school betterment. School improvement is in the hands of the people themselves and only by showing them can they be convinced of its need and induced to incur the necessary expenditures to secure it. Third, the supervisor in the field is the best agency for selling to the people the idea and ideals that mean educational advance. Fourth, among the rural school teachers themselves can be found an adequate supply of candidates if the stimulus for training is offered. Such selection and stimulus would also react favorably on the entire teaching force by giving it a future now found only by going to the city. Fifth, the training of these supervisors must be a State function just as is now the training of teachers. Sixth, most States already have in their department of rural education the organization to start such training courses. Seventh, by small additional appropriations a beginning can be made. The return to the State will be far in excess of the initial cost. A quicker educational return will come from such an appropriation for supervision than would come from an equal amount distributed in any other way. Eighth, this training, with a sound basis of academic preparation, should be largely directed field work supplemented by professional reading and appropriate extension courses. Ninth, the success of a few districts in each State will establish centers from which the demand for supervision will readily spread so that ultimately all rural teachers can have expert direction.

Again it must be emphasized that there is an imperative need today for a field force of trained, non-political, long-tenure educational leaders. The training of these leaders must be carried on by the State. Parallel with this training there must be wide-spread demonstration of the results secured from expert supervision.

THE USE OF TESTS AND MEASUREMENTS IN RURAL SCHOOLS

L. J. BENNETT, SUPERINTENDENT OF MIAMI COUNTY SCHOOLS, TROY, OHIO

Miami County, Ohio, is twenty miles square, lies in the fertile Miami Valley in Western Ohio, Troy the county seat which lies in the center of the county, being twenty miles north of Dayton. Piqua and Troy are cities of fifteen and seven thousand, respectively, and are not a part of the system. The county school system comprises three village units and thir-

teen rural units, the villages in population being 2500, 2000, and 1600. The largest of these villages has the distinction of being the smallest town of the world to qualify for a Rotary Club, and although a small town, is therefore more urban than rural. Six of the thirteen rural units, or townships, are centralized. The other seven still have one-room schools, although three of them are erecting new centralized buildings. The one-room schools, two of the centralized schools, and one of the villages are under the control of district or assistant county superintendents, devoting their entire time to supervision and administration. The other two villages and four of the centralized schools have local superintendents whose duties are divided between teaching supervision and administration. Thus the county superintendent in charge of these nine local superintendents is a school manager rather than a superintendent of schools. There are still a few folks in Ohio who think the county superintendent's work is like that of the Irishman who said he had an easy job: Nothing to do but carry bricks up three ladders all day long, while another fellow on top of the wall did all the work. So much for the organization of the particular County used in this discussion.

There is nothing new about testing and measuring school work. The pioneer teacher had his own standard of measurement which usually consisted of finding out when a pupil had finished a book and promoting him to the next higher one. Thus we once had promotion by readers, a child being in the first reader, later in the second reader, and so on. With a fine gradation of work, this system was replaced by the old-fashioned examination and this finally supplemented by close supervision. The latest development is the coming of the standard test, which attempts to measure, scientifically, certain fields of activities as well as the original ability of the children.

Standard tests, of course, are of two kinds: the intelligence test and the so-called educational test. The intelligence test is more interesting but less useful and is certainly harder to give than the average educational test. The intelligence test often serves as a basis of reclassification of pupils, but is generally dangerous to use in this way except in connection with other factors, which must be taken into consideration, such as not only a pupil's ability to do his work but also his willingness to work and the stage of completion of the work he has been attempting to do. The intelligence test probably does not give very valuable information about the great group of average children, because these children are already fairly well understood by their teachers, especially those who have been in school two or more years. The greatest value of this test is when given in a first or second grade. The first-grade child is often badly misjudged by his teacher. Brightness of tongue or backwardness of manner are the usual causes of such misjudgments. The difference in good or bad clothing will often cause the teacher also to make this error. For instance, a child in a grade recently tested was rated by his teacher as belonging to the lowest quarter of the class. This intelligence test shows

that he belongs in the highest quarter and was not far from the top. The boy was poorly clad, came from a family of humble social standing, and had older brothers and sisters who could not learn. He also was bashful, naturally. When the intelligence test revealed his potentialities, the teacher immediately set out to develop him and at the close of the school year, he stood second in the class in his school work. Such a case is not likely to occur in the upper grades, since the relative brightness and dullness of children sooner or later show through external conditions, although such is not always the case. Primary teachers and teachers of high-school freshmen, when not acquainted with those freshmen, are often badly deceived by the sociable child and the child who is inclined to volunteer to recite on all occasions. Such a child may be the brightest in the class and again may belong to as low as the second quarter of the class. The intelligence test is the check. Frequently, this kind of child, especially the high-school freshmen, is at first given high grades and a high rating. It is later discovered when the written work comes along that the child does not seem to be doing thorough work. Since the child is considered unusually brilliant, the teachers often have recourse to criticism and scolding when as a matter of fact, the child has lived up to his full mental ability. There is no more discouraging failure than a high-school student who is led to believe he is much brighter than he really is and who finally discovered he cannot do the work which others thought him capable of. The intelligence test given in the eighth grade is the proper check against this sort of disaster.

Another use of the intelligence test is in properly locating the extremes of the class. For example, a one-room rural teacher may have had some bright girl in her school for several years. She is well aware that the girl is the brightest in the class and probably brightest in her little school of fifteen or twenty children. She has done practically all the school work assigned. Nevertheless, this teacher does not know how this child is going to be able to carry the burdens of high school or do life's work, because in so small a school, being the brightest in the class does not necessarily mean much. Intelligence tests often show such children to be more ordinary than they are supposed to be. On the other hand, a bright child in the class is occasionally found to be more brilliant than anyone could imagine. I well recall the first intelligence test I ever gave. The teacher thought the brightest boy in the class might be promoted to the next grade in the middle of the year. After giving this boy a group intelligence test, and later a Binet-Simon test, we found that this pupil had a mental age practically three years higher than the grade in which he was located. He was at once promoted into the next higher grade and after being there two months, he made the highest grades in the room on written tests. He would show up in the usual age and grade reports as an accelerated child. As a matter of fact, he was still retarded two years behind his mental age. The intelligence test has revealed to us that we are usually less aware of our extreme cases in the upper end of the scale than in the lower end of the scale. No one knows how many of these geniuses have gone to waste

in the past because they were allowed to develop habits of laziness and bad deportment, not having enough work to do to keep them busy. One of the great problems for psychologists and educational administrators is this problem of the abnormally bright child. Merely advancing him in the grades does not offer a satisfactory solution, because in time he gets entirely out of adjustment socially.

The dull child who has dropped behind his grade a year or so is generally spoken of as retarded. The intelligence test has shown many of these children to be accelerated when measured by their mental age instead of their physical age. The special training of one or two per cent of humanity, who are the feeble-minded, has been worked out much more elaborately than the training of the other end of the curve—namely, the child of the real genius group.

While we have given a number of tests in Miami County Schools for the purpose of diagnosis in troublesome schools, yet no county-wide intelligence survey has yet been made, although one is planned for this spring. The tests, so far, made in villages and rural schools have not indicated any relative difference in brightness of children in town and country. Both town and country assume that their own group of people are brighter than the opposite group. When a county-wide intelligence test has been made, there will be some little evidence on this question, which, of course, will hold good only in the county which is surveyed. It is my opinion that the average will be found very nearly the same. Intelligence testing of one-room schools is a slow and difficult process, but the centralized and small town schools can be handled very nicely and the results obtained have been found accurate enough for practical purposes. Here, as in everything else, the centralized school proves its administrative merit. We feel that the intelligence test is necessary in the analysis before an accurate rating of a teacher's ability from any year's work can be made. A teacher who has thirteen failures in her grade may yet be a superior teacher who has been too conscientious to promote the subnormal children which she may have found on her hands. Teachers too frequently are rated by the number of promotions and high markings given, or by the smoothness with which they can conduct class when the supervisor is present. We can never have an efficiency quotient for teaching until we are able to determine just how much a teacher can do with a group of pupils with a given mental age and a given intelligence quotient, and even then the rating will not be entirely scientific, because we have no standards for measuring the elements that go to make up character. Usually a good teacher in the intelligence subjects is a good character builder.

Time will not permit a more extensive discussion of the intelligence tests. We have done much more elaborate work in educational testing and some valuable experience as well as useful information has been obtained. Shortly after becoming county superintendent, I tested a number of schools in Fundamentals in Arithmetic, using first Thompson's Minimum Essentials and later Curtis Series B. All the children in the villages, in

the grades from the third to the eighth, were tested, and we ran a selection of one-room rural schools, taking one school in six. All the testing was done by the county superintendent, the papers being graded by the office secretary. This work involved a frightful amount of driving in the spring of the year and kept the secretary busy for nearly two months grading and tabulating. This method of testing was carried on for three years. Our first discovery was that the county as a whole was considerably below standard, the village schools, however, being somewhat better than the rural schools. This was a surprise, as the rural school had long borne the reputation of a high grade of efficiency in teaching the fundamental operations and had seemed to be able to demonstrate this fact in the various ciphering matches. It was soon discovered, however, that those neighborhoods which attracted the most attention on account of the lightning calculators of their schools had uniformly low medians and scores in the fundamental operations. This we discovered to be due to the fact that the ciphering matches overtrained the expert and neglected the average student. The ciphering match in the history of rural education as well as the old spelling school had a virtue in pioneer times of placing emphasis upon a high degree of skill in these studies and showing the possibilities. In modern times, however, this form of contest has become a positive evil, because it almost uniformly neglects the masses and at the same time, camouflages this neglect by advertising its few experts. As a means of entertainment, it is permissible, but it is a poor educational device. We also discovered that there had been a great many promotions in one-room rural schools of children who had never been taught to subtract, but who in many cases had climbed as high as the fifth grade. This gave us a point of contact in our efforts to reduce reckless promotion of children in this type of schools. The mass result of our testing of arithmetic was a gradual improvement, although the county schools, as a whole, never succeeded in reaching the Courtis Standards in speed in all the grades. The improvement in the one-room schools was much more rapid than in the village schools, the latter apparently inspired with overconfidence as the result of the first test. A number of townships having one-room schools finally passed the Courtis standards successfully.

Improvement made in arithmetic, however, was unsatisfactory. In the light of later experience, I believe the difficulty was that neither teacher nor local superintendents took a deep interest in the work. They were not called upon to give or grade the tests and therefore were inclined to look upon it as a mere stunt on the part of the county superintendent. Consequently, there was not the close study of methods that there should have been in this field.

At the time we were testing arithmetic, tests were also given in spelling, using word lists made from the Ayres scale. These tests were conducted by the local superintendents after receiving directions from the county superintendent. The papers were graded by the teacher and the results were returned to the local superintendents. We soon found that spelling

was improving much more rapidly than number work and the schools, above the fourth grade, were soon above standard, while the third and fourth grades were close to it. We discovered some deficiency in our old-time spelling tests, but the best discovery of all was the enthusiasm and willingness to take part in this work on the part of the superintendents and teachers when once asked to do so.

These earlier testing problems have inspired several local superintendents to carry out tests of their own, which did not interfere with the county program. One school system has worked hard on spelling. The superintendent made a syllabus on "Methods of Teaching Spelling" and placed it in the hands of the teachers. There was little conference work in this school system but the syllabus was expected to be used. Within a single year this school brought its spelling from below standard to above the Ayres Standard. Another superintendent who at first was disgusted with the intelligence test as first used by the county superintendent was glad to see its great value in solving his problem of establishing semi-annual promotions. He has since tested his entire school system, high school and all, and has correlated his work with several tests given by the county superintendent. The correlations with the county superintendent were found to be quite high. We have several superintendents who have gone to summer school as a result of the showings made in the test, one man to study psychology, another to study measurements of intelligence testing, and a third to study methods of teaching reading. The supervision of these men in particular has been improved in these special lines a hundred per cent.

The most elaborate program of testing in the Miami County schools is the work we are now doing in reading. I came convinced that it would be wise to narrow the field to the testing of a single subject and selected silent reading for that purpose. The method of testing used was as follows: Each local superintendent was requested to test his own school system with the tests being given in the same week throughout the county. The papers were to be graded by the teachers, the results tabulated and turned over to the local superintendent, who in turn forwarded a copy to me. This office has been kept quite busy tabulating and interpreting results and reducing them to the form of curves. The first county-wide reading test was given in March, 1920. We found just what we expected, our schools somewhat below standard. Everyone went to work to improve silent reading.

The next county-wide reading test was given in March, 1921, just fifty-four weeks after the first had been given. We were slightly below standard in 1920, but in March, 1921, we were much above the standard in every grade. Comparing our figures with some figures given by Kelly, whose test had been used, we found that the Miami County villages were above the first-class cities of Kansas in all grades, and our one-room schools were above a group of one-room schools in Kansas in all but one grade. The general standard for the county, instead of being below as in the previous

year, was much above the Kelly Standard in all grades but one and in that grade, the sixth, showed marked improvement and was above standard. The fourth grade of 1921 was 46 per cent better than the fourth grade of 1920. Of course, a different group of pupils were tested, but it was hardly possible that there would be much difference in intelligence in the fourth grades of two consecutive years when spread over the entire county. The third grade, which in each case was taking its first test in Silent Reading, showed 30 per cent improvement over the preceding year. The median improvement of all the grades was $22\frac{1}{2}$ per cent. Needless to say, these results were quite satisfactory. Remember that the effect of growth was not measured, because the score for the sixth grade in 1921 was made by the same group of children who made the score for the fifth grade in 1920. Their score was compared in 1921 with the sixth-grade score for the preceding year made by this group of children. Consequently, the improvement was due to superior teaching and this in turn to systematic supervision of this particular subject. As the result of the reading tests and the supervision following, the lives of over 2700 children have been materially affected for the better. This is the kind of supervision that really pays.

Reading is the fundamental subject. A $22\frac{1}{2}$ per cent improvement in the teaching of reading helps all these hundreds of children in all of their other school work except in work which is purely drill. All the content studies and most of the arithmetic have been benefited.

Each of the annual tests above described were made by the Kelly Reading Tests. Objection might be made that there is a good deal of carry over from one year to the next, but we believe that such is not the case. First, a repeated questioning seemed to demonstrate that the children did not recognize ever having seen the test before when it was given the second time. In the second place, and what is more important, the third grade in 1921, which had never been tested before, showed a greater improvement over the third grade of the preceding year than any other grade had made excepting the fourth. If there were much carry over, this would not have been true. In the fall and late spring of 1920 and 1921, two forms of the Monroe Reading Tests were also given. One object was to measure the improvement between October and May, due partly to growth, partly to teaching. The Monroe spring test, however, will be used as the basis for comparison with the third form of the Monroe Test which will be given in April, 1922. Last spring Monroe Test was compared with a test given in the city of Pittsburgh at the same time, using the same form of Monroe. We found the Miami County schools to be above the Pittsburgh schools in reading in all grades as measured in comprehension, and in rate in all but two grades. The Pittsburgh schools have been closely supervised and are considered among the best cities. We account for this showing by the fact that Pittsburgh is testing several subjects annually, while we have narrowed our field to reading alone. Even at that, we feel that our showing is pretty good, for a system that still has a large number of rural one-room schools. A midyear Monroe Test was also given in

January of this year. The purpose of this last test was to stimulate interest on the part of the teacher and superintendent, and secondly, to make a diagnosis of individual cases. The January test found all the villages and part of the centralized schools above standard in the form used.

Diagnosis will be placed upon a chart made to illustrate the relative positions of each child in any given grade in a given school unit. The position of the child on this chart with reference to the standards for comprehension and rate will show at a glance whether this child is found below standard in rate or comprehension. It will also illustrate the position of those children who are so far above or below standard as to raise the question of reclassification. This chart is made on large cross section paper and hung on the wall of each schoolroom tested in reading. The chart in any given room or grade alone contains the figures of course for that grade or room, together with two primary axes representing standards. Judging from the results obtained in a few of the schools in Pittsburgh where such diagnostic charts were used, we are hoping to make this method a very effective one for the rapid improvement of some of the slower children in reading.

So much for Miami County's program for reading. We expect to keep up our testing at least until the law of diminishing returns shows we are not making any further gains and it may be wise to test annually even after that in order to avoid overconfidence. We are well aware that we are not the only people carrying on an extensive testing program. Some of the cities are well equipped in our State with a psychological department for the intelligence tests and with special supervisors for the educational tests. As county superintendent, I have made several discoveries which might be of value to others.

First, we have definite proof that the consolidated schools can be made a more effective instrument than the one-room rural school even for the teaching of the traditional subjects. It is not always true that this is the case for it sometimes happens that the building of a new schoolhouse means the neglect of the academic features of the work. In our early testing, we found our centralized schools somewhat poorer than our one-room schools, alike in reading, arithmetic, and spelling. No sooner, however, was the emphasis placed on reading than the chances for close supervision in the centralized schools showed results. The percentage of improvement in the centralized schools from year to year is much greater than in the one-room rural schools.

In the second place, our village schools are uniformly better than our rural schools. We have been assuming that this is due to their having been established longer, and hence being better organized. Some of the centralized schools, for example, have children in the upper grades who have spent most of their school life in the one-room rural school, and some of the weaknesses of their past schooling are now showing up.

In the third place, I have noticed certain types of superintendents who are more effective in producing results than others. I believe two qualities

are necessary for really effective supervision: persistence and insistence. Some men insist and make brilliant starts, but later forget all about it. The men who have made the best showings and who are above standards have made reading a subject of supervision in all teachers' meetings and prepare syllabuses of methods and have made a study of the various silent readers and then put these in the hands of the teachers.

In the fourth place, two of my supervisors of one-room schools are quite different in their ability to supervise schools in this particular subject. One man has some splendid teaching of reading in his schools due to his own efforts. The other man's reading is not so good, but his showing in the tests seems to be about the same as the other man's. At first, I was puzzled until I studied the retardation statistics and found that the mysteriously good showing was made by a superintendent who has retardation in his one-room rural schools of 42 per cent. The other man is an extreme in the other way, his retardation being only 20 per cent. With a 20 per cent retardation, it takes a good deal more effort on the part of the teacher and superintendent to make a showing in the standard tests than it does with a 42 per cent retardation. One result of this comparison has been that one superintendent has got busy to reduce his retardation while the other is looking around to see if he hasn't been too liberal about some of his promotions. Retardation figures, however, must always be taken in connection with high-school attendance. A superintendent with the 20 per cent retardation figures sends one third more pupils to high school per capita than the one with the higher figures. Another significant result is in the high scores frequently made by seventh and eighth grades in one-room schools. This is not due to any superior teaching, and is the simple and natural result of elimination of a large number of average children, due to the inefficiency of the one-room school in the lower grades. The effect on the public has been wholesome. We have done a good deal of club work in the rural schools and have the average amount of athletics. We found when we began testing reading and talking about results in the press that many people were surprised to know that the modern schoolman paid any attention to anything so old-fashioned as reading. The result was renewed confidence in the schools. Various local superintendents whose results are above standard have published these results in the local papers. An effort has been made to demonstrate to the public by means of the standardized tests that the schools actually are improving in their academic work from year to year.

In conclusion, a word of caution. Anyone who has never had any experience with standard tests should not take them too seriously. The intelligence test score for instance, of any particular child tested by a group test may be wide of the mark. This is especially true of low scores. No intelligence test should be given without the teacher's estimate of the child, as a check against the major errors of this kind. These misleading low scores are generally due to illness of the child. When the score is unusually high, it is more reliable, as there is practically no chance at all

of a pupil getting nearly everything by guesss. Where children are reclassified by the basis of the intelligence score, the extremes of the class should be checked by the original Binet-Simon test. If there is no time for this then there ought not be a great deal of re-classification. A superintendent sometimes rates teachers on the basis of an intelligence test, but this is often quite unfair. It makes a great deal of difference as to who gives an educational test, as to the condition of the atmosphere, of the school-room, and in the third place, the relative intelligence of the child sometimes varies remarkably from one grade to another. If intelligence scores and educational scores in several subjects are compared, then some rating of the teacher might be possible, but even then the work of the preceding teacher must be taken into consideration. Another caution: A superintendent should not attempt too large a program or he will find himself so involved in red tape in competition that his results will not show at all in a school-room. Another caution: One should not assume too much about an intelligence test. The brightest child will not necessarily be the biggest success, because character, good health, and future opportunity will all complicate the situation in the future. People who have had no experience in testing are likely to assume that some of us who do this work are freaks. As a matter of fact, scientific measurement has a tendency to make one cautious about making up his mind hastily about individual cases. Many persons perhaps ought not attempt to do testing if it will jar their peace of mind. The test is a useful instrument only in the hands of that type of superintendent who first wants to know what is actually being done and in the second place, who wants some sort of proof that he is doing something in the academic field. If used by such a man with such a fundamental purpose, tests will be found to be invaluable aids in the supervision and improvement of schools, whether urban or rural.

REAL SUPERVISION FOR RURAL SCHOOLS

J. S. HOFFMAN, SUPERINTENDENT OF HUNTERDON COUNTY
SCHOOLS, FLEMINGTON, N. J.

The objective of *real* supervision is the training of teachers in service. To approximate this objective, helpful constructive supervision must reach each individual rural teacher in a very personal way so as to magnify in her own mind the importance of her opportunity for service, stimulate growth in the art of teaching, establish standards to measure her own growth through pupil accomplishment, evaluate her inner resources, and arouse such latent power as she may possess into a dynamic force whose influence may have an appreciable effect upon the children committed to her care.

The one-teacher rural school offers the very finest field for teacher training in service. There is less rigidity and more opportunity for flexibility

in organization than can be found in the exacting machinery of a closely graded system. Herein lies a virgin field for experimentation that should attract the real supervisor who is imbued with the idea and spirit of purposeful activity.

The opening of this field for the type of supervision suggested is largely an administrative problem, and is dependent upon professional organization, and the freedom of the supervisor from lay control.

The average rural community is either indifferent to progress in educational training or passively satisfied with inherited and established conditions and the good school *keeper* is as highly appreciated as the good school *teacher*.

Rural teacher growth depends upon administration, supervision, and the individual teacher. All must coördinate for best results, and each must recognize the presence and importance of the other two factors. Wise administrators and supervisors know that the ultimate result of their ideals and plans must reach the child through the teacher who is in intimate and constant contact with him.

New Jersey's system of real rural supervision had its beginnings with the administration of the late Doctor Calvin N. Kendall as State Commissioner of Education. During the first five years, with the rural school and the rural child uppermost in mind, he created, organized, and put into operation, through democratic policies, a strong and effective organization and welded it into a unit by his striking personality and zeal.

This was accomplished through numerous conferences of city and county superintendents, supervising principals, and by the publication of monographs on elementary-school subjects embodying the very best method and practice of the day. He sent his elementary and high-school assistants throughout the entire State visiting schools, holding teachers' conferences, and addressing community gatherings; magnified and dignified the office of the county superintendent; made personal visitations with them to lonely isolated sections of the State; fixed the impress and magnetism of his stimulating personality and leadership upon pupil, teacher, and county superintendent. He was always a constructive critic—saw something good everywhere, but always left the impression "there is still more to be done." He surrounded his appointees—assistant commissioner and county superintendent—with conditions that make for growth.

Then came the opportunity to attach this strong power to its load and with the same masterful leadership he welded the connecting link—real rural supervision under the title of *Helping Teacher*.

The best test of a policy lies in the results it produces. When these can be seen they afford an easy and interesting way of judging its merits. Concrete explanations of helping-teacher supervision and its results followed.

THE CURSE AND CURE OF THE COUNTY SUPERINTENDENCY

ELLEN B. McDONALD, OCONTO, WISCONSIN

The curse of the county superintendency is threefold: It is not a profession; it is the football of politics; its horizon is limited to one county.

The county superintendency is not a profession but a clerical job. The county superintendent still sits at his desk making reports to the State Department of Education, to the County Board of Supervisors, to the State Department of Health, to the Rural Planning Committee, to the Agricultural Committee, to the Committee on Common Schools, to many and varied other authorities. The schools cry out for help, for inspiration, for guidance; the members of the school boards need a friendly word of advice or a suggestion for specific help, but the superintendent has no time to help or even to discover the need. A well-trained clerk could make far better reports in less time and set the superintendent free for the field work so sorely needed. As it is, he becomes a mere inspector of the schools; he "forms an opinion of the teacher's work" instead of discovering the cause for her weakness and training her for better work while she is yet in the field. He has no time to study his field as a whole, nor to see its relation to, or difference from the work of the city schools, nor to the schools of the State or Nation. Then because of his limited vision, his schools do not move forward, do not fit the boys and girls for the life they must lead. "Where there is no vision, the people perish."

The county superintendency is still the football of politics. That the State and the county superintendent, the one at the head, the other at the bottom of the educational ladder, are still chained to the wheel of politics, is strange. No progressive city would for a moment think of permitting its educational head to be chosen at a general election. They are too vitally concerned with the welfare of their children, and too wide-awake to the dangers of the system to even consider it again. Wisconsin recognized this danger but compromised by changing the time of election from the fall or general election, to the spring or municipal election—"taking it out of politics," they said.

We need not go into detail as to why a superintendent should not be chosen at a popular election. The reasons are well known. If it is not well for the city, it is surely not well for the country where the majority of electors are not informed as to the needs of education—sometimes not even as to the *need* at all; nor has he the vision of what education may do for a rural community. He is concerned with wrestling a living from the soil and votes to "keep taxes down" if he is told which vote will do that. The superintendent who wants to hold his job has his ear to the ground for the voice of the elector. He makes no stir, asks for as little as possible for the schools—no texts, buildings, nor better-trained teachers; enforces no compulsory education laws; becomes a spineless creature rather than

one who walks erect with a vision of what the country school may be and do for the country boy and girl. Does the picture appeal to a live red-blooded American? Think you he will be attracted towards the office of county superintendent of schools?

To win the election, stand not on a platform of, "Let us do the best we can for the boys and girls of today, for they are the men and women of tomorrow." Take rather, "What was good enough for our fathers is good enough for our children," or better yet, "Millions for good roads but as little as possible for good schools." Preach that tax economy begins at home with the schools where every vote can really count to lower taxes. Because the tax burden was heavy and the above policy followed, there was a turn-over in the county superintendency of Wisconsin alone, of 32 per cent last spring. That is greater than the teacher turn-over, appalling as that was. Business is alarmed at a turn-over of far less than that, and would call in experts at once to find the cause. We know both the cause and the remedy.

The third curse of the county superintendency is that the field of choice is limited to residents of the county. This shuts out desirable candidates who have had experience in other counties, and it results in putting in inexperienced men whenever a change is made. No matter how valuable nor how well-recognized the service a superintendent may have given in one county, if he loses out in election, he must give up that particular work in which he won such rich experience and enter some other form of educational work. Think you that this blind door will attract or hold well prepared, experienced young educators? Add to this that under the elective system the salary cannot be increased while in office, but that the county board must increase the salary *before* an election, if at all, and you have a final reason why the county superintendency is filled with inexperienced ambitious young people who lose out after a term or two, or with the educational politician who runs a farm or sells insurance or real estate between the making of reports.

The cure? It is not far to seek. Provide a county board of education in every county. Give it power to appoint the county superintendent from an unlimited field, going wherever they must to get the man with breadth of vision, rich qualifications, and practical experience needed; let them equip and organize the office for effective administration and supervision of the schools. In a word, let them *hire, fire, and pay* the county superintendent. Then unafraid and zealous for his work; calm in the assurance that if well done, it will be recognized; and believing that it is the most important educational field, the county superintendent works on building up the real bulwark of the Nation, the country school.

THE COUNTY UNIT OF HIGH SCHOOL CONSOLIDATION

A. F. HARMAN, SUPERINTENDENT OF MONTGOMERY COUNTY SCHOOLS,
MONTGOMERY, ALABAMA

If the progress of consolidation of schools in Montgomery County is interesting, it is due to a combination of circumstances, which cannot be set out in detail in this discussion. Suffice it to mention them cursorily. Those of you who come from sections of the country where a different order prevails, perhaps will be interested most in the fact that our progress has been accomplished with the county as the unit of organization in the administration of public education in accordance with the laws of Alabama.

The county being the unit of organization, our educational affairs are directed by a county board of education, consisting of five members elected by the people from the county at large. This board is an all-powerful body performing such functions as the election of their chief executive officer, known as the county superintendent of education, whom they may select from any place in the United States; selecting trustees of very limited powers, and fixing their terms of office; apportioning and expending State, county, and district funds; and initiating county and school district tax elections.

Under this county unit plan, the county superintendent, according to the confidence he can command and the coöperation he can obtain from his county board of education, becomes a more or less powerful official. The average Alabama superintendent will tell you that he is the storm center of all the ill educational winds that blow, or the harbor into which all good educational ships must some day sail. He formulates educational policies for the county; prepares and submits to his board for approval a building program for the county; nominates to the board his assistants, supervisors, clerical force, principals, teachers, transportation force, and janitors; selects textbooks when not in violation of the State Uniform Textbook Law; formulates courses of study, and performs many other functions of a similarly important nature.

The County unit of organization was perfected with the adoption of the Alabama School Code in the year 1919.

The consolidation of schools in Montgomery County may be interesting because of the rapidity with which the work has been done. With the exception of three suburban schools near the capital city, as recently as the year 1917, not one school of more than three teachers existed in the entire county. There was not one brick structure for school purposes. More than fifty one and two-teacher schools, pitiable beggars, constituted the county's establishment for the education of white children. School equipment was woefully lacking. Sanitation received little or no attention. The schools were absolutely without supervision. These facts must be kept in mind to appreciate the progress of consolidation in Montgomery County, under the county unit of organization.

The consolidation of schools in Montgomery County may be interesting because of the sparseness of the population, and consequently, because of the territory served and to be served by our consolidated schools. In the year 1920, in Montgomery County outside the city of Montgomery, a territory of approximately 781 square miles, there were but 4697 white persons over the age of 21 years or six persons per square mile. At the same time in the same territory, there were but 3020 white persons of school age, (minors over the age of six years) or four white persons of school age per square mile. The uniqueness, if not the difficulty, of our problem may be understood by the fact that our largest high school with an enrolment of 246 pupils serves a territory of more than three hundred square miles, that another school with an enrolment of 241 pupils serves a territory of two hundred square miles, and that none of the schools now in operation or to be put into operation in September of this year will serve a territory of less than one hundred square miles.

Consolidation under the foregoing difficult conditions would have been a thing impossible in Montgomery County but for a magnificent system of public highways consisting of 750 miles of improved roads, 500 miles being graded and graveled and passable every day in the year regardless of the weather. The perfect harmony and unity of effort between the County Board of Revenue and the County Board of Education in the laying out, development, and upkeep of roads as a part of the county's educational scheme is an interesting contribution to education under the county unit of organization.

Consolidation in Montgomery County may be interesting because of the completeness of the job. In September of this year, fifteen schools will provide ample accommodations for all the white children of the county and leave us a period of approximately five years for developing the schools from the more technical or professional point of view. Of these fifteen schools, three will be elementary schools (six grades) employing two teachers; four will be elementary schools (six grades) employing three teachers; five will be combination elementary and junior high schools employing from six to eleven teachers each; and three will be combination elementary, junior and senior high schools employing from twelve to sixteen teachers each. Commencing in the year 1917, with practically nothing but fine children and excellent roads we believe that the rapidity and the completeness with which our consolidations have been perfected would have been impossible but for the county unit of organization.

Some figures may serve to illustrate and emphasize the importance of our undertaking. On July 1, 1920, there were in Montgomery County, three substantial consolidations, one a suburban property estimated to be worth \$30,000; one a school in the open country representing an investment of more than \$90,000; and one a school in the open country representing an investment of \$130,000. These schools are monuments to the vision, energy, and effort of my distinguished predecessor, Honorable William F. Feagin. On May 10, 1921, the county being the unit of organization and

the electors of the city of Montgomery participating, voted to issue bonds to the amount of \$300,000 for the erection of rural, consolidated schools. The funds arising from this bond issue are now being used in the erection of five consolidated school buildings ranging in cost from \$45,000 to \$100,000, not including value of lands or equipment. But recently the County Board of Revenue has made an appropriation of \$62,000 from the general treasury (not *school* treasury) of the county, \$15,000 each for two small rural schools and \$32,000 for an addition to a suburban school. In order to provide an adequate addition to this suburban school, representing an investment of \$50,000, the County Board of Education has appropriated \$20,000 from funds in its control. On October 31, 1921, the County Board of Education let the contract for an addition to one of the schools erected in the year 1918, this new addition representing an investment of \$33,000. These buildings, including the smaller projects, occupy sites ranging from ten to eighty-three acres. During the scholastic year, October 1, 1921, to September 30, 1922, the Montgomery County Board of Education in coöperation with the Montgomery County Board of Revenue will have completed five major projects, two minor projects, and two substantial additions to present buildings, which, including lands and equipment will represent an investment of \$500,000, conservatively estimated. Based on the entire school establishment for the county we have an investment of \$250 for each person of school age. To appreciate the significance of these figures, it must be further understood that the total assessed valuation of property in Montgomery County amounts to only \$48,000,000 with assessments of approximately \$17,000,000 against property lying in rural districts.

To assist in completing and perfecting the consolidated school organization in Montgomery County, the people of School District No. 2, constituting all that part of the county not already voting the tax, voted on January third of this year to levy upon themselves a three-mill school tax in addition to all other school taxes then being levied. Considering that the bond election of May 10th prevailed at the very time that the Alabama Tax-Payers League was actively engaged in a campaign to reduce taxes and considering the critical time at which the election of January 3d was held, the depressing financial straits through which the people were passing and the impending \$25,000,000 Alabama Road Bond election of January 30th, we believe we have demonstrated in Montgomery County the wisdom and the possibilities of consolidating schools under a county unit system.

THE OUTPUT OF PROFESSIONAL SCHOOLS FOR TEACHERS THAT ENTER THE RURAL SERVICE

CHARLES E. BENSON, ACTING DEAN, SCHOOL OF EDUCATION,
UNIVERSITY OF OKLAHOMA, NORMAN, OKLAHOMA

The professional schools for teachers have a specific work to perform, that of training teachers for all types of teaching service. Much has been

said and more will be said about the splendid service being rendered by these institutions: of the earnest attempt to solve the problem of supply and demand: of the effort to place in each school and teaching position an efficient and well-trained teacher: but little has been said of the actual success of the institutions in meeting the demands made upon them.

This paper has to do with the graduates of professional schools for teachers who had completed the two-year curricula beyond high-school graduation before entering the rural field of teaching.

The rural school as used in this report is the one-room, two-room, or consolidated school in the open country.

The 1920 report of the U. S. Commissioner of Education has the following statement: "The rural schools of the country comprise a vast organization. Of the 20,853,516 children enrolled in the schools, 12,266,915 are in the rural schools, with an average daily attendance of 8,788,600, while the cities enroll only 8,586,601 and have an average daily attendance of 6,760,314."

This statement refers to schools in the open country. From these figures it can easily be seen that if there is to be an equity of educational opportunity the rural children are entitled to at least one half of the output of teacher-training institutions. A careful study has been made of a selected group of typical schools that train teachers and it was found that this group of schools graduated in 1910 a few more than 1600 students from the two-year curricula. Of these 9.7 per cent entered rural schools, 28.4 per cent entered village schools, and 41.8 per cent went into city schools. In 1915 nine per cent of the 2353 graduates from the two-year curricula entered the rural service; 36.4 per cent the village schools, and 42.7 per cent went into city schools. In 1920, of the 2079 graduates, only 6 per cent entered rural work, 29.1 per cent entered village schools, and 49.1 per cent went into city schools. These figures are for all types of rural service.

At this point it must be noted that in 1920 only 84.6 per cent of the graduates entered any kind of teaching work.

A further study was made of the proportion entering one-room rural schools. In 1920 it was found that only 5.2 per cent of the graduates of the selected group of schools entered this type of rural service. A supplementary investigation was made in 55 teacher-training institutions in all parts of the country to ascertain the number of graduates from the two-year curricula who entered one-room rural schools in the fall of 1920, the first year after graduation. The 55 schools from which data were secured had 5524 graduates. Of these 444, or 8 per cent, entered one-room rural schools. It was found that the range for the institutions from which data were secured is from none entering this type of school to institutions sending more than one half of their graduates into the one-room schools of the open country.

Of the male graduates from the two-year curricula in 1910, 19 per cent entered rural work, in 1915 this decreased to 17.2 per cent, and in 1920 only 4.3 per cent were willing to enter this kind of teaching service, and

the majority of these became either principals or manual-training instructors in consolidated schools.

From a study of the proportion entering the rural service of the graduates of the 55 schools sending in data it is evident that some of the schools are able to send goodly proportions of their graduates from the two-year curricula into the rural schools for at least their first teaching service. These schools are by no means all located in States where by legal enactment teachers are required to have their first experience in rural or village schools. They are not all located in rural States where towns and cities are few, but many are located in the shadow of great cities, and are surrounded by towns and cities of considerable size. The data secured from all parts of the country go to prove the statement that the location of a school training teachers rarely determines the number entering rural work. The investigation shows that the institutions with the greatest reputation for the training of rural teachers do not send the greatest number into this kind of service.

The study gives the following data relative to a State in the Middle West located in the very heart of the agricultural section of the United States. This State has four institutions established for the specific purpose of training teachers for the public schools. One institution located in the very centre of rural activities sent in 1920 two graduates or 1.2 per cent from the two-year curricula into rural schools. Another one of the institutions located nearly as well, in a part of the State where the best rural schools are located as far as boarding opportunities and salaries are concerned, succeeded in inducing 3.5 per cent in the same year to sacrifice themselves upon the altar of the rural school. The third of the institutions located in a less favorable section of the State as far as rural schools are concerned, surrounded by cities of a population ranging from 5000 to 100,000 or more, and a large number of towns, sent into the rural service in 1920 more than 42 per cent of the graduates of the two-year curricula. The fourth school located in a part of the State where towns and cities are few, sent 51.9 per cent into one-room rural schools.

These interesting data indicate that there must be some factor or factors at work in one of the institutions that is not present in at least two of the others. Perhaps it is best not to attempt to give the reasons for one of the institutions sending only 1.2 per cent of its graduates of the two-year curricula into rural schools while another less favorably located sends 42.1 per cent into this kind of teaching service.

It must be remembered that this paper has to deal with the graduates of the two-year level. Institutions doing little, if anything, for the rural schools on the graduate level of two years, may be doing a great deal below this level.

The function of teacher-training institutions is to prepare teachers for all kinds of teaching service, but it has been found that many have become training schools for the cities of their districts. If this fact should become well-known among the rural population it might lead to rather disastrous

results especially if the legislative bodies are composed of members from the rural communities.

The investigation shows still further that the completion of a rural curriculum does not insure the teaching in a rural school. In one school studied 22 graduates completed the rural curriculum, and only seven entered rural work of any kind. This is not peculiar however to the graduates of rural departments of our professional schools, but is common in other branches of the teaching service. An illustration will serve to show that the rural departments are not the arch sinners in this respect. The following distribution of 52 graduates of one institution for one year with their special preparation indicates a rather common practice.

Three graduates from the commercial curricula, three from the physical education, nine from the household arts, three from the manual training, and one from drawing taught the first year after graduation in the primary grades. Two graduates from the physical education curricula, seventeen from household arts, three from drawing, nine from manual training, and one from music taught in the intermediate grades. One graduate from the physical education taught in the kindergarten. One from the manual training taught in the grammar grades. These 52 graduates taught in fields for which they were not prepared, as against eight graduates of special curricula who went into fields for which they were prepared.

It was found that only 1.8 per cent of those entering the rural work in 1920 from the two-year curricula had received specific training for the specific work they were to do. In 1920 of those entering primary teaching 37 per cent had received special training for the work. Ten per cent of those entering intermediate grade work had specific training, and 16.9 per cent of those entering the grammar grades were specially prepared for their work.

According to the Commissioner's report of 1920 one half of the children of America are in the rural schools, and it can safely be estimated that the majority of the other half are to be found in the intermediate grades, then if the findings from a random sampling of the teacher-training schools of the country are valid, there is still left a tremendous step to be taken by the institutions before there is a perfect correlation between specific preparation and specific work.

It is believed that no one questions the statement that the rural child is entitled to as well a prepared teacher as are the children of the urban districts. When we compare the large per cent of the graduates of teacher-training institutions entering urban schools with the small number going into the rural field of teaching it is evident that the children of the rural communities do not receive a just proportion of the trained teachers. If this tendency continues for a few years longer at the rate of the past ten years the rural schools will be entirely without the professionally trained teachers—that is, those who have completed at least two years of study beyond high-school graduation.

The results of the investigation show that a few of the normal schools

and teachers colleges are sending a fair proportion of their graduates into the rural service and attempting to give an equity of educational opportunity to the children of the open country.¹

¹ For a fuller discussion of the problems of teacher-training the reader is referred to the author's *Output of Professional Schools for Teachers*. Warwick and York, Baltimore, Md.

JUNIOR EXTENSION WORK AS DEVELOPED THROUGH THE PUBLIC SCHOOLS

W. J. WRIGHT, STATE CLUB LEADER, CORNELL COLLEGE OF AGRICULTURE, ITHACA, NEW YORK

The framers of the Smith-Lever, or Coöperative Extension Act of 1914, wisely refrained from stipulating in detail the means or methods by which its provisions were to be carried into effect. The only definitions or references to method in the Act are contained in one paragraph as follows: "Coöperative agricultural extension work shall consist of the giving of instruction and practical demonstrations in agriculture and home economics to persons not attending or resident in the said colleges in the several communities, and imparting to such persons information on said subjects through field demonstrations, publications, and otherwise; and this work shall be carried on in such a manner as may be mutually agreed upon by the Secretary of Agriculture and the State agricultural college or colleges receiving the benefits of this Act."

This has naturally led to a variety of plans based partly upon the ideas and ideals of those responsible for directing the work in the various States and partly upon the State statutes governing and defining the functions and activities of the State agricultural colleges or the departments of public instruction. True there have been attempts to standardize the different types of extension work, a step which may have some justification on the basis of experience, but which carried too far will destroy initiative and must result in stagnation. There seems to have been a greater variety of forms of organization in junior-extension work among the various States than in senior extension. This is probably due to the fact that in dealing with boys and girls we are dealing with a group, the majority of whom are enrolled in the public schools and whose educational program in many States is placed by statute under the direction of the department of public instruction. It is doubtful if it will ever be possible to develop a uniform plan of organization for junior-extension work even if it were desirable to do so.

Granted that junior-extension work was intended to be included in the scope of the coöperative extension act by its framers, the question has been frequently raised as to whether the U. S. Department of Agriculture and the State Agricultural Colleges should be charged with the administration of a piece of educational work having to do with boys and girls of school age. There are those who contend that the responsibility for all such

activities should rest solely with the authorities responsible for public education.

It is not the purpose of this paper to re-open this controversy, but rather to discuss, at the request of your secretary, a coöperative plan now in effect in New York State in which the College of Agriculture and the U. S. Department of Agriculture, which it represents, share with the State Education Department the responsibility for the work so far as the children who are enrolled in the public schools are concerned. Not only do they share the responsibilities, but each institution places at the disposal of those immediately responsible for the development of the work such machinery and agencies as may be of special assistance. Thus the College offers the services of its corps of specialists, its county agricultural and home demonstration agents and provides rather liberally for the financial support of junior-extension work. The State Education Department, on the other hand, directs that its superintendents of schools and its teachers shall assist in developing the work and also contributes to its financial support.

Before going further it may be well to consider the purpose or object of junior-extension work. There seem to be at least three popular conceptions. One is that it is purely vocational, or in other words, its purpose is to prepare boys and girls for country life and to keep as many as possible on the farms. A second is a service or demonstration idea which, carried to its logical conclusion, would mean that certain few boys and girls in different communities would be selected because of superior advantages and trained to demonstrate certain practices in the community. A third conception of the purpose of junior-extension work is that it should offer to all boys and girls not otherwise reached an opportunity for instruction along some line of agricultural or homemaking activity either by demonstrations, publications, or otherwise but always supplemented by carefully supervised home work, the project. It is not vocational in the sense that it is deliberately planned to make farmers and farm wives of all the young people enrolled. But the training should be practical rather than academic to the end that it may be economically useful. For example, the purpose of a potato club should be to give to its members a knowledge, based upon experience as well as on study and demonstrations, of the methods of selecting and treating potato seed, and spraying, together with the benefits derived from such practices rather than a minute study of the potato plant or an exhaustive history of the potato plant's development as a food. The latter is interesting from an academic point of view but does not coincide with the fundamental object of all Federal subsidies for agricultural education from the original Land Grant Act to the Vocational Act, which object is the improvement of agriculture and farm life.

It is this third conception of junior-extension work that prevails in New York and which I have taken the time to place before you in order to make clear the plan which I have been asked to describe. It must be clear that for the purpose of giving definite instruction in agriculture and homemaking to a large number of boys and girls we already have the necessary ma-

chinery, so far as boys and girls of public-school age are concerned, in the public-school system. Given the sanction and interest of the State Department, the coöperation of the Superintendent and the help of the teacher, we have a machine and a personnel already in the field which it is well-nigh impossible to duplicate either financially or otherwise. True many of the teachers are not trained in agriculture and homemaking, but they are more or less well-trained as teachers. It is comparatively easy for the college specialists to give to these teachers, in a few training schools, a fairly comprehensive training in the use of the college publications which will enable them to direct the pupil in his work.

It is, however, frequently difficult to inspire teachers and superintendents with a desire or inclination to conduct club work, especially if they have had no experience with it. This is shown by the fact that of the 15,064 boys and girls enrolled for junior-extension work in 44 counties in New York in 1921, over 70 per cent were in the 16 counties employing county club agents. On the other hand 831 out of a total of 941 local leaders were in these same 16 counties, a majority of them being public-school teachers. It is the county club agent who furnishes the inspiration and keeps the machinery moving.

County organization—Specifically the plan for junior-extension work in New York State provides that it shall be directed locally by a county board for junior extension composed of a committee of the farm and home bureau and the district superintendents of schools, the number of representatives of the farm and home bureau being equal to the number of school superintendents in the county (from one to seven). This initial membership of the Board may be augmented by representatives of other interested organizations such as Banker's Associations, Pomona Grange, Breeder's Associations, Women's Clubs, Parent Teacher's Associations, and the like. This Board coöperates with the State College of Agriculture which also represents the United States Department of Agriculture, and with the State Education Department in employing a County Club Agent and assistants, in mapping out a program of work, in preparing a budget, and is responsible for local financing. A total of \$1200 of State and Federal aid is available to each county employing a county club agent.

The county club agent—Under the above form of county organization, the county club agent becomes the joint representative of the College, the U. S. Department of Agriculture, the State Education Department, and the local community as represented by the county board for junior extension. The county club agent is elected by the county board but must be approved by the Director of Extension and licensed by the Commissioner of Education. Certain minimum standards of training and experience are required. The County Club Agent carried out the directions of the coöperating parties in a general memorandum of agreement. His principal function is to organize and direct the work within the county in accordance with a prescribed program, leaving the instruction and inspection largely in the hands of the teachers who become the local leaders. He

arranges for training schools for local leaders at which he either gives the instruction himself or relies on the subject-matter specialists from the College of Agriculture. In addition he may give individual or group demonstrations, make field inspections, himself act as local leader for certain groups who have no local leader, or whose leader asks for special help. A portion of the regular teachers conference is frequently utilized as a training school for teachers who conduct junior-extension work. In other cases special training conferences are arranged.

The teacher as a local leader—Because of her interest and experience in dealing with boys and girls and because of her standing in the community the good teacher also becomes the good local leader for junior-extension work. This is particularly true if she happens to live in the community in which she teaches and is therefore able to continue her leadership throughout the summer months. This is particularly desirable in work with crops, the principal growing season of which is during the summer vacation. At present in New York State an increasing number of teachers live in the communities in which they teach. Frequently they are the parents of boys and girls who are themselves attending school. Such teachers with a natural interest in the community aside from their special school interest naturally make strong and efficient leaders.

The vocational teacher as a local leader—A special arrangement with those in charge of vocational agriculture and homemaking (Smith-Hughes Schools) makes it possible for vocational teachers of agriculture and homemaking to become local leaders of junior-extension work among the boys and girls in communities immediately surrounding the schools in which they teach and who are not regularly enrolled in vocational courses. These vocational teachers assume the entire responsibility for the leadership of junior-extension work in certain prescribed areas under the general plan and program prescribed for the county. They obtain the literature, record sheets, and other material from the county club agent and make regular reports to the county club agent. The County Board for Junior Extension in no way supplements the salary of these vocational teachers, but it may, and sometimes does, pay all or part of their travel expenses necessary in supervising junior-extension workers. Young people enrolled in vocational schools are not enrolled as junior-extension or club members. In counties employing no club agent, vocational teachers may, and do, conduct junior-extension work, reporting to the State club leader or through the supervising official in the State Education Department.

Records and reports—In the matter of records and reports teachers who act in the capacity of local leaders have a peculiar advantage over those having no school connection. The interested, energetic teacher uses these records and reports as the basis of much of her schoolwork particularly in arithmetic and geography. For example, if a boy has a note due at the bank for a calf which he has purchased this note makes a splendid concrete example for a lesson in interest. If a New York boy grows potatoes which eventually sell in Virginia the transaction offers a splendid opportunity to

teach geography, and likewise the boy learns something about the channels for marketing his produce. While it is possible for local leaders not connected with the schools to bring out these same lessons, it is a far less natural procedure. In fact the virtue of junior-extension work is its ability to furnish concrete problems for school work.

School fairs and achievement days—The school fair or achievement day is coming to be regarded as a regular feature of the school work in New York. It affords an opportunity for a community gathering when old and young congregate to see the exhibits and hear the members tell of their work. Incidentally it brings parents to the school who have scarcely set foot inside the school building in a generation. When there are enough workers in a district (five or more) the fair is held in the home district. Frequently it is necessary to combine districts. Occasionally township school fairs are held where all the schools in the township are dismissed for a day and all go to a central place where the exhibits and the program is held and a picnic lunch with games and songs is enjoyed.

The boy out of school—It should not be inferred that junior-extension work, conducted as I have all too briefly outlined, is an additional burden on the hard-worked pupil. On the other hand it is quite the reverse. It gives him a new interest in the school and farm and in things around him. It frequently brings a welcome economic income and what is more, often brings to his father and to his mother a knowledge of better methods through the demonstrations he has made in carrying through his project.

But it must be confessed that the elementary school is not always successful in reaching boys on the farm who have left school and who may be most in need of help and encouragement. It may be argued that they are the concern of the vocational teacher rather than the county club agent. Many of these boys are being reached by vocational teachers, not as vocational pupils but as junior-extension workers. Sometimes the county club agent makes personal contacts; sometimes it is possible to organize a club with some outstanding man or woman in the community as local leader. Again it may be possible for the club agent to guide them into extension schools or short courses and thus help them to obtain the assistance and encouragement they need. No real extension agent will stand idly by and see young men and boys becoming discouraged because they do not know where to turn for help, nor will he pass them by because club work has no appeal for them. It is the business of the extension agent to help such boys and young men though they may not swell his enrolment, or make an additional club.

In conclusion let me state that I do not offer the above plan as a perfect model applicable to all conditions. I have only sought to show how it is possible to have a full, happy, harmonious understanding and working agreement under which all agencies charged with "giving instruction in agriculture and home economics" within a State may do so efficiently and without jealousy or discord. From our point of view, the public-school system, properly organized, provides the machinery and equipment neces-

sary for effectively conducted junior-extension work among boys and girls in school. Such other machinery as is being developed is for the purpose of reaching boys and girls out of school. There has been no attempt to bring older boys and girls into club membership when in the judgment of the club agent their needs will be better served by extension schools, short courses, or by attending vocational courses.

JUNIOR EXTENSION WORK AS DEVELOPED THROUGH THE PUBLIC SCHOOL

Z. M. SMITH, STATE CLUB LEADER, LAFAYETTE, INDIANA

Interest in the farmer is universal. Why? Because agriculture is basic to all productive and non-productive activities. This interest is wholly legitimate. Unfortunately it is not always intelligently directed and applied. To the non-farmer agriculture and farm home life are so simple in their character that even a fool need not err therein. The non-farmer, believing as he does in the simplicity of rural-life problems and relationships, thinks improvement in rural conditions is easily accomplished and that he is capable of formulating a program of activity that will insure rural betterment. Consequently we have as many different programs as we have agencies working for rural improvement. The salvation of the farmer from utter bewilderment is placid indifference to the Babel of voices which with supplications and implications are smugly advising him they can lead him out of his slough of ignorance and incompetency. Were the ruralite not a thoroughbred humorist and a perennial optimist, he would not tolerate the maintenance of a great deal of the local, State, and Federal machinery which is maintained presumably for his social and economic uplift.

Too much is attempted *for* the farmer and not enough *with* him. We deplore the lack of rural leadership and yet persist in superimposing upon our rural population ideas and methods that stultify in embryo latent leadership qualities. Proportionately less effort should be made to render paternalistic aid to the farmer, and greater stress should be laid on the obligation and necessity of the farmer's assuming his own responsibilities. Rural society will continue to suffer to the extent that rural leadership and an intelligent following of such leadership are lacking.

An adequate program for rural improvement will be characterized by a solidarity that is noticeably wanting at present. Such a program will be constructed around and upon long-existing fundamental institutions. We are in error when we take the position that each separate activity included in the whole program requires a separate, unrelated organization for its execution. In the United States of America, the public school is the foundation and center of public education. Junior-extension work may be and should be conducted as a phase of public education. The successful prosecution of junior-extension activities should not require unnecessary

workers and needless expenditures. Neither should the work require for its execution an organization disassociated from the public school, the one institution we have created and maintained for the education of our youth.

We are indulging in mere platitude when we assert that the public school changes from time to time in its aims and methods and that it has not changed with sufficient rapidity to keep pace with the legitimate demands upon it. Without impairing their general education, boys and girls can connect their farm and home activities with their school work and thus provide a means by which to make practical application of their school instruction.

Miss Marjorie Scholl, a high-school girl of Fayette County, Indiana, shows clearly in her club story for this year how the school and home work can be correlated through club work. This story is based on Marjorie's experience in club work. She relates an incident in her experience at the home of her young married cousin who is overburdened with household cares and her babies. Herewith are given excerpts from her story which was submitted as part of her work in English composition.

"Marjorie was as strong and capable as any girl of sixteen could be and she went to work willingly. She had been engaged in club work for four years and had gained experience that taught her the easiest and most satisfactory methods of doing housework. All day long she went about her tasks singing blithely, and when night came the washing was done, the house cleaned, and there was a delicious apple pie on the table for John's supper.

"Oh! I had almost forgotten that we are nearly out of bread. I'll have to bake tomorrow," said Jean as they were preparing supper.

"Please, won't you let me do the baking, Jean?" asked Marjorie. "I've been doing all of ours this summer. I'm in the baking club you know."

"All right," consented the older girl, "you may start it this evening, if you wish."

The next morning Marjorie kneaded the bread while Jean was washing the dishes.

"I do not understand why you like to bake bread so well. It's always been a bugbear to me," said Jean.

"Well, you see, I make a game out of it. In the botany class in high school I studied all about yeast plants and how they grow. So I pretend that I am growing flowers in a garden. I make a rich, fine soil of the potatoes, sugar, and flour, and plant the young yeast plants in it."

"They grow very rapidly if properly cared for, and by morning they are ready for cultivation. It takes a great amount of cultivation, and the more the better. I use a spoon for a cultivator. As it takes a large amount of food for the plants, I add quantities of flour and some milk and butter to make the soil richer. When the plants in my garden have increased many fold, I cultivate again. This time I do it with my hands for it is such very particular work. After this second cultivation, which is really the kneading of the dough, my garden grows so rapidly that I have to make it into

separate plots. Now the plants have reached the flowering stage (the baking) and must be watched constantly and kept exceptionally warm. It is as much fun to watch these flowers develop as it is to watch four-o'clocks open. When they are full-bloom, they are a beautiful golden brown in color. You see they are so very different from any other flowers you ever saw that it makes them interesting."

"Now isn't that a queer game to play? I know you think it's silly, but it makes the work much easier and more interesting."

"I wish there had been club work in this county when I was of the eligible age," said Jean, as she laughed at her cousin's story. "They say an old dog cannot be taught new tricks, but I'm not very old yet, and I'm going to learn to play your game."

Clifford Anderson, a high-school boy, of Morgan County, Indiana, began his club experience with poultry five years ago. He has continued his poultry work each year and has added pig and sow and litter projects. He is an annual successful exhibitor at both the State poultry show and the State swine show at the State Fair. He now has 500 Rose Comb White Leghorns, 100 ducks, and a registered sow and litter of the Spotted Poland China Breed. All of his club work has been done in connection with his school instruction and under the supervision of his agriculture teacher.

Roy Magruder, while a pupil in the Technical High School in Indianapolis, carried out garden and poultry projects under the supervision of his teacher of agriculture. This June he will be graduated from the school of agriculture of Purdue University.

Fred Thomas, inspired by his success as a corn and a pig club member, entered high school at the age of eighteen years. He continued his club work throughout his high school course and saved his money to pay his expenses in college. He is a leader in the Purdue University School of Agriculture, from which he will be graduated in June.

Harrison, St. Joseph, Fountain, Delaware, and other counties in Indiana, have demonstrated the value of coördinating junior-extension work with the public school.

Following is given briefly the method of procedure in Fountain County: The State club leader appeared before the county teachers' institute and explained the nature and character of the club work that should be connected closely with the school work in agriculture and home economics. He then met with the county superintendent of schools, the county agricultural agent, and a group of teachers who would have classes in agriculture during the year, and assisted in outlining the club projects and the school exercises for the year. These outlines were given to the teachers at the beginning of the school year by the county superintendent of schools, and their nature and purpose were explained. At each monthly teachers' institute held during the year more detailed outlines were furnished for the work the following month and further explanations were given. Arrangements were made with the County Fair Board for club exhibits at the annual county fair. Two pavilions, 100 x 40 feet, have been constructed

for club live-stock exhibits alone, and they are filled to capacity annually. As a result of the club and school work, farm dairy herds of quality have been developed, the production of pure bred hogs has been greatly increased, home poultry flocks have been improved, home orchards have been made productive, corn production has been increased, the landscaping of farm homes has been given careful attention, and the social life of the young people has been enriched. Many of the club members have developed into club and community leaders.

Junior-extension work furnishes a most excellent medium through which pupils react in practical ways to the school instruction in agriculture and home economics.

The normal child is active. He does things. The things the child does are not always conducive to the peace of mind of the teacher or parents, because his superabundant energy is not always directed along lines of activity born of plans thoughtfully wrought out. Too often the teacher's plans call for nothing more than assigning lessons and hearing recitations from eight thirty o'clock in the morning until four o'clock in the afternoon. Such plans do not meet the needs fully of the normal child.

Agriculture and home economics, as practical arts subjects, are a boon to teachers who use them as a means of intelligently directing the energies of the pupils. The growing animal or plant appeals to boys and girls. Children prefer to work with things that are alive rather than read about them. Wide-awake teachers are quick to take advantage of this by having pupils do their agriculture and home economics work on a club-project basis. By this method the pupil deals with things with which he is to some extent familiar and in which he has a personal interest.

The school authorities and the teachers need the coöperation of active organizations such as the farmers' federation, farmers' institute, home economics association, parent-teacher association, grange, county fair board, live-stock breeders association, county bankers association. Representatives of these organizations should meet with the county superintendent of schools, the county agricultural agent, and the teachers, and discuss with them the club projects and school work, and coöperate with them in an active way in carrying out plans for coördinating the important lines of community activity. From the beginning of school in the fall until the culmination of the project work in the exhibit a year later, the school authorities, the county agent, the teachers, the pupils and the coöperating organizations must work together with a singleness of purpose.

SOME CONTRIBUTIONS OF THE NEW YORK RURAL SCHOOL SURVEY

JULIAN E. BUTTERWORTH, MEMBER OF THE COMMITTEE OF 21; PROFESSOR OF RURAL EDUCATION, CORNELL UNIVERSITY, ITHACA, NEW YORK

The historical setting—The New York Rural School Survey of 1920-22 is so directly an outcome of educational events and tendencies in the State during the last century or more that a brief presentation of educational history is desirable. Only in this way may those not familiar with the State understand the significance of the organization of the survey, its mode of operation, and some, at least, of its recommendations.

The first permanent school law in New York State, that of 1812, provided the framework upon which has been built the machinery responsible in large part for the survey referred to. On the one hand that law provided for the district system that is still the most powerful influence in the control of education. On the other hand it provided for some State direction; established the State superintendency; gave State aid; and required local taxation. In 1821 the State superintendency was discontinued, and the secretary of State was designated as superintendent ex-officio. This arrangement continued until 1854 when the State superintendency was reestablished.

As in other States the power of the State has been gradually extended. Among the powers given to the State educational organization may be mentioned: the appointment of conductors and instructors for teacher institutes, the appointment of local boards for State normal schools, the apportionment of State funds, the enforcement of a compulsory education act, uniform examinations for teachers' certificates, standards for buildings, and supervision of higher education. This latter function was assumed by the State in 1787 on the creation of the Board of Regents of the University of the State of New York. This board was endowed with power to charter colleges and incorporate academies and to exercise supervision over them. From 1812, when the State superintendency was established, there were, therefore, two agencies controlling education—the office of the State superintendent giving attention to the common schools, and the Board of Regents supervising the colleges and secondary schools. This division of the work led to such clashes between the two agencies, especially as regards the direction of secondary education, that in 1904 the so-called unification act provided the organization now in existence. Briefly, this organization consists of a Board of Regents of twelve, elected by the legislature, having general powers in the control of education; a commissioner of education elected by the Regents with certain powers specifically conferred by statute and others that may be delegated to him by the Regents; and a large force of workers including a deputy commissioner, three assistant commissioners, and chiefs and assistants of divisions and bureaus dealing with the various important activities of the State's work in education. Unquestionably it

is the most elaborate organization for the administration of a State school system to be found in the country.

After this unification came a series of events that created the situation immediately responsible for the recent survey. Andrew S. Draper, first commissioner of education, believed strongly and preached widely the doctrine of State responsibility for education. Certain decisions of the courts established the doctrine that the school is a State, not a local, institution. One of the most important of these decisions was that of 1897 growing out of a situation in the city of Watervliet. Members of the local board, due to internal dissension, failed to appoint the necessary teachers and school officers. An appeal was made to the State superintendent. He ordered the schools to be opened by a certain date. This not being done, he sent a State official to act as superintendent temporarily. School was opened with about 1400 pupils. Citizens then made application to the Supreme Court for an injunction restricting the State superintendent from interfering with the local school system. The request was denied and the action of the State superintendent upheld on the principle that "the mandate of the constitution [for an effective system of schools] cannot be modified at the will of any local board failing to discharge the duties imposed upon it by law, but that the power exists to compel obedience to this requirement, and this power is lodged in the State superintendent of public instruction."

This principle most of us would accept as sound. Yet such a principle could readily be misunderstood by the average citizen when emphasized and especially when accompanied by legislation, good in itself, but looking to an increase in the power of the State. It would appear that there has been such a misunderstanding.

From 1857 school commissioners had been provided as supervisors for the rural schools. These were elected by the people. In 1912, the name was changed to district superintendent and the number greatly increased. There are now 208 of these officials in the 57 counties lying outside New York City. These superintendents are elected for a period of five years by a board that performs no other function. There is no board comparable to the county or the township boards of some states to represent the people of an intermediate unit in the formulation and execution of educational policies. As a result the district superintendent is more nearly responsible to the State Department than to the people themselves. The feeling of rural folks that this is so is increased by the fact that the district superintendent has certain powers on which the farmer is particularly sensitive—namely, the redefinition of district boundaries involving consolidation, and the condemnation of school buildings. One hears not infrequently that the district superintendent should be selected by the people in order that the people may again control education.

In 1916 the State Department issued an order that after September 1, 1918, all schools, with a few exceptions, would be required to provide a system of approved toilets. It would appear that little of a State-wide

nature had been done to show rural people the desirability of such action. As a result a storm of protest was raised. While some followed the order others protested on one ground or another. The facts of the survey show a lamentable situation regarding outdoor toilets. In general there has been vast improvement where the approved toilets were installed. The difficulty therefore appears to be not with the soundness of the order itself but with the fact that the people were not made conscious of the seriousness of conditions and of the effectiveness of the remedy prescribed.

In 1916 the agitation for preparedness for war led to the establishment of a compulsory system of physical education. This provided for physical training supervisors approximately half of whose salaries were to be paid by the local districts. This cost, combined with the farmer's failure to understand the purpose of the act as shown by his belief that his children got sufficient exercise in home work, led to the virtual abandonment of physical education through the action of successive legislatures.

In 1917 the township was made the unit of local administration and the century-old common school district control was discontinued. The next year the law was repealed. Many thought that the consolidation of districts meant the consolidation of schools. To school consolidation the average New York farmer is at present bitterly opposed. Then there was dissatisfaction with the readjusted tax burdens and with the redistributed control. In fact the difficulty would appear again to be lack of complete preparation for an entirely new unit of local administration.

Thus we have, in a comparatively short period, three acts of the legislature and one ruling of the State Department looking toward a modification in the control of schools by the people in the common school district. Unprepared as most people seem to have been for these changes it was inevitable that opposition should have been created. It was natural too that the agent of the State, the State Department of Education, should have been accused of exercising autocratic power and that any new educational proposal should be scrutinized suspiciously to see if the State were seeking further authority at the expense of local control. As to whether such accusations and suspicions were justified is not our concern here. That many farmers feel as they do is almost as significant as if they had cause to so feel. Incidentally, it may be said that while the Department probably neglected to develop the right sort of public sentiment for certain legislation and while it may be true that certain divisions have been arbitrary in dealing with such an independent group as the farmer, it is undeniably true that the chief officials of the Department desire more local control. One evidence of this is that these officials have stood consistently for some sort of intermediate unit able to assume more of the responsibilities of school control.

The creation of the Committee of Twenty-one—The repeal of the township act left, as may be expected, many of the more progressive citizens dissatisfied with existing school conditions. Such persons had realized the deficiencies of the rural schools and had seen an opportunity for the town-

ship organization to provide an equalization of educational opportunities and a larger group contact that would have meant better conditions and greater satisfaction after the inevitable rough spots due to new adjustments had worn off.

The Department of Rural Education of Cornell University at its 1920 annual conference held during Farmer's Week took cognizance of this feeling. It organized its program about the question: "What can New York do to Improve Its Rural Schools?" The discussions of this conference emphasized the obvious fact that the question could not be answered without data that were not available. As a consequence a resolution was adopted urging the appointment of a commission of representative lay and professional people to attack the problem. The following day the Conference Board of Farm Organizations suggested the organization of a committee with three representatives from each of these groups: State Grange; State Farm Bureau Federation; State Home Bureau Federation; Dairy-men's League, State Teachers Association; State Department of Education; State College of Agriculture. Each organization then appointed its representatives and the first meeting of the committee was held in May, 1920. At this meeting it was discovered that the State Department of Education had some time previously taken steps to obtain money from the Commonwealth Fund of New York for a survey of rural education in the State. Later when the money was made available to the State Board of Regents, that body placed in the hands of the Committee of Twenty-one the administration of the funds. An executive committee composed of George A. Works, Professor of Rural Education, Cornell University; George M. Wiley, Assistant Commissioner of Elementary Education for the State; and Mrs. A. E. Brigden, President of the Home Bureau Federation, was appointed. Professor Works was designated chairman of the Committee and director of the Survey.

1. *Active control of the survey by a large representative group of lay and professional people* may therefore be given as the first interesting aspect of this piece of work. This control has not been perfunctory. From the beginning it was planned that there would be two reports—one for the profession that would include the detailed findings and the unmodified recommendations of the specialists in the various divisions; the other for the public, that would represent the decision of the Committee as to what was desirable and feasible under existing conditions.

The procedure of the Committee is of interest. Several sessions were spent in discussing the work to be undertaken: the questions that ought to be answered; the general nature of the data to be collected; the sections into which the work might be divided. The Committee on Direction was then authorized to select the staff personnel. This they did without interference from the Committee. C. H. Judd, of the University of Chicago, was selected to head the Division of Administration and Supervision; W. C. Bagley, Teachers College, Columbia University, the Curriculum and the Teaching Staff; Harlan Updegraff, University of Pennsylvania, Finance;

M. C. Haggerty, University of Minnesota, Measurement; Mabel Carney, Teachers College, Columbia University, Community Relations; J. E. Butterworth, Cornell University, Buildings; E. R. Eastman, Editor of the *Dairyman's League News*, Publicity. These heads selected their own assistants, some from outside the State, some from within the State. Among the groups thus utilized from New York State were district superintendents, members of the State Department of Education, village principals, city superintendents, teachers, normal-school instructors, and instructors from various college and universities. In all about 175 have shared in this work.

Before the collection of facts was actually begun most of the division heads appeared before the Committee of 21 and described their tentative mode of procedure. This gave the Committee a general idea as to what would be done. Then from time to time reports of progress were made. In September, 1921, when the field work was almost completed, a conference of all heads of divisions was called. After three days of discussion all met with the Committee of Twenty-one and a preliminary report was made in each field. In November sub-committees were appointed to report to the whole Committee on the work of each division. This was done in various meetings held during November, December, January, and February. The fundamental problems of the Survey dealt with administration and finance. As an illustration of the care given the reports of the specialists in these fields, it may be mentioned that about three days were given by the sub-committee and three days by the whole Committee to the question of finance. Two and one half days were spent by the sub-committee on the administration report and two days by the whole Committee. Nearly every aspect of the various recommendations was discussed both as to its soundness and its practicability. The Committee did not hesitate to make modifications of the recommendations of the specialists. Sometimes these modifications were in the direction of taking a shorter step toward the ideal, but illustrations are not lacking of the belief of the Committee that it was practicable to go further than the specialists advised.

One result, therefore, that has come from this active control by the Committee of Twenty-one is a healthful interaction between the two large groups involved in education—the layman and the professional man. In this connection an analysis of the personnel of the Committee is interesting. Of the twenty-one members twelve represent farm organizations and nine educational organizations. One Grange representative is a district superintendent, so that there are ten professional and eleven non-professional persons. Five of the group are women. Two of the professional representatives live in the open country. One of the farm representatives lives in a village and one in a city. Of the professional group three are State administrators, four are district superintendents, and three are university professors. It is thus seen that the group is about as representative of various rural interests as it could well be.

From this interaction has come some worthwhile by-products. On the one hand, it has given the professional people a genuine appreciation of

what the farmer can contribute in the way of viewpoint and sound common sense. I doubt if there is a single professional member of the committee who will not gladly acknowledge a debt to the farmer representatives. They have shown an earnestness, an intellectual keenness, and a willingness to learn that promises much for an improved rural education when the majority of country folks are aroused. All of us professional people on the Committee are only too glad to acknowledge the influence that these months of contact have had on our professional development.

On the other hand, the farmer acknowledges his obligations: a greater respect for the motives of the professional man, for his knowledge, and for his technique.

A second result of this democratic type of control has been a greater confidence on the part of the farm people toward the survey. There have, of course, been critics but the number is probably small compared with what would have been had the committee been made up largely of non-farm people or had it failed to exercise *active* control. From the beginning of the work the Division of Publicity has been alert. Meetings have been held in order to inform the people of what was being planned and in order to get the farmer's suggestions as to what he thought ought to be done. Such meetings have been held in every section of the State the attendance sometimes being as high as 400 to 500 from a half dozen neighboring counties. The Division has sent out thousands of questionnaires to local granges, Home Bureau organizations, and individuals urging discussion of the questions raised and inviting suggestions. Now that the work is practically completed the nature of the public meetings is being changed. The groups being met are smaller—local and county gatherings of all sorts. Specific recommendations are being presented and the criticisms of the farm population secured. Critics are by no means lacking, but there is in practically every meeting evidence that the recommendations are being accepted as along the right line. The Conference Board of Farm Organizations has given its approval. The State Grange has urged serious discussion in its local chapters. The task now is to develop sufficient sentiment that will secure legislation and legislation that will remain upon the statute books. If this becomes impossible the obvious task of the Committee is to revise its recommendations, so as to suggest a program that is attainable.

2. *The proposal of an administrative organization that looks toward a control of schools that is both democratic and effective* is another interesting aspect of the Survey.

At present the common school district has chief control of the schools. It raises the necessary funds, selects the teachers, looks after the building, furnishes the equipment and supplies, and selects the textbooks. All these powers are of course modified by State laws dealing with such matters as length of school term, minimum salaries for teachers, State aid and consequent requirements for receiving the aid. There are also State Department

regulations regarding such matters as qualifications of teachers, courses of study, and the promotion of pupils.

Dr. Judd and his assistants have shown a paradoxical situation in the control of education in the State. While the local district has authority in the most vital matters it has frequently failed to respond to its education responsibilities. It is often penurious; it has difficulty in finding a trustee, often choosing a person not present at the annual meeting; it frequently fails to support a trustee who attempts progressive measures; it neglects the building and its equipment. On the other hand, the district is jealous of its power and resents, as has already been shown, any measures that appear to limit this authority.

Three problems are involved in meeting such a situation: (1) A statement of principle governing the division of school control among the various types of units; (2) a local unit that will secure a larger group activity and so tend to develop a more progressive attitude toward schools and a greater ability to assume responsibility for school control; (3) a unit intermediate between local and State units representative of local interests and able to assume some of the authority that must now, from the very nature of the organization, go to the State. At present the intermediate unit is weak and unsound. There is no policy-making board; the district superintendent, while elected by a local group, is not responsible to this group except when the 5-year selection period approaches. He is primarily responsible to the State Department.

The first problem was met by the Committee through the formulation of the general principle that no higher unit should exercise control that can be exercised satisfactorily by lesser units. In application this will mean considerable revision of activities of control in regard to such problems as the selection of teachers, the preparation of courses of study, and the promotion of pupils. In general the application of this principle will mean less control on the part of the local unit in some problems, less on the part of the State in some, and much more on the part of the intermediate unit. A corollary to this principle is that the higher units are responsible for the exercise of leadership that will enable the lesser units to do as much as possible in the way of control. Dr. Bobbitt, accepting this principle, has worked out in detail the distribution of responsibility for various types of problems.

The second problem—a larger local unit—was met by the proposal of a community type of local organization that will be described later.

The third problem—that of a more effective intermediate unit—was solved in the following manner. A number of community units are to be combined into a territory comparable in size to that of the present supervisory district (usually three to five townships). Each community board of education is to elect one member of the intermediate board. Should this arrangement give a board of fewer than three members the problem is to be referred to a State Boundary Board, later described. This intermediate board will select the superintendent (after the terms of the present

superintendents expire in 1926); raise funds for administrative, supervisory, and clerical assistance; pass upon boundary questions of the various community units; approve plans for consolidation as submitted by the community boards; and perform other functions, in coöperation with the superintendent, within its province, such as assisting in the selection of textbooks, and in making curricula.

At present all schools in communities under 4500 are under the jurisdiction of the district superintendent. In practice the district superintendent seldom concerns himself with the work of the village board and its principal. However, since one of the most important objectives to be attained is the welding of a village and its outlying territory into a single educational unit, it is clear that a close coöperation is desirable between the district superintendent and the village principal. To meet this problem it is therefore proposed that after 1926 the district superintendent be not only the superintendent of the intermediate board but of each community board as well. Actually it will mean that the principal of the village school is the local administrator but subject to the district superintendent. Since the superintendent will, with such assistance as may be provided as time goes on supervise the outlying schools and since he is also the chief executive officer of the village school, he is thus in a position, as time goes on, to bring the two groups into more complete coöperation.

3. *The recommendation of a larger local unit of control whose actual boundaries are based upon such factors as topography, social solidarity, and trade area* is a third important outcome of the Survey.

New York is a State of mountains, hills, valleys, lakes, and rivers of such a nature as to favor the development of rather definite areas of social and industrial contacts. In view of this situation it is planned to utilize community units for local control. Professor Works, of Cornell University, who has for several years advocated some such unit, proposed its use in this survey and worked out the details of its application.

The map on next page illustrates this proposed community unit for Delaware County, in southeastern New York. The community units here outlined were proposed after an intensive study of the situation. It will be noticed that the community is not co-terminous with the town which in the township law of 1917 had been made the local unit of administration.

As may be expected in a State with long-established traditions the rural people hold to the school district. That this is true was clearly demonstrated during the agitation that led to the repeal of the township act. To meet, if possible, this attitude, the Committee has after canvassing various methods adopted a daring administrative proposal. It recommends that each present common school district be represented by its trustee upon the community board of education. The number of such districts will vary, but so far as can be determined the most frequent number will be about fifteen. The village that will usually be the center of this community district will be represented by its board of education. Should the village fear the domination of its schools by the surrounding districts it may elect

to the board a number not exceeding the number of representatives from outlying districts. This obviously cumbersome board has something to commend it. For one thing it is clear to those in touch with the situation that provision must be made for representation of the common-school districts if any larger unit for local administration is to be secured. Then the coming together of these people will in itself be an influence tending to break down the present barriers of provincialism and suspicion. What will very likely happen after a time is that the whole board will delegate many of its functions to an executive committee. In fact it would seem that some are now ready for such an organization if we may judge by the reaction from several communities where the proposed scheme has been presented. Accordingly the committee suggests two alternative types of representation: (1) A small board of, say six, three from the village with

an equal number for the rural sections; (2) a small board of, say five or seven, elected at large.

For making these community units the plan provides for the appointment by the Board of County Supervisors of a County Boundary Board. This will leave the definition of boundaries to local people. Where serious disputes arise or where adjustments must be made between counties, it is planned to submit the question to a State Commission made up of the Commissioner of Education and two persons, living under the rural education law, appointed by the Governor. This State Commission will also have the power to determine the number of intermediate units in the State after 1926.

Thus it will be seen that provision has been made for the development not only of a more intelligent interest in education but of an ability on the part of local people to perform effectively more of the functions of school control.

4. *A system of finance utilizing fundamental and constant factors for equalizing educational burdens and stimulating educational progress* is another contribution. At present New York as a State contributes about \$32,000,000 to the support of public schools. This is approximately 20 per cent of the entire cost. The remainder is paid by the various districts. As is to be expected the burdens in these districts vary greatly. In 1070 common school districts Dr. Updegraff found variations from less than 1.0 mill to 38.25 mills, the median being 5.44 mills on the real valuation. In union free school districts the median real levy is 8.94 mills; in cities and village, 9.90 mills. The State funds are at present distributed largely upon district and teacher bases. While the intent has clearly been to aid according to need and effort, studies that have been made show that the methods employed fall far short of accomplishing the purpose desired.

Students of educational administration are familiar with methods of distributing State-school funds. Such students are coming to realize that though the attendance basis is better in general than the census; the teacher better than the attendance; the valuation basis better than the teacher, etc., none of these can accomplish fully what is wanted because the factors are not fundamental in indicating either the need or the effort of any community and are not constant under varying conditions.

Dr. Updegraff has presented a plan that is an important contribution to the problem of apportioning State funds. Briefly his scheme is this: He found the median *real* valuation back of each teacher in the State, rural, and city combined. This was about \$290,000. Communities having a smaller valuation than this are therefore relatively in need of assistance. The *extent* to which any particular community is in need is dependent upon several factors: (1) The degree to which the per-teacher valuation of the community falls below \$290,000; (2) the number of teachers employed (since the \$290,000 is the valuation per teacher); (3) the amount of money it raises as indicated by the tax levy. The formula proposed by Dr. Updegraff for general aid is: (\$290,000 minus the per-teacher valua-

tion) times the number of teachers times the rate in mills times .626. The .626 is a figure that shows the relationship between the present per-teacher cost of schools (\$1054) and what a district with the median valuation (\$290,000) could raise with the median tax rate of 5.8 mills. Under this plan a community that is relatively poor will be aided in proportion to its relative poverty and its willingness to raise money for schools. The plan will encourage better things in education because money spent for better teachers, equipment, more curricula, and the like will increase the local tax and hence the amount that the State will give. However no community is to be aided beyond a local tax of 10 mills. If a community has a valuation over \$290,000 per teacher a flat grant per teacher is made the grant varying with the wealth of the community. Thus a community with a per-teacher valuation of \$300,000 to \$399,000 will receive \$40 per teacher while one with a valuation of \$70,000 or over will be entitled to but \$8 per teacher. In community districts in which the equalized valuation is less than \$350,000 per teacher there is to be a distribution for high-school teachers on the same basis as is provided for the support of elementary schools, to apply to all districts with an equalized valuation of \$350,000.

Dr. Updegraff then provides special aid to supplement this general aid. Thus, assistance is to be given for the erection of buildings and for major repairs, the aid varying with the wealth of the community; each expenditure of \$1200 for transportation is to add an additional teacher to the total number for whom aid is to be given; each normal-trained teacher in the outlying schools is to receive a bonus of \$20 per month.

With such an equitable scheme of State distribution added to the plan of making the community unit, rather than the common school district, the unit for local taxation, one of the great obstacles to the development of rural education in New York will be swept aside.

I have thus presented what seems to me to be the four most significant contributions of the New York Rural School Survey: (1) active control of the survey by a representative group of lay and professional people as a means of securing popular support; (2) the proposal of an administrative organization that looks toward a better distribution of authority in the control of schools; (3) a larger local unit of control based upon natural community boundaries; (4) a system of finance utilizing fundamental and constant factors in equalizing educational burdens and stimulating educational progress.

In evaluating the recommendations of the Committee of Twenty-one the reader should think of its proposals as providing not a *perfected* organism but a *developing* one. Some of the recommendations are not in accord with generally accepted administrative principles for the reason that the State is clearly not ready to accept those principles. However, the proposals do make provision for an organization that will tend to stimulate communities to overcome their own deficiencies.

SECRETARY'S MINUTES

BOSTON MEETING

OFFICERS

President—ERNEST BURNHAM, Normal School.....Kalamazoo Mich.
Vice-President—J. C. MUERMAN, Bureau of Education.....Washington, D. C.
Secretary—MABEL CARNEY, Teachers College, Columbia University.....New York City
Treasurer—WILLIAM M. ROBINSON, Principal Junior-Senior High School.....Orleans, Vt.

FIRST SESSION—MONDAY AFTERNOON, JULY 3, 1922

The Department of Rural Education of the National Education Association opened its sessions on Monday afternoon, July 3, at two o'clock in Jordan Hall of the Boston Conservatory of Music with the following program:

Some Eastern Contributions to Rural Education

THE HELPING TEACHER IN NEW JERSEY—Rachel Anne Fuller, Helping Teacher for Morris County, N. J.
 MEASUREMENT AS A MEANS OF SUPERVISION—Samuel S. Brooks, Union Superintendent of Schools, Winchester, N. H.
 RURAL SCHOOL ATTENDANCE IN MARYLAND—John F. Hershner, Assistant Superintendent and Chief Attendance Officer, Baltimore County, Towson, Md.
 COMMUNITY LEAGUES AND THE COÖPERATIVE EDUCATION ASSOCIATION OF VIRGINIA—George W. Guy, Executive Secretary, Richmond, Va.
 FINANCING RURAL SCHOOLS—Albert S. Cook, State Superintendent of Schools, Baltimore, Md.

SECOND SESSION—WEDNESDAY AFTERNOON, JULY 5, 1922

Some National Problems in Rural Education

THE CONSOLIDATION OF RURAL SCHOOLS—Lee L. Driver, Department of Education Harrisburg, Pennsylvania.
 THE PLACE OF THE ONE-TEACHER RURAL SCHOOL—Fannie W. Dunn, Teachers College, Columbia University, New York.
 SPECIAL NUMBER—Presented by Rural Teachers from Shelby County, Tennessee, in honor of Charl O. Williams, President of the National Education Association.
 THE SUPERVISION OF RURAL SCHOOLS IN DELAWARE (ILLUSTRATED WITH MOTION PICTURES)—Ina G. Barnes, Rural School Supervisor, Wilmington, Del.
 BUSINESS MEETING.

THIRD SESSION—FRIDAY AFTERNOON, JULY 7, 1922

Some Future Needs in Rural Education

THE NEEDS OF SMALL CHILDREN IN RURAL COMMUNITIES—Marion S. Hancel, Supervisor of Kindergarten and Primary Grades, Richmond, Va.
 THE NEED OF HIGH SCHOOL OPPORTUNITY FOR COUNTRY CHILDREN—William M. Robinson, Principal of the Junior-Senior High School, Orleans, Vt.
 THE EXTENT AND CONTROL OF RURAL CHILD LABOR—Charles E. Gibbons, National Child Labor Committee, New York City.
 DESIRABLE FUTURE DEVELOPMENTS IN THE EDUCATION OF RURAL PEOPLE—Kenyon L. Butterfield, President State Agricultural College, Amherst, Mass.

BUSINESS MEETING

At the business session on Wednesday afternoon the entire time was devoted to a consideration of the financial problems involved in the publication of the *Journal of Rural Education*. As a result of this discussion definite policies looking toward greater coöperation and efficiency in the future management of the magazine were adopted. Plans for its continued publication were also approved and delegated to the Secretary for execution.

THE HELPING TEACHER IN NEW JERSEY

RACHEL ANNE FULLER, HELPING TEACHER, MORRIS COUNTY, DOVER,
NEW JERSEY

The helping teacher is New Jersey's answer to the need of a plan for the supervision of rural schools. She is appointed by the Commissioner, her appointment is approved by the State Board of Education, and she is assigned to a county. Within the county her territory is selected by the county superintendent. It consists of those townships which are either too poor or too indifferent to secure supervision for their schools. She may thus be assigned to work in from three to seven or more townships and will direct from twenty-five to sixty teachers. The schools are largely of the one- and two-teacher type, with an increasing number of four- to six-teacher and even larger consolidated schools. In some counties there is one helping teacher, in others three or four. The county superintendent is the administrative officer of the county, and all administrative work is performed by him or by the local school boards. The helping teacher's job is specifically to improve classroom instruction and her work is expected to be purely supervisory. Entire charge of the classroom work and the pupil activity of the schools in her territory is in her hands.

The main features of such supervisory work are:

First—Her regular visits at intervals of from two weeks to two months; decided by (1) the geographical distribution of the schools; (2) the total number of teachers under her charge; (3) the possibility of doing a constructive piece of work.

Second—The monthly, bi-monthly, semi-yearly, or yearly, teachers' meetings, conferences, and visiting days.

Third—The hours and days spent by the supervisor at her own desk: thinking, planning, reading, studying, working out the solutions of the problems she will meet in the field.

The visits are for observation, for the analysis of some situation brought out by the teacher or the supervisor or the trial of a solution of such a problem; or they may be for the purpose of giving special tests to measure the pupils' progress according to a predetermined plan. The visit may have been planned for the purpose of developing some activity, as: the playground side of physical training, or the hot lunch program, or the reorganization of the morning exercises to make of them a real social feature. A large proportion of the visits of the helping teacher are made with the definite aim of improving the teaching of some subject, as, geography, or hygiene, or spelling, or good citizenship. Then her work may be a discussion of prepared topics with the teacher and the class. Or it may be that she will give a demonstration lesson. Or it may be that she will outline with the teacher a series of lessons or activities that will develop the subject in the manner desired. Always the visit will include friendly discussion of the work observed, and always commendation of effort and progress. Generally there will be a touch of constructive criticism or sug-

gestion for betterment, but this feature is quite as likely to be the teacher's criticism of her own work, as it is to be the supervisor's observation.

The supervisor rarely interrupts the regular program but makes herself an inconspicuous listener. Occasionally by previous arrangement she may take charge of a room to carry on some detail of her work. There will always be a relation of preceding visits to the present one, and a looking forward to the next visit, with definite suggestions for the amount of work to be done, or progress to be made.

Holding continuously in mind, as she does, the needs and abilities of each child and set of children, the single supervisor is able to direct the work of the whole school. She knows what are the best grade combinations to make, what organization of playground activities is best for the mixed groups of children. The helping teacher plan in operation in New Jersey is the best argument I know of against the proposal to try the advisability of having one supervisor to direct the primary grades, and another to guide the grammar grades.

From the teacher's standpoint think what it would mean to try to work with two or more supervisors. The organization of a one- or two-teacher school so as to benefit all pupils equally is a big task, when the teacher and the supervisor are putting their best efforts into it. Divide this task between supervisors urging the specific needs of different sections and the teacher will face an impossible situation. One supervisor will see the needs of the school as a whole, not the needs of one phase of the school's activities. Much of her plan and policy is developed in group teachers' meetings where by skillful leading the teachers are brought to contribute their experiences for the common good.

If, as is done in New Jersey and in Delaware, the plan of one supervisor to one set of children, one supervisor to one teacher, is carried out, it becomes evident that thorough and sound training in supervision is essential. No one realizes this more than does the supervisor who has worked as a helping teacher. She must not only have professional training, but she must have had a wide experience as a teacher. She must know from firsthand experience the actual schoolroom situations that arise, in each type of school. She must have faced and solved the infinite and amazing variety of problems that are the common lot of the rural teacher. She must work continuously for thorough scholarship. She must be consistent in demanding good citizenship on the part of the teachers and the children in that they shall perform thoroughly the work that is theirs to do. She must be expert in handling specific subject matter. And this must not be by any hit-or-miss method. Her experience and her training must have made her proficient in analysis, in remedial work, in applying her methods according to psychological principles.

To successfully employ supervision in any line all administrative duties must be excluded. This principle was firmly entrenched in the plan which Dr. Kendall developed. Any experienced educational leader realizes that the clerical work, the school board relations, the community leadership, the thousand and one decisions of an administrator, simply clog the current of

democratic supervision. In actual practice the helping teacher has found herself confronted by situation after situation where administrative work had to be performed by her if way was to be made clear for the progressive improvement of classroom instruction.

One instance will suffice for illustration, as it is most typical of the helping teacher's experience. No rural school has ever had an abundance of textbooks for reading. The common rule is a single book for a grade. Few schools have supplementary texts. None have suitably chosen and graded books for independent reading. It became most imperative that the helping teacher set in motion machinery to get that situation changed. Neither she nor the classroom teacher could even begin to improve classroom instruction in this most fundamental subject until the administration had provided the tools. Her success in changing this condition to one in which it was possible to begin real supervisory work in the teaching of reading has led the helping teacher to undertake other administrative work.

Bit by bit she has performed practically all the duties of an administrator. But she has never lost sight of the necessity for dropping such extraneous work the moment the proper authorities could be educated to see for themselves the need of their performance. She has attended board meetings for the purpose of acquainting the officers with the conditions of their schools; she has had to initiate programs for them and persuade the adoption of sound plans of procedure. She has been obliged to take the leadership in rousing the community from lethargy or animosity to intelligent co-operative action in behalf of its own children. She has had to struggle to open the eyes of such an awakening community to its civic duty and privilege of electing to the school board men and women of good standing and real ability. The time for a gradual relaxing of this community work is beginning to appear in the growing strength of organizations like the home-school associations and mothers' clubs.

The helping teacher has been the prime mover and backer of such large movements for the public good as the employment of public health nurses and the elimination of the old-style medical inspector; of the establishment of the county traveling library; of health programs on a county-wide basis; of county festivals and play days. New Jersey has reason to be proud of the splendid achievements of her most experienced helping teachers. But the helping teacher herself knows that she is but clearing her path of the bulk of administrative work that was "nobody's" business unless she made it hers. The hopeful factor is the growing recognition on the part of all educators that this type of work, wonderful and necessary as it is, is not supervision. Remarkable as have been the achievements of the body of helping teachers in the past six years they are looking forward to the time when they shall have "no administrative duties," as was Dr. Kendall's plan. The coming of that day will mark another goal in the progress of rural supervision.

