ADVANCE ESTIMATES OF PUBLIC ELEMENTARY AND SECONDARY SCHOOLS
FOR THE SCHOOL YEAR 1951-52

Prepared by
Research Division, National Education Association of the United States

THE AVAILABLE STATISTICS on public schools indicate that the year 1951-52 will continue to be a period characterized by increase in the demand for school services and decreases in qualified manpower and the purchasing power of school dollars.

During the World War II period the enrolment in schools declined slightly, many fully qualified teachers left teaching, school construction practically stopped, and financial support lagged. Beginning about 1947 the constructive forces in state legislatures and among all citizens moved rapidly to remedy wartime neglect and losses. The spurt forward of these constructive influences began to slacken in 1949. The lag in 1951-52 will affect manpower, financial support, and school construction. Meanwhile enrolments continue to increase steadily, the purchasing power of the school dollar declines, and the public schools must employ thousands of teachers who lack full professional qualifications.

THIS SUMMARY is based upon information supplied by state and territorial departments of education and education associations. It is the tenth in a series of national estimates begun in 1942-43.

Most of the figures in this memorandum are estimates. They are based upon previous years adjusted by expert judgment and by reference to the available preliminary surveys of individual states. A number of states have not completed their statistical summaries for 1950-51 and only a few have systematic data for 1951-52.

Previous experience with this series of advance estimates indicates that this report is a reasonably accurate statement of nationwide conditions as of October 1951. Elaborate statistical manipulations of these figures, beyond those given herein, are not advisable.

All of these difficulties are further complicated by nationwide manpower conditions (especially the uncertain demands of active military service), the restraints upon school construction, and the increasing budget and taxation of the federal government. These conditions are in turn affected by worldwide economic forces and unrest. The threat of war increases federal expenditures which in turn increases federal taxation. The combination of heavy federal taxation with lower purchasing power and higher local and state governmental costs has produced a "tightening" of the public attitude toward taxation. Reluctance to increase local and state taxes in turn impairs efforts to meet the need for higher teachers' salaries, new school construction, and recruitment in teacher education.

The foregoing summary suggests a somewhat static condition because there has been little change between 1950-51 and 1951-52. In both years nearly 90 percent of the states report fairly acute shortages of qualified rural elementary teachers (i.e., "very large" and "considerable"); in the cities more than 75 percent of the states have substantial teacher shortages in elementary schools.

For the nation as a whole there appears to be relatively little shortage of regular secondary teachers both in rural and urban areas. The estimated number of states in each category is about the same for 1950-51 and 1951-52. The shortage of qualified special secondary teachers seems to be on the increase since the number of states reporting "very large" and "considerable" shortages has increased since a year ago. The condition is apparently worse in rural areas (36 states) than in cities (23 states) but in both areas in a number of the states there is difficulty in finding enough qualified teachers for the special fields.

Needed supply--For three years these advance estimates have attempted to determine the number of additional teachers needed "to reduce teacher load and to provide adequately for increasing enrolments." The total for the nation has been about 36,000 each year (Table 3, column 7).

In some instances the estimated numbers reported by states have included the teachers employed on substandard certificates. No one knows how many of the holders of substandard certificates (70,691 in 1951-52) will eventually qualify for full certification. Each year a substantial proportion, thru summer-school attendance and other professional training, have obtained regular certificates. It must be kept in mind also that the acceptable minimum level of preparation varies considerably among the states.

If it is assumed that the 50 percent of those with substandard certificates should be replaced then the theoretical annual demand must be between 100,000 and 130,000 (i.e., 50,000-60,000 normal replacement, 25,000-35,000 substandard, and 25,000-35,000 additional need). Apparently about 60 percent of the annual demand is being met by employing persons with less than standard professional preparation.

Teacher education--The situation with respect to the teacher shortage may also be considered in terms of the number preparing for teaching. The present survey asked whether teacher-training enrolments in 1951-52 were larger, smaller, or about the same as in 1940-41. The details are given in Table 8, column 8. The general national picture for a period of years is as follows:

<u>School year</u>	<u>Number of states reporting current enrolments as</u>		
	<u>Much smaller</u> <u>than 1940-41</u>	<u>About same</u> <u>as 1940-41</u>	<u>Much larger</u> <u>than 1940-41</u>
1947-48.....	18	9	21
1948-49.....	9	14	25
1949-50.....	2	12	34
1950-51.....	5	11	32
1951-52.....	3	19	26

It is probable that the decline of the number reporting "much larger" reflects the increasing manpower demands of the military forces, government service, and industry.

facilities. These pupils are enrolled in school but attending in double sessions or other arrangements not as educationally acceptable as the typical, full-time school day.

In addition, according to the U. S. Bureau of the Census (reporting in July 1951 for the month of October 1950) nearly 4 million (3,997,000) children 5-17 years of age are not enrolled in any school. About 35 percent of this number are 14-17 years of age.

School building shortage--The present extreme lag in school construction began in the depression years; it became more acute under the construction restraints of World War II. Further complications have arisen because of population mobility and high birth rates since 1940. The estimates of the 1951-52 situation are given in Table 9. The present year compared with 1950-51 may be summarized as follows:

Type of school	Number of states in which building shortage is					
	Very small		Considerable		Very large	
	1950-51	1951-52	1950-51	1951