If the supervisor's policies are worth anything at all they are worth enthusiastic effort. No helping teacher but has suffered acute discouragement over the ineptitude of her teachers. She has large numbers of teachers

who through lack of personality, lack of scholarship, or some other reason, have no business in the schoolroom. She has others whose potentialities are great. From them she must secure, not passive acquiescence, but intelligent coöperative performance. And this has been one of the crowning achievements of the helping teacher. She has developed a faculty for making friends, and the coöperation which is inseparable from real friendship has followed. This has made it possible for her to play a waiting game, but one in which the supervisor must inevitably win. Right here lies one of the greatest causes for discouragement and disappointment on the part of the supervisor. It is one of the best illustrations of the need for more thorough and intelligent administration. I refer to the teacher turnover, which yearly sifts out, not the incompetent and the unfit, but the best of the rural teachers.

To make friends with from twenty-five to sixty teachers is in itself no mean accomplishment. To bring these diverse natures into agreement and harmony of action, and lay plans for another year's growth is tremendous gain. How discouraging then to find that the new year presents a fifty per cent change of personnel, and all the delicate work of establishing the right relationship must be done over again. Not until the administration sees that it is an acute money loss to allow this situation to remain unchanged is it going to be cured. It is an administrative duty to see that salaries paid to good teachers are sufficient to hold these teachers year after year. It is the administrator's work to provide right physical conditions and to supply sufficient and proper equipment. It is unquestionably the administrator's duty to remove the inefficient teacher.

An element that is beginning to present itself as a partial solution is the large number of splendid young people now coming up through the elementary schools under helping teacher supervision. For the helping teachers who worked with Dr. Kendall, Mr. Scott, Mr. Pitkin, learned to clarify their own plans so that the ultimate aim was as clear as any past performance could be. Day by day, week by week, year after year, they learned to eliminate non-essentials. They concentrated on essentials, and analyzed each essential into its parts. Step after step was made plain. Purpose, plan, method, procedure, was worked over and over. Unlimited patience went into the perfecting of technique, but under that was infinite care of the details of preparation. Teachers have learned to *know* themselves and steadfastly adhere to a program of advancement. Pupils are beginning to see that their little tasks are a part of a whole, and that the perfection of the whole depends upon the sound construction of each tiny part. Teachers, patrons, pupils, have learned to look to the helping teacher for educational leadership, and to compel themselves to greater achievement along the lines of modern education. Some of these young people will be trained and ready before many years to take teaching positions. Their advent into the ranks will mark another big step in the development of rural supervision by the helping teachers. For these young people are going to enter the work with a newly created respect for and loyalty to rural education. And they

will be prompt and enthusiastic in their acceptance of all that wise supervision can mean.

This marks, I believe, the end of the first epoch of helping teacher supervision. I venture to prophesy that the next big goal reached by the workers in rural education in New Jersey will be a complete acceptance of the helping teacher's rôle as the educational leader in her territory. Educational plans and policies as applied to that territory will be adopted only after receiving her careful consideration and approval. The whole educational scheme of rural communities under helping teacher supervision will be laid along broad lines, will be planned well into the future, will be sound in every detail.

The foundation for this belief lies in one phrase of Dr. Kendall's first report on the appointment of helping teachers in New Jersey, and has to do with helping teacher work as a profession. Dr. Kendall said: "A condition of employment shall be attendance upon summer school." An innocent requirement, but one fraught with the largest possibilities. Under the stimulation and inspiration of Dr. Kendall's wise leadership the helping teacher has grown to be not only a superior teacher with undeveloped potentialities, but a woman of wide and sound experience, broadly educated, holding bachelor's and master's degrees in her chosen field. She has raised her own standards, and has deepened her respect for the field of rural work. Given the right freedom now the helping teacher form of supervision will spell for the rural children under it the real beginning of equal educational opportunity.

I would not leave this subject without warning again that to permit rural supervisors, helping teachers, or whatever they may be called, to continue to do a large part of the work of the administrator, is to kill the best development of rural work. Each has its place and its part: the pupils, the teacher, the supervisor, the administrator, the school board, and the community and its organizations. The supervisor's work must be allowed to widen and deepen its own channel, else this growth of alien work will dangerously disguise its course.

The ways and means employed by the helping teacher and the tasks she has undertaken are so varied that a perusal of the yearly reports of that first group fascinates the reader. Her accomplishments have been great. Much of what she has done could be challenged as being not supervisory but legitimate administrative work. Yet the greatness of the need and the delays to the real work of the helping teacher if this administrative work were not performed, have in practically every instance justified the temporary employment of such means. All of the work of the first helping teachers, whether strictly supervisory or wholly administrative; whether it belonged in the activities of the helping teacher, or was the duty of the administrator, the school board, or the community, if it has contributed, and is contributing, to the arousing of rural America from its educational somnolence, has been and is, sound policy.

COMMUNITY LEAGUES OF VIRGINIA AND THEIR CONTRIBUTION TO RURAL EDUCATION

GEORGE W. GUY, EXECUTIVE SECRETARY, COÖPERATIVE EDUCATION
ASSOCIATION OF VIRGINIA, RICHMOND, VIRGINIA

The Coöperative Education Association of Virginia was organized in 1904 as a part of the great educational revival of the South. In 1905 it conducted the historic "May Campaign" during which time the State was covered with speakers in the interest of educational opportunities for the youth of the Old Dominion. It conducted the first two educational conferences held in Virginia, which conferences were participated in by the Department of Public Instruction and the State Teachers' Association and have come now to be the great educational gathering of the forces of education in Virginia during Thanksgiving week.

The Association is under the direction of the Governor of Virginia, the State departments, the higher institutions of learning and a group of citizens. The State superintendent of public instruction is chairman of the Executive Committee.

The Association organized the movement to interest our citizenship in public education and for this purpose it formed "School and Civic Leagues," with the schoolhouse as a center of work. These Leagues have developed into *community leagues*—centers where is crystallized the sentiment which finds expression in better schools, better health, better churches, and Sunday schools, better recreation, better care of the poor and delinquent, better homes, beauty and cleanliness of the home town, and better community leadership. The plan is to help and inspire the people to help themselves and to get the unorganized communities organized for self-help.

The grown people are organized into *community leagues* and the school children into *junior community leagues* and the organizations work together. The leagues of each county are organized into a federation with a president in charge of the county work; the county federations are organized into districts, with a Chairman in charge, following the same plan as that used by the State Teachers' Association. The local leagues meet once a month or oftener, the county federation at the time of the teachers' institutes in the fall and the district rally as a part of the district educational conference, usually in the spring.

The State meeting is held as a part of the State Educational Conference Thanksgiving week. Over 600 citizens were present last year at the State meeting, in addition to hundreds of teachers who visited the exhibits of the Association and attended its sessions. These league delegates were given an opportunity to make report of work accomplished during the year, business sessions are held and plans for the coming year's work discussed. Congressman Horace Mann Towner, co-author of the Towner-Sterling Bill, was our principal speaker last year and addressed our delegates on The Citizen's Interest in Education, explaining in detail the creation of a Department of Education, with a Secretary in the President's cabinet.

The Association is a big citizens' organization having for its prime purpose the betterment of the educational and civic needs of Virginia and the Nation. It is composed of men and women, boys and girls, officials and non-officials, all working together through the leagues with one aim, one hope, and one supreme faith for the development of the highest type of citizenship.

The late Franklin K. Lane said that the thing that impressed him so favorably with the work was that it was so practical, that we did not waste our time with vague theories as wide as the world but got down to the one big job of the world—in making the home town and all its parts better to look at, live in, and work with. Dr. W. S. Learned, of the Carnegie Foundation, who studied our Association very closely, says: "The Coöperative Education Association is the most appropriate, comprehensive, and effective organization in bringing about community coöperation with special reference to schools that is to be seen anywhere in the country and its vitality is particularly evident from its success in accomplishing so much with so little money."

The keystone of the Association is coöperation and where we have loyal, whole-hearted coöperation it follows as night follows day, we must have progress. Our motto: "Every public school in Virginia a community center where the citizens may unite for the improvement of their educational, social, moral, physical, civic, and economic interests." A broad program; yes, but it takes a broad program to enlist the citizenship of a State. Last year there were approximately 400,000 citizens who came together to discuss and study the various phases of school and community work, under the auspices of the community leagues. As a result of these group meetings intelligent public sentiment was created for the improvement of schools which has resulted in the passage of several million dollars in bond issue for schools quite recently. Public opinion is fast crystallizing for a large bond issue for roads. The health meetings held in various communities, in coöperation with the State Board of Health, have reduced typhoid fever from 14,000 to less than 3000 cases, or a saving of \$11,000,000, apart from the loss of life, suffering, and suspense.

Monthly programs are sent to the local leagues, emphasizing each month some particular phase of work to be done. Each State department head sends a special letter to the leagues calling attention to the needs along their particular line. The leagues are asked to do definite work and the suggestions are given them in a very concrete manner. For instance, take this month—July. A Citizenship Day Celebration has been planned for them and a copy of the program, with appropriate readings, music, pageant, etc., sent to each organization. The Governor of Virginia wrote a special message to our workers, calling upon them to set aside the fourth of July in celebration of CITIZENSHIP, its opportunities and responsibilities. The mayor of Philadelphia sent a beautiful photograph of the Liberty Bell for reproduction in our paper, "The Community League News," and the Community Service, Inc., supplied a pageant which we printed and distributed. Special request was made for honoring the new voters of the State—the

young men and young women who have acquired the right to vote within the past year, bringing to their attention the questions of vital interest to our citizens at this time.

The reports that come to our office show this year 116 definite objectives, including every activity from cleaning the schoolhouse to the erection of buildings and teacherages. The leagues assisted in equipping schools with adequate laboratories and libraries, playground and athletic equipment, supplemented salaries of the teachers, principals, and janitors, purchased pianos and phonographs, and moving-picture machines, entertained the teachers at institutes and at the beginning of the school session. Nearly two hundred thousand dollars was raised by 891 leagues that reported to the central office last year and the small beginning started by these leagues grew into a considerable amount as a community project. Three leagues that I have in mind raised less than \$17,000 in actual money, yet their plants aggregate nearly two hundred and fifty thousand dollars. Many times the league will raise the first hundred or thousand dollars and as the interest in the work is increased the sum grows by leaps and bounds until a new building, a teacherage, an auditorium, or ample equipment has been secured.

Many times I have seen a few books grow into a community library, a few bricks into a modern consolidated school and large, uninviting fields to attractive playgrounds with rollicking, romping children enjoying life to its fullest extent. The magic touch of the league animated by the community spirit has wrought a wonderful work among our rural schools. The biggest thing we have after all is not the development of the commercial and industrial activities, the size of our bank accounts or the expanse and extent of our territorial domain, the biggest thing that we have is that community spirit. That is the cement that binds our society together and has made America the leader of nations. If America is to continue to be great and be the Good Samaritan among the peoples of the earth she must still rely upon that community spirit which has given us our place of power, influence, and prestige.

Advantages of community effort—1. The leagues will become recruiting stations. They will discover men and women of initiative and directive power that might otherwise escape notice. They will set free the energy in the mass of our people as well as in the advantaged man. All the people, if united, in a noble purpose can accomplish far more than the most transcendent genius, even Napoleon himself if he attempts it single handed. The spirit of the whole educational movement condenses itself into the one word, coöperation.

2. The people on the spot know better the needs of the neighborhood than the leaders at a distance. If States differ, communities vary.

3. Through the leagues you enlist the constructive interest of all the citizens. The distinctive thing about the present educational revival is the part played by the citizens as distinguished from the teachers and officials. In seeking to energize democracy in the South, the school is merely a means

to an end. To stir the interest of citizens, to enlist their resources, to vitalize every neighborhood is the object of the leagues.

4. The local leagues give vitality to a community's will. What the brain is to the body that organization is to the community. Too long in the South the neighborhood has lacked a nucleating center for social progress which the school is admirably adapted to supply.

5. The whole program of the South is found in miniature in the neighborhood. The reclamation of exhausted soils, the improvement of roads, the development of industries, the betterment of the home, the growth of public libraries, the frank discussion of every public issue—all these aspects of Southern life lead up in the local league, which through the school tries to give efficiency to the community's will in the interest of progress. Thus the scope of the school is far wider than what we ordinarily mean by the term education. The school is to be the agency through which the economic, social, intellectual, political, and religious conditions in the neighborhood are to be transformed according to the spirit of order, progress, and national well-being.

The Rural Life Conference held in Richmond, May, 1921, the first State Conference of its kind held south of the Potomac River, was called through the suggestion of the Association. In this conference every State department having to do with rural life coöperated, and as a result citizens from every section of Virginia were in attendance during the two-days' conference. A permanent committee of 25, with Congressman R. Walton Moore as its Chairman, was formed for the purpose of conducting a State-wide campaign, holding group meetings in every school district in the State, using local, State, and National speakers for the purpose of stimulating a more definite and vigorous interest in the rural life conditions and to knit more closely together the agricultural, educational, religious, and all organizations having a common purpose. The campaign has just been conducted most successfully; over five hundred speakers volunteered their services; county directors were appointed and throughout all sections of the State group meetings were held that people might get together and discuss their own problems in their own way. This simultaneous effort has brought forth most enthusiastic and inspiring reports; many definite things have been accomplished and the campaign will be of tremendous value to our rural folk.

At a meeting held recently in our State the band played "America" and the audience stood and sang the familiar words. As the last strains of the song died away, one of the men present, with tears of patriotic delight trickling down his cheeks, turned to his neighbor and said, "Oh, that I could die for my country." My friends, there is a patriotism of peace as well as war and history tells us that where one government has been destroyed by wars and pestilence and all other calamities combined, corruption in time of peace has undermined a score. There is just as much patriotism in giving one's time to the betterment of civic conditions, in getting good people into office as in baring one's breast to the bullets of the enemy in time of war. In every sphere of life the right, the true, the

law, education must always be fought for; the wrong, the lawless, the ignorant must always be fought against. It is not enough to be merely against wrong; you must be actively against it for your influence to count. The farmer must not only sow the useful grain, but he must care for it and mature it, while the briars and thistles sown by accident and cared for by chance will flourish anywhere. So a field neglected will not grow up in useful grain, but in briars and thistles. A child neglected will not become educated or a good citizen of its own accord, but he will become bad and ignorant and to make that child good and to educate him takes the activity, the energy, and the best thought of the community.

There is a story of an Eastern King who caused a great palace to be erected as the abode of majesty and power. Stone by stone the structure grew and the heart of the king swelled with pride. One morning the palace was in ruins. "What great treason hath been accomplished here!" the king exclaimed. But a wise man of the court thus admonished the king: "There has been no treason here, thy house that was great and mighty has fallen, because the builders used mortar without sand, hence their work has come to ruin." So with the State; external grandeur counts for nothing. We may calculate our wealth as the sands of the sea, we may build the domes of our capitals and the spires of our churches until they pierce the clouds and glitter among the stars; all must fall and crumble away unless it be welded and strengthened by those principles of Christian education that constitute the groundwork of an enlightened citizenship.

THE CONSOLIDATION OF RURAL SCHOOLS

LEE L. DRIVER, DIRECTOR OF THE BUREAU OF RURAL EDUCATION, DEPARTMENT OF EDUCATION, HARRISBURG, PENNSYLVANIA

It might not be profitable to go into the history of consolidation very much, but I believe it would be of interest to trace in a brief way some of the high spots in the development of this class of school.

Consolidated schools have not arisen like mushrooms; they are the result of a gradual growth. Mr. W. S. Booth and Mr. U. J. Hoffman in the *Illinois Bulletin on Consolidation of Schools*, 1921, in answer to the question—"When and where did the idea of consolidation originate?"—gave this answer:

In 1853 a law was passed in New York permitting consolidation. This law was amended in 1864 but not much progress was made. Massachusetts claims to be the pioneer in this work. In 1869 Massachusetts passed a law permitting both consolidation and transportation. Not much progress was made in this State until 1890 when the movement gained much headway.

The movement was not taken up in other States until 1889 when the Connecticut legislature first authorized the consolidation of districts and in a few years provided for transportation. Maine, Rhode Island, and Vermont soon followed with laws authorizing consolidation of schools. Pennsylvania authorized the expenditure of school money for transportation in 1897 and the consolidation of schools in 1901. Ohio started the work in 1894 and made the law State-wide in 1898, and made an additional advance in 1914. Indiana first authorized consolidation and transportation in 1889. Perhaps the greatest development of the plan has been in

Indiana, Ohio, and Iowa. Minnesota has also made great progress in consolidation. The movement has gained headway in the southern and western States. In fact, the plan seems to be a Nation-wide movement.

Mr. Burr F. Jones, Agent for Elementary Education in the Massachusetts Bulletin of 1920, says:

It would be difficult to say when and where the first consolidation of schools occurred in Massachusetts. In the larger towns centralization of schools occurred at a very early date. The Latin grammar schools of the seventeenth century were centralized schools, each school being established for the benefit of the whole town, and the pupils being required to know how to read before admission was granted. For the purpose of supplying this elementary knowledge of reading, dame schools had been established by many towns before the Revolutionary War. By 1850, a third division, the intermediate school, had become common. In 1847 Boston instituted the graded school with separate classrooms, a type which was widely and speedily copied in the larger towns of the State.

In the rural communities progress was not so rapid. By 1869, however, enough centralization had been effected to bring about the passage of an act to authorize towns to raise and appropriate money for conveying pupils to and from the public schools, the money so raised to be expended by the school committee at its discretion. Towns immediately took advantage of this provision, both to convey remotely situated pupils to the high schools, and to convey elementary-school pupils from small districts to larger ones.

In his annual report of 1880, to the Massachusetts Board of Education, Secretary John W. Dickinson recommended "that the towns unite their very small schools, if they happen to have any, into larger ones. If necessary, a small appropriation may be made for the transportation of those pupils who would otherwise be obliged to walk a long distance. This plan is already adopted in many towns, and wherever it has been faithfully tried it has proved eminently satisfactory."

An Iowa Bulletin states, "The first consolidated school in Iowa was organized at Buffalo Center, Winnebago County. Transportation of pupils was begun in 1897, and by 1899 the new system was well established. The second consolidated school in the State was established at Terrill in 1901, the third at Marathon, 1902, and the fourth in Lake Township, Clay County, 1903."

In *The Story of Rural School Consolidation in Indiana* we find the following:

Caleb Mills, a pioneer educator of Indiana, probably was the father of the consolidated school idea. As far back as 1856, when he was the State superintendent of public instruction, Mr. Mills put forward some suggestions looking to the abandonment of the one-room, one-teacher district school. He favored the larger units and drew the fire of much opposition. In his report for 1856 he presented his views.

The superior wisdom and economy of the large over the small districts, said he, become apparent on a fair exhibit and impartial comparison of their legitimate results. A township of thirty-six square miles may be divided into districts of two miles square, as many of them really are. Thus carved, it presents nine cozy, quasi corporations with a corresponding number of children, often so small as to forbid the establishment of a school, or, if established, so insignificant as to belittle the enterprise and leave an unfavorable impression of its real character and consequence on the public mind. These nine schools, enfeebled by their numerical poverty, languish, droop and become so attenuated that it is difficult to ascertain whether there is any literary life and activity in either teachers or taught. It is a very natural conclusion that is often reached and acted on by trustees, that the schools are too small to justify the employment of first-class

teachers and therefore an inferior grade is sought and installed in these centers of literature and science to engineer their charge through the sublime mysteries of their own ignorance, put in the time and obtain a certified claim to a portion of the public funds. A more legitimate conclusion from given premises was never reached than that small districts insure small and ill-furnished structures, short terms, incompetent teachers and corresponding instruction, lifeless schools, and unawakened intellects.

Equally interesting information could be had from various parts of America. It will be seen, however, that the idea of consolidation seems to have originated in Massachusetts, at least it was first practiced there. Mr. Mills, however, seems to have been the first one west of the Appalachians to advocate this policy.

There is no movement before the rural-school people today of greater importance than the consolidation of its schools and there certainly is no problem that is receiving greater attention on the part of school administrators in all the States. The little red schoolhouse of song and story has ceased to function commensurate with the demands made upon society. Of course, there are those who harken back to the time "when we were boys" and view with a great deal of alarm that the institutions so near and dear to them are to be superseded by modern institutions.

A school administrator is constantly coming into contact with those who are opposed to this system and who offer all sorts of reasons, excuses, and suggestions as to why the new school should not be instituted. In other words, their policy is more of opposition than of construction. Back of the objection is the objector and before his position can be fully understood, his real motive must be known. The mere assignment of a reason does not necessarily carry with it any weight.

For example, we have on file in our Department this objection to the consolidated school, "The condition of our roads." One community objects to it because their roads are all improved, while another community objects to it because none of their roads are improved. The first states that it is unwise to travel on an improved road with children; the second that it is impossible to travel with children on an unimproved road. Of course, back of this is the real reason for their not wanting the school. Right here let us note that practically every objection, where consolidation is feasible, can be removed by proper administration.

Before consolidation is attempted in a community a thorough survey of that community should be made. This should be done by the county superintendent, at least it should be county-wide so that the entire county may be covered in the program and that no obscure community may be left hopelessly stranded. This survey should include the topography, the number, location, and condition of the public highways, the number and location of residences; the centers of population; the trade, civic, church, and political centers; assessed valuations; the possibilities of growth and improvement of the general character of the people.

No pains should be spared to educate the people of a community to the needs of such a school. The people should be prepared to go with the movement as much as it is possible although the time has never been, and

probably will never be, that one could wait until all the people were favorable to the project. Majorities are not always right and oftentimes the weight of an intelligent minority in a community should be considered rather than the majority of people. I like to think that the determining factor should be the majority of the intelligence of a community rather than a majority of number.

This school should be established with the view of meeting the needs of the life of the people of the community. We do not need to discuss here that the course of study should appeal to the people. Every child is entitled to be educated for the life he is to live, and he should be given opportunity in his elementary school, as well as in high school to help form a basis for determining what his work is to be. The fundamentals should be given, and in addition to that music, drawing, commercial work, and vocational work should be offered. Every consolidated school should, as far as possible, consist of both elementary and high school. If the full four-year high school cannot be established then as much of it as is feasible should be.

The school building should be large enough to more than meet the needs of the community. We presume that more mistakes have been made, oftentimes with the full knowledge of the administrators, in erecting buildings too small than in any other one thing. The pioneer in this movement especially found it impossible to have auditoriums, gymnasiums, and laboratories.

The location of the building is important. Generally speaking it should be located to give the greatest opportunity to the greatest number of children with the least amount of transportation. This is often modified, however, by the topography and condition of the roads. In conducting a campaign for consolidated schools, we have generally found that it is best to permit the question of the particular location to go unconsidered until all other necessary problems have been solved. People will quarrel more upon this point than upon any, or probably, all other points put together.

But when a school is once established, its success is only partially assured. Among the greatest problems of administration is that of transportation. A careful study should be made of the school community. Transportation routes should be established that will require a minimum amount of distance and time. The transportation vehicle should be placed in charge of a thoroughly responsible driver.

Ordinarily, the vehicle should be owned by the school district, but whether it is or is not owned by the district the directors should insist that it is sanitary, warm, safe, and comfortable for the children.

Too much attention and care cannot be paid to the selection of the driver. If people in the community are to do the work, we have found it ordinarily best to employ the man whose children are the first on the wagon and the last to leave it. This places the responsibility for the time of leaving, where objection is most apt to be raised.

Many States have adopted the plan of the teachers driving the school conveyances. This has been done with a great deal of success, especially in those places where the teachers live in a teacherage, or near the school

building. There should be a definite route established with a definite schedule and an insistence upon the vehicle maintaining this schedule. The driver should be placed under bond as well as contract for the efficient rendition of his work. A copy of a contract that has been found acceptable in many communities will be found at the end of this article.

In most States, the wagon driver has by law been given the full power of control as well as responsibility of the children while in the conveyance to and from school. This is as it should be. The county superintendent, as well as the school directors, should always investigate any legitimate objections, or complaints, that arise. When this is done they will be in a much better position to suggest a remedy.

A garage, or suitable shelter, should be provided at the school building for the housing of the school vehicle.

Teacherages should be built wherever possible in connection with the consolidated school. Many States have authorized the building of these homes out of public funds. So far as we know all States which have established teacherages are convinced that it is a wise thing to do.

A consolidated school should be so administered that it becomes the logical center for all community activities and if it does not become such a center, it isn't functioning as it should. Public sentiment, as well as community character, can be formed and shaped in the consolidated school. The school soon reflects the real spirit of the community. The school builds the community as well as the community builds the school.

The consolidated school gives school directors an opportunity to expend public money in the most efficient way. It gives them the opportunity to apply the fundamental principle that schools should be administered on the policy of not how little, or how cheap they can be maintained, but how well, and how much can be efficiently expended. The taxpayer's interest must, of course, be considered, but this is best considered when his money is expended to the best interest of the child. School taxes should be regarded as an investment, and the school should give the investor return for his money. This return, of course, will come in character, a high-grade citizenship, and a community stability that is worthwhile.

The period of the little red one-room school wherever it can be eliminated is past. Conditions no longer warrant such a wasteful expenditure of public funds, or, far worse, the lack of opportunity for boys and girls.

Children are not chattels, although they are so regarded in some places; they are beings entrusted to the care of the schools, and the schools can only perform that obligation best when they have given to these children the best that is possible to obtain.

In every State in the Union and in practically every community in which consolidation has been given a fair trial, consolidated schools have fully established their superiority over the ungraded school. We gave in the opening of this paper a sketch of the beginning of this movement. But today we are not so much interested as to who had the first consolidated school as we are in knowing who has the last consolidated school, and you can easily find out who has the last consolidated school in any given community by asking its superintendent.

TRANSPORTATION CONTRACT

Route No. County, Township

This agreement entered into this day of 19.., by and between the School District of County, by its Board of School Directors, party of the first part, and of, party of the second part.

The party of the first part hereto hereby contracts with the party of the second part for the transportation to the School of all of the children of school age which reside along or adjacent to the route hereinafter scheduled during the school year 19..-19.. upon the terms and conditions hereinafter specified.

1. The party of the first part shall pay to the party of the second part the sum of dollars per day for every day he transports said children, said payments to be made at the end of each school month unless otherwise specified.

2. The party of the part shall furnish the conveyance to be used and maintain the same in good order and repair.

3. The expense of operating said conveyance, if it be horse drawn, shall be borne by the party of the second part. He shall furnish, keep and feed all horses, supply and maintain all harness and other incidental equipment necessary. The party of the first part shall supply at its own cost all gasoline, oil, grease, tires, and other necessary equipment if said conveyance be motor driven. The party of the second part shall keep said conveyance in a clean and sanitary condition and shall wash it sufficiently to maintain the paint and metal parts in good appearance.

4. The conveyance herein provided for shall be operated on the following schedule, a copy of which shall be supplied to the person in charge or control of the children to be transported.

Beginning at:	Time	Returning to	Time
.....			
.....			
.....			
.....			
.....			
Arriving at school.....		Leaving school	

5. The party of the second part is expected to wait a reasonable length of time for the children along his route and shall not leave any point on his schedule before two minutes after the time designated thereon, unless all children to be transported from said point are on board the conveyance.

The said party of the second part shall have control of all children while they are being transported by him and shall maintain discipline while said children are in his charge or control. He shall treat all children in a gentlemanly and civil manner and shall care for and safeguard them to the best of his ability. He shall not use tobacco or permit it to be used by anyone in said conveyance while children are being transported. He shall cause the conveyance to come to a full stop before crossing any steam or electric railway and ascertain positively that it is safe to cross said railway before attempting to do so. He shall take such other care and precautions as the law or good judgment may require to safeguard those in his charge.

6. This contract shall not be transferred or assigned without the written consent of the party of the first part endorsed on the reverse side hereof. No temporary substitute may undertake the duties of the party of the second part without the consent of the party of the first part.

7. The party of the second part further agrees to give reports and information to the party of the first part or its designated representative, upon request, concerning the conduct of the children, the condition of the conveyance, maintenance of schedule, or other matters connected with this contract.

8. Any violation of the terms of this contract may, at the option of the party of the first part, operate as a forfeiture thereof.

9. The party of the first part shall adjust all matters arising out of this contract not specifically provided for therein.

In witness whereof the parties above named have hereto set their hands and seals the day and year aforesaid.

(School District)

By
President.

.....,
Secretary.
[SEAL.]

Bond

Know all men by these presents, that we as Principal, and as surety or sureties are held and firmly bound unto the School District of, County, Penna., its successors or assigns, in the sum of; to which payment well and truly to be made, we do bind ourselves, our heirs, executors, and administrators, and every of them, firmly by these presents; sealed with our seal, and dated the day of A. D. one thousand nine hundred and twenty.

The condition of this obligation is such, that if the above bounden
....., his heirs, executors, administrators, or any of them, shall and
do well and truly comply with all of the conditions and undertakings in the fore-
going contract to the best of their ability and do fulfill all the terms thereof unless
duly released therefrom and particularly do at all times exercise special care and
caution for the welfare of the children transported under the foregoing contract,
and provided that the said principal or sureties shall reimburse the district for
all loss incurred by reason of the non-performance or mis-performance of the
duties specified in said contract, then this obligation shall be void and of none
effect, but otherwise it shall remain in full force and virtue.

[illegible]

Assignment

For value received the party of the second part hereto hereby transfers, sets over, and assigns to all of his right, title, and interest in and to the foregoing contract which said assignment, to be valid, shall be approved by party of the first part.

.....

Approved this day of by
School District.

By Pres.
..... Sec.

THE NEED OF HIGH SCHOOL OPPORTUNITY FOR COUNTRY CHILDREN

WILLIAM M. ROBINSON, PRINCIPAL OF THE JUNIOR-SENIOR HIGH SCHOOL,
ORLEANS, VERMONT

President Harding is quoted as saying, "The opportunity for country boys and girls to have high-school education is all too slight. . . . We owe it to the childhood of the nation and the childhood of the agricultural districts of our land, to place at its disposal the utmost in educational facilities." The need for more rural high schools is imperative. Government reports in 1910 show that 85 per cent of the high schools in the United States are rural, *i. e.*, high schools supported by communities with populations of less than 2500. These enroll 40 per cent of all high-school students. This means, assuming that the numbers of urban and rural pupils of high school age are equal, that the urban child has a 50 per cent better chance than the rural child to be in high school.

A study made by the supervising teachers of the State of Wisconsin, which does not count the number failing or dropping out of school, shows that 54 per cent of the pupils who graduated from the 8th grade in the rural schools in June, 1920, went on to high school. Another study of twenty-five counties shows that out of 3187 children in the 8th grade in rural schools in June, 1921, 2026 received diplomas and only 1052 of these went on to high school. These figures do not include the 33 per cent who drop out before reaching the seventh grade, or the mortality between the grades and the high school would be considerably higher.

A partial study made by the Bureau of Education in 1918, indicates that but 5 per cent of all rural pupils graduate from high school as compared to 29 per cent of all urban pupils. This means in terms of high school graduation, that the city child has almost six times the opportunity of the country child. Does this seem fair to the rural child who has already been handicapped in the elementary school by a 40 per cent less per capita expenditure per year, by a school year shorter by over two months, and by an average daily attendance nearly 20 per cent poorer than that of the urban child? This handicap is not lessened by the fact that he is being trained by rural teachers, one third of whom have never completed even a high school course and hence are likely to give him a training less broad and of poorer quality than that received by the urban child.

The one-room school is not, except under rarest circumstances, a good school for rural children between 12 and 16 years of age. Except where consolidated schools exist, little or no adequate provision is made for the continued general education of rural young people between these ages. Many of the rural high schools as they now exist are futile agencies for the continued cultural and civic education of those of their pupils who are not planning to meet college entrance requirements. And college authorities inform us that even this 5 per cent or less are very poorly trained.

How may we meet the urgent need of high-school opportunity for country

children? The solution lies first, in arousing the rural folk to a recognition of their need of educational equality, second, in providing school organizations and courses of study suited to their needs, third, in securing rural-minded teachers, professionally trained for these schools. I shall discuss each of these briefly.

Publicity is one of the most frequently recommended methods of reform in rural school conditions. Sentiment must be aroused by press editorials, school notes, school demonstrations and exhibits of work, community meetings and parent-teachers' associations, and the enthusiasm of the teachers. The people must be aroused from their lethargic attitude toward the traditional rural schools with their inferior educational facilities. An appreciation of the rural school must be developed. People must get the vision that its aim is not to prepare for soft snaps nor white collar jobs, but for real citizenship. They must become acquainted with the new demands made on the school and its changes to meet these demands. They must be helped to see that a high school education is an investment fitting pupils to their places in society and paying dividends to the community, the State, and the Nation. School trustees must be led to see that their primary function is not to supervise nor administer the work of the school, but to employ one for that purpose who is specially trained in these lines and hold him strictly accountable for results.

To those who may object to educational progress on the basis of higher taxes involved we may add that it is probable that by the time the rural folk may be aroused to their need, that sufficient Federal and State funds will be available for distribution among those districts unable to support an adequate program of education to give them equality in educational opportunities.

But interest alone is not enough to enroll and to hold pupils in the rural high school. Its type of organization and offerings should appeal to rural pupils. In this day of propaganda, of destructionists, fusionists, and advocates of the game, we must cautiously choose our way.

Occasionally, however, a movement is set on foot that seems sufficiently in accord with experience and with common sense to give some promise of permanence and hence to justify serious consideration. I refer to the rural junior high-school movement which I have had the opportunity to observe at work for the past three years. In the last six or seven years in Vermont these schools have grown in number from five to fifty. Briefly stated the Vermont junior high school includes the seventh, eighth, ninth, and tenth grades.

Some of the advantages of this organization are, first, it facilitates departure from the antiquated traditional methods and subject matter since patrons and teachers alike are unaccustomed to it, and changes may be made with little outside objection. Second, it recognizes the principle of individual difference, those of adolescence being given special attention. Third, it affords social, moral, intellectual, and physical environment better adapted to the seventh and eighth grades than older organizations. Fourth, according to reports from various parts of the country, it has greater hold-

ing power on the pupils, due to more interesting material, better organization, and more effective administration. In my own school before the high school included the seventh and eighth grades, an average of only 82 per cent of the pupils promoted from the eighth grade, entered high school, whereas during the last three years an average of 96 per cent entered the high school.

The junior-senior high school organization involves more than departmental instruction and the mere inclusion of the seventh and eighth grades in the high school. It means a reorganization, and in some cases elimination, of the present subject matter which is traditional and the result of compromise rather than conscious development in the light of recent discoveries. Its subject matter must be suited to the needs of the majority rather than to the small number preparing for normal school and college. Its courses must use the rural environment as their background or setting to interpret the various studies—but they will not emphasize the science and practice of agriculture as a vocation at the expense of any other vocation and thus cause prejudice or undue force in determining any child's choice of life work.

The junior high school in addition to continuing much of the common training begun in the lower grades, tending to integrate society, shall offer in so far as possible short course of exploratory material well worth while in itself to reveal the possibilities in the various major fields of learning and thus assist the pupils in their choice of studies in the senior high school which will contribute to the general fields of their liking.

What subject matter shall be included in its course depends upon: its relative contribution to the objectives of education, namely, health, command of fundamental processes, worthy home membership, vocation, citizenship, worthy use of leisure, and ethical character, as announced by the Committee on the Reorganization of Secondary Education. And I am inclined to think that emphasis in the rural school should be placed on the objectives of home membership, health, citizenship, and the wise use of leisure.

The rural pupil who chooses to be a farmer, needs an education that will enable him to live a full life in the country. If he chooses to enter any other vocation such a foundation will equip him for a satisfactory life in that vocation. I shall now pass to my third point without mentioning any of the new subject-matter or courses that will contribute largely to these latter objectives since much of it is now known to most of you.

You must have rural-minded teachers, professionally trained for the rural high school. Teaching in rural schools is in all ways exacting and exhausting. It calls into play the teacher's every gift and power, with the obvious result that it makes great demands upon health, spirits, and courage. All of these are necessary in a high degree to its success. The teacher is quite often the only personal point of contact with the world living outside the community. His relation to the pupil must be peculiarly personal and sympathetic. Teaching so personal, variable, and subtle, above all other teaching should not be left to a young urban college graduate without

professional training or a low-salaried unprogressive teacher. We must have inspirational teachers. The best rural teachers are such because they are filled with the spirit of rural life and have an understanding of rural conditions. Rural teaching is not a commonplace thing, but a commonplace teacher can make it seem so.

The theory held in unprogressive quarters that any one can teach any subject, should be exploded. Teachers should be selected with particular consideration of their personal fitness and their special training in the subject. In hiring, the leaders for the extra-curricular activities should be kept in mind and distributed as evenly as possible among the teachers. Because of the teacher's responsibilities in these activities and other community interests, he needs must spend most of his week ends in the community of his employment.

The rural teacher must not, however, be so overloaded that he is pushed to the verge of nervous exhaustion, since that will result in either the early breakdown of the conscientious teacher who loves the work, or the spirit of indifference bred by the impossibility of doing effective work.

And lastly, we must have longer tenure for teachers, for without it the teacher cannot assist the principal in developing a growing curricula fitting the needs of the community in which the school is located. And the curricula can only adequately fit the community in the degree that the teachers become acquainted with the pupils, the parents, and the community.

THE EXTENT AND CONTROL OF RURAL CHILD LABOR

CHARLES E. GIBBONS, SPECIAL AGENT, NATIONAL CHILD LABOR COMMITTEE,
NEW YORK CITY

There are many kinds of rural child labor and varied conditions under which it has developed, just as is the case in the industrial field. I wish to consider the subject under two sets of agricultural conditions—namely, general farming and one-crop farming.

Under the heading of general farming are included the raising of such crops as corn, the small grains—wheat, oats, barley, rye, and the like—hay and forage crops, truck gardening and fruit culture for home consumption. This form of agriculture may be divided into the two sub-types, general grain farming and live stock farming, depending on which the emphasis is placed.

Under general farming conditions, land ownership is the rule, at least it is an attainable goal, by reason of tenancy being a normal stepping-stone. Laborers and tenants have a reasonable chance of becoming land owners. Likewise the family either owns the tools or enjoys a great measure of freedom in their use. There is little, if any, class feeling between the three groups of workers. The size of the farm is near that required to maintain the highest production commensurate with the highest return. There are, of course, exceptions on this point as in the great corn and

wheat-growing belts of the Middle West where large acreages are given over to the cultivation of these crops, but because they have other characteristics in common with their cultivation elsewhere, I leave them in this classification.

For the most part these crops are cultivated by the labor of the single family. Parents and children work together. The character of this labor has changed greatly in the last fifty years, due to the influence of machinery. Hand labor has been greatly decreased. The scythe and the cradle have given way to the mower and binder, the flail to the thresher, and the single plow to the riding cultivator and the tractor. This has made work on the farms for both children and adults easier and of shorter duration. The use of machinery has decidedly tended to decrease the need for child laborers, especially the younger ones. The expense and complication of much of it has made it profitable to have adults, or older children at least, to handle it. But, despite a favorable economic system and the aid of modern machinery, our investigations show that a great many children under rural farming conditions are required to work. Children were found working long hours and doing tasks that undoubtedly were far beyond their strength. That is the experience of those who have come up through it and it is a condition that exists at the present time. Numerous investigations show that work is given as an excuse for the non-attendance at school of a great many country children.

In West Virginia, we found, of approximately 150 families who kept their children home from school, nearly one half said they considered work of more importance than school. This is not an extreme illustration. Country parents have developed a work complex. There was a day perhaps when it was necessary for the children to help make the living, but that day has largely passed. That attitude of mind, however, on the part of the parents still exists. Too many still feel that they must keep their children at work so as to keep them out of mischief. The constructive value of play is almost unknown. With this attitude of mind, it is not surprising that we should find premature work, overwork, unhealthful work, uneducational work, yes, sometimes unproductive work, being done by country children. Work is not necessarily inimical to the best interests of childhood; in fact, it is necessary to the highest development of children, and no child should grow up without experiencing the discipline that alone can come from work. Children have a right to childhood and all that childhood implies. They have an inalienable right to health, education, and recreation. Whatever interferes with these things is to be condemned. Children's work should be developmental, educative, and have in it the element of training, but work for mere work's sake is wrong. Too much of the work of rural children is mere drudgery, because too many parents are unable to differentiate between children's work and child labor. The parents have never learned to think of childhood in terms of health, education, recreation. They, themselves, had little schooling when they were children, so why should they be overzealous in seeing that their children get so much schooling. To their minds, health is a matter of

getting better after illness overtakes them. As children they had no time for play, so why should their children waste their time in play. This attitude of mind is not intentional exploitation—exploitation seldom enters into it—it is simply the result of not knowing what childhood is. Hence child labor indirectly has become an important factor in the count against country life, and it is an evil that must be removed.

There is a wide divergence of opinion as to how this may be done. Personally, I am not at all convinced that for the children living under general farming conditions, the hope lies in prohibitory child labor legislation. It might be well to have a child labor law, simply to handle those who can be handled in no other way, but in my mind, the problem is primarily one of education, not legislation. Experience is showing this to be true of all forms of social progress. Children will have a better chance in getting the protection that is due them, by getting the parents to understand what they need, than by merely telling the parents what they cannot do.

The elimination of the evils of child labor is not the job of a single agency, but of every agency and every person interested in country life, and the first requisite is knowledge of country people and their problems. There has been too much of a tendency on the part of social agencies, including the schools, to develop their programs of work without a clear understanding of the problems to be met. The school can be the greatest factor in solving the child labor problem in general farming areas. It is the biggest socializing agency at work in the country today. It is one of the oldest and comes nearer touching every community than any other one. It has back of it vast resources, in money, personnel, and equipment. Yet, until very recently, it has but dimly recognized its obligation. There has been no real leadership in the field of rural education. The kind of training was and in many localities is yet poor. The teachers are underpaid and inadequately trained, the equipment poor and the curriculum illy adapted. Country children have not been taught in terms of their own lives, and have had practically no vocational training. I do not want to be unduly critical—progress has been made and I am not unmindful of the almost insurmountable difficulties to be overcome, but we must solve these problems—we must search deeper and understand more fully the why of the organizations we represent. We must write anew the aims and purposes; we must understand more intelligently the needs. In doing this, we may be compelled to scrap a lot of our pet theories. If necessary let us do it and do it fearlessly. Let us profit by the experience of other groups. As social workers and as school people we can get a valuable lesson from a careful study of the work of the county and home demonstration agents. In their limited fields, they have done more to enrich, and make wholesome and happy country life, than any other group. The boys' and girls' club work is more rapidly eliminating child labor and turning it into children's work than any other movement. The development is not negative, but positive. The education and training the club leaders are giving is not what parents and children ought not to do, but what they should do. This is the only rational solution.

Thus far child labor has been considered under general farming conditions. I wish now to consider it under one-crop conditions. The most important single-crops are cotton, tobacco, sugar beets, beans, onions, celery, asparagus and other vegetables, fruits, berries, and grapes. The cultivation of these crops has taken on many of the aspects of industry. We frequently hear the term "industrialized agriculture." For the most part the growth of these crops is peculiarly favored by soil or climatic conditions, or both. The return per acre is large, hence the price of land is high. A high degree of managerial ability is needed for their successful cultivation, especially the vegetable crops. There is a great deal of large acreage holdings and absentee ownership, particularly in cotton and tobacco sections.

Tenancy is high. One-crop farming has had its most detrimental effect upon the tenants. In fact, one-crop farming is not generally practiced by owner operators. Diversifications in these areas is not as widely practiced as in general farming areas, but whatever diversification there is, is carried on by the owner operators, and the single-crops left for the tenants to cultivate. There are, of course, exceptions to this statement, for both owners and tenants.

In the cotton and tobacco sections of the South, the tenant is known as a cropper. As a rule he has no tools or equipment, and of course owns no land. The number of acres he may cultivate is determined by the number of work hands in his family. His wife and his children from twelve years up are considered field hands. He pays for half the fertilizer, does all the labor, and receives half the crop. He is subjected to the pernicious credit system. He seldom has enough money to carry himself and family through the year, but must depend on the supply merchant. Overtime the owner operates a commissary. The credit price varies from 20 to 40 per cent above the cash price. Some may raise enough tobacco or cotton to pay out in the fall, but many of them have never been out of debt. He is always seeking a place where he can do better and move nearly every year, although it may be no farther than from one house to another on the same farm. The labor is hard and the hours long. It is nearly all hand labor. Tobacco must be planted, hoed, weeded, suckered, wormed, topped, gathered, and prepared for curing and for markets all by hand, and the operations for cotton are not much less—this means child labor. It is said that it takes thirteen months to make a crop of tobacco, and that required for cotton is almost as long. Child labor here is found in its most pernicious form. Children as young as five years of age can be found working in the cotton or tobacco patch all day long. Partly because of ignorance and partly because of the press of other work, he does not raise his own garden supplies. Many do not keep a cow and hence have no milk for the children.

Many of these communities are hot-beds of illiteracy. Because of their ignorance, the parents have little, if any, interest in schools, and child labor under this economic system is inevitable. It is both cause and effect. In so far as it is cause, child labor legislation will help to remedy the situation but to the degree that it is the result of the system, other phases call

for consideration. I believe initial consideration should be given toward righting the economic system. The cotton and tobacco tenantry is largely the product of the system. In many communities sharp class feeling has developed. Tenants and land-owners do not mingle in a social way. More and more land-owners are sending their children to town schools, leaving the tenant children to the mercy of the poorly trained one-room school teacher. Here tenancy is a social status and the tenants have become almost hopeless and helpless, in so far as their own effort is concerned. Their condition is little better than that of peonage, in the old-world meaning of that word. They have that satisfaction that comes from a realization of the uselessness of fighting and struggling against such heavy odds. Social efforts and social legislation can have small chance of success against conditions like these, because the very fundamental of human welfare is not right. Many of the families do not have a living income, and for others the margin above that required for mere existence is too low. This must be made right first. The problem is of national concern and is calling for the best minds to help solve it.

In the sugar beet, vegetable, and fruit areas, the workers, for the most part, are called laborers. Most of them are migrant families who go out for the season from urban centers. Occasionally the families come from rural centers, as in Ohio the onion workers come from the mountains of Kentucky. There are, however, a great many single men and single women who also follow the seasonal agricultural work.

Many of the families are of foreign decent. The majority of them own their own homes. In Lincoln, Nebraska, from which go between 300 and 400 so-called Russian-German families, annually to the beet fields, every one owns their own home and has it paid for. They live in a good section of the city and their homes are well kept, clean and tidy, but that cannot be said about the homes in which they live in the community where they work during the summer. Many of the homes are mere shacks and overcrowding is frequent. Many of them have no toilet facilities and the water supply is unprotected.

In the cherry and other small fruit sections, the workers are usually carried back and forth daily to the fields by the farmer. Mother and children, or frequently the children alone, do most of this work. In the strawberry sections, the workers are often housed in camps. Decent moral and sanitary conditions are hard to maintain. These camp followers work together in the fields where the local children are working and undoubtedly have a bad influence upon them.

For beet workers the maximum length of the season will probably not exceed seven months. Beet work seriously interferes with school attendance. The family leaves the city about the first of May. The beet fields are outside the jurisdiction of the city. In the country the rural school is out or soon will be. In the fall the rural school has not started or else the family will soon be going back to the city, and hence the children do not start to school. Furthermore, in many localities the country people maintain that since their families are here only temporarily and pay no

taxes, they ought not to be compelled to school their children. The fact remains the children are not getting the schooling to which they are entitled.

Small fruit picking, onions, celery, and other vegetables, do not, on the whole, seriously interfere with school attendance. Most of the work comes during the vacation period.

There is no compulsory regulation whatever as to hours. During certain operations, especially in beet culture, they are long. Where the laborers work in gangs as in the onion, celery, and small fruit-picking sections, the hours are usually limited to ten per day, but climatic conditions may frequently upset this schedule. In the cherry and other small fruit sections, no special means are taken to prevent children from falling out of the trees or off the ladders. In the onion, celery, and beet fields, the children crawl along on their hands and knees and infections are frequent. The ill effects of a stooping posture are given little or no consideration.

Child labor under these conditions must be remedied by legislation. It matters not whether the children work with their parents, or in gangs under a foreman; they are confronted by almost the same situation that children in factories face. They are paid on a piecework or daily wage basis. Children must be protected from exploitation, and education will help, but it will not do what it can for the children under general farming conditions. There the children are flesh and blood of those who own the land, tools and means of production. In the country child welfare, once understood, will receive primary consideration. In the city profits are placed first. A strict enforcement of the compulsory education laws will greatly help, but more is needed. The protection of health and an opportunity for wholesome play must be given more consideration, thereby safeguarding the unalienable rights of childhood.

Department of School Administration

SECRETARY'S MINUTES

OFFICERS

President—IRA B. BUSH.....Charlestown, W. Va.
Secretary—WILLIAM C. BRUCE, Editor of the *American School Board Journal*..Milwaukee, Wis.

The first session of the Department was called to order by President I. B. Bush in Gardner Auditorium, State House, Boston, Mass., at 2:30 o'clock, July 3, 1922.

The following addresses were heard:

COÖPERATION BETWEEN CIVIC ORGANIZATION AND SCHOOL AUTHORITIES—Karl F. Adams, Principal Lincoln High School, Seattle, Wash.

ACTIVITIES OF BENSON POLYTECHNIC HIGH SCHOOL—Honorable George B. Thomas, Member of the School Board, Portland, Ore. (Read by Mr. E. H. Whitney, Assistant Superintendent of Schools, Portland.)

CONSOLIDATION OF RURAL SCHOOLS—J. Buell Snyder, Board of Education, Perryopolis, Pa.

ACTIVITIES IN THE SCHOOLS OF EUROPE—Mrs. Edith McClure Patterson, Dayton, O. The meeting adjourned at 4:30 o'clock.

The second session of the Department was held on Wednesday, July 5, at 2:30 o'clock. Papers, illustrated with lantern slides, were heard as follows:

RURAL SCHOOL BUILDINGS OF THE SOUTH—S. L. Smith, General Field Agent for Rural Schools, The Julius Rosenwald Fund, Nashville, Tenn.

PLANNING THE MODERN HIGH SCHOOL—Dwight H. Perkins; Perkins, Fellows and Hamilton, Chicago, Ill.

GYMNASIUMS AND THEIR ACCESSORIES FOR MODERN SCHOOLS—Clarence D. Kingsley, State Supervisor of Secondary Education, Boston, Mass.

THE SCHOOL BUILDING OF NEW YORK CITY—C. B. J. Snyder, Architect, Board of Education, New York, N. Y.

SCHOOLHOUSE PLANNING AS A SCIENCE—Frank I. Cooper, Architect, Chairman of the N. E. A. Committee on Schoolhouse Planning, Boston, Mass.

Upon motion the Department unanimously reelected for president, I. B. Bush, and for secretary, William C. Bruce.

Mr. Dwight H. Perkins moved that the Department hold its future meetings in connection with the Department of Superintendence and that the officials take the proper steps to make this possible. The motion was carried.

Mr. Frank Irving Cooper, of Boston, then moved that the chair appoint a committee to study the problem of preparing a constitution and by-laws for the Department and report at the February meeting.

The president appointed Frank Irving Cooper, Boston, Mass.; S. O. Hartwell, St. Paul, Minn.; William C. Bruce, Milwaukee, Wis.; Frank Cody, Detroit, Mich.; and J. Buell Snyder, Perryopolis, Pa.

The meeting adjourned at 4:20 o'clock.

The third session of the Department took place at 2 o'clock, Thursday, July 6. Addresses were made as follows:

ACADEMIC, VOCATIONAL, AND PERSONAL GUIDANCE OF BOYS AND GIRLS IN THE HIGH SCHOOLS—H. E. Stone, Boys' Counselor, Central High School, Erie, Pa.

FINANCING STATE AND CITY SCHOOL SYSTEMS—Thomas E. Finegan, State Superintendent of Public Instruction, Harrisburg, Pa.

RELATION OF ADMINISTRATIVE OFFICERS TO BOARDS OF EDUCATION—George D. Strayer, Professor of Educational Administration, Teachers College, Columbia University, New York, N. Y.

KEEPING ABREAST OF SCHOOL PROGRESS—A MODERN SCHOOL SYSTEM—A. E. Winship, Editor of the *Journal of Education*, Boston, Mass.

A motion was made and seconded that the chair appoint a committee to study

the problem of the relations of school boards and superintendents and report to the department a statement of principles.

The meeting adjourned at 4:15 o'clock.

WILLIAM C. BRUCE, *Secretary*.

CONSOLIDATION OF RURAL SCHOOLS

J. BUELL SNYDER, BOARD OF EDUCATION, PERRYOPOLIS, PENNSYLVANIA,
AND SECRETARY LEGISLATIVE COMMITTEE, PENNSYLVANIA
STATE SCHOOL DIRECTORS' ASSOCIATION

I count it a privilege to discuss any problem relating to the schools before the Department of Administration of the National Education Association. The business of public education is the biggest business in the United States. A business that employs 620,000 people and spends \$800,000,000 a year is a big business. The people of the United States believe in this business; they believe in public education.

As I see it, the two great problems confronting the American people today are The Consolidation of Rural Schools and How to Guide and Direct the Energies and Activities of the People when They are not Working or Sleeping.

Your Committee has assigned me a place on your program to discuss the former problem The Consolidation of Rural Schools. This problem has many sides and it would take volumes to touch even slightly on each of the factors involved. I shall confine my remarks in the major to the economic and social phases of consolidated rural schools leaving the curriculum to the instructional forces of our schools.

One would naturally think that the rural population is always anxious to have the best come to them if it is the cheapest. Such is not the case. When it comes to tampering with the little red schoolhouse by the roadside where father and grandfather went to school, the younger generation questions the advisability, even though you can prove to them that they can save from 20 to 50 per cent in the running of the schools and get a similar per cent more educational equipment for their children. It is only through a space of years of constant effort that the consolidated school is welcomed in such a community.

It took years to convince the farmer that he would be financially ahead of the game if he would buy modern farm implements. It took years to convince him that it meant big money to him to have good roads. It also took years to make him see that financially he was ahead if he paid three times the road tax and had good roads instead of bad ones. It will take years to have some communities appreciate the advantages of consolidated rural schools.

From the time the first consolidated school was established in Montague, Massachusetts, in 1884, every district that makes a move to consolidate finds groups of patrons objecting. In analyzing their objections, we find that they usually concentrate on transportation and economy. They contend that transportation will be impossible in their community for various

reasons. They say that it will be a financial burden on the community—that it is all right for some certain places to have consolidated rural schools, but their district is not ready for it.

The President of the National Education Association, Miss Williams, has demonstrated in her county in Tennessee what can be accomplished in consolidating rural schools. The farmers, industrial heads, political bosses, and in fact every organization is back of her in perfecting her project. They see the economy and the wisdom in the movement. They see the social and the educational advantages that not only the boys and the girls of their county are receiving, but they themselves are socially benefited.

Taking the United States as a whole, we have made much progress in the consolidation of rural schools during the last ten years. During the last three years about 14 per cent of the one-room rural schools in the United States have been closed. Last year we closed 6 per cent of the one-room schools in the State of Pennsylvania or at the rate of 18 per cent for three years. The next ten years will see rapid progress being made in consolidation and by 1935 more than 80 per cent of the one-room schools now in existence will have been closed.

From now on, our normal schools, colleges, and training schools for teachers will train teachers to be boosters of consolidated rural schools just as we trained the teachers in the past generation to be boosters of hygiene and the evil effects of alcohol. The instructional forces must be in sympathy with consolidation. They must have a vision of the future consolidated school. The advantages of consolidated rural schools must be one of the chief subjects taught in our teachers' training schools. At present our colleges and normal schools devote more time to teaching *How and Why Cæsar Crossed the Rubicon* than they do to the *Advantage of Consolidated Rural Schools*.

Along every line the sun is shining on the future consolidated school project. The future consolidated school will be built on a plot of ground containing twenty acres or more and located where the railroads and lines of transportation make the school accessible. The eastern part of the United States is likely to be last in completing the consolidation project because of long established customs and prejudices. The method of consolidating rural schools will be perfected rapidly during the next few years. We will have commissions empowered to lay off a county or a State in units, such as we are planning in Fayette County, Pennsylvania.

In Fayette County we are planning to have a joint meeting of the county commissioners, county road supervisors, county school directors, county superintendent, and county surveyors, and at this meeting select a commission to plot the county as nearly as possible for future road building and the building of consolidated schools of the future. This plan will enable school districts to build their future schools at the proper crossroads and the farmer or home-builder will build his home so as to be on the future improved road.

Most communities now realize that the consolidated school is the social center of the district. They realize that it is the best place to adjust the

social activities of the boys and the girls and give them the greatest possible equipment to be efficient bread and butter winners when they get out in life's school.

The future consolidated schools will have courses in home making, practical gardening, industrial farm work, marketing, stock raising, manual training, electricity, mechanics of farm implements, and many similar courses including the academic.

The same schools will also be equipped with auditorium, with modern motion-picture apparatus, gymnasium with swimming pools and all modern appliances, play rooms—one for boys, one for girls, one for parents—modern equipped chemistry laboratory, modern equipped physics laboratory, athletic field that will contain basket ball, baseball, tennis, volley ball, and all other community games.

The future consolidated rural school and rural community will be in accord with each other. The rural school center will be getting its proper share from the school. The Community will be giving to the school the helpful and coöperative financial support necessary to make the school efficient in all its phases. The future consolidated rural school will have adjacent to it a splendidly equipped home or apartment house for the superintendent, principal, and teachers. The best and most beautiful room will be "The Democracy Room." This room will be equipped with substantial tapestry, pictures, carpets, and furniture. It will be open 364 days in the year for committee and conference work of the patrons, and on the 365th day, "The Democracy Room" will be used as the Voting Room for the entire district. I have long contended that the Voting Room should be the most beautiful room in the community so that when one steps in to exercise his duties as a voter he will be impressed with the importance of the duty he is about to perform.

It was only after the boys and the girls, who studied hygiene and the evil effects of intoxicants grew to be voters, that the National Prohibition Law was put upon our Statute Books. It will be after the boys and the girls who are now in our public schools reach the voting age that you will find 80 or 90 per cent of all the one-room rural schools consolidated. There will always be some one-room school buildings because of the topography of the different communities.

In every community the citizens will point you to General So and So or Attorney So and So or Banker So and So who was educated out there in the one-room school. We must convince this class of citizens that it was in spite of the one-room school instead of because of it that these men made good.

The evening school, the morning school, the all-day Saturday school that Dad and Mother taught out on the farm or in the home had more to do with the educational equipment that made it possible for these men to make good than the instruction they received in that one-room rural school.

The realization of the need of a well-organized community center for both the old and the young has taken on much impetus during the last few years. Among the factors that have contributed to this awakening in the

rural community are better roads, rural delivery, and automobiles. The young people of the country are now able to gather in social groups instead of isolated pairs.

The American people now realize that the Nation needs its rural life stimulated, that Nations survive only when the rural life of the Nation is made and kept efficient. It is well that every citizen should know that every Nation that has come upon the stage and acted its part and passed into oblivion or become a nation of lesser rank passes through three ages: (1) The Age of Peasantry, or the Crude Age. (2) The Age of Agriculture, or the Age of Prosperity. (3) The Commercial Age, or the Age of Decay.

I like to think of the United States as living in the second age, the Age of Agriculture or Prosperity, but since the efficiency of the rural population has to do with the greatness of a state or a nation, I beg leave to call your attention to the social shifting of our population toward urban centers. When Washington was President, 3 per cent of the people lived in the city and 97 per cent lived in the country. When Jackson was President, 20 per cent lived in the city and 80 per cent in the country. When Lincoln was President, 37 per cent lived in the city and 63 per cent lived in the country. When McKinley was President, 45 per cent lived in the city and 55 per cent lived in the country. And now, we find that approximately 60 per cent of the people live in the cities and 40 per cent live in the country. In other words, when Jackson was President there were 80 people living on the farm to produce food to feed 100. While now we find 40 people on the farm to produce food to feed 100. Or still another way of putting it is that in 1836 four fifths, or 80 per cent, of all our people lived in the rural districts, while now, two fifths, or only 40 per cent, live in the rural districts.

Many factors stimulate the march of our population to the city, but the greatest factor is the poor and inadequate rural and village school. In the last half century we have improved everything in rural life except the rural school. We educate the children in the country to go to the city. The city newspapers come to the country and tell of the good things and the big things they are doing in the city schools, and of course, it is only natural for the fathers and mothers to pull up and go to the city where their children can get a practical education. Most of them would be willing to stay on the farm if the schools were at all near the equal of the city schools.

Every State in the Union now has on its statute books laws favorable to consolidation of rural schools, and future law-making bodies will frame binding laws on the consolidation of rural schools, and appropriate money enough to put these laws into effect.

I have gathered data on the consolidation of schools from thirty States in the Union and find that the average cost of operating such schools is as follows:

Average cost of one-room rural school per month per pupil.....	\$6.48
Average cost of consolidated rural schools per month per pupil.....	\$5.55
Average cost of consolidated village schools per month per pupil.....	\$5.18

The social advantages of the consolidated rural school briefly are as follows: (1) The pupils enjoy the advantages of that interest and enthusiasm and confidence which numbers bring. (2) Pupils can be better classified and graded. (3) Tardiness and irregular attendance are reduced to the minimum. (4) No quarreling, improper conduct, or improper language so common among children on their way to and from school. (5) No wet feet or wet clothing, nor colds resulting therefrom. (6) Pupils have the advantage of better school rooms, better lighted, better heated, better ventilated. (7) This plan is sure to result in fewer and better teachers, better paid. (8) It makes possible a high school education for country boys and girls without breaking home ties in obtaining that education. (9) It provides means of recreation and entertainment in community games and sports, lectures, musicals, etc., which gives country life a variety and a charm that is absolutely impossible in the rural community without the consolidated school.

In summing up the factors involved in this the biggest problem confronting the American people, we find that there are no well established basic arguments against the project. Every move in favor of consolidation is a move toward social, economic, and moral betterment. Every move toward consolidation is a move toward better government. Every move toward consolidation is a move toward lowering the cost of living.

It is my belief that if we consolidate our rural schools the following hundred-year old prediction of McCauley's will never come true. "Before the end of the twentieth century, either some class or nobility will seize the reins of government with a strong hand, or your republic will be pillaged and laid waste by barbarians in the twentieth century as the Roman Empire was in the fifth, with this difference, that the Huns and Vandals who ravaged Rome came from without her borders, while your Huns and Vandals will be engendered within your own country and be the product of your own institutions."

It is my belief that if we keep our garden and farm products in quality and quantity proportionate to the city and industrial demands, that we will always have a happy and contented people. The rural people will be happy because they have a market, the city people will be happy because they have a rich supply of rural products.

We must encourage the tiller of the soil to own the soil he tills. We must educate all the children of all the people to appreciate and conserve our national resources. The one best place to give them this knowledge is in the consolidated rural schools. We must save our rural schools if we are to save the Nation. To save our rural schools we must build and maintain at appropriate places through our country thousands of consolidated, democratic school plants, and place in them highly trained teachers, teachers that fear God and keep His Commandments.

THE RELATION OF ADMINISTRATIVE OFFICERS TO BOARDS OF EDUCATION

GEORGE D. STRAYER, PROFESSOR OF EDUCATIONAL ADMINISTRATION,
TEACHERS COLLEGE, COLUMBIA UNIVERSITY, NEW YORK CITY

A board of education in American cities is the regularly constituted agent of the State, responsible for the maintenance of the public-school system. Whether elected at large by the people or appointed by the mayor, the board of education is charged with the responsibility of carrying out not only the requirements as expressed in the law of the State, but also the will of the people to whom they are locally responsible in the determination of the policies which lie outside of and beyond the legal requirements.

School boards have been maintained either as independent corporations or as a branch of the city government, because we desire, insofar as it is possible, to separate our schools from the partisan political administration characteristic of American cities. Even with the development of the Commission form of government our cities have maintained, and it seems to me most wisely, their boards of education. That this has been done seems to me not to be accidental. The distinction between the legislative function of the lay board of education and the executive function of the superintendent of schools, as commonly maintained, would of necessity be found wanting were the board of education abolished under the commission or managerial type of municipal government. A commissioner of education will, though he be a layman, come to exercise administrative functions, and the superintendent of schools will almost certainly become his assistant. The result can scarcely make for efficiency in administration or for professional insight or wisdom in the development of the school system.

There was a time early in the history of the development of our public schools when laymen were the only advisory or administrative officers. In the early days when the control and administration of a single school, often with only one teacher, rested in the hands of one or more laymen, any well educated man might reasonably have been expected to discharge the dual function of board and superintendent. In our modern school systems with many teachers in each of a large number of buildings, with courses of instruction from the kindergarten through the college, with millions of dollars invested in plant and equipment, with the development of the science of education and the technique of educational administration, no well advised layman would propose to exercise the executive function.

It is worthwhile to note in passing that school executives are chosen throughout the United States upon the basis of their successful experience. By far the larger number of superintendents of schools in American cities have served an apprenticeship in teaching and in the supervision and administration of single schools, or small school systems, before being elected to places of larger responsibility. In like manner, the school superintendent is the only type of public servant in the United States who is

commonly moved from locality to locality and from State to State across the continent because of his proved ability as an executive.

We have, as a matter of fact, developed the idea of professional service in the administration of public education in the United States, but even with this accomplishment much remains to be done in defining clearly the relationship which should exist between boards of education and their chief executive officer. It would be well if this definition were made so clear and so commonly accepted by members of the profession that no competent man would be willing to accept the position of superintendent of schools without having it understood that the board of education accepted the relationship as defined by the profession. The effect of such action would be most salutary. It is unfortunate that as the situation is at present a board that usurps the function of the executive, and whoever on that account forces him out of his position may confidently expect to find other competent men willing and anxious to accept the position so vacated.

To discuss the distinction between the function of the board and their executive officer is not to belittle the place of the board of education. No man who serves as a member of the board of control of a railroad company, or a bank, or a manufacturing enterprise, thinks less of himself, or of his colleagues by virtue of the fact that they entrust the execution of the policies decided upon to their executive staff. No bank, railroad, or industry is more complex in its organization, or requires a higher type of professional executive than does the public-school system.

Members of the board of education may best represent their constituency by selecting the highest type of executive to be found. Having rendered this service they are under the obligation to require of him from time to time a record of the work done and proposals for the development of the school system placed in their charge. The executive, if he be competent, must present his case to the board of education, must be able to demonstrate the wisdom of the policies which he advocates, must be ready to defend in terms of a measurable achievement his own administration.

Every board of education should in the course of a given calendar year pass upon the budget proposed for the ensuing school year. In many cases this will involve the rate of tax to be levied. In every case it will require the best judgment of every member of the board with respect to the cost of the service as at present maintained, and the possible extension of the work undertaken. The executive officer may propose to the board of education a single salary schedule based upon the proposition that men and women equally well qualified should be equally paid wherever they teach in the school system. This policy is contrary to the common practice in American school systems. The superintendent of schools proposing it should be ready to defend it and failing to carry conviction with a board of education should accept their determination of the question without feeling that they have in any sense usurped the executive function.

In like manner, the superintendent of schools must from time to time propose changes in the organization of the school system, building pro-

grams, changes in courses of study, and the like. If he is able either from the evidence available locally or by virtue of evidence accumulated in other communities to make his case clear he has a right to hope that the members of his board of education will act in accordance with his recommendation. If in advocating the establishment of junior high schools, for example, he can show the real advantage to the boys and girls of the seventh, eighth, and ninth school years, if he has defined the new type of organization in terms of the educational opportunities to be provided, and if the members of his board believe that the additional cost is justified by the evidence of service to be rendered to the boys and girls of the community, he may reasonably hope to see his recommendations adopted.

No superintendent of schools, however, has a right to propose expenditure of money or to insist upon changes in organization, or in the subject matter to be taught, merely because some other school system has made a similar change, nor because of popular demand. He may, however, propose an experiment with the distinct understanding that he and the board will be governed as to future action by the results.

A good board of education will insist, from time to time, upon having brought before them evidence of the progress and the efficiency of the school system. The members of the board have a right to propose that the schools, if adequately supported, become increasingly efficient from year to year. Measures of the progress of children through the school system, of achievements in the fields of study commonly taught, or the regularity of school attendance, of economies that have been effected in the maintenance and operation of the plant, and the like, should be presented frequently as evidence of good administration.

If the superintendent of schools is to be held responsible for results by the board of education, he must be recognized as their chief executive officer. The creation of the coördinate executive office of business manager cannot result in the highest degree of efficiency in the administration of the schools. Business transactions are significant only as they contribute to the realization of the educational program adopted. The officer who devotes himself to this field should be designated as assistant superintendent in charge of business affairs. The superintendent of schools must be given the authority to nominate, not only his immediate assistants, but the teachers who constitute the staff of the school system. It is folly to propose that any man can carry forward a program adopted by a board of education if he is handicapped by surrounding him with those who are out of sympathy with him and with the work which he is trying to do.

Nothing can be more fatal to the proper relationship of board and superintendent of schools than the desire upon the part of any member of the board to place in the school system a person of his own choice. A good executive, and he is the only type of man who should be retained by the board of education, will seek constantly to surround himself with able associates. He will strive earnestly to secure the best teachers that can be had for the salaries paid. With this responsibility and authority one

may reasonably hope for a maximum coöperation between the chief executive and his staff. Without it one has no right to expect that the staff will work in hearty accord with the superintendent.

It is important that the board of education consider the program and policies proposed by the superintendent of schools as a board and not in separate committees who report to the general body. There may be times when a special committee of the board will prove useful in reviewing carefully with the executive officer or his associates some problem requiring careful study from the layman's point of view. In such cases special committees should be appointed and their report should be considered along with the recommendation of the superintendent. Standing committees seem to me to be worse than useless. The chairman of a standing committee quite commonly comes to believe that he has some peculiar fitness or ability in the field represented by his committee and infrequently he will tend to assume the function of the executive. When standing committees make reports which are accepted by boards of education as a matter of senatorial courtesy one gets little careful consideration of the major issues to be passed upon by the board.

The superintendent of schools has a right to assume that policies and programs which have been accepted by the board of education will continue to be supported by them during the period necessary for proving their soundness. Nothing can be more disconcerting and surely nothing is more foolish than for the board of education to pass upon a policy and then because of popular clamor or personal spite to adopt a different policy before there has been a chance to establish the adequacy of the proposal.

It is obvious that we need on boards of education men of good judgment, of wide experience, and of sound common sense. They can and should check the executive officer who may become too enthusiastic or who would carry too heavy a load of experimentation in any given period. It is just as certain that they should, when convinced of the wisdom of the policy proposed, stand for it not only in board meetings, but before the community at large. A policy once adopted, they should consider it their policy as well as that of the superintendent of schools.

The right relationship between boards of education and superintendents of schools will come to exist when boards of education cease to think of their function as having anything to do with the execution of the policies which they adopt; when they scrutinize carefully each proposal brought to them by the superintendent of schools, and having passed upon it stand fast; when men who sit upon boards of education seek as earnestly to discover the best man available for the job of superintendent of schools as they would were they searching for a president of a corporation in which they are interested.

In order that the type of relationship described may be maintained it is of the utmost importance that boards of education be elected or appointed without reference to political affiliation. They must, if continuity in policy is to be the rule, serve for a relatively long term. It will be necessary,

as well, to provide that not more than one or two members leave the board at any one election or appointment period. In order that the board may act constructively as a board it will be best that not more than from five to nine members sit around the table at which the policies for the school system are decided.

In order that the relationship between boards of education and superintendents of schools be acknowledged by both parties and to some degree standardized, I would like to propose that a committee made up of members from both groups prepare, in terms of a code or set of rules, a statement of the relationship of the school executive to the board of education. I should like to present for the consideration of this committee the following proposals:

1. That the most important duty of the board of education is to select its chief executive officer, and to appoint him for an indefinite term.

2. That the board of education recognize the fact that its chief executive officer should nominate all associate or assistant superintendents, supervisors, directors, principals, and teachers, and all other employees, and that appointments to all of these positions be made only upon the nomination of the superintendent of schools. This provision is to be interpreted as opposed to the establishment of the coördinate executive office of business manager, and to require that such officer be designated as assistant superintendent in charge of business affairs. It is also to be interpreted as opposed to the organization of a board of superintendents with powers coördinate with that of the chief executive.

3. That the board provide, by its own rules, that the adoption of textbooks and of courses of study be on the recommendation of the superintendent of schools, and that it require that he indicate in making his recommendations the degree of coöperation which he has received from his assistants and associates of the administrative, supervisory, and teaching staff.

4. That the board require that the superintendent of schools report from time to time concerning the achievements and progress of the school system in terms of (a) the adequacy of the attendance service; (b) the progress of children in the school system, involving studies of retardation and elimination; (c) the adequacy of the adjustment of the school system to the needs of children in terms of the school organization, the classification of pupils, the courses of study, the organization of special classes, and the like.

5. That the board require the superintendent of schools to submit annually a budget showing the estimated revenue available, or to be made available, where the tax rate is fixed by the board of education, together with the program of work to be accomplished and the estimated costs by divisions and activities of the school system; that such budgetary estimates be based upon an analysis of costs by divisions of the school system, and by units of the school organization for one or more previous years; that such budgetary estimates include a salary schedule based upon principles which

can be applied uniformly throughout the school system, and that such estimates include as a special item a report on the present condition of the school plant with reference to the need for repairs, reconstruction, or replacement of equipment.

6. That the board of education require that the superintendent of schools direct a continuing study of the need for new school sites and buildings based upon an assembling of data showing trends in population for the whole community and shifts in population and in public school enrolment by convenient areas and by grades or other divisions of the school system; and that it pass upon the needs of financing such additions to the plant as may be necessary or expedient.

7. That the board pass upon the plans for new buildings approved by the chief executive officer and his staff and that the superintendent of schools indicate in the case of each plan so presented the necessity for the accommodations to be provided in terms of present or prospective enrolments not otherwise adequately provided for, and in terms of the relationship of the facilities to be provided in the new structure to the courses of study to be taught therein.

8. That the board act as a committee of the whole in considering and passing upon the program and particular recommendations of the superintendent of schools, and that all standing committees be abolished.

9. That the board of education adopt a set of rules governing its own procedure in which is established the position of the superintendent of schools as the chief executive officer of the board of education, and indicating his responsibility and relationship to the board as has been suggested above; that these rules define the qualifications of all of the employees of the board of education, and that they include a consideration of such other matters of uniform procedure as may be essential to the proper conduct of a system of schools.

10. That superintendents of schools formulate the qualifications required for members in good standing in their profession and that such qualifications include a certain minimum of education and of specialized professional training (or in lieu thereof for those now in office, successful experience as school superintendents in positions in which the individual devotes his whole time to administrative and supervisory duties), and that they provide through State departments of education, or through their own voluntary organizations for the certification of those who would enter their profession.

11. That it be considered unethical for any member of the profession to accept appointment to the office of superintendent of schools except as the conditions specified above are accepted by the board of education seeking to employ him.

*ACADEMIC, VOCATIONAL, AND PERSONAL GUIDANCE
OF BOYS AND GIRLS IN OUR HIGH SCHOOLS*

H. E. STONE, BOYS' COUNSELOR, CENTRAL HIGH SCHOOL, ERIE,
PENNSYLVANIA

I do not come before you this afternoon as an expert. An expert is an ordinary fellow a long way from home. I am an ordinary fellow, but Erie is not so far from Boston after all. Neither do I pose as a high brow. You know a high brow is one who tells you what you already know in language you can't understand.

I need waste no time in tracing for this group the origin and development of the guidance movement. Yesterday, you devoted, and I am sure, profitably, an entire afternoon to the discussion of school house planning. It has always seemed strange to me that so many school boards wise enough to hire architects to plan for their buildings, should be foolish enough to fail to hire specialists to plan the lives of their boys and girls.

Plato asserted that it is the business of education to discover what each person is good for and to train him to master that mode of excellence.

After all the centuries, the guidance movement has begun to make some progress. England, Germany, and other foreign lands have made beginnings. In our own country, private institutions, our public-school systems, great universities, and even the Federal Government through its Junior Employment Service, have begun to realize their responsibility.

I know about the splendid work some of you have been doing in this field. It is, however, the exchange of ideas and experiences that makes the National Educational Association of value to all of us.

During the past three years in Erie, Pennsylvania, it has been my privilege to be one of six people to devote full time to the work of educational, vocational, and personal guidance. It has been my further privilege and opportunity to work under an educational executive who understood, approved, and did not attempt to smother those faint glimmerings of initiative that appeared among those of us who worked in the ranks. With your pardon, therefore, I shall outline briefly the nature and scope of our activities. It seems to me very fitting that the Department of School Administration should give guidance a place on its program, because guidance considers the future employment throughout a large part of the school life of the child.

In the first place, a complete guidance program demands that the public-school system recognize its responsibility in helping boys and girls to discover their aptitudes. It demands also that provision be made by the public schools for the development of varying aptitudes when found. In Erie we have considered it essential also that the subjects in the high school courses be largely elective.

I am frequently asked what guidance is, and what it does. I answer: It is personnel administration in the schools, and by the schools, and for the benefit of the pupils of the schools. It is inspiring, because it deals

with the building of human lives. It concerns itself with the positive side of the training of young people. To form character, to fix ideals, to awaken ambitions. . . . What work could be more inspiring? It is a scientific attack upon the problem of conserving human energy and preventing human waste. Its business is helping boys and girls in their personal and educational problems, and helping them to choose, prepare for and make progress in occupations for which they are by inclination and ability best adapted. It does not mean selecting occupations, schools, or subjects for study for them, but rather, helping them to gain the facts on which they, with the help of their parents and friends, can make intelligent choices.

Is guidance by specialists necessary? I need only call attention to the complexity of modern life, the maze of occupations, the modern recognition of the doctrine of individual differences, and to the number of young people for whom at present the world of work is "a dark continent" when they leave school. I need only remind you of the large number who flounder about for years after they leave school. Help there was, but they did not receive it.

Not long ago I offended the president of a liberal arts college by making the statement that colleges, as well as high schools, have been criminally negligent in not having "shipping departments"—in not looking after the product after it has left the plant. I protested also against the annual "slaughter of the innocents" that takes place in both high school and college. Industry has recognized that the hire-and-fire policy is wasteful, unjust, and unsafe. Workers in industry are today transferred whenever possible and not fired. May not we in education draw a lesson? Is not our turnover too great? Guidance reduces turnover and prolongs school attendance.

At the outset I wish to register a protest against those who go about promulgating the dangerous doctrine, so pleasing to many teachers, that "every teacher is a counselor," and that there is no such thing as expert service in the field of educational, occupational, and personal guidance. The making of job-analyses is difficult. Occupational life is complex. Classroom teachers are busy and generally have more occupational opinions and prejudices than facts. Yet the facts about occupations exist, and, with a well organized department of Guidance, will be made available for use. It is possible to present to every high-school boy the promotional line from bank messenger to bank president, and also from inspector or straw boss to plant superintendent. It is possible to present the facts about apprenticeship opportunities, colleges, home, extension, and correspondence study. It is to be deplored that the slogan "every teacher a counselor" has, in some commonwealths, been used as a boomerang by local opponents of full time specialists in the field of educational, vocational, and personal guidance.

We began in Erie by outlining our aims. We began with a plan—with definite objectives. They were as follows:

1. Establishing of filing systems with records of students.
 - (a) Personal history of student.
 - (b) Educational history of student.
 - (c) Family history. Parent's ambition.
 - (d) Teachers' estimates of pupil's characteristics.
2. Survey of vocational opportunities of Erie.
 - (a) Analysis of conditions, advantages, and disadvantages in shops, stores, and offices.
 - (b) Study of local apprenticeship.
 - (c) Study of Erie occupations.
3. Conferences with parents and pupils for the purpose of:
 - (a) Keeping pupils in school.
 - (b) Assisting those who must leave to find work for which they are fitted.
 - (c) Removing the causes of failure in school work.
 - (d) Assisting pupils in their choice of studies and courses, and in the adjusting of their programs.
 - (e) Improving the personal habits of pupils.
 - (f) Giving information about higher educational institutions.
4. Establishing in each school suitable libraries containing inspirational books on occupations, college catalogues, etc.
5. Following the careers of those who have left the Erie schools, and encouraging them to continue their education:
 - (a) By returning to school.
 - (b) By availing themselves of night-school opportunities.
 - (c) Through correspondence schools, business colleges, etc.
6. The investigation of all applications for school exemption and employment certificates with a view to reducing the number who leave school unnecessarily.
7. The creating of widespread and intelligent interest in the guidance of Erie boys and girls.

Six years ago, or three years before counselors were appointed, a system of cumulative record cards was inaugurated. These, as you know, go with the child when he is transferred, and go with him when he is promoted to the six-year high school. They record occupational experience, teachers' judgments concerning the child, health records, attendance, academic marks, etc. They are, of course, filled out by the teachers.

Three years ago the six full-time counselors began their new work after special training for it. They soon found that the needs of the different high schools varied. Their work has therefore varied somewhat to meet these needs.

When the six-six plan was substituted for the antiquated eight-four system, life career classes were begun with seventh and eighth grade pupils. Local business and professional men coöperated by permitting us to make "little journeys" into the industrial, commercial, and professional homes of Erie. In the junior high schools were established also prevocational courses followed by various trade courses.

Sheets of facts on occupations, colleges, and apprenticeship courses were prepared and distributed by the thousands, giving both the students and their parents needed information. In the preparation of this material help was received from the various national engineering associations, and from many specialists both in the great universities and in practical life. In the mechanical work the commercial department of the high school coöperated.

Recognizing the social disapproval of innovations, many articles were prepared on various phases of guidance and printed in the Erie daily news-

papers. We realized the necessity of selling our guidance program and of keeping it sold.

Thousands of college catalogues were assembled, classified, and made available for use by interested students. Books of views of American colleges and universities were used as a part of an experiment in creative educational salesmanship. Books on occupations were also secured for the use of our students.

The science department demonstrated its interest in the movement by preparing and distributing a special bulletin explaining the nature and value of such subjects as biology, chemistry, and physics.

Teachers in the English department assigned oral and written compositions on various vocations with much enthusiasm on the part of students.

A beginning was made in following up and assisting graduates. Not long ago one young man who left our high school before guidance was established and later was graduated from a liberal arts college where he had no occupational guidance, wrote me. He had determined to study medicine but had had no chemistry or biology in college. He wanted me to help him with his plans. Another high-school graduate who had not entered an engineering school because he thought he did not have enough mathematics, was overjoyed when he found that there were good schools which he could enter without difficulty. Only recently I received a letter from a graduate of a nearby high school. His friends (?) had about convinced him that "if he became an architect he could not get a job for love nor money." He wrote to ask about advantages and disadvantages in this field. He decided not to follow the pseudo-guidance of his pseudo-friends.

Tests and measurements have also been used, with due caution, as a part of our plan, one of the counselors specializing this work.

Some of our most satisfying "cases" involve service in personal guidance. I shall never forget the keen-eyed fiery youth who came into my office one day and proceeded to pay his compliments to certain teachers and to assert vigorously that even at home he did not receive a square deal. With much satisfaction he displayed a lake-carriers card. He was going to get away from it all by leaving school and home and going on the Great Lakes. A brief interview, and a home visit, followed by an opportunity to "talk it over," led him to tear up the card and remain in school. Not long ago I had the pleasure of recommending this young man for a position in the advertising department of a great corporation.

In closing I wish to appeal for the establishment of a department of guidance in every large city, with an educator in charge who is both trained and experienced; for full time counselors, wherever possible, in every high school, and for part-time specialists where full-time workers are not possible.

I wish to urge also for every community in the land a careful study of the entire problem as to what our boys and girls shall do with their lives.

It is our duty to awaken an intelligent interest in the various problems relating to educational, vocational, and personal guidance.

Department of Science Instruction

SECRETARY'S MINUTES

OFFICERS

President—GILBERT H. TRAFTON, State Teachers College.....Mankato, Minn.
Secretary—ZELMA GOLDSWORTHY, West High School.....Minneapolis, Minn.

Owing to the absence of both the President, Mr. Gilbert H. Trafton, and the Secretary, Miss Zelma Goldsworthy, the first meeting of the department was called to order at 2:15 p. m. at the Franklin Union, by Mr. C. H. Stone, President of the New England Association of Chemistry Teachers. There were 75 people present.

The first speaker of the afternoon was Mr. William G. Vinal, Rhode Island College of Education, Providence, R. I., who spoke on *THE SCIENCE OF OUTDOOR RECREATION* emphasizing work that he and his colleagues were doing by camps and recreation centers.

Miss Gertrude Weeks, Boston Normal School, Boston, Mass., gave a most interesting and enthusiastic talk on the much discussed subject of today—namely, *HYGIENE AS A PART OF BIOLOGY*.

The third speaker of the session was Mr. Morris Meister, Teachers College, who discussed in detail “Methods of Managing a Science Club.” Mr. Meister was as brilliant as ever and gave numerous phases of the work necessary in order to have a real Science Club. His main point was a Club with one workable interest. He illustrated all his points with personal experiences in this line of work.

The last speaker was Mr. J. Richard Lunt, English High School, Boston, Mass., whose topic was *VIVIFYING THE TEACHING OF GENERAL SCIENCE*. It is impossible to describe the class exercise which Mr. Lunt put us all through. He used as the demonstration experiment the Electrolysis of Water. The members and friends present were treated to the most energetic teaching of a class that had been witnessed for some time. After the demonstration Mr. Lunt advocated the using of larger pieces of apparatus for demonstration work. He showed a number of pieces that had just been prepared by L. E. Knott Apparatus Co.

After a discussion in which many present took part the meeting adjourned at 5:30 p. m.

The second session of the Department of Science Instruction was called to order in the Lecture Hall of Franklin Union by Mr. Irving H. Upton, president of the New England Association of Physics Teachers, at 2:15 p. m.

The first speaker for the afternoon was Mr. C. H. Stone, president of the New England Association of Chemistry Teachers and Chemistry Instructor at the English High School, Boston, Mass. His subject was *TEACHING CHEMISTRY IN THE HIGH SCHOOL*. Mr. Stone treated this broad subject in a masterly fashion. He made especially strong the part played by Americans in the development of present-day chemistry. Mr. Stone discussed in detail the problems involving the use of 22.4 liters.

PHYSICS FOR GIRLS was the subject discussed by Mr. Walter G. Whitman, of the Massachusetts State Normal School, Salem, Mass. Mr. Whitman was familiar with his subject and gave many points of value that the teachers could well use. Mr. Packard, of the Brookline, Mass., High School, also spoke on this subject as did several others present.

Mr. Allen C. Hutchinson, South Side High School, Newark, N. J., spoke on *PHYSICS FOR BOYS*. This topic was well handled. In the course of Mr. Hutchinson's talk he gave a well-outlined course adaptable for non-college preparatory courses.

After the papers the annual election of officers was held. On motion of Mr. Stone, Leslie O. Johnson, head of the Chemistry Department of the New Haven High School, New Haven, Conn., was nominated for President. On motion of Mr. Packard nominations were closed and Mr. Johnson was declared elected.

Mr. Packard nominated Mr. A. C. Hutchinson, head of the Science Department, South Side High School, Newark, N. J., for vice-president. He was unanimously elected.

Mr. Stone nominated Mr. Arthur H. French, head of the Science Department in the Francis W. Parker School, San Diego, Calif., who was also unanimously elected.

After a brief reception the meeting adjourned at 5 P. M. after voting the meeting a grand success and the officers predicting an even better meeting in 1923 if the science teachers of the country respond as generously with suggestions as they have in the past.

LESLIE O. JOHNSON, *Secretary pro tem.*

HYGIENE AS A PART OF BIOLOGY

GERTRUDE WEEKS, BOSTON NORMAL SCHOOL, BOSTON, MASSACHUSETTS

An eminent physician in Boston has said, "Hygiene is the yellow dog among the studies of the curriculum," and I have not heard of any one's disputing this statement. If it is true that the teaching of hygiene in most of our schools is a farce—"the least taught and the worst taught of all the branches of the curriculum"—what is the cause of it?

Is it because the public is not alive to the importance of personal and community hygiene? The State certainly wants healthy citizens. Francis Bacon said, "Public health is the foundation on which reposes . . . the power of the community." The student of today must be viewed as the raw material of a new State; the school as the nursery of the Nation. To conserve this material is as logical a function of the State as to conserve the National resources of coal, iron, and water power." The only effective way to do this is through the public schools. Most of the States require hygiene teaching. Some States give special licences through examinations for teachers of hygiene; and specify the purpose, content, and method of instruction. However, the startling failure to meet health standards found in the examination of men of military age during the recruiting for the war, showed conclusively that the public, by and large, had not acquired proper health habits. This knowledge should have reacted in a lively enforcement of health regulations and higher health standards in general; and in particular, a careful inspection of the high-school teaching of hygiene to the youth of today. But it has not done so up to the present.

Is the poor hygiene teaching of today due to the fact that the subject itself is removed from the interest and experience of youth? Certainly not, for health concerns every moment of daily life from birth to death. There can hardly be a more important thing for a person to do than to study the question—and answer it—of making his body as smoothly running and effectively working a machine as it is humanly possible. As the individual is, so is the community.

Is the present dissatisfaction with the hygiene teaching due to the fact that it is poorly taught or not really taught at all? One who did not know the school situation might expect specialists in hygiene as teachers of

the subject in the high school. That sounds reasonable—hygiene teachers for the teaching of hygiene. But what are the facts? Perhaps the subject is quite overlooked by the principal of the school in making out the school program for the year. I have known that to happen. Or perhaps the principal does remember, but he is not especially interested. It is a State requirement; of course any good teacher can teach hygiene. Very often, the subject is given to the teacher whose teaching program needs an extra period or so. There is no question of his qualification for the work or his interest in the subject. Of course he may teach the subject very well, but the chances are that the type of work is a recitation from assigned reading on anatomy and physiology, a dead handling of a live subject, which can not function in any vital way.

Even if it is credited to the biology department, as is generally done, the head of the department is powerless to change the situation and better the teaching, when program-hours is the only guide in choosing the teacher of hygiene.

If the principal gives the subject to a biology teacher, many times he must take the work with large classes, where the lecture method is the only possible one. Of course a skeleton, charts, models, etc., can make the teaching of the bone, muscular, nervous, and digestive systems academically interesting, but at best, such teaching is impersonal, unmotivated and does not react in higher standards of personal hygiene on the part of the students—in better health habits. There is no "follow-up" possible on the part of the teacher.

Again, perhaps the subject is assigned to a very able and effective teacher of biology. This does sometimes happen. A biology teacher with a growing knowledge of the value and importance of hygiene and a delight in the subject itself can do very much. But isn't he, because of his special training, inclined to emphasize with these adolescents the study of biological systems and their functions, of bacteria and their reactions, rather than the forming of health habits?

There are other arrangements for the teaching of hygiene in the high school. Let me cite the situation in a city of fifteen high schools. In six of these, the teaching is done by the science department, but this does not mean, necessarily, a specialist in hygiene; in four by program-fitters; in two by physicians; in two by physical-education teachers; in one by a trained nurse. All of these courses are credited to science, biology section, whether or not the science head has any supervision or "say-so" as to the content or type of teaching. This is an encouraging situation only as it may be indicative of an unstableness that will ultimately find its true equilibrium.

Should hygiene be a part of biology? Before we can answer this question let us ask a few. First, what type of hygiene instruction will be most purposeful for high-school students?

High-school students are adolescents, which means that their own bodies are undergoing a period of stress and storm when, as Stanley Hall says,

"Old moorings are broken and higher levels are attained. When the annual rate of growth in height and strength is increased and often doubled or more, when the range of individual differences and average errors in all physical measurements and all psychic tests increases." High-school students are at an age to have special body consciousness.

Mentally, exaggeration is a marked trait; so is romance. It is a period of tenseness, eagerness, and dominance. Socially intimate companions are sought; hero-worship is common; social clubs are formed, and "societies" flourish; religious interests run high.

This is the material which the high-school teacher of hygiene must meet and satisfy. What does this high-school pupil want of hygiene? He may not be especially interested in the subject itself, but he does want power to do work, to get results, to enjoy life without the handicap of a disturbing physical body. He wants to be able to do with his body what the best of them can do. What shall be taught? How? Who is best qualified to teach this? What shall be taught? First of all, correct health habits. Secondly, in so far as the pupils are mentally able to assimilate and are interested, the biological reasons for these habits. Thirdly, the carrying over into their homes and communities the health habits and facts acquired.

As to habits, I recognize that psychologically this is not the habit-forming age. But if good health habits are not established of what avail is all our hygiene teaching?

How shall this be done? The method of teaching must be adapted to the moral, mental, and social stage of the adolescent. Make use of his new awakenings, his love of out-of-doors, and reading, his exaggerations, his eagerness, his social aspirations, his hero-worship, in leading him to form correct health habits. Praise him when he does achieve a real goal on the way and constantly encourage him in the right habits until they become as automatic as is possible. The study of the science underlying the value of these health habits of posture, proper breathing, and diet, sleep, fresh air, and cleanliness of person and surroundings—of building up a power of resistance to disease in his body—will follow the mastery of the elementary skills and processes necessary in forming these habits.

The interest in the feeling of increased power over his body and his physical surroundings will carry over, under the sympathetic attitude of the teacher, into the home and community. In O'Shea and Kellog's *Health Problems* are excellent suggestions for the manner in which this can be done. This book contains lists of suggestive questions—projects for the student to carry out—which will awaken a practical attitude toward hygiene.

And now for the question as to who is best qualified to teach to high-school pupils a hygiene which will function. If health habits are the vital thing, as I believe, then (1) the hygiene teacher must be an exponent of correct health habits; (2) he must have had the opportunity to see his students in a not too formal way where they are individually get-at-able so that he may advise and correct their habit-formations; (3) he must have

basic scientific training in the subjects of science and hygiene and (+) he must be one that participates in community health-betterment enterprises. Who best exemplifies these qualifications?

The physician is usually too much interested in disease and its cure and the more technical aspects of his subject to be the most desirable. This is true to a less degree of the trained nurse. In both physician and nurse the dominant interest is prevention and cure of disease rather than the fostering of an already good condition of health. Their service is demanded by sick people, not well people, and their biology is largely pathological. The nurse usually has community service as an asset above the doctor but neither doctor nor nurse seem to me the best teacher of high-school hygiene.

For the program-fitter—the teacher who is chosen because his program can stand another period or so—as a teacher of hygiene I offer no plea, nor would he take it kindly if I did.

The biology teacher, from the scientific point of view, is the logical candidate and pretty universally the accepted one. Yet if you inquire of a biology teacher, you will find that many have less interest and preparation for hygiene teaching than for the teaching of plant and animal science. At college, specialization in biology does not require nor include courses in hygiene. A teacher of high-school biology seldom has special training in hygiene. Yet at present, from the science point of view, which is oftenest the uppermost one, the biology teacher seems the logical candidate for the teaching of hygiene, as I said before. If good health habits is the chief aim, does the biology teacher have a good opportunity to make the teaching really function?

It seems to me that the requirements for the best teaching of hygiene in the high school are most adequately met by the teacher of physical training who holds the State certificate of health instruction or its equivalent in biological preparation. I am told that training schools for teachers of physical education require such foundation study of physiology and hygiene for the diploma.

Such a teacher directs his students in gymnastics, first-aid emergencies, drill, games, and dancing, all requiring coördination of mind and muscle and quick mental and physical reactions. As handmaids to these subjects, he shows the necessity of fresh air, proper temperature, good ventilation, deep breathing, and good posture; balanced diet; cleanliness of person and surroundings. It must be part of his work to note the reaction of individual students in each of these matters and to follow up cases requiring better hygienic conditions of sleep, diet, better proportion of rest and work, fresh air, and the like. He is often a direct participator in community health betterment programs.

Unless we can have a specialist in hygiene in the high schools, a man who has certain of the qualifications of doctor, nurse, biologist, and physical-education teacher combined, plus a certain special preparation and consecration, the physical education teacher, who can of all high-school teachers

best see and direct proper health habits, seems to me the best solution of our problem.

To put my topic, "Hygiene as a Part of Biology," in the form of a question, "Is Hygiene a part of Biology?", I would say, "No, not necessarily, either academically or pedagogically." A biologist, just because he is a biologist, is not a hygiene specialist, and may not even be much interested in that phase of the science which concerns specialists in human biology. This is no criticism of the biologist. Why should he be a hygiene specialist? Hygiene, as at present taught, as a part of biology, does not function to the satisfaction of the State, the teacher, nor the pupil. There seems to me no good and sufficient reason to go on assuming that the biologist, just because he is a biologist, is best fitted to teach hygiene in the high schools.

THE SCIENCE OF OUTDOOR RECREATION

WILLIAM G. VINAL, RHODE ISLAND COLLEGE OF EDUCATION, PROVIDENCE.
RHODE ISLAND

Every animal but the human gets its training for the life struggle through recreation. The human animal teaches about everything in school but simple outdoor living. What our children know about the great out-of-doors is in spite of our educational system. The indications are that the movement is not merely supplementing education but that it will transform it. There are many agencies taking up this missing link in our curriculum.

1. *The private camp*—There was a time when all our schools were private. We are passing through the same period in camping. There are now about 700 private camps which charge a tuition fee of \$200 or more for about two months in the summer. About 95 per cent of these are in New England and New York and 75 per cent are in the White Mountain region. Each camp enrolls 50 to 200 boys or girls. The main business of these camps is to teach the enjoyment of simple outdoor living. Harvard University is about to give its first Ph. D. to a student in the profession of camping.

2. *Institutional camps*—By institutional camp is meant those of the Boy Scouts, Camp Fire Girls, Y. M. C. A., and charitable organizations. There are about 5000 of these camps which charge a maintenance fee for two-week periods during the summer. These camps are usually located within the outskirts of large cities. In 1920 there were 364,000 boy scouts and 82,000 girl scouts in the United States. Scoutcraft supplements existing educational courses. Within the last few years, however, certain colleges have been giving courses with credit toward a degree, for Scout leaders. Scout-training courses are also fully organized in some junior high schools. It is solving the dress problem in many secondary schools.

3. *State parks*—Seventeen new State parks were organized last year. There are 2,000,000 acres of park land in New York State alone. The

most remarkable park is the one started at Bear Mountain in 1899 by Colonel Theodore Roosevelt, then Governor of New York. It is estimated that 50,000 people enjoyed its privileges in the summer of 1921 and that in five years' time it will be 250,000. This park has 40,000 acres. For the summer of 1922 there are forty-seven organizations that are running camps in the park. The camps have a capacity for 6600 campers at one time. These camps are very cosmopolitan. On Twin Lake one may see the following camps in the order named: Catholic Charity, Y. M. H. A., R. H. Macy Co. of New York City, Y. M. C. A. of Orange County, Jewish Settlement, Y. W. C. A. colored, and Negro Fresh Air colored. Over \$12,600,000 has been appropriated so far. Balanced meals are delivered hot and at cost to the various camps. The system has several portable saw mills, quarries, a steamboat line, a large inn and restaurant, and a large working staff. Winter camping is becoming as popular as summer camping.

4. *Colleges*—The only college that I know of that prepares in this line is Syracuse University. It has a Professor of Forest Recreation. In his department are taught camp engineering, camp sanitation, camp trails, and the landscape phase of camping.

5. *Schools*—The Country Day School is a movement in the direction of simple outdoor living but generally does not go as far as the camp in the fulfillment of the aims. The city of Detroit in the summer of 1921 made an appropriation from its community fund for camping. Nine hundred girls were taken care of in a camp on Lake Michigan. This is the nearest approach to a public responsibility for this phase of education.

6. *Business firms*—The business man is realizing the advantages of outdoor recreation. An example of this is the General Electric Company which maintains a camp on Lake George for its girl employees.

Outdoor recreation teaches a great deal that pertains to science. The method is entirely different. In camp one may learn to cook before a fire by means of a reflector oven. He learns that certain objects reflect better than others. He discovers that if biscuits are to be well baked that he must reflect heat to the bottom of the pan as well as to the top. He learns that he gets better heat if the reflector is at an angle of 45 degrees. And through all this experience he never hears of the angles of incidence nor of the different aximuths of the plane of reflection.

Science in the school must get more of the flavor of practice and less of the rule. One learns to swim by swimming and not by studying principles. In outdoor living there are many opportunities or shall I say the necessities for application of the principles of science.

MANAGING A SCIENCE CLUB

MORRIS MEISTER, TEACHERS COLLEGE, COLUMBIA UNIVERSITY,
NEW YORK CITY

After-school or extra-curricular activities have recently been receiving a great deal of attention from educators, administrators, and teachers. From the point of view of time spent, effort exerted, interest and thought stimulated, what our pupils do after school hours compares very favorably with what they do for us in the classroom.

Science teachers in particular are affected by after-school activities of all kinds. All sorts of apparatus under the name of boys is being sold to boys of all ages. Meccano, chemcraft, experiments with magnetism, light, electricity, the surveyor's outfit, the mineralogy outfit, and countless other sets and "inventor's" outfits, not to mention the recent radio innovation, are monopolizing more and more of the boy's play time, in activity which makes an intense appeal to the inherent manipulative instincts of boys of this age.

To guide and control this activity which at the present time is rather promiscuous and subject to all sorts of advertising propaganda of the various boy manufacturers, a Science Club under the direction of the science teacher becomes a necessity.

A successful science club for the junior high school boy

1. Must be a *general* science club rather than a club devoted to a specific purpose, such as chemistry, photography, etc. Only by means of activities of wide and general scope can the interests of the majority of individuals be held, and their various capacities given an outlet for development.

2. Must have a definite and simple organization, involving a constitution drawn up by the boys themselves, which will definitely specify the officers, their duties, types of meetings, payment of dues, admissions, impleachments, prizes, awards, etc.

3. Must have a definite program of activities. Five types of programs are found to be effective as follows: (a) The lecture (by member, director, or outsider); (b) the trip or excursion; (c) the assembly program; (d) the experiment program, and (e) the demonstration program.

The activities of the club and the awards are based upon the Club Point System, which consists of a list of fifty definite things a boy can do to score points of merit. For example, for presenting an invention, 25 to 50 points; for reading a science book, 15 points; for knowing the names and accomplishments of 10 great scientists, 10 points; for presenting and operating a meccano, erector, etc., construction, etc., 10 points.

The Science Club is designed as a vehicle on which to carry after-school science activities, in order to guide, control, and utilize them for enhancing the interest in curricular science in such a way as to introduce into the classroom work some of the free vital spirit so common to out-of-school projects and often so sadly lacking in school work.

THE TEACHING OF HIGH-SCHOOL CHEMISTRY

C. H. STONE, PRESIDENT OF THE ENGLISH HIGH SCHOOL, BOSTON,
MASSACHUSETTS

Probably every teacher here present has built up from his own experience a definite system of teaching, incorporating therein those principles and methods which he has found by repeated trial to be most effective. While such principles and methods may not always be successfully transplanted from the schoolroom of one teacher to that of another, they should, nevertheless, be of interest to teachers in general. It may not, therefore, be inappropriate if the following remarks embody the experience of a good many years in my chemistry classroom.

One of the first questions asked about a teacher is with regard to discipline. If there is any one subject in the high-school curriculum which so holds the interest and attention of students as to make discipline easy, that subject is chemistry. If properly taught, no other study makes so strong an appeal to all the senses, no other brings the student into closer touch with things and principles, no other except physics throws more light upon the environment of youth and none better satisfies natural curiosity. Unenthusiastic and uninspiring must that teacher be who cannot hold the attention of a class to such a subject during the recitation, and in the laboratory the natural desire of young people "to do something and see what will happen," if properly guided, makes discipline less of a bugbear than it is in other subjects. Teachers who are not alert, energetic, and enthusiastic may find discipline difficult and endeavor to enforce it by martinet rules, but where real work is being done and boys and girls are absorbed in the progress of an experiment or a demonstration, there will be little need for such methods. Instructors who find difficulty with discipline may well examine themselves to see if they are not somehow out of touch with the viewpoint and ideas of youth. Lack of sympathy with young people, inability to appreciate their immature attitude of mind toward the responsibilities of school life and work are frequent causes of disciplinary troubles. So far as possible, *suaviter in modo* may be the teacher's motto, but pupils should not be allowed to conclude that *fortiter in re* is not also a part of that motto. The earnest, sympathetic teacher with personality will have little difficulty in maintaining order, but do not permit your personality to stifle or override that of a pupil. Teach chemistry as a live, interesting subject; teach it whole-heartedly and enthusiastically; put sympathetic personality and knowledge into your teaching and your pupils will follow where you will. And remember that you may teach chemistry from what you *know* but you shall build character *by* what you *are*.

The recitation—Teachers should never forget that the study of science introduces the student into a new field. Everything is different from what he has been accustomed to. Unfamiliar apparatus, strange substances with peculiar colors and odors, and new words like those of a foreign language confront him at every turn when beginning chemistry. Hence at first

the teacher must go slow. New concepts are not quickly grasped. It is well to draw upon ideas already developed in previous science study and in chemistry we may draw largely from the study of physics which, in most schools, the pupil will already have had. Fortunately very much of chemistry depends upon physical principles so that development along these lines seems logical. Gradually the student will arrive at clearer concepts of purely chemical factors as he acquires familiarity with his new environment of material and of chemical transformations.

Then, too, it must not be forgotten that science calls for a different mental attitude than does most of the student's previous work. He has been accustomed to accept from the hand of authority facts and principles to be assimilated without opportunity for investigation or verification. In science the position is changed. The pupil may now become to a degree a judge of the facts that pass under his inspection; he may employ his powers of observation and of reasoning in ways untried before. He should achieve an independence of thought and judgment, an ability to arrive at correct conclusions from a consideration of presented facts. This mental attitude is reached slowly and the teacher must not attempt to force the development too rapidly.

Every recitation period should center about one main idea. The demonstration, the blackboard exercise, the recitations by the pupils, all should contribute something toward building up and strengthening in the minds of the class a series of related concepts centering about one principal idea. Some recitation periods are like the stream that flows into the desert until its waters are lost in the dry sands; like the stream, the recitation never emerges anywhere. Stick to the main theme and keep the class to it. An occasional excursion of thought may be justified if it can be made to contribute some additional knowledge bearing upon the main theme, but never go far from the central thought. It is often well to close the period with a summary, upon the blackboard perhaps, of the recitation just ended; this summary may be made the basis of review in the first part of the next day's recitation.

Since the beginner in chemistry is introduced into a strange world, it is fundamentally important that he should understand the nomenclature of that world. Personal experience has shown that failure to understand the meaning of a technical word or two in some paragraph has completely neutralized the pupil's effort in study. Therefore, point out in the advance lesson such words as need especial attention and give for each a definition in simple but accurate language. Some definitions in our texts do not seem perfectly accurate. Thus an acid is often defined as a "substance which gives hydrogen ions when dissolved in water." This is true but not wholly satisfactory. Does not an acid salt, say sodium hydrogen sulphate, also give hydrogen ions in water solution? Would not a more accurate definition of an acid state that it is "a substance which gives hydrogen ions in water solution, *and no other positive ions*"? When a satisfactory definition has been chosen, insist that it be learned as given and further insist that it be used over and over in the classroom until it becomes per-

factly familiar. The importance of repetition cannot be overemphasized.

All that has just been said regarding definitions applies with equal force to laws. And not only should pupils be held to correct statements of definitions and laws, but they should be required to give suitable examples illustrating the meaning of the definition or the application of the law. Insist continually upon accurate definition and accurate statement of laws and make repetition of these so frequent that from force of habit they are given correctly.

Most texts in chemistry, and many teachers, do not sufficiently emphasize the importance of the type reaction. The general principle underlying a whole series of chemical changes is vastly more important than any single case can possibly be. For example, most chemistry texts state that ammonia gas may be prepared by heating a mixture of ammonium chloride and calcium hydroxide. This is true but it is not the whole truth. You can demonstrate to your class in half a dozen ways that any ammonium salt treated with a base will liberate ammonia gas. Prove this yourself before the class, or let individual students try it, each using a different combination, until the truth is evident and the general principle established. Given five ammonium salts and four bases, let the class write equations for twenty ways to make ammonia. Then it will be time to consider with them why the text gives ammonium chloride and calcium hydroxide as the usual materials.

Other cases that come to mind are: the preparation of chlorine by oxidation of hydrochloric acid, other oxidizing agents than manganese dioxide to be used; the preparation of the halogens from their "ide" salts; the action of heat on nitrates of metals of valence two or more; and the general method for preparing the common acids. Any live teacher will think of, or can work out, other cases in which a general principle applies, such as that in which sand is heated with carbonates and phosphates in furnace reactions

Probably no topic in chemistry has caused more debate than the question: "When shall we teach valence?" My own belief is that valence should be taught before formulas and equations. It is hard to see how students can understand formulas without a knowledge of valence; it seems to me more a feat of memory than the result of real knowledge. In my own school we teach first a simple table of the common elements and radicals arranged as positive and negative factors under their respective valences. Elements with variable valence may be omitted, or only the more important valence given. The structure of radicals, and later of formulas, is made clear by graphic forms. Arranged as plus and minus factors in this way, the likelihood that students will write some of the impossible combinations sometimes seen in test papers is much minimized. No reference to ions is made at this time, but when this topic is taken up the student finds that he already has a fairly complete list of plus and minus ions. Taught thus the valence table serves two purposes. Much drill follows the study of this table until the pupils are able to write simple formulas and then more difficult ones with a minimum of error. After formulas, equations follow logically. In

all equations pupils are trained to indicate as diatomic molecules such elements as oxygen, nitrogen, hydrogen, and chlorine; they are also trained to indicate the decomposition products in such unstable substances as ammonium hydroxide and carbonic acid. The arrow, pointing up or down, indicates the gas or precipitate produced in the reaction.

There are various ways of teaching equations. One way may be considered here. Take the action of sulphuric acid on zinc. Hydrogen is liberated and zinc sulphate is formed. The hydrogen atoms surrender two valences to the one atom of zinc which goes into solution.

Again, take the action of sulphurous acid on potassium permanganate solution. Each molecule of the acid can take up one oxygen atom thereby changing the valence of the sulphur from four to six. The potassium atoms in the permanganate can undergo no valence change, but the manganese atoms pass from a valence of seven to a valence of two since manganese sulphate is formed. The manganese atom thereby loses five valences which are taken up by the sulphur, through the addition of oxygen. But each oxygen adds two valences so it is necessary to have at least two molecules of the permanganate thus making ten valences to be transferred to the sulphur. Five sulphur atoms can therefore be oxidized and the equation is

One type of problem may be mentioned here. It is often desired to find the volume of gas obtained from a given weight of material. This may be done by the use of 22.4 liters, as follows. Given 50 grams ammonium sulphate; to find volume of ammonia gas obtainable.

Since two molecular weights of the gas are liberated, the volume of ammonia obtained from 132 grams of the ammonium salt will be 44.8 liters. From 50 grams, of course, a corresponding volume will be obtained. This method has the advantage of giving the volume directly without first finding the weight of the gas.

We have found that a few simple generalizations from the Periodic Table are very helpful. The general properties of an element, its valence, its activity compared with other elements in same column are the chief points brought out. Some time is spent in drill on the table but not too much detail should be given in regard to it.

In the same way, the displacement series is made the basis of a whole list of important ideas. This table shows not only the order in which the metals displace each other, but it shows also the relative activity, the probability of a given metal occurring free, the probable method to be used in extracting from its oxide, its probable tendency to rust, its probable action on water, and its probable action on acids are some of the points dwelt upon.

The amount of ground covered in the average high school will vary

much, the length of periods and the number of actual school weeks being determining factors. But the teacher who has given a thorough treatment of the non-metals with the accompanying laws and theories, ionic theory especially, need not feel that the course is inadequate because the metals have not been studied. If a few typical metals, sodium, calcium, iron, and copper or lead, are studied, the others may be omitted. Here again we must fall back upon our general principles, and with the aid of the periodic table and the displacement series endeavor to give certain fundamental ideas which will apply to any of the metals. The general methods for preparing metal compounds may be taken in the same way. It is better not to cover too much ground. Better do less in extent and do it well than to undertake too extensive a program and not succeed in making it yield a satisfactory result.

With regard to methods of conducting recitations a word may be said. A cut-and-dried form of recitation may become wearisome with daily use. The teacher should use a variety of methods. Oral recitations may be varied by using the topic method or the rapid-fire method. Sometimes send a pupil to the board to write out some process or build up a series of equations while at the same time discuss orally what he is writing. If conditions are favorable it is often a good plan to assign in advance to one pupil a certain topic to be presented by him before the class on a certain day. Let him then set up his apparatus, carry out the experiment, discuss it fully, and be prepared to answer any relevant questions the class may ask.

With classes of forty or more it has been found a good plan to give frequent short written tests, allowing five minutes in which to write a description of some process, to draw and letter some pieces of apparatus, to write five definitions, to solve some problem, or to answer some question in descriptive chemistry. Longer tests requiring the whole period are given once a month. Drawings of apparatus with detailed description are sometimes called for to be handed in at the next recitation.

The teacher must use every effort to keep the whole class on the alert. No pupil, after reciting, should be allowed to sink back with the idea that he is done and nothing more will be expected from him until the next recitation. Too often high-school students are inclined to think that unless they are actually reciting they are exempt from the necessity of mental activity. This attitude must be discouraged in every possible way. The teacher must keep watch over the class, having his finger on its pulse so to speak, and be quick to detect any general flagging of interest or individual inattention.

The live teacher will make a good many demonstrations, small and large, during the course. These should not be duplicates of experiments to be done later in the laboratory by the students, except that in the early weeks of the course such procedure may be advisable in order to give the pupils correct ideas as to the setting up of apparatus and its proper manipulation. But the demonstration of itself is of little value. Pupils are inclined to regard it as simply an exhibition of something amusing or temporarily interesting; few pupils will look below the surface for the important meaning

which the demonstration holds. Every demonstration should be accompanied or followed by a thorough quiz on the points which the teacher intends to show, with careful attention to detail. Tell the class nothing which they can observe for themselves or find out by process of reasoning, and do not leave the demonstration until the last bit of information, the last point of teaching value has been wrung from it; otherwise it will fall short of accomplishing its full purpose.

While demonstrations may be made powerful instruments for teaching, the lecture method is almost worthless for high-school students. It falls short in efficiency, because it does not impose sufficient responsibility upon the student, because it does not demand real mental activity from him. Unless he is held responsible and unless he is devoting mental effort he will not get much from the exercise. The lecture is too much like the moving picture; it moves too rapidly to leave a lasting imprint upon the mind. Of course, an occasional five minutes may profitably be devoted to some interesting bit of biography or the details of some recent advance in science, but on the whole *avoid the lecture method*. As a rule teachers talk too much; make your pupils do the talking.

Where it is possible, a study should be correlated with the other subjects which are being taken with it, or have been taken in previous years. Knowledge is one, not a series of unrelated units. Whatever the student has already learned or is learning should be brought to bear upon his present problem. Chemistry should especially be correlated with English and with physics. While it is not the function of the chemistry teacher to teach English, an effort can at least be made to require good English in both oral and written work, to call attention to misspelled words, such as insoluble, preparation, and filtrate, to insist on neatness and reasonable arrangement of work: these are no more English than they are chemistry. Constantly call to pupils' attention the necessity of using the knowledge previously gained in their physics course; use the same formulas in solving problems under Boyle's and Charles' Law and in thermometer conversions that were used in the physics course. The breaking of thick glass bottles when heated, the contraction of gases when heat is removed from them, and other incidents in the laboratory afford opportunity to emphasize to the student the importance of using the knowledge supposed to have been acquired in his previous work. History and modern languages may be correlated to a less extent while drawing should be required of all students taking science.

There is also the correlation of chemistry with the environment of the student. Without at all abandoning the emphasis on the importance of general principles, the bearing of chemistry upon the daily life of the world should not be neglected. Such topics, as the automobile with its three factors of steel, rubber, and gasoline, the principles of photography, fireworks and explosives are suggested. The chemistry of the home and the chemistry of fertilizers, sprays, milk, and the soil are topics which should receive especial treatment in the rural high school.

There is need in our high schools for a well-planned four-year course in

science. Four-year courses already exist in English, History, Mathematics, Latin, and consecutive courses in other subjects. Science, however, has not universally received the same consideration. Somewhere in the four years there comes a break. While we may not maintain with Spencer that science contains that knowledge which is of sole value in life, it is at least of sufficient value to warrant an equal consideration as to length and continuity of course with other subjects in the curriculum. Both physics and chemistry, usually given in the last two years of the high school, would profit by this arrangement. The steady development of observational and reasoning power in scientific work is seriously interfered with where a break occurs during the second year.

Time does not permit more than mention of such topics as "Assigned readings," "Essays," "Industrial excursions," "Problems"; but I want to speak of one topic more fully. It seems to me the time has come when we may justly dwell upon the word American in our chemistry teaching. During the past ten years this country has shown that it has chemists second to none; it has shown that there is an American chemistry. Mention of only a few lines of endeavor, such as optical glass, dye stuffs, war gases, explosives, and nitrogen fixation will show that today we stand upon a chemical level with any of the nations. The names of American chemists should be as freely used in our class work as those of European chemists. Let us give to America and to American chemists the credit which is their just due. And the lesson taught us by the Great War must not be forgotten. Not again must our country be so dependent upon foreign chemical industries. We must train our own chemists here.

The laboratory—If the recitation room is the place in which the student thinks out answers to questions from the teacher, the laboratory is the place in which he thinks out the answers to questions of his own. It is the one spot in which his ability to initiate and to correlate are put to the test. No laboratory directions should be so detailed as to leave the student no opportunity to exert his powers of constructive ability, observation, and reasoning. The teacher should pass from student to student, inspecting, criticizing, questioning, suggesting, but telling as little as possible. Too much telling is bad. One fact or principle discovered by the pupil is worth half a dozen told to him by the teacher. Telling does not create independence of thought; that comes best through the pupil's own efforts.

In the laboratory the pupil may work out small research problems. Let him, for example, find out for himself why sulphuric acid does not work well on marble when making carbon dioxide; why heat is needed in making nitric acid by the general rule but is not needed in making hydrochloric acid by the same rule; whether any oxide can be used with HCl in making chlorine; why the oxygen delivery tube should be removed from the water in the trough when all the bottles are filled while the hydrogen delivery tube need not be removed. These are simple points not beyond the power of the average student who is willing to make mental effort.

In the laboratory the special interests of individual students may be allowed chance for expression. For some years in my own school we have

given boys who were interested and ambitious special work along the line of their choice after the regular work was completed. The preparation of simple salts seems to appeal to them more than any other of the lines open, although experiments in the chemistry of textiles, of foods, and of agriculture are available. Specimens of this work and of note books used are on exhibition here.

So far as possible the course in chemistry, both in lecture room and laboratory, should be kept as humanistic as possible. The colleges have almost forced upon us much academic work, but such work is of less interest to the young student. The chemistry of the automobile, of photography, and the like makes a stronger appeal than the chemistry of substances for which the student can see little use. Where such procedure is possible, some separation of non-college preparatory students from the others seems desirable. For such students the course can be much modified and more of the chemistry that deals directly with their life interests and environment could be made use of.

Throughout the whole course, training in the ability to observe, to see relationships, to correlate facts and to draw from observed facts correct conclusions is the aim of chemistry teaching; the accumulation of much information is important but of less real value. Observe and think is our "Open Sesame."

Before closing, a brief mention of some conditions which handicap our teaching should be made. The first of these is the abnormal size of classes. To give proper and efficient instruction to classes of forty or more is a task to try the skill and patience of the very best teachers. With half divisions in the laboratory this gives twenty for a single teacher. Fifteen is as many beginners as can be efficiently handled in the laboratory unless an assistant is provided. I am aware that school officials are often in the position of King Leodogran when he entertained the Queen of Orkney and her sons, "not as he would but as he could." Nevertheless large classes militate against the best teaching.

A shortened recitation period is another handicap. With a given amount of ground to be covered, the maximum of time should be granted for recitations. Less than forty minutes with a class of forty seems inadequate. No period should be less than forty-five minutes.

I plead also for the recognition and adoption of the principle that every science teacher should have one period a day free from every official assignment. This time is absolutely necessary for setting up and testing demonstration apparatus, for repairing broken apparatus and constructing new; for trying out new experiments; for making solutions; and for the hundred things which must be done on the teacher's own time if the free period is not granted.

I cannot speak here of such topics as: lack of home coöperation, of the too evident outside activities of students, of jazz and moving pictures and the automobile which take so much time that should be given to study. These are all factors which affect the quality of the work we are trying to do or rather the quality of the product we turn out.

When we look into the future and realize the great part which chemistry is destined to play in this country, a strong feeling of responsibility comes over us. There are great problems waiting to be solved by the chemists of the near future, and these chemists are now our students. Upon them will fall in the coming years the solving of the problems of waste, of conservation, of new fuels and new sources of power. If they are to do well their part then, we must do well our part now.

To lay the broad and deep foundations of chemical knowledge on which others may raise the superstructure, to cultivate in youth those powers of observation and of reasoning which lead to the best results, to waken in them a realization of what chemistry means to the country now and in the future, and to stir in them an ambition to contribute something to the science which has done so much to make our modern civilization possible by promoting the safety, comfort, health, and material wealth of our people, this, O Fellow Teachers, is your task and mine.

CONTENTS OF A COURSE IN PHYSICS FOR GIRLS

WALTER G. WHITMAN, SALEM STATE NORMAL SCHOOL, SALEM
MASSACHUSETTS

In these days of liberal educational thought, we can hardly expect a widespread agreement of educators upon any definite list of topics in physics which may be proposed as essential to the proper education of girls. When we are hearing so much about the purposeful activity of the pupil as the essence of real education, one hesitates to propose any list of topics under the title of content of a course. In any such list there will probably be some topic which will so appeal to some girl that she will feel an "inner urge" to undertake its study.

There are some of you present who remember the time when one course in physics was proclaimed as a foundation course for all pupils, boys and girls, college preparing and non-college preparing students. It was a panacea, a universal course without which no further progress and no understanding of the applications of physics were possible. Many pupils could see nothing worth while in many of the topics but they were led or dragged through that course by the thousands and few there are who look back upon those days of the old physics with gratitude.

Times have changed since then. Now we find some schools with physics courses for students going to college and other courses for those not going to college and in the college preparatory course there is considerable latitude for variation of the course. We find some schools offering courses which they think are particularly adapted to boys and those especially fitting for girls. Fourteen years ago I had the pleasure of starting a class in physics for girls in the Ethical Culture School in New York.¹ Possibly

¹ See "School Science and Mathematics," p. 146, February, 1909, and p. 494, June, 1910.

courses with material selected for girls had been given before that time, but surely since then many schools have developed special courses for girls.

There are now available two textbooks in household physics. These were written for the use of students of household science and therefore primarily for girls. The organization of these books is along lines of a scientific classification of the subject matter and for that reason a bare outline of the main topics gives an altogether inadequate idea of the value of the material contained in them. In order to suggest the content of a course in physics for girls it seems necessary to name units based upon an altogether different system of organization. It was for a long time a custom in our textbooks to make a study of the scientific principles and then to add a few practical applications, apparently as a reward to the faithful plodders who had waded through a maze of (to them) purposeless figures, formulas, and experiments. Would it not be better to have the purpose of the work fixed in the student's mind at the start, and would not a course built up of a series of worth while projects—definite units of study—which have a direct appeal to the student, produce in the student's mind a readiness for work which would bring satisfaction in the accomplishment? Believing this is so I have dared to depart from the customary practice of outlining courses and suggest a list of project-problems.

What principle of selection of material should guide us in deciding the content of this course? First of all it must be of educational value; it must help in the girls' development in some way. Beyond this I have found it extremely difficult to define a standard of required conditions which must be fulfilled by any subject matter to be entitled to become a part of this course. However, it is probably true that a subject meeting any one of the following conditions may be included in the list from which selection of class work may be made.

Subject matter shall be included if it helps one: (1) To understand the construction and proper use of any household device, as a study of the kitchen range. (2) To improve one's method of doing a thing, as methods of dustless cleaning. (3) To feel satisfaction in having accomplished a thing of interest, as learning how to use the camera properly. (4) To understand common things of nature, as atmospheric pressure, its relation to storms as well as to vacuum appliances. (5) To know about things of general interest, as the difference between an airship and an airplane. (6) To develop a scientific attitude of mind and to use the scientific method in everyday life, as an investigation to find the best conditions for baking a custard. Any one of the large projects or problems which are given in the following list may be subdivided into smaller problems and projects.

LIST OF PROJECT-PROBLEMS FOR A GIRLS' COURSE IN PHYSICS

1. *What are the things which are essential to our existence?*

This question involves a discussion of matter, the different forms of energy and the ether.

2. *How are we dependent upon heat?*

This question calls for a survey of the different useful applications of heat in keeping us warm, the production of food, the cooking of food, providing means of travel and, in various industries, producing important materials essential to modern civilization. Incidentally will be discussed the nature and theory of heat.

3. *What common effects of heat can we utilize?*

Change in temperature for our comfort, cooking and industries.

Change in size utilized in the thermometer, in heating by convection, and the cause of winds.

Change in state—water frozen and stored as ice for refrigeration. Water vaporized and the stored heat used for warmth and power.

Change in composition—important chemical changes brought about by heat—cooking, baking, production of illuminating gas, iron and other products.

4. *What does the thermometer tell us about heat? How does it do it?*

Principles used in temperature measurement. Special thermometers used in the household. How the thermometer is made.

5. *How is heat carried to all parts of the room?*

A discussion of conduction, convection and radiation.

6. *How is our weather a resultant of heat conditions?*

Moisture in the air, formation of clouds; winds; storms.

7. *How is heat in our bodies regulated?*

Source of heat. Normal body temperature. Heat losses. Sensitiveness to cold; taking colds; proper clothing.

8. *How is a house heated?*

What does it mean to warm a room? How is heat lost?

9. *How may the house be heated by warm air?*

A comparison of the stove and warm air furnace. How to manage devices for control of heat.

10. *What are the advantages of heating by hot water and steam?*

A comparison of heating by these two methods and advantages of each.

11. *What is the need of ventilation and how may it be secured?*

Fresh air, vitiated air, effects of temperature, humidity and circulation. Methods of ventilation.

12. *How is heat produced and used in the kitchen?*

This involves a study of the construction and operation of the coal and gas ranges and hot water supply equipment.

13. *What uses do we make of boiling temperatures?*

Low temperatures of boiling in vacuum used in food production. Normal boiling temperatures and the cooking and preserving of foods. Cooking and preserving food and sterilization by increasing the temperature with the pressure cooker.

14. *How do meters measure the gas and electricity used?*

Structure of meters; how they work. The dials and how to read them.

15. *What supplementary uses of heat are there?*

Simple electric, oil and gas heaters and cookers; their value in conserving the use of larger units.

16. *How can food be cooked without fire?*

Principles of fireless cooking and usable applications. Use of thermos bottle.

17. *Is electrical heating desirable and advisable?*

How heating is produced by electricity. Devices in which it is readily used. Advantages and cost.

18. *How may we use refrigeration to the best advantage?*

Refrigerator, efficiency, cold storage, artificial ice.

19. *How can we help reduce the annual fire loss in our community?*

Causes of fires and means of extinguishing.

20. *How can we make heat work for us?*

Types of engines; different ways in which heat is used for power. Important application of power in the automobile.

21. *What simple science principles are involved in our everyday uses of light?*

Explanation of how light is transmitted, absorbed, reflected, refracted and measured.

22. *How can we make the best use of natural light?*

Sunlight and skylight in our house. Relation to health. Colors from sunlight.

23. *What kinds of artificial light are desirable?*

Compare early and present day methods of artificial lighting.

24. *How can we secure proper lighting?*

How we see. The eye. Light needed. Measure of illumination. Types of lighting.

25. *How do our common optical devices work?*

Principles of reading glass, telescope, field and opera glasses, binoculars and eye-glasses.

26. *How may we obtain a home water supply?*

Water in nature. Pumps. Gravity distribution and city water supply.

27. *What principles underly the use of machines in the home?*

Simple machines. Efficiency of machines. Washing, sweeping and sewing machines.

28. *What measurements are important in the household?*

Units of weight and volume. How measurements are made. Kitchen units. Need of checking up groceries, fuel and ice purchased. Measurement of time.

29. *What appliances are useful in the removal of waste from the home?*

Pipe systems. Traps. Flush tanks. Sewers. Cesspools. Septic tanks.

30. *Can we protect ourselves and our property from lightning?*

Character of electrical charges and discharges. Lightning. Protection against lightning. X-rays.

31. *How is electricity produced and set to work?*

Electric cells. Magnets. Electromagnets. Generators. Electric bell and motor.

32. *How may electricity be obtained in a country home?*

Small electric generators for gas engines or water power. Work; horse power; water power.

33. *In what ways are we dependent upon sound?*

How we make sound. How we hear. Music and musical instruments. Operation of the telephone.

In this discussion and outline it is probably evident to you that I am advocating the project-problem method of treatment. I do most thoroughly believe in project teaching but I am aware of its many difficulties and I believe that many of us, unless we misapply the term "project," must continue some formal teaching. An alert teacher will readily find an occasion where both the individual and group project may be undertaken and carried on to a successful conclusion.

The working out of these project-problems will require laboratory work, observation and investigation. It is a kind of work that involves the scientific method and if the attitude of mind required in this study can only be carried over into the actual household problems in real life we may look for a more rapid increase in household efficiency.

The late Secretary Lane, of the Department of the Interior, is responsible for the statement that there are two and one half million domestic natural gas consumers who waste over eighty per cent of the gas received. If this is true, it is also probably true that there are as many more users of artificial gas who waste thirty to fifty per cent of the gas they pay for. But wasted material is not the most vital waste we find in the American home. If you could go into the homes you would be astonished at the lighting conditions under which some of your pupils study. You would also learn something of the heating and ventilation as well. Conditions frequently exist where not only the eyes are being ruined but their health is being sacrificed because of ignorance of the proper conditions and how to obtain them. And the loss of life from fire in the home can be greatly decreased by greater knowledge of fire and fire making and the proper care of inflammable liquids, fuels, and devices using them.

Household science problems are becoming increasingly important. The scarcity of domestic help makes it necessary for more housewives to do their own household work. This scarcity creates a demand for more labor-saving devices in the home. These labor-saving devices are really scientific apparatus adapted to practical uses. In the complex life of our large communities it is not merely the scientific problems of the home but the science problems which grow out of our living crowded together amid such artificial surroundings. Not only our comfort but our health demands appliances which are not needed under more natural conditions. One cannot run a modern home with its multitude of comfort-producing and labor-saving devices, efficiently, without a practical working knowledge of the more common principles of heat, light, mechanics, and electricity. Every housekeeper ought also to absorb something of the scientific spirit of research. By applying scientific methods to household problems better results and a saving of material and labor can be obtained and, best of all, we may help in the conservation of healthful human beings.

PHYSICS FOR BOYS

ALLEN C. HUTCHINSON, SOUTH SIDE HIGH SCHOOL, NEWARK, NEW JERSEY

The average course in high-school physics through its development for preparing boys for college is naturally better adapted to boys than to girls. In spite of this fact, girls in mixed classes often seem to do as well as boys. There is also required of the *boys* an extra mental effort to master much of the matter which is offered them. So it seems to me that in order to improve the method of presenting the subject of high school physics to boys, we must eliminate as much as possible the cause of this extra mental effort. This does not imply that the path should be "strewn with roses," but it does mean that the path will be more pleasant to travel.

Most of this extra mental effort is a waste of energy, which would better be applied in a more useful way. Some of us fail to realize how strange and difficult this subject of physics seems to the average pupil. So it is our duty as teachers of physics to approach the subject in a simple and natural manner, and employ suitable means for the cultivation and retention of interest on the part of our pupils. You cannot make over the boy but you can adapt the subject to the boy.

It is my province to suggest some means by which this subject of physics may be presented to boys with the hope of better results. It is not my intention to lay out any special course for boys, but to suggest methods by which any teacher can work for improvement. Most of us are continually working for the betterment of our work. If we are wide-awake, we read and visit and talk and listen in hopes of securing something which will help us.

Most important of all is the personality of the teacher. It is through this personality that the pupil may receive inspiration to master his subject by the cultivation and retention of interest in it, for "interest is the natural basis of effort." The stronger the interest, the greater the effort. Of course this implies personal contact between teacher and pupil. We must not neglect the human side. The more individual attention the better. By this means we learn what the boy likes. What does the boy need? Can they be made to coincide? It is for us to show the boy that very often what he likes is concealed in what he really needs.

We all realize the difficulties involved in doing ideal work under unfavorable conditions. We are hampered by the size of our classes and the character of their members, by the facilities offered, and the time at our disposal. And sometimes we are too closely bound by a syllabus. As Professor Woodhull said at the close of his last talk to the New York Physics Club: "I do not see how you do so well considering the conditions under which you have to work."

In planning what we shall endeavor to do to make this course better for boys, let us consider what the *ideal* course should seek to accomplish. The primary object of all science is to "ascertain the established relation of things, or the tendency of certain events to be uniformly followed by cer-

tain other events." The object is to ascertain facts and to trace their relations to one another. The powers which regulate these relations are mostly hidden from us. So the real science we teach will be that by which our pupils come to realize the relations that certain physical events bear to one another. These relationships we call laws or principles. Although we hope that our pupils will be able to make accurate statements of these laws, principles, and definitions our endeavor should be that they acquire a real knowledge of them first. These concise statements are very difficult for high school pupils on account of lack of practice in making statements of that kind. If we are going to demand of our pupils this ability to state accurately a large number of laws, principles, and definitions—especially the last—then we shall have to devote an extra amount of time and labor in perfecting them in this direction. In this connection we should always demand good illustrations or applications of their statements to emphasize real knowledge rather than mere words. This might suggest a closer relation or coöperation between the science and English departments of our schools, for the spoken and written work of our science lessons is often good subject matter for practice in concise English.

So the boy should acquire some of this knowledge of science by knowing some of these relationships of the physical world in which he lives. Certain of these should be selected for special study; others he may or may not acquire. If he is a wide-awake boy, he will learn many unawares, although he may not be able to make accurate statements of all of them.

He should be able to concentrate his mind, for without this ability he will be unable to attack the problems of life. He should be able to group the salient factors of a problem and to grasp their meaning, and the ability to organize them into a clear statement. In other words, he should learn to think clearly and express himself clearly. We would hope for him to acquire to a greater or less degree the ability to initiate wise action. We wish him to learn to concentrate, to analyze, and to organize. If he acquires all these, he will have developed character and built the foundation of good citizenship.

"An acquaintance with the facts and principles and processes of natural phenomena furnish him with some understanding of the elementary laws of nature, which are necessary for healthy, intelligent, and efficient living." This knowledge will give him a better use for his leisure moments. The interest of boys of all ages in radio is a good illustration of this.

In discussing the subject matter for this course of physics for boys it is not my intention to offer a syllabus for such a course. Each teacher or group of teachers will probably plan out a course and continue to adapt it to conditions and improve it from time to time. I would abbreviate the ordinary syllabus to some extent, for I think there is not enough time to cover the whole ground in a proper manner. I would sacrifice much of the work under sound and light to give more time to mechanics, heat, and electricity, and if I found it advisable, I would eliminate much of the mathematics involved, especially that in acceleration. It is simply a matter of quality rather than quantity. Experience will tell us whether our pupils

are really learning physics. In regard to laboratory work there are hundreds of possible exercises, the limits being only the facilities within our reach. My suggestion is that the experiments be worth while, illustrate different important facts and principles, and require thought in the manipulation of apparatus.

Some one has said that "science is classified common sense." Can we make the physics we teach a matter of common sense? We should teach our pupils to apply the rule of common sense to what they are learning, so that things may seem natural rather than strange and unnatural as is too often true.

What we teach we hope to make a part of the boy's real knowledge. He does not really learn until he does in some way make his knowledge a part of his own experience. "Experience in a field is necessary for anything like mastery of the field." So the physics we teach must be of a practical nature, or it will not become a part of his real knowledge. Therefore in the elimination of any matter from our course, let us eliminate that which is not practical.

Many things appear difficult to a pupil merely because they are strange to him. Often this is due to a too abrupt approach to the subject. Some things may be acquired readily without special preliminary preparation, but others need a slow and carefully planned approach and are then easily acquired. Some streams are easily crossed, some are impassible, others would seem difficult to cross but for the bridges over them. It is for us to lead our pupils to these bridges of the difficulties of science by the most natural paths.

In regard to this manner of approaching a new subject, Professor William H. Kilpatrick speaks of "psychologizing subject matter." He says "A teacher must prepare for the learning of his pupils." We must "get the pupil to start at the beginnings of his science." "It means to make a path of psychological order from the learner's present state up to a state where he has much experience well organized." This means then that we must teach the boy from the boy's point of view, approaching new material through facts and events that are familiar to him from having been a part of his previous experience. In this connection general science is a great help to us as it has brought the boy part way along the road which he is to travel. Here is a marked difference in the teaching of boys and girls, not in the method, but in the difference in the facts and experiences by which we approach the study of new things. The teacher must have a personal touch with his pupils. He puts himself in the boy's place, and with the same viewpoint they go on together.

It is a matter of considerable thought and experience for the teacher to plan these approaches to the many new things of physics, but it is a great satisfaction to observe by an awakened interest that you are on the right track and are putting the thing across in a satisfactory manner.

The next thing I would emphasize is a clear presentation of the subject. This includes all that has to do with the teaching of the subject, the demonstration, the recitation, the explanation of the text, the method of

questioning, and the laboratory work. The first essential in this connection is *simplicity*.

It is said of Galileo that he was never satisfied until he made a subject as clear to his pupils as to himself. In regard to instructions to pupils a former principal used to say, that whenever a statement was made for a pupil to hear or read, it should be worded not so that the pupil could understand it, but so that he could not help but understand it. You cannot rely on pupils getting the idea intended on the written page. It is necessary that text assignments be thoroughly clarified by the teacher. Professor Briggs, in a talk to some of us teachers a few years ago, emphasized one point in particular—namely, that in conducting any recitation or demonstration with a class the main thing to be taught should be clearly presented to them at the beginning, and kept before their minds to the very end, so that at the close of the period, there could be no doubt, that each pupil knew what he was expected to learn at that time. One of my college instructors in science used to put daily outlines of the lesson on the blackboard. This was of great help to me, and I have always employed this device in my teaching. It did not seem to be a very common practice in those days, but is quite common today.

There is one bridge that helps us cross many of the difficult streams of learning. This is the bridge of interest. Work is secondary to a boy in the mastery of a problem in which he is really interested. Think of what boys have done during the last few years in connection with radio; the time and care and study they have employed in building their sets, listening in, learning the code, receiving, transmitting, experimenting, and often perfecting their apparatus. Quite a number of the inventions and improvements in radio are due to the American boy. We as physics teachers have a great fund of material from which to draw to maintain an interest among our pupils. Most pupils enjoy demonstrations and laboratory work, and answering questions when they know the answers. Most of them like to do problems if they can solve them. So let us stimulate this interest and set it to work in the right direction.

In regard to this interest in radio: There is more sense in our teaching radio than the telegraph. Of what practical use is the telegraph to the average boy? They do not experiment with the common telegraph in these days. Our pupils have outstripped us. Our syllabus is out-of-date.

Last winter I made some artificial galena by heating some sulphur and lead in a closed crucible. As a detector it is sensitive all over. There is no need of a buzzer attachment to your set when using it. Later at a meeting of our Science Club one of the boys gave a demonstration of making this "galena." Since these demonstrations, many of my pupils and others have been eager to make this artificial galena to go with their radio sets. Only last Friday three boys came to me on the last day of school asking if they could use the laboratory for making some crystals.

In the matter of demonstration we should be careful to select facts and principles that need demonstration. These demonstrations should be as clear as possible, and accompanied by a line of talk with pointed questions.

to keep the pupils thinking actively about the matter at hand. I believe in using the best apparatus available for the purpose and of such a size that every pupil of the class can see it.

In regard to laboratory work, the experiment should be worth-while and conducted in such a manner that the pupil will have to think about what he is doing, and what he is to learn from the exercise. If possible nothing should be allowed to divert his attention from his work. A few pointed questions for him to answer at the close will help him to remember the more important points of the exercise.

It is only by constant practice that we shall be able to develop in him the ability to think clearly. I think sets of pertinent questions are fine for this practice in thinking logically. Questioning is an art which some of us have to acquire. I believe time will be well spent in making out sets of questions requiring careful thought in answering. Even though your pupils may not answer such questions correctly, they can follow the reasoning when the correct answer is made clear to them, and gradually they will learn how to attack questions of this kind. Such questions require something more than snap judgment.

There are several other means to help keep the boy interested in physics and to help him in his progress in science. One is the formation of clubs holding regular meetings, conducted in an orderly manner with definite programs. Then there is the conducting of trips to industrial plants or places where there is opportunity to observe practical applications of physical principles. There is the showing of moving or other pictures in the school and elsewhere if occasion offers. Also there is the opportunity for authoritative talks by citizens having an intimate knowledge of certain facts or applications of physical interest. There is to the matter of outside reading not only from the library, but from the magazines and newspapers to keep in touch with the science movements of the day. If there is an active club, much of this may be carried on through the club under the supervision of the teacher.

We as teachers are especially interested in character development. Above all we wish to turn out good citizens. By personal contact we should recognize originality and should indicate our appreciation by helping it along. We teach discipline by maintaining it. Our pupils acquire a respect for Nature's laws; they should respect our human laws. With us he will have learned attention, persistence, accuracy, and self-control, and we trust a certain amount of culture, which will be of use to him in his leisure hours.

In this development of character there is the great problem of honor in our schools. We draw from all classes, and too often there comes into our midst that element that has little regard for honor. We must not turn out little crooks. Punishment is seldom a remedy. We teach them the laws of conservation of mass and energy. Let us teach them the law of reward for labor; that nothing is gained without paying for it in some way; that the reward for toil is health, wealth, and mental satisfaction. We shall find that it is easier to lead them than to drive them. I see the

solution of the honor questions in the pupils themselves. If the fight against dishonor is not fought by the pupils as a whole through their general organization, then let the pupils of your class carry on the fight, or let the physics club do it if one is organized.

Before I close I will say a word about a scheme they are trying out this year in Stuyvesant High School, New York. They are fortunate in having as principal a former prominent science teacher who naturally takes a strong interest in the science work of that school. This scheme emphasizes a simple approach to the whole subject during the first half year and a more intensive study during the second half. During this first half year everything is of a purely qualitative nature and little is done in regard to statements of laws and principles and the use of mathematical formulas. Their system includes one day for lecture, one for laboratory, and three for recitation. It has been in use only during the last half year, but I judge, from a talk I had with one of the teachers last Monday evening, that results promise well for the success of the scheme.

So in closing, I will again suggest, that you select suitable subject matter of a practical nature, with an abundance of useful applications, and a set of experiments on important facts and principles, preferably those requiring care and thought in the manipulation of apparatus. Approach the various lessons in as clear and simple a manner as possible and in the natural psychological order. Stimulate and maintain interest in any legitimate manner. In directing the mental activities of your pupils, constantly work to develop clear thinking, utilizing for this purpose, among other things, pertinent questions and problems demanding persistent and logical thought, all of course within the range of the pupils' abilities. Let us teach this "reward for toil" and keep watch on the honor of our pupils, for we wish above all for them to become good citizens.

Department of Secondary Education

SECRETARY'S MINUTES

OFFICERS

President—H. T. STEEPER, Principal of the West High School.....Des Moines, Iowa
Secretary—OLIVIA POUND, Assistant Principal of the Lincoln High School.....Lincoln, Nebr.

WEDNESDAY AFTERNOON, JULY 5, 1922

President H. T. Steeper was unable to be present and the secretary, Miss Olivia Pound, presided.

Mr. Maurice Ricker, United States Health Service, Washington, D. C., discussed SOME PHENOMENA OF ADOLESCENCE IN RELATION TO CHARACTER TRAINING.

Dr. Elbert K. Fretwell, Columbia University, gave a highly stimulating discussion of EXTRA-CURRICULAR ACTIVITIES. He said there is as yet no definition of extra-curricular activities. What is part of the curriculum in one school, such as the work of the school orchestra and chorus, does not receive credit in another school. At present some sort of athletic training is part of practically every school program. Training for sound bodies and sound health habits are recognized as an essential part of any school program. It is the school's business to seize opportunities to supervise the activities the pupils will carry on anyway. The school must direct the capable pupils toward developing leadership. The student body must be directed to select the right leaders in the school. The boys and girls must be taught to meet their responsibilities and to be intelligently obedient to authority.

The school paper should represent the whole life of the school. It should furnish opportunities for talented writers. By giving credit for extra-curricular activities the work of the pupil can be supervised. Care must be taken not to restrict them too much. Assembly activities also should represent all interests in the school, such as musical, dramatic, athletic, and so on. This will give each group a means of expression.

A lively discussion followed Dr. Fretwell's address.

Dr. F. H. J. Paul, principal DeWitt Clinton High School, New York City, discussed STUDENT ORGANIZATIONS.

Principal Eugene R. Smith, Baltimore, Md., spoke on Character Training. He divided his discussion into two divisions. (1) What the pupil needs in the way of character training. (2) What method the school authorities should use to fulfill these needs. Children do not have moral standards. They are born with certain tendencies. These must be so trained that the children will develop right standards. For instance, there is wide difference of opinion among pupils as to what constitutes honesty. The criterion should be what is best for the school. The school authorities should help the pupils develop standards of character by means of example, precept, trying out, examining racial standards, and so on. The pupils should have an opportunity to discuss the ethical problems of the school and arrive at definite decisions. The teachers should study the character of each pupil and consciously help him to overcome defects.

Dr. C. D. Kingsley, Boston, Mass., gave a brief report of recent progress of the Commission of Secondary Education.

Thursday Afternoon, July 6, 1922

Dr. Thomas W. Butcher, Kansas State Normal, discussed professional training of high school teachers. He said in part that there is no standard at present in regard to what the teacher is expected to accomplish. There is need of an educational program. Ten per cent of all people are not over ten years mentally. The popular education of the high school concerns a small group at the top. This upper group is destined always to rule. The school must train this group to see

what their relation to the people is. The talented should know that they are expected to bear heavy responsibilities. They should realize that public office holding is a responsibility of this especially endowed class. Democracy tends to mediocrity. There is need of a binding ideal. Education, heretofore, has fostered individual needs—not the needs of the Nation. People must realize that they are the Government. Citizenship has been too cheap a thing. High-school teachers need contact with life and need a clear conception of the part the school plays in training for living. They should teach children to live now, to know their government, to study civilization. Above all they must "keep school." There must be authority even in a republic.

Dr. Thomas H. Briggs, Columbia University, spoke on Professional Training of High School Principals.

Principal Karl F. Adams, of Seattle, was ill and unable to be present. Miss Snow, of the Seattle schools, spoke briefly for him on How High School Authorities Can Better Cooperate with Civic Bodies. She described economic conditions in Washington State after the World War and what the schools did to educate the foreign population to use local products in place of the products they had been accustomed to in the old world. The Chamber of Commerce used the schools as a means of coöperation between dealers and the people.

Dr. L. L. W. Wilson, Philadelphia, was absent, travelling in Europe. Her paper was read by a representative from her school.

Principal W. E. Wing, Portland, Me., discussed National Honor Societies of High Schools. There are six or more of these societies at present in existence. All aim at improving scholarship but with this demand excellence in school citizenship. Several demand also meritorious service to the school.

Mr. C. C. Certain's report on High School Libraries was read in part.

Because the members of the section seemed strange to one another, there were no nominations of officers for next year. The president of the department was empowered to choose officers for next year. The appointments were: for president, E. E. Crawford, president of Idaho Falls High School, Idaho Falls, Idaho; for vice-president, R. R. Cook, Topeka High School, Topeka, Kans.; for secretary, Mary Sawyer, Girls' Adviser, Brookline High School, Boston, Mass.

CHARACTER TRAINING

EUGENE RANDOLPH SMITH, HEADMASTER OF THE PARK SCHOOL,
BALTIMORE, AND OF THE BEAVER COUNTRY DAY SCHOOL, BOSTON

Character training has always been one of the objects of any good school. The fact remains that it has been to a large degree an indefinite and unanalyzed object. To really accomplish what is aimed for it is necessary that such a broad subject as this be analyzed into its working parts in a way that will make it possible to obtain definite results.

For school purposes, it seems to me, there are three steps in the character training of the pupil. The first is giving him an understanding of standards; the second, the desire to live up to the standards; and the third, the strength to carry into effect this purpose.

It is easy to forget that our present social and moral standards are the results of thousands of years of community experience and experiment. They have been built upon the failures and successes of the race and are even yet in process of formation. There are certain standards that are quite universally accepted. Others, while they are accepted by the majority of people are still resisted by numbers of others who are equally conscientious and intelligent. Still others are open questions with what appear to be equally valid arguments for and against them. It is evident, there-

fore, that there is no absolutely fixed body of standards and that no child can be expected to know the generally accepted standards without persistent and thorough training.

Let us for a moment consider the child from the day he is born. At birth his only controlling forces are his own desires, which are largely instinctive. There is to him no such thing as social or moral right or wrong. During the early stages of childhood to desire a thing is sufficient motive for attempting to get it, and it is only through training that he discovers that there is such a thing as property or that one can not take with impunity anything that he wishes. As apparently simple a thing as distinguishing between truth and falsehood is really a complicated matter, and for a child to learn that there is a distinction between telling a falsehood in relation to facts which may be acted upon and telling an imaginative story is a long step in adapting himself to social codes.

As a boy or girl develops the fixed and unfixed standards of adult life are continually forcing themselves upon his or her attention, inhibiting many of the natural instincts. It is therefore of supreme importance that at each step of their school lives pupils should have some definite and understanding explanation of these standards. It is only fair to them to explain that the laws that are generally accepted have been worked out by the community experience of which I have spoken, and that one is simply storing up trouble by attempting to fight against them. Such laws, for example, are the ten commandments, which, despite their religious origin, are nevertheless social laws, and are such laws as would be laid down by any intelligent body of social experts if they were not already in existence.

If the child is taught the fundamental importance of service to others and consideration for others, much of the doubtful body of standards can be safely left to his own judgment under the various circumstances that will arise from time to time.

But granting that a conscious effort is made to teach world standards to the children, the mere knowledge of such standards will not necessarily mean that they will be lived up to. It is first necessary that the attitude of the child shall be one of coöperation rather than of antagonism. Much harm has been done in school life by letting the children feel that the teachers are their natural enemies whom they should outwit if possible. Such an attitude is the foundation for disrespect toward law and authority and toward the breaking down of all respect for community coöperation. It is absolutely necessary that children while yet in school shall acquire the attitude that the laws are their own, accepted by common consent to make their environment as helpful and happy as possible. This can come best through actual experience in helping to make such laws, which includes seeing their purpose, and therefore desiring to live up to them and uphold them. Student participation in the conduct of the school in its government as well as its activities is a powerful tool for this purpose. If children help to form the traffic laws for passing in the hall, the rules for

the conduct of the library, the hundred and one simple agreements or codes that make for successful handling of bodies of children together, they will take the first, and a very important, step toward a similar community helpfulness on a larger scale.

The third subdivision I have made is closely related to the second. I know of no way to increase one's strength in meeting new situations except through experience, and experience that requires judgment, and action upon that judgment.

We have long recognized that physical exercise and mental exercise are desirable things, but we have not yet given sufficient weight to social and moral exercise. We have even taken for granted that at the magic age of twenty-one a person became qualified to vote, just as we have assumed that boys and girls who are controlled at every step in the high school can, with impunity, be thrown into the greater freedom of college life. Neither of these assumptions has proved itself justified and the remedy in both cases is the same. From the earliest days children should be given responsibility, should be expected to uphold the standards they have been helped to form, should learn through their own social experiences and moral successes and failures.

The so-called self-government or student participation is a logical and efficient means of training. The greater the responsibilities the pupils prove able to assume the finer the training becomes. I should like to say, however, that the less machinery that is used in any form of pupil government the more chance there is for its success. I believe that too much machinery has been the cause of more failures in this regard than any other single cause. The nearer to a coöperating family spirit a school can attain the nearer it will come to ideal community conditions.

Details regarding student government have been so much discussed this afternoon that I shall not go into particulars regarding it, my only desire being to record my own unqualified confidence in its value. I go so far as not to believe in supervising examinations in the high school, and I do not believe it necessary to exact pledges or require signed affidavits. A high ideal of honor, a friendly and coöperative spirit between pupils and faculty, and the deterring effect of public opinion, which does not approve of dishonesty, can keep the school's record clean in this respect.

One of the most powerful helps in forming the standards of a student body and in bringing the individual into harmony with those standards, is the open meeting discussion of what is right and wrong and what is best for the group in question. I have no great faith in preaching to children, for while precepts have some value, it is very difficult to make them a real part of the child's mental make-up. On the other hand, a free discussion with one's peers leaves definite impression and helps to formulate one's own ideas.

One discussion of this kind that seemed to me very valuable took up the subject of honesty. The reasons why honesty was important were dis-

cussed, pupils nine years old to college age taking part in the discussion. Various kinds of doubtful cases were talked over.

In one such open discussion recently over 150 children defined every kind of dishonesty except that of cheating in examinations. This particular thing did not occur to any of them because they had never had their examinations supervised, and had not, therefore, had it forced on their attention! Another open discussion that proved particularly interesting was one on the subject of gambling. I had noticed that the pupils were playing simple games in which they won something from each other if they were successful. One of these was throwing cards at a crack, the winner taking all the cards thrown. As I felt that this was bringing in an undesirable element I called together all the students over 8 years old and asked them what gambling was. After an animated discussion we finally decided that gambling was getting something for nothing because one was more skillful or more lucky than one's opponent. My next question was whether we should have gambling in the school or not.

The response to this question was extremely embarrassing. A boy at once announced that his father would not play golf unless he was betting at least a ball a hole, while a girl quoted her mother as saying that bridge whist was absolutely uninteresting unless there was some stake.

I was forced to stop the discussion a moment while I begged them to leave out their families, and I restated the question like this, "Will this school be a happier and better place if we play gambling games, or will it not?" The pupils canvassed the matter thoroughly then took a secret ballot, with the result that only one pupil in the school voted against dropping every kind of gambling game. As soon as the vote was announced one of the oldest boys arose and said that he had cast the one negative ballot, simply because his family was accustomed to all that kind of thing and it never seemed to him particularly harmful. He added that he had been thinking it over while the vote was being taken and he believed the majority was right about the school; at any rate, that he was willing to join them and live up to the decision.

It is likely that if a rule had been made against playing the various kinds of games concerned the student body, not having had the standard clearly formed in their own minds, would have resented it and would have evaded it in every possible way. Having talked it over thoroughly themselves, they believed in the decision and there was no possibility of their resenting it and fighting against it.

From the standpoint of the school there has been one grave difficulty in character training. This has been the teacher's lack of information regarding the characteristics of the pupils. Schools have added the great advantages of physical examinations, mental tests, and standardized subject matter tests. It is also necessary for them to have some means of studying in a reasonably objective way the various characteristics that underlie school success and moral and social responses.

Although many teachers have attempted to study the characteristics of children, they have been handicapped in various ways. One way has been the lack of any common language in which to define the stage of development of the child. I believe that the schools must work out some way of meeting this need and I am going to tell you of the solution that we have been using at the Park School in Baltimore. Our method has been to define five classifications under each characteristic study, each teacher placing a child in one of the five classes at the time of the semi-annual characteristic marking. The following classifications are for honesty. They seem to me to be reasonably typical and therefore show how a similar method can be used for any characteristic in question.

Class 1—Those who are not only honest with property and in their school work, but are absolutely straightforward and truthful in all their relations.

Class 2—Those who are honest with property and in clearly defined situations, but may sometimes evade or excuse themselves instead of meeting an issue squarely.

Class 3—Those who are generally honest, but are still lacking in ability to make fine discriminations between honesty and dishonesty. They may sometimes strain a point in getting help in their work, or equivocate, or be careless of property rights in small things, such as pencils, paper, etc.

Class 4—Those whose ideas of honesty are less clear than in the higher classes, or whose sense of honor is less keen. They more easily yield to temptation, and are likely to be more ashamed of being caught than of the dishonesty itself.

Class 5—Those who are deliberately dishonest.

If there are clearly defined differences between a child's honesty regarding property, school work, and straightforwardness and truthfulness, a double, or even triple, mark may be given. In that case the numbers would indicate in order the child's classification in these respects.

Other methods are being devised in various places, but all have the common purpose of keeping the teachers awake to the importance of such qualities and of giving them a usable means of analyzing their pupils in a way that is not only helpful to them but is definite enough to be passed on to others.

In closing, I wish to stress two points: *the value of experience in forming character*, the absolute necessity of each child's being allowed to meet situations that call for judgment, decision, and action. It must, however, be remembered that a reasonable proportion of failures is to be expected, and that the school should not be discouraged because its pupils are not superhuman.

The other point is to re-emphasize *the importance of the forming of the standards* of which I have been speaking. I believe this is the most neglected part of our school character training and it is certainly not the least important part. We must be conscious of the child's total ignorance of the adult world and of the need of consistently forming, step by step, those standards, and attitudes toward them, that will eventually bring the child into harmony with what is best and will make him an active factor for good citizenship and general betterment.

STUDENT ORGANIZATIONS AND THE DEVELOPMENT OF CHARACTER

FRANCIS H. J. PAUL, PRINCIPAL, DE WITT CLINTON HIGH SCHOOL,
NEW YORK CITY

Character is the outgrowth of the moral principles that guide us in our practical responses to life situations. In the ultimate analysis the basis of character must be instilled in the home, and at the earliest possible moment. The development of character must take its origin in the inculcation of right principles, but it also requires opportunity for practical application of such principles under wise guidance. Instruction is a necessary element in the formation of character in order that we may know the right. But training is also an essential. Knowledge of the right does not insure its performance.

Through the curriculum and in the moments when he draws moral lessons from the occurrences of life the teacher has his opportunity for instruction that will build up strong powers of reflection that center attention on the right. The teacher's own personality is even a stronger factor than curriculum or direct instruction. It is in activities outside the classroom that the teacher gains one of his greatest opportunities to influence the character of his students. It is this that makes it so necessary that teachers acquaint themselves with the motives that prompt students to organize into groups for the satisfaction of varying interests. It is this that requires that they participate in and direct such organizations, if through their own characters they are to influence the characters of their students.

We cannot ignore the fact that it is natural for students of adolescent age to form organizations good or bad in the ultimate effect on their characters. We cannot escape our responsibility in determining which type of organization, the good or the bad, shall prevail.

Teachers' attitudes in regard to this problem vary according to their temperaments, and according to their sense of obligation to their students. One type of teacher opposes all student organizations on the ground that they interfere with studies. Such a teacher puts the curriculum above the student, and fails to use the instinct to organize as a means of arousing interest in subject matter. Another type regards students' organizations with indifference if not with annoyance, either because he feels that such organizations reflect only the play instinct, or because he resents the extra labor that they may impose upon him. The real teacher, the teacher who possesses a socialized viewpoint, the teacher who grasps the character-forming possibilities of student organizations, is the one who sees in such organizations opportunities for direct contact with his students in vital social situations. Such a teacher regards the student organization as a laboratory in which character reactions, both qualitative and quantitative, can be determined.

That which we wish our nation to be, our schools must first be. When

we know the kind of citizens our country needs, we have determined the type of students our schools should develop.

Our country needs citizens that have had their individual talents so developed that they will render to the community the best of which they are capable. Our schools should reflect this need by providing opportunities that will enable those of special talent to discover and to develop their peculiar powers. Student organizations that grow out of the subjects of the curriculum afford a ready means to encourage those of special ability to develop their natural interests.

Our country needs citizens who shall be able to think for themselves on public questions, citizens who recognize the fact that the right of self-government can be maintained only when all members of the community respond to the obligations upon them of respect for and obedience to self-imposed law, citizens who seriously assume the obligation upon them of wise choice of those to whom the enforcement of law is entrusted. Practice in response to such obligations can, in the school, be afforded by student organizations in which privilege and responsibility are recognized as common to all.

Our country needs citizens who show that beyond the duty of self-support, beyond the duty of providing for those dependent upon them, rises a greater duty, that of thinking and acting for the community as a whole, that of making the community to some degree better because they have lived in it. Such citizens reflect the ideal of social responsibility, the ideal of service. This ideal should also actuate our student organizations, both those that exist for the development of the individual and those that have as their aim the welfare of the entire student body.

Through the positive use of student organizations for such ends as have been outlined, coupled with the recognition of the fact that our students are even now members of the larger community, we can create schools that do not exist for the schoolmaster but for the youth of our land.

Education has always had and always will have two aspects, the individual and the social, varying according to the point at which we place our emphasis. Every agency of education shows these two aspects. Student organizations are no exception. From the standpoint of the individual student we find that these organizations have their chief gratification: (1) In giving a broader outlook on the significance of each department of instruction, and opportunity for practical application of principles learned therein. (2) In giving opportunity for specialization and the choice of a life career. (3) In encouraging the development of high standards of achievement. (4) In developing initiative and executive ability. From the standpoint of the group as a whole, student organizations prove their value: (1) In providing social experiences for all who coöperate in general activities. (2) By arousing the desire for self-government and the sense of responsibility for the selection of leaders on the basis of worth. (3) By creating a democratic public opinion that recognizes achievement, and rejects accidental differences, whether those be of birth or wealth. (4) By encouraging the spirit of service as the goal of school life.

This two-fold service of student organizations can best be illustrated by considering the concrete case of a school in which such organizations are considered as vital agencies in effecting the social purposes for which the school exists. In such a school the many organizations can be classified into the following groups. Subject groups; Fine Arts Group; Athletics Group; Social Group; Coöperative Group; School Publications; Honor Society.

The meaning of these respective designations becomes more clear when we enumerate some of the organizations to be found in each group, as in the following outline:

SUBJECT GROUP	FINE ARTS GROUP	ATHLETICS GROUP
Good English Club	Orchestra	Track Team
Short Story Club	Band	Baseball Team
Oratorical Society	Glee Club	Football Team
Debating Society	Camera Club	Soccer Team
Playgoers Club	Sketch Club	Swimming Club
Mathematics Club	Arts & Crafts Club	Crew
City History Club	Dramatic Society, etc.	Golf Club
Economics Club		Tennis Team
Latin Club	SOCIAL GROUP	Rifle Team, etc.
French Club	Class Organizations	
Spanish Club	Inter-School and Form	
German Club	Dances	
Italian Club	Chess Club	
Physics Club	Senior Class, etc.	
Chemistry Club		
Radio Club, etc.		
COÖPERATIVE GROUP	GENERAL	
Disciplinary Squad	Publications Board	{ School Annual Weekly Paper Monthly Magazine Students Manual
Traffic Squad	Bank	
Lunch Room Squad	Afternoon Help Classes	
Sanitary Squad	Big Brothers	
Office Squads	Reserve Officers Training Corp.	
Gymnasium Squad	Religious Clubs	
Library Squad	Hebrew Culture Society	
Study Hall Squad	Y. M. C. A.	
Blind Class Squad	Newman Club	
Multigraph Squad	Honor Society	
Printing Squad		
School (coöperative) Store Squad		

Participation in these organizations is provided for both during and after the regular session of the school. Boys participating in organizations functioning during school hours, are permitted to engage in such activities when they have free periods.

A brief explanation of a few of these organizations may be desirable. The Playgoers Club has for its purpose the inculcation of standards of taste for reputable current plays. During the course of each term, six plays are attended. These are chosen under the guidance of the faculty adviser. Reports and discussions of the plays attended are required at subsequent meetings of the club. The Traffic Squad has charge of halls and stairs during changes of class. This squad serves a very vital purpose in

the main building of the school which, built to accommodate 3200 pupils, now has 5400 in attendance. The Sanitary Squad assumes responsibility for the encouragement of habits of cleanliness in the classrooms, the lunch room, and the neighborhood of the building. The Office Squads, include those students who serve in the two main offices of the school as well as those who are attached to the offices maintained by the different departments of instruction. Boys on all squads, are, in connection with their duties, given opportunities to come into closer contact with the teachers of the different subjects. The result has often been the deepening of an initial interest that has eventuated in the choice of life careers. The Blind Class Squad is composed of those boys who act as guides and readers for the blind pupils of the school. Some members of this squad have carried their altruistic interest even to the extent of mastering Braille, the writing method used by the blind pupils of this school, in order the better to assist those for whom their efforts are intended. The Afternoon Help Classes are directed by boys who have achieved marked success in the different subjects of the curriculum, as well as ability to instruct their less fortunate comrades. Student teachers for such classes are carefully selected by student supervisors acting under the guidance of the faculty adviser. These classes are not intended to exempt teachers from the necessity of assisting backward pupils, but rather to supplement such efforts by opportunities which some boys prefer to accept rather than to admit their ignorance to teachers. The student teachers of these classes are advised by the regular teachers and in some subjects special directions and syllabuses are prepared as aids to the fledgling instructors. The Big Brothers are older students, known only to their faculty adviser, to whom are referred the cases of students who are special problems to their teachers. In various ways they reach such students and act as intermediaries between them and the school. They interpret the school to the students, and in turn bring to teachers facts concerning them that the students under consideration would never confess to a member of the faculty.

The Honor Society constitutes the impelling force behind the activities of this school. Membership in this society is attained only after his worth has been established by the applicant. Scholarship, character, and service are the requisites for admission. It is this requirement of a record of service performed that prompts the socially minded student to find some organization in the school through which he can contribute his share to the general welfare. He receives an opportunity for personal growth, and is prepared to offer a record of service when he knocks at the door of the Honor Society. The student members who constitute the Assembly of this society consider all applicants who have first shown that they have met the scholastic requirements. The names approved by the Student Assembly are then referred to the Senate, composed of a selected group of teachers. In order that justice may be done and the possibility of prejudice removed, boys rejected by the student members of the honor society have the right of appeal to the Senate. Further emphasis is placed on service as an end in school life by reserving to the Honor Society certain advanced and general types of service.

In a school such as we are considering it is essential that behind all its activities there be a means of unifying the various purposes of these minor organizations. Such a means is afforded by the General Organization. The ultimate aim of this General Organization is to encourage the participation of each student and teacher in the social life of the school broadly considered, to the end that the school may become a living, human organism and that each may find his opportunity to render the type of service of which he is capable. This is well shown by the fact that when new pupils enter the school the varying privileges afforded them by the General Organization are outlined. At the same time they are urged to consider what talent each of them possesses that can be contributed to make the school better because of their residence within its walls. In like manner each new teacher is required to show ability and readiness to contribute his share to the social welfare of his students.

Membership in the General Organization of the school is open to all students. The dues are twenty-five cents each term. The direct material advantages include reduced prices at the school coöperative store, reduction in admission fees at school games and other school functions, and relief from all forms of expense when representing the school in any activity.

Some idea of the popularity and extent of influence of the General Organization in this school is shown by the fact that during the term just ended 6405 students, including those housed in the two annexes of the school, were members in good standing, 103 different clubs, teams, and organizations were conducted under the General Organization, and over a hundred teachers assumed specific duties as advisers in connection with these subordinate organizations. The annual income of all activities of the General Organization, including the conduct of the lunch rooms, amounted to over \$55,000. The value of the property of the General Organization is at present over \$6000. The aim of all activities is not only to teach the benefits of coöperation, but also to furnish further benefits for the student body. Thus the net profits of the lunch room during the past year on a gross business of \$35,000 amounted to but \$300. Low prices and high standards of quality in food provided are always placed before profits. A further example of a similar nature was shown in connection with the school field day, which took the form of an excursion up the Hudson River to a State park fifty miles from the city of New York. Four thousand of the older students were transported with 150 teachers on a steamer of the Hudson River Day Line.¹ The price charged each student was but fifty cents, ten cents more than that paid by the school to the steamboat corporation. This extra margin was used to provide medals for the athletic events and for the production of a motion picture of these events. The net profit was but seventy-five dollars. This sum was immediately turned into the general treasury. When the surplus in the treasury becomes large, the General Organization is guided by the counsel of the citizen who urged that it is a disgrace to die rich, and its officers search for means of using the

¹ The usual charge to the public for this trip is \$1.50.

surplus that will redound to the ultimate advantage of the student body that has created it. Thus an appropriation of one thousand dollars was made for the purchase of scenery and appurtenances that would make it possible to conduct all dramatic performances in the school. The most recent appropriation of this kind was one of one thousand dollars for the production of several motion picture reels illustrating the life of the school. It is probable that this money will be returned to the school by exhibitions of the film when produced.

The governing body of the General Organization is the Executive Council, composed of both student and faculty members. The number of student members exceeds the number of faculty representatives. All student members, including the President, are elected through the franchise of their fellows. The faculty representatives are socially minded teachers representing different groups of activities. At the head of this group is the Honorary President of the General Organization, a teacher specially chosen by the principal. He is given full authority and is held responsible for the activities of the General Organization. His only compensation other than personal growth is in relief from classroom assignments a sufficient number of hours to make it possible for him to meet the responsibilities of his office. All meetings of the Executive Council are open to members of the student body who desire to attend. All requests for expenditure of money must take their origin in the Executive Council. The same is true of all proposals for change in the constitution and by-laws of the General Organization.

Faculty control of the General Organization is maintained by the Board of Governors. This body is presided over by the principal of the school. Its other members are a student member, elected by the Executive Council; the Honorary President of the General Organization; and another faculty member chosen to represent the teachers of the school. Before a measure originating in the Executive Council becomes operative it must receive the approval of the Board of Governors. Appropriations must also receive this approval. The Board of Governors has no power to initiate the expenditure of money beyond an emergency appropriation of twenty-five dollars. The final veto power rests in the hands of the principal of the school. This is very rarely used, and even then only when a measure conflicts with the regulations of the Board of Education, or is obviously contrary to public interest.

It is axiomatic that when men live in groups of any considerable size the necessity for some form of government arises. What that form of government shall be depends on the stage of development reached by the individual men who live under it, and the ideals that prompt the acts of the group. If men do not show practical capacity to govern themselves from within some form of government from without will be impressed upon them. Student organizations, through the development of this practical capacity, should make unnecessary the imposition of any form of government from without.

The General Organization just outlined has developed from the recog-

dition of the fact that our purpose as American teachers is to prepare our students for the fullest possible individual development consistent with the ever present obligation to grant to others the right to similar development. Coupled with this is the purpose to inculcate in students the sense of responsibility to the group to contribute to its welfare the best of which they are individually capable. The General Organization, through its many coordinate activities, aims to reflect life in a democratic community as well as to prepare for later participation in the life of such a community.

Equality of opportunity is provided for by placing no restrictions upon membership in the organization. Recognition of worth as the basis of distinction is emphasized through scholastic requirements and evidence of achievement as essentials for those who desire to secure positions of trust and responsibility. The natural desire of adolescents to participate in the conduct of their own affairs is encouraged through the many opportunities afforded for coöperation in the management of the school. Through the resulting responsibility for the achievement of commendable results in the many phases of school life, the constant aim is to arouse in every student a sense of responsibility for the success of every school activity.

The General Organization, viewed from the standpoint of the individual pupil, represents an effort so to use the facilities of the school as to provide for each pupil an outlet for his interests. He is encouraged to find himself both vocationally and avocationally. Every facility is afforded him to exercise any capacity for leadership he may possess, any executive ability that may be his. The contacts provided by such an organization make it possible for students of similar character and similar tastes to meet on the ground of common interests and thus form lasting friendships. The free intercourse of students and teacher advisers provides a social situation from which both students and teacher may benefit.

The General Organization also provides experiences that emphasize the obligations of the individual member to his community. Freedom of action is not regarded as something conferred from without but as something resulting from recognition of the demonstrated ability of students to co-operate in the regulation of matters directly affecting them. Self-discipline as a result of group membership is made a conscious necessity. This in turn creates a sense of community responsibility that affords training in the very essence of citizenship in a democracy. The constant emphasis on service to the community as the basic reason for the existence of the organization, and the standard by which its members are always to be judged, creates for students opportunity for experiences under a truly moral order—experiences that lead to the discovery of self through self-denial.

From the loyalty that develops when every student feels that the school assumes an obligation to recognize his interests and that he must in turn regard his every act in the light of his duty to the school, it is easy to effect the transition to an intelligent loyalty to the local community and to the nation itself.

REPORT OF COMMITTEE ON LIBRARY PROBLEMS—THE SCHOOL LIBRARY AS A PROBLEM IN ARCHITECTURAL DESIGN

C. C. CERTAIN, CHAIRMAN, ASSISTANT DIRECTOR OF LANGUAGES,
DETROIT, MICHIGAN ¹

The growth of the school-library concept—It is a matter of history that during the past decade or two the attention of school administrators has been given largely to the problem of developing and equipping in the public schools adequate laboratory facilities needed in the teaching of the exact and social sciences and the manual and domestic arts. The effort given to the solution of building problems in this connection has been so intense that other important problems have been temporarily neglected.

For this reason school buildings have, on the structural side, been designed in a way to make it extremely difficult to house in them libraries adapted to modern educational requirements. School architects have been left entirely to their own devices in library design, while pressure all the while has been brought to bear upon them by persons interested in other lines of school-house construction. Consequently, the provisions formerly made for the housing of school libraries have been most inadequate for modern educational needs. In fact, in many of them it is utterly impossible to teach in accordance with present-day educational and industrial requirements because of the handicap of poorly constructed school libraries.

The temporary neglect of the library is such a serious matter that accrediting organizations throughout the United States, such as the North Central Association of Colleges and Secondary Schools, have developed standards which they are widely recommending. There has been in the past few years a general awakening to the existing state of affairs. In consequence, organizations other than those interested specifically in higher institutions of learning have taken up the question of adequate library facilities in public schools. The National Education Association, for example, has adopted and distributed widely a report on standard library organization and administration for secondary schools. The American Library Association ² has approved and is distributing documents adopted by the National Education Association. The New York State Legislature recently incorporated in one of its school laws standards promulgated by an authoritative educational organization. Obviously the school library as a concept has become so definite that educative bodies and State governments are now legislating terms of this concept.

The secondary-school library concept—A study of the lay-out in Diagram I will give a clear concept of library design in terms of present-day requirements. A modern secondary-school library should consist of a suite of rooms so designed as to facilitate the teaching process both in individual instruction and in group instruction. Indeed, a library offers every possible

¹ In addition to the chairman, this committee includes the members listed on page 33.

² Standard Library Organization and Equipment for Secondary Schools of Different Sizes.

advantage to the individual pupil who may be in search of information or of any type of matter, so far as that is concerned, which may be of real or fancied value to him in a personal way. But the modern secondary-school library goes far beyond this type of merely personal service, and includes service in the most comprehensive sense so far as various social groups in the school are concerned, such as classes, clubs, committees, athletic associations, etc. The library suite includes, therefore, not only a reading room with its open, accessible shelves, with its convenient magazine stands and newspaper racks, with its files of lantern slides, postal cards, and visual materials of various kinds, with its cases of films for moving pictures, with its supply of records for victrolas, and with its carefully analyzed catalogs, indexes, and lists, but also the library classroom and the small conference rooms where pupils have actual experience not only in the use of books as tools, but also as a means of wholesome enjoyment combining the delights that come to persons associated in the stimulating pastime of literary discussion. The small conference rooms are conveniently equipped for the use of pupils working on problems of a social character; they are important adjuncts to classrooms where pupils are engaged in carrying out projects of any kind. In addition to these rooms, there are the sound-proof victrola room, the teachers' conference room, and the librarian's workroom. Classroom method in the modern sense of the word cannot function adequately unless the school is provided with a library possessing the features that have just been outlined.

SPECIFICATIONS FOR SECONDARY SCHOOL LIBRARIES

JUNIOR AND SENIOR HIGH SCHOOLS

Lighting:

Artificial

Electric Ceiling Fixtures

Indirect or semi-direct lighting.

No table lamps

Natural

The glass area of the windows equal to 20 per cent of the floor area (1 sq. ft. of glass to each 5 sq. ft. of floor space).

Finishes:

a. Ceiling

Color ivory white

b. Upper wall

Lichen gray, or light buff

c. Wainscoting or lower wall

Color, light buff, stone, or pale azure

d. Dark colors avoided in woodwork and trim

(1) Oak: Fumed oak acid stain filled with gray filler consisting of white lead paint, with addition of lamp black to tone to proper color of gray.

(2) Birch

Bulletin Boards:

Color harmonizing with the wall tones.

f. Floor

The floor should be covered with linoleum or cork carpet to deaden the sound. An unobtrusive pattern should be selected in colors of gray, brown, or green, in shades that will harmonize with the colors of the walls.

Shelving:

a. The shelving should be built into the walls of the reading rooms and of the alcoves of anterooms.

b. The top shelf should not be more than six feet from the floor.

c. The bottom shelf should be at least ten inches above the floor.

d. The shelves should be three feet long and eight inches wide.

e. The shelving at one end of the room, at least, should be adjustable.

(1) All fixed shelving should be ten inches apart.

f. In estimating the capacity of shelving, eight books to the running foot should be used as the basis.

(1) There should be shelving enough to provide not only for an adequate collection of books when the library is first organized, but for all probable additions for the next five years. The minimum capacity should provide for one book for each child and teacher belonging to the school. There should be shelving in the reading room proper, outside of the conference rooms to accommodate at least 4000 volumes. The space below the glass around the pupils' conference rooms should be utilized for two shelves, 10 inches above the floor.

- g. There should be two three-foot sections of shelves, twelve inches wide, to take folio books and magazines, such as the *Scientific American*.

(1) These sections of shelving should be located as nearly as possible to the front center of the room.

- h. A built-in magazine rack, and a built-in news rack should be substituted for two sections of shelving. It is important that this rack or a similar one be so designed as to provide for picture books for little children.

Bulletin Boards:

All wall space between windows, and the walls 18 or 20 inches above the shelves should be covered with corticin or cork for bulletins. Wall space should be reserved to accommodate at least two sections of about 16 sq. ft. for bulletin boards made of corticin or cork.

Doors:

Swinging doors with glass panels are desirable.

LIBRARIAN'S WORK ROOM

Shelving as in the library reading room.

The space below the bottom shelf should be utilized for built-in cupboards.

For two or three sections of shelving should be substituted cabinet space for storage purposes.

These cabinets should be twelve inches deep.

There should be running water, sink, and drainage board.

LIBRARY CLASSROOM

The wall space on one side of the room should be equipped with shelving of the same dimensions as that in the reading room.

The walls should be equipped with display surfaces of cork, extending upward from the top shelf 18 or 20 inches.

Not more than two thirds of the room should be furnished with chairs.

The portion of the room beneath the sky-

light should be finished architecturally to give the impression of a chapel or special ante room of appropriate design. There should be adjustable shutters to regulate the amount of light admitted.

There should be a speaker's platform of a few inches elevation.

There should be a lantern screen equipped with roller.

PUPILS' CONFERENCE ROOMS

There should be at least six conference rooms.

The conference room should not be less than eight feet wide and not less than twelve feet long.

The maximum length of the room should not exceed nine feet. The maximum capacity of the room should be nine pupils.

One of these conference rooms should be made sound-proof for pupils using the Victrola. (Adjacent to the workroom.)

The two conference rooms located against the end walls of the main reading room should have shelving on one side and at one end.

The specifications for shelving in the main reading room should apply in every detail to the shelving in these conference rooms.

The conference rooms should be made completely of glass extending from the ceiling to a point not more than 3 ft. 6 in. above the floor.

The glass for these rooms must be transparent.

These rooms should be adequately ventilated by artificial means.

There should be glass doors.

There should be transoms at the top of the rooms, that can be opened both into the reading room and into the corridor. This transom ventilation is of special importance for use during warm weather when the artificial ventilation is shut down.

TEACHER'S CONFERENCE ROOM

This room is of the same design as the pupils' conference room. It is equipped with shelves for books and periodicals on professional reading.

Special problems in school library design—Architects will agree that the school library, although one of the most valuable and important departments is one of the most difficult to provide for properly in an architectural way. The specifications given in preceding sections of this paper are subject to many modifications, inasmuch as the library may not always be the controlling feature. Other features may enter into the situation in such a way as to require many adjustments in the design of the library. This is only too frequently the case. It seems advisable, therefore, to present briefly some considerations which may, under some conditions, have to be taken into account.

1. *The reading room and the conference rooms*—A difficulty of the kind just pointed out is encountered in the construction of large high schools in which the spans between walls are usually such as to require library rooms too narrow to accommodate the number of pupils who should have access to the library. In the event that the floor space for the library reading room and the committee rooms cannot be readily provided, because of the narrowness of the building, the difficulty might be obviated by housing

the library in two rooms placed symmetrically on the second and third floors with book-lifts or other special carrying chutes between them. In this case the library classroom or club room could adjoin the room provided for reading purposes on one floor and the librarian's workroom could be similarly placed on the other floor. The location of the teachers' workroom near the library is highly desirable. In the event, however, that such location is not possible, a room conveniently located elsewhere should be reserved for the teachers. This might be placed near the librarian's workroom, or in some other convenient location. It is necessary for teachers to confer frequently over their work in the library and unless there are ample whispering facilities their conferences may be a source of considerable disturbance to both pupils and librarians. The teachers' conference room is therefore indispensable.

Conference rooms of this kind, provided for pupils, should be equally distributed in each of the large reading rooms.

The plan discussed in the previous paragraph is far from ideal and is, at best, only a make-shift, but, if the requirements of lighting and ventilating cannot be met adequately otherwise, the library may have to be housed in this way. The objections to the plan are serious, since separating the rooms of the library suite necessitates much passage back and forth. The location of these rooms in different parts of the building will increase the traffic through corridors and create other administrative difficulties.

With regard to the location of the library suite, it should be kept in mind that the library constitutes one department in the modern high school which, like the auditoriums and gymnasium, will be used by every pupil enrolled, with the difference that the library, if properly used, is more frequently needed than either the auditorium or gymnasium, and should, in consequence, be more centrally located than either of these.

2. *A problem in architectural construction*—Since large high schools should have a floor area adequate to accommodate ten per cent of the daily attendance at any period and since the conventional high-school building is of a design making it difficult to supply a rectangular room of sufficient width, it would seem that architects might devise a plan that would permit the building of a room of adequate width. This might be done by the construction of a wing of the desired width and lighted from both sides; in fact, the second floor of an entire wing might be utilized for this purpose. Under these conditions there would be windows on both sides and at one end of the library suite. The rooms on the floor beneath the library might then be utilized for domestic arts or science laboratories.

It would seem, too, that the problem might be solved by placing the library on the second floor of a section of the building extending centrally between the two wings, the usual location of the auditorium or gymnasium. Diagram II shows the design of a library planned for this location.

If the conference rooms for pupils are to be located in the main reading room it is highly desirable to have the main reading room constructed with windows on both sides. The conference rooms should be arranged along

an outer wall with windows opening into each room. This arrangement not only furnishes the necessary light, but also solves the problem of ventilation.

3. *Conference rooms*—The objection may be raised that the entrance to the conference rooms directly from the library has the disadvantage of permitting traffic through the reading room which might result in noise and confusion. It may be said, however, that the entrance to these conference rooms directly from the library is highly desirable by reason of the fact that necessary supervision may best be maintained under this arrangement. In the public school, furthermore, practically the entire organization is controlled by a schedule. Consequently, the general shifting in and out of the reading room of the library is simultaneous with the entrance of the groups into the conference rooms and class rooms.

The conference rooms should be enclosed with glass partitions extending the entire way to the ceiling. These rooms are provided for the purpose of giving committees or other student groups sufficient isolation to enable them to converse in low tones without seriously interrupting individual readers. The wainscoting in the lower portions of these conference rooms should not exceed three feet six inches in height, for the pupils at their conferences should be at all times within sight of the librarian.

4. *Shelving*—The extent to which shelving should be built in should be determined by an actual count of the volumes to be accommodated in the library. All available wall space in the reading room, the library class room, the conference rooms, and in the librarian's workroom should be reserved for shelving even if the number of books required for the first few years does not demand so much shelving. In the main, school librarians and other authorities feel that the library reading room should be left entirely free of book stacks.

5. *Book stacks*—Unfortunately school architects are sometimes inclined to insist upon stack rooms for books, rather than wall shelvings. The objection to stack rooms on the part of educators is that stacks are cumbersome and furthermore not adapted to the needs of the school library. Book stacks in the reading room interfere with supervision. The notion that the wall space available in the reading room is not sufficient to accommodate the necessary number of books is very erroneous. It will be found on actual measurement that from eight to nine books may be shelved per linear foot and that a judicious use of wall space will provide all the shelving needed for ordinary purposes. In fact, reading rooms which provide for the standard twenty to twenty-five square feet per reader for from eight to ten per cent of the daily attendance in the school will also provide wall space to accommodate from four to fifteen thousand volumes. There is a very strong feeling that books requiring stack storage should not be permanently in the secondary school library but should be borrowed through some public library agency. The total number of volumes in a secondary school library should range from three to ten thousand, depending upon the enrolment of the school and the character of its curriculum. Only

books which are in frequent or constant use should be in a school library; open shelves around the walls will accommodate all of these that are needed. From an educational standpoint the advisability of placing stacks in the reading room is in general not debatable. The stacks are undesirable.

6. *Combination study hall and library*—Correspondence with school architects throughout the United States reveals that in some places the library and the study hall are combined. This practice may seem to result in economy but no school working such a combination as this can claim to have a library in an educational sense.

If it is necessary to combine in any way the library with the study hall, this should be done only so far as reference books are concerned. It may seem possible to work out an arrangement whereby all reference work could be done in the study hall. Books, such as dictionaries, encyclopedias, atlases, yearbooks, histories, and books bearing immediately upon such subjects as manual arts and the sciences are sometimes stored in the study hall. According to this plan all books of a literary character and all books relating to recreational reading would be housed in the library proper. Such an arrangement as this, however, would not be satisfactory from the standpoint of training pupils in the use of books and libraries. In fact, the arrangement would result in serious misconceptions as to the true nature of the library and as to its administration. Experience indicates that the scattering of books through several different rooms in the building results in a tremendous loss. The division of responsibility between the librarian and the study-hall teacher is sure to result in misunderstanding as to the proper administration of books and other library materials. The library in the school is not a luxury but an educational necessity. It is an educational concept. Merely to place books in study halls and other rooms in the school building is not by any means to provide library facilities.

7. *Interior decoration*—The ingenious architect will find that the school library offers many opportunities for alleviating lines of construction in the school building. There are few features of the school that admit as much freedom in architectural treatment as does the library. It is needless to say that the possibilities of this should be used to the utmost advantage. There is opportunity here not only to make the library more aesthetically satisfying than almost any other room in the school, but also more satisfying to the pupils than the architecture of the homes from which many of them come. No stretch of the imagination is necessary to give vision of these possibilities. The ugliness of the apartment house, with its rigid, severe lines, its cheerless corridors and small windows, may have its influence offset by some enthusiasm in the architectural treatment of the school library. Such features as an open fireplace in the library will give an atmosphere of ease and comfort to the room. The impressions of the children may be made satisfying and their tastes may be improved through the enrichment of their surroundings in the library.

THE PROFESSIONALLY TRAINED HIGH-SCHOOL PRINCIPAL

THOMAS H. BRIGGS, PROFESSOR OF EDUCATION, TEACHERS COLLEGE,
COLUMBIA UNIVERSITY, NEW YORK CITY

It is axiomatic that to the largest extent a principal determines the character of a school. If he has a clearly defined program which he has convincingly developed with the teachers, if he consistently works with them to make this program a reality in practice, the school is a unity, an organization effective for securing definite results. If, on the other hand, the principal is uncertain of his goal, arbitrary in his routine administration, and narrow in his conception of his duties, the school is a heterogeneous collection of teachers, each attempting more or less what seems good in his own sight. No generalization is more true than this: as the principal, so the school.

Formerly, as the name implies, the principal was a head teacher taking care of the details of administration in his odd moments. But as our high schools have increased in importance and size, the principal is today the executive in charge of a no mean institution; in many instances he is supported by one or more assistants and by a corps of heads of departments. These heads of departments and the teachers are all highly trained, speaking relatively, and the human raw material with which they work is the most precious that the community has. The principal, then, has become one of the most important public servants, and as such has responsibilities that make his selection a grave duty of the superintendent and board of education.

No head of a comparable commercial or industrial plant would for a moment be considered unless he were technically trained for his position or unless he had manifested superior fitness through experience in other similar positions. No teacher is selected today in our better schools unless he is professionally trained or manifestly successful in experience. Not even a kindergartner would be considered unless she had technical and professional training for her specific work. But as a rule there is no such requirement for the principal, the most important influence in the most important element of the great public investment of education.

What are the sources of our high-school principals? In the smallest schools they are simply trained teachers. In the larger they are usually promoted on the basis of their "experience" in the smaller, the demands of which are so different as to make this experience of little worth, or else they are promoted from the corps because of successful teaching or of personality. It is profitable, of course, for a principal to have performed administrative duties, and it is almost essential for him to have been a successful teacher and to have a good personality; but in the large majority of instances the newly elected principal today is prepared for his work to no such adequate degree as similar administrators in other lines of work.

The results are that traditions, often of very limited effectiveness, are perpetuated; practices that seemed good in the small school are brought up to the larger, not infrequently without the maximum of success; and generally the principal learns his job at the expense of the pupils, the teachers, and the public, who are paying the full salary of a man supposedly already trained.

There are obvious limitations to this method of preparation. Only the ablest and most inventive can through personal experience develop beyond a narrow limit. Even they would profit and progress faster with a sound basis of theory and with a broad knowledge of what has proved effective in other similar schools in the United States and abroad. Such men as manifest success as high-school principals are constantly being offered positions as superintendents, where again they learn their duties with full pay. We have happily passed beyond the day when a teacher began in the first grade and was successively promoted grade by grade up into the high school. We must now get away from the equally mischievous practice of promotion from teacher to principal and from principal to superintendent. What is needed is a body of men and women professionally trained as high-school principals and school boards educated to demand such training and to reward it so that the successful may afford to remain in the work for which they have proved their competence.

To the credit of high-school principals it must be said that many have exerted themselves mightily to grow. By visits to other schools, by associations such as this, and by study in summer schools hundreds are annually adding to their powers. But there are fifteen thousand high-school principals in the United States.

Of these fifteen thousand the majority spend a considerable part of their time in duties that are not those of a professional principal. In Missouri, exclusive of St. Louis and Kansas City, only six per cent of the principals teach one period a day or more; sixty-one per cent teach five periods or more. In the first class high schools of West Virginia the median number of teaching periods a day for the principals is 3.2. It probably is wise for every principal, even in the largest school, to teach one class so that he may keep in close touch with one phase of the school, but it is obvious that when teaching he is not in the best sense of the word a principal.

The facts for Missouri and West Virginia are more or less true for other States. The amount of teaching done by principals would in most cases, even when finances are limited, be considerably reduced if the principal could show the board of education a convincing professional program of how he proposed to use his time for the improvement of the school. Board members are usually practical enough to see that it is uneconomical to require the highest paid employee to teach when if freed from this duty he can make five or fifteen mediocre teachers into good ones, improve the educational plans of the school, and direct the social life of the pupils, so that they are prepared more effectively to take their places in the community.

A principal is removed from his professional work to a part-time teaching position usually by the demands of the higher authorities; he removes himself from his professional opportunities by assuming duties that can be as well performed by others. Every visitor of high schools has seen numerous instances of principals who fritter away their time in doing routine work that properly belongs to a clerk, a janitor, a teacher, a pupil, or that may as well be left undone. One principal of a large high school runs the book-room; another hands out supplies; a third unnecessarily sits as guard over a small study hall. These and other similar duties should not be performed by the highest paid officer of the school. They will not be performed long by the professional principal, for he will convince the board of education of the economy of employing a low salaried clerk to free him for larger activities; he will delegate the duties to teachers or pupils, who usually are willing, frequently are glad, to assume such work with its minor responsibility; or he will organize and develop his school so that some of the matters take care of themselves. Much time can be saved for professional duties by more economical organization, by turning off work promptly, by the persistent *will* to devote oneself to the higher things of which one is capable.

How principals actually spend their time is determined somewhat by the exigencies of the season and by fortuitous happenings. It is interesting, however, to consider the following table which shows the distribution of time by seventeen principals in eight different States during the month of April. These principals had under them from nine to sixty-five teachers; they devoted from 5.4 to 9.7 hours a day to their own work. A study of the table shows at once that there are extravagancies in some details and parsimony in others—a variation that hardly seems possible if these seventeen men had a common professional ideal of their duties and a professional program for accomplishment.

TABLE I—*The Minimum, Median, and Maximum Percent of Time Devoted by Seventeen Principals to Various Duties During the Month of April*

	Minimum	Median	Maximum
Teaching	0.0	19.1	53.8
Routine Office Work.....	11.9	37.8	63.2
Interviews	1.9	15.1	50.0
Observing Teaching	0.0	7.2	35.2
Criticizing Teachers	0.0	2.3	28.3

The primary responsibility of a principal is leadership. An executive is successful not for what he does but for what he gets others to do. The principal of a high school should study to ascertain the peculiar activities in which each teacher is strong and focus his attention on these until they have obtained their maximum growth. Thus he not only secures the greatest possible positive contribution to the work of the school, but he also goes far toward the developing of an *esprit de corps*.

The principal should also, after ascertaining the individual faculties of his staff, delegate to each one some responsibility, large or small, for which

he is peculiarly competent. This sentence means precisely what it says: the principal should delegate not only the duty but also the responsibility. It is the teacher's opportunity to exercise initiative, to organize, to fail or succeed. Whatever happens, the teacher grows and because of the experience is ready for some harder task. After this delegation the principal should stimulate, advise, and encourage; and when success is accomplished, recognize it and give public credit to the one deserving it. Many administrators are jealous of the successful accomplishment of their subordinates and short-sightedly attempt to withhold credit or to secure it for themselves. Even such selfish injustice should recognize that in the long run the public thinks of the school as a whole and of the principal as the one ultimately responsible for what is good or what is bad. Really successful administration is found when each individual in the corps is enthusiastically doing the tasks that he is most able to do well.

The duties of the principal fall into three major classes: administration, the direction of the social life of the school, and the improvement of instruction. The first of these, the duties of administration are definite, concrete, and imperious. Because of this it is easy for a principal to fall into the habit of giving them first attention and even to make of them a fetich. But the professional principal soon recognizes that a school is administered only that it may be instructed, that his systems and his routines have no value unless they decrease friction and facilitate the work of the teachers. The professionally minded principal also recognizes that most of the administrative duties, which others jealously reserve for themselves, can quite as well or better be performed by a clerk or delegated teachers, and so he perfects his organization so as to free himself for more important responsibilities. The sure sign of inefficiency is a high-school principal continuously busied with routine details.

The second class of duties, pertaining to the direction of the social life of the school, has become of major importance with the recognition that both abroad and at home a large part of the secondary education of youth is outside the classroom. In the great British public schools boys learn much of academic subjects, but they learn more that makes them potent in European affairs and in their intimate social life from the unwritten but no less real traditions of the school. To an extent the same is true in other foreign schools, especially in the *lycée* of France. Until recently we were influenced by their curricula and to a large extent ignored the other equally important factor of education. Of course conditions are different in our schools, but while we concentrated on the teaching of subject-matter, with incidental and often fortuitous personal influences, the pupils developed their own plans for social life. When they became highly organized and interfered with formal instruction we officially took cognizance of them; and influenced by the recent emphasis on social education, we now perceive in these extra-curricula activities of the boys and girls an opportunity for another real phase of education.

It is probable that there is in most schools some teacher more competent

to direct details of the social life of the school than the principal is. In many schools teachers trained and experienced in this work are employed especially for it. The professional principal recognizes the importance of the extra-curricula life as truly educative, he relates it to his fundamental philosophy, he delegates its direction to one or more especially competent teachers, and he encourages its development as he does that of the department of history or science or fine art. Much has been accomplished in this new field for public education during the past decade and the possibilities are limitless, but a principal needs professional training for its direction so that he may economically learn what has been attempted and winnow the good from the trivial or merely spectacular. In a field so recently cultivated it is inevitable that some mistakes have been and will be made by short-sighted enthusiasts. Here the professional principal finds an opportunity to direct the natural tendencies of youth for social relations and activities so that they may most profitably make returns on the public investment of education.

The last of the major duties of the professional principal concern the improvement of the subject-matter taught and the teaching. In these matters, whatever else it may have or lack, a school achieves its modicum of success. One would suppose, therefore, that all principals give the major part of their time, attention, and effort to the improvement of instruction. But this is far from true. In fact, it is unusual to find principals who give the matter, either directly or indirectly, any considerable amount of attention. By their own statements, which probably do not err in being undergenerous, one period a day or less is given to supervision of instruction by 52 per cent of the principals of first class high schools in West Virginia, by 65 per cent in Kentucky, by 76 per cent in Virginia, and by 89 per cent in Missouri, St. Louis and Kansas City being excepted.

The reasons for the neglect of this most important field are several. The one most commonly given is lack of time. But that is not the real reason. As previously stated, a professionally trained principal learns how to organize his school, to delegate duties, and to present to the board of education a convincing program likely to secure time necessary for what he believes to be essential. Even when average principals have time at their disposal they do not ordinarily spend it in the supervision of instruction. In one large city high school there are two assistant principals and five clerks. Set forth neatly in an organization book are the duties of each one—corridor patrol, control of the keys, lunch room finance, signing excuse blanks, and the like, but not one item pertains to the improvement of subject-matter or of instruction. This situation is extreme and exceptional in that the principal has adequate assistance; it is not untypical in that he had organized the school so as to care for the easy, concrete, objective details and neglects the difficult and more or less intangible matters for which the school exists.

The real reasons for the neglect of attention to the improvement of instruction is that many principals tacitly recognize their incompetence to perform the duties satisfactorily. Inasmuch as most high-school teachers

have some training and all but a few are experienced, no superficial inspection can be satisfactory, no arbitrary criticisms and dogmatic directions can long pass for success. Poor teachers may be made good, and good teachers made better by regular supervision, even though it consists only of suggestions of helpful detail and keeps each teacher consistently doing his best to secure the approbation of the supervisor; but the demand, the insistent need, is for a leader who will work out with the staff in teachers' meetings, in committees, and in personal conferences clearly stated and convincing statements of purpose, for each subject as well as for the school as a whole, and then follow, day in and day out, with observation, learning, suggestion, encouragement, and recognition. This is the sort of supervision that is needed, the sort that is not likely to be given unless the principal is professionally trained for this work.

Both as a science and as an art, supervision demands preparatory training. It must be based on a clear conception of the purposes of education, so defined as not merely to give mental satisfaction but also to demand and direct action. Practical training is often criticized today by those who believe in "a broad cultural education," holding that each one should

Earn the means first—God surely will contrive
Use for our earning.

We believe in "a broad cultural background," and we in the professional schools deal chiefly with those who have sought it, with varying degrees of success, in their undergraduate days. Whatever their achievement there, they need now a pragmatic gospel—a gospel that begins with a vision of what should be done and ends with the realization of doing it. The fundamental demand in professional training is an understanding of the purposes of education in a democracy and of the secondary school as one of its important agencies.

Effective supervision must be based, too, on a knowledge of the practices that have proved good in foreign schools as well as in our own. Only the most sublime genius can expect to discover by his unaided efforts practices better than all the rest of mankind have discovered. Those who are not sublime geniuses must seek in their professional training to know, to observe, to evaluate the best practices of others, and to translate them into such form that they are adapted to new situations. Personal visiting is helpful in this matter, of course, providing it is spent in continuous observation of skilled teachers and a concentration on their virtues rather than on their shortcomings; but surely directed observation and evaluating discussion with others of cumulative experience and similar interests will prove more economical for those who seek professional training.

This observation can be most valuable only when it is subsequent to a knowledge of sound learning and teaching processes. Psychology has so advanced in the past generation, especially the psychology of education, that it must be known by the professional principal—not merely known as a science but translated into theses that will make teaching skilled and economical. To learn abstract science is relatively easy; to apply it to effective

activities of the schoolroom is difficult. Every suggestion from the practices of skilled teachers and from experienced supervisors tends to add to the potency of a student preparing himself to improve the skill of teachers who may be under his direction.

And finally, after purposes are clearly conceived, science is learned, and directed observations are made, a student needs practice under supervision. Pure theory is beautiful to contemplate; it has often been considered adequate on examinations. But any professional school that offers it without concomitant opportunities for guided practice contradicts and weakens its own teaching. Law schools have their moot courts, medical schools their laboratories and hospital service, and schools of education, which concern the very matter of effective learning, must no less afford in their professional training opportunities for applying in practice what has been learned in theory. Beyond that, ideally the student should be personally followed into his first real position and afforded generous help. That being usually impossible, professional schools of education do the next best thing and give considerable assistance to their alumni through correspondence and conferences at frequent meetings. Through these same means the professional schools are constantly accreting their own knowledge by ascertaining the successful practices of their alumni.

It has been declared, sometimes stridently, that "principals are born and not made." So are horses. But I have never heard a stock breeder argue that training cannot improve a horse, whatever his breeding. It is quite true, of course, that some men are endowed with native powers of leadership and that some acquire in their social training a degree of tact that enables them to work with others deftly and with a minimum of friction; but these qualities alone will not make a successful principal, professionally considered. The more the native endowment of a man or woman who aspires to leadership in education, the more he is capable of profiting from professional training of the right kind. It is again a case of the talents: from him of many talents, much will be required. Even he with the single gift, or rather with a small endowment of several, can increase his capital and prepare himself for greater accomplishment.

As said before, the demand by principals actively at work for professional training has been their acknowledgment of its need and their recognition of its worth. The sacrifices that have sent hundreds to summer schools are the evidences of a professional ambition as commendable as it is superlatively fine. Now even more is demanded of those who have faith in themselves and the aspiration to qualify for leadership where it is urgently needed—not merely summer work but study through the academic year when more effective training can be had, especially in its directed field work.

Every one agrees that in a period of change opportunities are greatest to make one's contribution, to influence largely the shaping of practices that are yet not indurated into habits. And every one recognizes that secondary education in the United States is today growing and changing as no other phase of education ever has before in the history of the world. It is unique

that we can recognize the opportunity while it is still here. The demand for leaders is unprecedented—a demand not merely for men who can “keep the school running without friction,” but rather for those who have a vision, who have knowledge, who have skill, who have the power, and above all consistent courage in the face of whatever obstacles may be to translate all of these into a program that works. The situation is a challenge to every one who aspires to make a contribution to the advance of mankind. The contribution is in large measure dependent on the professional preparation for it.

Department of Superintendence

SECRETARY'S MINUTES

OFFICERS

President, R. G. JONES, Superintendent of Schools.....Cleveland, Ohio
Vice-President, WILL C. WOOD, State Commissioner of Education.....Sacramento, Calif.
Second Vice-President, EDWIN C. BROOME, Superintendent of Schools.....Philadelphia, Pa.
Treasurer, IRA B. BUSH, Superintendent of Schools.....Erie, Pa.
Secretary, S. D. SHANKLAND, President of the Andrews Institute.....Willoughby, Ohio

EXECUTIVE COMMITTEE

Chairman, R. G. JONES, Superintendent of Schools.....Cleveland, Ohio
JESSE H. NEWLON, Superintendent of Schools.....Denver, Colo.
FRANK CODY, Superintendent of Schools.....Detroit, Mich.
RANDALL J. CONDON, Superintendent of Schools.....Cincinnati, Ohio
JOHN H. BEVERIDGE, Superintendent of Schools.....Omaha, Nebr.

Sunday Morning, February 26, 1922¹

CAN EDUCATION BE MADE TO PRODUCE SOCIALIZED CHARACTER?—E. A. Ross, Professor of Sociology, University of Wisconsin, Madison, Wisconsin.

First Day's Proceedings

Monday Morning, February 27, 1922

Music by Schurz, Senn, and Lake View High School Students

Overture, Poet and Peasant—*F. von Suppe*. Mr. James Mason, Conductor.
Pas des Fleurs from *Naila—Delibes*. Miss Ellen C. O'Malley, Conductor.
March—*Tannhäuser—From Wagner*. Mrs. Dora G. Smith, Conductor.
Greeting to Spring—*Strauss*. Lake View Glee Clubs and Orchestra, Mrs. Dora G. Smith, Conductor.

The first General Session of the convention of the Department of Superintendence of the National Education Association was called to order Monday morning, February 27, 1922, in the Auditorium Theater, Chicago, Illinois, by the First Vice-President for the year 1921, Mr. Ernest A. Smith, Superintendent of Schools, Evanston, Illinois.

Mr. Smith presented the gavel to the President of the Department, Mr. Robinson G. Jones, Superintendent of Schools, Cleveland, Ohio, who presided until the close of the session. The following program was presented:

ADDRESS OF WELCOME—Edward E. Gore, president of the Chicago Association of Commerce, Chicago, Illinois.

¹ This meeting took place in the Studebaker Theater. Unless indicated, other meetings were held in the Auditorium Theater.

THE OUTLOOK IN EDUCATION—

- (a) For Technical Education—Samuel Insull, President of the Commonwealth Edison Company, Chicago, Illinois.
- (b) For Commercial Education—Frederick George Nichols, Director of Commercial Education, Harrisburg, Pennsylvania.
- (c) For Cultural Education—Frank Aydelotte, President of Swarthmore College, Swarthmore, Pennsylvania.

FINANCING ADULT EDUCATION—Frank P. Graves, State Commissioner of Education, Albany, New York.

PRESENTATION OF JOHN J. TIGERT, U. S. Commissioner of Education, Washington, District of Columbia.

PRESENTATION OF CHARL ORMOND WILLIAMS, President of the National Education Association, Memphis, Tennessee.

BUSINESS MEETING.

At the business meeting, officers for the ensuing year were nominated from the floor. Omitting those who declined to allow the use of their names, the list of nominations was as follows: *For President*—John H. Beveridge, Omaha, Nebraska; A. B. Meredith, Hartford, Connecticut; and H. B. Wilson, Berkeley, California. *For First Vice-President*—F. W. Ballou, Washington, District of Columbia; E. C. Jones, Albany, New York; Charles S. Meek, Toledo, Ohio; E. E. Oberholtzer, Tulsa, Oklahoma; and Miss Lorraine E. Wooster, Topeka, Kansas. *For Second Vice-President*—M. G. Clark, Sioux City, Iowa; H. S. Gruver, Worcester, Massachusetts; Miss Minnie J. Nielson, Bismarck, North Dakota; and H. B. Work, Lancaster, Pennsylvania. *For Treasurer*—Ira B. Bush, Erie, Pennsylvania. *Executive Committee*—One to be elected for term of four years—T. H. Harris, Baton Rouge, Louisiana; Peter A. Mortenson, Chicago, Illinois; Payson Smith, Boston, Massachusetts; and Miss May Trumper, Helena, Montana.

Monday Afternoon, February 27, 1922, 2:00 o'clock¹

Executive Session, as Authorized at Atlantic City and Des Moines

The meeting was called to order by the President, Mr. Robinson G. Jones, Superintendent of Schools, Cleveland, Ohio. He presented Lady Anne Azgapetian, of the Near East Relief Committee, 151 Fifth Avenue, New York City, wife of General Azgapetian of the Armenian Army. She spoke of the critical situation in Armenia and asked for an expression of sympathy from the floor.

Mr. Randall J. Condon (Cincinnati, Ohio): "Mr. President, I want to say to our friend from Armenia, in behalf of this association, that we sympathize with the Armenians, and I want to move an expression of our deepest sympathy and appreciation for all that Armenia is and has been and our everlasting confidence in what she shall be; that out of sacrifice and suffering comes peace and comfort; and I take especial pleasure in moving this expression, because two years ago we gave a leave of absence to our Director of Attendance in Cincinnati that on your frontier of Armenia he might administer to the hungry children of Armenia. On January 15 he sent me a message that Armenian boys and girls are as sweet and loving and tender as American children; and on New Year's day when the gifts he was administering were distributed their hearts rejoiced, because America had not forgotten them, and the children of Armenia went without one meal a day of this ration that was given to them that they might send their bit of relief on to the more hungry children farther in the interior. So I have great satisfaction in moving this expression of good-will and sympathy for Armenia."

Mr. William Davidson (Pittsburgh, Pennsylvania): "Mr. President, in rising

¹ This meeting was held in the Gold Room of the Congress Hotel.

to second the motion of Dr. Condon, will you permit me to say that I have been deeply and profoundly touched by the appeal of the speaker from Armenia. Years ago, that great English statesman, William Ewart Gladstone, said to the people of his day and time: 'To help Armenia is to help civilization.' And it was but yesterday that the world heard the voice of America's greatest humanitarian worker, Herbert Hoover, saying: 'Armenia presents the most desperate situation in the world today.' America, in the past, has risen to the call of this noble little nation, and the American people will not fail that nation now. This body has been fortunate indeed in having had an opportunity to listen to this appealing and touching address from the lips of a native representative of the newest republic in the world today—the Republic of Armenia, the very great need of whose children has been so graphically presented to this body. Mr. President, I take pleasure in seconding the motion of Dr. Condon."

The Chairman: "Gentleman, you have heard the motion for the expression of our sympathy as stated by Dr. Condon and seconded by Mr. Davidson. All who are in favor of this motion will please rise to their feet."

The motion was thereupon unanimously carried by a rising vote.

The Chairman: "It is unanimously carried."

Mr. William M. Davidson: "For the information of the members of the Department and also for the information of the Near East Relief speaker of the afternoon, may I say that in a recent collection of food products the children of the public schools of Pittsburgh gathered together supplies, the cost of which in the aggregate amounted to more than \$120,000. This is but an indication of the manner in which the people of our whole country are rising to meet the needs of the distressed peoples of the world."

The President appointed a committee of two, consisting of Dr. Condon and Superintendent W. M. Davidson, of Pittsburgh, to prepare formal resolutions and transmit them to Lady Anne Azgabetian and her associates. The formal resolutions follow:

Whereas, Among the peoples of the Near East a most desperate situation was brought about by the World War, and continues to exist today; and

Whereas, The Armenian nation, in particular has demonstrated by innumerable acts of heroism, its unflinching support of Christian principles, and civilization; and

Whereas, It looks to America as its only hope of earthly salvation, because it has trust in American idealism and because the United States stands as the one unchallenged exponent of altruism and the spirit of world regeneration which has followed the war; and

Whereas, The Near East Relief was chartered by the United States Congress and organized for the purpose of raising and distributing the funds contributed by the American public in order to relieve the destitution of these suffering races; and

Whereas, The thousands of orphans preserved until this time through our efforts are wholly dependent on us for life, now therefore be it

Resolved, That the Department of Superintendence of the National Education Association, in convention assembled February 26 to March 2, in Chicago, does endorse the efforts of the Near East Relief, and recommends that all educational organizations give a practical expression of their faith in the brotherhood of man by bringing before their membership the need of the Near East Relief for liberal support in its calendar of activities.

The Secretary, Mr. Sherwood D. Shankland, of Willoughby, Ohio, made an oral statement of the financial condition of the Department.

Mr. Ira B. Bush, Superintendent of Schools, Erie, Pennsylvania, Chairman of the Committee of Forty, which had been appointed to prepare a Constitution and By-Laws, then submitted the report of his Committee, which was as follows:

*Draft of Proposed Constitution of the Department of Superintendence of the
National Education Association*

ARTICLE I—Name

The name of this association shall be the Department of Superintendence of the National Education Association.

ARTICLE II—Object

The object of this association shall be to promote the general educational welfare in the field of administrative education and supervision, to make constructive studies, to further the effort and increase the efficiency of persons engaged in education, to foster the professional zeal, to advance educational aims and standards, to protect and advance the interests of school administration, and to establish and maintain helpful, friendly relationships.

ARTICLE III—Membership

Section 1. Membership in the Department of Superintendence shall consist of active, associate, and honorary.

Sec. 2. All persons shall be eligible to active membership who are members of the National Education Association and who are engaged in supervisory and administrative positions—namely, State, county, and city superintendents, and associate, assistant and deputy State, county, and city superintendents, and supervisory and administrative officers in city and county school systems exercising the functions of associate, assistant, or deputy superintendents; all State and National officers of educational administration; the heads of teacher-training institutions, colleges, and universities having departments or colleges of education, the heads of these departments or colleges of education, and professors of school administration or supervision in these institutions.

Sec. 3. All members of the National Education Association, who are actively engaged in any phase of school work, may become associate members of this department by paying the regular membership fee, and shall be entitled to all the privileges of this department except the right to vote and hold office.

Sec. 4. All members of the National Education Association, who have been engaged in supervisory or administrative positions, as defined in Sec. 2 of this article, and who have retired from such service, may have the privilege of honorary membership in this department upon recommendation of the Executive Committee.

Sec. 5. The Executive Committee shall have power to pass upon the credentials of all applicants for membership.

ARTICLE IV—Officers

Section 1. The officers of this department shall be a president, a first vice-president (who shall be the retiring president), a second vice-president, an executive secretary, a treasurer, and four members of the Executive Committee who, with the other officers of this department (with the exception of the executive secretary), shall constitute the Executive Committee.

Sec. 2. The President, vice-presidents, and treasurer shall hold office for the period of one year from the date of election, including one full year's service in the promotion and operation of one meeting of the department.

Sec. 3. The executive secretary shall be selected by the executive committee for an indefinite period.

Sec. 4. Members of the Executive Committee shall hold office for four years, one member retiring each year. At the first election the member receiving the largest number of votes shall serve for a term of four years and the others for three, two, and one years, respectively, according to the number of votes received.

ARTICLE V—Election of Officers

Section 1. The procedure for the election of officers shall be as follows: Nominations shall be made from the floor on the morning of the second day's session at a time previously agreed upon by the Executive Committee, and announced in the printed program of the meeting.

Sec. 2. *Method of balloting*—The tickets issued by the secretary of the department to the members of the association shall be provided with a detachable stub, to be used as a ballot.

Two places for balloting shall be provided, one at the secretary's headquarters, the other at the entrance to the auditorium in which the general sessions are held.

The ballot-boxes shall be open for voting from 11 A.M. until 6 P.M. on the third day of the meeting.

Those candidates receiving the highest number of votes for the respective offices shall be considered the choice of the Association, and declared elected.

The entire procedure of balloting shall be in charge of the Executive Committee and secretary.

Sec. 3. *Announcement of the result of balloting*—At the last regular business meeting, the president shall call for the report of the secretary, announcing the result of the ballot cast for the several officers of the association. In case of a tie vote, the executive committee shall cast lots to determine the successful candidate.

ARTICLE VI—Appointive Committees

The appointive committees of this department shall consist of a Resolutions Committee, an Audit Committee, and such other committees as may be authorized by the department from time to time.

ARTICLE VII—Annual Meeting

The annual meeting of this department shall be held on the fourth Monday in February, and the three succeeding days.

ARTICLE VIII—Amendments

This Constitution may be altered or amended at any annual meeting by two thirds vote of the active members present, the proposed amendment having been submitted in writing at a previous regular business meeting.

(NOTE.—This Constitution shall become effective immediately upon its adoption except as it relates to the officers and members of the Executive Committee, elected at the Atlantic City meeting in February, 1927, who shall complete the terms of office for which they were elected.)

By-Laws, Department of Superintendence of the National Education Association

ARTICLE I—Duties of Officers

Section 1. It shall be the duty of the president to preside at all meetings and in conjunction with the executive committee to prepare programs for the annual meeting of the department; to appoint all committees not otherwise provided for. He shall be chairman and a member of the Executive Committee, and shall call meetings of this committee whenever he deems it necessary, or whenever he is requested so to do by a majority of the members of the committee. He shall perform all other duties appertaining to his office.

Sec. 2. In the absence of the president the vice-presidents shall preside in turn. In case of vacancy in the office of president, the second vice-president shall at once succeed to the office of president.

Sec. 3. The Executive Secretary shall keep a complete and accurate record of the proceedings of all meetings of the department and all meetings of the executive

committee, shall conduct the business of the department, as provided by the Constitution and By-Laws, and in all matters not definitely prescribed therein be under the direction of the Executive Committee, and in the absence of direction by the Executive Committee, shall be under the direction of the president. He shall receive all moneys due the department and transmit them monthly to the treasurer; shall countersign all bills approved for payment by the Executive Committee or by the president in the interval between meetings of the Executive Committee. He shall have his records present at all meetings of the department and Executive Committee. He shall keep a list of members of the department and shall revise said list annually. He shall be secretary of the executive committee and custodian of all property of the department, not in charge of the treasurer. He shall give such bond as may be required by the Executive Committee. He shall submit an annual report to the Executive Committee at each annual meeting. At the expiration of his term of office he shall turn over to his successor in office all money, books, and property of the department. He shall serve during the pleasure of the Executive Committee.

Sec. 4. The Treasurer shall receive from the secretary all moneys paid to the department and shall transmit them monthly to the secretary of the National Education Association. He shall keep a correct account of all moneys so received and transmitted. He shall countersign all bills approved for payment by the Executive Committee or by the president in the interval between the meetings of the Executive Committee, which have been signed by the secretary and shall transmit them to the secretary of the National Education Association for payment. He shall give such bond as is required by the Executive Committee. At the expiration of his term of office, he shall transfer to his successor all moneys, books, and other property in his possession belonging to the department.

ARTICLE II—Duties of Committees

Section 1. The Executive Committee shall assist the president in arranging the annual program, and in arranging for the place of the annual meeting *when empowered by the department so to do.*¹ It shall select an executive secretary and fix his salary. The Executive Committee shall submit an annual report at one of the business sessions of the department, shall recommend to the department the appointment of special committees for investigation and research. It shall recommend the amount of money to be expended in such investigations, but in no case shall it incur debt. It shall decide what sections and departments of the National Education Association may be affiliated with this department.

Sec. 2. The Resolutions and Audit Committees shall be appointed by the newly-elected president immediately upon his election and shall make their report at the next annual meeting succeeding their appointment.

ARTICLE III—Dues

The dues in this department shall be five dollars per year for both active and associate members, and shall be paid annually to the Executive Secretary.

ARTICLE IV—Vacancies

All vacancies occurring in any office other than that of president shall be filled by the Executive Committee.

ARTICLE V—Rules of Order

Roberts' Rules of Order shall govern in all business meetings of this department.

¹ Passage in italics struck out. See p. 43.

ARTICLE VI—Amendments

These By-Laws may be amended at any regular business meeting of this department by a majority vote of the members present, the amendment having been submitted in writing at a previous regular business meeting.

(Signed for the committee)

IRA B. BUSH,
Chairman.

Mr. Bush moved that the Constitution and By-Laws as submitted, be adopted, and his motion was duly seconded.

Mr. Corothers moved that the last sentence in Article 2, Section 1 of the By-Laws be amended to read as follows: "It shall recommend what sections and departments of the National Education Association may be affiliated with this Department."

The amendment was seconded, put to a vote, and lost.

The chairman ruled that the vote fixing the amount of the annual dues must be taken separately.

Mr. Oberholtzer moved that the fee for members of this Department be fixed at five dollars per year. The motion was duly seconded and carried unanimously.

Mr. Stoddard, of Beatrice, Nebraska, moved that the following proviso be added to Article 4, Section 4: "Provided, that the member elected every alternate year shall, at the time of his election, be holding his position in a town of less than 50,000 population."

The motion was seconded, put to a vote, and lost.

Mr. Downes moved that Article 2, Section 1, of the By-Laws, be amended by striking out the following words: "When empowered by the Department so to do." The motion was seconded and put to a vote, viva voce. The chairman being in doubt appointed Mr. Hunter, Mr. Gwinn, and Mr. Bentley, as tellers, to count and report a standing vote. The vote was taken and the motion adopted by a plurality of twenty-three votes.

The question recurred on the adoption of the constitution as amended. The question was put and the Constitution as amended, adopted unanimously.

Mr. Smith, of Evanston, moved that the Department of Superintendence express its approval of the twelve groups now affiliated with the Department. The motion was seconded. At the direction of the Chairman, the list of the twelve groups was read by the secretary. It was as follows:

1. National Council of Education.
2. Department of Rural Education.
3. Department of Elementary School Principals.
4. Department of Vocational Education.
5. City Training School Section.
6. National Association of Directors of Educational Research.
7. National Association of High School Inspectors and Supervisors.
8. Department of Elementary School Principals.
9. National Council of Primary Education.
10. National Council of State Departments of Education.
11. The National Society for the Study of Education.
12. The National Society of College Teachers of Education.

The pending motion to approve the above list was then voted upon and carried.

Mr. Davidson, of Pittsburgh, moved that it be the sense of this meeting that the executive committee should include in its list of affiliated organizations, the department known as the Council of Kindergarten Supervisors and Training Teachers. The motion was seconded.

Upon request the secretary read communications from various other groups desiring affiliation.

Mr. Bentley moved, as an amendment to the above motion, that the executive committee be instructed to request the union of the Primary and Kindergarten groups, with a view to its affiliation as a single suit. The amendment was seconded.

Mr. Hunter moved that the whole matter be laid on the table, which motion was seconded and carried.

Mr. J. H. Beveridge, superintendent of schools, Omaha, Nebraska, then presented the annual report for the executive committee, which, on motion of Dr. Condon, was received and referred to the new executive committee. (See p. 1457.)

Mr. Albert Shiels, of New York, then made the report for the Department's committee on Boy Scout activities. On motion, duly seconded and carried, the report was approved.

Mr. J. F. Keating moved that the nominations made at the morning session be the nominations of this body under the new Constitution. Dr. Condon moved to amend so that all persons nominated for either First or Second Vice-President be considered nominees for Second Vice-President, which motion was accepted by Mr. Keating. The motion as amended was duly seconded and carried.

The secretary reported that the relationships of the county superintendents to the Department of Rural Education and the Department of Superintendence, presented a problem which should receive consideration. On motion duly seconded the executive committee was authorized to make a working agreement with the Department of Rural Education, valid for one year, to cover all matters of common interest to the two departments. On motion the meeting adjourned.

Monday Evening, February 27, 1922

The Civic Music Association of Chicago presented the Civic Orchestra of Chicago. Mr. Frederick Stock, the celebrated director of the Chicago Symphony Orchestra, conducted.

A Symposium on the Need of a National Organization for Educational Service

Alexander Inglis, Professor of Education, Harvard University, Cambridge, Massachusetts; George D. Strayer, Professor of Educational Administration, Teachers College, Columbia University, New York, New York; A. E. Winship, Editor of the *Journal of Education*, Boston, Massachusetts; S. P. Capen, Director of the American Council on Education, Washington, District of Columbia; Edwin C. Broome, Superintendent of Schools, Philadelphia, Pennsylvania; Olive M. Jones, Principal of School 120, New York, New York; W. A. Jessup, President of the State University of Iowa, Iowa City, Iowa; and John W. Withers, Dean of the School of Pedagogy, New York University, New York, New York.

Second Day's Proceedings

Tuesday Morning, February 28, 1922

Boys' Glee Clubs from seven elementary schools. Kinder Band of sixty pieces—first-grade children. Community singing.

ADDRESS OF WELCOME—Mr. William Saltiel, Corporation Counsel of the city of Chicago.

School Architecture, Building, and Equipment

Prepared by Randall J. Condon, Superintendent of Schools, Cincinnati, Ohio

IMPORTANT ELEMENTS IN THE DEVELOPMENT OF THE SCHOOL BUILDING PROGRAM—N. L. Engelhart, Professor of Education, Teachers College, Columbia University, New York, New York.

ADAPTING A SCHOOL PLANT TO THE CURRICULUM—Charles L. Spain, Deputy Superintendent of Schools, Detroit, Michigan.

SOLVING THE PROBLEM—THE ARCHITECT AND THE SUPERINTENDENT—Frederick W. Garber, of the firm of Garber & Woodward, Architects, Cincinnati, Ohio.

THE ADVANTAGES OF THE ONE-STORY PLAN—Dwight H. Perkins, of the firm of Perkins, Fellows & Hamilton, Architects, Chicago, Illinois.

CALIFORNIA'S CONTRIBUTION TO SCHOOL ARCHITECTURE—John J. Donovan, Architect, Oakland, California.

This program included 8000 square feet of school-building exhibits, in the Leiter Building, State and Congress streets, one block west of the Auditorium.

Tuesday Evening, February 28, 1922

Joint meeting with National Society for the Study of Education

Third Day's Proceedings

Wednesday Morning, March 1, 1922

Mixed chorus—350 pupils from sixth, seventh, and eighth grades.
Community singing.

The Process of Financing Education

Prepared by Thomas E. Finegan, State Superintendent of Public Instruction, Harrisburg, Pennsylvania.

THE PROBLEMS BEFORE THE COMMISSION IN CHARGE OF THE EDUCATIONAL FINANCE INQUIRY—George D. Strayer, Chairman of the Commission, and Professor of Educational Administration, Teachers College, Columbia University, New York, New York.

FINANCIAL NEEDS OF EDUCATION—

- (a) Rural Education—Arthur M. Hyde, Governor of the State of Missouri, Jefferson City, Missouri.
- (b) Education in Cities—Mark L. Thomsen, Cleveland, Ohio.
- (c) Higher Education—Frederick M. Davenport, Member of New York State Senate, and Professor of Law and Civil Polity, Hamilton College, Clinton, New York.

HOW MAY THE NECESSARY FUNDS FOR PUBLIC EDUCATION BE PROVIDED?—Edwin R. A. Seligman, Professor of Political Economy, Columbia University, New York, New York.

Dr. Finegan then announced the names of the winners of prizes offered for a character code, for character education.

BALLOT BOXES OPEN—Votes for officers of the Department of Superintendence were deposited between 11:00 A.M. and 6:00 P.M.

Fourth Day's Proceedings

Thursday Morning, March 2, 1922

Music by Crane and Harrison Technical High-School Students

"Hungarian Lustspiel"—Keler Bela, Mr. Frederic B. Emery, Conductor.
"Sicilian Vespers"—Verdi, Miss Louise Hannan, Conductor.

The Ideals to Be Achieved by Public Education

WHAT HAS THIS COUNTRY REASON TO EXPECT BY WAY OF CULTURE, EFFICIENCY, AND GOOD CITIZENSHIP IN RETURN FOR THE COST OF OPERATING PUBLIC EDUCA-

TION IN THIS COUNTRY?—William O. Thompson, President of Ohio State University, Columbus, Ohio; Frank E. Spaulding, Graduate School, Yale University, New Haven, Connecticut; John J. Tigert, U. S. Commissioner of Education, Washington, District of Columbia; and Will C. Wood, State Superintendent of Public Instruction, Sacramento, California.

State Superintendent Francis G. Blair, of Springfield, Illinois, presented the report of the committee on resolutions, which is on page 1460.

Mr. Douglas presented the report of the Canvassing Committee on election returns declaring the following to have been elected for the ensuing year: President, John H. Beveridge, Omaha, Nebraska; Vice President, F. W. Ballou, Washington, District of Columbia; Treasurer, Ira B. Bush, Erie, Pennsylvania; and Executive Committee, for term of four years, Payson Smith, Boston, Massachusetts.

The newly elected President, Superintendent John H. Beveridge, of Omaha, was then introduced and addressed the Department.

President Jones then declared the meeting adjourned.

Thursday Afternoon, March 2, 1922

SUPERINTENDENTS OF CITIES OF POPULATION UP TO 25,000¹

Chairman, Theodore Saam, Superintendent of Schools, Council Bluffs, Iowa

School Buildings

THE PLANS FOR A BUILDING PROGRAM—E. E. Lewis, Superintendent of Schools, Rockford, Illinois.

VIRGINIA'S BUILDING PROGRAM, ITS AIMS AND VOCATIONAL WORK—E. T. Duffield, Superintendent of Schools, Virginia, Minnesota.

THE ONE-STORY SCHOOL—A. A. McDonald, Superintendent of Schools, Sioux Falls, South Dakota.

SOME MOOTED QUESTIONS IN SCHOOL PLANNING—William V. Ittner, Architect and School Specialist, St. Louis, Missouri.

Some Functions of a City Superintendent

THE SUPERINTENDENT AND THE COMMUNITY—R. B. Irons, Superintendent of Schools, Winona, Minnesota.

THE SUPERINTENDENT AND BOYS' WORK—J. Lindsey, Superintendent of Schools, Mitchell, South Dakota.

THE SUPERINTENDENT AND STANDARDIZED TESTS—D. C. Bliss, Superintendent of Schools, Montclair, New Jersey.

THE SUPERINTENDENT AND THE COURSE OF STUDY—H. B. Bruner, Superintendent of Schools, Okmulgee, Oklahoma.

THE SUPERINTENDENT AND SUPERVISION—N. L. Engelhart, Professor of School Administration, Teachers College, Columbia University, New York, New York.

SUPERINTENDENTS OF CITIES OF POPULATION OF 25,000 TO 100,000

Chairman, Ernest A. Smith, Superintendent of Schools, Evanston, Illinois

WHY MAINTAIN THE PRESENT SALARY SCHEDULES AND THE OBLIGATIONS INVOLVED?—M. G. Clark, Superintendent of Schools, Sioux City, Iowa.

THE ARGUMENTS FOR AND AGAINST THE SUPERVISION OF INSTRUCTION—Charles A. Wagner, Superintendent of Schools, Chester, Pennsylvania.

THE NEXT STEP IN SCHOOL SUPERVISION—E. E. Oberholtzer, Superintendent of Schools, Tulsa, Oklahoma.

¹This meeting was held in the Red Room of the Hotel La Salle.

SELLING THE SCHOOLS TO THE PUBLIC—H. B. Wilson, Superintendent of Schools, Berkeley, California.

DISCUSSION OPENED BY O. J. Kelly, Superintendent of Schools, Binghamton, New York.

QUESTION BOX—YOUR MOST PERPLEXING PROBLEM—Conducted by E. C. Fisher, Superintendent of Schools, Rock Island, Illinois.

SUPERINTENDENTS OF CITIES OF POPULATION BETWEEN 100,000 AND 250,000¹

Chairman, Zenos E. Scott, Superintendent of Schools, Louisville, Kentucky

PROBLEMS OF FINANCING EDUCATION—HOW THEY ARE BEING SOLVED IN MY CITY—

John Wilson, Superintendent of Schools, Paterson, New Jersey; W. A. Sutton, Superintendent of Schools, Atlanta, Georgia; S. O. Hartwell, Superintendent of Schools, St. Paul, Minnesota; and S. E. Weber, Superintendent of Schools, Scranton, Pennsylvania.

GENERAL DISCUSSION—M. E. Pearson, Superintendent of Schools, Kansas City, Kansas; Paul Stetson, Superintendent of Schools, Dayton, Ohio; and Harvey S. Gruver, Superintendent of Schools, Worcester, Massachusetts.

SUPERINTENDENTS OF CITIES OF POPULATION OF 250,000 TO 450,000²

Chairman, Jesse H. Newlon, Superintendent of Schools, Denver, Colorado

HOW MAY THE SUPERINTENDENT KNOW THE EDUCATIONAL NEEDS OF HIS CITY?—Frank W. Ballou, Superintendent of Schools, Washington, District of Columbia, and Randall J. Condon, Superintendent of Schools, Cincinnati, Ohio.

DISCUSSION—David B. Corson, Superintendent of Schools, Newark, New Jersey; Frank B. Cooper, Superintendent of Schools, Seattle, Washington; and E. U. Graff, Superintendent of Schools, Indianapolis, Indiana.

THE NEXT STEPS IN FINANCING OUR CITY SCHOOL PROGRAM—Herbert S. Weet, Superintendent of Schools, Rochester, New York.

DISCUSSION—I. O. Winslow, Superintendent of Schools, Providence, Rhode Island, and W. F. Webster, Acting Superintendent of Schools, Minneapolis, Minnesota.

HOW WE ARE SELLING THE PUBLIC EDUCATION PROGRAM IN MY CITY—J. M. Gwinn, Superintendent of Schools, New Orleans, Louisiana.

DISCUSSION—Ira I. Cammack, Superintendent of Schools, Kansas City, Missouri; Henry Snyder, Superintendent of Schools, Jersey City, New Jersey; and D. A. Grout, Superintendent of Schools, Portland, Oregon.

SUPERINTENDENTS OF CITIES OF 450,000 AND OVER³

Chairman, William L. Ettinger, Superintendent of Schools, New York, New York

This was an informal discussion of the problem of financing education in our large cities, including the sources and amount of school funds, the method of determining and setting up the budget, the method of disbursement, the adequacy of funds for current expenses and building programs, control by agencies other than the Board of Education, and related subjects.

DISCUSSION LED BY Edwin C. Broome, Superintendent City Schools, Philadelphia, Pennsylvania; Frank Cody, Superintendent City Schools, Detroit, Michigan; William M. Davidson, Superintendent City Schools, Pittsburgh, Pennsylvania; R. G. Jones, Superintendent City Schools, Cleveland, Ohio; and Alfred Roncovieri, Superintendent City Schools, San Francisco, California.

¹ This meeting was held in the Tiger Room of the Hotel Sherman.

² This meeting was held in the Pine Room of the Stratford Hotel.

³ This meeting was held in the Green Room of the Congress Hotel.

THE OUTLOOK FOR COMMERCIAL EDUCATION

FREDERICK G. NICHOLS, STATE DIRECTOR COMMERCIAL EDUCATION,
HARRISBURG, PENNSYLVANIA

The future of commercial education is in the hands of educational administrators—superintendents, principals, and directors—who make up the membership of this Association. That a place on your program has been made for the discussion of business training augurs well for its future in the public schools of this great industrial country. I welcome this opportunity to lay before you a few of the more pressing needs in the field of education which I have the honor to represent.

Under the wording of the subject assigned me I do not consider it within the scope of my paper to discuss commercial education in detail, but will forecast the future of business training in the public high school. I shall not outline curriculum content, nor shall I discuss all the controversial questions that have grown out of this field of education. I shall confine my remarks to public-school commercial training and in doing so I am not unmindful of the fact that the colleges, universities, Y. M. C. A., Y. W. C. A., K. of C., correspondence schools, and extension schools of many kinds are rapidly responding to the popular demand for business education. Nor am I ignorant that evening school commercial departments are overflowing with pupils whose requirements are not being met. The extension character of the training required by evening-school pupils is not recognized. With adequate provision for the supervision of commercial education in the cities throughout the land this apparent failure to meet a great need will be converted into a profitable and successful department of business training. After all it is in the high school that correct principles of commercial education can be worked out to best advantage. Once these principles are established, their application to other types of schools will be easy.

Importance of commercial education—While commercial education was the forerunner of all other types of vocational education, its present importance and scope are but little appreciated by those who have had no intimate connection with its development. This is partly because the public-school records do not tell the whole story. The private school still gives a large part of the instruction demanded by patrons and supporters of the public-school system.

The following figures may help us to understand the magnitude of the problem with which we are dealing. They may serve also as a challenge to those who think that the high school is already meeting its full obligation. From 25 per cent to 30 per cent of all the public high-school pupils in the United States are enrolled in the commercial department. In Philadelphia 50 per cent are commercial pupils and over 70 per cent of the high-school girls take commercial work. For every commercial pupil enrolled in a public high school there is another pupil enrolled in a private school. The cost to the Federal Government of administering Smith-Hughes Vocational

Education throughout the country is \$200,000 a year. There are a score or more of private business schools whose separate tuition income equals this amount. The Federal Government appropriates annually for vocational education a sum which when it reaches its maximum will be \$7,000,000. This sum must be matched by a like sum to be appropriated by the States, making \$14,000,000 in all. The taxpayers who provide this large sum of money for all types of vocational training except commercial, pay an annual private business school tuition bill of a million dollars more than this total, or \$15,000,000.

Early beginning in private school commercial education—In the early fifties business was small. There was little competition. Transportation facilities were inadequate, and each community was more independent of other communities than it is today. Business occupations were general in character. Division of labor had not yet touched the business office. Business had small use for girls or women. Those who were employed performed general office duties with the major emphasis on bookkeeping. The boy who wished to learn a business, or whose father was ambitious that he should do so, looked around the neighborhood in which he lived for an opportunity to secure what really amounted to an apprenticeship. Without special training of any kind and with but meagre general education he set to work to learn all he could about the business in which his lot happened to be cast. He worked in the closest possible relationship with his employer, who gladly became his teacher. His duties were sufficiently varied to bring him into contact with every phase of the business. He kept the books, such as there were, handled the cash, and attended to receiving, storing, and shipping goods. He banked his employer's money and paid his bills. Credits and collections were not entirely outside his range of duties. Financial problems were discussed with him or in his hearing and he acquired a keen appreciation of the importance of this side of business administration. The economic factors of that period were far less complex than they are today, and what he picked up about business management and the true economic basis for business procedure was sufficient for his purposes. The general nature of his calling brought him into contact with those with whom his employer dealt—creditors and customers alike. He became a student of people and soon sensed their widely differing mental characteristics. Inevitably he learned the business, acquired a partnership, or launched a business of his own.

Thus it will be seen that little business education was needed in that day of small business enterprises. One who could write well, figure accurately, and apply the simple rules of single-entry bookkeeping found little difficulty in getting a start.

It was under these conditions that commercial education had its origin. In the early fifties an enthusiastic devotee of the penman's art set out from the foothills of rugged New Hampshire to teach people to write. Stopping here and there wherever a group could be interested in his birds, scrolls, and artistic shading, he organized penmanship classes in competition with

the singing-school teacher and other itinerant educators of a day long since past. Those who were attracted by the freely distributed advertising literature of these pen artists were drawn largely from the counting houses where they earned their daily bread "keeping books." Flourished writing was of little use to people who daily faced the necessity of writing within the not over-generous spacings of journals and ledgers. Consequently the demand grew for simplified penmanship and the well-remembered Spencerian penmanship came into being.

When artistic penmanship had given way to the more practical business writing demanded by office workers it was but natural that bookkeeping and business arithmetic should be added to the commercial curriculum. Very little so-called practical education was given in the public schools of that period. The real high school had not yet come into its own. The preparation of the few for further collegiate study absorbed most of the attention of public-school administrators. A rigid academic curriculum, admirably adapted to the requirements of those who were going to college, made no appeal to those who had little hope of going beyond the high school. Those who were forced to leave the high school early or who never entered high school at all were left to shift for themselves. With these conditions in mind it is easy to understand how the occasional evening or afternoon commercial class grew into a permanent private business school in communities large enough to support such a school. Enterprising leaders in this field were not content with a single school. Such intrepid enthusiasts as Bryant, Stratton, Brown, Draughon, and others organized "chains" of schools which brought this type of practical training to the doorstep of almost every city dweller. Even those who lived in the country found ways and means of taking advantage of this freely advertised opportunity to prepare for the much coveted city position.

In the sixties a new impetus was given to business training. At the close of the Civil War thousands of young men in the North and South were suddenly faced with the necessity of readjustment. They had been interrupted in their plans to go to college or to prepare for a profession. Many found it necessary to go to work almost at once. The private business school seemed to hold the key to a business connection. It is small wonder that thousands enrolled in this type of school during the period which followed this great National crisis and that hundreds of new schools were opened to meet this easily stimulated demand for business training. To the credit of the private business school it should be said that no small proportion of the successful business men of the generation just passing gladly admit that they owe their success in no small degree to the initial position secured through this type of school. How much of their success was due to natural industrial conditions and to native ability cannot be measured exactly, but without detracting from the credit due the school which trained them it may be said in passing that young people who face the future today are facing a very different set of conditions from those that confronted young people of the period under discussion. New eco-

nomic and social conditions make new educational demands, which should be met by effective readjustments in school administration.

The next impetus to business training was given by the invention of the typewriter in the seventies. Shorthand which had been in use for centuries immediately became the basis of a new office service, and to the original business course which I have referred to shorthand and typewriting were added.

Commercial education in the high school—Until the early eighties the private school, organized to meet a definite need, held a virtual monopoly of business training. Its graduates found initial positions for which their training had qualified them and from which they could advance to higher places. The real worth of business education was established beyond question of doubt and public-school administrators became interested in this new field of education.

The rapid growth of the private business school during the thirty-year period immediately preceding 1880 did much to force the demand for a wider range of educational opportunity on those who administered public education. Thus it came about that in the early eighties those commercial subjects which formed the private business school curriculum were added to the list of subjects offered in the public high school and a certain measure of freedom was permitted pupils in making up their program of studies.

At first a few commercial subjects were permitted as options; later other business subjects were added. Still later a full program of commercial work was permitted in the upper high-school years. Finally, commercial work in a limited quantity was permitted in the first year of the high-school curriculum. Then the two-year business curriculum was introduced. From this point on up to the present time the relative merits of the "long" and "short" commercial curriculum have been the subject of unending controversy. There is as yet no consensus of opinion on this subject.

The high-school commercial curriculums were originally patterned after those of the private business school so far as the technical subjects included were concerned. And the high school is still following the lead of the private school notwithstanding the failure of the latter to continue its responsiveness to the demands of business in a period of extreme specialization.

Present status of public-school commercial education—In the earlier period there were but two major office positions—bookkeeper and stenographer. All business training revolved around these two occupations. Today there are literally scores of office and store employments, and yet, business education in both private and public schools goes on revolving around two services that have long since ceased to have a monopoly of the office pay-roll. A few collateral subjects, such as commercial law, commercial geography, and economics of business have been added to the old business curriculum, but these subjects—valuable as they are—are general in character and bring to the curriculum no training for new vocational objectives.

In some schools the two-year business course is offered. In others the

commercial work is confined to the third and fourth years. In still others it runs through the entire curriculum. In all, the vocational and general business education subjects are the same. Bookkeeping, shorthand, and typewriting make up the vocational units. Commercial law, commercial geography, and possibly economics comprise the general business training units. In some schools salesmanship of the usual book variety and business English are added. In a two-year curriculum bookkeeping, shorthand, typewriting, business writing, and business arithmetic are offered. Except for English the academic subjects are omitted. If they are included the technical subjects are given inadequate attention. In a business curriculum of any other length these subjects are its chief content. They are not all suited to children of the early high-school years, and they are inadequate as a program for the upper high-school years. A recent survey in twenty cities shows that of nearly 4000 office and store workers under eighteen years of age only 33 are bookkeepers and only 88 are stenographers. This statement challenges our most serious consideration. In the remainder of this paper I shall attempt to outline briefly the more important needs in this field of education which can be met only through the sympathetic, earnest, aggressive, and intelligent coöperation of state and city superintendents and school principals.

Reorganization necessary—Our present commercial courses in both public and private schools are not wholly suited to modern business requirements. We are now in a period of big business made possible and even necessary by the extremely complex economic conditions under which business is done. Competition is keen. Transportation facilities are highly developed. Specialization is the key note of the age. Division of labor is fully as operative in the office as in the shop. In securing initial employment special skill is a larger factor than general ability, but for advancement general ability must accompany special skill. Girls are competing with boys in every department of business organization. Where once the general office man reigned alone now rules the office manager with his small army of entry clerks, ledger clerks, cashiers, receiving clerks, shipping clerks, stock clerks, calculating machine operators, messengers, file clerks, mail clerks, copyists, stenographers, dictaphone operators, credit clerks, collection clerks, almost without end.

Not only are there a multiplicity of separate and distinct occupations, but there are numerous administrative departments each dealing with some important phase of the modern industrial or commercial plant—the purchasing department, sales department, advertising department, accounting department, correspondence department, personnel department, credit department, financial department, and others of equal importance. The boy of 1850 sought an opportunity to learn a business; the boy of 1922 first seeks a chance to master a special department of business.

Definite commercial education policy needed—Having in mind the early beginnings of business education and the contrast between the requirements of business, past and present, let us proceed to set forth a commercial education policy in terms of present-day needs.

Reorganized commercial education defined—It may help us in our thinking if we state what commercial education is not. First, it is not a subject like English, mathematics, or history. It embraces these subjects and many more—academic, semi-technical, and technical. Second, it is not a single curriculum or grouping of essential subjects. The number of commercial curricula that may be developed in any school is limited only by the size of the school and the variety of pupil needs that may be recognized. Third, it is not confined to a single school or type of school. Commercial education forms an essential part of the program of the junior high school and of the senior high school; of the continuation school and of the evening school. Fourth, it is in no way antagonistic to other forms of education, either vocational or academic. It is supplementary to them. Fifth, it is not confined to preparation for a single occupation, or to any one of many occupations. While it is true that training for the position of bookkeeper, or that of stenographer is commercial education, it should be emphasized that commercial education is not training for either of these two vocations exclusively. It is something bigger and more far-reaching than this limited conception of it would indicate. Sixth, it is not a type of education that is confined to a single group of pupils in any school system. It contains elements that are of vital importance to the well-being of all people whatever may be their lifework objectives.

Stated in positive terms commercial education is that type of education which is designed to prepare people for the discharge of the responsibilities of citizenship as well as for immediate service in business. It seeks to insure growth into positions of responsibility and trust in the great industrial organizations with which this country is filled, and to stimulate an interest in the acquisition of a proprietary interest in some commercial enterprise, large or small. It is a phase of vocational education so far as its immediate placement values are concerned, but it does not rest its whole case on its job-training attributes. It is not wholly unlike so-called general education in its ultimate aim—the development of useful citizens who are trained to serve society through the medium of business. In the high school it should be sufficiently comprehensive and elastic to insure that core curriculum which by common consent is deemed essential to intelligent and effective citizenship training. It is not exclusive as to any kind of academic work which can be made to yield an element of training, direct or indirect, in the preparation of people for the places in the Nation's commercial life which they seek to fill. Its sponsors should recognize the outstanding differences between the requirements of business as it *was* and as it *is*; of pupils who have but a year to spend in high school and of those who can remain to graduate. Its curricula should be shaped for those who accept early employment and seek extension training in the continuation school as well as for those who are privileged to continue their studies in the high school. Office workers who, finding themselves blocked in their efforts to advance, seek help through the evening school should find a type of training suited to their needs. Modern commercial education plays no favorites,

but extends a helping hand to the one who would sell even as to the one who would "keep books"; to the one who prefers general clerical duties to service as a stenographer; to the one whose bent is in the direction of calculating machine and other figure-work quite as freely as to the one who prefers engrossing or some other form of pen work; to those who have aptitude for credits and collection work, or the advertising field, or personnel work, or any of the other three hundred or more types of service in a modern business organization.

Both general and vocational commercial education needed—Commercial education needs cannot be met by a single subject, or by a single curriculum, or in a single type of school. There are two distinct phases of technical commercial education. One has to do with definite preparation for a known business occupation, and the other concerns itself with preparation for future advancement. The former contributes to the achievement of an immediate vocational objective, while the latter develops that comprehension of the economic and social aspects of business organization and management so essential to ultimate growth into the higher places which require administrative skill. Neither of these phases can be ignored. Which shall be the controlling factor in the establishment of any given curriculum must be governed by the circumstances of each case. For example, for those who can remain in the high school but a short time the primary consideration may be preparation for a business position; for those who can remain longer, ultimate promotional training may play an increasingly important part in proportion as the period of training is extended. Likewise in the limited time at the disposal of evening school pupils it may not be possible to offer both phases of technical training at the same time. Those who need vocational training to help them handle their present duties more satisfactorily should get it. Those who are sufficiently trained for their present tasks may profit most by a more general type of promotional training.

It will be seen, therefore, that the four-year high school presents two distinct business-training problems. The first one concerns children who go no farther than the first or second year, and this includes more than 50 per cent of those who enroll in our city high schools. The second concerns those who remain to the end of the third or fourth year. I respect the opinion of those who would defer all business training until the upper high-school years, but I contend that no one has yet found a way to accomplish this result. If no commercial work is offered in the first and second years those who choose this kind of education in these two years go out and buy it. The fact remains that they are not kept from getting it. School officials must decide whether the best interests of their constituents will be served by forcing them to send their children to the private school to get a senior type of business training poorly adapted to their needs, or by developing a junior type of business training in the early high-school years and convincing parents of its superior merit. The latter plan would seem to be more in keeping with the spirit of democracy in

education. Furthermore, it rests on sound vocational education principles.

It is of the utmost importance that English, social studies, and science form a part of every high-school program of business training. Each year should contain some general business education whose vocational values may not be apparent, as well as some definite vocational business training suited to the requirements of pupils of the age for whom it is intended. To insure this ideal program of commercial studies research work is needed. We must know what junior business occupations are open to them, what are the exact duties of these positions, and what special training will suffice. Likewise, before we attempt to force all boys and girls to pursue a common business course in the upper two years of high school we must satisfy ourselves as to the exact requirements of the many senior commercial employments that are open to high-school graduates.

Commercial education by yearly units—Investigations already made indicate that when we are in possession of all the facts we shall be able to set up our curriculums on the unit-year plan, with each year a unit in itself entirely adequate to the immediate vocational requirements of those who complete it. For children below the third high-school year we shall find that junior clerical practice, business writing, business arithmetic, type-writing and elementary bookkeeping will meet all technical requirements. This will leave ample time for English, social studies, a year of general science, and the general but important business subject of commercial and economic geography.

This training will not prepare for the positions of bookkeeper and stenographer, but it will train for the only kinds of positions children under sixteen years of age are employed to fill. It will serve as a basis for more advanced training in the high school or in the extension school. Through it pupils have been and will continue to be encouraged to go on with their formal education. This type of elementary training may be regarded as both vocational and preparatory to more advanced work. Those who finish but a single year and drop out to go to work will have acquired a marketable skill and some good general education. Those who continue a second year and then seek employment will enter business on a slightly higher plane. Thus each year's training is valuable in and of itself. At the same time it is so constructed as to articulate advantageously with the succeeding year, thus encouraging pupils to remain in school.

Differentiated curriculums in the upper two years—The problem of the senior type of training in the upper two years of the high school is one that can be met only by differentiation both in the interest of better vocational preparation and of better "background" education. Under the present plan nearly all major in bookkeeping and shorthand. In some schools salesmanship is added. Not all boys and girls have the mental and physical qualities that make for success in shorthand; hence, it should not be required of all commercial pupils. Not all are sufficiently interested in figures to justify the belief that they will succeed as bookkeepers; hence, bookkeeping should not be required of all. Some pupils will be more inter-

ested in selling as an occupation than they will be in any office pursuit. Their commercial course should be shaped accordingly.

By properly differentiating in the third and fourth years of high school, time will be conserved for more English, social studies, and such important general commercial subjects as business organization and management, office practice, office management, commercial law, economics of business, advanced business mathematics, and business finance, subjects required to supply the general business training which was obtained formerly through the employer's personal instruction and the wide range of duties performed. Without it the office employee of today finds much difficulty in getting ahead. His experience finds range only within a single department and too often he has no contacts in the wider field of general business administration.

Educational values of commercial subjects—The commercial subjects as they are taught today are better organized as to content and instruction method than they were a few years ago. Their educational values are becoming recognized. It is no longer true that commercial courses are snap courses. They represent a range of difficulty quite equal to that of older secondary-school subjects. There is that sequence and continuity for which we were once forced into the fields of mathematics or foreign language. Beginning with the new subject called junior business training, one may continue through elementary bookkeeping, advanced bookkeeping, and elementary accounting. This sequence may be followed in college through advanced accounting, auditing, and actuarial science. Other sequences are available to those who do not elect bookkeeping as a major line of vocational preparation.

College entrance credits for commercial subjects—Much concern is felt in many quarters over the unwillingness of colleges to accept graduates of commercial courses. That some colleges already accept such pupils is evidence that there is a growing respect for this type of work. I am convinced, however, that the first duty of the high school, so far as commercial education is concerned, is to meet the needs of the more than ninety per cent who will not go on to college. This does not mean that those who would pursue collegiate study are to be neglected. In almost every city extension business training of collegiate grade is available to those who go to work after finishing their high-school preparation. It is safe to assume that every commercial graduate can find collegiate business courses that are open to him, although he may not be able to enter the particular college of his choice. Our special task is to see that commercial courses are well organized and that the quality of instruction commands the respect of educators. The question of college-entrance credit will then take care of itself. Colleges that have courses for which the modernized high-school business courses are a preparation will open their doors to graduates of such courses.

The administrator's responsibility—I want to point out some of the things which you as State and city superintendents, high-school principals, and administrators of public education can do to hasten the day when com-

mercial education shall square with present-day needs. First, you can demand that State departments of public instruction include in their personnel a director of commercial education whose duty it shall be to make studies, investigations, and reports that will help us realize our ideals in this field of education.

Second, in view of the fact that commercial education is now being offered in the continuation school, the evening school, the junior high school, and the senior high school you can work for the employment of a city director of commercial education whose duty it shall be to so coordinate and articulate the business training offered in all these schools that it shall meet the full requirements of all these different groups of pupils. Figuratively speaking, the boy who is in the junior high school today may bob up in the continuation school tomorrow. The day after he may return to the senior high school only to appear on the evening-school rolls still later. Only by centering responsibility for all business training in one director can unity be secured. Furthermore, in any city where all these types of schools are in operation one man should be free to make the local studies and investigations required as a basis for the development of a proper and adequate commercial education program. About twenty cities already have such directors. Others are seeking suitable candidates to fill such positions.

Third, you can lift your voices in protest against the omission of any adequate commercial teacher-training program in most of the States. Remembering that more than one fourth of all high-school pupils are taught by commercial teachers, you can insist that the quality of instruction received by this part of the high-school group shall be as good as that received by any other part.

Fourth, you can demand that all States make provision for properly certifying commercial teachers. More than thirty States have no such provision. In these States teachers who have never pursued a commercial course of any kind may teach the business subjects.

Fifth, realizing the part which office machines are now playing in business, you can make the same effort to get such equipment for your commercial department as you do to get needed equipment for your industrial department. I recently saw \$40,000 worth of industrial equipment in a single high-school room, while no provision is made in that school for any commercial equipment except that required in the typewriting and book-keeping rooms.

Sixth, it is as much the obligation of the public school to train for office and store work as it is to train for work in the shop, in the home, or on the farm. Federal, State, and city agencies have been established to see that the latter types of training are given in accordance with modern industrial, agricultural, and homemaking requirements. The former type of training is offered without much regard to actual business needs. You can see to it that all commercial courses in your schools are organized and conducted with the actual vocational requirements of pupils in mind. What is more important, you can take steps to acquaint your public with modern business

employments and the essential training required to insure ultimate success in these employments. In other words, you can adopt an aggressive attitude toward commercial education and abandon that attitude of mild interest which has driven thousands out of the high school to get business education without, however, slowing up the gradual but certain drift toward this type of training.

Seventh, the closest possible affiliation between your commercial departments and local business men should be established and maintained. To this end you should advocate that your school board maintain a membership in the name of your commercial department in at least one business men's organization, such as the Chamber of Commerce, or the Ad Men's Club, or the Board of Trade. A membership in a commercial workers' club or association would likewise be productive of a better understanding of the part which commercial education can and should play in preparing people for service in business.

Eighth, you can foster school-guidance activities, including vocational guidance, as will insure a better vocational choice by most of your pupils. While it is probably true that about one fourth of your high-school pupils should pursue commercial courses, it is equally true that many who are now pursuing such courses are ill adapted to this type of training. It is equally true that many who are in other departments should be enrolled in the commercial department. Effective guidance work should reduce such misfits to a minimum. Furthermore, with a differentiated program such as I have suggested, guidance through preliminary tests, study of personal characteristics, home environment, and school records will be required to insure wise elections on the part of those to whom such differentiated curricula are available.

Commercial education has demonstrated its right to a place in your plans for public-school education. Its future development will keep pace with everchanging social and economic conditions. While recognizing the rights of those who seek vocational training commercial educators will not be unmindful of the need for citizenship training. Their curriculums will be as varied as the differing aptitudes, interests, and capabilities of pupils who enroll for business training require. Your interest in all forward movements in education leads us to believe that you will strike hands with those of us who while trying to conserve all that is good in the present content of commercial education are striving to make it more adaptable to modern requirements.

THE OUTLOOK FOR CULTURAL EDUCATION

FRANK AYDELOTTE, PRESIDENT OF SWARTHMORE COLLEGE,
SWARTHMORE, PENNSYLVANIA

We are living in a time of crisis. The world today knows how to make war better than ever before in its history, but it is learning with difficulty the art of living in peace. This is true in industrial relations no less than in the relations between countries. Peace demands coöperation, understanding, and good-will. It is possible only among a people who understand the spiritual satisfactions of life as well as the material. The purpose of liberal education may be defined as teaching men to live happily and peacefully together.

The English democracy feels the educational stress of the times no less than our own, and the recent government reports on the teaching of the classics, modern languages, natural science, English literature, and on adult education are worthy of the study of every American educator.

In these reports there are many complimentary references to the educational system of the United States. Liberal education in this country is far more widespread than in England and our technical education is perhaps more liberalized than that of any other country. It behooves us, however, not to rest on our laurels, but to search anxiously for means of improving our own system.

The line which that improvement should take seems to me clearly indicated in the report on the study of English in England. The point is there made that there has never been in the history of the world a great liberal discipline which was not founded on the study of some great literature, and the point is further made that for English-speaking peoples the natural vehicle for such a plan is English literature.

Perhaps the most hopeful element in the situation in this country is the popularity of the study of English literature. We should, however, interpret that subject more broadly, making it a study of the history of English thought. Other encouraging signs of the times are the widely-felt demand for the teaching of our National ideals and for liberalizing still more our technical training.

Teaching of our high-school students is the most important part of our whole educational system. Upon the point of view of our high-school graduates; upon their ability to deal intelligently with moral and political issues; upon their ability to get pleasure from the finer things in life depends more than upon anything else the success of our democracy.

*TO WHAT EXTENT ARE WE WARRANTED IN PURCHAS-
ING EDUCATION FOR ADULTS FROM FUNDS LEVIED
FOR THE TRAINING OF CHILDREN
OF SCHOOL AGE?*

FRANK P. GRAVES, PRESIDENT OF THE UNIVERSITY OF THE STATE OF NEW YORK AND STATE COMMISSIONER OF EDUCATION, ALBANY, NEW YORK

This subject is not of my own choice; it was assigned me. It is of such a leading nature as to suggest being a variant of the example given in the old textbooks on formal logic, "How long is it since you left off beating your wife?" Why should we imply that the funds necessary for educating adults should be subtracted from those intended for training children? If it is imperative that adults should be educated, why should not the financial support for this be forthcoming, irrespective of what we devote to other good educational purposes? The query also reminds me of the economic adjustment offered the schools by some city boards of estimate and control, or the solution frequently suggested by legislative committees on finance: "Yes, we will let you increase this man's salary or make that necessary extension of your work, if you will agree to cut someone else's salary or give up some other feature you believe to be important." It assumes that nothing worth while can be accomplished in education without sacrificing something else deemed equally important. This is a curious but current conception of compensation.

But against any such assumption I must protest with all the vigor I possess. Such an attitude is utterly un-American; it is entirely out of keeping with the spirit of our educational ideals. In this country we have embarked on a policy that is absolutely unique in the history of civilization, and have determined to give to each and every one all the training of whatever kind he can possibly utilize. We have done this deliberately, despite the gloomy predictions of all other nations, in the firm belief that it will not only produce the most nearly perfect development of the individual, but will best promote the welfare of society by enabling it to secure the benefit of all its human resources. Accordingly, we have come to hold that every one should be offered the training that will best suit his educational needs.

Acting on this principle, we have for some time been providing in our school systems for all varieties of intelligence. Not only have we arranged for all types of defectives, delinquents, and dependents, but are now slowly coming to afford opportunities for gifted and supernormal children, who have hitherto been most sinned against, but are bound to furnish our democracy with its leadership. But there are striking gaps in our American theory when we come to deal with those past the compulsory age, whom, in contrast to the others, as implied in the title of this discussion, we may consider as "adults." There are a large number of young people who leave

school as soon as the law permits, and a tremendous number of older people whom the law seems never to have reached,

Statutes of the various States have, in general, been aiming to bring it to pass that all children shall be required to attend school until they are fourteen years of age and have finished the elementary grades. They have apparently succeeded better with the age limit than with the grade qualification, for, while approximately seventy per cent remain until fourteen, less than forty per cent complete the eight grades. And when the legal barrier is passed, the proportion of those dropping out increases rapidly in both instances, until by the end of the high school there are but eight per cent remaining and about the same per cent of the young people of eighteen are still in school. To put it in a slightly different way, out of twenty-five pupils of school age, only ten complete the eight grades, and but two finish the high school, while less than three quarters of our pupils have the benefit of schooling up to fourteen, and much less than one half of the young people between fourteen and twenty are in schools of any kind.

The proportion of illiterates and of aliens among our adults, as estimated from the statistics taken during the war, is still more disturbing. To judge from the examinations given in our army camps, approximately one quarter of our people are unable to read an English newspaper or write an intelligent letter, and from twelve to fourteen millions, more than one eighth of the population, are foreign-born. And that these two facts are somewhat related no one can for a moment doubt, for while there are many remote and isolated places where our compulsory laws have not reached the native inhabitants, illiteracy in English has received its greatest accumulations through the influx from southern and eastern Europe and from Asia.

Even more serious are the revelations concerning the intelligence of our people. If we can trust the estimates made by Dr. Robert M. Yerkes in the Report of the Psychological Examining Board in the United States Army, almost one half (47.3 per cent) of the white men in the draft, native and foreign-born, proved, through intelligence tests, to be morons—that is, while adults, to have a mental age of seven to twelve years. This is appalling, but we pile Pelion upon Ossa in our problems when we turn to the statistics of foreign-born. Here we find that, while persons of inferior intelligence among the native Americans form twenty-two per cent of the group, there are forty-six per cent of the foreign element as a whole, and sixty, sixty-three, and seventy per cent of those natives of Russia, Italy, and Poland respectively.

Truly, the load that Uncle Sam is carrying in his endeavor to educate all is prodigious! What can we do to assist him and to carry out our American theory of training? Being a plain schoolmaster and not a statesman, I answer unhesitatingly, let us, first of all, stop once and forever the flood of illiteracy and inferior intelligence from Europe and admit only the foreigners who can strengthen our stock and ideals. We shall have difficulties enough in maintaining our standards, with the handicap of our own home-made morons, and the assimilation of the weaker foreigners that we

have already received. Our educational policy requires us to carry our own people, but we need not undertake to shoulder the burdens that have been evaded by Europe and Asia as well.

Now, having decided not to enlist any more recruits in the ranks of illiteracy and mental deficiency than we are obliged to enlist by home conditions, let us see what may be done to improve the educational situation. In the first place, we must find some way to stop these wholesale withdrawals from school. It is intolerable that thirty per cent of our young people should drop out before they are fourteen and sixty per cent before they have completed the eighth grade. Our compulsory attendance laws and the drag-nets necessary to enforce them must be greatly strengthened in most of our States. In my judgment, it would also be well for the school authorities to study the situation through experts and visiting teachers, and see how far the work of the school itself is to blame for the elimination. Many of our young people leave school because of dire poverty at home or the selfishness of parents, but in numerous other instances the failure to go on is due to a want of appeal in the course itself. There is no doubt but that the introduction of the industrial element in the upper grades and the establishment of trade schools and technical high schools have secured greater interest and enabled public education to reach larger numbers, especially those who are stronger in mechanical than in abstract intelligence, or those who feel that they must become self-supporting and responsible citizens as soon as possible. Undoubtedly, we should in the future greatly extend this industrial training and greatly broaden it by correlating with it the work in English, mathematics, science, and history.

But even when we have rendered this industrial work most efficient and most broadening, our statistics indicate that there will still be a large body of young people who do not stay in school because of want of intelligence. And the needs of these sub-normals should be met by some form of continuation or part-time work. With their lack of intelligence, it will be impossible for them to appreciate any schooling that does not touch immediate needs and interests. They need the stimulus of the contact with actual work, to get the feeling of reality, and the schooling that they secure through part-time must apply to concrete situations, if it is to seem of value. And I may say, in passing, that I am heretical enough to believe that they will obtain far more from this type of work than they will by worrying along in the lower grades of the high school, and incidentally diluting the work of secondary education, as is too often done at present.

The requirements of these young people of weaker intelligence is already being met to a considerable extent and will be more adequately provided for in the future, especially if we learn to adapt the continuation work in the public schools more closely to their needs. It should aim to be less a review of the common branches or a study of the academic subjects and more of a training in the vocations—trades, industries, and commercial fields. The work under various religious organizations, such as the Y. M. C. A., the Y. W. C. A., the Catholic and the Hebrew associations, and the various

private and special schools, such as the correspondence schools, the mechanics' institutes, and the schools for apprentices and employees of the large manufacturing and mercantile establishments, have, for this reason, proved in the past more effective in dealing with continuation education than have the public schools.

But much more serious is the situation caused by our failure hitherto to select and properly educate the gifted among our young people who have, because of poverty, want of interest, or other reason, dropped out of school early and gone to work. The selection and training for leadership in a democracy is the most important function to be performed by our public education. Our absurd notion of democracy as implying that all men are born equal in ability has prevented us from fully realizing this. We have assumed that equal educational opportunity means the same education for all, and have not appreciated the absolute necessity of training leaders for a democratic society. We average individuals can for a while conserve the achievements of the past and keep the machinery of every-day life in operation, but we are obliged to look to our intellectual superiors for the new steps in progress that alone can keep the world from stagnating. Unless we select and train our genius, society must slip back into barbarism. The leaders in intelligence have made our inventions and discoveries, have organized our industries, have produced our inspiring literature, and have written our constitutions. And the best that we Americans can hope to do is to select such geniuses from our numbers, see that they are properly educated, and then trust to their leadership. There is no investment made in their education that does not yield large dividends in the way of increased prosperity and happiness for the rest of us.

By means of intelligence tests and vocational guidance, it is now possible to approximate the place in life that should be occupied by each of us and thus greatly increase the welfare of all. And it is known that we cannot hope to predict from what stratum of society our genius will arise. We must, therefore, seek the most efficient means of detecting and training him, wherever he may be found. We have to a certain extent succeeded in providing for him through differentiation of the work in the elementary school and in the variety of elections and options in the high school, and, west of the Alleghenies, he may obtain a higher education in almost any line with little or no financial resources. But, in spite of this provision, there still remains the problem of furnishing a training for those natural leaders, who, through straitened circumstances, want of interest in the ordinary school course, or accident of location, have been prevented from securing the education that would develop them best and enable them to accomplish the most for society. The opportunities furnished for them at present in the evening courses, both in extent and variety, are quite inadequate. Occasionally one of the intellectual leaders has shaken himself loose from his surroundings and after maturity has obtained a higher education, but he has had to achieve this through some private foundation. Even such institutions as the private normal schools—Lebanon, Valparaiso, Ada, Fre-

mont—have in the past, every now and then, helped develop a leader for the world in this way, and in the future the meagerly equipped but enthusiastic trade union college may accomplish much the same purpose for democratic society.

But this service should not be limited to private education, and it never can be satisfactorily performed upon a commercial basis. It should be the effort of all proprietary institutions to render themselves unnecessary. They may perform duties to which the dear public has not yet aroused itself, but if there is any function of education that requires attention, it should be made possible to carry it out under public auspices. The training of leaders who have not had an opportunity in the ordinary public schools, like all other adult instruction, has as yet been little developed, but in the future of our democracy it is destined to become a most important part of educational service. And, as a whole, every sort of adult education must be provided by evening or day classes, by long or short courses, and through training adapted to the abilities, interests, and needs of the persons not now provided for in the public system. And this must be done, not at the expense of the training of children under fourteen, but through a separate and distinct appropriation for the purpose. Neither phase of our public education can be neglected. They are both absolutely essential to the preservation of our democratic ideal and form part of the educational policy to which we have committed ourselves. Every school budget must contain as large an item for adult instruction as is required to provide for the continuation schools that are necessary to train all those beyond school age for a greater personal development or more complete preparation for social service. And this must be quite independent of the various expenditures that are needed to render the education of children under fourteen attractive and efficient.

THE NEED OF A NATIONAL ORGANIZATION FOR EDUCATIONAL SERVICE

ALEXANDER INGLIS, PROFESSOR OF EDUCATION, HARVARD UNIVERSITY,
CAMBRIDGE, MASSACHUSETTS

In the determination of Federal policies for education at the present time are involved two distinct problems of major importance. One of these problems concerns the policies to be followed with respect to Federal subsidies. The other concerns the policies to be followed in the organization of Federal agencies which deal with education. Of the two problems that which concerns policies of Federal subsidies involves questions of such fundamental importance to education and to government that by comparison the problem of the exact form of organization of Federal agencies sinks into insignificance.

The fact cannot be too strongly emphasized that at the present time the problem of the policies to be pursued with respect to Federal subsidies is

by far the most important problem involved in the relations of the Federal Government to education. The whole development of education throughout the country is fundamentally affected by policies of Federal participation in its support and control. For this reason I shall deal first with the problem of Federal subsidies and reserve for the close of my discussion the problem of the organization of Federal agencies for education.

Lest there be any doubt concerning my attitude toward Federal subsidies for public-school education, let me state at the outset that I am totally opposed to any participation by the Federal Government in the support and direction of our public schools, not only because I believe that it involves policies subversive of our entire theory of government, but also because I believe that it involves policies which in the long run are bound to be bad for education itself. I believe that the policy of granting Federal aid in support of public-school education is fundamentally unsound as a policy of government, that it is dangerous for education, that it is bad economic policy, and that it is essentially unfair.

Having thus taken a position which probably appears extreme to the majority of this body, I am in duty bound to give my grounds for assuming that position. But before attempting this it is necessary to clear the ground of the jungle growth of tangled thought which may interfere with the free swing of our axe at the deadly Upas tree of Federal subsidies.

In the first place, let us recognize that in all parts of this country public education is far from being that which we should all like to see it, that in parts of the country it is almost unbelievably bad, that vocational education has scarcely begun to be recognized, that the amount of illiteracy and of near-illiteracy is alarmingly great, that attention to physical education throughout the country is almost negligible, that our large foreign population constitutes a serious problem for education and for society, that most country children do not have anything like a fair opportunity for education, that in many sections of the country short school terms make effective education all but impossible, that a large part of our teachers lack proper education, training, and experience—let us recognize all these and many other defects of education too numerous to catalog. They are conditions which cry aloud for reform in the appealing voices of children deprived of their rights as American citizens. They are undoubted and undoubtable facts which cannot be ignored.

But it is a far cry from recognition of the defects and needs of education to the conclusion that those defects should be or will be remedied and those needs met by some form of Federal subsidies. Such a conclusion has no necessary relation to the single premise of present inefficiency and denial of a policy of Federal subsidies does not for a moment imply any unwillingness or unreadiness to take effective steps for the improvement of existing conditions. It is sheer demagogism to charge those who oppose Federal subsidies with failure to appreciate the needs of education or with unreadiness to improve existing conditions. The problem to be faced is not one which involves the question of recognizing and remedying those conditions:

it is one which involves solely the question of the best methods to be employed. It is not a question of whether we shall try to meet the needs of education. It is a question of whether we shall call upon the Federal Government to participate in the support and control of public education or rely on those means that have in the past been almost wholly responsible for the development of a system of education which, in spite of all its defects and shortcomings, constitutes one of the greatest achievements of the American democracy.

Back of all arguments for Federal subsidies for education lie two premises which are worthy of consideration: (1) that there is great need for improvement; (2) that States and communities have shown themselves unwilling or unable to remedy the grave deficiencies which are readily recognized. The first of these premises is undoubtedly sound and need not be debated. The second premise has by no means been established and deserves far more serious consideration than it has received. It is well worth while to consider briefly both the question of the readiness of States and communities to improve educational conditions and the question of their ability properly to support education.

Are States and communities unwilling or unready to assume and perform their proper responsibilities for public education and to remedy existing defects? There can be no doubt that all States have in some degree been delinquent in provision for important educational needs. There can be no doubt that many States have long permitted intolerable conditions to continue. Fundamentally important educational needs have long been neglected by States and communities. We cannot too strongly condemn such neglect. But the facts of the situation have not always been considered carefully by those who would cut the Gordian knot of education with Federal subsidies and by Federal participation in the support and control of public education. Without diminishing in the least our disapproval of defects in State school administration we should recognize certain facts which in part explain, though they do not excuse, some of the conditions which we so strongly regret.

It is a fact that some of the conditions which we criticize are the direct results of our very attempts to improve education. An example of this is found in the problem of teacher supply, a problem in no small degree created by our attempts to extend facilities for education and to extend the amount of schooling provided. More schools, more children in school, and an extension of provisions for compulsory attendance—these things have created a demand for teachers that could not possibly be met in any brief period and that cannot be met over night by legislative fiat.

A second fact to be kept in mind when we examine the delinquencies of States and communities is that it is but recently that even educators have become conscious of actual conditions. It took a great war and the draft to make us realize the perils of illiteracy, the demand for Americanization, and the need of physical education. It has taken a new science of education and comprehensive surveys to bring existing conditions and needs to the

consciousness even of specialists in education. It is not too much to say that our conceptions of public education have been all but revolutionized within the past two decades, and it is a legitimate question whether we have not attempted to progress too rapidly. Certainly we cannot criticize States and communities for their failure completely to adjust their educational systems to all the multitudinous needs that have been recognized in their fullness and actually created only within a decade or less.

It is true, of course, that many defects of education have long been recognized and are still to be remedied. But it is also true that within recent years authorities in almost every State have been trying hard to remedy those defects and have been gradually succeeding. There are few States which at the present time have not fairly definite plans for the elimination of the short school term, for the removal of illiteracy, for Americanization, for improvement in physical education, for the development of practical and vocational education, for the improvement of the teaching force, and for most of the other improvements which might be considered as likely subjects for Federal subsidies. In all parts of the country the disclosures of the selective draft, extensive surveys, and criticism from within and without have stung the public conscience to the quick, and there is observable an almost feverish endeavor to blot out the delinquencies of the past. Is this to be chilled by the cold blast of Federal subsidies and Federal interference? I for one pray that it may not be.

But it may be said, and it has been said, that some States have not the resources of wealth to permit the proper development and care of education unless they receive assistance from without. This has been stated more frequently than any attempt has been made to establish its truth. At present we have no means of knowing what the available wealth of any State is, and if we had such information we have no way of determining how poor a State must be to require Federal assistance for the maintenance of an effective system of public education. If there are States actually unable to support an efficient system of education the number is certainly small. In the speaker's judgment, not a single State in this country is financially unable to maintain an efficient school system. Those States which cry poverty are usually the very States which least have attempted to provide for anything like an honest system of assessment valuation and which have not yet learned what it means to provide for an efficient system of taxation. It is incumbent on those who argue for Federal relief to prove that States are financially unable to meet the demands for education.

That States vary in resources and in taxable wealth is obvious. What then? Shall we for that reason attempt an equalization of wealth throughout the country for school support? Any such procedure can mean but one thing—the complete nationalization of educational support and control. Until we are ready to do that we must ignore National differences in resources and in taxable wealth. It is clear, of course, that the policies of equalization in support within States is a totally different proposition from any National equalization in school support, since the State is already the

recognized agency of control and administration. Equalization of support is feasible and proper only within the unit of control.

The practice of granting Federal subsidies for education is bad governmental policy. The moment anyone supports such practice he is forced to choose between the two horns of a vicious dilemma: either he must advocate a policy of granting subsidies without provision for their supervision, accounting, and control, or he must advocate a policy of granting subsidies with definite provision for some control over their uses. In the one case he contemplates the expenditure of public funds with little or no assurance that they shall actually be expended so as to accomplish the ends designed; in the other case he contemplates interference in the control of education by those primarily responsible for its administration in the several States—and that at long distance and with respect to special projects. On the one hand he faces the example of the wasteful dissipation of public lands and public money granted to the States throughout the nineteenth century; on the other hand he faces the example of the intolerable interference with educational policies involved in the Smith-Hughes Act.

Nor can it be argued that the Federal Government can safely delegate authority and responsibility for the proper and effective use of Federal subsidies to the State authorities. In all probability State departments of education can be relied upon to see to it that Federal funds are honestly expended for the purpose for which they were granted, at least within the letter of the law. But the appropriation of funds is determined primarily by State legislatures and by their juggling of budget items and the assignment of budgetary appropriations it is perfectly possible to defeat the whole intent of Federal subsidies. This the Federal Government is powerless to prevent, unless possibly by an intolerable and unheard-of form of Federal control. Even the famous "fifty-fifty" policy of Federal subsidies can guarantee only that at a given time additional State funds shall be expended and additional attention paid to the special object of the subsidies—always with the possibility that by the manipulation of State funds, of the State budget, and of appropriations the State may rob Peter to pay Paul and the general development of education be advanced not a bit.

Within the brief space of seven years, beginning with provisions for the Smith-Lever Act of 1914, there has developed rapidly a tendency for the Federal Government through subsidies to the several States to do by indirect means what it has not the power to do directly. Within that short period have come the Smith-Lever Act for extension work, the Smith-Hughes Act for vocational education, the good-roads acts, the Act for Industrial Rehabilitation, the Maternity Act, and the extensive proposals of the Towner-Sterling Bill. Whatever be the protestations of those responsible for these measures and whatever be their declarations of intent, it is clear that we have been developing rapidly a degree of Federal participation in the support and control of activities over which previously the State has been supreme. Let us not be deceived. All acts providing for Federal subsidies in aid of education carry with them the dynamite of Federal partici-

pation in the control of education and the determination of educational policies. When that bomb explodes it will be of little service to have their advocates protest that they did not know their guns were loaded. The "fifty-fifty" policy is one of the most subtly dangerous inventions of modern Federal politics, at least as far as education is concerned.

If the policy of Federal subsidies were one which involved bad governmental practice, but could be shown to be favorable to educational development, one might be inclined to submit to governmental defects for the sake of educational gains. However, in the judgment of the speaker, the practice of granting Federal subsidies to the several States in supposed aid of education is not only bad governmental policy, but a policy which in the long run interferes with the proper development of education itself.

It is always possible to give a temporary stimulus to any enterprise by means of a special subsidy, and education in any locality can always be raised temporarily to a higher level by means of aid from without—at least as far as the special object of the subsidy is concerned. Such a practice, however, appears to have an inevitable tendency to result ultimately in a lowering of the educational morale of the local public through the lessening of local initiative, interest, and responsibility. The inherent defect of outside aid is that it operates to sap the vigor of local responsibility. Paternalism in any form inevitably generates a sense and practice of dependence. Once begun, dependence on outside support or control demands constantly increasing operation of the outside agency, and the ultimate result can only be reliance on that outside agency. Some of us believe that within the State such a result is inevitable and, all things considered, eminently desirable. Are we ready yet to go further and look toward the complete nationalization of educational support and control? Such is the legitimate expectation if we continue on the road which we have entered within the past decade. We should call a halt. Certainly we should understand clearly the policies on which we have embarked. Again, let us not be deceived by the disclaimers of any intent to develop any Federal centralization of education. We must judge from the character of their acts and of their recommendations rather than from their statements of intent.

Whenever Federal subsidies are granted in aid of special phases of education or to meet special needs of education a serious difficulty arises in educational administration. The general policies of school administration must be determined by State and local authorities. Upon them, with their knowledge of local conditions, of local needs, and of local sentiment, must rest the responsibility in general for the determination of educational policies, for the balancing of various forms of educational development, for the distribution of available funds according to a well-defined program of educational development. Now steps in the Federal Government and says: "Unless you are willing to waive your rights to participate in public funds which in part have been derived from the wealth available in your State and which otherwise might have been open to taxation for your educational needs, you must give particular attention to these special projects which the

Federal Government is fostering. If you wish to take advantage of the Federal subsidies you must allot so much additional State money to these projects. You must change your plans for the development of education in your State and you must let us determine in part the educational policies to be followed." Theoretically, it is possible for the State to waive its right to Federal funds; practically and politically, however, the infamous "fifty-fifty" policy forces the State to accept the Federal subsidies and to modify its educational policies to meet the demands of the Federal Government. Such long-distance interference to school administration may be desirable. In the judgment of the speaker, it is vicious.

The practice of granting Federal subsidies for education is not only bad governmental policy and bad educational policy, but it is also bad economic policy. It would seem to be a principle of practical finance that wastefulness in the expenditure of public funds is in direct proportion to the remoteness of the appropriating agency from the source of supply. On the whole, communities are less wasteful than counties, counties less wasteful than States, and States far less wasteful than the Federal Government. People can see the uses to which is put money taken from them for expenditure within the community; they keep some track of county expenditures; they are not without thought for State funds; but they lose all sense of responsibility and sometimes all conscience when it comes to the matter of Federal funds. The wastefulness of the Federal Government, even in matters with which it is primarily concerned and in which it acts directly, has become proverbial. When it reaches out into fields with which Congress is but little acquainted and with which it can deal but indirectly, the Federal Government appears to proceed almost without chart or compass. In education Congress can but reach out into the dark, since it can deal but indirectly with educational administration.

When the States provide for the collection and distribution of funds for education they can do so on the basis of a reasonably definite knowledge of the needs and resources of the schools within the area over which they have control. Special aid may be granted where special need can be shown. Special projects can be subsidized on the basis of known facts, and it is within the power of the State authorities to supervise the uses to which the State money is put. This is not so with the Federal Government. It must appropriate Federal funds more or less blindly and without any real knowledge of the amounts needed. It must yield to political exigencies and apportion its subsidies in such a way that all States, or a majority of them, receive equivalent benefits, regardless of their merits and needs. No way has yet been devised to place the granting of Federal subsidies on anything like a sound economic basis, and it is doubtful that the apportionment of Federal subsidies on any sound economic basis would ever receive the necessary support of Congress.

Finally, it may be stated that most Federal subsidies for education are essentially unfair—unfair not because they operate to equalize the burdens of educational support, but because they fail utterly to accomplish that end or even to attempt it. In the past Federal subsidies have had no relation

to ascertained needs of the several States nor to the extent to which States have exerted themselves to provide for educational development. They have been granted to States indiscriminately on the basis of such and such elements of population or the census distribution of educational conditions. States which have extended themselves for the development of vocational education are placed in the same category as those which have never lifted a hand to assist in its development, and funds are distributed not with reference to demonstrated needs and efforts, but solely on the basis of population distribution. This is fundamentally unsound and unfair, but it is doubtful that Federal subsidies for education could be secured if Congress were asked to distribute funds on any other basis than one involving an indiscriminate apportionment.

All persons who are familiar with the educational activities of the Federal Government and who are interested in the development of education in the United States must realize that many things are radically wrong with the organization of Federal agencies for education. They must realize that too many departments, divisions, boards, and bureaus have a hand in the determination and administration of educational activities to permit the intelligent coordination of educational endeavor. They must realize that widely different policies are followed in the various agencies participating in educational work. They must recognize that the Federal Bureau of Education has occupied a very insignificant position and that it has been starved financially from the beginning. Something must be done to bring education to its proper place in the Federal Government.

How should the Federal agencies for education be organized? The answer to this question must be found in the character of the functions which should be performed by the Federal agency or agencies of education. It is all but universally agreed that with respect to education the functions of the Federal Government should be advisory and stimulative rather than executive, directive, and administrative. In the judgment of the speaker, we should go farther and say that the Federal Government should not attempt directly or indirectly to control educational policies in the several States. The proper function of the Federal Government in education is that of guidance and stimulation through investigation, through the scientific study of educational practice and of educational conditions on a nationwide and comprehensive scale, through the collection and dissemination of information, and otherwise, when called upon by States and communities for expert service. Here is a field in which no other agency, certainly no State agency of education, can function as effectively as the Federal Government. It is a field peculiarly suited to Federal agencies of education, a field of service the importance of which can scarcely be overestimated.

If this be the proper function and if this be the proper field of Federal activity in education, there can be but one answer to the question of the organization of Federal agencies of education, or rather of the Federal agency of education. It must be an organization suited to the purposes for which it should exist—that is, it should be an organization designed to pro-

mote the technical, scientific, and expert study of educational practices, of educational problems, and of educational conditions, with the end in view that States and communities may be benefited by the stimulating guidance of such technical, professional, and expert investigation. This it cannot be unless in purpose and in fact, in administration and in personnel, the dominating elements are professional rather than political.

Whether this organization be provided through the creation of an independent department of education, by an independent commission of experts, or be provided through a division or bureau of some other department—in the judgment of the speaker, that is not a problem of primary importance. What is of supreme importance is that the organization be such as to ensure the dominance of professional, scientific, technical, and expert functions, with the greatest possible freedom from the virus of political control or influence.

THE NEED OF A NATIONAL ORGANIZATION FOR EDUCATIONAL SERVICE

GEORGE D. STRAYER, PROFESSOR OF EDUCATIONAL ADMINISTRATION,
TEACHERS COLLEGE, COLUMBIA UNIVERSITY, NEW YORK, N. Y.,
AND CHAIRMAN OF THE LEGISLATIVE COMMISSION OF
THE NATIONAL EDUCATION ASSOCIATION

Religion, morality, and knowledge being necessary to good government and the happiness of mankind, schools and the means of education shall be forever encouraged. This preamble to the Ordinance of 1787 expressed an ideal and a relationship which have been consistently maintained by our National Government from its earliest history until the present day. By the setting aside of lands, by the distribution of surplus revenue, and by appropriations for specific purposes the National Government has sought to provide for the common good by the encouragement of education in the several States. During the last fiscal year the National Government appropriated for education the sum of \$149,800,000. These funds were administered by bureaus distributed through seven of the ten departments of government and by three independent establishments, the Federal Board for Vocational Education, the Veterans' Bureau, and the Commissioners of the District of Columbia.

In the year 1866 the National Association of School Superintendents of the National Teachers' Association at a meeting held in Washington took action in favor of the creation of a Department of Education and presented a memorial to Congress. A Department of Education was created in 1867. The National Teachers' Association expressed its appreciation of the work of the new department and evidently took it for granted that it would be developed and extended as had been the Department of Agriculture established five years earlier. There were those, however, who sought to destroy the Department before it could demonstrate its usefulness, and before

it was two years old a bill was slipped through Congress abolishing the Department of Education and transferring its functions to an office in the Department of the Interior. That those who sought to reduce in importance the office of the Commissioner of Education by the abolishment of the Department were successful is evidenced by the fact that for the last fiscal year of the \$149,800,000 expended by the National Government for education the U. S. Bureau of Education, exclusive of the money spent for the education of natives in Alaska, was allowed the sum of \$162,000.

Good administration demands that the National Government's participation in education be organized under a single head. There is at present no coördination of the many agencies responsible for the educational activities encouraged, or carried on, by the Federal Government. The duplication, overlapping, and working at cross purposes, which is characteristic of the present situation, can be remedied only by means of the establishment of a single governmental agency dealing with education. In order to accomplish this end three alternatives have been proposed.

First, the organization of the National Government's educational activities under the present Bureau of Education; second, the establishment of a Federal Board or Commission of Education; and third, the creation of a Department of Education with a secretary in the President's Cabinet.

There are few who would argue in favor of delegating to the Bureau of Education all the duties and responsibilities with respect to education now divided among the various bureaus, divisions, departments, and administrations of government which deal with education. There is not even a remote possibility of such an organization being brought about. The assembling of these various administrative agencies under one head would require that this officer hold a position superior to that of a bureau chief.

There are those who have argued in favor of the second alternative, a National Board or Commission for Education that should choose a National Commissioner of Education. It has been suggested that this Federal Board of Education might be directly responsible to the President but without the status of an executive department, and thus free from political influence. The analogy of the State and city board of education has been invoked. But the relationship of the National Government to education is not the same as that of the State and local governments. State and city boards of education are responsible for the certification of teachers, for the adoption of textbooks, for the development of courses of study, for the levying of taxes; in general, for the control, administration, and supervision of the schools. The National Board of Education could do none of these things. The National Government cannot and should not control or administer the schools within the several States. The functions of a National department of education are to promote and to encourage education, and to conduct such inquiries or investigations as will lead to the development of a more efficient system of schools to represent this most important function of democracy in the councils of the Nation, to provide through reports, and by means of conferences competent leadership. Those who base their argu-

ment for a National Board of Education upon the analogy with States and local boards have, it seems to me, failed to keep clearly in mind the distinction in function existing between them.

It has been argued that a Federal Board of Education, charged with the responsibility of choosing a commissioner or director, would remove the office from politics and make possible the continuance in service of any incumbent of the office who proved efficient. Presumably the members of the Federal Board of Education would be appointed by the President and confirmed by the Senate. Have we any reason to believe that this Board would be any less likely to act without relation to political considerations than would the President of the choice of the members of his Cabinet? Membership upon the Board itself would be just as likely to be determined by political considerations as would the appointment of a Secretary of Education. A Board made up in this manner could no more be expected to appoint a commissioner or director without political considerations than could the President be expected to choose his secretary upon the same high plane. It may be noted in passing that we have had in our National Government in the Department of Agriculture a man continued in office through the administration of presidents of the opposing political parties because of his acknowledged fitness for the place which he held.

If the Federal Board of Education were made up of men of National reputation, it would be extremely difficult to secure their attendance upon board meetings held in Washington. If the Board were made up *ex officio*, it would suffer from all the weaknesses of all boards so constituted in that none of its members would consider the work of the Board of Education as of primary importance. The Director or Commissioner of Education, under the Federal Board scheme, could not under the constitution be an officer of the National Government, but merely an employee of the Board of Education. If it be argued that the President appoint the executive officer of the Board, the supposed advantage in removing the Director or Commissioner from the realm of politics entirely disappears.

Our National Government is organized on a departmental basis. The number of these departments has been increased as the functions of the National Government have been differentiated or the responsibility of the Nation for the welfare of all of the people recognized. We have in the National Government today seven departments—state, treasury, war, navy, justice, post-office, and interior—which are organized for the administration of certain functions over which the general Government has sovereign power. On the other hand, we have three departments—agriculture, commerce, and labor—which are commonly known as welfare departments. These agencies of our National Government are organized to promote the general welfare. It is significant, however, that the Secretary of Agriculture, the Secretary of Commerce, and the Secretary of Labor have seats in the Cabinet and sit at the table around which are discussed all of these questions of policy with which the executive branch of our Government is concerned.

There is today no more serious problem before the Nation than that which centers in the education of all of our people. With more than half of the teachers in our public schools with inadequate education and professional training; with approximately one fourth of the adult male population, as revealed by the army tests, unable to read the English language; with millions of foreign-born who have little appreciation of American ideals or American institutions; with an alarmingly large per cent of the adult population physically handicapped because of neglect during childhood and youth; with the gross inequalities that exist throughout the Nation in the opportunity provided for education, there can be no problem more important for consideration at the counsel table of the Nation than is education.

If the public-school service is to be adequately represented at Washington, there must be a Secretary in the President's Cabinet. If the Nation is to continue its support of those educational activities and agencies already receiving Federal aid, it will be because a member of the Cabinet makes known the needs of this service in the preparation of the National budget. If the scientific investigation which should be carried on by the National Government is to be undertaken and carried forward on a truly National basis, the director of this enterprise should surely take rank with the Secretary of Commerce, the Secretary of Labor, or the Secretary of Agriculture. If education is to have the status, the dignity, and the influence in our Federal Government necessary for the establishment of National leadership, we must have a Secretary of Education.

It is significant that the National Education Association and this Department of Superintendence have again and again during the past fifty years, and more especially during the past three years, recorded themselves in favor of the establishment of such a Department. It is even more significant that at this time millions of men and women outside of the profession, through organizations national in their scope, are working shoulder to shoulder with us for the realization of our purpose. One of these organizations has appropriated \$125,000 to carry forward our program as expressed in the Towner-Sterling Education Bill. Shall we keep faith with them, or shall we confess that our repeated endorsement of this measure, the history of fifty years of consistent advocacy for a Department of Education, is to be abandoned because it is not expedient for us to stand fast? Shall we admit that we cannot carry on because we find opposition to our program? Shall we notify Congress that we repudiate our former action? I believe that the answer will come from this body in no uncertain terms. We will stand because our cause is just, because our program is conceived in the interest of the public welfare. Good administration, the structure of our National Government, the practical importance of education in our National life—all call for the recognition of education in our Federal Government through the establishment of a National Department of Education with a Secretary in the President's Cabinet. We will not give up the fight until our program has become the law of the Nation.

THE NEED OF A NATIONAL ORGANIZATION FOR EDUCATIONAL SERVICE

A. E. WINSHIP, EDITOR OF THE JOURNAL OF EDUCATION, BOSTON,
MASSACHUSETTS

An organization is the creation of live organs. It is the product of live activities. Its creation is as indispensable to social and civic, industrial, and commercial life as the organization of the human body is to human life. Snakes and birds have the same organization. They started on their career with the same organs. One stayed on and in the earth and squirms and hisses; the other took to the heavens and soars and sings. Every organization has within it both tendencies. It will ultimately become one or the other.

There has never been an organization created by so many organs working at the same time as in the National Education Association under its present plan. It is useless to prophesy what its future is to be. It can never be what the medical organization is. A medical association and others of that kind are protective in their very nature. Nothing of this kind is possible in anything created by kindergartners and university presidents, high-school and rural-school teachers, by fifty-seven varieties of interests.

It would seem as though the salary issue would unify all, but one can but smile when he realizes that four years ago the official leaders in the National Education Association denounced those women teachers who were so mercenary as to think of joining an organization from so low a motive as to increase their salaries, and now these same men are pleading with the women teachers to join the National Education Association because of its effect upon their salaries. That simply means that anything is right if you do it in our way, and nothing is right that is not done in our way. That is impossible in an organization of all teachers. That is snaky.

The Yeoman Association has 6000 leagues in the United States, with 300,000 members, and they are to build a ten-million-dollar educational home for the orphans or half orphans of their members. The Loyal Order of Moose has an even larger membership. They are both soaring and singing.

The National Education Association must be so organized that every one of the 600,000 teachers will want to be in it without any suggestion that it will pay them to be in it.

The Grange had a vast membership on the ground that it would pay to belong. Then it slumped almost out of sight. Now it is coming back as an organization for service.

The only organization of teachers that can abide will be an organization for better service for children. Selfishness will always produce squirming and hissing. Service is always soaring and singing.

THE NEED OF A NATIONAL ORGANIZATION FOR EDUCATIONAL SERVICE

S. P. CAPEN, DIRECTOR OF THE AMERICAN COUNCIL ON EDUCATION,
WASHINGTON, D. C.

The remarks I am about to make will not be popular with this audience. Nevertheless, I hope that you will give them thoughtful consideration, and if I seem dogmatic, remember that the time limit imposed does not permit of extended argument.

This Association stands committed to a program for the National organization and support of education that is in part fallacious. The program appears to be based on the uncritical acceptance of financial and administrative devices that have had a recent temporary popularity. It appears to ignore the results of the Federal Government's long experience in dealing with education, with labor, with agriculture, and with science. Hence the program has met with opposition in the house of its friends. By no means all educators agree to it. Many of the leading economists and students of government oppose it. The program has also encountered political obstructions that were probably not foreseen. It has not made the progress which its promoters have expected. These are doubtless the reasons why the question of a National organization for educational service comes before you again.

I should like to approach the question from a point of view which, I think, has not been prominent in your discussions hitherto. Let me start with an axiom. The kind of National organization that is established should be determined by the kind of service to be rendered. What service do we want from the Government? Nobody wants the Government to manage and support the schools of the Nation as it manages and supports the post-office. There is practically unanimous agreement that the Government should perform only those services for education which cannot be performed by the States and smaller political units.

What, then, are the educational services which the States cannot perform? Three are very conspicuous.

First, States cannot insure the consideration of education in the formulation of National policies. And education is not only one of the largest concerns of the United States; it is likewise the most potent force both for moulding National attitudes and for fostering material well-being.

Second, States cannot gather information on a National scale, or make those comprehensive studies of the National educational enterprise that are required to promote efficiency and guide the development of educational practice.

Third, States cannot focus on National problems the best thought of the country and so furnish leadership in the determination of National educational policies.

Put, positively, we need from the Federal Government—to an extent to

which they are not now supplied—recognition of education in public policy, information and scientific investigation, leadership that will coördinate and inspire educational undertakings throughout the country. On these points practically all persons are agreed. Obviously, the National organization that is set up should be amply equipped to perform these functions.

There is much disagreement as to whether the National Government can profitably render other services. The gist of the disagreement is Federal aid. Many persons believe that States cannot support their own systems of public education, particularly that they cannot maintain the various new types of training made necessary by modern social conditions, and that consequently the Government should render financial help. This proposition, however, is not generally accepted. And the dissenters are of the opinion that large financial participation by the Federal Government in the conduct of education carries with it dangers that should be avoided as long as possible.

But let us be honest. The truth is that nobody knows whether the States can continue to maintain and develop their school systems under present conditions of Federal and local taxation. If they cannot, nobody knows how much and what kinds of Federal aid may be necessary. That is a matter that could only be determined by a searching and costly investigation such as has never yet been made. Much light may be shed on the question by the Educational Finance Inquiry now being carried on by the American Council on Education under the direction of Dr. Strayer. But until the results of that inquiry are available all comprehensive propositions for Federal aid are sheer guess work.

Meantime, however, one thing is sure. The type of financial assistance proposed in the Federal measure endorsed by this Association is disastrous. The policy of "50-50" coöperative appropriations has already undermined the autonomy of the States. Such appropriations have been attended everywhere by difficulties and dissensions that have nullified many of the benefits that they were designed to secure. The policy is beginning to fall under suspicion even among legislators. I venture to prophesy that it will soon be entirely discredited.

Now my plea to the Association is this: do not regard this matter as closed. Take it once more under advisement. The present political situation, if nothing else, justifies such a procedure. Instruct your legislative commission to bring in a new proposal, in the light of the discussions of the last three years, guided especially by a careful study of the Federal Government's past experiments in the promotion of education and of related National interests. Request it to provide for the creation of a Federal agency to perform those functions and only those functions which the Federal Government has proved that it can perform well. Bid it follow the facts, even if they indicate a wholly different kind of organization than any you have yet considered. There could be no more fruitful expenditure of the Association's funds.

This question is above personalities and above parties. It is more impor-

tant than the commitments of associations. It concerns the welfare of the children of the United States. It involves as well fundamental principles of government. Nothing of more solemn and far-reaching import has ever come before this body. For what is eventually enacted will fix the trend of American education for generations to come.

THE NEED OF A NATIONAL ORGANIZATION FOR EDUCATIONAL SERVICE

E. C. BROOME, SUPERINTENDENT OF SCHOOLS, PHILADELPHIA,
PENNSYLVANIA

Do we need a National organization for educational service in the United States? Education, as a National enterprise, was not provided for in the Constitution. It was an implied responsibility among the several undesignated powers and duties delegated to the several States. All of the States, although tardily and weakly in several instances, have undertaken to establish a system of free public education for their children.

The administration and support of public education, however, has very generally been entrusted to local communities, controlled by local ideas, and limited by local funds. In this way we have struggled for over a century to develop a universal system of free public education. As a people we are committed to the principle of equal opportunity for all. Every boy and girl, regardless of the accident of birth and residence, should have an equal opportunity of obtaining an education sufficient for intelligent and responsible citizenship. We know, however, that, notwithstanding the large aggregate expenditure for public education, we are still far from realizing this object. We know that, after a century of public schools, a boy in the mountains of North Carolina or Kentucky has by no means an equal chance with the boy of Springfield, Massachusetts, or of Berkeley, California. We know that, according to recent reports, over a million children in this country are being taught by teachers of no education beyond the common school. All of this after a century of free public education under local control and support.

What the people of this country need, not the people of Springfield, Berkeley, or Cleveland, but the people as a Nation, is a unanimous conviction of the importance of universal education as an indispensable measure of National security. If another international struggle comes among civilized nations, the nation which will prevail will not be the one with the most powerful armies or the greatest physical and financial resources. It will be the nation which has educated its children most thoroughly and generally.

The first and most necessary step in this important undertaking is to increase public respect for education. We must make education, as a National concern, appeal strongly to the imagination of all people. We must

give education a definite and tangible place, inferior to none, among our National enterprises—in the same degree as we have dignified agriculture and commerce and labor.

It is not necessary to expend a hundred million dollars annually in order to attain this end. The American people are naturally proud. They are individualists. They like to pay their own way. They don't care to be subsidized. Any suggestion that they need financial aid to do their duty is offensive to most Americans. When the American people, all the people, are convinced of the vital importance of a National system of free public schools, so administered that no community may fail to maintain adequate standards, they will cheerfully pay the bill. There is sufficient wealth in every State to maintain, without Federal aid, an efficient system of public schools.

The problem, therefore, it would seem, is not to subsidize, but to dignify education. This is the main reason, it seems to me, why education should be given an official position of first rank among the Federal departments, a position which will assure for education the dignity and public respect to which education is entitled as the most important public enterprise. A Department of Education, with a Secretary in the Cabinet, would not only command for education the public esteem which it merits and needs, but would also stimulate throughout the country an interest in education, at present wanting in many sections.

For over a quarter of a century the idea of a Federal Department of Education has been advocated. For nearly four years a bill, known as the Smith-Towner, or Towner-Sterling bill, has been before Congress. I hold no brief for that particular bill, although it has been several times endorsed by this Association. This bill is faulty in several particulars. For some reason it fails to include several educational bureaus which now exist. The provision for an annual appropriation of \$100,000,000 is a questionable item. Moreover, the apportionment of this appropriation for the several activities is not based upon experience or an actual survey of needs, but upon a more or less arbitrary estimate.

Aside from the merits or defects of the Towner-Sterling bill, there seem to be no valid arguments against making education an enterprise of equal importance to agriculture, commerce, or labor. Our present Bureau of Education is an agency whose chief business is to collect and distribute information. The successive commissioners have been educators of ability and distinction; but the subordinate position which they have held has carried no authority and has gained little recognition from the non-professional public or the other Federal departments.

Besides commanding respect for public education, a Department of Education would be in a position to accomplish certain other necessary objects in education. It would: (1) unite all Federal agencies of public education; (2) conduct investigations, surveys, and would establish National standards; (3) state, clarify, and define educational objectives; (4) give

publicity to conditions that need to be understood; (5) deal with problems National in scope, which the several States cannot adequately handle; and (6) promote educational relations with other governments.

What we need most in this country, and first, is not an immense Federal appropriation to subsidize slothful communities, but an educational awakening that will arouse local pride, stimulate local competition, and increase the respect of the American people for public education. A Federal Department of Education will do more than anything else to accomplish this result. It would neither control nor interfere with local enterprise. Years of experience with the Department of Agriculture have shown us that that important branch of the Federal Government has stimulated and encouraged local effort. There is no reason to believe that a Federal Department of Education would not do the same.

A Federal Department of Education under a Cabinet officer would not materially increase National expenditure. At present there are about forty agencies in Washington that are in some way directing or aiding educational endeavor throughout the country and spending public funds for the purpose. The consolidation of these numerous and overlapping activities into one department would certainly result in greater efficiency, if not in greater economy. I hope we have reached the limit in the establishment of State and Federal bureaus, commissions, and other agencies to do this, that, or the other thing which somebody of influence wants done. The time for consolidation and elimination is at hand. The opportunity is before us to do this in the field of National education, as well as to give education the rank in public esteem which it deserves.

The main difficulty with education today is that many small, and even large, communities are satisfied with low standards, small appropriations, and a provincial conception of education. The great projects of National highways, of reclamation, and of conservation of National resources would never have been achieved by local initiative. Education is a project of greater concern than any of these, and the time has come when we must, through properly constituted National leadership and by the influence of National inspiration, broaden the horizon of our provincial vision until as a people we shall acquire a better sense of relative values, shall comprehend the fact that education is the most important enterprise of the Nation, the only guarantee of future prosperity and security.

THE NEED OF NATIONAL ORGANIZATION FOR EDUCATIONAL SERVICE

OLIVE M. JONES, PRINCIPAL OF SCHOOL 120, NEW YORK CITY

I may be one of those who rush in where angels fear to tread, but nevertheless I am impelled to speak in a very homely, everyday, practical sort of way about some of the arguments which seldom find open expression on

the platform in a discussion of National organization for education but which influence men's thoughts (and votes) more powerfully than the logical plans which are generally presented. There are several such objections and arguments operating against the proposition of National organization for the equalizing of educational opportunity. *Every objection, when analyzed, can be classified under fear.*

One is the fear of the Foundations. I frankly confess I share it. But it is because I share in it that I believe in National organization for education. I fear the domination of any privately financed and carefully organized combination of individuals, by whatever title it calls itself. And because I fear it, I believe there should be in the National Government a department which will protect public education from any such domination—protect it because its officials are appointed by persons directly responsible to popular vote. Because I fear it, I believe that education should be organized nationally, so that there may obtain equality of educational opportunity, apparently threatened in times past by political or commercial or industrial or religious combinations, and so that the investigations and researches necessary to educational advance may be supported and financed as the work of public, not private, educational authorities.

A second fear is the fear of supervision. In the first place, does not such a fear carry with it a confession of desire to escape meeting requirements conceded to be justly expected? Why fear supervision unless one has something to hide or means to evade doing right? Why should the State, an impersonal body, fear supervision? In the second place, the fear of supervision in connection with National organization for educational service is an absurd bugaboo, a goblin created by enemies of *public* education to frighten off its friends, for supervision has no place in National organization for educational service as I see it, and I would fight its inclusion as vigorously as I now believe in National aid to impoverished States. A section of the proposed bill is explicit in this regard.

The third fear is that someone is going to get a job as a result of National organization. But since expression of this fear would be interpreted as the jealousy and envy which do really prompt it, a camouflage of high-sounding phrases and speciously idealistic reasoning is established. People have lost patience with this camouflage and are antagonized by the insincerity which it conceals. Naturally, National organization of education means someone to carry out the purposes of organization. When the Department of Labor was established, it meant a man to direct the work of the department. So now there must necessarily be someone to administer the affairs and duties for which the creation of a National organization is desired. Is the jealous fear of who may possibly be selected a good reason for depriving the Nation of an educational procedure on which its own existence may depend?

A fourth fear is that social justice will suffer. I challenge the sincerity of this fear. I think we should be grateful to Felix Adler for showing us the danger we are in through our illusion as to what social justice consists in, and for showing us that behind that term there shelters a dangerously

exaggerated individualism which is destructive of a National ideal, which would tear down the unity of the American people, so difficult of attainment by a Nation composed of groups originally widely separated by varying ideas and ideals. This fear expresses itself in an outcry against the danger of uniformity. I come from a city which is a perpetual refutation of any such danger. And no one there really fears uniformity, for we all know it can't be done. With a single course of study, a single set of regulations and by-laws and one individual superintendent of schools, dearly loved and deeply trusted by all, our 700 or more schools are as individual in their characteristics as the contour of the faces of their principals.

Sometimes this exaggerated individualism, the selfish individualism which leads to chaos, calls organization Prussianism. A recent newspaper letter said that Prussianism is a greater evil than illiteracy, and cites Germany as proof of his argument. But German education was not *public* education nor was it *equal* opportunity for all the people, and it is in the land of unequal opportunity that Prussianism has its chance to grow. And evil though it was and great as was its harm to civilization, the Prussianism of the Kaiser is no more an enemy of democracy than the Prussianism of a political boss, who has his chance to flourish because of the ignorance of the people he manipulates.

The real enemy of democracy is not in National organization for public education but in mob power, the power of mobs of illiterate voters swayed and misguided by conscienceless leaders. And as Prussianism, so called, is the enemy of the opportunity of the individual, so is this greater evil of illiteracy which leads to the autocracy of the mob and the boss.

A fifth fear is the fear of politics. I recently attended a meeting in New York called for the purposes of considering ways and means of taking the schools out of politics. As I listened to the two chief speakers declaim against political influence in the schools, and each describe his patent remedy, my conclusion was that each really meant: "Take the schools out of *your* politics and put them into *mine*." This fear, too, is a hobgoblin raised against every National public improvement ever contemplated. Which is more to be feared: the politics of today, which is blind to the needs of children in its budget appropriations, or the politics, which may or may not happen, but which is so controlled by law that appropriations must be made to aid each State to give the same minimum educational opportunities to every child?

The real political issue here is one of votes. The children of the Nation will benefit by National organization for equal opportunity in education, and the *children* have no votes. Not that I'm arguing that they should have. I'm merely stating the fact that local politicians ignore children's needs through fear of adult votes. The woman voter, whose suffrage privilege is still new, has not yet awakened to this political issue. I urge every teacher to join every civic organization in which he or she can obtain membership in order to arouse women to the needs of the children and

make the politician fear the vote of the children's defenders more than that of the taxpayers.

There is still a sixth fear—the fear of interference with the rights of parents. Recently I read the astonishing statement that the general Government has no more right to dictate to the father how much he must educate his child than to prescribe his food or the shape of his clothes, and again that the Government in assuming to direct the minimum requirements for an intelligent citizenship is usurping the place of the father and depriving him of his most sacred privilege, that of directing the training of his offspring. Did one ever hear such fallacy? In the first place, there is no “sacred privilege” about it. The training of his offspring is no “privilege” but a solemn obligation, a bounden duty, which the Government has as much right to enforce upon parents as to enforce laws for the observance of any other duty. The Government owes it to the child who is to be its future citizen to compel the parent and the community to give that child at least a minimum of education.

Again a fear—this time of increased taxes, possibly well-founded.

My brother has seven children. The State where those children were born has little wealth and its educational opportunities are few. His ranch gave a good living but little cash, and it takes big sums to send seven children away to school. So he gave up his ranch and took a salaried position in a city in order to send his children to public school. Is that industrial efficiency? And that State is not to blame. It simply hasn't the money to do better, and it never can have.

Conditions in such States can never be better unless aid is given by wealthier States. That aid should not be given as a charity to be doled out in unequal amounts or withheld as the giver may choose. I was shocked at a recent convention to hear the refusal expressed by the representative of a wealthy city to listen to the needs of the rural sections of that State where bogs and forests make population sparse and money scarce even while essential industries are carried on there.

New York State has compelled New York City to meet the needs of the rural communities. The Government must similarly meet the needs of the poorer States. State aid to education and minimum requirements of education are familiar to us in New York. We have recently fought hard to secure the reenactment of every clause which provides such State aid. Federal aid extends to each State as a whole that which New York State now gives each community which meets the conditions for that aid.

A recent newspaper article states that it is bribery to make a gift of money by the Government to a State that meets its conditions. Since it is acknowledged that the richer States are already in advance of the minimum requirements, and since it is conceded that the wealthier States should be made to help the less fortunate communities, where does the bribery come in? I believe it is merely an attempt to create another fear and accomplish an evil purpose by indirection. It is easy to defeat good by appeal to fear, and so our enemies are busy manufacturing fears for the unthinking.

Aware of probable comparison with preceding instances of Government aid or Government direction, the same newspaper article states that these other agencies "operate, under absolutely defined constitutional power." Clever, that. First, an appeal to our fears that there will be an infringement of the Constitution. Second, an argument against an assumption so cleverly made that the average reader is blinded to the falsity of the assumption, for no proponent of Government aid by National organization for education has ever dreamed of anything except operation under absolutely defined constitutional powers.

Another instance of the same form of argument is an assault upon the provision for a requirement of minimum qualifications as a prerequisite to Government aid by a long harangue on what are to be the standards in history. The average listener is carried away by the argument, and forgets that no proponent of minimum standards ever proposed anything in regard to history or any other subject, except the ability to read and write English. Will the creator of this bugaboo accept a challenge? Will he dare assert that this democracy has not the right to demand minimum standards in reading and writing English in the education of its future voters? The people who raise these bugaboos and rouse these fears are either opponents of public education or have aims which make them fear an enlightened citizenry.

Public education *is* the Nation's business. Americanization is. Not long ago I spoke in a community where several of the teachers spoke no English at home or even at recess in the yards with their pupils. I heard a soap-box speaker say to a crowd in a foreign language, "This is what I dare not say to you in English because I would be arrested." He disregarded me because I was only a woman and presumably unfamiliar with his language. Can we have an American Nation if there is no power to organize education nationally so that these things cannot be?

Lastly, I make my stand in favor of National organization for education because I am a woman, deeply interested, personally and professionally, in equal opportunity for education of all children and of the women of all nations that come to our land. Women vote in America. I fought for suffrage and would fight again for women's equal rights as citizens. Therefore I want women educated and taught to use their intelligence and their votes for the best interests of children. And I know there are people, now in great numbers in this country, whose men brutally beat the women of their families if they go to any kind of school, and then at the command of a boss or a gang leader drive these same women to the polls to vote, as those women never could have been induced knowingly to vote, against the best interests of school and home.

The writer who called National organization for education Prussianism advised us, if we want it and believe in it so strongly, to demand that it be done by Federal amendment. We are ready to do so, but will the States never grant a National good except by Federal amendment? We have the long and historic struggles for abolition of slavery, for women

suffrage, for prohibition. Must the protection of the equal educational opportunities of children, the Nation's right to maintain an intelligent citizenship, depend upon an unnecessary Federal amendment, or will our political leaders and our anti-American agitators submit now and assist in the establishment of both by means of National aid and National organization?

THE NEED OF A NATIONAL ORGANIZATION FOR EDUCATIONAL SERVICE

W. A. JESSUP, PRESIDENT OF THE STATE UNIVERSITY OF IOWA,
IOWA CITY, IOWA

Differ as to means—From the days when Washington, in his Farewell Address, dwelt upon the necessity of an enlightened public opinion as essential to our form of government to the present popular voice of alarm relative to the Nation of "sixth graders," there has never been any serious note of discord. All are agreed that we must have an educated electorate. It would be impossible to stage, under any circumstances, a serious debate on the question of the importance of education. The only possible opportunity for debate is centered around a discussion of the *means* of obtaining this common objective.

Experience varied—There have been wide variations in governmental machinery ranging from extreme local control, as exemplified in the district system in Massachusetts and Iowa; highly centralized State control, as exemplified in New York; and Federal control, as exemplified under the provisions of the Smith-Hughes Act. Thus, we have tried local initiative, State control, and Federal subsidy. Critics differ in their judgment as to the relative efficacy of the different plans.

Best method not clear—The State of Iowa, with a highly decentralized system of public education, with relatively little subsidy, with opportunities for tremendous initiative on the part of local communities, has been able to provide a school system that compares in efficiency, as measured by financial support, buildings, equipment, consolidation, length of term, high-school graduation, and the like, with States where all of these factors have been subject to State subsidy, statutory regulation, and all the other trappings of theoretical educational administration.

Certainly the National program for vocational education has not met with such freedom from criticism as to make us feel that we have spoken the last word in regard to Federal control and subsidy.

Progress and public opinion—Real progress is ultimately dependent almost wholly upon *public opinion*. The tremendous increase in interest in public education and its relationship to the problem of Americanization, within recent years, has come about through an awakened public interest. Excellence in school conditions, whether we look to physical plant, eco-

conomic reward, or educational efficiency, has been directly in proportion to the dominant public sentiment within the community. This has been true irrespective of provisions for the minimum wage; controlled curricula, rigid inspection, or other semi-coercive devices of the State at large.

Public opinion vs. bureaucracy—The best single hope for obtaining desirable educational ends is through the creation of public opinion, directed toward the specific minor objectives involved in the whole. In the degree that a National organization for educational service will be a dominant factor in creating a favorable public opinion with a will to achieve, in that degree such an organization will be worth while; but in the degree that this National organization rests its case upon men's coercive devices of inspection, of regulation, of auditing accounts, of supervision, and the other routine activities of bureaucracy, in that degree the normal progress of education will be limited rather than advanced.

Recent public response splendid—Future educational historians will note the years through which we are just passing and direct attention to the really marvelous progress that is being made in education since the war. And to what has this been due? Not to coercive policies but to the widespread response of leaders, to the import of facts relative to illiteracy, facts relative to the need of a trained electorate. These facts, revealed by the war, came with something of a shock, but the response has been dazzling. An aroused public has brought better curricula, better buildings and equipment, and better instruction.

Voluntary organization responsible for progress—Our progress thus far has come about through the leadership of great voluntary organizations which are peculiar to America, such as the National Education Association, the Department of Superintendence of the National Education Association, the National Society for the Study of Education, and scores of similar associations. These bodies have afforded opportunity for the development and stimulation of hundreds of leaders who have worked in turn with other organizations, National, State, and local, to the end that we have created sentiment in every section of the land among all classes of persons irrespective of race, creed, or party. Woe betide American education if any of this is lost. We must depend upon more of this rather than less in the future.

Short term of Cabinet officers—Much is being said in favor of a Cabinet officer representing education. In this connection it is important to consider certain factors involved. How long do Cabinet officers ordinarily remain in their positions?

The department of political science of the University of Iowa reports, after an investigation covering the fifteen administrations from 1861 to 1921, that there has been an average tenure of two and two thirds (excluding the *ad interim* appointments of only a few days). Thus there is no expectancy that a Secretary of Education would serve even during a single administration.

Not only are Cabinet officers in power for a short time, but as a part of

party government they and their recommendations are constantly subjected to bitter partisan criticism and with all of the legislative interference only too common in our State and National assemblies. Could the wisest educational statesman have escaped the bitterness of the last administration? Does anyone doubt that there will be equally hostile criticism of the present Cabinet? These partisan conflicts function in dramatic reversals of public policy, complete repudiation of programs. Are we wise in urging that education be thrust into this hurly-burly of partisan strife?

Who will serve?—Have we enough educational statesmen to afford to throw them on this wheel of short tenure and bitter criticism? The supply is all too short for the places of leadership and responsibility where conditions of tenure and partisan interference have been made much more satisfactory.

Political strife—Experience thus far in city, State, and institutional control has led us to strive for longer tenure and freedom from partisan alignment. Even where statutory tenure has been short it has been the practice to provide for continuity of service by force of public opinion. Certainly no one nowadays seriously favors partisan responsibility for educational administration in city, State, or university. Are we not in danger of proposing a system of partisan Cabinet representation which will actually lead to strife and ultimately to a divided public opinion in educational matters?

United public opinion essential—I do not wish to be placed in a position of being an opponent of a National organization for educational service, but I do wish to keep uppermost in the discussion the importance of united aggressive public opinion. We need leadership having not only outstanding personality involving the highest type of statesmanship, but we need continuity and freedom from ordinary partisan alignments. Is this likely to happen with a Secretary of Education in the Cabinet?

A constructive suggestion—In connection with our program for a National organization for educational service might we not draw a valuable lesson from the Judicial Department? Here we see the Supreme Court of the United States created and maintained under conditions of dignity, continuity, and freedom from partisan dictation. Why should we not create our central machinery for National educational service after some such pattern as this rather than cast ourselves into the whirlpool of politics?

IMPORTANT ELEMENTS IN THE DEVELOPMENT OF A SCHOOL-BUILDING PROGRAM

N. L. ENGELHARDT, PROFESSOR OF EDUCATION, TEACHERS COLLEGE,
COLUMBIA UNIVERSITY, NEW YORK CITY

The school building is the most important physical agency or instrument utilized in the educative process. The school building is a means to an end, not an end in itself. The problems involved in school-building planning and school-building construction are mere resultants of the acceptance of

an educational policy and the establishment of definite educational aims. In the past when the educational program had not been clearly defined and the conservation of health, the development of home makers, the vocational aspects of education, and the like had not been given a place among the definite aims to be achieved, the school-building problem was a simple one, indeed. The experience and practices of years have clarified the educational ends to be sought. With this development of educational aims has come the demand for school housing of such construction and character as to tax severely the community purse and to bring to the fore the questions of economy, adaptability, and efficiency which too often have been ignored or overlooked in the past.

The school-building needs of the country have grown to vast proportions. School-bond issues for the past two years aggregate the greatest total of all two-year periods in the history of public-school development. In the year 1921, \$240,000,000 worth of school bonds were issued in the United States. Estimated on the basis of present contracts undertaken in many communities and assuming somewhat similar needs in other communities, approximately one and one half billion dollars must be expended on school buildings in the United States at this time to assure school-housing conditions which will make possible the achievement of our accepted educational aims. City after city has accepted its responsibility and is assuming its share of this huge construction burden. Three, five, and ten million-dollar school-building programs are being reported frequently. School systems with annual budgets for current expenditures of two or three hundred thousand dollars are reporting bond issues for three and four times their annual allotments for education. An increasing faith in public education is evidenced on every hand. The deliberate acceptance of the cost burden in many communities demonstrates clearly the deep nature of this faith. For the country at large, the funded debt assumed for public-school purposes in 1921 was eight times as much as that incurred in 1916 for similar purposes.

The demand for a dollar's worth for every dollar spent has, however, become more insistent than ever before. The school-building plant represents the crystallization of the highest ideals and purposes of community coöperation and community enterprise. The wide discussion of such ideals and purposes is developing a more critical public attitude toward community investments in school buildings as well as in the educational field. Without the determination and acceptance of educational aims by the leadership of a community no satisfactory building program can be advanced. With the recognition of the ends to be sought through the educative process, the underlying principles of school-building program development may be laid down. The principles which follow are not mutually exclusive but are of sufficient importance to require separate mention.

The educational organization decides the nature of the school plant and the character of the buildings. The age-groups to be taught, the curricula to be pursued, the individual variations to be recognized, and the space and equipment to be allotted to every individual child are the elements of prime

importance. Complete definition of the educational organization is essential. The educational organization must become a matter of practice and not remain an empty form. The school system which professes to have adopted a 6-3-3 organization and over a period of years permits every variation therefrom to exist without change, has failed to recognize the educational economy that will result from the unification of its system. With the educational organization defined, the types of buildings and the comprehensive nature of the structures are determined. No acceptable educational organization can profitably utilize any longer school buildings which are mere nests of classrooms. The modern schoolhouse is an intricately and wonderfully planned structure, offering every facility for advancing the complex and expanding curriculum program involved in the full concept of public education.

Financial and educational economy dictate the size of the individual schools. From the standpoint of economy of operation, maintenance, supervision, and general administration, all available evidence is in favor of the large individual schools. One thousand to twelve-hundred-pupil elementary-school buildings, twelve to fifteen-hundred-pupil junior high-school buildings, and fifteen to twenty-five-hundred pupil senior high-school buildings are considered desirable when proper allowances are made for the size and type of the community. It is reasonable to suppose that educational economy will likewise result under conditions which permit of better classification, more frequent promotions, and a greater concentration of special facilities than would be possible in smaller plants. Scientific investigations of the next few years may throw new light on the optimum size of school buildings from the angle of both financial and educational economy.

Standards of schoolhouse planning and construction must be determined by State authorities through rigid scientific procedure. The wider experience and the more comprehensive machinery of State education departments should be utilized more fully to safeguard communities from ill-advised planning and faulty construction. Neither the infrequency of school-building construction in the small community nor the instability of administrative control in the large city should be among the reasons advanced for failure to secure buildings which become permanent community assets and fully adapted to the needs of the educational program. Local conditions may vary, but, within reasonable limitations, local adherence to State standards is recognized as most desirable. State standards involving economy, the recognition of State educational aims, and the gleanings from the experiences of hundreds of other communities have no inconsiderable value.

To the degree that the conservation of health and the program of physical education are emphasized among the State aims in education, should the State insist upon adherence to building standards which safeguard the body of the child, leave his physical faculties unimpaired and offer opportunity for further physical development. The splendid progress made by some of the States may well serve as an incentive to those which still lag far behind.

The health and play programs of progressive educational organizations can be advanced only where adequate school sites have been provided. Four to six acres for elementary schools, six to eight acres for junior high schools, ten to twenty acres for senior high schools are standards which are being accepted by so many growing communities that their general acceptance seems inevitable. The very rapid growth in urban population in the United States and the extreme residential congestion of many cities emphasize the importance of making adequate provision in the school development program for plenty of air, sunlight, and open spaces. The large percentage of physical defectives, humiliating to our National pride and contradictory to our educational aims, and the needs of our social development programs unite in emphasizing the importance of large school sites. When recent reports covering playground conditions show that 1,800,000 of 3,600,000¹ in 429 American cities have less than 6 x 6 square feet each of playground space, or even none at all, and that 70,000 children² in one of our largest cities have been provided with only thirty-five pieces of playground apparatus on their schoolgrounds, the urgent need for the development of playground standards becomes clear.

No school-building program can be adequately advanced without full consideration of city zoning and the policies developed by city zoning commissions. The values derived from scientific city zoning are being sought by many city councils or boards of aldermen. Zoning is the controlled direction of building development along orderly and well considered lines of city growth. This movement should receive the earnest support of all school administrators, or, when necessary, should even be initiated by them in their communities, as it doubly insures any investment made in new school housing. The hundreds of thousands of dollars spent in the construction of school plants, which, in a short time, have been surrounded by manufacturing, railroad, and other industrial developments, have not contributed toward the creation of confidence of the public in school administrators.

School-building planning must anticipate population trends and should consider every element of adult and child population growth. Private corporations, such as telephone companies, have shown the way in the field of population analysis which may well be followed by schoolmen. Telephone companies lay their cables and construct their exchanges not to meet present service demands only but in terms of future patronage. Every available population fact that may have its bearing on future growth is utilized in the prognostication of service needs. What private enterprise has found it profitable and possible to do the school system may well adopt.

¹ Know and Help Your Schools, 2d Report; National Committee on Chamber of Commerce Cooperation with the Public Schools, 1921; American City Bureau, New York City.

² Strayer, George D., and Engelhardt, N. L. The School Plant and School Building Program of Baltimore, 1921; Board of School Commissioners, Baltimore, Maryland.

The selection of school-building sites should be on the basis of known population data and in terms of desirable environment standards. No longer should politics, personal gain, or undesirability for any other purpose be the basis for selection of school sites. The anticipation of future needs, based on housing types, residential saturation, transportation development and industrial sectioning, and the advance purchase of sites determine to a large degree the desirability of the future plant. Continuing map studies of population growth are essential administrative tools for success in this field.

Travel distances for present and future child population are factors to be considered. There has been a tendency toward standardization of the one half mile radius for elementary schools, one mile for junior-high school, and one and one half miles and more for senior-high school. The tremendous overlapping in the elementary-school districts of many cities, where the erection of small school buildings has been the rule, is evidence of failure to recognize the invaluable results of city planning and the gains to be secured from the establishment of distances between home and school which children of varying ages may be expected to travel. The degree to which pupil travel standards have been ignored in the past is evident in a recent city school-building survey, where ten elementary-school buildings were pointed out as falling within the district defined by a three-eighths mile circle being drawn with one elementary school as a center. If a child may, within a half-mile walk from his home, reach any one of six, eight, or ten school buildings, the chances are against his finding any desirable, high-grade, fully equipped schools in the group.

A school-building program is a continuing program. A prevailing fallacious concept is that appropriations for school buildings are to be considered necessary only at stated intervals, and that such appropriations once made have solved the building problems of the community for an indefinite period. The school-building problems of no actively growing American community can be laid aside with the assumption that the task is completed. Tax-payers should recognize that the opportunity for developing and improving the school plant always exists. The aim of the administrator should be to keep his school-housing projects so far in advance of actual needs that short-time sessions and temporary housing do not become necessary except in times of urgent stress. Attendance and census records should be so utilized that the physical facilities in space and equipment become available for the school child when the compulsory laws of the local custom bring children into school for the first time. The superintendent of schools who can say during times of peace that his community has a record of no part-time pupils and no unsuitable housing has demonstrated, without question, his ability as an administrator.

The program of publicity developed in conjunction with building policies should be of a continuing nature and give clear-cut estimates of what the future building needs may be. Communities informed far enough in ad-

vance react more favorably when additional funds are sought for the further development of their plant.

School-building planning and construction require a specialized architectural skill and training, together with a knowledge of the educational field. In the field of school-building construction, it has been a common practice for members of boards of education to assume the chief responsibility. This responsibility is not wisely delegated to lay members of boards of education with perhaps only a temporary interest in the problem, nor even to the architect who has not made himself thoroughly familiar with school problems and needs. Along with the rapid standardization of educational provisions has come the development of architects who have been willing to recognize the exceedingly complex nature of school-building planning and who have equipped themselves to render a special service in the educational field. Only as boards of education assure the highest degree of coöperation between the educational forces which administer policies and the architectural forces which supervise the working drawings and specifications of school buildings will investments in school buildings be guaranteed gilt-edge.

Elasticity of planning is a positively essential element to be considered in plant development. Changing educational methods and administrative policies will necessitate varying adaptations of the school plant. During one decade study halls may be deemed essential, during the next they may be rated as superfluous. An elastic plan recognizes variations as concomitants of educational growth. School authorities who plan in terms of the ultimately desired structure, although only a fractional part is needed today, serve the more intelligently. The wisest policy to pursue is to reserve for all time the possibility of addition to any plant except as positive assurance prevails that the best size has been attained.

Public-school structures should be of a permanent construction in keeping with the nature of the program to be advanced. Unfortunately, Type D construction, consisting of masonry walls, but of otherwise ordinary or joist construction and wood finish, prevails today in the forty-five per cent of existing school buildings, and even a less permanent construction in twenty-one per cent more. Fire-proof construction makes for permanence, lower maintenance, and repair costs, less fire insurance and greater community assurance in the safety of its children.

True economy in school-building costs is not inconsistent with the program outlined above. On the contrary, it is implied in every step. Real economy is effected only as the full educational program is understood, and as the physical agencies employed to achieve those ends are utilized effectively to the greatest degree, by the greatest number of people, over the longest period of time. Economy results when permanence is assured, debt, maintenance, and operation costs are kept at a minimum, and the highest physical, social, and educational efficiency of the product is achieved.

The new technique that is being rapidly developed in the field of program planning will strengthen the professional status of the superintendent

and will establish more firmly his position as a community leader. In communities that have felt the need for more adequate school planning, the school administrator can be relied upon to bend his energies to the solution of the difficulties growing out of such need.

ADAPTING THE SCHOOL PLANT TO THE CURRICULUM

CHARLES L. SPAIN, DEPUTY SUPERINTENDENT OF SCHOOLS, DETROIT,
MICHIGAN

The present-day elementary school has developed from the one-room building of Colonial days, which was built chiefly for religious instruction. This building was developed into a type like the Quincy Grammar School, built in Boston in 1848, a four-story twelve-room building with a separate room for each grade. Training for social and industrial life had then replaced religious training and the curriculum included the three R's, history, language and grammar, conduct, bookkeeping and object lessons.

In spite of the present-day demand that the child be trained not only as an individual but also as an effective member of society, with provision in the curriculum for health, citizenship, worthy use of leisure, and experience with materials and tools of industry, and training for worthy home life, the Quincy type of building is still typical. It would seem impossible to teach in this box-like building physiology and hygiene, play, physical education, literature, civics, nature study, music, art, sewing, manual training, and cooking in addition to those subjects formerly taught, yet that is what is being attempted.

Detroit's solution of the building problem is the platoon school, the general plan of which is familiar. Half the school is seated in home-rooms where the three R's are taught; the other half simultaneously engages in special activities, gymnasium, play court, auditorium, library, science, literature, music, art, sewing, cooking, and shop. At the end of one and one half hours the two halves change.

Platoon schools have been constructed by remodeling old buildings, by adding an auditorium and gymnasium to any building of from twelve to twenty-seven rooms, thereby increasing its capacity to 33 1/3 per cent, or by building a new structure. In the last three years forty-nine elementary school additions and nine new buildings have been constructed, and money is available for nine more new buildings and five more additions. The number of platoon schools has increased from six in 1918 to sixteen in 1919, thirty-two in 1920, and fifty-one in February, 1923. The entire aim of the program has been to adapt the school plant to meet the requirements of the present-day curriculum.

SOLVING THE PROBLEM—THE ARCHITECT AND THE SUPERINTENDENT

FREDERICK W. GARBER, ARCHITECT, CINCINNATI, OHIO

My subject is Solving the Problem—The Architect and the Superintendent. I wish I knew some definite formula that would sometimes work successfully, but there seems to be none. You superintendents who have had some experience in building know, and so do the conscientious architects, that any successful solution of a school is a difficult problem and not a divine inspiration conceived in a few minutes. There are as many perfectly designed schools as there are superintendents in this room. This is equally true of banks, libraries, and residences. Never have I seen like ideals expressed in elevation or plan, although each group has a marked family resemblance.

Let us take the residence as a type or example to explain what I have in mind. If two residences of \$10,000 each for two clients of different temperaments were to be given as a commission to one architect and his ideas were to be expressed, the solution would no doubt be the same for both. If the architect functions properly, he will study his client's needs, methods of living, conducting his household, and the like, and base his solution on this information. His solutions would then be different; and so it is with any two large schools. The standardization of two- or four-room schools as a whole may be possible, but never of larger ones.

In Cincinnati, and what I have to say today refers to our work in Cincinnati exclusively, in addition to meeting the different educational needs for schools which are affected by environment and lot conditions, the board and superintendent insist that the schools be varied in their architectural treatment. In varying the design of the buildings, we believe that a distinct educational value is created that will arrest the attention of the pupils and inculcate good taste. In fact, if pupils secure their preliminary education in school buildings of the highest type, the fineness of the architectural design will educate them, particularly the boys, to a most respectful attitude toward architecture and its good influences.

Site and environment in the city schools have much to do with the final expression. Let me contrast several grade schools to show our point of view. Westwood, our first school, is in the suburbs, located on a lot of about six acres, which lies a trifle above the street grade. I wish to contrast this with the Guilford School, also a grade school, but located in what might be called a commercial, old-resident and tenement district; in fact, it faces a ten-story shoe factory. The lot is a typical downtown lot, and here the problem was to exaggerate the scale so as not to have it appear dwarfed by its high neighbors and probably higher ones in the future.

Let us leave this school and go to the hill-tops to a poor colored district and contrast the two foregoing with this. Douglas is also a grade school on a very small lot and is devoted exclusively to colored children. The

Bloom School, a grade school with provisions for a junior high school, occupies one half a city block in an old tenement district. This, in a small way, illustrates better than I can put in words what we are attempting to accomplish.

Before I leave this problem to take up an individual problem, I want to leave this thought with you superintendents: In any city, many schools would be better placed if the Park Board would work in closer harmony with the Board of Education. As one studies the administration of cities, I am convinced that more concerted action would not only provide better locations but would result in infinitely better results. Perhaps the City Planning Commissions which are now coming into vogue will have a pronounced influence, and surely no phase of city planning is more important than the proper sites for schools. It is not my intention to convey the impression that schools should be placed in parks, but their proximity to small parks and playgrounds which might be made one comprehensive scheme with the school, would certainly be an achievement worth while.

In discussing the superintendent and the architect, I intend to take the East Side High School as an example. The East Side High School is the last high school to be finished, and will illustrate how in Cincinnati the Board of Education, the superintendent, and the architect operate in the solution of a problem. When I say superintendent or Board of Education I use them as synonymous terms. No better working basis between Board and superintendent, I dare say, can be found than in our city.

As an abstract problem, building, whether a school or otherwise, consists of three factors: size, material, and cost. Fix any two of these factors of the problem and the third can be solved by the architect, providing reason and judgment are exercised. Too often the cost and size are fixed and the material never goes beyond the paper stage. What has been called size or requirements is the function of the superintendent. His task is not a light one, for each department head will, if he or she be human, demand all and more than is required. This is as it should be. Who of us has not seen an unbalanced school due to an over-strong personality in some department. The superintendent must then weigh carefully and adjust nicely the balance between his departments. No light task, I assure you. Some day I hope some architect will find a man willing and rich enough to give each department just what it thinks it needs. The result will be a school of many buildings with a total capacity to house all the activities of all the schools in one group. Henry Ford could not endow it, much less a city, but he might be called upon to furnish a rapid-transit system for easy access between departments.

The superintendent in Cincinnati has always laid down what he desires to accomplish from an educational standpoint in a program that has been considered with him by the Board of Education. This covers all departments. He went further in the East Side High School and expressed just what he would consider as ideal in the relation of one department to an-

other. These qualifications are of primary importance. The educational problem is, in my opinion, the *raison d'être* of the school. This program was given to the architects as the preliminary step that preceded the design of the school. These mandatory conditions and the site selected were the conditions upon which the architects were to base their solution of the problem.

A word as to the site: The site selected by the Board of Education consists of thirty-eight acres, an old farm located on the edge of one of our best residence districts. It also draws from a remoter district children from a factory colony. These conditions called for a school to house all the activities that could be required in a high school. As Superintendent Condon expressed it in words that are now carved on the base of the tower: "All who will may enter and find within these walls equal and varied opportunity for a liberal education, based alike upon art and industry, with books and things, work and study combined; and where good health, the spirit of play, and joy in work well done shall abound."

Some of the restrictions which did not lighten our task were of great importance. First, the lot faced an important thoroughfare. Second, the axis of another equally important thoroughfare terminated in whatever would become the fore-court of a group of buildings or the principal feature of the exterior of the building. Third, the extreme variation in the grades of the lot was sixty feet.

Conferences were held at this time with the superintendent almost daily. Several tentative sketches were made in the office, but none seemed to solve the problem satisfactorily. Except at great expense would the lot admit of all departments being housed in one building. The fine wooded valley running parallel with the street we considered should be preserved. We were of the opinion that with the lot restrictions, it would be best not to house all the departments in one building but to arrange them in a group of buildings. All preceding high schools in Cincinnati were housed under one roof. A rough sketch was made, outlining the various departments without details, just assigning spaces. The Board of Education was called in and a great discussion followed.

The chief objection to a group plan was the time that would be lost in moving classes between periods. This objection was answered by the president of the board and the superintendent, who believed and has since proved the fact that a few minutes so lost would be more than made up by the efficiency of the pupils in the classroom; the advantages of outlook and the fenestration also were not to be ignored. The points of the compass are such that the sun is present some time each day in each room.

The departments at this time were located and the development of the plan began. The departments as located were as follows: the central building houses on the first floor the administrative office and the auditorium; the second floor, the balcony of the auditorium and the library; the third floor, the lunch rooms. Grouped about this center, beginning with building "A," extreme left, the commercial department is housed on

the first floor with one of its rooms in building "B" in the rear. Continuing along the rear you have two classrooms and a small auditorium. The rooms facing the fore-court are literary club rooms which are used for club purposes, teachers' meetings, and so forth, and for recitations in literature. The second floor of building "A" is occupied by a large study hall and sewing-room. On the second floor of building "B" is housed the arts and crafts with a large classroom. You will note that the art rooms are on the same floor and adjacent to the library in building "C." The third floor of building "A" is occupied by a model flat, girls' study room, classroom and laundry and a girls' chemistry laboratory, and on the same level in building "B," domestic science rooms. You will also note that the girls' chemistry, which is devoted to the chemistry of cooking, is adjacent to the domestic science rooms located on this same floor in building "B" and the lunch room on the same floor in building "C." Building "D" is devoted entirely to classrooms, faculty rooms, and emergency room. The classrooms were not all located in building "D," but some were located in each building except building "C." This permitted of a little more elasticity and reduced the moving of classes from building to building. They were also placed in this building because of their central location, and particularly for their proximity to the industrial arts building and the gymnasium. Building "D" is devoted entirely to the sciences and their lecture rooms and several classrooms, and on the upper two floors in a corresponding position, as in building "A," are the boys' study rooms.

In the program for the gymnasium and the stadium, which might be considered a part of it, the superintendent desired to house the physical activities of the school and to make provisions for visiting teams and for all the activities of the stadium, the only stadium for use of all the high schools. On the first floor, which rises above the concourse level to the left, are located the plunge, showers, and dressing-rooms and immediately above it the gymnasium for the girls. To the right the same provisions are made for the boys. As the land slopes toward this end of the building, provisions were made for a laundry, where in time we hope to have the necessary machinery installed. Between these two gymnasiums is located the open-air gymnasium. The open-air gymnasium can be used by either boys or girls and the walls are prepared for hand-ball and basket-ball. This gymnasium is used only when the weather will not permit the use of the field for gymnastic exercises. By the use of team rooms, visiting pupils are excluded from all the gymnasium.

In the industrial arts, all departments of industrial work were to be housed. Grouped with the industrial arts buildings are the heating facilities for the entire group of buildings. This building, although externally conforming to the design of the buildings for the gymnasium and the academic group, is on the interior finished as a factory. The building is extremely compact and the corridor space, which runs the full length of the building, is divided into two stories for each shop height to provide the necessary locker space. In this building are housed on the first floor auto-

mobile construction shop, testing laboratory, foundry, forge, and machine shops; on the second floor, carpenter shop, mill room, plumbing and sheet metal, pattern and cabinet shops; on the third floor, electric construction laboratory, composing pressroom, and drafting rooms.

During the detailed layout of these departments, which took several weeks, each day the Board, of seven members, the superintendent, and the department heads met in our office for conference and study. Here all the details and arrangements of each department were thrashed out. We did not always agree, but we were a large family each doing the best he could to bring about an ideal school.

As to special features, in laying out the preliminary sketches, the architects found that the number of pupils per class varied with each department. In the interest of economy in construction and teaching, after a long talk with the superintendent they asked if it would not be possible to fix, in so far as possible, the same number of pupils for all classes in all departments. This was an innovation, and after much discussion it was finally decided to fix each class at thirty or multiples of thirty. In other words, the gymnasium classes were fixed at sixty, two units, with provision for ninety if needed. The science, commercial, industrial and household arts were fixed at one unit or a multiple thereof. A small auditorium was provided to take five units. This is used for special group instruction for science classes, music, and special lectures in which lantern slides and moving pictures are used. The study rooms, four in number, were fixed at eight units each. The total capacity of the school was figured at 1800. This provides for one half the pupils on this basis to make their "home-rooms" in the study rooms. With thirty classrooms the total number of pupils is made up. Each pupil is provided with a locker in the corridors which distributes the pupils over the entire building. The lockers take up all the space between double walls not used by columns, heat ducts, and other utilities. I know that some authorities do not agree with this scheme, but we have found that it works. What the total capacity of the school would be if all departments were working to their full quota of thirty I am not prepared to say, as that would be a matter of program; but this I do know, that this year there are 400 more pupils than the school was designed for and as yet no interference with the functioning of the school has been noted.

In lieu of "home-rooms" for the teachers, we have a faculty room. In this room provisions are made so that a number of instructors can use it as headquarters when not teaching. This applies primarily to the teachers who do classroom work only. The departments in science and the commercial arts have provisions made for offices for their use, and there is no difficulty in the arts department of having the teachers use them as home-rooms. There is no reason, however, in the opinion of the superintendent and architects, why the classrooms should not be used every hour of the day—and they will be when the school becomes crowded. It is false economy to permit a room to be used for instructions for two periods a day, say in Latin, and used for no other purpose during the remainder of the day.

Such a teacher would be assigned to a class as a pupil, and her remaining time, if not utilized in class work, would be employed in the faculty room. The use of the faculty room and the provision made for doubling up certain units has added an elasticity which we have not found in our other high schools.

As to the exterior, these buildings were built during the war and we suggested the Colonial type of architecture, because we considered it would make a special appeal and the site ideal for this style. I have always been apprehensive of the use of this style in a school building because of the tremendous scale of the windows and other features which might well be considered objectional, if it were contrasted with other buildings, usually residences. But here we have a lot with enough foliage to exclude such a comparison. The buildings are approached from either end through the valley and on the main axis by the bridge. The bridge became necessary, as we retained the beautiful wooded valley between the street and buildings. The drive follows the rear of the Academic Group. The fore-court is approached across the bridge on the axis of the tower. The tower not only marks the axis on Madison Road, which it faces, but also terminates the end of Erie Avenue and can be seen for at least a mile and a quarter.

The cupolas on the buildings and the chimneys are for discharging foul air. The gymnasias and the industrial arts face the long side of the athletic field and are at right angles to the axis of building "D." Beyond the athletic field, when the demand is created and funds are available, the Board expects to develop an agricultural school.

We are now engaged on another high school, and the superintendent and the principal of each high school are now developing a program that will take advantage of all we have learned in the East Side High School. A school is always a difficult problem because of the few tricks left to an architect. He is compelled to juggle with the large blank wall spaces and the tremendous window areas. Excessive ornament is tabooed, and even if well done is apt to be considered in bad taste.

Finally, I have come to the conclusion that the architect alone cannot in this day, when costs are not too low, solve any school successfully unless he has the hearty coöperation of the superintendent and Board. The superintendent in the interest of economy must study his problem for educational needs as never before. The architect must study not only cost, but also the problems of up-keep and expansion. Aside from cost, the best results cannot be obtained except by careful planning and study. It is not inspiration, but sober, logical judgment and a perfect understanding of the educational needs as outlined by the superintendent, and a thorough understanding of these needs by the architect, that will answer the problems that you superintendents have. That all problems should be clothed with beauty is necessary as an inspiration to good teaching and for the good of the pupils. A beautiful building exterior and interior without a well-arranged scheme for practical educational needs is not a successful solution. If the practical

needs are answered without having good designs, it is equally unsuccessful. The real solution must combine needs and architectural housing.

Whether the school be large or small, the answer should be the same, and will be if sufficient study and thought are used. The architect cannot stand alone, nor can the superintendent; each has a distinct function to perform if a perfect school is to be built.

THE ADVANTAGES OF THE ONE-STORY SCHOOL PLAN

DWIGHT H. PERKINS, ARCHITECT, CHICAGO, ILLINOIS

School buildings of one story have the following advantages over those of two or more stories: First, superior classroom lighting; second, greater safety; third, easier adaptability; fourth, cheaper construction and maintenance; fifth, more homelike—"less institutional" design; and sixth, ready conformity to development and changes in educational methods. The views which will be thrown upon the screen are arranged in the order and according to these topics—sometimes without relation to each other—except those showing Cleveland and California schools which are grouped according to buildings.

First—Lighting—The advantages of controlled top light are available for all rooms. Classrooms along the outer walls have windows as well as skylights,—the cheer-giving window views of sky and trees are retained. Assembly rooms, storage space, toilets, and other portions are properly and sufficiently lighted from above. Sunlight may be admitted through the ceiling. One is, therefore, at liberty to disregard orientation in locating classrooms—all north or all south exposure may be provided, as well as east or west exposure, because the defects of too little or too much sun may be corrected by means of the skylight adjusting vanes. Uncontrolled skylight is both bad and unnecessary. By means of the revolving sheet-metal vanes, covering the entire skylight area, one may darken the room for stereopticon use, or may "open wide" and admit all the light there is on a cloudy day. The vanes can be set at any angle so as to admit light and exclude sun.

Walls and ceilings can and should be colored so as to augment the introduction and diffusion of light to relieve eye strain and increase the refining effect of beautiful interiors. Top-lighting simplifies this problem.

Second—Safety—Stairs are forgotten, no crowding, no stumbling, no time required to make use of them. Exits are multiplied indefinitely. Children can escape all at once and in every direction. Even the windows, so close to the ground, would provide safe and adequate egress were every door in the building locked.

Basements containing combustible stores are eliminated. Stairways and halls cannot be filled with smoke from fires below. While it is advisable to build all walls and partitions of incombustible material, such methods are not obligatory, and it is customary in such buildings to build the roof

of wood. Nothing but a property loss can result, and that can be covered by insurance.

Basement space required for heating plant and for janitor's storage can be placed beneath terraces and not under classrooms, again promoting safety as sometimes defined by laymen.

Third—Adaptability—The uses to be made of the separate classroom exits are obvious: instant dismissal in fire-drill, or at closing time, as well as passing to and from out-door play, all of which promote class independence and decrease class interference.

The central assembly rooms, particularly in elementary schools, are used with perfect ease not only as lobbies or thoroughfares, but for many kinds of group instruction. The stages are enlarged and become kindergartens or gymnasiums, giving multiple use for single investment.

An assembly hall in constant use, even though that use be incidental, has been found to be valuable when it is pleasantly furnished and decorated. It should not be shut off for the occasional ceremony, as the old-fashioned parlor in the home was. Such halls are not isolated when placed as in the buildings to be shown on the screen. On the other hand, their strict use as gathering places is in no wise restricted.

During evening assemblies, it has been found advantageous to allow the parents to use the classrooms as committee rooms, coat rooms, and the like.

Additions are easily made by simple extensions of the corridors, and the construction of rooms between and along them exactly as in the original portion. Such additions can be made without interfering with the school sessions.

Fourth—Economical construction and maintenance—The question of cost is the one usually put first, but here it is not answered first because it is minor as compared with light, safety, and adaptability. Although this type of plan was brought forward at first for financial reasons, it has maintained its position and growth, I believe, entirely for its other merits. I would advocate it, even though it were more expensive than other types.

The one-story plan is economical to construct because all superfluous basement space may be omitted. Basements may be limited to actual boiler, coal, and storage requirements, so that three fourths of the first-floor construction may be directly upon filling upon the ground surface, no floor spans required.

All staircases and space for same, as well as corridor space opposite stairways, are omitted. Corridors may also be more compactly planned in one than in two or three-story buildings, and corridor space costs just as much classroom space.

Twenty-five per cent of the corridor length and cost may be saved by the simple device of turning the classrooms with the end to the outside, and with top light there is no objection to this. This arrangement also results in better wardrobe and blackboard locations, and is shown by one of the slides taken from a design to be built in Hammond, Indiana.

Roof construction, as noted above, may be combustible and less expensive and this without jeopardizing life.

No claim is made that one-story buildings cost less per cubic foot than others; on the contrary, they have been found to cost slightly more, about three or four per cent. The saving results from decreased bulk.

Slides prepared for the Hawthorne Elementary School at Elmhurst, Illinois, give comparisons of a one-story and a two-story plan of similar capacities and facilities. In this school unnecessary basement space and first-floor construction were omitted in the two-story plan as well as the one-story. No special advantage was given the one-story. Of course, more land is required for this type, but not enough to cause prohibitive cost. As for maintenance, less building requires less work for cleaning and repairing.

The question will occur to you, Is this type more expensive to heat than the two- or three-story? Let us be frank and admit that it is. This is particularly true if ceiling lights are not placed beneath the classroom skylights. When they are, the extra cost of heating the classrooms becomes negligible, but when they are not, it will cost from six to eight per cent more for coal because of the loss of heat from the skylights.

In regard to heating and ventilation apparatus, I believe it is not possible, or desirable if possible, to limit the heating and ventilation to the single fan, plenum chamber indirect system. I believe that one form or another of what is now known as the split system should be installed in which radiation is placed under the windows or in shafts immediately in connection with classrooms so that they may be heated without movement of the fan. In such installations fans, plenum chambers, and ducts exist for ventilation purposes only and have only incidental heating functions to perform.

Fifth—Design—In the opinion of many, schools should become less overpowering institutions and more home-like. Always situated in residence districts, they should take on more the character of homes, a central home of the community made inviting and approachable day and evening by young and old. The one-story type seems to comport with this conception.

Sixth—Conformity—The slides will show great variety in plan, but much more diversity might be shown, if desired. This diversity results from the freedom of the basic idea, from the expanding demands made upon schools, the changing curricula, and from conditions of funds, site, and locality. The freedom from restraint, both upon architects and educators, seems to be influencing builders of this type of schools along original and progressive lines in such a way as to make a distinct contribution to education at this time, and, I believe, to point the way for better service, more real education, and future progress.

THE PROBLEMS BEFORE THE COMMISSION IN CHARGE OF THE EDUCATIONAL FINANCE INQUIRY

GEORGE D. STRAYER, DIRECTOR OF THE EDUCATIONAL FINANCE INQUIRY,
AND PROFESSOR OF EDUCATIONAL ADMINISTRATION, TEACHERS
COLLEGE, COLUMBIA UNIVERSITY, NEW YORK CITY

Our conception of the scope of public education has developed and expanded during the past generation. In no part of the United States is the education provided in the elementary school now thought sufficient to satisfy either the demands of society or the needs of the individual. To the original elementary school we have added high schools, vocational schools, continuation schools, special classes, and college and university training at public expense. We have, as well, enlarged the scope of education to include physical education, health service, recreation, community organization, and the like. The cost of education has increased many fold. We are without any very clear definition of the extent of the program which is required, and we have no sound estimate of the cost that will be involved in providing for the realization of the whole or a part of the program.

We are living in a period of economic readjustment and uncertainty. There is in the popular mind a reaction against any increase in taxes and a demand for retrenchment in the support of governmental activities. We who work in the field of education are conscious of the inadequacy of much of the work that is now being done because of the failure to provide sufficient funds to pay for the service of properly qualified teachers or to provide the necessary buildings and equipment for schools. But however great our need, we are faced with the necessity of inquiring concerning the economic resources available for the support of schools. In making such an inquiry we may not ignore the cost of other governmental services, nor may we be unmindful of the fact that a very large percentage of our National income is consumed in maintaining the standard of living which we now enjoy. Because of the complexity of the situation confronting us, we need to assemble the facts upon which to base intelligent action in the financing of education.

The importance of an investigation in the field of educational finance was emphasized at the Citizens Conference on Education, called by the United States Commissioner of Education, in the spring of 1920. This conference passed resolutions urging a thorough-going investigation of the cost of education and of the public resources available for the support of our schools. The discussion at that time, participated in both by laymen and by educators, made it clear that we could not hope to advance the program indefinitely without a sound factual basis for estimating the costs involved.

A group of State and city superintendents of schools and other members of the Department of Superintendence met at Atlantic City in 1921. After considerable discussion they agreed that an inquiry concerning the present

program of education and the cost of maintaining it was most vital to those charged with the responsibility for administering public education. They appointed a committee from their number to assist in launching such an investigation, provided funds were made available for the conduct of the inquiry.

The American Council on Education secured contributions amounting to \$170,000 from the Commonwealth Fund, the General Education Board, the Carnegie Corporation, and the Milbank Memorial Fund to cover the expenses of the investigation. These funds were contributed to the American Council on Education, with the distinct understanding that they would be spent in accordance with the best judgment of the Commission appointed by the Council. Those contributing the funds have from the start made it clear that they do not seek to influence in any way the conducting of the investigation and that they will not be responsible for its outcome. The Council has placed in complete charge of the inquiry a Commission composed of men experienced in education, taxation, and business. This Commission consists of the following persons: E. C. Brooks, S. P. Capen, E. P. Cubberley, Edward C. Elliott, Thomas E. Finegan, Robert M. Haig, Victor Morawitz, Henry C. Morrison, George D. Strayer, and Herbert S. Weet. The first meeting of the Commission was held during the last week in October. My report to you today is, therefore, an account of the progress of the inquiry for the four months that it has been under way.

The primary aims of the Educational Finance Inquiry will be to determine for typical States the program of public education which they have proposed in their constitutions and statutes, the extent to which these programs are now actually carried out, the present cost of education, and the cost that would be involved were the proposed program fully carried out. The distinction which we shall seek to make between the requirements of the law and the actual provision for education now made is a real one. In so simple a matter as the requirement of compulsory school attendance between seven and fourteen years of age there are very great variations in the enforcement of the law and consequent variations in the cost of public education. In many States the requirement with respect to the organization of special classes for those who are over-age, the establishment of continuation schools, the organization of vocational schools, the provision for medical inspection and health service, and the like, are only partially carried out.

We shall endeavor, as well, to discover what the cost of education would be were certain standards adhered to. For example, what would public education cost if every teacher in the elementary schools had a minimum training of standard high-school graduation, plus two years of professional training? How would the cost of education vary if the size of classes in the elementary and high schools were reduced to commonly accepted standards? What would be the cost involved in providing free textbooks in all schools? What does it cost to provide health service and dental clinics? What is the added expense involved in providing the vocational guidance

made possible by the organization of a modern junior high school? What do school lunches, transportation of pupils, special classes for the feeble-minded, the anemic, the blind, and the crippled cost? From these and other closely related inquiries we ought to be able, when any new program for public education is urged, to indicate the added cost of maintenance involved. The disregard of our present legal requirements has been due, in a large measure, to the adoption of an extended program without any satisfactory provision for the financing of those new enterprises which have been added from time to time.

The Commission proposes, as well, to compare the growth in other governmental expenditures with the growth in school expenditures. It will be interesting to discover whether or not the large increase in the cost of public education is closely related to the increase for other governmental functions. We know that the program for public education has been greatly expanded. It may appear that there has been a similar expansion in other services provided for by local, State, and National government. A preliminary inquiry has already been undertaken with respect to taxation in support of public education. Studies which seek to evaluate current practices in the fiscal administration of schools are under way.

The Commission decided to undertake as an initial inquiry an extensive study in one State. It is expected that in the study of a single State methods of investigation may be developed that may be found applicable elsewhere, and that this preliminary inquiry may make it possible to economize time and effort in the more extended survey. For the purpose of this initial inquiry the State of New York was selected. This choice was made because of the completeness and accessibility of the financial reports made to the New York State Department of Education, which are based upon a uniform system of accounting, and an account of the thorough-going study of rural education just completed by the Committee of Twenty-One, of which Professor George A. Works, of Cornell University, is the chairman. Considerable progress has already been made in the New York State inquiry, and the investigation has been extended to two other States, Illinois and California. While the inquiry is being conducted in these States certain other investigations are under way which of necessity must be extended to the whole country. For example, the expenditures of the National Government for education have been carefully listed. Inquiries concerning the fiscal administration of city school systems, school debts, insurance, and the like, involving data from communities throughout the country are well under way.

In any analysis of the cost of education it is necessary to differentiate among those units of organization commonly making up our educational system. The inquiry will, therefore, seek to discover the cost of elementary schools, junior high schools, high schools, teacher-training institutions, colleges, and universities. Certain other units of school organization, such as continuation schools, special education, and adult education, can be differentiated and their cost determined.

Another type of analysis of the cost of education in terms of the work actually done in the classroom is being undertaken. It is good to know the total cost of elementary schools, but it is far more informing to know what educational ends the elementary school is designed to attain and what it costs to realize each of these purposes. The present program of education, as we find it in modern elementary schools, can be organized around four large objectives:

(1) To read, write, and speak correctly the English language, and to know and use intelligently the elementary processes of arithmetic. By common consent these are the fundamentals without which satisfactory citizenship cannot be secured.

(2) To know and to observe the laws of physical health and well-being, and to appreciate the meaning of life and nature.

(3) To know and to appreciate the geography and history of the community, State, and Nation, and of the world at large; to realize one's share in the social, civic, and industrial order of such a democracy as ours, and to meet the obligations which such knowledge and appreciation should engender.

(4) To share intelligently and appreciatively in the fine and useful arts through the pursuit of drawing, music, of manual training, and the household arts as they are related to the three great universal needs of food, clothing, and shelter.

It will be helpful to know the relative proportion of the elementary-school budget which is expended for the teaching of fundamentals, as compared with those subjects which are sometimes considered less essential. With these facts before them, it may be that some of the critics of our schools will be less free to charge wastefulness, and that they will understand better than they now do the place and the cost of that part of our work which they call fundamental.

In addition to the analysis of school costs by units of school organization and in terms of educational objectives to be realized, it is proposed to undertake a careful study of those costs which cannot be charged directly to any specific unit of the school system. These costs are commonly designated as overhead. There is a popular belief that the overhead charges in the field of education are excessive. Nothing has been revealed by our inquiry to date that lends support to this charge. Nevertheless, it seems important to carry forward a most careful analysis of the charges for educational and business administration of schools, and in so far as it is possible to compare these overhead charges with similar costs in other undertakings.

The fiscal administration of schools involves the study of the participation by the State in the support of education as well as an inquiry concerning local administration and control. What part of the total support of schools is provided by the State? What sources of revenue are allocated for school purposes? Is there a State school tax? How is the burden of support as between the more and less wealthy communities equalized? All of

these problems are important for one who is interested in the support of public education in our American commonwealth.

The question of the separate financing of education is everywhere being considered. In the United States today approximately forty per cent of all of our cities are organized so as to give the boards of education control of the financing of public education, including, with certain limits, the levying of taxes. In about twenty-five per cent of our cities the board of education is completely dependent and is required to submit its budget to a general municipal fiscal authority, commonly the board of estimate and apportionment, and is permitted to spend funds only as they are granted for the purposes designated in the budget passed by this body. Other city boards of education enjoy varying degrees of independence or are subjected to varying degrees of control. The inquiry seeks to discover the effect of these variations in the fiscal administration of city school systems.

An inquiry concerning capital outlays has also been instituted. In the great majority of American cities there are insufficient accommodations for the children now enrolled in the public schools. In many communities old, unsanitary, and dangerous buildings are still being occupied. Many millions of dollars must be invested, if children are to be accommodated, and if their health and lives are to be safeguarded. It is important that in the expenditure of these millions the utmost economy consistent with sound educational practice be observed. The problem of financing building programs is one that may not be neglected in the study of school finance. In like manner, the present practices with respect to the insurance of school buildings, the preparation of school budgets, and fiscal accounting are worthy of consideration.

The Educational Finance Inquiry has no program which it seeks to impose. It cannot enter upon a study of the degree of efficiency that is attained by our schools as at present organized. It does seek to inquire what resources may reasonably be expected to be made available for education; what the cost of the program is as actually developed today; and what the cost would be were the program which has been proposed fully carried out. It will seek to analyze costs and to propose in the light of experience sound financial administration. It will endeavor to make clear the cost of expanding the present program, or of adopting higher standards than those which are now commonly found. It will seek to show what changes in our program would be necessitated were a policy of retrenchment required of those who administer our schools. It is only as we present to our public these basic facts with regard to the cost of education that we can hope for an intelligent solution of the problem of financing our American public-school program.

In all that the Commission plans to do it is dependent upon the coöperation of those who administer our public-school system. It is gratifying to be able to report that to date the Commission has had the most cordial and intelligent coöperation of all who have been asked to furnish data. or to

interpret the facts assembled. It will welcome any suggestion or criticism which any of you may be willing to give. The Commission is glad to work with you in the interest of our American public schools and for the welfare of the Nation.

FINANCIAL NEEDS OF RURAL EDUCATION

ARTHUR M. HYDE, GOVERNOR OF THE STATE OF MISSOURI, JEFFERSON
CITY, MISSOURI

In this hearing the value of education will stand admitted. Discussion of education from the standpoint of the individual, of society, or of the State is unnecessary. Here, at least, all will agree that the primary duty of the State is to afford to its citizens, present and yet unborn, an opportunity for an education, and that the primary duty of the parents is to make any sacrifice that can be made for the education of their own and their neighbors' children.

No better test, to my mind, can be made of the value of education than this. Imagine the doors of all the schools of the world closed today to remain closed. In ten years the world would be one fourth illiterate; in twenty years one half illiterate, and any form of civilization would be endangered; in thirty years the world would be chaotic, and in forty years the night of the Middle Ages would have settled upon us. The world and its civilization—all that has been won by centuries of struggle—is separated from the abyss of savagery only by forty or fifty years of education.

The greatest problem of education today is the problem of rural education. Soon after coming into office I made a study of the conditions in rural Missouri. The schools of the towns and cities in Missouri, my friends, are, generally speaking, very creditable to the State of Missouri. The schools of the towns and cities of Missouri are not perfect, but they are so good that every Missourian can be proud of them. But what about the rural schools? I was amazed to find that our country boys and girls got on an average 121.6 days of schooling a year, whereas their city brothers and sisters got 171.5 days a year. That the boy of the town and city got fifty days more schooling than the boy of the country. I was amazed to find that eighty per cent of the university graduates, of the graduates of our State teachers' colleges, of the holders of first-grade teachers' certificates in this State, were teaching in the towns and cities, and that eighty per cent of the third- and fourth-grade certificate holders were teaching in the country. In the town they have grade schools, kindergartens, high schools, vocational training. In the country they have the one-room schoolhouse, which goes no higher than the eighth grade, and has to alternate its grades to go that high.

On further investigation I found that such a city as this taxed all of the property of all the people in the whole city, in order that every child, rich

or poor, living in the confines of this city should have an equal educational opportunity. I found that Kansas City, with 325,000 people, that St. Louis, with 800,000 people, taxed the property of the whole population, in order that every one might bear equally the burden of taxation to give to every child within the city limits an equal educational opportunity.

I found also that in Missouri there are 8836 rural school districts. Under the Missouri Constitution, the Board of Directors of a school district can levy forty cents taxes on one hundred dollars without any vote of the people. If the people of the district permit it, by a direct vote authorizing it, the Board of Directors of a school district can tax them sixty-five cents on the hundred dollars. Under the guise of economy of State affairs, former administrations of Missouri had assessed farm land and farm property at a small fraction of its value, or at from twenty to forty per cent of its real value. The farmer, therefore, could use only from twenty to forty per cent of the value of his own land as a basis for levying taxes for the support of his own schools.

Let us assume that the maximum of sixty-five cents was levied in every case. There were 852 school districts in Missouri which, under the old system, couldn't raise by local taxation more than \$195 a year to support their school system. There were 868 more districts under the old system that could not raise \$260 a year to support their school system. And out of the total 8836 rural districts in Missouri, more than sixty per cent—5511, to be exact—were unable to raise by local taxation as much as \$520 a year.

The average rural school district has less than 200 people in it. Let's see what it would mean to St. Louis if the school system of that city were on the same basis as it is in the average rural county. St. Louis has a magnificent system of schools, not perfect, but by all means one of which it is proud, consisting of its grade schools, its high schools, its vocational-training opportunities, and so on, and why? Because St. Louis taxes as one school district the property of 800,000 people, all in one district. To place St. Louis on the same plane as a rural county, divide St. Louis into school districts of 200 people. That would give St. Louis not one district but 4000. Instead of the magnificent system of schools St. Louis now has there would be 4000 one-room schoolhouses, 4000 school boards, 4000 independent teachers. Instead of great school buildings with laboratories and libraries, give to St. Louis the one-room schoolhouse, with its scanty curriculum, its poverty of equipment, and I venture the assertion that St. Louis would be little better than a whistling station inside of ten years. People would not live there; they would go, as so many farmers have done, to some place with better facilities for the education of their children.

The problem of the rural school is twofold. First, how to finance better schools in the present districts; second, how to induce consolidation of districts and finance the vastly improved consolidated schools. We have attempted an answer to this problem in two ways in Missouri. First, we put

property in the State for taxation upon the assessment books at as nearly what it is worth as we know how. Why was that necessary? First, because it takes money to build and maintain a school; second, because with fractional valuation of farm land there were 5511 school districts which were assessed at \$80,000 or less, and which at the highest rate of taxation permitted by the Constitution couldn't raise more than \$520 per year to support their schools; and third, because an efficient school cannot be maintained upon \$520 per year. Consequently, the only thing that could be done was to raise the valuation of the land and other property, so that the rate permitted by the Constitution would raise more money if the people wanted to raise it, and so voted.

Under full valuation the number of schools which were limited to \$195 a year for support was reduced from 852 to 252. The number of schools limited to \$260 a year was reduced from 868 to 357. The total number of schools limited to \$520 a year was reduced from 5511 to 3186. The enrolment of schools increased by 41,226, and there were in Missouri 6,000,000 more days attendance in 1921 than there were in 1920 as the consequence of the change in policy.

I know, and the statistics prove it, that the farmers of Missouri want their children to have the very best education that it is possible to give them. The statistics prove it, because eighty-one per cent of the school districts of this State voluntarily voted for the maximum levy permitted by the Constitution for school purposes. Now, my friends, when I think of the country boy or girl, trudging his mile or two to school through the mud and dust of spring and fall and the snow drifts of winter, trying to get an education in the one-room school that stops at the eighth grade, taught by a perfectly noble person, but one whose training entitles him only to a third- or fourth-grade certificate; trying to compete in the race of life on fifty days less schooling per year, in a school equipped, perhaps, with an old battered globe, a tattered map, but with no library and no laboratory, trying to compete in the race of life with his city brother and sister, with their specialized departments and their great equipment—when I think about the country boy and girl, I repeat, trying to compete under these unequal conditions, then I feel that it is a wonder, nay more, it is a marvel that out of the country have come so many of the world's great leaders.

Don't imagine that the change in assessed values was accomplished without a jar. The politician got busy and set up a howl that we were raising taxes on the farmers. The county courts and local school boards seized upon the increased valuation to levy much-needed revenues for improvements. The farmers became alarmed because they did not understand, and we heard from them in tones that were mistaken but by no means uncertain. You see, the farmers had for years been fed upon false political propaganda. They have been educated to believe that the cities should pay practically all the taxes, and that they were saving on taxation by having their lands assessed at a small fraction of their value. They were saving a few pennies

on taxation, but the voice which loudly proclaimed the pennies saved was silent as to why they could not maintain their schools. The hands which held out to the farmers a few cents saved in taxation were choking back their holiest aspirations for an education and a fair chance in life for their own boys and girls.

The fight is not yet over in Missouri. The farmers are beginning to understand. I have faith that when they do understand they will approve. They tell us it means our political ruin. But I am going to be Governor three years more in Missouri, and during those three years the kiddies of the farm are going to get a square deal. I want to know if there is a square-toed, up-standing, hard-hitting Republican or Democrat farmer in Missouri who will trade off his kiddies' chance for an education for a few cents per acre of taxes?

We did another thing in Missouri. A council of the leading educators of Missouri met to tell me what was the matter and what ought to be done about it. That council, backed by State Superintendent Baker, produced the County Unit Bill. I put every ounce of pressure I had behind it, and it finally passed.

Volumes have been written and songs have been sung about the one-room schoolhouse. It is a great American institution; out of it have come many of the world's biggest and best men. If there were nothing better to take its place, I would join, as I am sure every man here would join, in the defense of the one-room schoolhouse to the last ditch and last breath. But there is something better. It is the consolidated school. The consolidated school brings to the country, out where the farm boys and girls can get it, the blessing of eight grades of schooling, plus four years of high school. It gives to the boys and girls of the country equal opportunity, because it gives them a chance for an equal education with their city brothers and sisters. And this, my friends, is what the County Unit means, because it facilitates consolidation of schools and equalizes educational opportunity.

I had the figures the other day from Lafayette county. The superintendent had put out a sheet which showed that in Lafayette county they had levied a tax in the various districts running from five cents as a minimum to sixty-five cents as a maximum in the country, and \$1.50 as a maximum in the city. The County Unit means that there will be nobody "sneaking by" on a nickel for schools. The County Unit also means there will be nobody getting penalized because he believes in good schools. The County Unit system of schools will facilitate consolidation of rural schools and the construction of rural high schools. The County Unit means that all the property of all the residents within the jurisdiction shall be taxed equally in order to give every child within that jurisdiction the same identical opportunity for an education. That is all it does mean.

A noted American, Roger Babson, was visiting the President of the Argentine Republic, who remarked that South America was richer in natural resources, in forest and water, mineral and mine, than North America, and then asked Roger Babson why it was that North America had developed

so much more than South America, although South America was naturally the richer. Mr. Babson, as guest, did not answer. The President answered his own question, and the answer was this: "North America has developed more because the Spaniard came to South America in quest of gold; the pilgrim came to North America in quest of God."

My friends, I do not preach Christianity in the terms of the pulpit. I wish I could. But this I do know; fifty years ago Missouri was as great as her people, and no greater. Today Missouri is as great as her people, and no greater. Fifty years from now Missouri will still be of the same size as her people. Fifty years ago Missouri was richer in mineral resources than she is today; fifty years hence Missouri will be less rich in mineral resources than she is today. Not in mineral resources, and not in hogs, not in terms of material wealth will the greatness of a people be measured; Missouri will be measured in terms of the greatness of her people, and her people will be gauged, first, by their morality; second, by their education; and third and lastly, by their possessions.

I am not a politician. I wish I were. The State administration has put its feet in a pathway, the end of which is a bigger and better Missouri, because it means a bigger and more holy and better educated people in the next generation than we have in this. My friends, did you ever stop to think what it is that makes America, your country and mine? Are you one of the people who believes that America is nothing more than scope of territory and a spot upon the geography? Are you one of those who believes that America is nothing more than its Constitution and a set of laws that limit and define the rights of common men? Are you one of those who believes that America is a sort of social experiment station, a human biographical laboratory, wherein are weighed and calipered the rights of class and mass? My friends, America is all of these things, but America is more than the sum total of these things. If you seek for the commencement of Americanism and of America, you must go back through Abraham Lincoln, on his knees on the floor of the White House; back through George Washington, on his knees in the bitter snow of Valley Forge; back across the ocean to the French Revolution and to the Magna Carta, that great charter of human liberty, wrung from an obstinate and despotic crown at Runnymede; back further to that old cross upon the hill of a Skull, whereon hung The Man who first taught mankind liberty and brotherhood, when he taught all men to say that basic term of human brotherhood, "Our Father." Taking their aspiration and their inspiration from Him, there has struggled down through the ages a long, long caravan of men, bearing at their head the torchlight of human liberty. There has struggled up the long trail of centuries an unnumbered and innumerable host of men who fought upon thousands of battlefields, who pushed ever forward the torchlight of human brotherhood, justice, and liberty, until at last that torchlight was transferred to our shores, to be caught up by a Washington, a Hamilton, and a Jefferson, and America has become the golden hope of the whole world today!

It was the men who founded your Government, who first set it down in black and white: "Religion, morality, and knowledge being necessary to good government and the happiness of mankind, schools and means of education shall forever be encouraged." I stand here tonight proud of the fact that during the last year the State of Missouri was able to give to the common schools of the country and of the city \$1,142,000 more of State money than they ever had in their history before. I am proud of the fact, if they needed the money, that the school boards of our State have dared to raise seven and one half million more than the schools ever had from that source in their history before.

FINANCIAL NEEDS OF EDUCATION IN CITIES

MARK L. THOMSEN, CLEVELAND, OHIO

When I saw your program for this morning and saw the list of distinguished and scholarly speakers it was with a good deal of fear that I made an attempt to face you, and yet in a way this is a familiar gathering. If I had the time to reminisce I would tell you how well I know many of you who have never seen me, because it was only four or five years ago when we needed a new superintendent in Cleveland and made a Nation-wide search. In the process of that search I obtained confidential information about most of you who have the right to call yourselves prominent educators at all. That canvass was so thoroughly made that while we could not choose all of you for superintendents for the city of Cleveland the same list served for several boards of education, and in two instances that I know of superintendents for large cities were chosen from that list. They were the very men we had under consideration. Some of them we did not take because we could not take two.

My relations with superintendents of schools have been very close. We have the same sort of fight in Ohio that Governor Hyde, of Missouri, outlined to you, and as a professional man meeting the superintendents from all over the State it was interesting and encouraging to me to find the readiness with which those superintendents were willing to leave the matter of raising the funds to those who were members of the Board of Education, who were simply buffers between those of you who were doing the real work and the public itself. In the process of that campaign I, of course, became acquainted with many superintendents. I wish this morning I had the time to call by name those of you in cities outside of Ohio that I got to know. Frank Hunter's name has just been mentioned. I spent a whole day with him in a room at the Blackstone Hotel in Chicago. I shall never forget that pleasant interview. I hope I can meet him here after this morning's exercises.

I want to express at the opening of my remarks my great pleasure in the fact that Dr. Strayer and the committee that he represents has finally undertaken what should have been undertaken ten or fifteen years ago

when there broke out an epidemic of surveys of school systems the country over. These surveys, of course, have done a great deal of good. One of the most notable surveys was made of the Cleveland school system. I learned a great deal from it, but in nearly all those surveys the cart was put before the horse. What should have been done first of all was not done. They tell you what a school system ought to do and then call your attention to how far you failed in doing it, when what should have been done was to provide the money with which to do it.

You cannot have an ideal salary schedule, you cannot pay a superintendent \$2000 a year, unless you have the funds with which to pay, without going to the other extreme which has been done in so many places and borrow not only for the physical equipment of the school system but borrow for the actual operating needs from year to year and burdening the system with a debt that is huge. This I will refer to later on.

So I am very glad to know, indeed, that Dr. Strayer and these fellows who have been in the surveys the country over have finally come to see the light, have come to the point where they are thoroughly investigating the sources of revenue for the school system the means by which they may be raised, and then where those funds after they have been raised or they have been made possible, where those funds shall be applied.

Now, the needs of the country have been most eloquently outlined by Governor Hyde. I wish he had been Governor of the State of Ohio through the period when we had to fight for funds in that way. We would not have had much of a fight, but we actually had a fight, because the then Governor of Ohio was ambitious to be President of the United States and did everything that any human being in office could do to withhold from us the power of taxation for at least two years until he had succeeded in getting the nomination and in making the canvass for the presidency. Everything that any man with shrewdness and great ability could do was done. He offered me anything. He would allow us immediately to certify the deficits for two years in advance and issue bonds for them in advance, mind you. He would do anything but actually raise the money because he felt very strongly that he wanted to be able to say while he was in office, while he was seeking the nomination for the presidency that during his term, in spite of the war and high prices, taxes had not been raised.

I am glad that Governor Hyde takes the other view. I believe that the greatest function a board member can fill, the greatest service he can give to his community and to his State is to preach with fervor and with absolute conviction that the public if the question is properly put before it, will pay for education. The public will do that sooner than anything else.

That was the burden of my song during the four years that I was a member of the board and for the three years that I was President of the Association of Board Members for the State of Ohio. Now having said that, it may seem queer to you what will come after, but it will not seem any queerer to you than a statement I read in the paper last night made

by Dr. Frank Spaulding, because he mellowed evidently very much and advocated great tolerance towards the middle-aged teachers in prodding them towards greater efficiency. I presume that he too has seen the light that in all these things, efficiency, newer methods, content training, and so on, that in all those things exactly the same as in tests we may go too far and we may have no longer as a result progress but actual revolt, an overturning of the good that has been done.

I remember saying at one time at a meeting that I hoped we would not go too fast, that we would not get beyond the public, because it had been my observation as a student, as an observer of political reform—I think Mr. Davenport who preceded me will bear me out—that sometimes the most thorough-going reform administration in city government is the one that gets most readily upturned. I presume no city in the United States had a finer administration than had New York City under Mr. Mitchel. Later on he died, I believe, in the War. Yet his work was overturned overwhelmingly at the end of four years, and apparently the overturning has been sustained, and I think very largely due to the fact that those men, good as they were, failed to educate and take the public along with them. Instead of having a continuous reform, instead of having an evolution of good things there was a temporary revolution and then a turning-back to the things that they had had before.

This illustration is important at this time, because while you will need, and Dr. Strayer and his committee will find you will need many more millions of dollars than you have ever had before to carry out a so-called ideal administration of a public-school system that you want, you will, in my judgment, get it much sooner, say within ten years, if you make one tenth of the progress each year instead of trying to make the entire progress in one year and having it overturned the second and third year thereafter.

I am saying this to you men and you women, because you are the superintendents of this country, to you will come the work of educating those with whom you work. That means, first of all, your associates, then the members of your own board that you have to labor with, and through them in turn, the education of your own local constituency. If you can carry that along with you you will succeed; if you can't carry it along with you you will be kicked out sooner or later, not because you are wrong but because you fail to catch the necessity of educating the public with you.

Just now we have undergone a tremendous burden of taxation, and yet there are greater calls for money than we ever had before. Boards of education the country over—I am no longer a member of the Board of Cleveland and so I am not speaking from that standpoint—have been unfortunate in having this acute situation that the War brought about with the cost of living so high that the actual salaries received by the teachers were utterly inadequate to fill the needs, and thousands of faithful teachers left the ranks. No matter how much they loved their work they were compelled to leave because they could not live on those salaries.

This exodus from the teaching ranks brought the great wage revision,

a revision of salary schedules throughout the country. Those salary schedules, of course, are not even now what they should be, but they are a tremendous step forward, and as the cost of living falls I personally hope that the salaries will not fall with it, that the salaries will remain on the scale where they were placed. Nevertheless, these boards have been burdened with an operating cost for the time being, and coming also at the same time as the great needs for the National funds it has made it extremely hard to carry the burden. Exactly the same problems that confront boards of education confront the President of the United States today, and I can't say too much in admiration of the way he is handling this bonus question. I am not speaking either for or against the bonus legislation that is proposed in Congress, but I approve of the President's insisting that if the bonus legislation is passed, made obligatory upon the Government, there shall also be provided at the same time the funds with which to meet it, that we shall not continue to go on and borrow and borrow and borrow.

That brings me to the greatest need in city financing today—that is, the means with which to pay the debts that have been accumulated in one form or another. Now you may want to know something of what from the standpoint of a board member has been the great need of the city school. The country school needs have been outlined to you. American cities like Chicago, St. Louis, and Cleveland, they are good for examples of what I mean, have grown in a haphazard way, nearly all of them without any definite plan, nearly all of them without proper spaces laid out in the beginning for parks, school grounds, playgrounds, breathing spots. As they have grown they have become congested in certain portions, usually the ones with the least facilities. The ordinary playgrounds are utterly insufficient to take care of the growing needs of the school children, nevertheless city school boards must at a time when property values are high purchase and condemn property for school grounds, plan larger school buildings at enormous cost, utterly out of proportion to their utility.

Then we have the great influx of foreigners. I was born abroad myself. I always speak of this matter with the greatest sympathy, and I hope with some understanding, I am sure with a greater understanding than some of those who count themselves authorities thereon. This foreign population requires special attention. We have in Cleveland what we call steamer schools, so-called because they are composed largely of children that came fresh from the steerage compartments of European steamships. With this huge foreign population there came with it the great illiterate foreign population, sometimes illiterate only so far as the English language was concerned. The great problem of trying to educate such an adult population entailed enormous expense on the city government.

Now these are problems for the city government that the country sees nothing of. I have found it extremely difficult in going before the legislature of the State of Ohio to convince those men, the majority of whom were from country districts, that these problems were not imaginary problems, but that they were real problems with which every board had to deal.

Great as those problems are, still greater problems have been thrust on the average city school system by the fact that the compulsory age for school is constantly being raised. In the State of Ohio it is for some pupils eighteen years, for others, sixteen. I remember the time when it was raised from thirteen to fifteen years, a huge increase in school population which we had to take care of at once. Now when we have once covered a district and placed in that district schoolhouses with a certain number of rooms to take care of the normal number of pupils, then all of a sudden we have had thrust upon us the problem of taking care of anywhere from twenty to thirty per cent more pupils. Then came makeshifts of every kind for housing more pupils in the same rooms. The Gary plan was tried, then the shift plans, the Kalamazoo plans, and all the other plans were tried as fast as experts could think of them, half-day sessions, and the like.

I remember going to Public School No. 64 in New York City, in which Dr. Emerson, of Boston, had succeeded in getting the Bureau of Experimental Work in New York to inaugurate the experiment of better feeding or nourishing of children, particularly from that district, and I remember how I looked it over and how I admired the ingenuity with which the Board of Education in New York, or its head, had made use of what they could for playgrounds, for with the enormous street congestion, dangerous to life and limb, something had to be provided in the way of playgrounds. Do you men in the rural districts have any idea of what it means in a city to provide for a single new school in a district of that kind, not only enough room in which to erect the building itself, but some halfway adequate school provisions for the children as well? That is the tremendous burden that is put on the modern American city today. Then there is the question of secondary education. I admit all that Governor Hyde said. He said it so well, so thoroughly. I am so heartily in sympathy with the program that he has inaugurated in Missouri that I hope he will remain in office long enough to see it through. I am so heartily in sympathy with it that I would dislike to have you think for one moment that I am criticising what he said, but the question of secondary education in the cities is far more important than it is in the country for the very simple reason that we have not the occupations that are decent and healthful or at all proper for children from fourteen to seventeen in the Nation's cities. I was brought up in the country, and from the age of twelve to the age of nineteen I did not go to school at all. I am a college man today, but I do not particularly lament or regret the fact that from the age of twelve to nineteen I was kept out of school. There was plenty of good healthful, sane work that exercised my brain probably as much as school would have exercised it and gave me a sense of responsibility as well. There was plenty of work of that kind that could be done. If you go to the cities and you want to pick out an occupation for boys and girls nine, twelve, and seventeen years of age, what will you get? The meanest kind of factory work, dangerous to health, under circumstances that are morally

unfit for those young people. It is doubly important for us to take care of that huge school population through that adolescent period, and we must do it by some type of secondary education. It takes a great deal of money to equip such a school as our Cleveland East Technical High School, the forerunner, according to Mr. Wirt, of Gary, and others, of many fine technical high schools in the country. It takes a huge amount of money, enough to found a college to build a school like that in modern times. I think we have an appropriation at this time of fully a million and a half for one of those big schools. These are the problems that are thrust upon the city school officials today. They cannot be taken care of twenty or forty years from now.

I would not plead for less money for the country, I would plead, if I had any power to plead effectively, for far more money for country schools than they are receiving today. One of the pitiable and pathetic things that I found when as an amateur in the matter I started out to reform the laws of the State of Ohio was that because a constitutional provision exists that the laws must be of uniform application, I could not help Cleveland without reforming the laws of the entire State. It was pathetic to me to find that the small town of stationary population, no growth and no decline, of which there are a great many in this country, were through stupidity and neglect in far greater difficulty financially than were the great cities like Cincinnati and Cleveland and Toledo and Columbus, just because they had forgotten entirely what Justice Brewer, of the United States Supreme Court, stated to our graduating class in law school, that one of the great curses of the United States was not our great industrial trusts that were then being prosecuted in the courts, but it was the abominable trust of the people of the United States in the future generation to pay the debts that we were piling up in endless bond issues at the time.

For these cities have almost all of them, without exception, gone hugely in debt to provide the buildings and the equipment that is needed for modern city work. Some have also, through faulty budgeting, gone in debt for actual operating expenses.

I am a resident of one of the suburbs in Cleveland, adjacent to another suburb, counted one of the wealthiest and most rapidly growing suburbs around Cleveland. The board that went into power a few weeks ago found that instead of having any sinking fund in that suburb there was absolutely nothing but a book entry. Every dollar in their sinking fund had been used up for operating expenses, and that was done in a wealthy enlightened suburb, where there was no need of such a procedure, because they had nowhere near reached the limit of taxation. Two of the board members have come to me for advice. What will they do with the school population growing at a rate that will probably increase their school population in the average more than 20 per cent a year? What will they do when the very buildings that they have today for which bonds were issued a long time ago are not paid? Now that is the fault of budgeting. Somebody—either members of the board who were mentally too lazy to make

the investigation evidently, or a superintendent, a clerk, or a paid official, who also was mentally too lazy to put the facts before the board, and the facts through the board before their public—failed to get what was needed at the time it was needed when there was plenty of funds.

The suburb in which I will live is near there and its population, though a very small population, is even wealthier. Exactly the same thing is being duplicated there with long term bonds running from thirty to thirty-five years, with extremely small nominal payments on the principal at the present time and after an expenditure to meet the debts which could have been paid at the time they were incurred instead of having the funds with which to meet the actual operating expenses that are needed when the crisis comes—I say that is one of the worst things that has cursed the American city school administration the country over.

One of the things that I recall as the President of the Board of Education was the signing of nearly ten million dollars of bonds on school buildings. I had voted for the measure, and we got the bonds, but every bond that I signed, every time I added my signature it was a thousand dollars, and I regret it. The best I could do was to get them in on a strictly serial basis of twenty years' maximum life, and even then I knew that every time we spent a million dollars for school buildings we spent five hundred thousand dollars before we paid it off for interest on those bonds. Now bonds run on the average at least twenty years, and many times forty years. In the case of forty-year bonds before the principal is paid for you have paid the principal, and you have paid twice as much as the principal in addition to that before you are finally through. Now such a burden on the financial system for education is enormous; moreover, it puts a burden upon every new superintendent who goes into a district that he should not have; it puts an obligation on him that he ought never to shoulder.

The best warning I can give you is this: While you plead for more money, plead for absolute honesty with your public. Plead for the payment of your debts. Don't unload them on another superintendent or another board. Plead for the payment of your building, so that you can use the building without having afterwards simply to scour the pot clean for money in order to pay the interest and sinking fund charges for that building, for every growing city needs buildings every year, needs new books, new chairs, needs coal with which to heat those buildings, and needs new buildings. New buildings are just as much an everyday necessity in a modern city as is the matter of what you ordinarily call the maintenance of that property.

Now you are to have a discussion on higher education by Mr. Davenport, and you have undoubtedly what will be an extremely scholarly and sane presentation of how to raise money by Professor Seligman, and I envy him his topic. That is one of the things that I feel competent to speak on. You are up against the old question of whether the Federal Government shall give considerable aid to education the country over. In every State where this matter comes up you will have the question of how much, the

question of how big the proportion of the expenditures for local educational purchases shall be made by State appropriations, which means State taxes. I would emphasize to you, the question of the county unit, so that no one little district with a rich population can get along with an extremely small levy for tax purposes, while other districts that do not have a rich population will have a much larger levy. You will have such problems come up. Let me give you this as the practical solution of some of these things. I do not know what Professor Seligman will tell you as to the theory of taxation, but I believe he will agree with me that in the long run, if you do not hitch your wagon to the star of local revenue you will get bumped sooner or later, if you do not hitch your wagon to the star of local revenue you will get bumped. I am for State revenue, and I am too in favor of some Federal assistance, but I do not think it is as important as you think. If I had the time I would explain. I am for it, and I hope it will come. Don't work to get the bulk of your money for local education from State revenue, because I don't think it is coming from there, because you will always have gross inequalities of taxes on local property, so that the flat rate works a great injustice, but if you will look to the education of the public where you are located up to the point where they can see that the expenditures you are making are just expenditures, that they are necessary expenditures, that there is no great or no unnecessary overhead, if you will do that you will in almost every instance get the local support that is needed, even though the taxes reach a point where it hurts. If you really have at heart the welfare of the children of the district which you are serving, keep on educating your public. They are not doing it in the suburb where I am living. They are not doing it in the adjoining suburb. They have done it in the city of Cleveland, in spite of the fact that the burden there is far greater than it is in those suburbs, and in spite of the fact that every time an issue has been put before the public to increase taxes for school purposes it has been carried, overwhelmingly carried. Why? Because Dr. Spaulding, while he was superintendent, because Mr. Jones, who is your President, followed him, because the Board that served with him, kept the public absolutely informed all the time, because there was not a cent of expenditure taken from the sinking fund that belonged there, because every dollar that was to go toward the payment of debts was put in there, and because the books were opened and were kept in such fashion that they could be seen.

The country will not stand for useless taxes. They are disgusted with taxes that simply stand for useless and extravagant expenditures. They will stand for the other, and you men who are in charge of these school systems ought to go through your system with a fine-tooth comb and eliminate every bit that is unnecessary expenditure at this time.

Put the emphasis upon what you pay your teachers. You are the ones to do the actual work. Put the emphasis on what you pay your teachers and put your emphasis on paying debts, so that each superintendent and each board and each year's administration has the funds for that year to

use. Do that and you will get what you want. I think you will find many times that there are expenses you can eliminate. I think you will often find that at least for two or three years to come, while the country is adjusting itself to this after-war condition, you may get on without any additional taxes of any kind. Educate the public, and carry it along with you, and when the time comes that you want to strike for more money you will get it, you will get it in almost unlimited quantities, so long as you can prove to the public that your use of it is right.

FINANCIAL NEEDS OF HIGHER EDUCATION

FREDERICK M. DAVENPORT, MEMBER OF NEW YORK STATE SENATE, AND
PROFESSOR OF LAW AND CIVIL POLITY, HAMILTON COLLEGE,
CLINTON, NEW YORK

I wish Commissioner Finegan would go out in my district in central New York and make that introduction. They might not believe it but it would satisfy me.

You remember Mr. Dooley who once kept a saloon in Chicago, used to say to his friend Hennessey, before the days of the Eighteenth Amendment: "Hennessey, never mind when they get you wrong, it is only when they begin to get your number that you are in danger."

I am asked to speak briefly this morning on the financial needs of higher education, which I reckon means colleges and universities, since about everything else has been covered. Whenever I tackle a big subject like this I always think of a story that Bishop Vincent, of the Methodist Church, used to tell of a rather emotional Methodist preacher who was in the habit of beginning every address with a brief invocation, and saying: "O, Lord, hold me together until I tell it," but I have always been accustomed myself, when I used that invocation, to vary it a little, "O Lord, hold them together till I tell it." But I did not make that prayer this morning, because I heard Commissioner Finegan make that \$20,000 offer and I knew that that would be far more fruitful of your staying through than any prayer I might personally make.

Of course, one way to discuss this subject, the financial needs of higher education, is to suggest the extending fields into which funds may be poured, and how to get the funds through assessments and levy. Last summer in the month of July it was fearfully hot out in the State of Maine, and it looked as though the crops would not come through, and although they did not take much stock in it in that hard-headed section of the country they finally agreed in that community that they would have a meeting and pray for rain. They all came together. First, a brother who was quite accustomed to public prayer, got up and began something after this wise: "O Lord, send a deluge. Send the blessed floods of thy rain." Well, that did not suit that Yankee audience very well, and after

him there was a fellow of the town-meeting type who got up and said: "O Lord, we don't want no deluge. We don't want the blessed floods of thy rain. The soil is pretty thin in these parts. What we need is just three or four days of old-fashioned sizzle-sozzle."

I think what we need in discussing this subject for a few minutes this morning is all the practical sense we can muster, because we have a real problem, and so I shall begin and end by saying that the most important financial need in higher education is the elimination of waste. Now that is not a new thought, I realize, but it never was so pressing as it is now. You begin to hear about that sort of thing everywhere, in industry, in the case of the railroads—the wastes of competitive terminals, the wastes of returning empties, and all sorts of waste. You read the report of the Hoover Committee of the Federated American Engineers on Industry, and you notice particularly in the five great trades the burden of it is the elimination of waste, fifty per cent of which they charged to management and about twenty-five per cent to labor, and when you come to government in America, well, there is Hell-and-Maria Dawves, of this part of the country, over in Washington doing what he can, and then in my own State of New York we have a very sensible man in the Executive Chair, Governor Miller, who is attempting to show what can be done in the efficient, economical, and business administration of a great commonwealth. We are proceeding under his administration in New York on the principle [which I think is absolutely sound], that you have got to have advance but you ought not to try to have it faster than you can pay for it and manage it. I agree, too, with what Mark Thomsen said this morning, that you ought not to go any faster than the public sense of your community goes along with it. I am in entire agreement with Governor Hyde with respect to the wholesale use of the referendum, but I have the most tremendous respect for the public sense developing slowly under education into public opinion. I believe you can get anything through that method with the American people.

In our part of the country the general burden of education, both rural and municipal, is widening and bearing heavily upon the taxpayer, and the groanings are increasing in volume with each passing year.

The most important financial need in higher education is the elimination of waste. What is the situation? Students are crowding into colleges and universities. The number of students between 1898 and 1915 doubled; between 1898 and 1920, more than doubled. Since the war and especially during the last year or two the institutions of higher education have been smothered with students.

If you ask, why such an inrush, there are all kinds of answers. One is that there is an aroused consciousness about what constitutes living, as the result of the war; parents are bound to have this thing called higher education for their sons and daughters. And then there is the more cynical view of the anonymous writer in one of our leading magazines, quoted by President Coffman, of the University of Minnesota, in a recent address. This

anonymous writer suggests that higher education be financed by requiring students to pay fees on the basis of the grades they receive. He describes a school that was in dire financial distress. Everyone was discouraged and despondent. The faculty met from time to time and engaged in the usual academic discussion, but academic discussion did not supply funds to buy coal or to pay the grocer or the butcher. The president of the institution held out the hope of better days but no one could see them. A business expert was employed to study and report. He discovered that there were two classes of students, those who go to college for an education and those who are in college because it is a fashionable and respectable place to be. He recommended that all students having a grade of 90 or better should be exempt from fees; those having a grade of 80 to 90 should pay a fee of say \$200 a year, between 70 and 80, \$500 a year, and so on down until those who received grades of 20 or below should pay a twenty thousand dollar fee. Out of three thousand students he discovered that 180 would have no fees to pay. One of the mythical fathers, sending his twenty thousand dollar check, is reported to have written: "It comes high, but I believe it is worth it to be rid of the boy for the year."

This cynical view of the institution of higher education as more or less of an eleemosynary cross between an orphans' home and a school for defectives and delinquents is somewhat borne out by the rapidly vanishing ratio between what the student pays and what public funds or private endowments pay into the treasury of so-called higher education. I believe statistics for 1900 indicate that the student paid one half. Now he pays perhaps one third, or one quarter, and the end is not yet.

But the bill of particulars grows. In the institutions of higher education we pour funds into wider and wider extensions of curriculum. Instead of the college, for example, holding itself to the baccalaureate degrees, it is reaching out into what is known as applied science degrees—civil engineering, electrical engineering, chemical engineering, and the rest.

Moreover, in so-called higher education we are running out into the fringes of knowledge, seeking meticulously the limits of specialization, with an ominous increase of financial overhead as the result of the process. The number of faculty hens with one chicken grows apace, not in one institution alone but in many institutions within the same area; same kind of hen, same kind of chicken. It is probably all right for Yale to teach the Mandarin dialects, but why should all the institutions in New England or in the country teach them, too? If there is a good man on the dative case somewhere, why not coördinate effort, why not let all the dative case sharks swim in his waters and give them the credit for it where their college or university residence happens to be? Why in most institutions of higher education is not a restriction to essentials and concentration upon quality the important thing? Why are half the colleges doing university work? Why couldn't we dispense with twenty-five to thirty per cent of all the institutions of higher education in the country? Sentiment, you say. A cat with nine lives is not in it with a college, so far as tenacity of existence

is concerned. We thought that many institutions would blessedly perish of starvation in the period of financial tension following the war. But alumni, friends, communities rallied to support, and nearly all the perishing are held back from the brink of the Styx. All right; but this overlapping, competitive process is helping to crush the spirit and effectiveness of higher education as it is of religion. The drives and the deficits go merrily on. But is not there an end to it all? Isn't there a limit to the gutting of the social income of the country?

Has the time come, for example, when we must examine the situation and ascertain more sharply than we have whether there is a dividing line between the general social value and the value to the individual of various types of higher education? If we are to train persons for future individual performance and careers of more than average earning power, is it right that training of this sort, professional and technical, where the direct value to the individual is very high, should be altogether a charge upon the public purse or private philanthropy, or rather to a considerable extent a lien upon his future earnings, to be at least in part repaid by him through a sound system of loan agreements? We are trying in this country to do something never tried before, we are offering practically free almost any kind of professional education, or any other type of higher education. How long can we bear up under it?

From the standpoint of public funds certainly, and to a degree from the standpoint of patriotic private endowments, what ought the money poured into the treasuries of higher education to be used primarily for? I think not so much to produce professional technicians and prosperous individualistic careers, but to produce the statesmen of politics and government, the statesmen of industry, the statesmen of journalism, the statesmen of literature, the statesmen of education, the statesmen of organization—in a word, the National leaders without whose vision the country perishes and of whose genius America never stood so much in need. Where are your great Americans in National affairs? Where are your "spacious-minded" citizens who give leadership to a democracy? The wiser heads in American industry will tell you quietly that they cannot begin to find the broad directing minds needed in larger number every year as industry grows in organization and complexity. The professional technician rarely becomes a directing mind, without which all is lost. And the wiser heads in industry now look for the men of broader liberal training in higher education to fit into an industrial environment which has outgrown the technicians. If the whole system of National higher education is not moving in the channel which produces first of all statesmen of the broader National affairs, is it not drifting towards National waste?

Surely what we need most is men who can broadly think and plan for this whole people. We should have learned that from the war. The only reason that the planet is worth living on today at all is that France produced for the world one man who could think, in Ferdinand Foch.

Are our colleges, which above all should be training centers for National

leadership, furnishing environment which develops the leaders? Football or hockey is an intelligible and interesting game to college students, but is knowledge as yet an intelligible and interesting game? Not so that you would notice it. On its academic side, the college is yet a passionless home of culture and calm. By the waters of paradise there we sat down and plucked Utopian flowers in Icarian valleys; a resting and ruminating spot between the actuality that was and the actuality which is to be. "'Tis better to have come and loafed than never to have come at all." Would the modern college training have advantaged Lincoln? Only the Infinite knows. It might have been an act of sabotage comparable with heaving a boulder into a Corliss engine. One of the most striking things about Roosevelt was the comparatively slight contribution which his Harvard education seems to have made to his great store of knowledge and power. The birds, the woods, the jungle, the wild animals, the cow-boys, the wardheelers, the bosses, the Rough Riders, the Kaisers—they educated Roosevelt.

But there is one tremendously vital side of college existence, the side of athletic and social activity, and into that channel the energy of American college youth pours itself with abandon.

Is not there a reason and has it not a bearing upon waste and finance? English traditions of higher education in Canada and Great Britain divide the student body into the "pass" group and the "honor" group. "Pass" courses are taken by the "pass" group—as I understand it, a distinct and separate curriculum. The large group of "honor" men who strive eagerly for mental achievement, make the reputation of all Canadian and British universities and furnish the leadership of affairs in the British Empire. Their "honor" men are managed in a totally different way, in different classes, with different relation to their teachers, with much independence, but are held to a rigid program of achievement. The system gives a man who is keen, who is anxious to develop his mental resources, an opportunity to do it on a broad scale in personal contact with his instructors who are directing his studies. It is said to have a surprising effect upon the general morale of higher education. I do not speak from knowledge. I employ my information only as an illustration.

In American higher education, on the other hand, we have a tendency to run every man, good or bad, through the same mould. Practically all our colleges and universities have some kind of an honor system, but the "honor" group consists of three or four or ten per cent; and there is practically no effect upon the student body as a whole. The student body as a whole we have leveled down to the average or below the average, precisely as some of the labor unions do.

And it is no wonder that there has grown up, inside the institutions of higher education, an inner world of vast activity that has no relation to the actual purpose for which the students are in college, a world dramatic, social, musical, athletic. Something must be invented to satisfy the boundless vitality and energy and initiative of young Americans. And there are large numbers of men in every college, the best of them from the stand-

point of future leadership, whose powers find insufficient outlet and interest in the mass-curriculum constructed for the mass-average. And many of them are left to invent other forms of training which have at least the merit of stirring their enthusiasm and capacity for individual achievement, and helping them still to conceive themselves as members of a burly and progressive race.

How are we to remedy the waste of such a system as ours—by adopting arbitrarily the mental class-cleavage grouping of the English and Canadians? I think there is a better and more distinctively American way. Perhaps twenty-five per cent of the wastage may be stopped at the threshold. This is what they are seeking to do at Columbia, as I understand it, by testing out applicants for admission to the college of liberal arts and sciences by simple psychological methods. I am informed that last year, out of 750 applicants, about 450 were admitted. The combination of the scientific test for intelligence with the conventional test for scholarship favors gifted boys with poor advantages above rich boys with gifted tutors, as Thorndike puts it. It is therefore a genuinely democratic method, brings better material into the colleges and eliminates the financial waste of attempting the instruction of the unfit.

But after the men are in, at the end of the sophomore year, after they have had their full chance and have demonstrated that they are not qualified with capacity, desire, and earnestness, why shouldn't they be weeded again? Every student, speaking in a purely financial sense, is a financial liability instead of an asset. Then why not liquidate the liabilities at least at the end of the sophomore year? Thus we may economize energy, effort, and funds during the last two years, when the greatest intellectual impression is to be made upon personality anyway. For the large group which would then be left, the democratic principle is not, every man down to the level of the average, but all men up to the height of their capacity for mental achievement.

The financial remedy for the ills of higher education is to be found, I think, not in new methods of assessment, and apportionment of taxes, but in the elimination of waste in organization and functioning through a return to sound principles of democratic philosophy. Something must be done other than new drives, new deficits, new extensions of curriculum, and new taxes.

I know there are virginal educational areas which have never yet been ploughed. I know that in certain directions there is a genuine call to advance. But when unit costs are rising and the volume of units is rapidly increasing and the social income is not expanding to meet the rising costs, the chief financial need of higher education is economy of expenditure, of function, of organization; and above all, the fixing of purpose dominantly upon the expenditure of public and semi-public funds for the development of broad leadership in American affairs.

HOW MAY THE NECESSARY FUNDS FOR PUBLIC EDUCATION BE PROVIDED?

EDWIN R. A. SELIGMAN, PROFESSOR OF POLITICAL ECONOMY, COLUMBIA UNIVERSITY, NEW YORK CITY

When I see before me this immense and distinguished audience I am reminded of the story of Hennessy's friend. Pat had led a rather checkered life and now, being on his deathbed, sent for the priest to grant him absolution and to perform the last rites of the church. When the priest saw him he said: "Well, Pat, haven't you decided yet whether you want to go to Heaven or to Hell?" Pat replied: "Well, Your Reverence, Heaven is a very attractive place. I like it for its climate and for many other reasons. But, saving your presence, I prefer the other place for its company."

Thus you see, gentlemen, why it is that I feel so much complimented in addressing you today. Now we come to the topic, that very thorny topic, to which I am assigned to speak. And, instead of reading from a prepared paper, I prefer to talk to you quite freely from a few notes. Let us first try to see why and how the problem of the inadequacy of our present revenues to finance education has arisen. There are at least four reasons for the emergence of the problem. The first reason has been referred to by several of the preceding speakers, that education looms continually larger in our actuality and in our imagination and that we are yet only in the very beginning of that movement. While agreeing with almost everything that my distinguished predecessor, Senator Davenport, has said, I should nevertheless like to urge that there are almost no bounds to be set to the possibilities of the education of the future.

I wonder how many of you have read that inspiring book by G. D. H. Cole, the British Guild socialist. Despite the fact that I am by no means in accord with his economic teachings, I think that his last book presents more successfully than anything else that I have read a picture of what education may come to be in a democracy. We may as well accept the proposition that there is going to be continually more spent for education; for it will be an ever better education. Inasmuch as the world tests a country's civilization not by the amount spent for its battleships, but by the sums spent for education, this feature of the problem will constantly acquire greater significance.

In the next place, I should say that we find in education, as in every other form of modern social activity, a well-defined transition from private to public activity. The schools, like the roads, the courts, the army, like almost everything else that is a matter of communal effort today, were originally private. Even today in this country we have in many of our States not alone private schools, such as primary and secondary schools at the bottom, but private money-making professional schools at the top. Education, however, perhaps more rapidly than any other domain of communal life in a modern democracy, has gone over and is today in this coun-

try markedly going over from the private to the public field. Therefore, the difficulty of financing education has become aggravated because the expenditure must nowadays be met primarily out of the public funds, and not by any means to such an extent as in the past out of the large contributions of the wealthy to private institutions.

In the third place, even after education became a public function it for a long time paid its own way. The time was when through the receipt of educational fees there was no net burden resting upon the community at large. Senator Davenport has pointed out to you how even in the higher education we are gradually going over from the thirty per cent to the fifty, sixty, seventy, or even eighty per cent of cost resting as a deficit on the institution or on the community as a whole. In many democratic countries you still have school fees. The distinctive characteristic of our country, however, is the public school. For, as you all know, the public-school system of Great Britain, far from being public in our sense, is the most aristocratic type of school in the world. In this country, however, the public-school system with the implication of free and gratuitous education started partly under Dutch, partly under Anglo-Saxon influences. That idea is now working its way to the very top of the edifice. With the transition from a public-school system which pays its own way through fees to a system which has got to be supported by the community, the fiscal problem emerges. The streets are swept and cleaned today not by the abutting householder, but at public expense. The courts today are no longer self-supporting, as in former times: Adam Smith, you remember, recommended that court expenses should be paid out of fees from the litigants in order to make the judges more diligent in their work. Just as the courts are today supported out of public revenues; just as the public policeman has supplanted the private watchman; so it is coming to be with education.

Finally, we come to the last point, which is that in the forms of public revenue themselves there has been a great change. In early times public expenditures were defrayed out of voluntary contributions. We know in every colony of what is now the United States the exact date when the contributions from the men "whose heart is willing," as the law quaintly put it, no longer sufficed for defraying the public expenditures. There were so many whose hearts were obdurate that they had to substitute for the voluntary offering the compulsory payment. But even then and until very recently the revenues of Government were defrayed from other sources, and taxation was of exceptional occurrence. While a man was then as now willing to die for his country, very few were found who were willing to dig their hands in their own pockets for their country. Public expenditures in Colonial times were very largely met by lotteries, by special assessments, by fees. The very institution with which I am connected, Columbia, was started and maintained for a long time by a lottery. Taxation is an entirely modern development, a development of the end of the eighteenth and the nineteenth century. Our troubles with England were due not so much to the fact that taxation was without representation, as to the fact that there

was an effective method of taxation. The modern difficulty has arisen because people must now pay those expenses which hitherto were defrayed in other ways.

Notwithstanding everything that I have said, isn't it true that the average man today is willing to pay his taxes provided he knows that his neighbor is also doing the same? Haven't we seen today, as a result of the great war, this unheard-of readiness on the part of citizens of our own country as well as other countries to bear crushing burdens for the common good? Again, isn't it true that while education has developed and while the needs, as we have been told, have prodigiously augmented, wealth has also increased *pari passu*? Aren't we far wealthier today than we were a generation or a century ago? Aren't we the richest Nation of the world, upon whose very whisper hangs the decision of diplomats and statesmen all over the world? How is it, then, that rolling in wealth as we are, with a readiness of the average citizen to listen to the claims of education, how is it that we find this great and growing embarrassment?

Well, gentlemen, the reason can be put in a nutshell: our technique of public revenue has not kept pace with the increase in our wealth and with the increase in our financial needs. We have the wealth, but are no longer able to tap it effectively. That is the real core of the difficulty.

What is it that we practically find? When our revenue system developed in this country it was in accordance with the underlying economic facts. The first thing that the Puritan settlers did, when a few years after their arrival they went over to this system of compulsory contributions, was to lay down the principle that every man should contribute according to his ability. "Faculty" is the word you find in the New Plymouth laws; and in parts of New England today they still call it the faculty tax. How was this faculty or this ability measured? In a way very different from the custom in the old country. In Great Britain, when you speak of a man being worth £10,000, what do you mean? You mean that his income is £10,000 a year. But in this country when you say a man is worth \$10,000, you mean that his property is worth \$10,000. Now why did we develop in this country the system of measuring wealth by property? Because in the feudal system, in the Middle Ages, in Great Britain, land was never bought or sold, and a man's wealth could be measured only by his rent roll. But in this country as soon as we started trying to conquer nature in our fight with the virgin conditions of this continent, land, like everything else, became the object of daily purchase and sale. Accordingly, a man's wealth in those days was measured in terms of the land that he had, and after a while of the other scant property that he might have acquired. That was perfectly right and perfectly true, because in those days there were not any very poor, just as there were not any very rich. Every man worked and every man had a little property and things went along fairly well. A man's wealth was measured in terms of his property.

Now, however, the situation is entirely different so far as the fundamental economic facts are concerned. A transition, nay, a revolution has

taken place. Just as our economic system has changed from the primitive economic system to the modern industrial system, so the basis of our fiscal life has changed. The old general property tax which gradually developed in parts of this country at the end of the eighteenth century, in other parts during the first quarter of the nineteenth century, and in still other sections only toward the middle of the nineteenth century—the general property tax has become, so to speak, a sacrosanct idea, a shibboleth, something to conjure with. Not one man out of a thousand will think of a man's ability to pay taxes except in terms of the property that he owns. Yet it is today entirely wrong. It is a thing of the past in almost every other part of the world, where the general property tax has disintegrated and disappeared. It is fast going in this country in the more developed States of the Union. Senator Davenport has just introduced a bill in New York State doing away with the last vestiges—most of the others were done away with some years ago—of the general property tax, and in many another State the general property tax is beginning to disintegrate and crumble.

Now why is it that property is no longer the fit test of ability to pay? Why is it that the efforts that are being made throughout the length and breadth of this country and the endeavor of our school authorities to secure a little more money by bothering with property assessments are all bound to fail? The Governor of Missouri has just told us—of course, we have only a few States where that deplorable situation of the fractional assessment that they have in Missouri exists—what their great effort has been to jack assessments up to the level which is found in most of our other States, legally at least. I do not wish to deny for a moment that for purely local purposes the selling or property value of the real estates is still quite defensible as the basis for assessment in this country. I won't go into the reasons as to why that is, because that would lead me too far astray, further than to say that where there is under our modern economic conditions an immediate capitalization of the yield or produce into the changed property or selling value, as is the case in land, you can still use property as a test of ability to pay or of value in real estate. But the case is very different with all that kind of property outside of real estate and with all those elements of ability outside of property.

There are three reasons why we have got into this muddle. First, the growth of intangible property. The industrial revolution created corporations about the middle of the century, when our first general corporation laws were enacted. This mass of intangible property, consisting of securities, of stocks, bonds, and all the rest, as well as of mortgages, constitutes a great part of the wealth of this country nowadays. No method ever devised by mankind, from the time of the Roman when they used torture in the attempt to elicit the facts, down to the listing and tax-ferret laws of modern times, has ever succeeded in making a man declare his intangible personalty when he has an inducement not to do so. One great reason, accordingly, why our general property tax has become a failure, especially in proportion as you are dealing with those States where you find more

industry and commerce, is because intangible personalty has slipped out of the assessment list. As a result the burden falls upon the owner of the tangible personalty, chiefly the farmer. That is one of the great reasons of discontent in this country today.

The second point is perhaps even more important, namely, that the economic revolution has brought about the emergence of immense sources of wealth entirely unconnected with property. Our railway presidents who get \$50,000 or \$100,000 a year, our great lawyers and doctors who make from \$100,000 to \$300,000 a year in the city of New York, our architects, our engineers, the whole mass of modern society has in it persons who receive immense sums in the way of emoluments and earnings. Yet if they spend all those earnings—and you can generally count upon their good wives to do so—they are not liable in one iota to any form of property tax. Thus we find entire classes who are not in any way reached under the system of property as a criterion of faculty.

But there is something still more important. Under the older economic system, where things went along placidly, where there was less speculative activity, where there was no modern world machinery of trade and commerce, a business man's prosperity could fairly well be measured by his stock-in-trade or his property. Now, with the prevalence of speculative activity, with the development of the turnover, with the progress in all those other more subtle economic aspects of our modern life, a business man no longer reckons his prosperity according to his property or stock-in-trade, but according to his profits, and these profits may stand in very little relation to his property. Take two men with the same profit, but with very divergent stock-in-trade. Take, for instance, the large department store and the diamond merchant. Although they may enjoy the same yearly profit, they will have not only entirely different store accommodations, but also entirely different quantities or values of stock-in-trade. Their turnover may vary, and the ratio of profits to stock may vary. That is the reason why the business man today no longer believes, if he is an intelligent man, in property as the test of success. When the war with England took place, how did we finance it? So far as direct taxation was concerned, by a tax on property. In the Civil War we had indeed a very small and insignificant tax on income, but we had primarily a direct tax on property and, above all, the indirect taxes. But what happened in this war? Not a single example of a property tax, and very little from indirect taxes. Seventy or eighty per cent of all our tax revenue consisted of taxes on profits and on incomes. Isn't that enough to show you what the situation is and how the world has changed? Yet only a few of our States have begun to be touched by the recognition of this transition which we in the Federal Government have long since realized.

In other words, the reason why our revenues are inadequate is because we are tinkering with an outworn and irremediably defective machine. You can't patch it up. I don't mean to say that there are not States in this country which are more agricultural in character than, let us say, New York or Massachusetts or Illinois, where for some time perhaps the general

property tax will linger. But I do mean to say that the sooner we realize that the real basis of taxation, the real criterion of ability to pay has changed from property to produce, or yield, or earnings, or profits, or income, the better for all concerned.

Now what has taken place? We find that in our industrial States like New York, Massachusetts, and now New Jersey, that even in the West, in Wisconsin and in some of the Southern States, like Delaware and others, after trying in vain to accommodate present fiscal methods to present conditions by developing a more or less unsuccessful corporation tax, we now have gone over to supplementing, or, as in New York, supplanting the property tax by a system, first, of taxes on income, and second, more important even than that, by taxes on business.

Why is it that the farmers find so much difficulty? I quite agree with what Mr. Thomsen has said, that, after all, the problem is one of local taxation. Under our present conditions, however, even if you escape the deplorable situation of fractional assessment in a few of the Western States, you can't have a full assessment of your local real estate. For, since the real estate is used also as a basis of the State tax, and since the State tax is apportioned locally according to the amount of assessed valuation, there is an inevitable tendency on the part of every county assessor to cut down the local assessments to the lowest possible figure. The lower the local assessment the less the contribution to State tax. But even if you were able to jack up the local assessments of real estate, you would still have the two problems of intangible property, which does not find its way at all into the assessment lists, as well as the existence of your rich doctors or lawyers or other professional men who cannot be reached by a property tax.

The thing to do is to make even the local revenues more adequate, more in keeping with local ability to pay. That means, in the first place, to do away entirely with the State tax on real estate, keeping your real-estate tax only for local purposes and getting your State revenues from other sources, as we are beginning to do in many of our States. But it means far more than that. It means that you will tap the State-wide sources of wealth, the incomes of individuals which come not from the land, but from the opportunities connected with the real estate in their locality, the incomes which do not go to the farmer in the locality, but which go to the merchant who lives in the town or to the man who lives in the city, but whose career depends fundamentally on the farmer. You have got to tap those sources of revenue, and you can do this by very low rates, as we are showing in New York. In New York, with an average rate of two per cent on incomes and four per cent on business, we are securing a revenue this year of sixty or seventy millions of dollars. Even Delaware has recently imposed a similar tax, which they call an income school tax, devoting the whole of the revenue to schools. Whether we do the one thing or the other, the point I desire to make is that the revenues will come in so abundantly under a modern system of taxation that the State will be able to turn back to the localities monies which in a deeper sense really flow from

the localities. Half of our New York income tax goes back to the localities, and when, in addition to that, the local real estate is no longer assessed for State purposes with the result of pulling down the assessment, and when, as in New York, the localities get a share of the income in proportion to their assessed valuation, the old-time tendency to undervaluation is counteracted, and the higher local valuation will require a smaller tax rate to raise a given sum. Thus you will have both coming and going such an immense increase of potential revenues as to satisfy everyone, and the embarrassments, hitherto found in this country from the financing of education, will come to an end.

I want to close by a story which may illustrate our program. A few years ago I was traveling in Switzerland, where, as you know, the only means of passenger transportation is often the stage-coach. At a small mountain station I paid my fare and clambered up on the box of the diligence. Shortly afterwards a peasant came along with a big basket and bought a second-class ticket, climbing up and then sitting down next to me. I wondered, but said nothing. Then came an old woman with a large bundle on her head. She asked for a third-class ticket, but instead of going inside she also got up and sat down on my other side. Then I said to the postilion: "What does this mean? I paid for a first-class ticket. Now these good people come in here and, although they buy second- and third-class tickets, they crowd in beside me. What is the explanation?" The postilion smiled and said: "Wait a bit and see." So he cracked his whip and the six mules started off at a brisk rate. Soon we came to a hill. They began to walk, and as the hill became steeper we came to a stop. Then the postilion jumped down and cried out: "First-class passengers, remain seated; second-class passengers, get out and walk; third-class passengers, get out and push." Now, ladies and gentlemen, if we are really serious about it, we all want to be third-class passengers, and push for the reform of which I have spoken.

WHAT HAS THIS COUNTRY REASON TO EXPECT BY WAY OF
CULTURE, EFFICIENCY, AND GOOD CITIZENSHIP
IN RETURN FOR THE COST OF OPERATING
PUBLIC EDUCATION?

W. O. THOMPSON, PRESIDENT OF OHIO STATE UNIVERSITY, COLUMBUS, OHIO

President Jones: It is not so hard, as a rule, to get interested in what lies in front of us; it is more difficult to review the work we have done, analyze it, and face some unburied mistakes. This program has been set together with malice aforethought, that it may be an example to us. We have been proceeding by adding more money to our budget. We have been adding more subjects to our curriculum, constantly expanding, and it is a wonder now if it is not time to check up to see whether we have given in return to these communities in proportion to what the communities have given us. In short, are we achieving the ideals that we set out to achieve? Have we kept them strictly in mind during the expenditure of our time, our efforts, and our funds, to the end that we may have what the public wants? If you will look at the program you will discover that we have men east and west of the Mississippi Valley, men of varied phases of education, men of varied training in education, men with varied experiences in education. I am proud to present this group of men to you this morning, and I believe that they will present to you some of the consensus of opinion, based on substantial fact, out of the righteousness and mellowness of some of the richest experience that this country has ever afforded men in public life. I wish to thank you particularly because this is Thursday morning, and I hope the members on the program this morning will feel that this is a real tribute, that you men have stayed through these long meetings all this week and are out here fresh as daisies to meet this group.

I shall ask you first to listen to Dr. William O. Thompson, the president of the Ohio State University, a man whom we respect in Ohio for his good sense and for his practical views and because of his long and successful experience. Dr. Thompson.

Dr. Thompson: Mr. Chairman, Ladies, and Gentlemen: The topic announced this morning, as given to me, was "The Ideals to be Achieved by Public Education."

The topic for this morning is an inquiry that cannot be otherwise than wholesome. This, if I understand it, is the spirit of modern education. Very few educational gatherings in the last generation have failed to develop this spirit of inquiry into the aims, the processes, and the results of education. The accent or emphasis may have shifted from time to time, but at no time has there been indifference. The teachers of the country are continually alert as to the quality of their work and its results upon the rising generation.

In no other circles of the country is the free exercise of the critical spirit more welcome than among the scholars and teachers. The result has been that no educational theory has been repressed. Men are free to utter their

convictions and their beliefs. On the other hand, no theory worthy of attention establishes itself without a challenge and the test of experiment. This critical attitude toward education is chiefly from within. Giving all due recognition to the occasional writer or non-professional critic, it may be noted that the most critical of all critics are to be found in the rank and file of the education of the country. This attitude toward the work to which the teacher has devoted his life preserves it from dry decay and from irresponsible anarchy.

This critical spirit in which I assume we all rejoice has put under the microscope of criticism every proposal as to content of courses, subject-matter, methods of teaching, organization of material, and indeed every educational principle or practice yet invented or discovered by our most fruitful minds. The high value of this critical attitude is here affirmed. Further attention is invited to the suggestion that this perpetual criticism of our work does not justify the oft-repeated statement that nothing is settled in education. It may be well to remember that no fallacy or folly can find permanent place in our educational program in the face of such criticism. The public may reasonably expect the teachers of the country steadily to eliminate the least desirable and to perpetuate the most effective principles and practices in education.

Education an experiment—This attitude suggests that all education is an experiment with the human spirit. By the very nature of the case it cannot be a static science or a fossilized practice. This great laboratory in which the teachers of the country are working out the experiment with the human spirit is the most throbbing, thrilling place in the world. No one should claim infallibility or inerrancy for it. At the very best it is a rationally conducted experiment by the most capable among us. There are no patents on its processes and no secrets to be withheld. These great and vital experiments are in the interest of the individual and of society where the spirit of dogmatism and conclusiveness are alien to the atmosphere of education. We are not unmindful of the confidence with which the ultra-conservative mind clings to the past and all that it holds. These minds are apt in adverse criticism of all that is new chiefly because it is new or incomprehensible to a mind chiefly interested in archæology. Inertia and sleeping sickness may be quite as fatal to progress as St. Vitus' dance or the rickets. The failure to appreciate that education is of necessity an experiment has turned many otherwise good people into carping critics when they ought to have been our most constructive helpers. Even then they have not been entirely useless. Sign-boards have a double function, to point out the way of progress and also the way to avoid. Constructive criticism is always welcome, but even the most iconoclastic criticism is not entirely without profit.

The public attitude—I am putting emphasis upon this view of education for the reason that our inquiry must recognize that the "public" graciously taken into our confidence this morning does not always fully understand just what the function of the school is in our system of education. Frequently it assumes to know. Especially is this true of the ex-

educator whose memory of the schoolroom is more vivid than his knowledge of present conditions is accurate. One may read volumes of this kind of educational comment and agree heartily with it if it were in accordance with actual conditions.

Public comment upon education is always sincere, but often misled and deceived through the inability of the educator to inform the public, or his failure to appreciate the importance of such a disclosure. At best, the teachers of the country are not good in wholesome publicity. The result is that education has often suffered at the hands of its friends and of those who sincerely desire to be its friends.

The freedom to experiment—The one fact that stands out in American education in which we all rejoice is the freedom to experiment which has been accorded the teacher. Granted for the moment that all education is a progressive experiment with the human spirit, nothing could be more vital to the progress of civilization than the freedom to experiment with our ideas. Happily there has been a large field of freedom in which practically all our progress has been made. In certain circles we have heard much about the necessity for academic freedom and the liberty of the mind in the presence of great dogmas. In fact, however, they have been but passing phases. Public education has been kept singularly free for any rational experiment looking toward the discovery of new principles or the improvement of existing practices.

The spirit of the teacher has had much to do with this state of affairs, but I am not unmindful of or unappreciative of the fine progressive spirit of the public which has sustained the teacher in his effort to do more than has yet been done for the American child and youth. This freedom for experimentation in education is, in my opinion, one of the greatest present-day assets within our grasp. It may, and doubtless will, give rise to much that is ephemeral, but we may confidently trust the same critical judgment of the scholars and teachers to lead us into the green pastures and beside the still waters rather than over the Niagara.

Standards of education—These are the days in which we are hearing much that is novel and some that is startling in the field of educational standards. The object of all this, let it not be forgotten, is to discover whether the schools are doing the work as well as they might or as they ought under all the circumstances. Serious scholars are in doubt as to the high efficiency of much of our work. The normal earnestness with which they are attacking the situation merits our enthusiastic commendation. No doubt some of the standards of measurement are artificial and to a degree defective. No one would claim for them inerrancy. The earnest judgment of the most accurate scholar may need revision. It is from within, let it be now said, that this critical spirit has found expression. Teachers and investigators are convinced that some unattained standards are within the possibilities.

Further, there is admission now that our standards of measurement long in use have measurably failed to serve as a satisfactory standard of intellectual or educational progress. The examination system imported from

the Old World has grown hoary with age, notwithstanding a long-continued paralysis. The National Education Association years ago vocalized its doubt about the efficiency of the examination system both for promotion from grade to grade and for entrance to high school or college. The inertia of the academic mind since the discovery of the examination system and the insufferable contentment of those promoted with their own status prevented any progress. Meantime the educational world tolerated this device because no genius came along with anything better.

But times are changing. During the war no army officer could discover a skilled workman or a man of special talent in response to a requisition from the War Department. It took a psychologist to go down into the ranks and by some intelligence tests discover the talents tied up in napkins, and quietly clothed with the authority of the Government put these talents out to work. This shocked the entire country into submission. A new test of intelligence and of intellectual progress has been found by which it might be known whether one man was more skilled than another or whether any man was more skilled than his present status would suggest. When 112 teachers of history can read the same lot of papers and vary in their estimates from about 25 or 30 to 75 or 80 no intelligent man needs to be told that the examination system has broken down utterly. When students prepared in private schools well equipped to pass entrance examinations by men who live, move, and have their being in examinations, are compared in their college progress with students prepared in the free atmosphere of a public high school and the comparison results favorably for the high-school student, it should be no crime to suggest that our standards of measurement have not been all we could desire. That this question looms large in every educational program throughout the country is one of the most hopeful signs of progress on the educational horizon. It is notice to the public that the schoolmaster is determined to find out the truth in this matter.

A further criticism—I venture to suggest that we are apt to overlook the consequences sure to follow this rejection of the absoluteness of the old methods. For a long time education has been too much a matter of command. The more mature mind in dealing with the less mature mind has unconsciously and perhaps without malice aforethought assumed the air of command. We set a task for the student. We tell him to do as he is told. He follows the dictation and direction of the textbook, the laboratory guide, or the teacher. We then proceed to examine him to discover whether he has obeyed orders. Too many examinations have been set with this definite thing in mind rather than the idea of intellectual growth or educational progress. In other words the tendency has been and still is to a great degree to put the entire responsibility for education upon the student. I have known college professors who disclaimed almost all responsibility.

In a most interesting and illuminating article on the scientific technique of curriculum making, Professor Judd discloses this same tendency to adjust curricula, to rearrange the contents, all with the pupil in view. This

is admirable so far as it goes. It would be fine to have a curriculum that a pupil could comprehend and a content that he could master, but finer by far to have one that a teacher could teach and then to hold the teacher responsible for doing his work as well as the pupil is expected to do his.

The modern shake-up in standards of measurement will develop the fact that in this great experiment with the human spirit which we describe as education there is some responsibility attaching to those who conduct the experiment. In the final analysis the teacher will share responsibility with the pupil and the student. Interestingly enough the great leaders in graduate education have pointed with pride to those of their students who have marked successes. Gladly they share the honors. In these days we hear more of the failures to pass in high school and college and less of the reason why these failures accumulate from year to year. Our systems of inspection and examinations have been applied too exclusively to the student. Let us not relieve him of any responsibility that is his. On the other hand we may as well prepare for the inevitable. The new standards of performance will be found to apply to the teacher. Therein lies our next progressive step in education.

In Ohio last year if we may trust public statements, 180,000 pupils failed to pass in the schools of the State. Making all proper allowances and discounts this situation cannot be accounted for by heredity, intellectual dullness, the presence of the moron in the class, or the kind of textbook used. Even poor ventilation will not entirely explain the situation. The teacher is part of this process. In some of our schools there are more important questions than those of physical equipment and salaries. The public may reasonably expect us to meet this situation courageously and honestly.

Cost of education—The element of cost is inevitably included. We could not escape it. I propose no statistical study. I would suggest, however, that the public mind is not altogether convinced of the soundness of our educational methods in finance. I have rarely heard complaint on the score of salaries paid to teachers or to superintendents and principals. The truth is that the well-nigh universal belief among us as to the efficacy of education in preparing the children to live well in a democracy has carried with it a high appreciation of the service of the teacher. People are not complaining about the rewards or remuneration of the teaching. They have, however, a legitimate right to raise an inquiry as to the efficiency of public free education in dealing with the great masses of children and youth entrusted to our care. They share our anxiety, and they pay most of the bills. The question is not whether education is worth what it costs. There is no money value that can be put upon education. Nevertheless, there is just inquiry as to whether the measure of our efficiency corresponds to a rational expectation.

The fact already referred to that one hundred eighty thousand in any State in this Union should fail to show satisfactory evidence of progress in our system of education is a distinct challenge to us either to explain the situation in a satisfactory way or to discover why we cannot explain.

We cannot escape the responsibility for our trust in view of the large freedom we enjoy in our methods of work.

Let us now pass to another phase of the inquiry suggested by the topic for the morning,—namely, the field of idealism in which the school has its life. Our ideals are our ideas emotionalized to the highest pitches of enthusiasm. Was it Carlyle (but no matter) who taught us that religion was morality touched with emotion? Where there is no vision the people perish. The schoolroom, if it be a place of education, thrills with this emotionalized idea. Here is the kingdom of the human intellect regnant with all the possibilities of its power.

Intellectual standards—First of all, we affirm that a national expectation from the public requires that the schoolroom be supremely intellectual. I shall not debate but assume the utility of much of the new subject-matter, such as agriculture, mechanic arts, household arts, as well as much of the older material.

I should like to insist upon the cultivation of the intellectual power demanded by the ability to read and to interpret. Inasmuch as George Washington persisted to his dying day in some incorrect spelling and since Homer and Shakespeare were afflicted with the same weakness I shall not insist upon spelling but direct attention to the fact that all these men dealt familiarly with ideas and not too much with mere words formerly known as the "signs of ideas." These men were sufficiently intellectual to deal directly with ideas however expressed in spelling.

It should not be overlooked that this is an intellectual world and requires an intellect equal to its interpretation. Modern invention has not abolished the necessity of intellectual power. The mediocre intellect will never scale the heights of lofty thinking or enjoy the pleasures of a world of thought relations. The interpretation of the world with all its history of struggle, of passion, of ambition is an essential to progress. Somewhere in our educational system these free intellects must have their opportunity. Much of our energy has been given to reducing education to terms for the simple instead of reducing the great ideas to the terms of clarity and simplicity. In the multitude of words we have lost our ideas and our ideals. Too often do we hear the complaint from the best intellects of the dullness and monotony of the classroom. The call today, as I see it, is that the schoolroom shall be so highly intellectualized as to develop the power to deal with ideas and ideals. This is the field where American traditions have developed the spirit of conquest. No adequate program of Americanization is possible until this power of interpretation has been developed.

Supremacy of law—A second remark now offered is that the public may justly expect the school to maintain a proper state of mind toward the supremacy of law as accepted by the American people.

I do not refer to the supremacy of the law as the bulwark of the *status quo* but as the conditions precedent to all orderly progress. We are not interested in sudden revolutions but in steady progress. Our Constitution as the supreme law of the land has stood for more than a century subject

to nineteen amendments. Doubtless it will continue to stand subject to other amendments as the popular mind centers upon new conceptions of citizenship and of government. The point in mind is that education is a process in an intellectual world where the orderly processes of law obtain. The human intellect is no exception. The human being should early learn that this is an orderly world where chaos, anarchy, and lawlessness are the enemies of all progress and happiness.

Ideals as to freedom—A third remark is that the public may rightly expect us to maintain the highest ideals as to freedom. This great constitutional democracy has been developed under the ideals of civil and religious liberty, of a liberty under and within the law, and of the rights of both persons and property. Here is a more or less well-ordered society in which the supreme good of society and the rights of the individual are happily blended. The history of our progress in civilization as illustrated in the institutions of society such as the school, the home, the church, the courts of justice, and the legislative bodies, all unite in making America what she is. Those who love the flag in its idealism cherish the school as the great organization of society for progress and happiness. This is more than a political or economic issue. It is the great moral issue of the day. Teachers and citizens alike are disturbed at times because of the lack of moral stability or of moral alertness on the part of public-school pupils and of college students. Compulsory education has thrust all classes into the public schools. As some one has remarked, "The streets have gone to college." It may be well to remind ourselves, therefore, that the most stupendous moral issues of all history have been thrust upon the schools of the country.

We are confronted not only with the facts of illiteracy in a very literal sense, but with a social and moral illiteracy infinitely more appalling. The schools are set not only to redeem the intellectual life of the rising generation, but to redeem the social and moral situation so that a patriotic love of our institutions may perpetuate an America worthy of our best traditions and our reasonable expectations. Constitutions and laws are not in themselves guarantees of free institutions. Men build institutions and ordain constitutions. The supreme issue, therefore, is the building of the citizen who will support his government and maintain free institutions. Meantime it is well for the citizen to be economically efficient and sufficient. It is well that his education shall contribute to this end.

In a very large sense the supreme issue is the moral quality of his citizenship. If the school shall contribute liberally to this high purpose no cost of education can compare with the value of the results. A free citizen in a free country cherishing and supporting free institutions is the crowning glory of our civilization. The school needs no other justification.

WHAT HAS THIS COUNTRY REASON TO EXPECT BY WAY OF CULTURE, EFFICIENCY, AND GOOD CITIZENSHIP IN RETURN FOR THE COST OF OPERATING PUBLIC EDUCATION?

FRANK E. SPAULDING, HEAD OF DEPARTMENT OF EDUCATION, GRADUATE SCHOOL OF EDUCATION, YALE UNIVERSITY, NEW HAVEN, CONNECTICUT

President Jones: I feel especially qualified to introduce the next speaker. I have had, as you know, the pleasure of working with Dr. Frank E. Spaulding. I think I ought to be permitted to say that he has been the greatest superintendent of schools Cleveland ever had. He has done most effective service there. Later he had the opportunity in Europe to test out men of all grades, shades, ages, and varieties. If he did not have the opportunity to see some of the products of the education of this country, I don't know who has. I think Dr. Spaulding recognizes things and absorbs them when he sees them. I am especially impressed by his judgment because he discovered me.

Dr. Spaulding: This country is spending a round billion of dollars a year in "operating public education." What is a fair return for this expenditure? This is a typically American question, a question couched in the terms and breathing the spirit of American business efficiency.

Important as this question is, it is far transcended in importance by these questions: What results, other than culture, efficiency, and good citizenship, as these are currently conceived, must this country seek from her public schools? And, what beside money, beside the things and services that money can buy, must this country invest in public education?

Sir Auckland Geddes maintained in a recent address that the end of education is "to turn out minds that see facts in a certain color." What is the color of our public education? We have never seriously faced this question of the color of our education—so much more fundamentally important than the facts of education, with which we are chiefly engrossed. We do, indeed, give some consideration to the various pigments that we think should be introduced into the color of our education. But this is as far as we ever go in dealing with the color of our education; we stop with the detailed pigments that we think should be represented.

But what of the color, the deep fundamental color that has absorbed all the pigments that we have introduced, the color that is the resultant of all pigments; what is it? Is it patriotism? Is it honesty and sincerity? Is it truthfulness? Is it goodness? Is it courage? Is it cheerfulness? Is it generosity? Is it humility? Is it sympathy? Is it love of humanity? Is it love of justice? Is it regard for law and order? Is it sense of duty and obligation? Is it service? Is it character? Is it thirst for knowledge? Is it regard for accuracy? Is it appreciation of the beautiful—in art, literature, music, nature?

It contains traces, indeed, of all these pigments, some quite marked, others so faint as to be hardly discernible by the naked eye. But the color itself,—

the deep, all-absorbing, overwhelming color of our public education, is *individual success* through individual effort,—the desire, the determination for individual achievement; and this desire, this determination, is overwhelmingly, almost universally, focussed upon ideals of material achievement, of material prosperity.

Our schools are not to be criticised for this color of the education that they give; this color has been inevitable. Our schools but represent and prepare their pupils to realize the dominant interests and purposes of our people. These interests and purposes were expressed by Emerson, over three quarters of a century ago, in language that needs but slight if any modification today, when he said, "In America out-of-doors all seems a market;" the lecture platform, the pulpit, legislative halls, the public press, "recommend conventional virtues, whatever will earn and preserve property; always the capitalist; the college, the church, the hospital, the theatre, the hotel, the road, the ship, of the capitalist,—whatever goes to secure, adorn, enlarge these, is good; what jeopardizes any of these is damnable."

Our public schools are popular institutions, in every sense of the term; they are the creation of the people; they are supported by the people; they are made to serve the interests and demands of the people. These interests and demands are fundamentally, overwhelmingly—may we not say increasingly?—the demands of business, of material prosperity.

There is not one of the important developments which make up the educational progress of the last quarter-century, that does not represent a business demand, that does not maintain itself and justify itself chiefly in terms of its contribution to material prosperity.

When the business man is asked to make his criticism of the public schools constructive, to specify in positive terms the improvements that he would have made, what does he reply? Teach pupils to spell; to write a legible hand; to compose a business letter; to perform fundamental operations in arithmetic quickly, confidently, and accurately; to be prompt; to carry out instructions; to be loyal to the interests of their employers—all excellent business assets that contribute directly to material prosperity.

It is far from my intention to criticise the business demands on our schools. With the life of our people what it is, with our dominant interests, our aspirations and ideals what they are, these demands on our public schools are inevitable, just as inevitable as the color of the education for which these demands furnish the pigment.

My purpose in holding up before us the fundamental, overwhelming color of our education, and in directing attention to the equally fundamental and overwhelming public interests and demands that supply the pigments of this color, is that we may face such profound questions as these.

Is this overwhelming color of individual, material success a satisfactory color? Is it a safe color in which to prepare our youth to see the facts of life? What is to be the end of the domination of these material interests, these aspirations and ideals, that perpetuate and strengthen themselves through the color that they impose on all our public education? Pushed to the limit, do these guarantee the perpetuity and advancement of civilization?

The life of our people on this continent began with the stern struggle to wrest from nature the bare necessities of living; and this was but a renewal in America of a struggle as old as the human race.

Until very recent times, the struggle in this country was almost purely individualistic; every man for himself. America, the land of individual opportunity! The raw materials of nature were at hand for the use of everybody; the degree of prosperity that any man might achieve was limited, but limited only by the man's own efforts. There was little room for dispute or uncertainty concerning the ownership or enjoyment of the proceeds of individual exertions.

But these primitive conditions of individual success are largely and increasingly of the past. Nature's raw materials lie freely at the hands of few today; isolated, individual labors, where possible, accomplish little. Coöperation is today indispensable; the extent of harmonious coöperation is already the measure of achievement; its importance is bound to increase rapidly.

For the first time in recorded human history, we have in America the unique spectacle of an immense, populous nation in which there is an abundance of all the elements required to provide not merely the necessities of life but comforts and even luxuries in generous measure. The raw materials are at hand in almost limitless variety and abundance; human intelligence, expressed in scientific discoveries, inventions, effective organization, and administrative control, and especially in the Iron Man of rapidly growing efficiency—such intelligence is also at hand in increasing abundance. The effective application of this intelligence to raw materials, in ways that are already mastered, insures a product abundant for the needs and comfort of everyone. And as we are convincingly told, we are now but just beginning to glimpse the practical possibilities of developments of material prosperity that in a few years may surpass that of the present as much as the present surpasses the primitive prosperity of three centuries ago.

What is the fitting color in which to see and to deal with these stupendously promising, these awe-inspiring, these terrifying facts? The color of individual success through individual effort has demonstrated its fitness as the color in which to see and to deal successfully with the raw materials of nature under primitive conditions. But as the all-dominant color in which to see and to deal with human facts, is it not already beginning to reveal its limitations, its unfitness? May it not be that this color is largely responsible for the human frictions and collisions in which center our gravest concerns today? Does this color not facilitate, lead naturally and almost inevitably to the exploitation, in the interests of individual success, of humans in place of materials?

Not a few competent observers and thinkers, whose judgments rightly command respect, see grave danger of the self-destruction of present civilization through war. May not the color, in which men see and deal with the facts of peace, be the source of equally grave danger for civilization? Where, indeed, but in the color in which Nations see facts, do wars originate?

The color in which our public education prepares our children and youth to see and deal with facts is surely a matter of supreme concern, both domestic and international. This country, through its leaders, through its statesmen—its statesmen in industry and commerce, as well as in government—must take public education seriously, to a degree never yet approached. Our statesmen must regard and teach our whole people to regard public education, the color of public education, as of fundamental and transcendent concern to the immediate problems of government, of commerce, and of industry. They must even give our basal problems of public education precedence over problems of government, commerce, and industry, because the solution that we make of our basal educational problems goes so far to determine the form that all these other problems shall take a few years hence.

WHAT HAS THIS COUNTRY REASON TO EXPECT BY WAY OF CULTURE, EFFICIENCY, AND GOOD CITIZENSHIP IN RETURN
FOR THE COST OF OPERATING PUBLIC
EDUCATION?

JOHN J. TIGERT, U. S. COMMISSIONER OF EDUCATION, WASHINGTON, D. C.

President Jones: We have a new Commissioner of Education whom we have not all seen and heard. We are expecting great things from him. He has come on the stage of education in an active time, in a time of opportunity. Dr. Tigert has had a varied experience and training. We are very glad to hear from him, particularly this morning, because of the opportunities he has had as a Rhodes scholar at Oxford to get the English and the European viewpoints which give him then an international viewpoint of the results of education.

Dr. Tigert: The general theme of our discussion at this time is the Ideals to be Achieved by Public Education. The word "ideals" in the caption makes it evident that a statistical summary of what is possible with our present expenditures, agencies, and organization of education is not what is wanted but rather what are the most desirable objectives of education in the light of the country's needs. In recent years, this matter of the ideals of educational effort, especially with reference to citizenship, one of the phases to which we are expressly limited in this discussion, has been discussed more frequently than almost any other educational topic, largely because of the influence of the war and attendant conditions. The subject suggests itself, no doubt, to some of us as a threadbare theme, and this is a great temptation to undertake some ingenious application of the subject that might assume the aspect of something new under the camouflage of an old title. I dare say that others on the program may do this. At the risk of being trite, an old foggy parading in the old-fashioned long skirts of pedagogical innocence, I propose to discuss the subject as it has been stated.

Truth is eternal and there are some things that will have to be reiterated for a long time if we are to get them entrenched in American life. It

would be unthinkable that any teacher for the sake of novelty, interest, or originality would vary the alphabet, numbers, or forms of speech from time to time. Likewise there are certain truths which are so fundamental in educational objectives as to seem to me to be generally accepted if not self-evident. Emphasis must be continued upon these truths until we have reached our goal.

One of these generally accepted tenets is the necessity of an enlightened, informed, and intelligent citizenship. This necessity is the mother of the American public-school system. I shall not dwell upon the fact that such a large part of our population are without the pale of the schools as to make it well-nigh impossible for them to be intelligent, right-thinking, and right-acting citizens; so much so that this one thing alone imperils the future of the American Republic. But I wish to stress the point that there is still something to be desired in the efficiency of our schools.

The American people spend more money upon education than any other people in the world, and they have a right to expect at least as much, if not more, enlightenment, efficiency, and culture from their schools as any other people. Perhaps they get this, but I do not think that we can be satisfied with present results. An ideal is something that is never realized, but it tends and should tend to stimulate improvement.

Our people are a young people. The American people do not by nature have the capacity for infinite pains, laborious effort, and careful exactitude that some other peoples possess; but they have an energy, an initiative, and an invention that no other people in the world have today. These characteristics make for progress of a certain kind, in that we are quick to seize upon new ideas, fads, and innovations, but the same qualities of character sometimes make for half-baked results. We attempt to teach much more than we can teach well or accurately. There is a vice as well as a virtue in our multitude of fashions, methods, plans, and devices for the improvement of education. We need, it seems to me, greater efficiency in inculcating the fundamentals. Let it be said that we have made marvelous progress in the past ten years. I shall take no time here to summarize the educational renaissance that we have enjoyed since the World War.

Assuming that we should secure reasonable and satisfactory returns for our outlay for education in the way of culture and efficiency, assuming that we might even secure the maximum of these, should we be satisfied? I think not. Education which makes for enlightenment and efficiency without at the same time developing the proper attitude toward society is not only unsatisfactory, but it may prove a menace to the Nation. We must be as much concerned about what our boys and girls learn to do as we are about what they learn to know.

The French philosopher Amiel puts this thought beautifully. "Humanism," says he, "is but the emancipation of the mind. Christianity preaches and brings salvation by the consecration of the will. One makes better by enlightening, the other enlightens by making better. It is the difference between Jesus and Socrates." The Socratic law that virtue is knowledge does not insure that all men will practice the good that they know. If we

cannot teach the old-fashioned virtues of honesty, justice, decency, and the Christian doctrine of love along with modern thought, then we had better dismantle our splendid and magnificently equipped schools and return to the old log schoolhouse. We had better have citizens who have character and little erudition than citizens whose knowledge is a peril to society.

The man who discovered that surgical instruments should be sharp made an important discovery, but the man who discovered that the instruments should at the same time be sterilized made, I think, a more important discovery. So far as I am concerned, if I had to be operated on, I would much prefer a dull knife that was clean to a sharp knife that was foul. The former could do little or no damage, but the latter would carry the noxious germs so far into my body as to destroy my life. And so, to enlighten the mind, to emancipate the thought of man without the proper direction of will, is but to magnify the injury he will do in the world. Education for knowledge and efficiency alone will possibly enable a man who might have been only a house robber or a highwayman to become the head of some great business concern where he can steal on a big scale, or to reach some position of political power in which he may wreck society.

President Angell, of Yale, says that he would prefer to have an immoral Greek professor rather than an immoral football coach. This does not mean that football is more important than Greek, but it does mean that the football coach has more opportunity to develop character than the Greek professor. Sam Jones, the evangelist, once said: "I would rather have my boy in Heaven learning his A B C's than in Hell reading Latin and Greek."

Germany has furnished us a conspicuous illustration of the evil of education or culture and efficiency without the proper social attitude. Germany raised the efficiency of education to the nth power. Illiteracy is almost unknown among the German people. They have made marvelous strides in culture in the field of philosophy, in the application of science. But this efficiency was directed into a spring at the throat of the world and enveloped it in a "Pentecost of calamity" that almost destroyed civilization. Says Professor Althearn, "Four thousand two hundred college professors caused the World War." He has reference to the German professors who taught so efficiently that they made sixty-eight million people subscribe to such doctrines as: "Might is right; We are a race of Supermen; God demands the destruction of the weaker peoples about us; The tombstone of a dead German grenadier is more beautiful than all the paintings ever painted; Democracy is the death agony of organization,—it is the means whereby cattle become rulers; And now abide faith, hope and hate, and the greatest of these is hate."

The efficiency of German education in disseminating these diabolical doctrines, in applying modern science to the art of destruction, and in various other ways has brought civilization to the verge of collapse. Could the Germans have foreseen how their efficiency would be prostituted? I think not. Far better for Germany and for the world that her people had all been illiterate than that she should have taken the course she has taken.

Illiterates are not all bad citizens, nor are they altogether inefficient. Let me say that there is an erroneous impression that the illiterates of America are confined largely to the Negroes and the mountain-whites of the South, and that these mountain-whites are undesirable citizens. Nothing could be further from the truth. There are great centers of illiteracy in the big manufacturing States—Massachusetts, New York, Pennsylvania, and Illinois. Further the so-called ignorant whites of the South have made perhaps as large a contribution to the Nation as any other of its people. It is unfair and preposterous to place so much of our shortcomings, as revealed in educational statistics, in inefficiency, and in other respects at the door of the ignorant whites of Kentucky, Tennessee, and North Carolina. Abraham Lincoln was one of these. So was Andrew Jackson and many others who have rendered unquestioned service to the Republic.

It is unfortunate that some people in the country generally do not appreciate the sterling qualities of the mountaineers of Kentucky and Tennessee. There are many illiterates among them, but they have some efficiency and are usually splendid citizens. They were efficient enough to win the Battle of King's Mountain, in the dark hours of American history; they were efficient enough to destroy the flower of the British Army, fresh from campaigns against the armies of Napoleon, at New Orleans.

If one questions that they possess efficiency today let him note the three men selected by General Pershing to stand by the grave of the Unknown Soldier. The three men who were considered by their Commander to have rendered the most conspicuous service to their country in the recent war and in the order of service were, first, Sergeant Woodfill, a Kentucky mountaineer; second, Sergeant York, a Tennessee mountaineer; third, Major Whittlesey, of New York.

Certainly, Alvin York had some kind of efficiency that enabled him to kill and capture a German battalion armed with machine guns. Certainly, he must have been something of a patriot.

The illiterates do not form the most dangerous class of American citizens. Let us by all means wipe out illiteracy, but let us not fail to see that much more is required to make America safe.

We must do something to enable the many nationalities who constitute our citizenship to understand and appreciate America; we must do more to help our native-born Americans to appreciate the contributions that these varied elements have made to our American life. Both of these are problems of education. Many of these alien peoples have come to our shores with ideas subversive of government because they have lived under despotic governments that have engendered hatred. We must implant in them a love and an appreciation for a government such as ours which permits its citizens so much freedom that they may be free to write and speak as they will about it. Today our country is being sown with literature directed at the overthrow of our government. Many publications are dedicated to this purpose. We pick up leaflets upon unemployment intended to incite the laboring classes to rebellion, which call for the overthrow of the American Republic and close with "Hail to the Soviet Government of America."

We have not yet learned to teach citizenship to our own American-born boys and girls. We must teach respect for the flag; we must teach the principles of American government; we must teach American history in a far more effective way if we are to insure the future of American democracy.

Americans are intensely patriotic, but through ignorance they render less respect for their flag than some other peoples. The French people, and even the defeated Germans, invariably uncovered in the presence of the American flag overseas. I watched a parade on last Labor Day in a great American city and I only saw three men uncover, though the flag passed repeatedly. This is not a matter of lack of patriotism; it is a matter of ignorance.

Every American boy and girl should be taught to know that the American flag was the oldest flag that was carried in the World War; that it is the only flag that has never been lowered in defeat; that it has never followed armies of conquest; that it has never been unfurled except in behalf of liberty—and then perhaps Americans would learn to appreciate the forms of respect for such an emblem.

I believe heartily in the American Legion's program of citizenship. I would have all teachers take the oath of allegiance. I would require them to be American citizens. I would require the teaching of American history and government. I would have the American flag displayed on every schoolhouse in the country.

WHAT HAS THIS COUNTRY REASON TO EXPECT BY WAY OF
CULTURE, EFFICIENCY, AND GOOD CITIZENSHIP
IN RETURN FOR THE COST OF OPERATING
PUBLIC EDUCATION?

WILL C. WOOD, STATE SUPERINTENDENT OF PUBLIC INSTRUCTION,
SACRAMENTO, CALIFORNIA

President Jones: The chair is planning to close this meeting at twelve o'clock or very close thereto. I shall dispense with an elaborate introduction of the last speaker in order that the time may be conserved. Mr. Will C. Wood, State Superintendent of Public Instruction, Sacramento, California, is an introduction in himself, because of the great work he has done in this country. He is a National figure and you will appreciate him.

Mr. Wood: It is not often that a school man finds himself called upon in a conference of his peers to justify the American school system of which he is a part. I confess at the outset that the task set for me has not been considered a light and transient one. The time and situation demand that as schoolmen we analyze our purposes and accomplishments carefully; the back-sweep of the tide of war enthusiasm in the form of retrenchment has struck us and we must avoid the dangerous undertow that is bound to carry

out to sea all institutions too weak to withstand it. The American people generally are asking themselves and one another and particularly the leaders of education the very question the president of this department has put to me: What in the way of culture, efficiency, and good citizenship has the country reason to expect in return for the cost of operating the public schools? In discussing the problem, however, I would emphasize the wording in which the problem is defined. The discussion is concerned not with what the people expect, but what the people have *reason* to expect from their expenditures for public education.

The natural point of departure in this discussion is the amount we are now expending for the elementary and secondary schools of our country. The figures for the year ended June 30, 1920, show a total expenditure for the public schools by all the States of a trifle less than nine hundred million dollars. With the growth of population and the upward trend of wages that persisted in the early part of the last fiscal year, we may safely assume that the total expenditure for public education during the year ended June 30, 1921, was between \$1,000,000,000 and \$1,100,000,000, which is approximately \$10 for each man, woman, and child in the country. Let us compare this expenditure with the total expenditure of 1911, a decade previous. The total expenditure for that year was \$446,727,000, or \$4.76 for each unit of population. The Federal department of labor is authority for the statement that during the year 1921 the purchasing power of a dollar was less than half its purchasing power in 1911. In other words, the \$10 per capita expended for public education in 1921 could purchase no more than the \$4.76 *per capita* expended in 1911. The so-called increases in school expenditures during the last decade have therefore not been increases at all. School expenditures measured in purchasing power are no greater today than they were before the war. After all the agitation and enthusiasm for education growing out of awakened recognition of the Nation's dependence upon and duty toward the youth it had drafted for its defense, we find that expenditure for schools has barely kept up to the pre-war level. The country as a whole is spending for education in 1922 a less proportion of its total income than in 1911. It must therefore be observed that the schools are guiltless of the greed of the profiteer.

What in the way of culture, efficiency, and good citizenship has this country reason to expect in 1922 in return for the cost of operating the public schools? The answer is simple and direct: inasmuch as it is spending no more of purchasing power upon the schools in 1922 than it was expending in 1911, it has reason to expect no more by way of culture, efficiency, and good citizenship than it secured by the expenditures of 1911. It has *reason* to expect no more, but as a matter of fact it is getting more, the increase being chargeable to the devotion of the great body of teachers and school administrators to the cause of better America. Let not this last statement, however, be seized upon to impose still further upon the missionary spirit of the teaching body. It would be dangerous to do so. A disposition toward missionary work is probably a matter of inheritance, and there are strong indications that the missionary strain in the human blood-

stream is running out, probably because most missionary school-teachers, being wedded only to their mission, leave no descendants to perpetuate their self-sacrificing strain.

I said a moment ago the American people have reason to expect from their schools in 1922 no more than they secured from them in 1911. Fortunately for our purposes, the results secured in 1911 have been measured with a fair degree of accuracy. The boys who were eligible for enrolment in the elementary and high schools of America in 1911 and the years immediately preceding were the very boys who were subject to the drafts of 1917 and 1918. We know now what kind of men they had become. Some were accepted, others rejected or placed in limited service. I firmly believe that the return made to America by the young men accepted in the American Expeditionary Force exceeds in value the total cost of their education a thousand times. The pluck and courage, the quickness of mind and body, the qualities of character that kept the great majority of them clean, the ability to meet new situations successfully, the wonderful initiative—all these indicate that the schools had rendered the Nation a service of untold value. However, when we turn to the men rejected or put into limited service, we read a different story. The Army educational tests, as distinguished from the Army intelligence tests, show that 29.4 per cent of the men included in the first draft were unable to meet the relatively simple test of intelligent reading and legible writing. Up to the outbreak of the war, the Army would not enlist illiterates, but the draft of June, 1917, yielded almost a hundred thousand illiterates or near-illiterates, the majority of whom were native-born. They could not sign their names. They could not read signs or bulletins about camp. They could not communicate with the folks at home. The report of the Surgeon General shows that of the 3,208,000 men included in the first draft and physically examined 949,000, or 29.59 per cent, were totally or partially disqualified for military duty for physical reasons. According to the last Federal census, we have in America 4,931,905 illiterates, of whom 3,084,738 were native-born. These figures attest the incompleteness rather than the incompetency of the American school system of 1911 and the years immediately preceding. We cannot deny, however, that incompetence played its part in making possible the insufficiency of education revealed by the draft. Could we escape incompetence and its results, with 30,000 of our 600,000 teachers having only an eighth-grade education or less; with 150,000, or one fourth of our teachers, having only two years of high-school work or less; with only 120,000 having the standard of preparation for teaching recognized as the minimum in all civilized nations; with one fourth of our teachers having less than two years' experience and with more than half of them having less than four years' experience in teaching? Is it any wonder that the boys of rural communities showed a greater percentage of illiteracy, a greater percentage of physical defects, and less ability on an average in reading and understanding than the boys from the cities, when we consider that the typical rural-school teacher has had less than two years of high-school work, is under twenty-one years of age, has had less than two years of experience in teaching, and

is at least twenty miles from a superintendent or supervisor who visits her only once a year? It was just such conditions as these that made possible the disappointing revelations of illiteracy, near-illiteracy, physical defectiveness, lack of comprehension and appreciation of American purposes and ideals during the World War. The inadequacy of the American school system of 1911 and preceding years made possible the educational defects among the men drafted for the Great War. Since America is putting into her public education no more of her substance *per capita* in 1921 than she put into it in 1911, she has reason to expect no better results from the school system of 1921. It would be an idle thing to discuss what America can expect from the school system of 1921. We know what we can expect. I shall therefore devote the remainder of this address to a discussion of what the American people have reason to expect in the way of culture, efficiency, and good citizenship from the school system of 1931.

What kind of school system shall we have in 1931? It depends entirely upon the attitude of the American people toward facts that are well-known. One erstwhile leader in the American educational world decries the use of school statistics which show our shortcomings and cause the country uneasiness and concern, and bids us emulate the ostrich and seek surcease from anxiety by burying our heads in the sand. Since the American people after opportunity duly offered have neglected to accept the lead of this modern Ichabod in other matters, we may safely assume that, far from imitating the foolish bird of the desert, they will emulate the proud eagle of the Nation's ægis, being ever alert against danger and keeping the serpent safe within its talons. I do not doubt that the American people, when they know the facts, will gladly build and support a school system to match the Nation's need. Encouraged by this hope, I shall outline what I believe the American school system should embrace by the year 1931.

The school system of America must be based upon the principle of equality of opportunity. Every child born in America is entitled to a fair chance to develop to the fullest such native abilities and tendencies as are not socially undesirable. In planning to realize equality of opportunity, it is necessary to recognize natural inequalities, so the school system must include divers means to meet divers needs.

The school system of 1931 will frankly avail itself of intelligence tests to determine whether individuals have sufficient mental endowment to justify public expenditures for their education. As school administrators, we must frankly recognize that there is a point in the scale of intelligence, below which native endowment is so slight, that effort to develop it is wasted, or largely wasted. If we are men of judgment, we will define with scrupulous care, the cases of individuals whose intelligence is below the minimum point in the scale, as custodial cases, and insist that the State make provision for them outside the school department. Notwithstanding sentiment to the contrary, the schools can no longer justify expenditures of from three to five times as much upon individuals who will never reach the bare limit of self-support, as upon individuals of normal intelligence. The

school system of 1931 should be expected to care only for individuals who possess sufficient native endowment to justify education.

The school system of 1931 will concern itself with all citizens of the republic, young, old, or middle-aged, who are capable of improving themselves and are desirous of doing so. Education we would define as the process of more fully initiating the individual into the life of the community. Such education begins in infancy and continues as long as the individual needs and desires fuller participation in the life of the community.

What are the steps or stages, or perhaps I should say, the degrees of initiation into community life? The first I would mention is the step of acquaintance with the language arts and number, these being the accepted fundamental tools of knowledge. Every individual in America of normal intelligence by the time he has reached the age of twelve years should as a very minimum know how to read ordinary English prose and verse, write legibly and with reasonable grammatical correctness ordinary business and social letters, spelling the commonly used words with accuracy. In addition, he should know how to count to at least a million, how to handle simple measures of length, weight, and volume and how to add, subtract, multiply, and divide with accuracy whole numbers and common and decimal fractions. He should also know the more fundamental rules of personal and community hygiene and should have mastered at least a general outline of the history of our country, an acquaintance with our leading National heroes, and with the principal features of our National, State, and local government. Such knowledge, I say, should be the very minimum. In addition to this knowledge he should be trained in the more fundamental habits of personal and community life.

It is not pleasant to contemplate the fact that there are millions of adults in America, most of them born here, who have not met even the first requirement I have mentioned. The people of America have a right to expect that this blot upon American democracy shall be removed before 1931. To be effective the program must include the following means for overcoming illiteracy among the on-coming generation: (1) Laws making full-time attendance compulsory for all children between the ages of six and sixteen years; (2) laws providing for the appointment in every community of intelligent supervisors of attendance who will conceive their duties to include not only the bringing in of truants but also the duty of seeing that blind, deaf, crippled, orphaned, feeble-minded, and destitute children are placed in touch with agencies capable of caring for them, and the duty of acting as mediator between school and home before truancy becomes a fact; (3) a course of study for primary-school children that will be vital and based upon motive; (4) provision for the supervision of health and physical condition to prevent loss of attendance and secure a proper physical basis for school work and, where necessary, hot school lunches; (5) annual registration of minors to discover children who are not attending school; (6) special classes in our larger cities for the deaf, blind, and crippled children, for speech defectives, and for retarded pupils; and adequate State institutions for the care and education of such children

living in districts where special classes cannot be economically maintained; and (7) itinerant schools and itinerant teachers for children who, for various reasons, cannot attend schools.

For overcoming illiteracy among the adult population we must include in our program the following: (1) evening schools, conveniently placed for working adults in schoolhouses, factories, or warehouses and offering special courses for adult illiterates; (2) specially trained teachers who understand the special problem of teaching adults, are interested in the work and willing to get in touch with the men even while they are working; (3) special textbooks intended to meet the needs of adult illiterates; (4) afternoon classes, conducted if necessary in the front room of an illiterate woman's home, for the benefit of illiterate mothers, including a nursery for the babies that may be brought; (5) home teachers to keep in touch with foreign homes, raise them to the American standard, and interpret to the mothers the institutions of America; and (6) itinerant teachers to visit and instruct adult illiterates at rural centers.

If such a program is adopted, and if the Federal Government will in the meanwhile keep the gates closed against illiterates and people of low intelligence, we can abolish illiteracy without doubt by 1931. It is all a question whether America is interested enough in human beings and in the future of democracy to pay the price of a clean and wholesome record.

The minimum program of education I have outlined will make only a slight return to the country by way of culture, efficiency, and good citizenship. We must not deceive ourselves as to the value of mere literacy and acquaintance with the tools of knowledge. Literacy, considered apart from its use, means little by way of culture, efficiency, or good citizenship. Thomas Huxley sums up the value of literacy thus in his admirable essay on a liberal education: "If I am a knave or a fool," says Huxley, "teaching me to read and write won't make me less of either one or the other—unless somebody shows me how to put my reading and writing to wise and good purposes. The only medicine for suffering, crime, and all the other woes of mankind is wisdom. Teach a man to read and write and you have put into his hands the great keys of the wisdom-box. But it is quite another matter whether he ever opens the box or not. And he is as likely to poison as to cure himself, if, without guidance, he swallows the first drug that comes to hand. In these times a man may as well be purblind as unable to read—lame, as unable to write. But I protest that, if I thought the alternative a necessary one, I would rather that children should grow up ignorant of both of these mighty arts than that they should remain ignorant of that knowledge to which these arts are means." Literacy taken by itself may have been what Alexander Pope had in mind when he wrote:

A little knowledge is a dangerous thing;
Drink deep, or taste not the Pierian spring.

To secure any adequate return from our school expenditures in the way of culture, efficiency, and good citizenship, we must extend education be-

yond the point of mere acquaintanceship with the fundamental tools of knowledge.

The individual is born into a world governed by natural laws with which he should become acquainted; he is also born into a complex world of human relationships—a world filled with activities that in their present form are the products of human experience. He stands in the relation of debtor to the forefathers of his land; to the people of ancient Greece, Egypt, modern Britain, and even China and the Celebes. He lives, not alone, but dependent upon many men of many lands; upon a multitude of economic, governmental, and social institutions and agencies. If these people and institutions are to serve him he must have at least a bare acquaintance with them. And if he in turn is to serve others, whether of his own or future generations, it is essential that he become so acquainted with the more significant human activities as to enable him to choose a service suited to his likes and talents. He must become acquainted during his earlier years with the elements of a wide range of studies that interpret human and natural environment. By means of books and contact with things, he must acquaint himself with human geography, the literary heritage of his people, the history of his country and the roots thereof, the government under which he lives, the community life about him, and the more significant phases of nature, including the simpler elements of the sciences. May I say in this connection that the great organization of Boy Scouts of America, working apart from the schools but auxiliary to them, has wonderful possibilities as an educational agency for acquainting boys with their natural and human environment. The plan for awarding merit badges for such subjects and activities as agriculture, architecture, art, astronomy, automobiling, aviation, bird study, botany, business, camping, chemistry, civics, conservation, cooking, craftsmanship, and cycling—to stop only with the “c’s”—fills a real need in the life of American youth. Generally speaking, Boy Scout education with its emphasis upon doing and upon project work is even more vital than much of the work of the schools. The value is in acquainting boys with significant human activities.

While the horizon of human interests is being widened by means of school, scouting, and life activities, instruction and training should also be given through biography and literature, as well as by precept and example, in the character-building elements, including manners, morals, and worthy ideals. By the time the individual has reached the age of twelve he should have acquired the ability to read aloud intelligently, to read silently with reasonable speed and comprehension, and to put his thoughts on paper in clear and grammatical language, with due attention to the spelling of words and some attention to simple organization of material.

The matter may be summed up as follows: During the first six years of the school course, corresponding to the logical elementary-school period, the child, in addition to the acquirement of a good working mastery of the tools of knowledge, should also have acquired acquaintance with those elements of the human and natural environment that are foundational for culture, efficiency, and good citizenship.

The period from the age of twelve to that of twenty may be recognized as the critical period in the life of the individual. Physical, psychological, social, and economic problems of that period tend to make it one of stress and sometimes distress. These years determine very largely whether the individual is to develop successfully those interests and activities that make for culture, efficiency, and good citizenship. They determine in large measure whether he will become a swimmer, a sinker, or a floater. They correspond roughly to the period of secondary education, and during this period we have the right to expect that he shall develop, subject to the possibility of change, a major interest that will lead ultimately to a life career worth while to himself and to society.

The career chosen may involve the development of valuable skill in a vocation or the acquirement of general and specific knowledge foundational for later specialization; but a life-career motive there should be, before the end of the period, subject, as I have said, to revision in the light of broader experience. With such a motive, the individual in most instances will seek as a matter of course to develop the culture and efficiency necessary to his calling. However, this will not in itself be sufficient. The demands of society will not be met unless the individual has a reasonable acquaintance with the best and highest ideals of the human race and particularly of the American people. He should have as a minimum three years of vital work in English, classical and American literature, which shall function not only in appreciation of literary form and content but also in continued reading of the best thought as it develops in current literature. He should have as a minimum such acquaintance with the history of the world as a well-planned one-year course in European history will give, and in addition a course in American history of at least one year. He should have such acquaintance with our governmental, economic, and social institutions as may be acquired in a minimum period of one year. He should have acquaintance with at least one laboratory science in order that he may know something of the scientific approach in solving problems, since science plays so vital a part in the life of our time. He should also have developed through a reasonable program of physical education a strong body, with mind and muscles coördinated, a wholesome interest in outdoor activities, and an intelligent grasp of personal and community hygiene.

The outline of the secondary field I have submitted represents the minimum requirement which *all* citizens of this Nation should have opportunity and encouragement to meet. In order to afford this opportunity, I suggest that the secondary-school system of 1931 include the following: (1) compulsory full-time education up to the age of sixteen, regardless of the fact that the elementary course may have been completed before that age, and compulsory part-time education up to the age of eighteen, as heretofore suggested; (2) junior high schools embracing the seventh, eighth, and ninth years; senior high schools representing the tenth, eleventh, and twelfth years, and where necessary, junior colleges representing the thirteenth and fourteenth years; (3) a cosmopolitan or inclusive high-school curriculum broad enough to include not only the foundational cultural subjects but also

the representative vocations for both men and women; (4) election of studies on a scope sufficiently broad to permit the individual student to build a program suited to his needs around the common core of prescribed work heretofore described; (5) part-time and evening classes placed to meet the convenience of workers, enabling the individual to get a broader and better understanding of the job on which he labors during work hours and preparing him for the next round in the ladder of his vocation, as well as for better exercise of the prerogatives of citizenship; and (6) intelligent vocational guidance and life-career counsel.

Such a program does not afford a guaranty of a reasonable return in culture, efficiency, and good citizenship. Its merit is that it exposes the individual to the contagion of culture, efficiency, and good citizenship. After all is said and done, culture, efficiency, and good citizenship cannot be imposed; they are matters of inward growth, inspired by outward suggestions and influences. However, the country will have reason to expect that the great majority of young people who complete such a program of education will not only have acquired valuable information, knowledge, a life-career motive and with many, reasonable skill in a vocation, but will also have developed some of those chief qualities, habits, abilities, attitudes, and ideals that mark the cultivated man, the efficient human, and the good citizen. Indeed such should be the constant motive of those who do the training. We have reason to expect that the majority of them, to a reasonable degree, will have "made the body the ready servant of the will;" that their intellects will be trained to distinguish between truth and error; that their minds will be trained to think hard and with reasonable precision; that they will have learned to love beauty in nature and in art, and to hate the sodden and the vile.

The country has reason to expect that individuals coming up to citizenship through such a course will have developed genuine ability to think, which is essential to worthy citizenship. Ability to think is a better test of qualification for citizenship than mere literacy. James Bryce in his last work, *Modern Democracies*, recalls English rustics of sixty years ago "shrewd men unable to read, but with plenty of mother-wit, and by their strong sense and solid judgment quite as well qualified to vote as are their grandchildren today who read a newspaper and revel in the cinema." He also points out that the voters of Greece learned their politics, not from the printed page, but by listening to informed orators and by discussion among themselves. "It is thinking that matters," says Bryce, "not reading, and by thinking I mean the power of getting at facts and arguing consecutively from them. In these days our reading has become a substitute for thinking. On the printed page, truth has no better chance than falsehood, except with those who read widely and have the capacity of discernment. A modern voter guided by his party newspapers is no better off than his grandfather who, in England, eighty years ago, voted at the bidding of his landlord or employer. A democracy that has been taught only to read and not also to reflect and judge will not be better for the ability to read." For the expenditure made for education the country has the right

to expect that the majority of citizens will have the power of getting at facts, the ability to reason therefrom, and to give a reason for the faith that is in them.

The country also has reason to expect that the majority of individuals completing such a course will have developed a sense of duty and responsibility necessary for the continuance of a democratic civilization. To this end, the secondary-school period must afford abundant opportunities for participation in school activities involving responsibilities; opportunities for the exercise of initiative and self-direction; opportunities to learn to live and serve with people, even at the price of making mistakes.

There is reason to expect that students under such a program will have grown out of many of the petty prejudices, provincialisms, and superstitions that fetter the human mind and will; they will have developed that open-mindedness which is essential to progress; the open-mindedness which recognizes that truth has not yet been fully revealed, but is still in process of revelation; the open-mindedness that is willing to examine thoughtfully and carefully new ideas and things even though they may threaten to shatter, or modify, some of our cherished beliefs. It is indeed strange that men and parties and creeds should seek by violent or near-violent means to check the growth or modification of ideas and ideals. It was closed-mindedness that caused Jesus of Nazareth to die on the cross, Socrates to drink the hemlock, and Galileo to be thrust into prison. And yet each of these great characters is today reckoned as one of the greatest benefactors of human kind. The shadow of intolerance, falling across the path of human kind throughout the ages, has always retarded human progress. By keeping men in darkness it has slain its victories by millions and cramped the souls of whole nations and races. Open-mindedness has to its credit the discovery of America, freedom of religion and conscience, the development of science and its marvelous applications to human needs, the progress of engineering, the conquest for civilization of almost the entire earth, the birth of the American Republic, the growth of democracy, the development of humanitarianism, the conception of a warless world. History and science are united in discounting the fear of open-mindedness. Man is by nature conservative. Dr. William James in his *Pragmatism* declares "Our minds grow in spots; and like grease-spots they spread as little as possible: we keep unaltered as much of our old knowledge, as many of our old prejudices and beliefs, as we can. We patch and tinker more than we renew. The novelty sinks in; it stains the ancient mass, but it is also tinged by what absorbs it. Our past apperceives and coöperates; and in the new equilibrium in which each step forward in the process of learning terminates, it happens relatively seldom that the new fact is added raw. More usually it is embedded cooked, as one might say, or stewed down in the sauce of the old." In other words, James points out the innate quality of conservatism in the human mind. What is needed as an undoubted mark of culture, efficiency, and good citizenship is neither an intensification of the incrustated grease-spots of the mind nor an open-mindedness ready to embrace anything bearing the impress or ap-

pearance of novelty; rather is it a critical or examining attitude—a disposition to made ideas, whether novel or ancient, stand the test of careful analysis. In discussing culture in his essay on "Sweetness and Light," Matthew Arnold includes open-mindedness and the development of intelligent criticism of ideas as the chief marks of culture. "Culture," he says, "is a study of perfection and has its origin in a love of perfection. The great aim of culture is that of setting ourselves to ascertain what perfection is and to make it prevail. Not a having and a resting, but a growing and a becoming is the character of perfection as culture sees it. Now is the moment for culture to be of service—culture which believes in making reason and the will of God prevail, believes in perfection, in the study and pursuit of perfection, and is no longer debarred by a rigid, invincible exclusion of whatever is new from getting acceptance for its ideas simply because they are new."

Such is the program and such the purposes of the American school system. A sense of responsibility and duty; a general knowledge of the world and its more worthy activities; a special knowledge of at least one human activity; a trained mind, responsive to the best ideas and ideals, whether old or new; an ability to make one's way in the world honestly; a love of perfection that silently but surely reshapes the soul toward perfection; and a heart that beats in unison with the best in the kingdom of this world and the kingdom above—these, in reasonable measure, are the fruits the country has reason to expect from a generously supported American school system.

VIRGINIA'S BUILDING PROGRAM, ITS AIMS AND VOCATIONAL WORK

E. T. DUFFIELD, SUPERINTENDENT OF SCHOOLS, VIRGINIA, MINNESOTA

Virginia is a city of some 18,000 people. Its school district is not co-extensive with the city, but is platted in the form of an inverted chair, ten miles due north and south and six miles due east and west, and covers 48 square miles of territory. Virginia serves a rural, mining, lumbering, and residential population. Its school enrolment of 4000 children is distributed as follows: 2 per cent, strictly rural; 7 per cent, locational or small village; and 91 per cent, urban.

The rural population is taken care of as a unit by itself through the first eight grades; the small village groups are partly now and next year will be totally assimilated into the city schools through our own system of transportation.

Virginia's future building program combined with its present equipment will aim to satisfy the general demand of cities similarly constituted. It contemplates two general types of grade schools: Type 1—To house the kindergarten and the first four grades; and Type 2—To house the kindergarten and the first six grades.

These two types are so located geographically that the normal children of the kindergarten through the fourth grade will not be required to travel more than a quarter of a mile to school, and normal children of the fifth and sixth grades not more than one half a mile. Type 2 structures will be found on the extreme wings and in the centre of the city. Type 1 structures are and will be located between the Type 2 structures.

Type 3—The Junior-Senior High School organized on the 6-3-3 plan is already finished and is located geographically in the centre of the city, and also in the centre of school population.

Type 4—This building, an old seven-room building, is being gradually set aside and remodelled for the subnormal group. Its present equipment is for several trades and as the number of teachers increase the vocational training will be made more varied.

Type 5—This is the purely industrial type and houses those departments separately established on a commercial basis.

Virginia now has the following schools:

Type 1	-----	3 schools
" 2	-----	1 school
" 3	-----	1 school
" 4	-----	1 school
" 5	-----	2 schools
" 6	-----	3 schools, rural and village.

Now under construction:

Type 1	-----	1 school
" 2	-----	1 school

Contemplated within a year or 4:

Type 2	-----	1 school
Junior H. S.	-----	1 school

The Type 2 school being contemplated will be a conversion of a Type 1 school to a Type 2 by the addition of 10 or 12 rooms.

We are now erecting a modern fire-proof grade school of Type 2 with 17 class rooms, combined auditorium and gymnasium. Plans are being prepared to erect a 12-room Type 1 structure in an isolated section of the downtown district this summer.

When our present plans are complete Virginia will have for its immediate needs:

Type 1	-----	3 schools
" 2	-----	3 schools
" 3	-----	1 school
" 4	-----	1 school
" 5	-----	2 schools
" 6	-----	3 schools

To complete our entire program we will be forced at the present rate of growth of our school population to erect a junior high school to accommodate the seventh, eighth, and ninth grades and the prevocational shops.

Each building is equipped with the modern idea of a maximum average of twenty-five pupils to a teacher. The room capacity is thirty-five pupils.

In discussing our vocational system, we are brought face to face with the large corporation school trying to strengthen its usefulness in directing the training of their employees into one narrow channel which spells increased production for the company and yet involves decreased general capacity for usefulness of the individual. They are demanding more and more as time goes on that a man stick to what he is doing, because of the expense and economic risk involved in "changing over." We must meet this corporation school by giving a broad general training and also enough specialized work to enable a youth to finish his apprenticeship in the trade of his choice quickly and intelligently.

The Virginia schools have as their aim the making of students who are mentally alert, physically fit, morally straight, and vocationally efficient. It is attempting to provide vocational efficiency by the following method.

Our Department of Research is the centre of vocational and educational advisement activities. It is the centre because within this office are collected into a folder file system various records of all the pupils in the Virginia schools. Copies of classroom achievement, attendance, scholarship, intelligence test, I. Q., physical, dental, medical, and social records, and any other pertinent memoranda are filed under individual pupils' names. This body of information for each child is of definite value in advising with the pupils and their parents, concerning their future school and life activities. It is also of particular value in studying the problems of the retarded, dull, and subnormal pupil as well as the supernormal cases.

Beginning with the seventh grade a systematic endeavor is made to present the different phases of life's industrial activities to enable the students to find themselves. The seventh and eighth grade students are given eight different vocational experiences for two years in courses ten weeks in length, one hour a day. Thus the seventh grade boys are given a short intensive experience in drafting, agriculture, home mechanics, wood turning, and pattern making. The seventh-grade girls are given work in cooking and sewing. The eighth-grade boys are given work in electricity, printing, office practice, and metal work (machine shop). The eighth-grade girls are given photography, office practice, cooking, and sewing.

These lines are all taught by expert tradesmen, and we feel that these experiences are a distinct contribution to the general education of the boys and girls and at the same time afford them a basis for better selection of their future school courses and later vocations.

After this tryout period in the grades, the students are asked to begin making a decision between a professional and an industrial career. Here

the vocational advisors collaborate with the research department in trying to interpret for the student the past achievements as revealed in the folder file of the research department. If a student selects a professional career he chooses those subjects offered as prerequisite to his entering the special school or university. If he selects an industrial career he is given an opportunity for intensive training along a number of different lines. At this point the parents are required to sign the program of the student certifying that they are satisfied with the program selected by and for the student.

The students in agriculture have a real farm of sixty-seven acres, fully equipped with buildings and machinery, and fully stocked. This farm together with a greenhouse, dairy department, and classrooms in the high-school building serve as an experimental laboratory for both practical and theoretical work. The products from the farm such as, vegetables, garden truck, milk, and eggs are used in the domestic science and cafeteria departments.

The classes in carpentry are building a cottage under the conditions as found in the trade. We propose next year to acquire property, put in a permanent foundation and temporary heat so as to erect and enclose a building during the mild fall weather; heat it during the winter months for the interior finishing, painting, and otherwise complete it in the spring; dispose of it at public sale, the building to be removed from our site and the premises prepared for another building the following year.

The work of the print shop is entirely of a productive nature. The shop prints practically all the school printing. We plan on introducing a certain amount of commercial work so as to create the atmosphere of a business establishment and to bring our work in closer touch and competition with the trade so that we may prove to ourselves and others that our work is of the proper standing.

The electrical department handles storage batteries on a commercial basis; armature winding for the motors and generators of our school system, the interior wiring in the buildings put up by the carpentry classes. Work of a commercial nature is constantly provided for these classes.

In the automobile department an agreement has been reached with the local garage owners whereby no objection is raised to our taking such commercial work as we find necessary for instructional purposes.

And so on through our trade departments we are making an attempt to do first-class teaching and at the same time command the respect of skilled mechanics in the trade by doing as much practical work under conditions found in the trade as we are able to absorb into our instructional system.

Pupils studying trades are taught English, science, mathematics, art, and similarly related subjects. The mathematics is the mathematics of the particular trade, the science is closely related to the trade itself. Thus much unrelated material is disregarded.

LIST OF SUBJECTS TAUGHT IN OUR VOCATIONAL SCHEME

1. English
 - (a) Public Speaking
 - (b) Shop English
 - (c) General English
2. Normal Training
3. Science
 - (a) General Science
 - (b) Geology
 - (c) Physiography
 - (d) Biology
 - (e) Botany
 - (f) Physics
 - (g) Chemistry
 - (h) Related Science
 - (i) Physiology
4. Mathematics
 - (a) General Mathematics
 - (b) Related Mathematics
 - (c) Commercial Arithmetic
 - (d) Higher Algebra
 - (e) Solid Geometry
5. Commercial
 - (a) Office Practice
 - (b) Typing
 - (c) Shorthand
 - (d) Salesmanship
 - (e) Bookkeeping
 - (f) Commercial Law
 - (g) Commercial Geography
6. History and Social Sciences
 - (a) United States History
 - (b) English History
 - (c) Modern History
 - (d) Ancient History
 - (e) Social Sciences
 - (f) Community Civics
 - (g) Economics
 - (h) Industrial History
7. Art
 - (a) Art for Art's Sake
 - (b) Related Art
 - (c) Applied Art
8. Languages (Ancient and Modern)
 - (a) Latin
 - (b) French
 - (c) Spanish
9. Household Arts
 - (a) Cooking
 - (b) Cafeteria Management (Lunch room)
 - (c) Sewing
 - (a') Commercial Sewing
 - (b') Advanced Trade
 - (c') Home Furnishing—House Planning
 - (d') Millinery
 - (e') Dressmaking
 - (f') Hand Sewing
 - (d) Home Nursing
 - (a') Elementary Dietetics
10. Music
 - (a) Band
 - (b) Orchestra
 - (c) Harmony—Music Appreciation—History
 - (d) Glee Club—Chorus

11. Trades

- (a) Printing
- (b) Woodwork—Carpentry—Cabinet Making
- (c) Turning—Pattern Making
- (d) Machine Shop
- (e) Electricity
- (f) Automotive
- (g) Drafting
- (h) Agriculture
 - (a') Farm crops and soils
 - (b') Animal Husbandry
 - (c') Farm Law, Surveying, Sociology
 - (d') Marketing
 - (e') Dairying
- (i) Photography
- (j) Mill work
- (k) Foundry
- (l) Forging
- (m) Building Construction

A strong feature of our vocational work is conducted in the night schools where the following subjects are offered to about 1000 students.

- 1. Americanization
- 2. Business English
- 3. Bookkeeping
- 4. Shorthand
- 5. Typewriting
- 6. Cooking
 - (a) General Cookery
 - (b) Boy Scout Classes
- 7. Home Furnishing
- 8. Sewing
- 9. Art
- 10. Building Construction
- 11. Printing
- 12. Drafting
- 13. Machine Shop
- 14. Wood Turning—Pattern Making
- 15. Auto Repair
- 16. Electrical
 - (a) Battery Repair
 - (b) Motor and Armature Winding

We are becoming more and more convinced that our scheme of vocational guidance is showing satisfactory progress.

(a) Many of the students who enter the so-called trade courses discover themselves and their abilities and later transfer to the professional courses.

(b) It is keeping the students in school longer than previously, so much so that we are about to recommend the immediate addition of four more trades to the shops and extending more openings to girls.

A comparative statement of the enrolment of boys in June, 1921, and September, 1921, corroborates the above statement:

REGISTRATION

Grade	June, 1921	Sept., 1921	Decreased enrolment
8	103	100	3
9	109	105	4
10	74	69	5
11	52	46	6
12	40	39	1
Total.....	378	359	19

The following table gives figures to show that in the Junior-Senior High School the diversified trade courses are keeping the greater majority in school.

¹Including 148 sixth graders now enrolled in seventh grade.

It also gives evidence that we do not need so much compulsion to keep children in school as we need compulsion to offer the necessary courses to make it worth while staying.

We are still in the experimental stage and just beginning to treat our vocational work scientifically. Public education in the past had for its object the trained intellect. It accomplished this too largely through the medium of the printed page. It often neglected to bring the mind into contact with real things where this might easily have been done.

The result was often to remove the student from the practical as he pursued his education in higher schools. The ideal of the American people is markedly a person who can do things. The ideal of the Corporation Trade School is preëminently utilitarian. Attempt is being made in Virginia to combine the humanitarian and utilitarian ideals in a well-balanced harmonious whole which will result in an intelligent, practical citizen capable of making a place for himself in our civic and economic order thus contributing his share not only in the field of labor but in the civil and social organizations as well.

THE ONE-STORY SCHOOL

A. A. MC DONALD, SUPERINTENDENT OF SCHOOLS, SIOUX FALLS,
SOUTH DAKOTA

In its five new schools recently completed, the city of Sioux Falls has made a radical departure from the ordinary type of two- and three-story schoolhouses. The buildings are one story in height, fire-proof in construction, panic-proof in arrangement, and embody the latest ideas in ar-

rangement for the health of the pupils, the efficiency of the instruction, and the wider use by the community. The five buildings are practically identical in plan, construction, and equipment. The classrooms are arranged along a central court which serves as an assembly room, gymnasium, and community center. The space between the two front entrances is given to administrative offices, a library, and minor rooms of general use. At the rear is a stage which serves also as a kindergarten-room. Manual-training and domestic-science rooms are placed at the rear corners of the building.

The assembly room will seat approximately 500 persons; it is lighted wholly from above and is furnished with folding chairs, so that it may be used for all school activities. It is equipped for social-center use and has a booth for a stereopticon and motion-picture machine. The floor may be cleared readily for indoor gymnastics or physical training, marching, or folk dancing. The large stage is sufficient to accommodate a chorus of 300 children and may be used for general school exercises and amateur dramatics. The stage may be separated from the balance of the auditorium by a curtain, so that it is for all practical purposes a separate room. It has a large bay in addition to the skylights and is finished in attractive home-like style with a fire-place.

The classrooms are wider than long and are equipped with built-in wardrobes. They receive their main light from above through large skylights and depend upon the side windows for auxiliary light only. A minimum of woodwork has been introduced, and the concrete floors have been covered with battleship linoleum to eliminate noise and to facilitate cleaning. The overhead lighting is almost ideal in softness and evenness, movable chair desks have been introduced in place of fixed desks, so that great mobility in the adjustment of classes to various types of work is possible.

The sanitary equipment of the building is of the most modern type, the toilets and baths are on the main floor where they may be readily accessible to the children and under close supervision of the principal and teachers. The kindergarten and first grade have a separate toilet and lavatory. The heating plant and janitor's storeroom are the only portions of the building which are below grade. The boilers are outside of the main building, so that in case of accident no harm will come to the children. The buildings are fire-proof throughout, four large exits lead directly to the playground, and a separate exit leads from the kindergarten to a low terrace. The buildings are accordingly panic-proof. No steps are found in these buildings, even the door mat is sunk to the floor level to avoid tripping. There is every reason to believe that the buildings embody the latest and most modern ideas in schoolhouse arrangement and construction, so that they will conserve the health and insure the safety of the children and that they will augment the efficiency of the administration of work.

To summarize: These buildings are fire-proof, panic-proof, and so arranged as to promote the efficiency of all school work as well as the efficiency of all community-center work, such as parent-teachers' association, basketball games, and any meetings for public welfare.

MOOTED QUESTIONS IN SCHOOL-BUILDING SERVICE

WILLIAM B. ITTNER, ARCHITECT AND SCHOOL SPECIALIST, ST. LOUIS,
MISSOURI

Schoolhouse planning and construction involves but one big problem, namely: *successful adaptation of facilities to educational needs*. Nothing less than this will result in efficient building service. And it is *building service* that school architects together with school administrators are striving to secure.

Educational needs and demands vary with the different communities. There are common elements, to be sure, but there are a greater number of individual elements. Classroom work is similar in most schools, but the proportionate number of classrooms will vary with different schools. For instance, with the platoon and work-study-play plan, a smaller number of regular rooms are required than with the traditional organization. And quite a number of schools are organizing on the platoon plan or some modification of it.

There is a greater difference with the other component parts of the school plant, namely: auditoriums, work shops, libraries, laboratories, and physical education quarters. These vary even with schools in the same city. Some schools have no auditorium at all; others are inclined to make them of sufficient size for the entire student enrolment, which, of course, may represent waste. Again, there are schools with the barest requirements for shops and laboratories, while others include the richest environments possible for these activities. Practically all schools are now including physical education quarters, but even so there are variations in demands and policies regarding these facilities. One gymnasium is desired for some schools, and in others two are deemed indispensable. In many southern communities playgrounds are used practically the entire year; consequently, gymnasium space may be reduced to a minimum in the elementary schools or eliminated entirely.

Even the non-instructional space varies. For instance, the size of the lunch rooms depends on the type of organization and the general policies regarding their use as instructional quarters when not appropriated for school lunches. Main corridors in some schools serve informal educational uses as well as a means of circulation; consequently, a restriction of their space might be accomplished at too great a sacrifice.

A matter which often emerges as an obstacle to adaptation is the continued demand for more housing. School plants are usually planned for the more immediate housing needs and by the time they are completed the enrolment has outgrown them. *Housing problems argue for adequate foresight and a survey of future as well as present needs*. The efficient school architectural organizations include experts for the necessary housing investigations as well as experts for educational adaptation.

Educational demands are constantly changing; therefore, educational programs must change and these, in turn, call for occasional changes in the

school plant. The successful school architect must anticipate future educational needs and problems when planning present needs. Elasticity is the secret of continued building service. The building plan must be elastic, so that alterations and expansions may be readily made with the greatest economy and without impairing lighting or ventilation.

With *adaptation* as the dominant thought, *the planning and development of every school plant becomes an individual and a constantly changing problem.* The debated questions of size of auditorium, group plan *vs.* compact plan, top-lighting, and one-story buildings resolve themselves into variations of methods in bringing about a solution to the varieties of building projects. No school architect who is a student of changing educational demands and organization and who is fully aware that needs and policies vary with practically every community will ever take a decided stand for a certain size or type of auditorium applicable to all types of schools. Nor will he advocate the group plan indiscriminately, nor top-lighting, nor the one-story schools except as they apply in the solution of particular problems.

The full possibilities of school auditoriums as socializing units and educational factors are being realized in a comparatively small number of schools. Where an auditorium is desired for occasional large gatherings only, the financial drain becomes too great on the school's resources for its installation in all schools of a community. In this case it is better to select one or more schools with central location and restrict auditoriums to them. The size, then, will depend on contemplated use. *There is no doubt, however, that the auditorium may and should become a vital instructional force* and it is to be hoped that all schools will organize, so that this desirable asset will really become a necessity through educational demands.

In schools where the auditoriums are used regularly by groups of classes for instructional and socializing purposes the over-large room is a disadvantage. *Instead the medium-sized auditorium, preferably with a capacity of from six to eight hundred, is the most practical.* This medium-sized space if planned in correct relation with a stage gymnasium and separated therefrom by a sound-proof movable partition can always be enlarged for special occasions.

There has been some discussion on the advantage of group planning in schoolhouse construction. If the group plan can show greater educational adaptation than the compact plan, then it should receive paramount consideration in the initial planning of school plants. Nevertheless, it requires a large site, adds materially to the cost of construction on account of the large number of outside walls, necessitates needlessly long runs of pipe lines for heating and ventilation, and requires extra cost for tunneling or construction of covered passageways between buildings. It also adds to the problem of administration, supervision, and janitorial service. If the educational advantages can outweigh these disadvantages, well and good.

Sometimes it may be necessary to institute a group plan. Circumstances may force it. For example, at Greenfield, Ohio, Mr. E. L. McClain, a public-spirited citizen, through a generous impulse, donated a beautiful

high school to the city several years ago. It was complete in every respect. At the present time the Board of Education is planning an elementary school in close proximity. And Mr. McClain is matching this by another donation in the form of a detached annex to the high school for additional shops, agricultural laboratories, and a swimming pool. The completed plan will include a group of three buildings. Here the group plan is desirable, and it is usually unavoidable where old buildings are to be enlarged and eventually replaced.

It has been argued that the group plan gives a more pleasing effect architecturally. There is also a negative to this assumption. The best in architecture is not necessarily a detachment of component parts but rather correct proportion, proper relationship, nobility of mass, and simplicity of design. Surely, these can be attained as well with a consolidation as with a detachment of related parts. So, again, it is a question of *individual adaptation, a study of the elements involved before a solution can be evolved.*

Much time and energy have been wasted on discussions of top-lighting. This type of lighting may be ideal for shops, but it is decidedly questionable whether this method of lighting alone or in combination with side lighting will be found generally satisfactory for classrooms.

First of all, there is danger of improper distribution of light. The result is usually an over-supply of light in the center portion of the rooms, with blackboards and the more remote parts in semi-darkness. It is obvious that lack of proper light distribution constitutes an obstacle to building service. There is also something in the psychology of closed-up walls. Rooms with adequate and properly arranged side lighting are far more cheerful and inviting. Furthermore, top-lighting for classrooms is restricted to one-story buildings, and these are only recommended in specific instances.

The question of proper lighting is intimately connected with a number of conditions. It is at once a matter of adaptation. That the light should come from the left side; that the window area should be in proper proportion to the floor area (which varies in different latitudes), and that windows should extend to the ceiling of the room are matters on which there has been a general agreement.

As suggested in a preceding statement, the question of top-lighting naturally relates to the one-story buildings which should be restricted to the warmer climates, and it is not always advisable to erect them there. A couple of years ago several elementary schools were being planned for Dallas, Texas. A tendency seemed to be in the direction of the one-story schools. A report of comparison between a one- and a two-story building with identical facilities was requested. Several of the outstanding results were as follows: (1) Site comparisons revealed that the one-story required 15½ per cent larger site than the two-story building to provide equal play space; (2) in cubical content the one-story exceeded the two-story by 54,336 cubic feet; and (3) the cost was \$20,648 greater.

Without any outstanding counteracting educational advantages, no light-

ing or safety advantages of the one-story over the two-story plan, the new Dallas schools were planned as two-story structures.

In the smaller as well as the larger cities *adaptation revolves around centralization*. The development of a large number of small plants instead of a small number of large plants precludes successful adaptation and building economies. For instance, if a city with eight small schools of approximately four hundred pupils each attempts to install gymnasiums, shower baths, and auditoriums in each plant, the cost becomes prohibitive. How much saner to provide two large plants with a capacity equal to the eight schools. Two auditoriums, two gymnasiums, and other enriched facilities in proportion are then financially possible. The city of Detroit furnishes an excellent example of transition on a large scale from small schools to large units. Greenfield, Ohio, is as good an example of the advantages of one large centralized group for a school population of fourteen hundred pupils. For a medium-sized city, Gary, Indiana, stands out as a shining example of centralization.

When adaptation and centralization are achieved, the mooted questions will change color. The size of the auditorium will be determined after an understanding of contemplated use. Top-lighting and the one-story type of school will generally prove impractical. All of the so-called mooted topics will be absorbed by the one great problem of adaptation. To sum up: *Centralization, the scientific adaptation of the school plant to educational and housing needs, present and future, elasticity of building plan*, so that changes and expansions are practically and economically possible, and the *reduction of non-instructional space to the required minimum* constitute the guiding principles in the development of school plants in all communities.

THE SUPERINTENDENT AND STANDARDIZED TESTS

D. C. BLISS, SUPERINTENDENT OF SCHOOLS, MONTCLAIR, NEW JERSEY

One of the most significant developments in recent educational administration is the extensive use of standardized tests. It marks the change from schools administered on the basis of mere opinion to a procedure having for its justification ascertained facts. Such tests have now been employed for a sufficient length of time to show that they may be used for three things: (1) Determination of existing conditions; (2) Diagnosis of causes of failure; (3) Prognosis for future procedure.

Judging from their practice, our schools seem to assume that the first step constitutes the whole testing program. They need to realize that the accumulation of medians, averages, graphs, and the like is of little avail. The important thing is such an analysis of these returns as will show the causes of failure, and then such a modification of method as will remedy the situation. The sick man is not helped when he is told that appendicitis is the cause of the severe pain. He wants action, and that quickly.

Doubtless it is of interest to the teacher to know that her class reaches a certain average on the Woody Test. If that is the beginning and the end, the time consumed in giving the test is largely wasted. If the class record is poor, the teacher wants to know why it is poor. It may be due to much drill on some operations and too little drill on others.

Little consideration had been given to the prognostic value of tests until their extensive use by the army in classifying the millions of men gathered by the selective draft. It is of this phase of testing that I wish to speak in the brief time at my disposal. For the sake of using concrete facts, I will describe in considerable detail how Montclair has used the standard test in the sixth grade as a means of determining the grouping in the seventh grade, or the first year of the junior high school.

One of our largest junior schools is recruited from four elementary schools of the most diverse character. One of these schools is attended almost wholly by Italians, another by Negroes and Italians, a third by children from an unusually fine type of American ancestry, while the fourth school is of a cosmopolitan character, with extreme types represented.

When the junior school was first organized, the principal faced a difficult task. Here were children of all degrees of intellectual ability, gathered in one school. The only information available to the principal was the promotion record of the child. Variation in the standards of the four schools and in the marks given by a dozen teachers made this record of little value as a means for classifying the pupils. The only thing to do was to form tentative groups according to the available evidence and later make such adjustments of individual pupils as their record in the junior school required. The larger part of the first semester was consumed in this wasteful procedure.

It became evident that some better means than the trial-and-error method must be found for classifying these children.

Accordingly, during the latter part of the year 1917, a battery of six tests was given to all sixth-grade pupils in the four schools, and on the basis of the results the names of the pupils were arranged in order, the pupil making the best record being No. 1, and so on. The first year the six tests employed were: Thorndike Visual Vocabulary, Thorndike Scale Alpha, Trabue Completion, Whipple Easy Opposites, Courtis Arithmetic Series B, and Ayres Spelling. One hundred ninety-six pupils were thus tested, and five fairly homogeneous groups were formed. These groups constituted the basis for assignment to sections, in making up the classes for the following September.

As may be imagined, it was a task of considerable magnitude for one person to give these six tests, rank the papers and indicate the respective groupings. Unless these groupings were justified in the light of the records of the seventh grade, the scheme would necessarily have to be abandoned.

Accordingly, after the close of the year in 1918, the scholastic record of these same 196 children was compared with their prognostic record to determine the degree of accuracy of the prognosis.

If a pupil was ranked in Group-I in the prognosis and his record the next year placed him in Group-I, we were entirely satisfied. If the prognosis placed him in Group-V and his record located him in Group-V, the prognosis was considered correct.

The fact should not be overlooked that the group in which a child was placed at the close of the seventh year depended entirely upon that most variable of all measures, the teacher's mark. The amount of this error no one can tell, but it is doubtless a considerable one.

When the first prognostic grouping was checked by the first scholastic grouping, the accuracy of the placement was close enough to justify all the time and labor expended. Accordingly the same plan has been followed for four years, and the grouping checked the subsequent year.

The close resemblance of the personnel of the two groups is best illustrated by this chart, showing the prognostic grouping in 1919 and the scholastic grouping in 1920.

Of the original prognostic Group-I, 67 per cent were classified in Group-I on their record, 23 per cent in Group-II, 3 per cent in Group-III, and 7 per cent in Group-IV. Not a single pupil went to Group-V.

Of the prognostic Group-V, 74 per cent were classified on their scholastic record as belonging in Group-V, 10 per cent in Group-IV, and 16 per cent in Group-III. Not a single pupil was placed in Group-II or Group-I.

It is evident that the difference between any two groups is very small. While 67 per cent remained in Group-I, the 23 per cent that were placed in Group-II might well be classed in Group-I, leaving the 3 per cent and 7 per cent of Groups III and IV as the sum of the prognosis error.

While these two groups show the highest correlation between the prognostic and scholastic groupings, the entire record for the four years is most significant. The per cent of all children examined remaining, on their record for the year, in exactly the same group in which placed by examination, is as follows:

1917-1918, 43 per cent; 1918-1919, 36 per cent; 1919-1920, 42 per cent; and 1920-1921, 44 per cent.

If these percentages were increased by the inclusion of these children in adjacent groups, the resulting groups, which are sufficiently homogeneous for working purposes, would show an accuracy of placement of about 80 per cent.

When it is remembered that one of the factors consists of the weighted marks of different teachers, the error does not seem excessive.

This study gave some interesting facts upon the relation of the junior high school, with its differentiated courses of study, to elimination.

In 1917, the junior high school had not been organized long enough for the school to realize to the fullest extent the opportunities for adapting subject matter and methods to the needs of pupils. Elimination was least in the most advanced section, and increased progressively as appears below:

PROGNOSTIC GROUPING

	<i>Number</i>	<i>Elimination</i>
Group I	28	4
Group II	36	8
Group III	51	11
Group IV	42	15
Group V	38	21
Total	195	59

With a clearer appreciation of the significance of the junior high school and a better adjustment of the curriculum, three years later eliminations were not only fewer in number, but clearly were not dependent upon scholarship.

PROGNOSTIC GROUPING, 1920

	<i>Numbers</i>	
Group I	39	5
Group II	42	9
Group III	44	9
Group IV	41	7
Group V	36	12
Total	202	42

While the diagnostic tests employed the first year of this plan were fairly satisfactory, a few substitutions have been made whenever new tests appeared which seemed better adapted to the purpose.

Our experience with the use of a selected list of tests for the purpose of determining the proper grouping in the junior high school, while by no means infallible, indicates a degree of accuracy in the placement of pupils that fully justifies the effort.

THE SUPERINTENDENT AND THE COURSE OF STUDY

H. B. BRUNER, SUPERINTENDENT OF SCHOOLS, OKMULGEE, OKLAHOMA

The importance of the course of study—Of chief importance in any school system is the quality of instruction. Next to the teacher herself, the most forceful factor in determining what the quality shall be is without doubt the course of study. In spite of this fact, the relative amount of time given to this most important phase of the superintendent's work is very small.

Time-consuming details, such as building programs, budgets, insurance, and the multiple other tasks which fall to the lot of the average superintendent are given precedence over the course of study because this feature

will wait. The public makes vicious attacks upon us, when our buildings and finances are not in proper shape, but the long-suffering students and teachers generously accept our excuse again and again that we are too busy to do the most important thing for which we are hired.

On account of this neglect on our part, hundreds of new teachers form improper habits in their first year's experience, since there is nothing to supply the direction so badly needed. Many of them retain these habits throughout their schoolroom careers. To my mind this is one of the chief causes of unsatisfactory teaching.

Who should write the course of study?—Most of us in administrative positions have overestimated the amount of our own time which would be required to put across a vital and useful course of study. In many instances, the mere showing of a favorable disposition toward its making will light the fires of enthusiasm and initiative in our teaching staff and will result in a product far superior to the superintendent-made, scissors-type course which is so prevalent today.

As far away as the superintendent is from actual instruction, it would be next to impossible and extremely unwise for him to dictate many of the details. In the first place, he will not have the correct knowledge except in a general way, and in the second place, as pointed out above, he does not have the time which a thorough job would require.

Much has recently been said in regard to the sharing of administrative duties with the classroom teacher. Fortunately, we have got beyond the saying stage and many of us have realized the tremendous advantages to ourselves and to the school systems which we represent of letting the teachers in on our administrative problems, especially those of a policy-forming nature. I know of no better way of bringing the teaching forces into a helpful and coöperative relationship with the administration than that of assisting them in organizing in such a way as to initiate and carry to completion a course of study which really meets the needs of the pupils in their charge. As to their fitness for this work, there is no question, for, after all it is the classroom teacher, together with her immediate supervisors, who should determine the course of study, especially the details, since it is she who comes in direct daily contact with the child's life. Hence she knows better than any other the requirements and standards to which any course must measure up.

Upon the superintendent, however, should devolve the first move in this direction. It is his business to indicate a desire to have his teachers coöperate in doing what has formerly been supposed to be his job. It is his business to discuss with them schemes so that all agencies will work in harmony and not at counter-purposes. It is also his business to discuss with them the needs of the school in general, so as to insure a proper balance to the course of study, thus eliminating undue emphasis on any particular features. And last, but most important, it is his task and duty to provide (through administrative adjustments) time and facilities for the teacher to carry out the requests he has made of her.

What should the course of study be?—These are times of flux. Never before in the history of school work has there been a greater need for new and up-to-the-minute courses of study, highly flexible in many respects, a course of study which will be suited, not only to the varying needs of children, but also to the needs and conditions, financial and otherwise, of the community and school in which the course is to function. The loose-leaf type, where teachers are permitted and encouraged to write suggestions for yearly revisions, is often highly desirable.

Now, as never before, are we beginning to recognize the need for the kind of course of study which will take into account the different types of mentality. To my mind the greatest need in the field of education at present is a course of study, followed later by textbooks, suited to the needs of children of both superior and inferior types of intelligence. This is totally lacking today as far as I am acquainted with the facts.

Yet in these times of change, our course must keep its finger on the spot. It must not be allowed to *wander* aimlessly. In certain respects it must be very, very definite, or many teachers, especially the inexperienced ones, will stray far from the mark. With all its flexibility, it must be in some features uniform, not the goose-step type, but so arranged that each part will work with all others toward the same unified end.

In order to insure some of these things, it will probably be necessary for the superintendent or his supervisors to set out a scheme something like the following, which will be directly applicable in any department or field of work. Teachers do not consider a carefully made set of directions as an imposition, but will take them in the spirit in which they are given—namely, as a guide toward unified effort.

A typical set of directions from the superintendent to the makers of the course of study—"In order that our efforts may be bent toward the same end, may I not ask that each of you follow in the main the suggestions given below in making your particular portion of the new course of study which, when completed, will be of such great assistance to you and me and every one in your department and school?

1. State definitely the goals or aims of your course.

- (a) The ultimate aim.

- (b) The immediate aim.

2. Content.

- (a) Give list of standard tests which may be used to determine the efficiency for your grade of work, mentioning the desirable standards.

- (b) State the minimum essentials, outlining in great detail the first two or three weeks' work, as it should be covered by an average teacher with an average group of pupils.

- (c) Give list of usable projects, carrying one of these projects to completion in great detail, so that an inexperienced teacher may be able to follow any project on your list by using carefully the directions you give in your example.

- (d) Give content bibliography in detail, mentioning the books, pages, publishing companies, and the like.

3. Method.

(a) Mention as many little concrete devices as possible whereby a teacher can put across the content of this course.

(b) Give complete bibliography on method, mentioning a broad range of suggested methods. This is a tremendous asset to any course.

4. The general bibliography, referring to exact pages and chapters, making the material so accessible that there will be a maximum attraction for its use by teachers."

Instruction is supposed to be the chief business of the public schools. Around this as a centre should revolve all other things, buildings, budgets, compulsory attendance—everything. Yet it is deplorable, when we consider what a relatively small amount of effort superintendents give to this field. The time is rapidly approaching, and rightly so, when the superintendent will be judged more and more by the quality, recentness, and usableness of his course of study as well as upon the size of the bond issue he has floated, the type of building he has constructed, or the increase in taxes he has convinced the people to vote, important and necessary as all these are.

WHY MAINTAIN THE PRESENT SALARY SCHEDULES?

M. G. CLARK, SUPERINTENDENT OF SCHOOLS, SIOUX CITY, IOWA

I have no brief today, fellow superintendents, for the defense of the teacher's pocket book *per se*. Neither have I prepared for you columns of statistics concerning the present-day evaluation of teachers' salaries in terms of their living costs. Rather, my discussion has to do with what we commonly call the school product, its output—boys and girls—and with their vision of life and their attitude toward our democracy. This appears to me to be the only real basis for our discussion.

Our salary problem, therefore, as I see it, is not merely a question involving the basis for our 1922 teachers' contracts, but is rather a problem involving the future of this school output. It involves the establishment of a policy that shall determine for at least a generation or more the trend of our democracy through its educational influences.

Place of the public school—I believe, therefore, and this is my first thesis, that we must determine clearly for ourselves and for our communities the place which the public-school system really occupies in the development and perpetuity of our democracy and in the functioning of American institutions.

The American public school has been the great bulwark of American democracy. It has been more than an educational agency. It is far more than a place for teaching the rudiments of civilized communication. It is something far greater than a place in which the child familiarizes himself with the tools of life's business and of social economy. It is the one institution in which the spirit of America and the ideals of America have been

held before the minds of America's young people, to take root, to grow and to function through their lives.

America is America because of the American public school. American democracy is American democracy because of the democracy of the public school. American backbone is American backbone because of the teaching and the training of American youths in American schools. Our civilization has held together against the onslaughts of the millions of uneducated south Europe emigrants because of the American public-school system. The American melting pot is the American public school. America is cohesive—in so far as she has cohesion—because of the truths and principles that have knit the hearts of American public-school children together.

In supporting the public school of the city, State, and Nation, therefore, the tax-payer is doing more than paying for the training of the intellectual child. The public-school tax pays for the upholding of American institutions. The public-school tax pays for the maintenance and the safety of the city, the State, and the Nation. The salary of the teacher, therefore, must be commensurate with this demand. It must insure teacher quality, rather than teacher quantity.

Teaching functions—My second thesis calls to your attention the vital relationships existing between remuneration and teaching function. A true teacher is a leader. She only can lead who is sure of her objective and sure of the path to its approach. Life must be concrete to the teacher. She must be a functioning part of her community, otherwise her life is not concrete, her knowledge is purely academic, and her pupils will quickly lose confidence in her leadership. A leader possesses the spirit of leadership—mentally, morally, physically, socially. She must feel herself the peer of her fellows in dress, in living quarters, in community functions. She mingles happily with other community leaders. To deprive her of this is to deprive her of leadership—to deprive her of companionship and, above all, to deprive her of self-respect.

Teaching ought not to become again synonymous with self-disrespect in community associations. The spirit of the true teacher is always buoyant. It must remain buoyant. The broken-spirited have no place in the school-room.

Again, as a leader the teacher must feel free from worry concerning her financial future. She must be assured, through the salary policy of her community, that her thrift and her financial management will bring to her old-age security. To deprive her of this possibility of necessity destroys her spirit of independence and re-creates her a discouraged community mendicant, an avowed husband or new job hunter, or a society hater in her secret attitude. On the contrary, the true teacher feels the call to community helpfulness. Instead of being an object of pity and charity she desires to bestow charity. This is a part of life she ought not to miss; it is a personal trust and responsibility in keeping with her character.

The teacher who really functions as a child leader must be assured of a functioning remuneration. Her salary must be commensurate with her

self-respect. It must be commensurate with the respect which the community gives to its leaders. It must be commensurate with the respect the community would have its children give its teachers. It must be commensurate with ideas of thrift and of personal financial independence. Without this assurance she is dominated by an unreasoning fear, an influence from which every school-child should be protected. Such weakness soon dominates the school atmosphere and destroys its virility. The past two years of promised financial security and of equality in community life have done much for the betterment of the teachers of our country. Their financial independence has reacted upon their very personality. They are men and women among men and women. They have entered community affairs. They have assured much of leadership in community organizations—social, civic, and religious. May this betterment, this leadership, not be lost through false salary economies.

The procreation of the profession—My third thesis deals with a far more subtle danger to our American institutions. It may be said that in keeping with the general law of life a vocation procreates itself. The type of tomorrow's teachers depends upon the "call" today's teachers send out to the young on-coming generation. This is the call of their spirit, the call of their attitude toward life, the call of their attitude toward their vocation, the call of their community leadership, the call of the part they play in the world's work, the call society accords them in its ranks. It is a call that youngsters never misinterpret. High-school and college students are more busily evaluating life's possibilities than they are evaluating the worth-whileness of geometry and latin.

Red-blooded, virile, intellectual, spiritual boys and girls in high school and college are listening for calls. They respond to a "call" only as it appeals to their idea of worth-whileness, of ability to fit into their conception of a life-work that shall give opportunity for their ambitions to function. They feel an obligation to the world. They feel themselves to be worth-while. They resist a call that does not put up to them a challenge to do their part in the accomplishment of the world's progress.

The time has come when the make-shift teacher, especially men, must be taboo in the business of teaching. The man waiting for a higher call has no business at the teacher's desk. There can be no higher call for him. Child leadership demands men who see in its call the highest and best that life affords in human service.

The teacher's call, therefore, must be a call for the best in American boyhood and girlhood. Our schools must have the best of our young people—the pick of American virility—if they are to survive and maintain the position Doctor Eliot says they now occupy. Anything, therefore, that weakens the position of the teacher in the minds of the young people of our schools and colleges necessarily weakens its call for the procreation of the profession. Is not this principle largely responsible for the position occupied by the church in American society today?

For the first time in the history of teaching, teachers are occupying a

position of medium financial respectability. The call of the profession to a virile class of young people will depend upon this condition being maintained and even strengthened. Any tendency to lower the standard of salaries will react upon the future generation of teachers. It will enervate the profession and, therefore, weaken the schools.

Principle of waste—My fourth thesis has to do with the principle of waste. For centuries the world moved on its way totally ignorant of the wonderful possibilities of electricity. It knew nothing of the potentialities by which it was surrounded. It wasted through generations of human struggle the abilities of electricity to work for man, to light and to heat his home, to convey messages from country to country, even to cure the ills of man himself.

The world's greatest waste, however, is its constant waste of human potentialities. The waste of intellectual, spiritual, and economic possibilities. The human potentialities of the future are all gathered in the school-rooms of today. The loosening of those bonds are largely in the hands of the teachers. The potentialities of day after tomorrow likewise are in the hands of tomorrow's teachers. To place before a group of children a teacher with any form of handicap is to continue human waste. The world can only afford to place in such a position of leadership a teacher of broad vision, of high ideals, of great intellectual and spiritual caliber. No one can measure the potentialities of a group of twenty children. Unless the bonds of those possibilities are loosened, unless vision is kept before these children, the probability of waste is immeasurable.

The sad part of the story is that human waste is never recovered. Gold is never destroyed. Man's ingenuity makes it practically always possible to bring about its recovery. But the potentiality of the human mind, abused, lost, wasted, is gone forever.

The call of the teacher's cult to the future generations of teachers is a call for the solution of the problem of human waste. It is a call for the highest and best in our young manhood and young womanhood to respond to a great need in America. It is America's call. The best in industrial leadership demands the best in financial remuneration. It cannot otherwise be obtained. The best in human life naturally gravitates to those positions in the world's service which humanity recognizes and honors. While true honor is a spiritual recognition of the spiritual service of man, as yet most effective recognition of worth-while service in world work is measured by the dollar. The red-blooded, the virile, the great in vision, demand their complete recognition and place with the world's leaders.

Conclusion—In concluding, I would emphasize two things: (1) The round of possible National decay. The story of the farmer who bought more land to raise more corn to feed more hogs to get more money to buy more land is well known. The seemingly harmless proposal to lower teachers' salaries in order to ease the tax burden of the moment will bring us face to face with an educational, economic, and moral round of National decay. This round will read somewhat as follows: Ease the tax burden

by lowering teachers' salaries, employ a lower type of teaching personality, secure a lower standard of teaching, resulting in inefficient schools, a lower standard of community life, a devitalized State, and finally a degenerating democracy. Then the round again, a further decrease in teaching salaries, a further decrease in school efficiency, a still lower standard of community life, a greater devitalization of the State, a further lowering of National ideals. And thus the round goes on.

Rather, let us demand a constantly recurring round of increasing National efficiency, a round that shall start with the principle of financial insurance of self-respect and of self-support for the teaching profession.

(2) What shall we as a group of superintendents do concerning the problem with which we are faced? In a democracy we must start with the unit of democracy, the individual tax-payer. From him to the community. From the community to the State, and finally to National policies or standards. Let the superintendents, the teachers, and the friends of education place before their tax-payers, before their communities, some such group of facts and ideals as I have feebly tried to sketch in this paper. Let us formulate a platform, looking toward a more efficient democracy through a more efficient teaching body; a platform upon which we are willing to stand. Let us preach and teach the principles of this platform untiringly in our local communities. Let us fill the newspapers with these facts. Let us study the question and become certain of the validity of our argument. Then let the educational forces of the entire country stand pat. Let them fight, if need be—it will be a fight for a better America—but, above all, let us hold that which we now have.

THE ARGUMENTS FOR AND AGAINST THE SUPERVISION OF INSTRUCTION

CHARLES A. WAGNER, SUPERINTENDENT OF SCHOOLS, CHESTER,
PENNSYLVANIA

The opposition to supervision needs to be classed as opinions urged against supervision; they are not arguments.

1. Supervision destroys the individuality of the teacher. This is true of poor supervision; the poor teacher has no individuality to suppress. Good supervision develops teachers by correcting the improvable work and by offering extra inducements and recognition to the original teacher.

2. Supervision expects too much of teachers. A complaint of the inert and mechanical teacher. Good supervision inspires the best teacher most, of course, because there is *most to inspire*.

3. Supervision has no professional standards. This fact is being changed and rendered less true every day and year. Supervision is passing from the individual to the professional basis.

4. The supervisor tries to catch teachers unprepared. Spying is not supervision, but a base counterfeit.

5. Teachers object to supervisors' little supervisory slips; they, too, want to write slips on the supervisors. Merely a quibble, but teachers should be recognized and their opinions of their work taken into consideration.

Some other opposing claims are met in the opinions in favor of supervision: (1) Supervision helps the new teacher most quickly into unity and harmony with the system; (2) Supervision helps the poorly trained teacher to become a better teacher, improving as rapidly as the teacher will exert herself; (3) Supervision induces meditation, contemplation, self-criticism by teachers; (4) New ideas, plans, procedures are brought into the system by supervision and adapted to the system; (5) The best work of the system is used as type and model for other teachers of the system; (6) If rating and pay are to be based on effectiveness in work, supervision is needed; (7) The work of a system is unified by supervision; opportunities of the children are made as nearly equal as possible in all points of the system; and (8) Supervision is called for by the tendency to specialization in every human activity. The accumulated knowledge and the acquired skill of professionals can thus become an inexhaustible resource for system and profession.

THE NEXT STEP IN SCHOOL SUPERVISION

E. E. OBERHOLTZER, SUPERINTENDENT OF SCHOOLS, TULSA, OKLAHOMA

I have been asked to discuss "The Next Step in School Supervision." In the definition of my subject I wish to have it understood that supervision in its broad sense is chiefly to stimulate the development and efficiency of all the activities and functions of public-school education.

We have long devoted much of our time to the observational, inspectorial type of supervision. In this respect we have practiced the old-fashioned method of struggling for progress through the trial-and-error policy, but, in the present day, education has received a new interpretation, a new enthusiasm, and a new stimulation. The science of education is making rapid progress. Educational method is passing through a period of change in the direction of larger initiative and individuality for the learner. Among educational workers there is being developed a higher sense of professional obligation which finds itself embodied in renewed interest in professional organizations among teachers and other educators, while in the public mind there is a growing demand for a wider program of education and more efficient results.

Moreover, America is taking the lead in this movement. Universal education with the objectives to meet the needs of a democratic society and to adapt the individual to his social and economic place is truly an American program which is destined to grow until it becomes a world program of education, recognized, respected, and relied upon for the ultimate salvation of world civilization.

Surely, expert supervision should be constructive. It should seek to establish a unity of effort throughout the schools, so that the part of each

one in the education of children may be as effective as possible. This unity of purpose and coöperation is the chief object of supervision and should receive the same scientific consideration as is now being given to the measurement of results in teaching through standard tests and measurements. At the present time, among cities the size of this group—namely, 25,000 to 100,000, there is no scientific procedure or proper machinery to give the expert supervision needed, or to extend supervision to include these important fields.

The three types of supervisory officials now generally recognized are: (1) The superintendent, (2) the supervisor or director of special subjects or departments, and (3) the supervising principal.

As we look into the present status of these officials, we find many conflicting conditions which prevent them from doing expert supervision.

Superintendent James Van Sickle, of Springfield, Massachusetts,¹ gives in his statement of the best use of the superintendent's time the following duties:

His task is to assign duties and keep hands off, yet know what is being done. He must serve as the acting head of a great and intricate business; he must serve as a clearinghouse for all requests, sane or insane, pressed by supervisors, principals, teachers, and the public. He must sift the "likely" requests and present them to the board clearly and convincingly. He must keep the school board informed regarding his policies and plans, and also with regard to the progress and success or failure of such plans and policies. He must educate a constantly changing board, a task that is likely to call for all the skill and tact that he possesses. He must hold himself in readiness to supply any member of the board or the city government, on short notice, with such information as may be desired. He must often interpret the board to the teaching force, and the teaching force to the board. He must serve as a court of appeal in cases of discipline. He must keep things smooth in his field.

George A. Mirick, of Cambridge, Massachusetts,² defines the two classes of school officers relating to instruction. The school commissioner, whom he assigns as director, relating to the selection of subordinates, inspection, selection of textbooks, and the improvement of teachers; as an executive he is the agent of the board of education in its relation to the community and to the teaching group. As an organizer he is responsible for the whole system in each department relating to administration, instruction, and supervision.

Mirick delegates to the supervisor duties quite separate from administration. The supervisor must be authoritative on subject matter, on curriculum, on method, on scientific procedure, on motivation, on diagnosis, and in seeking coöperation in planning and conducting meetings. The chief point about this type of supervision is that it is widely removed from administration and inspection.

Moreover, in dealing with the supervisors or directors of special subjects or departments, we find that few of them have the perspective of the whole school program or the scientific training which reaches into the various fields and interests that lie outside of the special subject.

As we turn to the supervising principal, we are confronted again with

¹ Des Moines Report, N. E. A. Proceedings, Vol. 59, p. 727.

² *Elementary School Journal*, Dec., 1918, p. 285.

the conflict in duties and the proper distribution of the principal's time for supervision, administration, and clerical work. Worth McClure, of Seattle, Washington,¹ finds that the greatest need of principals is a study looking towards a development of two things—namely, (a) a philosophy of the principalship, and (b) a working, administrative, and supervising technique. He found a wide variation of opinion as to the duties and proper distribution of the time of the principal. Fifteen university professors give the following table of relative importance of the functions of the principal.²

Rank of Importance	Function	Median Weighing	Total Weighing	Range
1	Supervision of teaching.....	40	582	25-65
2	Administration	20	310	10-40
3	Community leadership.....	15	218	10-25
4	Professional study.....	11	197	5-30
5	Clerical work.....	10	130	0-20

A group of city superintendents assigned the following valuations:³

Rank of Importance	Function	Median Percentage	Range
1	Supervision	50	40-80
2	Administration	20	5-60
3	Clerical work.....	10	0-25

Forty-three Seattle elementary-school principals were asked to give relative importance on the basis of time emphasis. This combined data shows that administration received about thirty per cent more time than did supervision and about seventy-three per cent more time than clerical work. Supervision received about twenty-six per cent more time than clerical work, while the relative importance of the functions in actual practice, as observed by thirteen university professors, is given in the following table:⁴

Rank of Importance	Function	Median Weighing	Total Weighing	Range
1	Administration	30	452	27-50
2	Clerical work.....	30	375	20-40
3	Supervision of teaching.....	17	217	5-30
4	Community leadership.....	10	126	5-25
5	Professional study.....	9	88	0-20

From the foregoing statements it is evident that there is yet to be found proper scientific procedure and organized machinery to meet the full needs of supervision. Nevertheless, we can determine with a great deal of accuracy how well we are administering certain parts of the present curriculum and the results we are getting in teaching some phases of subject matter, thus checking indirectly one phase of supervision.

If we wish only to measure the results in addition and multiplication we have well-defined standards for this, but if on the other hand we turn from checking results in the fundamental processes of arithmetic to challenge the wisdom of our practice in presenting certain phases of the subject

¹*Elementary School Journal*, March, 1921, p. 500.

²*Elementary School Journal*, March, 1921, p. 503.

³*Elementary School Journal*, March, 1921, p. 505.

⁴*Elementary School Journal*, March, 1921, p. 506.

matter or in introducing it in particular grades, then we have no scientific data to prove the value. Mere opinion still prevails to a great extent in the selection, arrangement, and placing of curriculum activities and in the evaluation of subject matter. For example, we have not yet the scientific procedure nor the organized machinery for ascertaining whether algebra belongs in the first year of the high school or the second year, or whether a foreign language should be taught in the first year of the junior high school or in the last.

So the problem of curriculum construction, testing, arranging, and placing is still left largely to agencies which are guided by the practices of tradition, personal opinion, or as Dr. Judd says, "In the happy-go-lucky plan of the chance enthusiast."¹ Referring again to Dr. Judd, who finds there is no well-defined agency for securing the new curriculum material or overhauling the old, and relates a concrete experience of his in the assignment to fifty members of the National Association of Secondary School Principals the task of each preparing five lessons in social and industrial organization material that each should try in his own school and report on them. Very little response was obtained, although the parties to whom this task was assigned were volunteers, and after a year and a half of "patient waiting and correspondence," the committee had eighteen lessons. Quoting Dr. Judd, "The evidence is painfully clear that high-school principals do not regard themselves as the chief agents of society for the construction of new material on civics." . . .

"As we have no adequate scientific methods, or constituted agencies, for the reconstruction of the curriculum, it certainly behooves us to take up the consideration of the curriculum problem and to canvass the possible lines of procedure which can be adopted to remedy the situation."

Scientific measurement through standard tests has come to be a definite part of the routine school work. Although there was opposition to these tests on account of new revelations made, and although this new procedure disturbed ordinary routine, yet to this movement we must ascribe the awakening of school administrators to the results achieved by their respective school systems. Valuations in practice, waste in coördination, introduction of new courses into the curriculum, and revision of subject matter have all been attacked without any very consistent study or knowledge of the remedies needed. If scientific tests are to make a lasting contribution they must produce more than adverse criticism. They must assist in the evaluation, not only in the technique and procedure in teaching, but also in the technique and procedure in supervision and curriculum building.

Since these tests have been developed to a point where they serve with considerable success in gaining knowledge of children, regarding both the differences in intelligence of the group and the status of the individual in achievement, we are now ready to take the next step by reviewing our theory of educational organization with respect to the individual child and the group to be taught, not as a means to an end but as an end which

¹ *School and Society*, Vol. XV, No. 367, p. 2.

must meet all the individual needs and social demands. Public-school education must ever keep in mind mass or group teaching, administered without sacrificing the individual to the masses.

However, instruction is but one phase of education. There is always a possibility for new means of improvement in education, which we, as school administrators, are obliged to recognize. What value are we obtaining in the field of practice from experts in scientific research? What value are we obtaining from curriculum builders in the finer adjustment to our local needs? What value are we obtaining from textbook writers in bringing us the new materials and methods of presentation derived directly from the field of practice? To answer these questions we must turn again to the broad field of public education. The correct solution of all problems, which leads with the least resistance to the direct results we desire, must come from careful scientific supervision of all phases of public education.

Then the *next step in school supervision* is to establish scientific procedure and a proper organization for the evaluation of supervision as it relates to all phases of public education. It must attack problems of technique and method, problems of teaching service, problems of supervisors and directors of special subjects, or departments, and problems of curriculum building and subject-matter revision. The next step in supervision is *scientific and expert supervision* of supervision. This is the new problem in the science of education to which teacher-training institutions, public-school administrators, and experts in every field of education must direct their attention.

F. J. Kelly¹ suggests, as one of the opportunities for teacher-training institutions in the program of American education, the establishment of new relations between these institutions and the public schools, that they become definitely associated with some of the best public schools of the State for clinical service as a teacher-training laboratory rendered under typical public-school conditions and with adequate expert supervision paid for by the teacher-training institution. Further, that these teacher-training institutions, at least one in the larger cities, maintain experimental schools and other agencies for purposes of research in the fundamental educational sciences in the field of actual practice. This suggestion, if embodied in public education, will become one of the greatest forward steps in solving scientific supervision. Research from long distance and aside from the field of practice is apt to miss its mark by way of developing wrong theories and methods, very much in the same sense as the mighty German gun, which thundered forth its huge missiles without tangible results, except to terrorize, weaken the morale, and maim the innocent.

Quoting Dr. Kelly further, "The demand for research facilities in education rests upon two propositions: First, education is built upon the social sciences of psychology, sociology, economics, and political science. Since these social sciences are so little developed as yet, any profession built upon them must be constantly changing in its so-called 'established principles.' To guide this constant change there is need for the most careful and con-

¹ Des Moines Report, N. E. A. Proceedings, Vol. 59, p. 89.

sistent research. Second, the research should be carried on by educational institutions as a part of the work of public education.

"Today research is the key to supremacy in most lines of business. Manufacturers of electrical goods, rubber goods, oil products, pottery, silk, or what not, depend more upon some unique device or process for the superiority of their output than upon accuracy of workmanship. Accordingly they set up expensive laboratories quite independent of their factories, employ high-salaried experts to busy themselves in attempting to discover some better way."

Is it not, therefore, important for us, who are active in the field of public education and who recognize good business methods in industry to see that in the big business of selling the schools as the greatest social need of civilization our obligation is to begin at once the practice of big business in so far as it can be related extensively and efficiently to educational practice? We cannot afford to continue our greivous mistakes in waste and progress when good business points the way to success. But this development needs careful guarding, for we have yet few well-trained workers in the social science field, in research methods, and in sane, efficient practice. We must bring the teacher-training institutions and the public schools into direct contact, and this adjustment must become so sensitive and well-timed that there may be no loss of energy or efficiency. Perhaps our State universities should take the lead, but our men and women in the field should certainly be awakened to the great opportunities in this new field.

Detroit, in the field of public education, has perhaps the honor of taking the first step in organizing the training school, the research department, and the department of supervision under the authority of Director Courtis. This, it seems to me, comes very nearly to the proper coördination of efficiency departments which shall bring about expert supervision of supervision.

As superintendent, I feel the need of that kind of accurate and direct knowledge of the work being done in our own school system, which shall enable me and others to judge of the results and unified effort as we move toward the one single goal. I need scientifically derived tests for checking supervision of my own effort, the effort of our principals, and the effort of our directors. I need to sit down with our business leaders and point to the results which will define to them in practical terms progress and development, costs and efficiency, extensions and achievement. I am unable, however, to do this, because we have not as yet, neither in the training schools nor in the field of practice, individuals trained for this type of supervision. We have not yet discovered scientific procedure or organized effort to undertake the task.

We are in need of a new type of supervisor—the director of supervision—directly constituted for this particular task and subject to no influence except the direction of the superintendent. This new type of supervisor must be able to see impersonally results, movements, and practice all interpreted in the well-defined objectives constituting the program of edu-

cation. The next step in supervision, in my judgment, demands this new type of service and investigation, leading to organization of new departments in the field of training and practice. It demands that we apply business practice, scientific practice, and serviceable practice in experimenting, in developing, in using and in carrying forward the work of public education. Curriculum building, selecting, testing, arranging and placing subject-matter material, adaptation of curriculum to social demands and the improvement of all activities of public education through expert supervision is the great work to be accomplished.

No organized department of public education has exerted so much influence on the world program of education as has this Department of Superintendence of the National Education Association. If we come here merely to discuss, merely to think over and relate our experiences, then we will not have achieved the greatest good, but if we come here with practical and forward-looking ideas, to have them criticised constructively and sincerely, in order that they may become embodied in some field of practice, truly tested by laboratory and scientific methods, carefully standardized and carefully reported, then we are transferring that type of experience which is usable in furthering the interests of public education. However, let me drop a word of caution—namely, that all of these theories, all of these theses, and all of these discussions must remain directly related to a program of security and progress, founded upon the principle that education is for the child and that the education of every boy and girl must be so conducted as to preserve and develop those elements of personality that are especially valuable in a democratic social structure. As a part of this program of education in nation building the next step in supervision is yet to be realized. *Let us move forward!*

SELLING THE SCHOOLS TO THE PUBLIC

H. B. WILSON, SUPERINTENDENT OF SCHOOLS, BERKELEY, CALIFORNIA

Just as the successful merchant must interest and convince the public that it is desirable to spend money for his merchandise, so must those responsible for public education interest and convince the public that it is wise to spend the money needed for schools. The church, the Christian associations, and all other social agencies which are dependent upon public approval for their financial support face a similar problem.

In opening a discussion of this topic, we need to remind ourselves of a few basic considerations. In the first place, schools are established and maintained by the public in our democracy in order to accomplish certain work for the children of the Nation better than the public believes this work can be otherwise done. Secondly, they depend ultimately upon the will of the people for every detail of their development and maintenance. What type of service they shall render, how they shall be managed, and in what amounts they shall be financed must finally be decided by the people.

Their approval or disapproval on all fundamental matters quickly registers itself, and if their wishes are not heeded decisive expression may be definitely expected at the polls. In light of these considerations, it is evident that the public schools of any age or locality express approximately the dominant convictions of the people regarding what education should try to do and at what expense. Leading the public to provide such schools as are necessary and to meet the costs thereof is therefore a problem in broad, fundamental, public salesmanship.

The history of American education reveals that two problems which concern us in this discussion have been constant problems. One concerns the quantity and types of education which the public shall provide and the other the amount of money which must be expended to provide these desirable types of education. These problems are interdependent. The quantity and types of education which may be maintained are determined mainly by the total funds available for use. On the other hand, an appreciation on the part of the people of the children's need of more education and of the varying types of education which are necessary to meet the needs and supply the serious shortcomings in the people, releases more funds for the establishment and maintenance of schools.

Since the money available controls what may be done, we are apt to think of our task in salesmanship as merely a money-raising problem. To do so is to approach the problem backwards, with the resulting confusion that follows inevitably from placing the cart before the horse. Merely securing the money needed is not marketing the schools to the people. This attack may succeed occasionally as far as getting needed money is concerned. It is not, however, a satisfactory handling of the matter because it is not a fundamental procedure. As a matter of fact, constantly presenting the schools' actual needs in a frank, honest, concrete fashion constitutes the real essence of selling the schools to the people. Any other procedure is clearly superficial and is therefore certain to prove ineffective more often than otherwise.

From the above discussion, educational salesmanship must first devote itself to keeping clearly and constantly before the public the amount and kinds of education which are necessary to achieve the ends society expects of the public schools. The public has a right to expect this. If it is not done, it must not be blamed if it does not support the public schools as those responsible think it should.

This task in salesmanship is a continuous one. It is necessarily so from at least four standpoints. First, the population whose support is needed gradually changes and new comers must be kept informed. This is especially true in rapidly growing centers of population. Oftentimes the latest citizens to come into a city or community are soon going to be numbered among the most influential people of the community. They must have a chance to be informed of the views of the school administration in reference to the needs of the schools.

Second, the needs which should be met in part through schools gradually

change, requiring that the processes of education shall be continually readjusted to meet these changes. For example, physical education and recreation are now provided in larger measure than before in an effort to meet through the public schools certain needs of the people with which we were but little concerned before the great war. Likewise the schools are responsible for ministering in many other ways to the physical vitality of children as they were not a few years ago.

Third, the convictions of people as to what the schools should do change. As a result of the changed thinking of people, such subjects as music, manual training, home economics, which formerly were not provided, are now a part of the work of every modern school. They came in at first as a result of the agitation and demands of intelligent, progressive citizens, and not through the initial efforts of educators. As the thinking of people changes and enlarges the plans of the administration responsible for the schools, the whole people should be advised that they may react intelligently in support of the school's expanded responsibility.

Fourth, ideas change in reference to how the school may go about its work most successfully. The public must be kept informed of these changed procedures with reasons therefor. It is now considered advisable to provide every school of any size with an assembly-room, with workshops, with visual instruction materials, and so on. Since the provision of these facilities entails added expense, the whole public should be kept informed in reference to the basic reasons for such changes.

In view of the foregoing basic considerations, the administration responsible for any system of schools must keep before the public certain major phases of the school program. Both costs and results secured must be presented; otherwise, the public is in no position to give willing and adequate financial support to the school program. A satisfied public is just as important in financing the public schools as are satisfied customers in the success of any business or commercial enterprise.

What, then, are some of the major aspects of any public-school system's program about which the people must be kept informed and with which they must be in hearty accord?

First, the values to society of good schools must be continually kept before the public. As education grows more complex and complete, and as schools improve to meet life's needs, new ways of stating these values so that they shall be inclusive and in the language of the latest thought must be found.

It is highly important that the values of education be always presented fundamentally to the public. The people should become accustomed to think of education not in terms of mere mastery on the part of children of the various subjects of study. Rather they should think of the contribution of the school through the teaching of subjects and related experiences to the physical, moral, vocational, avocational, and citizenship efficiency of each child as a child and as a citizen. No opportunity for keeping before the public these large aims of the school should go unused. Both in public

addresses and in the regular school publications, such as the courses of study and board of education reports, these fundamental undertakings of education should be concretely impressed upon the public mind. Nothing will do more to dignify education and to give it its rightful place of dominant importance in human affairs, thus enabling the public thoroughly to appreciate that no necessary price is too great to pay for the results which successful schools insure.

An educational program which seeks effectively to achieve such fundamental results makes a convincing appeal to every sane person as a plain business proposition. The experiences of the war did much to convince all of the superior efficiency in any undertaking of an educated citizenship. This was evidenced first in the power of a highly trained but miseducated Germany to defy the world for four years. It was also seen in the success with which our own citizenry successfully met every new and trying situation presented by the war. In consequence of this world-scale demonstration of the values of thorough education, we find our civic and fraternal organizations and our women's clubs seriously concerned to aid the improvement of education as never before. They realize that progress in democracy, in civilization, and in human liberty all depend on the constant improvement of our educational institutions, and they are intelligently aggressive to make them efficient.

This general point of view must be borne out and supported in each community by concrete evidences that the schools are achieving the results projected. The Nation-wide practice of devoting a week annually to education will bring large dividends in terms of increased support for education if the opportunity is wisely, honestly, and generously improved. On such occasions not only should desirable progress which is dependent upon education be emphasized, but the actual results produced by schools should be convincingly set forth.

Second, the need and importance of the total organization and machinery of the public schools should be kept continually in the public mind. Otherwise, the public fails to see the reasons for the changes and improvements which are constantly appearing in a progressive school system. Not understanding the need for such improvements, they are objected to as expensive "frills." The modern business man and woman progresses in business matters by reaching out for each new method or device which promises increased efficiency, such as the adding machine, the dictaphone, the modern filing system, and so on. Yet, many people who are progressive in their own business, if they are not kept informed of changed and improved procedures in education with the reasons therefor, condemn educational changes as fanciful and faddish.

A few of the major items in the machinery of operating a modern school whose need should be understood by the public may be noted briefly. The need of adequate grounds for play and gardening must be borne out by the types of work done and the results secured. The reasons for providing other than mere standard schoolrooms of the conventional type must be

evidenced in the profitable types of work and experience provided the pupils and in the uses made of the school by the community. Only thus can the expense be justified for providing and maintaining libraries, workshops with tools for use in art, cooking, sewing, manual training, club rooms for community meetings, assembly-rooms for various school and neighborhood purposes, lunch and rest-rooms, gymnasia, and so on.

Newer types of equipment must justify their existence by the kinds of work they are used in and by the results secured which would be impossible otherwise. When so presented, the public will readily understand the need of providing movable furniture rather than fixed school desks; ample supplies of supplementary and reference books; visual aids of all sorts, such as maps, globes, reading and music charts, stereographs, lanterns, lantern slides, moving pictures; musical instruments, such as pianos, victrolas, band and orchestra instruments, and so on.

The need and service of the modern course of study with its many subjects and varied advantages must be understood. Unless it is, it does not stand justified in the public mind in contrast with the narrower curriculum of a generation ago. How it is demanded by the modern school's effort to educate each child as completely as possible for the varied duties of life in a complex civilization must be understood concretely.

The service rendered by research departments in schools in promoting economy and efficiency must be understood that this addition to the modern school system may be approved and supported. Every progressive business man and woman knows the service which research agencies have rendered in their lines of work, but they are entitled to an explanation and demonstration of the service it renders in schools. How it aids in fixing proper standards, in judging whether pupils' attainments are satisfactory, in classifying children to promote better progress, and through the doing of these and other valuable things insures better education for the children at less cost, should be made clear.

The improved school service which is rendered by well-trained, professionally minded, adequately paid teachers in contrast with the results produced by mediocre teachers should be clearly demonstrated. The largest expense for good schools goes into the teaching staff. The higher the standards maintained in selecting this staff, the more expensive it is. That the increased results from securing such teachers far outweigh the costs should be made evident.

The time limits fixed for this topic make it impossible to discuss in detail the ways and means of leading and guiding the public so that they are intelligently and wisely active in promoting the development and improvement of their schools and at the same time enthusiastic in meeting the costs for public education. Certain basic considerations in determining the methods that should be used have been indicated above, however. For guidance as to detailed procedures, much good help is now available. Particular mention should be made of the excellent aid which may be found in

Alexander's School Statistics and Publicity and Alexander and Theisen's Publicity Campaigns for Better Schools.

Before passing from this phase of the topic in reference to how this work shall be gone about, four lines of fundamental procedure should be mentioned which are desirable to employ in working with the public. I shall note them in order of ascending importance.

First, reasonable use should be made of expert opinion. The public mind in America is fairly well informed. It considers principles and policies, not merely the immediate and tangible. The complexities of modern business necessitate expert professional advice, so the people are trained through their business experiences to consider seriously the advice of the expert, provided his positions are supported by common-sense considerations and tangible concrete evidence. The views and advice of experts in reference as to how to improve the public schools should, therefore, be brought to the attention of the public. This may be done through public addresses before civic, social, parent-teacher, and fraternal organizations, and through the public press. The public has a right to expect its school officials to keep them informed of new ideas and procedures which may lead to improved educational advantages for the children of the community.

Second, successful practices in use which are not employed in the local schools and which promise improved educational advantages should be presented to the public. Visits to observe these practices should be arranged. Both school officials and interested citizens should visit. The results secured from such visits should be reported through the press and before meetings of all sorts. Photographs should be secured. With many types of work, exhibits may be arranged. These exhibits serve corresponding ends in preparing the public mind for improving education that they serve in commercial lines in creating a demand on the part of the public for improved manufactured or other products.

Third, great attention should be paid to presenting to the public the results their schools are securing. They should see their schools at work under normal conditions. Once or oftener annually, the results secured should be shown through an exhibit. The exhibit condenses the year's work for the busy citizen and affords him a chance to study quickly the results his annual investment in education is helping to produce. Both the staple and newer lines of work should be shown. Features employing the children in action should be arranged. Statistical data should be presented graphically. Graphs to bring out progressive steps and improved results covering a period of years render it easy to see whether progress has been made. Brief addresses interpreting what the exhibit shows help in getting its meaning understood. The accomplishment of this result is also greatly helped by having in charge of every part of the exhibit both children, teachers, and parents who will take an interest in meeting visitors and in helping them to get the most possible from the exhibit.

Fourth, much more extended coöperative relations with citizens who are interested in improving their community in all possible ways should be es-

tablished by the schools than generally obtains. Advisory and consultation committees should be established whenever their help may be honestly asked. These committees never fail to prove a real help in analyzing and enlarging the plans and policies under consideration. Further, it should be understood that the school administration welcomes constructive suggestions and help from every source—mothers' clubs, parent-teacher organizations, women's clubs, and other civic, social, and fraternal organizations. If these coöperative relations are genuine and extensive use is made of them, the thinking, influential people throughout the community have all contributed to the development and shaping of every new policy and program before it is matured. The result is that when it is put into effect, or submitted to a vote, there is little doubt of its success. Not only may large groups of citizens, organized for coöperative effort, aid in raising money and in voting bonds, but in putting into effect better salaries for teachers, modernized school curricula, and improved school facilities, such as junior high schools, night schools, Americanization programs. The large results achieved through such efforts in many places attest the efficacy of these procedures in executing such measures. The writer's experience with types of effort of this sort in Berkeley during the past four years warrants him in urging upon you such ways of working.

This discussion aims to emphasize throughout that the public schools in any community should be kept concretely and adequately before the people at all times with the object of having their plans and results clearly understood and enthusiastically supported. When enlarged programs with increased costs are put into effect, they should come as a result of extended, well-considered thinking on the part of the whole public. Such changes should gradually evolve and shape themselves as a result of coöperative counsel rather than as the result of hasty, revivalistic efforts of a revolution-type.

That communities vary greatly in their support of school programs is evident to even the casual observer. That the same community supports its schools better at certain times than at others is equally apparent.

In the main, the difference in communities and in the same community at different times is due, provided what the people are asked to support is wise and desirable, to the way it is presented to the people—to the chance they are given to know fully and fairly what they should do. American communities vary in wealth and therefore in the types of programs they are able to support. They also vary in types of people which predominate and in controlling interests. School programs should not, therefore, be uniform nor will the expense bills be uniform. Experience suggests strongly, however, that communities support programs which are sensible in plan and costs, provided school leaders give the people a fair chance to be convinced that the proposed program is a good one. The responsibility for the success or failure of any community to put into effect a proper school program falls definitely, therefore, upon the school administration of the community.

That more definite provision must be made by school officials for carrying the duties of leading community thinking and planning aright is becoming increasingly evident. This arises out of greater costs for schools. It is also emphasized by the increasing complexity of modern education.

When leadership in presenting school programs and in securing financial support for them is so vital to community welfare, why is it not more adequately provided? The reasons urged are many, such as: "It takes time when there is none to spare because there are so many other things to do"; "We do not know how to do this work; there is no accepted technique which is sure to succeed"; "It costs money, when there is not enough now available to meet the needs of the schools." All of these state real difficulties, but each must be met and overcome. Time must be found to do the thing which is basic to all else. A little money must be spent to insure the raising of the greater amounts of money needed to finance the major efforts of the school. While there is no "fool-proof" technique of working, there is a good deal of help available as to how to proceed. Where it is lacking, common sense and ingenuity must do the best they can, for the task must be done.

In closing, let me remind school boards and administrators everywhere that only those school procedures and results can be sold permanently in any community or State which are actually worthy. Nor may school authorities expect to finance smoothly even the most worthy undertakings unless they have been presented to and kept before the public, so that they know and are definitely convinced of their worth and genuineness. While the duties and responsibilities of school authorities are many, this task of leading the public in the understanding and support of the best school system which can be conceived for and financed by any community is a primary duty which no school administration may neglect. The discharge of this duty is an indispensable prerequisite to all other efforts, and so must receive first attention if the progress and security of our public schools are to be maintained in keeping with the progressive evolution of modern social, commercial, and political institutions generally.

YOUR MOST PERPLEXING PROBLEM

E. C. FISHER, SUPERINTENDENT OF SCHOOLS, ROCK ISLAND, ILLINOIS

In putting this question to a number of leading school men they were quick to respond "Financing the Schools." The question of financing the schools is like the poor, "always with us."

To me the most perplexing and vital problem that we have in our schools is our inability to deal with the child as an individual rather than as a member of the group. The schools should so adapt their courses of study to the children as to make it both possible and practicable always to have every child at his best.

This is a departure from the traditional group method where a definite

achievement was required of all pupils, regardless of ability, and will require not only a rewriting of our courses of study, but also "selling the teacher on the proposition."

The traditional group plan does not take into consideration the ability and the individual differences of pupils. The minimum requirement is the standard of achievement. No provision is made for a large percentage of the children who have ability far beyond this standard. The result is disastrous in that it tends to hold the stronger children to a mediocre attainment.

Much time and money have been expended in the study of the average and the subnormal child, while the stronger and more intelligent have been left to drift. These children should have the consideration and direction that their ability warrants.

To illustrate, during the semester just closed, our course in reading was arranged and directed on the basis of ability. Many children read well and satisfactorily, according to the best Standards of Measure in reading, ten books; a few read twelve or more, while some, in doing their best, barely completed the basal text with an additional supplementary reader.

It needs no argument to see and believe that such a procedure places only one limit on the individual pupil, and that is the limit of his own ability. It is a measure of each pupil "by his own yard stick, not that of another."

The advantages of the plan are: (1) It tests and then teaches; (2) it keeps every child at his best; (3) it avoids comparison, except with the pupil's own record; and (4) the consciousness of his own growth is a constant incentive to greater effort. This is not a theory but a practical and workable ideal. The difficulties in the administration are: (1) Selling the teacher on the plan; (2) adapting the course of study to different abilities; and (3) reducing the number of pupils per teacher. The latter is the most difficult because it is based on the question of finance.

PROBLEMS OF FINANCING EDUCATION—HOW THEY ARE BEING SOLVED IN MY CITY

S. O. HARTWELL, SUPERINTENDENT OF SCHOOLS, ST. PAUL, MINNESOTA

The charter of the city of St. Paul has definite restrictions on city funds which make the task of securing adequate school revenues especially difficult. Taxes are based upon *per capita* of population, \$30 *per capita* being the limit for all tax costs for the running expenses of the city including the schools. Under present conditions the schools cannot expect more than one third of this sum. To this \$10 *per capita* is added State apportionment and State aid, making the present allowance for the schools a little more than \$11 *per capita* of population.

The only way to change charter restrictions is by amendment through popular vote. The only other avenue for additional funds is through the possible increase of State funds. Neither way gives immediate promise.

As the charter is drawn amendments almost necessarily involve the increase for other departments as well as for the schools; because of this, recent attempts to secure a higher *per capita* have failed. Apparently, the school campaigns have restored in the public a realization of school needs without as yet a discovery of the legal means of meeting them.

The campaigns, however, have had an effect on the apportionment of funds in the different branches of the city government for the schools. The efforts of the Department of Education are directed along four main lines. First, a careful budget. The budget for 1922, prepared in July, 1921, did not ask for all that the schools needed, but it did make clear through analysis of activities that the amounts asked for were absolutely necessary. As a result, it was the only one of the departmental budgets not reduced by the city comptroller, who has the task of making the final budget. He cut nearly \$2,000,000 from the requests of other departments.

Second, publicity regarding school facts and school needs. Before and during the war our financial restrictions were so acute that much emphasis was placed on school poverty with a somewhat necessary, though unfortunate, corollary of poverty of results. Actually we can show good results for the money expended. The present effort of publicity is, first—to establish clearly the fact that quality and extent of school service must depend on the support given through taxation, and second—to present the school needs on the basis of a city modern in spirit and up-to-date in public service.

Third, a needed step is the careful planning of a building program for a number of years ahead. Since 1900 the city has lagged in its building activities. We are now spending a bond issue authorized at the opening of the war; it is meeting the most pressing needs. To catch up and keep up, further bond issues will be necessary. Detroit, Michigan, in the last few years has shown the value of a fundamental analysis of population and building conditions as the basis of a building program. We are fairly advanced in a similar study. It has already proved most valuable.

The fourth line of effort is economy in the administration of present funds. This is a vital requirement in establishing confidence in management and educational results. On this confidence must really rest the plea for the additional funds needed to keep public education abreast of the city requirements.

HOW WE ARE SELLING THE PUBLIC SCHOOL PROGRAM TO OUR CITY

J. M. GWINN, SUPERINTENDENT OF SCHOOLS, NEW ORLEANS, LOUISIANA

We have learned wisdom from the peddler by the park gate, who shows his dancing monkeys and pretty balloons in a way to make the children clamor and cry for them and then the parents buy. Sell education to the children and you have sold it to their parents and your city. The converse of this proposition is also true, sell education to the parents and you

have sold it to the children, for the attitude of parents toward the schools is by far the most powerful influence in determining whether the children enter, remain in, and complete the scheduled courses in the schools. As practical salesmen, we seek to sell both pupils and patrons, but our chief endeavor is directed toward the children, for it is through them as salesmen that parents find the way to the dotted line.

Educators of old, like a certain man, made a great supper and bade many, but those invited made excuses and did not come. Then the master of the house said let anybody come—the poor, the maimed, the halt, the blind—yet many didn't come. Then he sent out his servants—his attendance officers—with orders to go into the highways and hedges and compel them to come in. Here the translator doubtless omits a few clauses which were in the original text, "and being compelled to eat what they didn't want it gave them indigestion and with one accord they made straight for the highways and hedges, saying 'never again.'"

Teachers have been so captivated with their educational menu that for a long time they thought the beauty and value of grammar and mathematics, history, and hygiene would sell themselves to the children. Later, on finding many not sold, reluctantly they asked the aid of the law to compel them to partake of the educational feast, only to learn that you may lead a horse to water but you can't make him drink. More recently, teachers have learned that this old truth is not a truth at all, for you can make him drink if you salt him. This is our task today.

It is a long story, too long for my brief minutes if it be not apart from the purpose of this theme, to note the changes that have been made in the educational program, looking toward selling education to all the children. The story concerns itself with changing the old, ugly, barren, uncomfortable, ill-furnished school building into new, attractive, beautiful, hygienic, and comfortable well-equipped building with adequate and equipped playgrounds; it concerns itself with the replacing of the unattractive, unskilled, and little educated teacher—salesmen—with attractive, skilled, and better educated salesmen (teachers) or in transforming the best of the old into teachers with modern points of view and ways of doing; it concerns itself with the enrichment and extension and increased usefulness and compelling attractiveness of the courses of study all so arranged to suit the varying capabilities and needs of the children; it concerns itself with a closer study of the customers who buy—the children—so that the right goods may be offered them. We have learned that all should not have the same program of studies and that selling plans for one are not suited to others. All of these we have attempted and are attempting to do in New Orleans, and the end is not yet.

We are inclined to see our own problem the most difficult and I have sometimes wished I had an easy place like the other superintendents in this group. The facts warrant my holding the opinion that selling public education in New Orleans has its own peculiar difficulties for the salesmen of private and parochial education are numerous and active.

How well public education is selling to the children is seen in the tre-

mendous increase in enrolment we have had in one year. February 1, 1921, we had enrolled 50,097, while February 1, 1922, the enrollment was 55,971, an increase of over eleven per cent in one year. Has any other city in this group, without an equal increase in population, experienced such an increase during the past year? We had a right to expect an increase of about two per cent in one year as our population is increasing about eighteen per cent in ten years so our increase in school enrolment during the past year has been more than five times the normal rate of increase.

Our public has been sold on the proposition to give the school board the right to levy taxes for the operation and extension of school facilities. During last school session, this proposition was voted into the State constitution by a vote of three to one of the voters in the State and by as great a proportion in New Orleans. Included in the plan is the authority given the school board to issue bonds for school buildings to run for not more than forty years and to require a tax for floating the bonds of not more than one and three quarter mills. In view of the fact that our rate of assessment is at 85 per cent of the cash value of property, this rate produces more funds than four or six mills where assessed values are one quarter or one fifth of the real value of the property.

It was a great and interesting campaign of education that prepared the way for the peoples' vote. The school board and administration officers were ably assisted by a permanent organization of citizens known as The Public School Alliance and by seventy permanent, organized school parents' clubs with about 10,000 members, several teachers' organizations, and organizations of women and by the press of the city. In this campaign, the child was made the center. "Give the children a chance," "The best is none too good for the children," and "The children expect you to do your duty" were some of the compelling slogans of the campaign. The needs of the children for buildings and grounds, good teachers and books, and other things needed were given first importance. The need of the teachers for adequate pay so that the best men and women could be drawn into the school rooms as teachers and held there was also a powerful force in securing a favorable vote on the tax.

We endeavor to keep selling our schools to the people—I think nowhere has the press been more generous of its space. School news and stories are always found in the columns of our papers. During the past month our leading morning paper sent a reporter to school; she remained a whole day in each half grade with one teacher, and on the following morning there was a whole column story about a day's work in the first B or the third A, as the case may be, and a large cut showing some phase of the day's work. These sixteen daily stories are but one instance of how our newspapers help inform the people of what the schools are doing. We believe in our goods and know that about all that is needed to make a sale is to show the goods.

American Education Week was made much of in our city. The press gave full accounts, a great electric sign was placed across our principal business street by order of the mayor, and blazed out its announcement

of the week and its invitation to visit the schools. There were 402 separate exercises in the public schools, representatives of the American Legion and others made 287 addresses at these meetings and 12,509 visitors came to the schools.

One of the most important functions of the superintendent of schools is to associate himself with the business men of the community. Each Thursday he attends the Chamber of Commerce luncheon, where opportunity is given to talk the school program to business men and on special occasions to address the whole group; on Wednesdays he sells education to the Rotary Club of the city, and as often as opportunity is afforded he addresses the organizations of men and more often he speaks to organizations of women and especially to the organizations of parents connected with the schools. There is one general professional organization of teachers and many organizations of classes of teachers—these organizations help materially in selling programs to the city.

Our mild winter climate makes it possible to stage large out-door demonstrations of school work, these pageants, athletic and physical education, and musical and other events never fail to call favorable attention to the schools. New Orleans public schools have been more fortunate in receiving large gifts from the estates of former rich citizens than any other city. On the first Saturday in May we observe Founders' Day—formerly called McDonogh Day in honor of John McDonogh, who about seventy years ago left one half of his, at that time, large wealth to the public schools of the city. It is an impressive and beautiful sight to see the thousands of little children bringing their flowers to deposit around his monument in one of our public squares and then by thousands march singing through the mayor's parlor and City Hall. This demonstration always attracts the moving-picture men, the newspaper photographers and reporters, and thousands of citizens have their attention called in a favorable way to the schools.

On the first Saturday in May, we hold at our famous, or some may say infamous, race track, our annual track and field meet for boys in the elementary schools. There are some thousands of these boys in competition—sometimes eight hundred contenders entered in the fifty-yard dash—the competition among schools is keen and usually fine and this annual event finds much front page and other space, with pictures, in all our papers.

There are many other details that could be given of ways and means employed in our selling program but enough has been said to give the more important means employed, and others would not differ materially from means in common use in all your cities.

In summary, the child is made the beginning and the end of our selling program; we seek to make our education so worthwhile and the teaching so effective as to attract and hold him in school and to fill him with school spirit and information, so that he becomes a salesman, selling his parents. Parents are organized and are active in practically all our schools; wide publicity is given our school program through newspaper

articles and stories and news and through addresses and discussions and exhibits of what the schools are doing and what they need and how the peoples' money is being spent.

REPORT OF THE EXECUTIVE COMMITTEE OF THE DEPARTMENT OF SUPERINTENDENCE

J. H. BEVERIDGE, SUPERINTENDENT OF SCHOOLS, OMAHA, NEBRASKA

When asked to open this discussion it occurred to the speaker that he could serve the Department best by getting an expression from its members. To this end he asked a number of superintendents to write a brief letter setting forth their own ideas on the future policies of the Department and others to state the kind of program they would plan for the coming year if the responsibility of preparing such a program were theirs.

Each member of the Executive Committee was also asked to express himself on this topic as a result of his experience in working on this committee. The following is a consensus of opinion then of a representative membership of the Department supplemented by additional ideas, an outgrowth of the experience of the Executive Committee. For convenience let us consider first, constructive suggestions and second, specific questions to be answered.

CONSTRUCTIVE SUGGESTIONS

For superintendents—A majority of inquiries answered seem to indicate that this Department should be in reality a meeting of superintendents for the discussion of superintendents' problems in such a concrete and effective way that these administrative officers will be able to render better service to their constituency. This is not, however, unanimous. Many hold the membership should include college and normal-school presidents, deans of education in colleges and universities, heads of research departments in city and State school systems, and the like.

Public school finance—One of the most important and immediate problems we face is that of financing public education. Future schools will be more expensive than those of today. If public education is to serve its real purpose means of supporting it must be found. The compulsory school age has been extended, attendance in high schools is rapidly increasing, standards of teachers' professional preparation are being raised. Hence it will be necessary not only to increase taxation, but new sources of revenue must be found. Why not let this body appoint a commission to study taxation and the collection and distribution of public funds? Such a committee would study and report for a period of three to five years; or possibly be continuous. This committee should be alert to coöperate and affiliate with other commissions making similar studies.

School publicity—In order to secure necessary financial support we must undertake the "development of basic evidence" that will enable us to carry

forward effective publicity campaigns. The public must understand what the school is doing and what the needs of the school are. This department should know what has been accomplished through effective publicity campaigns and how such campaigns were planned and carried out. The technique for such publicity for State, city, and county should be carefully worked out and made available in a definite, concise, and concrete form. It should be organized on a Nation-wide basis. A commission from this Department should be named to work out the best that has been thought, said, and done in selling the public schools to the respective communities and make its report to this body with definite recommendations and state what the fundamental principles underlying school publicity are and how the need for and value of public education may become rooted in the minds and hearts of the people.

Building program—What are the steps in formulating the building program for a city? Can old buildings be reconstructed or remodeled to meet present-day requirements? How are buildings properly located? What are the types of heating and ventilation for respective climates? How best conserve space, still secure plenty of fresh air and sunlight? How secure best plans and specifications? How get satisfactory janitorial service after you have your building? What is standard equipment for each type of building? How buy it at a reasonable price? How shall you make a building survey of your city and formulate a building program covering a series of years indicating needs for housing school children and how these needs may be most economically met commensurate with efficiency? This will involve present cost in relation to operating costs of large and small units and a study of educational objectives in each department of school organization. School buildings are constructed for the means of instruction, not as an end in construction. We commend the plan of a building exhibit in connection with the meeting of this Department this year. The idea expanded to meet new needs should become an annual event.

Educational objectives and achievements—Let us take an inventory of what we are doing to see if our cause is defensible before we carry it in an aggressive way to the people. This should precede our publicity campaign. What are we doing in each of the following units—elementary school unit including kindergarten and first six grades; junior high-school unit; senior high-school unit; training or normal-school unit; special school unit; part-time or continuation unit; adult education unit; and educational citizenship unit?

What are the objectives to be attained in each unit? What subjects of the curriculum are designed to realize these objectives? What are the costs of each unit in terms of educational objectives? Would it not help each one of us to study the system with which he is affiliated in terms of objectives and accomplishments?

It seems to the speaker that at every meeting of this Department some report of educational achievements in the past year with a forward outlook should find a place on the program.

Budget making and expenditures—In order to meet the demands for constantly expanding needs of the modern city and an efficient school system more accurate and scientific methods of budget making must be worked out. We must face this situation in a businesslike manner. We should make our requests for funds in terms of past accomplishments and for well-defined future needs. We must furnish the board of education and the appropriating body with such detailed information as will enable them to reach intelligent conclusions with respect to the adequacy or excessiveness of amounts requested. This will necessitate still better methods of accounting, a better system of bookkeeping, better comparative unit cost in relation to achievements attained. The better business man the superintendent is the more effectively will he be able to handle this phase of the administrative problem.

Here is an opportunity for a committee from this Department to render a real service to education by giving specific reason for the faith that is in us.

Better school organization—This Department can well afford to study the problem of efficient school organization. No doubt such a study would assist school administrators in eliminating waste and in securing better returns for money invested, in classification, standardization and distribution of schools, supplies and equipment, in the classification of pupils according to their abilities and aptitudes, in the advantage of the larger administrative unit over the smaller to a reasonable degree. We can bring better organization into child accounting by live census, improved attendance records, a more careful study of promotion and failures coupled with better management of the attendance department with the assistance of the visiting teacher, vocational director, and school nurse.

We might inquire concerning the value of teacher participation in certain forms of school organization.

The supervision of instruction—Here is one of the most fruitful fields for improving the efficiency of the schools. Every superintendent knows that where the best supervision is there is the most efficient school in the city, other factors being equal. Why is School No. 27 always best in everything? If every school in Chicago, Denver, Rochester, Omaha, or Cleveland had as good supervision as the best school in that city has, the efficiency of that school system would be increased—say thirty, sixty, or a hundred per cent. Every careful study of supervision evidences this sentiment. We need to know the best that has been accomplished in supervision. Have you noticed how silent most books on education are in respect to supervision? Here is an opportunity for an alert committee to render service to the profession.

The foregoing occurs to the speaker as the more important and immediate topics for the consideration of this department. A committee or commission should be appointed by the department to study these separate items and make constructive reports and recommendations to the department.

The speaker is not unmindful of other important matters deserving the attention of the department, such as: (1) How boards of education are

created; (2) the necessity for independent political control of boards of education; (3) coöperation between city systems; (4) curricula building; (5) teacher-supply, preparation, tenure of office, etc.

SPECIFIC QUESTIONS

1. Shall this Department be made a clearing-house for the status and advancement of the profession in this country? What is the key to making the organization professional? Should it be the business of the paid secretary to coördinate the best available vision on educational matters? If not what should be the responsibility of the secretary.

2. Shall the Department publish a yearbook which contains the best that is recommended and approved by each annual meeting? Shall the secretary have as his aid a Department of Research for carrying out and following up the suggestions of each annual meeting?

3. What is to be the relationship existing between the twelve affiliated organizations and the Department? Shall the Department attempt in any way to direct the groups into a harmonious whole or shall these groups be independent?

4. Shall the cities be arranged as in groups with simply one program for each group or shall we have two programs for each city group—one, a session open to all, and the other, an executive session where superintendents only of cities within the respective groups meet together to discuss problems peculiar to their respective groups.

5. Shall the program for 1923 be a program of distinguished talent giving addresses or shall the program be one for the consideration of problems and the reports of commissions, with constructive recommendations which will aid the superintendent in his work?

RESOLUTIONS OF THE DEPARTMENT OF SUPERINTENDENCE

CHICAGO, ILLINOIS, MARCH 2, 1922

MEMBERS OF THE COMMITTEE

Chairman, FRANCIS G. BLAIR, State Superintendent of Public Instruction..Springfield, Illinois
 KATHERINE HAMILTON, Assistant Superintendent of Schools.....St. Paul, Minnesota
 WILL C. WOOD, State Superintendent of Public Instruction.....Sacramento, California
 EDWIN C. BROOME, Superintendent of Schools.....Philadelphia, Pennsylvania
 FRANK W. BALLOU, Superintendent of Schools.....Washington, D. C.
 CHARL ORMOND WILLIAMS, Superintendent of Shelby County Schools, Memphis, Tennessee,
 and President of the National Education Association.

The Department of Superintendence of the National Education Association of the United States, representing, as it does, the head education officers, administrators, and superintendents of the school systems of the several States and territories of the Union, believing that huge armaments on land and sea are disturbers rather than promoters of international goodwill and world peace, creators rather than reducers of those vast National debts which hold the masses of mankind in poverty and ignorance, do hereby most heartily commend President Harding and his cabinet for their leadership in calling the world conference on the limitation of armaments and

for the far-reaching and fundamental work accomplished; and believing that the war-worn peoples of the earth realize now as never before that an ignorant populace is one of the main causes of wars, furnishing as it does an easy prey for deception and exploitation by ambitious and unscrupulous leaders, and that moved by the revelations of this great war the quickened thought of mankind is turning with eager faith and hope to universal education as the only guarantee of and sure foundation for a permanent world peace, and believing that in their search for a system of free public education which gives promise of immediate and abiding results, the American system of public instruction cannot avoid becoming an object of searching inquiry and observation—believing these things, we the members of the Department of Superintendence undertake a restatement of those principles and policies which we consider fundamental to the organization, administration, supervision, and instruction of a thorough and efficient system of schools, sufficiently elastic and responsive to meet the needs and demands of the growing thought and life of democracy.

1. No Nation-wide system of education can be thorough and efficient in implanting National ideals, aspirations, and principles in the minds of the youth, in transmitting from generation to generation its spiritual and intellectual inheritance, without liberal financial support from district, county, State, and Nation. Most of the defects and failures of such a system as reflected in unfit, unsanitary grounds and buildings, in inadequate equipment and courses of study, in ill-trained and incompetent teachers and supervisors, are traceable to insufficient revenues. Granting the possibility of effecting economies in present costs through better organization and instruction, we renew our former declaration that in order to raise the level of intelligence and citizenship throughout the Nation, in order to remove the National menace of ignorance and illiteracy, our State and National leaders must face the great task with statesmanlike vision and courage and provide for such National, State, and local revenues as will make possible the establishment of Nation-wide standards of intelligence, morality, and good citizenship.

2. In the consideration of Federal appropriations, it is necessary to restate and redefine the responsibility and authority of Nation and State in the establishment and control of public education. Education is a function of the State and not of the Nation. The principles of our Government and the teachings of our history establish that fact. Any attempt to transfer or limit this peculiar State function cannot fail to impair rather than improve the effectiveness and thoroughness of education. However great the need may be for more uniform opportunities and standards of education throughout the Nation, however lofty and patriotic the motives of those who may advocate it, any plan, either by direction or indirection, to establish and control educational standards and policies from the National capital will be destructive of sound governmental and educational principles and policies. But grants of vast tracts of land and large sums of money have been made from time to time by the Federal Government to the States for the encouragement of education, without such conditions

as impaired the educational authority and responsibility of the States accepting such grants. In-so-far as certain features of the Smith-Lever and the Smith-Hughes acts seem to violate this principle we call upon Congress to amend them.

3. Believing that the Towner-Sterling bill now before Congress recognizes and embodies the policy of the undivided responsibility and authority of the State in matters of education, we reaffirm our approval of the principles of that bill.

4. Much of the thoroughness and efficiency of a school system depends upon the size and character of the school unit of taxation and supervision. The small local district with a small enrolment and small taxable wealth is a relic of pioneer times and is an obstruction to educational progress. The size and shape of the local school district must be determined not only by its educational needs but by its revenue resources. As the child is as much a citizen of the county and State as he is of the local district, a part of the cost of his education should be borne by the county and the State. The county should be a unit for taxation and supervision in order to equalize educational opportunities and establish uniform standards throughout the country. The State should be a unit for taxation and supervision in order to equalize the educational opportunities and maintain uniform minimum standards throughout the State.

To the financing and management of public education should be applied the soundest business principles and experience. We approve the budget system of estimating the annual needs and apportioning the annual revenues and the use of a uniform plan of cost accounting such as has been recommended by a committee of this Department.

5. We believe that a system of public instruction to meet thoroughly and effectively the needs and demands of a free and self-governing people with universal suffrage, must offer a program of free educational opportunity extending from the kindergarten through the university, that the courses offered should be responsive to the growing thought and needs of society and should prepare for complete living in the social, intellectual, and industrial life of a democratic community. Such programs of study should provide in addition to the so-called cultural studies, courses in history and principles of our Government, thrift, vocations and homemaking, health, and social service.

6. If the National disgrace of ignorance and illiteracy is to be removed, thorough and effective compulsory attendance laws must be enacted and enforced in every State and district in the Union.

7. Current criticism of autocratic and domineering superintendence, of overlapping, duplicating and conflicting supervising authorities, whether well-founded or not, must not blind the public to the fact that one of the greatest needs of our school system, one of its most economic factors, is close and effective supervision. The need of teachers with native and acquired abilities is basic and paramount, but unless there is wise, sympathetic, forceful leadership to unify and direct their efforts toward common ends there must and will be great confusion, conflict, and waste. We therefore,

declare a thorough and efficient system of schools impossible without close and competent supervision in every district, county, and State.

8. We declare for careful statutory definitions of the respective functions and for clear and definite legal provisions establishing the duties and powers of State, county, and district superintendents.

9. There can be no such thing as an equal educational opportunity for the youth of a State or Nation until every child has a thoroughly prepared and efficient teacher. What we would implant in the hearts and minds of our children must first be found in the hearts and minds of the teachers. To secure for every school in America a good teacher is the most imperative need and demand of the hour. Therefore, in order to attract the brightest and the best persons into the teaching work and to encourage them to make the necessary preparation, we recommend that this Department commit itself to a campaign.

(a) To hold the present salary schedules against the reaction which has already set in.

(b) To hold and strengthen our teachers' pension and retirement funds.

(c) To lift the standards of qualification so as to exclude the untrained and unfit.

(d) To enlarge and strengthen our teacher-training institutions.

10. We believe that the interests of teachers and superintendents are one and we deplore any and all influences or forces which seek to create division and conflict between them.

11. We believe that thoroughness and efficiency in our school systems demand that teachers and superintendents who have met the standard of qualifications and employment shall not be dismissed from their positions except upon definite charges stated and established.

12. We feel that our schools cannot do their best work without the intelligent sympathetic support of that basic institution, the American home. Every influence which tends to impair the home life of the Nation is a blow struck at every other institution, but more especially at our schools. Every effort to strengthen and enrich the home life of our people should have the aggressive support of this Department. We, therefore, commend the National Home Makers Guild in its effort to secure professional recognition of this great work and to secure through proclamations of the President of the United States and the Governors of the several States the setting aside of October the 31st, each year, as Home Makers Day.

13. We declare that the public schools of America are established and maintained for the education of children in a knowledge of the truth and we deplore the apparent tendency to make them a medium for the spread of propaganda of various kinds. We further protest against the use of our public-school organizations for the furtherance of commercial schemes or as agencies for the collection of money for any purpose whatsoever.

14. In order that our educational system may more effectively remove illiteracy, and more thoroughly Americanize and assimilate the foreign-born elements in this country we call upon Congress to close the doors for the present against any further foreign immigration.

Department of Vocational Education and Practical Arts

OFFICERS

President—WILBUR H. BENDER, State Director of Vocational Education.....Des Moines, Iowa
Secretary—MISS FRANKIE CONNELL, Supervisor of Continuation Schools.....Hannibal, Mo.

PROGRAM FOR CHICAGO MEETING

FIRST SESSION—TUESDAY AFTERNOON, FEBRUARY 28, 1922

PART-TIME EDUCATION—Mrs. Susan M. Dorsey, Superintendent of Schools, Los Angeles, Calif.; Lulu Auracher, Principal of Continuation School, Des Moines, Iowa.

GENERAL DISCUSSION.

DIFFERENTIATION BETWEEN VOCATIONAL INDUSTRIAL EDUCATION AND GENERAL MANUAL TRAINING OR INDUSTRIAL ARTS—T. E. Johnson, State Superintendent of Public Instruction, Lansing, Mich.; Ira I. Cammack, Superintendent of Schools, Kansas City, Mo.

GENERAL DISCUSSION.

SECOND SESSION—WEDNESDAY AFTERNOON, MARCH 1, 1922

FUNDAMENTAL PROBLEMS OF HOME MAKING IN THE HIGH SCHOOL—Anna E. Richardson, Chief Home Economics Education Service, Federal Board for Vocational Education, Washington, D. C.; Wylle B. McNeal, State Supervisor of Home Economics, St. Paul, Minn.

GENERAL DISCUSSION.

IS EXPENDITURE OF CITY FUNDS FOR EVENING ADULT VOCATIONAL EDUCATION JUSTIFIABLE?—John H. Beveridge, Superintendent of Schools, Omaha, Nebr.; E. C. Hartwell, Superintendent of Schools, Buffalo, N. Y.

GENERAL DISCUSSION.

FUNDAMENTAL PROBLEMS OF HOME MAKING IN THE HIGH SCHOOL

ANNA E. RICHARDSON, CHIEF HOME ECONOMICS EDUCATION SERVICE,
FEDERAL BOARD FOR VOCATIONAL EDUCATION, WASHINGTON, D. C.

The aim of vocational courses in Home Economics should be to train girls and women to be skilled in the occupations of the home, to be proficient in the application of principles and knowledge on which the successful practice of the vocation depends, as well as to assume the responsibility for the management of a home. We should study the work and responsibilities demanded by the wife and mother in successfully managing a home and the duties which a woman must successfully perform in purchasing for the wants of the family, in providing for the social and spiritual demands, and in maintaining the right standards of family life, if we aim to really offer training which, in any small degree, is to fit our girls and women for the many sided occupation which we call home making.

The first demand of home economic teachers was for real products. This pushed small quantity laboratory cooking out of the schools and substituted for it the lunch room family-size portions, the home kitchen in place of laboratory equipment. Planning and purchasing as well as the preparation, not only of one dish, but of a meal, are essential if these girls are to go home and prepare real food for real families. Not only must this instruction be given in the schools under as nearly normal conditions as possible, but the girl must have the chance to do a real bit of home making in a real home. This is accomplished to some extent by the practice cottage.

A few years ago there was scarcely a course in child care or training to be found either in high school or college home economics courses. A great change has come in this respect and some of the high schools are finding opportunity to bring into school life contact with children through special home projects, attendance at day nurseries, children's homes, and the like.

I have been frequently asked the question, "Do you not think it is better to reach many girls with a little home economics than a few girls with a vocational course?" The educational value of a general course in home economics is accepted and experience has proved its worth. General courses cannot hope to offer training which will fit for the many sided vocation of home making, and it was for this reason that the vocational education funds were appropriated to help support a specially planned course for the girls who are desirous of this training and are willing to give adequate time to it.

There have been no sufficiently conclusive studies made to determine just how much training should be offered to girls in home making. Our statistics show that only 142 out of every 1000 pupils entering school graduate from high school so that it is important that we offer this opportunity where we will reach the greatest number. Therefore, we have urged that at least the first two years of high school be devoted to a program of home making as varied as we can make it, so that the girl may get an appreciation of the home and the manifold variety of its occupations and responsibilities.

When we have seen what training can do for the agricultural and industrial interests of the country, can we hesitate to apply some of the same scientific and educational methods to home-making?

IS EXPENDITURE OF CITY SCHOOL FUNDS FOR ADULT EDUCATION JUSTIFIABLE?

J. H. BEVERIDGE, SUPERINTENDENT OF SCHOOLS, OMAHA, NEBRASKA

Adult education in this discussion has reference to that training which is given to those beyond the compulsory school age and will include even those who, having been granted work permits, are required to spend a portion of their time in school in order to meet legal requirements. In some cities

this will refer to the training of those beyond eighteen years of age; others, beyond sixteen, and in some cases even those beyond fourteen years of age.

Necessity of adult education—The necessity for adult education is found in our belief in a democracy as the best type of government. Although Americans contend that a democratic form of government will serve society better than any other, the speaker is inclined to believe, when honest with himself and with the history of his own government, that democracy is still on trial. Sometimes he is inclined to the idea that in certain departments of the social order and even in certain departments of our own government that there is so much democracy that there is some difficulty in knowing exactly what is to be done with this type of government so that the best interests of the people may be served.

Concerning this situation it is clearly evident that the perpetuity of our government can only be assured through an intelligent electorate. No matter how optimistic one is, how enthusiastic in the interest of his own country or even how patriotic, he cannot face the facts of the present day without being compelled to admit that a higher level of intelligence in the electorate is necessary in order that the better interests of the country may be served.

The complexity of our present social order is such that it requires an insight and an understanding of the economical and social conditions in order to live rationally and perform the functions of American citizenry. Such an understanding of our economical and social conditions in turn requires a high intelligence level and continuous study on the part of adults as defined in the beginning of this discussion.

An impetus has been given to adult education because of the association of members of all classes of society, political and economical, on a common level during the world war. Through this experience of the people the members of society have come to recognize in part the value of education to themselves, to their friends and to certain movements in which they become interested. They are coming to see more clearly than ever before that in this country a common language—an American language, if you please—is necessary to an understanding and comprehension of what is going on in America, that in this country at least this is the basic and fundamental language, an inseparable exponent of citizenship.

And yet in addition to the necessity of adult education because of our democratic form of government another important sociological question arises. As society is now organized adult education is necessary as a protection to civil as well as political society. As the speaker sees it, one of the most essential points that confronts society today is how workers spend their leisure time, the out-of-regular-employment hours. It is significant to the welfare of this country that the extra-work hours shall be so employed that this time shall contribute to the welfare of the individual and to the welfare of society. How we spend our non-work hours will to a large degree determine the destiny of our nation.

Do you realize that almost one half the waking hours of the laborers of

today per week are non-work hours? Some statisticians have figured that in a city of two hundred thousand people there are over one million extra non-work hours per day. This may be a little exaggerated, but it signifies the importance of formulating a philosophy and practice for the proper use of the non-work hours. The factory system, division of labor, specialization and efficiency programs are giving us new social problems. Much work is now regulated as perfunctory and fails to develop power. It is of such a character that it is monotonous, it does not offer the opportunity for self-expression.

While many of us find in the work in which we are engaged great joy and satisfaction, yet when one studies modern industry it is not difficult for him to understand the attitude of the people when upon hearing the president of the Boston Labor Union speak encouragingly of Doctor Elliott's address on *The Joy of Work*, derisive laughter swept through the audience. One might inquire if handling a single tool day after day in a factory or sorting pens weeks after week or merely sliding rings from one place to another to be cut by a tool for a distinct purpose would set a man's soul on fire with enthusiasm for his work. This type of work baffles self-expression. One could even conceive that another engaged in such instinct-defeating work as this would lead him occasionally to wish that he were where he would burn body and soul. But the problem is here. Society must meet it. Its members must be given enough education to enable them to study, to think, to appreciate so that some form of self-expression may find a place in their lives, in their non-working hours. We must give people the opportunity to get not alone food for the body but food for the soul. We must enable members of society to get wholesome mental relaxation, to understand better the great out-of-doors, to cultivate a taste for literature and music. Indeed it would be well if they were taught how to play.

Almost every person feels within him "an instinct that reaches and towers and groping blindly above it for light climbs to a soul in grass and flowers." Ages ago a wise man said, "Wisdom cometh from the opportunities of leisure." Someone has suggested that one great difference between Lincoln and other men was the way Lincoln spent his leisure time. It was in their leisure hours that Henry Irving, the actor, and De Souchet, the dramatist, laid the foundation of their success. In history the names of such are legion.

Adult education is needed to discover worthwhile leadership. Proof of this is found in the organization growth and development of Foreman's Training Classes in factory and business organizations. That education of this type aids one in becoming more efficient in his vocation goes almost without saying. With the passing of apprenticeship it becomes necessary to train for the vocation by schools provided for that purpose.

Evidence of the value of adult education—"By your fruits ye shall know them." The following letter shows the value placed upon such training by a student in an evening class at Racine, Wisconsin:

DEAR MR. GRAHAM:

In 1914, when you were in charge of the vocational schools in Racine, I received my first glimpse of an evening school. To learn the English language and to be able to read English books was the height of my ambition. Being ignorant of the American customs, government, and history, I was more or less prejudiced against the average American. However, under the splendid environment of the evening school, which served me as an eye-opener, I have not only changed my opinions concerning the American people, but I have also changed the course of my life and set up my ambitions to a much higher level. Those moments when America and her opportunities were unfolded to me as an open book shall never fail in my memory.

During the evening school course, I realized that there was a chance for me to go to a high school and later to a college. So, in the fall of 1916, I entered Racine High School, from which I graduated in the spring of 1918. In April of the year 1918, I entered the service of the U. S. Government so the progress of my ambition was slightly retarded. However, in the fall of the year 1919, I reached the place after which my heart was yearning for years—I entered the College of Engineering of the University of Wisconsin.

This, in a few words, gives you the vision to which the evening schools opened my eyes. Not only have I learned to love America and her institutions, but I have also learned to appreciate the efforts of the men who, through the vocational schools, are absorbing large numbers of the coming aliens by opening their eyes to the splendid ideals and opportunities of this great country.

Most sincerely yours,

JOHN SLOZAK.

No doubt most of the cities represented here this afternoon could relate similar experiences. Just how Omaha has several boys who are taking regular high-school work as a result of an interest developed in evening school study. William Novak entered the South Evening High School in 1918. He is now completing his regular high-school work carrying six subjects and doing his work well. Another evening school student who is interested in architecture, Harold Sefren, is now in high school taking four periods in mechanical drawing, one in electricity, one in geometry, and one in woodworking. It is unnecessary to multiply numbers.

Here is a letter from the American Smelting and Refining Company showing the value to the Company of "The Foreman's Training Class" conducted by the public schools of Omaha, Nebraska.

Omaha, Nebraska,

April 27, 1921

It affords me considerable pleasure to commend the Foreman's Training Class, which was conducted during the past eighteen weeks in our plant, this class based upon the text "Foreman Training and Factory Management."

This class has been conducted here during a very trying period and has certainly a large influence in establishing among our foremen an appreciation of the fact that our problems are their problems, that our responsibilities are their responsibilities, and that our business is their business. It is a course which develops straight thinking along constructive lines which is a particularly desirable thing at this time.

ARTHUR E. HALL,
*General Superintendent of the
American Smelting and Refining Co.*

The speaker heard the manager of this Company state in public that the training given in this Foreman's Class saved the company \$200,000. He

also heard a graduate engineer, a student in this same class, say he had learned more about managing men in sixteen lessons in the Foreman's Training Class than he had learned in all his previous experience. He was a university graduate with several years' business experience.

With evidence of this kind you may be interested to know what we attempt to teach in this type of adult education. Briefly stated the following are the objectives in Foreman Training: (1) Increased production. (2) Improvement of operations and processes. (3) Decreased cost of operation. (4) Improved coöperation. (5) Decreased labor turnover. (6) Development of an understanding by the management, the foreman and the workers of the responsibility of each individual with regard to factory operations. (7) Recognition of the relation of the factory to the community and the community to the factory. (8) Recognition by the worker of production as a social rather than as a mere duty to himself and to the business in which he is employed. (9) Stimulation of other types of desirable training. (10) Preparation of analyses of jobs for use by foremen in training workers. (11) Preparation of foremen as industrial instructors. (12) Provision of job specifications for each job.

Foremen training has proved so successful in Nebraska that many business institutions are arranging to continue training through the organization of regular foreman conferences. From this type of training increases in production have resulted ranging from fifteen per cent at the close of ten lessons in a large laundry to one hundred per cent after twenty-one lessons in an engine factory.

Improvements in operations and processes causing a direct saving of money is but a small part of the general result from such courses. The more important results seem to be the *esprit de corps* developed, loyalty to the institution and right attitude toward life. To illustrate, during the packers' strike in Omaha one of the largest companies said that the training given to the foremen in their factory through affiliation with the public schools was by far the greatest factor in bringing about an amicable settlement.

Reports from thirteen cities selected with good geographical distribution representing the several districts of the United States show that last year \$323,043 were spent for adult education. In twelve of the cities the total enrolment was 41,719 pupils. Only one city of over one half million is included in this list, that one being but slightly over that figure. It can hardly be charged that these cities are doing what is not justifiable.

The several cities were asked to give estimate of value of work in adult education. Statements follow indicating cities by number: (1) Just as valuable as day school. (2) Most valuable work in proportion to cost. (3) Value cannot be estimated. Here to stay. (4) Teachers think it so valuable that they contribute their services. (5) Highest regard for work. (6) Valuable service rendered. (7) Much help given. (8) Of value to all who attend. (9) This work should be curtailed in this time of retrenchment. Of less importance than child education. (10) Has been limited until additional revenue can be secured. (11) Money brings a

large return for money spent. (12) Wise expenditure but funds inadequate. (13) Much help given serious minded students.

The burden of evidence seems to be that adult education is necessary and valuable and that a city is justified in spending or investing public funds for its support. This type of education in the larger way is not only for the welfare of the city, where the adults live, but it is for the welfare of State and Nation. All should contribute to the support of this type of education, and to adult vocational education for that matter, for this is a medium through which eventually will come the training for citizenship and for service. Indeed the speaker cannot see how the two can be entirely separated if the best interests of either or both are to be served.

It has been shown that there is need of adult education in our democratic government, that it is necessary for the conservation and development of citizenship in the non-working hours, that it helps to increase the efficiency of workers in service, that it is an aid in developing worthy leadership.

Its value is evidenced by statements of brother workers and employers. Cities have given their approval by support and statements concerning its value. This type of education has received both State and Federal aid.

Through the aid of public land grants State colleges have been established for the teaching of agriculture and mechanic arts. Other subjects are not excluded. By 1915 there had been established sixty-seven institutions giving instruction to sixty-nine thousand students. We have our State universities with their professional schools and giving baccalaureate degrees. Why should not city schools train for vocations and citizenship? It is just to community, State, and Nation.

If retrenchment must come the *child* should come first. Let us never place the dollar above the child.

BOSTON MEETING

SECRETARY'S MINUTES

The Department of Vocational Education and Practical Arts met Thursday afternoon, July 6, 1922, in Alumni Hall, Wentworth Institute. The meeting was called to order by L. H. Dennis, State director of vocational education for Pennsylvania, who presided over the meeting in the absence of Mr. Bender, the president. Mr. Dennis presented the various speakers, and in connection with each topic briefly set forth the importance of having the aims and objectives, as well as the basic need, of vocational education clearly analyzed and understood. He urged vocational teachers and administrators to clarify their own vision and thinking first and to follow this with a definite effort to inform correctly those engaged in, and responsible for, the administration of education generally.

The program follows:

VOCATIONAL EDUCATION AN ECONOMIC NECESSITY—Emery Filbey, University of Chicago, Chicago, Ill.

THE ECONOMIC VALUE OF VOCATIONAL TRAINING—Robert O. Small, State Department of Education, Boston, Mass.

VOCATIONAL EDUCATION FOR THE RURAL COMMUNITY—Augustus O. Thomas, State Superintendent of Public Schools, Augusta, Maine.

After the addresses had been given, the meeting adjourned to the lower floor, where a delightful reception was held.

The only business transacted was to appoint a nominating committee, consisting of A. L. Williston, principal of Wentworth Institute, Boston, Mass.; Professor George A. Works, Cornell University, Ithaca, N. Y.; R. W. Heim, State director of vocational education, Newark, Del. This committee reported the following: For president, L. H. Dennis, State Department of Public Instruction, Harrisburg, Pa.; for vice-president, Benjamin W. Johnson, University of California, Berkeley, Calif.; for recording secretary, C. C. Colvin, State Department of Education, Springfield, Ill.; for corresponding secretary, Leigh J. Rodgers, head of the department of machine work, Wentworth Institute, Boston, Mass. The report was adopted.

VOCATIONAL EDUCATION AN ECONOMIC NECESSITY

EMERY FILBEY, UNIVERSITY OF CHICAGO, CHICAGO, ILLINOIS

For purposes of this discussion we shall assume that vocational education includes "any form of education whether given in a school or elsewhere, the purpose of which is to fit an individual to pursue effectively a recognized profitable employment, whether pursued for wages or otherwise."¹ We should further assume that "vocational education of any specific kind functions when, as a result of a definite amount of training, an ascertainable degree of proficiency in the exercise of a vocation is shown in the individuals trained."² Any attempt to show economic necessity for vocational education must then take account first of the fact that such training is purposeful, and second of the fact that the return on such training should be measurable in terms of functioning.

In order that we may get this problem more clearly before us it seems desirable to canvass briefly present provision for the training in question, claims for and actual measurable accomplishment. We shall then be in a position to discuss probable economic returns as a basis for present-day programs of vocational education. In order that undue confusion may be avoided the discussion will be confined to training of less than college grade and for the most part to young people between the ages of 14 and 18, although in a few instances statistical material introduced covers training for adults as well as for juniors.

Since complete statistical data are not available for all lines of employment it seems desirable to refer for quantitative measures of training provision to the field of trades and industries which has been rather clearly defined and for which there is rather complete information.

The comparative significance of this group is indicated by reference to the United States Census Bulletin on Comparative Occupational Statistics for 1920. These statistical computations show that of the 41,614,248 persons ten years of age and over who are engaged in gainful occupations, 30.8 per cent, or 12,818,524, are working in the manufacturing and mechanical industries. Of this number approximately 15 per cent are women. The total group is larger by approximately two millions than the agriculture,

¹ David Snedden. *Vocational Education*, p. 535.

² David Snedden. *Vocational Education*, p. 537.

forestry, and animal husbandry group and as large as the combined groups of workers in trade, professional service, domestic and personal service, and clerical occupations.

A survey of present training provision and attainment for this large group of workers presents some rather striking facts. The 1920 census shows for example approximately one apprentice, so called, to eighty workers, although attention is called to the fact that many of these young people may be engaged in "machine tending." Incomplete data for 1910 as compared with those for 1920 show on the whole a marked decline in apprenticeship due in large part, no doubt, to more rigid classification. A correspondingly low percentage of apprenticeship training is reported by the Committee on Elimination of Waste in Industry of the Federated American Engineering Societies. It finds in the building trades, for example, a group representing some 3,000,000 mechanics and laborers, which is approximately 7 per cent of all persons employed in gainful occupations, only 1 per cent of the total number of workers listed as apprentices. It is evident that the large fraction of workers in these occupations is being trained, if at all, through provision other than apprenticeship.

Carefully prepared estimates of the work done by trade schools both public and private indicate that up to 1910 the total registration of regular students in trade schools did not exceed 1800, and that the number registered in 1920 was not in excess of five thousand. This meant in 1910 one trade school student for 6000 workers in manufacturing and mechanical industries and in 1920 one student for 2500 such employees.

The Annual Report of the Federal Board for Vocational Education for 1920 shows the following enrolment for training in public all-day, part-time, and evening courses in "Trades and Industries": All-day, 21,224; part-time, 17,244; evening, 48,354. Interpreted in terms of the working population represented, this means one all-day student for 600 workers; one part-time student for 750 workers; and one evening school student for 250 men and women employed in manufacturing and mechanical industries.

Using 2500 wage earners in manufacturing and mechanical industries as a base for distributing trainees we find the following representation: Apprenticeship, 25; evening schools, 10; day-schools, 4; continuation schools, 3; trade schools, 1; total, 43.

This means one trainee to 57 workers, which even if all training represented were quantitatively acceptable would be meager provision against which to check economic or other returns in any large way. If we assume an average productive work period of thirty years and an average training period of two years there should be under normal conditions one trainee for fifteen workers. This number checked against our present showing would indicate that approximately one fourth of the workers are being served even if we were to assume that present indicated provision were qualitatively acceptable, a condition which cannot be assumed, especially for a large part of the training indicated under apprenticeship and continuation schools.

Since the total number of employed workers is approximately 3.3 times the number employed in manufacturing and mechanical industries and since approximately only one half of the total population ten years of age and over is engaged in gainful occupation, this means one trainee in all industrial courses combined for 8250 gainfully employed and one to 16,500 total population ten years of age and over. On this basis we have at the present time, including apprentices, trade school students, day, evening, and continuation school registrants forty-three students in the industrial courses for a community population of 20,625. This thought of in terms of a community program does not represent major effort in the training of young people for vocations, especially since there is no indication that training for other lines of employment is more generously provided than for manufacturing and mechanical industries.

The Military survey of New York State, 1918, shows one boy in seven of the sixteen, seventeen, and eighteen-year-old group in school. Since this is the period during which vocational education can best be administered there is here again indication that up to date we have not provided even quantitatively for vocational education for those entering upon employment on less than the college level. It is obvious that, if school provision through vocational education is desirable, much remains to be done, and continued support, especially at public expense, calls for justification. It is in this connection that we find the advocates of vocational education resorting to the economic argument in favor of such training. Unfortunately the proponents of vocational education, just as those who have become enthused over possibilities for service through general education, have been inclined to deal in generalities rather than in specific factual returns from training undertaken. Upon the basis of generalities we find in the literature of Vocational Education proposals covering returns through wage increase and increased earning power; through conservation of materials and elimination of waste; through health improvement, safety and general well-being, and through other miscellaneous returns such as costs and standards of living. Needless to say we have experienced to date nothing approaching a wind-fall of blessing through realization of any or all of these general objectives.

Douglass has pointed out some of the fallacies connected with the early discussion centering around the "wage worth of vocational training," and shown that contrary to early expectation under certain conditions training on a large scale might be expected to reduce rather than increase the money wage. His conclusions indicate the fallacy of attempting to justify vocational education on the basis of direct wage increase.¹ It is doubtful if even such an ingenious system of computation as that employed by the Commission on National Aid for Vocational Education can long escape public challenge, although it proposed a modest wage increase of only ten to twenty-five cents a day for trained workers.² There is here something

¹ Paul Douglass, *American Apprenticeship and Industrial Education*, pp. 307-314.

² Report of the Commission on National Aid to Vocational Education—63d Congress, Second Session, Document No. 1004, p. 18-23.

akin to the situation which would be created among dentists if larger and larger numbers were to be trained. Instead of increasing the financial return it might reasonably be reduced as more and more workers were raised from the less productive levels of employment, a movement which would in turn tend to increase the wage return for the depleted group. Leaving then as relatively profitless any further discussion of wage returns, what economic returns should be expected from Vocational Education?

In one of the early papers presented before this section in 1879 we find this statement:¹

The problem then that seems to be before the educators of today is how some system of Industrial Education can be incorporated with our excellent public-school system, so that general culture and hand culture may be carried along together harmoniously. If this can be done we believe the laborer of the United States will lead the world in ingenuity and handicraft. How this may be done we leave to be considered by the papers and discussions in this Department which are soon to follow.

And again:

Labor is not only the child of education, but is dependent on it for its skill and productiveness. Education is now more necessary to the laborer than ever before, because the kind of labor required demands skill and knowledge rather than brute force, which is more and more supplied by steam and other forces of nature.

We find here an effort similar to more recent pronouncement from such groups as the Commission on National Aid to Vocational Education to encourage one form of vocational education because of general economic considerations of a national character. In addition to its argument that vocational education would be a wise business investment, the Commission on National Aid to Vocational Education called attention to the need for conservation of natural and human resources at a time when advantage from natural resources was on the decline and necessity for competition in world markets was becoming more and more pressing. It pointed out the necessity for increase in the efficiency of labor in the shops and elsewhere to overcome any loss through failure of the resource factor. It also indicated opportunities to reduce waste through relieving unemployment, underemployment, and other forms of improper work connection through a program of education which would fit unskilled labor for transfer to "scarcer and more needed work of management" and high-grade technical performance. Through such transfer from overcrowded to more remunerative occupations the commission hoped to make possible marked expansion of our industries.

Although the above statements of economic need are not subject to the same technical complications involved in attempts to show wage increase, they are very general statements and difficult to check in terms of training accomplishment. The following statement from former Secretary Redfield is subject to the same difficulty although it does reflect the economic interest of one of the staunch supporters of the vocational education movement:²

¹Addresses and Proceedings, National Education Association, 1879.

²Alvin E. Dodd, To Fit Millions for Their Work. *Manual Training Magazine*, December, 1915.

We are among the world's great industrial peoples, striving mightily for our place in the commercial sun. We need that place to keep our workmen employed and their families happy, but we omit a necessary thing to win and hold the position for which we strive. We train the physician for his job, the lawyer for his profession. We teach the veterinary how to care for the horse, and we even expect a dog doctor to know his job. With exceptions, excellent indeed, but all too rare, we are letting the city boy and the mechanic's son go it alone. We are so busy with winning our way, so concerned with our own National, State, and local affairs that a great problem like the wasting of our youth has been almost untouched.

Here it has come to be that years of a young mechanic's life are wasted in the learning how to earn his living after he has reached the time of life when it is his desire and duty to earn that living. Here is a weakness and a waste that may well alter the place of the United States in the commercial and industrial world.

Mr. Miles,¹ writing in 1912, called attention to the tariff situation and to the necessity for international competition in production. Facing prospective tariff reduction he pointed out that "the volume of imports will largely increase and every additional dollar of import must be offset by an additional dollar of export, carrying an equal percentage of labor."

This he held to be fundamental if the American working man was to retain his standard of living, much more fundamental if he were to improve it. He held that "as a people we are ignorant of foreign trade. America is to be likened to a huge stevedore bearing down to the ships of the sea crude and semi-crude material for the use of the capital, labor, and intelligence of foreign nations."

Contrast this general statement made by Mr. Miles in 1912 with a specific statement made by him before the City Club of Chicago in May of this year and you have an indication of progress which would afford a satisfactory measure of efficient vocational education so far as economic necessity is concerned. His statement follows:

Take hosiery, for instance: In the last five years a single operator has run twenty-five automatic machines, making the entire stock of 150 dozen pairs daily. Her piece-rate has been reduced to two cents per dozen pairs, and yet she gets three dollars a day. These socks cost 81.5 cents per dozen pairs today, including 36 cents for the yarn, and retail at ten cents a pair. The total labor cost from raw cotton to finished sock is two cents per pair; the lowest wage in the world, and the highest weekly earning paid to any hosiery workers in the world.²

Mr. Miles points out that similar conditions prevail today in the manufacture of shoes, agricultural implements, sewing-machines and certain other products which are produced in America more cheaply and better than in any other country, making possible favorable competition in world markets and at the same time paying high wages.

Savings in production can unquestionably be shown in agriculture, where it is claimed that the cost of producing the crop of a given year has been reduced by approximately \$20,000,000 a year over a period of fifty years, resulting in an economic gain of near one billion dollars annually at the present time. In other words the modern farmer is beginning to be something other than a "miner, mining the fertility of the soil, and selling it for the bare cost of the mining."

¹ H. E. Miles, Industrial Education, Bulletin No. 28, National Association of Manufacturers, 1912.

² H. E. Miles, Chairman of the Fair Tariff League, Address before the City Club of Chicago, May 17, 1922, City Club Bulletin, May 22, 1922, p. 83.

Corresponding progress is to be noted in business and in homemaking, but in all lines of productive effort there is yet much to be desired, as is indicated by the recent report of the Committee on Elimination of Waste in Industry of the Federated American Engineering Societies.¹ While it is possible to show gross gains it is also possible to show enormous wastage and it is for the most part through the elimination of specific items of waste that the economic value of vocational education is to be found. Additional gross gains in productivity or well-being may be equally chargeable to other forms of education or to general social factors rather than to specific vocational training. Let us look, then, at a few of the specific items of waste as determined by this recent engineering investigation. The committee finds that "waste in industry is attributable to (1) Low production, caused by faulty management of materials, plant, equipment, and men; (2) interrupted production, caused by idle men, idle materials, idle plants, idle equipment; (3) restricted production, intentionally caused by owners, management, or labor; (4) lost production, caused by ill health, physical defects, and industrial accidents."

Here we find at last a satisfactory base for a discussion of the economic return from vocational education.

It should be possible through specific training to correct our present faulty handling of "materials, plants, and men," and it should be possible through bringing about better understanding of the complete program of production to reduce the willful restriction of output, both by management and by men employed. Such wastes as are represented by illness, physical defects, and industrial accidents are clearly chargeable to the economic account, although they represent incalculable loss in terms of human suffering and social maladjustments.

As an example of the economic return which would be possible through one form of vocational education, both in school and in employment, let us consider the return possible through health training, including safety. Recent estimates show that the 42,000,000 men and women gainfully employed in the United States lose approximately 350,000,000 days each year because of illness. It has been estimated that at least 45 per cent of this loss is preventable. This means for the gainfully employed a loss from preventable disease and death of near \$1,800,000,000. Add to this economic item the long term result of 6,000,000 cases of organic disease among wage-earners, resulting from infection, and we have a situation which challenges our vocational education program in no uncertain terms. A challenge for measured production.

In addition to loss through illness there is an equally attractive field for educational service through accident prevention. The fatal accidents in industry alone for 1919 were approximately 23,000. In addition there were 575,000 causing four weeks or more disability, and 3,000,000 causing at least one day's disability. Impaired earning power caused by death or disability combined with time lost because of accident have been estimated as

¹ "Waste in Industry," Federated American Engineering Societies, Washington, D. C.

representing an economic loss of near \$853,000,000 for the year 1919.¹ It has been estimated that proper safety measures including education would prevent between 50 per cent and 80 per cent of these accidents. Here we find a specific objective for vocational education which would result in material economic gain, both for the employer and for the worker.

This combined loss through illness and accident representing as it does some 4.3 per cent of our total national income, or the return on productive labor for 1,750,000 workers, does not approach the total wastage reported by the Engineering Societies. To this amount should be added loss through "faulty production control," "faulty labor control," preventable idleness of men, plant, and equipment, and loss resulting from willful restriction of production. The total waste estimated for the metal trades covered by this investigation was fixed at 28 per cent, ranging from 6 per cent in the best plant to 55 per cent in the poorest. If we assume, and there is just basis for such assumption, that metal trades plants are as well managed as are other productive enterprises, we are justified in concluding that approximately 28 per cent of the workers now employed are engaged to no purpose. Numerically this means wasted effort for 11,480,000 men and women, or more than three times the total increase in our working population between 1910 and 1920.

The mere recognition of the fact that these enormous wastes are to be found even in our best managed enterprises carries us one step forward in the matter of solution. It remains to seek out the specific causal factors before remedial treatment can be effective. Fortunately some progress is being made through detailed analysis of the situation. The committee finds that approximately 50 per cent of the responsibility for waste should be lodged with management; 25 per cent with labor, and the remainder distributed among outside agencies.² Such a distribution at once suggests the training level on which specific corrective vocational education should be administered if definite economic returns are to be expected. It should, for example, be found possible through trade extension courses for adults, to attack many of the problems centering around the control of materials and the scheduling of production. It should be, and experience has proved that it is, possible through foremanship training to relieve much of the friction and consequent loss due to inefficient handling of labor. Similar results may be expected although not yet so clearly demonstrated through the thoroughgoing pre-employment vocational training of young men and young women who are to enter the more responsible positions in all lines of productive work. Such training is represented by much of the unit trade, agricultural, and homemaking courses administered under the Federal Board for Vocational Education and by the training now available in such schools as the New York City Textile High School. Training of this character coupled with leadership and expert service made possible through corresponding training on the college level, and connected on the other hand with an extended program of education for all workers en-

¹ Statistical summaries from "Waste in Industry," Federated American Engineering Societies, Washington, D. C.

² "Waste in Industry," Federated American Engineering Societies, Washington, D. C., page 9.

courages us to expect a measurable economic return from vocational education.

If the return from education of the rank and file of workers is to be a measurable one, vocational education must be as specific for this group as for those who are to provide for more efficient management. If vocational education is to reduce illness; prevent accidents; make for conservation of materials, through reducing the amount of spoiled work and the number of broken tools; motivate workers and reduce friction; quickly and effectively adjust workers to the kind of employment for which they are best suited, thus reducing unemployment, underemployment, and labor turnover; it must have definite economic objectives and instructional practice must be adjusted to these objectives.

To be effective such training administered in all-day, part-time, evening, or corporation schools must break for all time with "machine" methods of education and in like manner with teachers who can see educational return only in terms of "machine-made" educational product. We must get away from an administrative program controlled by teachers of special subjects. We may well begin by teaching workers and potential workers, who present themselves for vocational education, that part of the material in the field of health education which will enable them to keep fit and to protect themselves against loss from accident. We may give them training in social science and economics which will enable them to interpret the social and economic forces surrounding them in their work. Those who are privileged to advance to positions of responsibility should have enough to prevent the kind of disturbance to which President Howard, of the Commonwealth Steel Company, referred in a recent address, in which he compared the influence of a foreman or other responsible employee in charge of labor, who persists in "rubbing labor the wrong way," to that of an individual who stands in front of a very delicate and expensive machine and deliberately throws sand and grit into the bearings. This leads to material loss. The treatment of workers in many instances brings on similar results with consequent loss through ill-will and under-production. The vocational education of junior management in this detail of handling workers affords a specific objective, the return upon which is easily measurable. Equally measurable is that return upon the training of workers who are subjecting themselves to management without basic information to serve as a guide to safe and sane action; in other words, without "grit resisting" protective devices or qualities. All workers need this protection and something of the ability here implied and the giving of such ability affords one of the outstanding economic requirements of the present day.

The marked need for a higher type of technical productivity is too obvious to call for elaboration here. Suffice to say that in this field of endeavor is to be found instructional material for all levels and for all types of vocational education yet proposed; educational opportunities for training which can be made to result in a type of ability which can be used to marked economic advantage both to the individual and to the community at large.

Great as is the economic necessity for such training and even granting pointed and specific objectives now available for many units of vocational education, there is no guarantee that a major return can be expected unless the detail of instruction can be carefully controlled. There is in all probability no better statement of the problem here presented than that prepared by the American Defense Society in its bulletin on "Reconstruction in Education." A brief selection from their statement follows:

Training must do more than develop the automatic skill required. It must do more than impart the special knowledge needed. Unless it also makes the student master fundamentals, unless it also fosters initiative, it is hardly justified as education. Therefore the translation of job specifications into school procedure requires an analysis of the specifications for a given type of work into "common operations" or fundamental principles and processes.

It is now generally agreed that instruction is most effective when given by means of jobs, projects, or handling of real cases. The difficulty in constructing a course of instruction on this principle lies in selecting or organizing a series of jobs, projects, and real cases which gives proper attention to all the factors of skill and knowledge called for by the list of fundamentals. The content of the course must cover comprehensively the requirements of the specifications.

Once equipped with this type of instructional material and provided with instructors and administrators who are in sympathy with and trained in its use we may expect a very definite return upon vocational education; a return of economic as well as of broader social value. Such a program should function in part as a corrective to the disturbance generated in the course of our rapid transfer from a rural to an urban population and from a relatively crude to a highly scientific system of production. It should make possible a type of current progress which would prevent the condition to which attention was drawn in a recent article; a warning against lack of progress which would permit "the schools to lie becalmed in the currentless drift of old educational opinions and routines."

Department of the Wider Use of Schoolhouses

PROGRAM OF MEETINGS

OFFICERS

President—JOSEPHINE C. PRESTON, State Superintendent of Public Instruction..Olympia, Wash.
Vice-President—I. B. MORGAN, Director of Vocational Schools.....Kansas City, Kans.
Secretary—EUGENE C. GIBNEY, Director of Community Centers, Board of Education.....New York, N. Y.

FIRST SESSION—MONDAY AFTERNOON, JULY 3, 1922

Architectural Adaptation of School Buildings for After-School Use

- ARCHITECTURE THAT ENCOURAGES THE WIDER USE OF SCHOOLS—William B. Ittner, School Architect, St. Louis, Mo.
WIDER USE OF THE SCHOOL PLANT—Frank Irving Cooper, School Architect, Boston, Mass.
WIDER-USE PROBLEMS IN RURAL SCHOOLS—Dwight H. Perkins, School Architect, Chicago, Ill.
HOW SCHOOLHOUSES IN NEW YORK CITY ARE PLANNED FOR USE OUTSIDE OF SCHOOL HOURS—C. B. J. Snyder, Superintendent of School Buildings, New York, N. Y.
DETROIT'S NEW COMMUNITY CENTER SCHOOLS—Frank Cody, Superintendent of Schools, Detroit, Mich.
DISCUSSION LED BY—N. L. Engelhardt, Teachers College, Columbia University, New York, N. Y.

SECOND SESSION—WEDNESDAY AFTERNOON, JULY 5, 1922

Wider Use of Schools in Cities

- FACILITATING THE USE OF SCHOOLS BY CITIZENS' GROUPS—Eugene C. Gibney, Director of Extension Activities, Board of Education, New York, N. Y.
HOW WE SOLVED THE JANITORIAL PROBLEM—James T. Mulroy, Director of Extended Use of Schools, Boston, Mass.
THE VIRGINIA COÖPERATIVE EDUCATION ASSOCIATION—ITS INFLUENCE ON THE COMMUNITY THROUGH THE WIDER USE OF SCHOOL PLANTS—Mrs. E. Fenno Heath, Member Executive Committee of the Coöperative Education Association, and County President of Patrons' Leagues in Elizabeth City County.
HOW CIVIC ASSOCIATIONS CAN HELP RUN SCHOOL CENTRES—Violet G. Williams, Recreation Commission, York, Pa.
DIFFICULTIES IN THE DUAL DIRECTION OF AFTER-SCHOOL ACTIVITIES—W. C. Bachelor, Recreation Commission, Utica, N. Y.
WIDER USE OF SCHOOLS AND THE SCOUT MOVEMENT—Charles Mills, Director of Publicity, Boy Scouts of America, New York, N. Y.
BUSINESS MEETING.

The officers for 1921-1922 were reelected, and the school building program will be continued.

SCHOOL ARCHITECTURE THAT ENCOURAGES WIDER USE

WILLIAM B. ITTNER, ARCHITECT AND SCHOOL SPECIALIST,
ST. LOUIS, MISSOURI

Service is the test of good school architecture. The more efficient, the more extensive the service, the better the school plant. The topic could also read, *How the Wider Use of Schools Encourages Good School Architecture*, since the vital consideration in all school planning is adaptation to use. At the same time the stimulating influence of a salient suggestive environment on wider use cannot be overlooked. The two phrases, therefore—namely, *Good architecture* and *Extended use* support one another. Efficient schoolhouse planning encourages a multiplicity of uses and vice versa, maximum use calls for efficient building service.

School plants of yesterday cannot serve the expanded education of today—The old-time one-room rural school with its monotonous emptiness and isolation could not serve anything but a mere handful of children for textbook study. A far more fruitful service can be offered by the enriched consolidated rural school quite general today. The stereotyped box-like structure on a barren restricted site in our city of yesterday had no greater propensity for service than the forlorn and neglected one-room rural school. But compare it with some of our inviting architectural creations of today. This difference, no doubt, is the result of a change in needs. The fundamental changes in the working and living conditions of our great commonwealth have evolved a change in educational demands with a shift of emphasis on vital educational considerations. And simultaneously, an enriched and expanded school life has created demands for riches and more varied equipment in the form of buildings and grounds; in other words, for a new type of school plant.

Present-day objectives in education and community development require a rich, varied, and extensive environment—The maintenance and promotion of physical health is now a fundamental in elementary and secondary education. It is likewise a fundamental in the development of community life. The traditional classroom school could never serve an active health program. Playgrounds, gardens, gymnasiums, and showers are demanded for all. Neither can the barren environment of yesterday's schools serve for training in manual skill, worthy home membership, and wholesome use of leisure. Work shops, drawing rooms, laboratories, auditoriums, and school libraries are required. Classrooms for book work are not eliminated in schools, but they constitute only a portion of the facilities today and not the complete equipment. It is the renaissance in public education then, with its new objectives, together with an appreciation of the expansion of public-school service that have a new type of school environment—one that is richer, finer, far more interesting, varied, and extensive.

Public schools of today exist for all people as well as for all the children

of all the people—Public schools originally were established for children and primarily today they exist for “all the children of all the people.” But gradually, as education has become a continuous process, schools have expanded their service to include also “all the people.” And again, it is this wider use that continues to encourage greater efficiency in plan, richer and more varied facilities and more beautiful buildings and grounds. When analyzed, the facilities essential to adult uses are practically the same as those needed for the young folks. The chief difference lies in greater variety of certain instructional quarters and in size of equipment. For this reason secondary schools or complete centralized plants often serve better for adult uses than elementary schools. But where secondary schools are more or less remote, even present-day elementary school equipment can be adapted for community service.

Efficiency of plan is an ally to community service—The proper location and relationship of the component parts of a school plant are important both for regular and community service. Take, for instance, the gymnasiums, showers, pools, and accessories. Unless these recreational facilities connect directly with the play grounds, there will always be a discrepancy in the service of the full equipment.

It is essential that the auditorium be located on the main floor in close proximity to the main entrance, or arranged with a direct outside entrance. It is desirable, also, that the school library be near the main entrance, or at least centrally located in the building. But these requirements of location and correlation also serve the regular student body efficiently. Therefore, there need be no special re-arrangement of facilities when planning for wider use.

Successful lighting, ventilation, and heating encourage wider use—The successful lighting, ventilation, and heating affect the success of community as much as regular school uses. The “open plan” type which permits of maximum natural lighting to all parts of the building and an artificial lighting system of proper distribution and intensity ought to give satisfactory lighting service. The “open plan” type of building results in maximum natural ventilation, as well as lighting. In addition to this provision a properly designed, installed and controlled heating and ventilating plant will secure during the colder weather sufficient air movement, humidity, and normal temperature at all times. And it has become common practice now to install heating plants in such manner that rooms like the auditorium, library, the gymnasiums, the offices, and any others may be separately heated and ventilated.

School plants should represent the noblest architectural creations in the community—The interior of a school plant is but one phase. If schools are to appeal to the whole community, if they are to extend beckoning hands to the boys and girls who have dropped, for various reasons, then their exteriors must also evidence interest, variety, and beauty. In other words, exteriors must be symbolical of the interiors. There was lack of appeal both to children and adults, young and old in the school-house school-

house of yesterday. No one wonders now that children were glad to get away from it and that adults never entered its portals unless need compelled. The chief counteracting influence of the dead environment was, perhaps the radiance from the soul of a born teacher who inspired youth to great day-dreams. But what an assistance the present-day environment would have been to such a teacher, an ally rather than an obstacle.

In order to insure an architectural individuality, the exterior design of building should represent an evolution of the interior plan. If the interior plan is rich, well-balanced, and proportioned, the exterior should evidence these qualities. Then schools will not only be good to look upon, but interesting and cheerful to work and study in. They will constitute community assets both educationally and architecturally, as well as effective agencies for human advancement.

WIDER USE OF THE SCHOOL PLANT

FRANK IRVING COOPER, ARCHITECT, BOSTON, MASSACHUSETTS

A recent study of new school buildings now in process of erection has brought out the surprising fact that over two hundred and eighty millions of dollars will be spent for school building in the United States during 1922. Two hundred and eighty millions of dollars for school building that if used for school work in the customary way would mean that these buildings would be used only five or six hours of each school day, five days of each week, thirty-eight weeks in the year. In other words, school building would be used 190 days out of 365 possible days leaving two hundred and eighty million dollars buried so far as its use is concerned for 175 days of the year. This calculation refers to new structures only.

Carrying this investigation one step farther the report of the U. S. Bureau of Education gives as the total valuation of school property in 1917 the sum of \$1,983,508,818. The great part of this stupendous amount of money lies idle for 175 days of each year.

In many communities the public need for greater civic and social opportunities has focused attention upon the idle school plants. The people saw they already possessed one of the first requisites for providing these civic and social opportunities, that is, a meeting place convenient of access, comfortable, and oftentimes ready for use. The public was aroused and the use of the schoolhouse began to grow.

Gary, Indiana, is a striking example of the use of the schoolhouse by the people for sixteen hours each day. The children of that favored community no longer creep unwillingly to school but go joyfully to the school building many times during the day whenever their varied educational processes call them there and in all parts of the buildings they look happily about their work and happy about their play. And the parents of Gary, when their day's business is complete and their home work is done, go to these same school buildings and make use of educational opportunities for themselves in classes conducted for adults, and enjoy playing with each

other and with the children in the big auditoriums where music and drama and literature fill pleasant hours.

In Knott County, Kentucky, there is a chain of little schoolhouses which were built to meet the need of community work for the adults and education for the children. The first one of these little schoolhouses was built at Caney Creek and is the fruit of the untiring and unselfish effort of a visiting lady who saw the need of the little community and had a vision of the richness and beauty which it would add to the lives of all the people in that mountain valley.

This little schoolhouse contains a room for the kindergarten with a little kitchen in which lunch is prepared for the children and which is used as the distributing center for refreshments during the social meetings which are held in the big room. Beyond the kitchen is a room fitted out for industrial work and domestic science; this gives opportunity for instruction and practice in all kinds of manual work, both for the school children and for the grown-ups. These three rooms take up about one half of the building. The other half is a large room which is used as a schoolroom for older children through the high school grades, during the hours set apart for school work. At other times it is used as an assembly room for public meetings of all kinds in that community. At one end of this room there is a stage which may be shut off by folding doors; at the other end there is a folding partition by means of which a small portion may be shut off as a recitation room. Beyond this end of the room is a small room used for the principal and for a community library.

This little schoolhouse has been used so much and has given so great satisfaction that six similarly situated communities in this county have asked for the privilege of duplicating it and have erected a like building. Money for carrying on the activities of this little school has been raised in part by the community and in part by subscription. This past winter a selected group of boys from this school traveled with its founder over the eastern part of the country, telling of the work of the school.

In Wakefield, Massachusetts, there is being built a high school building which allows in some unusual ways the extended use of the school building. It is planned for a comprehensive high school, with class and recitation rooms, laboratories, commercial rooms, domestic science and domestic art rooms, library, mechanical and free-hand drawing rooms, shops, assembly hall, gymnasiums, lunch room, and principal's and superintendent's suites. Of these rooms the administration suite, assembly hall, gymnasium, shops, and the rooms for domestic science and art are planned also for community use.

The administration suites are so planned that by opening folding doors small meeting halls may be arranged for groups of not over one hundred persons each and each hall has its separate outside entrance.

The assembly hall, gymnasium, domestic science, and domestic art rooms, and the lunch room are all so planned that they have their own outside entrances and each may be used by its own group of people without interfering with any other group and without opening up the rest of the school building.

The gymnasium is behind and on the same level as the stage of the assembly hall and may be used to enlarge the stages, conversely; when exhibition games are played in the gymnasium, the assembly hall may be used to seat the spectators.

There are here given three specific examples of communities which appreciate the value of the school plant, the needs of the community, and the way in which these two are brought together: Gary, Indiana, which by its long-established school system and well-designed school buildings has been a prime mover in the increased use of the school building. The little town of Caney Creek, Kentucky, solved its own problem successfully and was an inspiring example imitated by several communities. And the old town of Wakefield, situated in one of the earliest and most thickly settled of our States, recognizes the same conditions and is meeting the same need in a similar way and by carefully planning its school buildings is preparing the way for a wider use of the school plant.

DIFFICULTIES IN THE DUAL DIRECTION OF AFTER-SCHOOL ACTIVITIES

W. C. BACHELOR, SUPERINTENDENT OF RECREATION, UTICA, NEW YORK

I have been requested to present briefly some difficulties in the dual direction of after-school activities. I will, however, confine myself to a discussion of some of the difficulties experienced by the Utica Department of Recreation in the use of school grounds as playgrounds and school buildings as community centers. I make no apology for confining my discussion to our own local problems as this in no way limits my subject. The difficulties experienced in Utica have been so many and so varied as to adequately cover the entire subject and include most of the obstacles which will be encountered in the average community.

The words "dual direction" referring to after-school activities in Utica is hardly appropriate, as our local school board conducts no after-school activities other than parent-teacher associations, the evening schools, a grammar school baseball league and interscholastic athletic teams, the two latter engaging only about one per cent of the school enrolment, and these for only a brief period of the year.

The suspension of the building program during the war left Utica, as it did most other cities, in a condition which has necessitated since the war an increased rate of expansion, and the consequent large appropriations required to compensate for past deficiencies in this respect explain in some degree the opposition on the part of a minority of the Utica School Board to undertake anything in the way of development of after-school activities.

However, the Department of Recreation which "aims through the proper utilization of leisure time to build physique, develop character, and promote citizenship" considers these so-called extra curricular activities as of equal if not even greater importance than some of those of the conventional school

curriculum. The Recreation Commission two years ago, therefore, outlined a comprehensive and diversified program of supervised recreational activities covering the summer vacation period and including after-school activities during May, June, September, and October. This was supplemented by community organization during the remainder of the year—that is, from November to May.

Having secured an adequate appropriation for the extension of this work, which had been carried on to a very limited extent for some years previous, the Commission proceeded to enlist the coöperation of the School Board to the extent of securing permission to use certain parts of several school buildings and school grounds for the establishing of community centers and playgrounds. Although the Commission arranged to pay the janitors generously for the additional work entailed and agreed to assume all responsibility for any damage to buildings other than ordinary wear, the cost of light, heat, and water, found upon investigation to amount to about \$1000 a year (the school board's annual appropriation that year being \$1,260,000) led a conservative minority of the board to withhold for more than a year the granting of permission to use additional school buildings for community activities.

The fact that school buildings in Utica, in the construction of which their use for other activities than those of the conventional school curriculum has not been taken into consideration, make the supervision of activities of this nature difficult, was also a factor in the reluctance of the school board to have the buildings used for this purpose even by another duly authorized municipal department.

Among these difficulties was the absence of assembly halls and gymnasias in many of the buildings, or, where they existed, their location being such that, with the absence of doors in corridors, the shutting off of those parts of the buildings not in use was impossible. Location of toilet facilities and drinking water requiring the throwing open of an entire building is also a problem which will be met satisfactorily only by providing, in the original planning of a building, for the partial use of the plant for community purposes. An admirable example of foresight of this nature is seen in the new schools recently constructed in Schenectady.

Of the five school buildings, the grounds of which are being used at the present time by the Department of Recreation as playgrounds, not one is so constructed as to allow toilets and drinking water to be shut off from the rest of the building. These are not therefore available to those using the playgrounds.

Another problem where after-school activities are conducted by an agency other than that which is responsible for the construction of school buildings is the inadequate size of recreation areas adjacent to schools, or, where the grounds are adequate, the unfortunate location of the building in the center of the area. I am reminded of big brother Bill who was admonished by his mother to give little Johnny half the bed. Bill did as he was told but slept in the middle and Johnny had to take his half on both sides. As most of Utica's thirty school buildings "sleep in the middle" only five of our

fifteen playgrounds are located on school grounds, and, of these five, a more advantageous location of the building was possible in most cases.

The opinion still held by a certain number of school board members, though fortunately a steadily diminishing minority, that school buildings should be constructed and maintained as well solely for the education of children, and furthermore that this education should be confined largely if not entirely to the stereotyped "3 R" variety, is undoubtedly the greatest obstacle in the path of wider use of schoolhouses. The persistence of this antiquated idea, aside from being one of the chief reasons for the dual direction of after-school activities in so many cities, is also the greatest complicating influence.

As an instance of this, a request by the Recreation Commission for the use of showers otherwise idle throughout the year in one school building two afternoons a week during July and August for school children under the supervision of playground directors was granted only by a bare majority vote of the school board. In another case where a playground is located on a school ground, the use of a small side entry-way is permitted for the storage of the playground equipment but access to the building is denied. Thus, in the event of an injury to a child, water, use of telephone or other convenience has to be secured through the generosity of neighbors. In another instance, three match scratches on the wall of a stairway leading out of a school building prompted an investigation of the conduct of community activities.

This idea, that school buildings are solely for school children, when shared by janitors, teachers, and even by school principals adds infinitely greater complications. One manifestation of the resentment toward those who would profane the sanctity of the schoolroom by its use by others outside of school hours in Utica has been the circulation of petitions among uninformed residents of a community in the attempt to prevent the opening of a building as a community center or to cause it to be closed afterwards. So deeply has this affected various subordinate school employees in Utica that a personal visit to the mayor to register a protest against this sacrilege has not been deemed too drastic.

We have also found obstacles to the dual administration of after-school activities in Utica originating outside the city. I refer to a State law in New York which prohibits any person being simultaneously on the payrolls of more than one city department. This prohibits payment by the Recreation Commission of teachers or janitors already on the payroll of the Department of Education for additional work in connection with after-school activities. Were this work conducted by the same department, as in the case of the evening schools, this difficulty would not arise.

Now, I hope none of my hearers will construe this paper as an indictment of our School Board, our teaching staff, or even our janitors in Utica. We have without exception a School Board composed of men and women of rare ability all of whom are highly esteemed in the community, and a majority of whom heartily endorse the program of after-school activities being conducted by the Department of Recreation. We are also proud

of the personnel of the Utica schools, from the superintendent down to the humblest employee not excepting the janitors. Among the more than five hundred employees in our school system an overwhelming majority are with us and with their coöperation I think I am safe in saying that a very definite start has been made in the wider use of school buildings in Utica.

I was asked to discuss difficulties in the dual direction of after-school activities and, rather than theorize on what I may have read or heard on this subject, I have given you actual facts regarding some of the difficulties which have confronted us in Utica during the past few years.

*THE VIRGINIA COÖPERATIVE EDUCATION ASSOCIATION
—ITS INFLUENCE ON THE COMMUNITY THROUGH
THE WIDER USE OF SCHOOL PLANTS*

MRS. E. FENNO HEATH, MEMBER EXECUTIVE COMMITTEE COÖPERATIVE
EDUCATION ASSOCIATION, AND COUNTY PRESIDENT OF PATRONS'
LEAGUES IN ELIZABETH CITY COUNTY, VIRGINIA

The Southland of this Nation with which the average reader is familiar, through history, story, and song, is that of plantation life, with negroes singing in the cotton fields or strumming their banjos by the cabin door. In those days of the Old South there were three predominant factors, the home, the church, and the state, and by them all conditions and all classes of people were influenced and controlled. After the Civil War conditions were changed and a fourth factor appeared, that of community life, which was to be far-reaching in its effects, for included in this big factor are the sub-divisions: public roads, public libraries, public health, and public schools.

It is now universally recognized that good roads are necessary because progress travels only where there is a good broad highway. Virginia is an agricultural State, the products of the soil being the chief source of revenue. It has been my pleasure to travel thousands of miles through its one hundred counties and address thousands of its people. To reach these different sections it was necessary to pass through portions of five bordering States—North Carolina, West Virginia, Kentucky, Tennessee, and Maryland, and the District of Columbia. In these 100 counties I have seen cotton in all stages of production from blossom to bale, tobacco being grown, picked and cured, field after field of corn, some with the slender green shoots just showing, others offering their ripening ears, peanuts growing, shelled and made into nutlet; have seen coal mines, coke ovens, and smelters in full operation, huge trees felled and converted into the various forms of lumber, portions of them being ground into pulp and the pulp made into paper, and I found it was difficult to convey these products to market because of poor roads. Fifteen inland counties are without railroads, and eighteen with less than twenty-five miles of them. When you consider what this means you cannot blame those who live in the country for being attracted to the

cities and towns because of the better advantages obtainable for their children. At present we are working in Virginia to get our people to vote for good roads, for we realize we cannot fully develop the other subdivisions of our community life unless we have proper roads over which to convey the materials and people for building and utilizing public libraries, disseminating the knowledge of how to keep well, and making use of educational facilities.

Each State has its own peculiar problems to solve. One of Virginia's greatest is its illiteracy. In educational affairs Virginia ranks forty-third among the forty-eight States. This illiteracy is caused almost entirely by the negro, the mountain white and the isolated population. There are only 50.1 per cent white children and 36 per cent of the negro children in school.

The negro situation is being very nicely solved by philanthropists of the North and West providing funds for the support of the Hampton (Va.) Normal Institute. This noted school trains negroes for leadership and has produced Booker T. Washington, Major Robert Moton, and others of lesser note who have founded schools which have colored teachers and community workers to teach and lead their own race.

The mountain people of the South are a distinct and typical group of American citizens; in fact, they are the most distinct and the most typical of all groups and classes in America today. Perhaps you have never realized that the mountains of the South constitute a territory as large as New England, with the State of New York thrown in for good measure. An incomplete census of 1910, the latest available at present, shows over five millions of natives living within the confines of the Southern mountains, and probably since that time the number has very largely increased. The tragedy of the mountaineers is the early marriage of girls from eleven to thirteen years of age and the large families; a woman of twenty will often be the mother of six or more children. Perhaps that is one of the reasons these people are so poor. It is an interesting fact that these people are the actual lineal descendants of those hardy warriors and true patriots of the Revolutionary War, and no other section of the United States can show so large a percentage of people descended from colonial stock. Many years ago a well-known educator said, "There is a mountain part of Old Virginia, though the world and the leading families of Virginia seldom think of its mountain counties," but we are glad to be able to tell you today that statement is no longer true.

During the World War we found that in one Virginia class of 961 boys examined for the army 487 could neither read nor write. These mountain boys, sturdy and sunburned, strong in body but untrained in mind, who previously had been scarcely ten miles from home, had never seen an airplane, a battleship, a steam engine, or a train of cars, went to war. Their mothers said, "It's terrible fur, but his Country needs him. He sure can shoot straight; I reckon them Germans will find that out for I teachd him myself to shoot the wild animals about here." I talked with one boy

eighteen years old who had attended school only two weeks and yet he went to war and fought in behalf of a country that had not treated him as it should, for our forefathers intended that all of our boys and girls should be taught liberty, democracy, equality, and loyalty through book education and public schools. Since these boys have come back they have sought an education, and how the women and men are working to aid them!

One county, Page, has organized over 40 leagues and it is like a fairy tale to hear the things they are doing. One old woman who had twenty cents a week for spending money gave up her snuff and tobacco to help buy books for her grandchild. These women who dip snuff and smoke a corn-cob pipe would be shocked to see "a sure-nuff" lady smoke a cigarette. One mother was so anxious that her girl should be trained for a teacher that she ploughed a large field, planted the seed, cut the sugar cane, and by using her own body in place of her horse (which had become sick) worked the machinery to grind the stalks and then boiled the juice to make the sorghum. It was six months' hard work but she was happy because it gave her daughter a year's schooling.

While passing over a lonely country road I saw a large crowd standing outside of the doors of the little school house which was also used for a church. A funeral service was just closing. The body of an old teacher was being carried to its last repose. Above the sobbing I heard a voice saying, "Her worn out frame of seventy-two years will soon rest in the grave, but she is not dead, she still lives in the children that she has sent out into the world from this school house. Her teachings shine forth from three pulpits, several court rooms, seven medical offices, two hospitals, and an improved community." These are the people who have taken for their motto *Hand in hand for God and school*.

We are proud to report that our second vice-president, Dr. McConnell of the Virginia Coöperative Education Association has taken for his life work the founding and carrying on of a normal school at East Radford to train the girls from the isolated districts in order that they may be able to go back and teach among their own people.

The aristocracy of Virginia has always been highly educated because they have had the benefits of governesses, tutors, private schools, colleges, and universities. It has been a comparatively short time since they have sent their children to the public schools. Our system has improved rapidly since 1904 when some of the prominent educators realized that coöperation of parents and teachers was necessary to make the public schools a success. These people from all over the State met in Richmond and promised to give their culture, influence, and money to help raise the standard of education so that even the humblest might have an acknowledged place in the world. The Coöperative Education Association was conceived and planned with the school house as a community center for the district and every school to have a league. We now have 1600 leagues with 40,000 members. This year in presenting the eighteenth annual report we have just cause to be proud of the constructive work done by these community leagues.

Four hundred thousand citizens were brought together to discuss and study their various educational and civic problems.

The great need of our people is information, and the school houses, the real temples of democracy, are used not only for the instruction of the children during the school hours but during evenings and holidays for addresses, public discussions and entertainments of various kinds, thus broadening the mental horizon and deepening the social and civic interests of our citizens.

Those of us who are directing affairs do not promote any especial plans because each community has different interests, but we strive to stimulate interest and suggest practical ways and sources of information and help, that other like minded groups have utilized for their several communities and found helpful: for instance, during the war the statement was made and proved, "It is nine times safer to be a soldier in the trenches than a baby in the cradle." Hence our motto—"100 counties—100 school nurses"—for we believe in not only looking after the children who are ill but in teaching the parents whose children are well to keep them well.

President Harding has said, "The will of the people should flow upward rather than the will of those in temporary authority to flow downward," and Lincoln said the Government should be of the people, by the people, for the people, and the people of conservative Virginia voted an overwhelming majority for compulsory education.

Our Coöperative Education Association is likened unto a wheel. The rim is the association, the hub, the Community League, the spokes connecting the hub and the rim are better coöperation, better recreation, better schools, better health, better highways, better homes, better agriculture, better churches, and all of these topics were used during the Second Rural Life Campaign, the Rural Life Committee being organized and set to work by the Coöperative Education Association. There are many school houses that would not have been built and many educational goals that would not have been attained but for the leagues and now there is added this agency that is seeking to enlist all governmental, religious, and social agencies to make life brighter and more attractive to the agricultural producers of the commonwealth. The first meeting was called by Governor Westmoreland Davis, May 17-18, 1921, in the Hall of the House of Delegates, Richmond, and 692 delegates registered during the conference. This year seventy-eight counties participated.

The ancient Greeks had an athletic contest that they called the torch race. Each contestant carried a torch and the first to reach the goal with his torch still burning was the winner. This was a difficult feat, but there was always a relay to seize the lighted torch and "carry-on" if a runner was unable to continue the race. The ancient game symbolizes the Co-operative Education Association. Those of us who have been carrying the educational torch flaming high with color will soon have to entrust it to others, therefore we are preparing the children of Virginia to "carry-on."

Daniel Webster said, "The welfare of a Republic lies in the education

of its children." This year we have started a department in our Richmond office called "The Junior League." The principles are: (1) love of country and home; (2) love of school; (3) care of health; and (4) self-improvement. The purpose is to teach good citizenship. Lincoln said, "When I die may it be said of me by those who know me best, that I always plucked a thistle and planted a flower where a flower would grow." The Patrons Leagues of Virginia are striving to pluck the thistles of illiteracy, vice, and uncleanness, and to plant the beautiful flowers of education, virtue, and good health.

I was requested to tell you something about the League work in my home county, Elizabeth City. Educationally that county ranks number one in the list of the State's 100 counties, and the George Wythe League, located near my home, leads all the rural leagues in the State. You may be interested to know that beginning April 30, 1607, John Smith tarried two or three days at Kecoughtan, afterward in May, 1620, renamed Elizabeth City. In 1634 Benjamin Symmes granted land, etc., for the maintenance of a free school for the white children of Elizabeth City, and "Kecutan" the first free white school in the Western Hemisphere. In 1659 Thomas Eaton established a similar school in the same locality, and at present there is a combination Symmes-Eaton school still drawing funds from money left by these two men.

George Wythe, born in our county in 1726, was the first American Chancellor, first Professor of Law at William and Mary College, and a signer of the Declaration of Independence. In 1776 he gave a large endowment fund to found a school in the district that is now named for him, and our school is known as the George Wythe School. When the women of Virginia were recently given the power to vote, we of Elizabeth City County undertook and put over, with the help of the men, bond issues, which resulted in the erection in our county of eight beautiful school buildings for both white and colored children. It mattered not that we had to break up a political machine to do this for we women realized that our motherhood did not begin and end within our own homes, but that we were responsible to Virginia; and the main reason we now care to vote lies in our desire to give the next generation the benefit of better opportunities than exist at present. You can see that our league is very democratic, because we believe that the object of the Patrons League is to advance the social, civic, and school interests in the community, and our membership includes ministers, lawyers, doctors, mechanics, and day laborers who meet upon a common level and work for a common good. The welfare of our children is the watchword of every day and hour—all else is secondary and we expect to see in Virginia an improved people, good roads, public libraries, and good health developed through the influence of the schoolhouse as a community center through coöperation of teachers and parents.

When the children of my neighborhood heard that I was coming to the National Education Association they asked me to tell you about our flower gardens, the mother who learned to sing while washing dishes, and Johnny Jones' mother's new hat. About five years ago I noticed that nearly every

one in our district planted vegetables only, so when I ordered seeds for my own flower garden I purchased enough to give away plants for transplanting. People now come from miles around to see the continuous flower gardens cultivated by the children of the neighborhood, and one lady from the North was so impressed with this expression of beauty—our pictures made with the brown earth for our canvas, our trusty little trowels for our brushes, and our seeds for colors—that she has written an article about it to read before the National Garden Club Association.

Johnny Jones is a newsboy. His mother has a large family of girls and boys. She is young and pretty, but she was so tired of washing dishes three times a day that once she felt almost ready to drown herself in her dishpan. She has a very sweet voice and now she practices scales with the glasses, octaves with the silver, and songs when she scrubs the pans. She has learned to read notes, count time, and not long ago sang a solo at our Mothers' meeting. She painted her washboard blue, and is going to paint her next one rose color because it is so much nicer to wash the clothes on something pretty. Her children carry home their little things from school, such as a drawing exhibited before the class, a book from the school library, a little bag of candy or cakes, purchased with money saved from carfare by walking home; they tie these little gifts, of no great value, with brilliant ribbon (that teacher gives them) and lay them on the kitchen table. Johnny's mother came to the league the other day in a new hat that he earned for her to wear for that express purpose. Perhaps there are other boys as proud as this one, but I doubt it, and surely no other mother could be happier, for

'Tis the little things and the common things and the things we do each day;
'Tis the little sign and the little song and the common words we say
That round at last to the perfect whole. For life is but this, my dear:
A summing up of the common things that makes the common year.

Oh! the little things and the common things are the things that make the day,
The common sun and the common rain and the grass beside the way:
The song of a bird in the swaying bough, the flashing of soft brown wings
Are all but a part of a perfect whole, God's beautiful common things.
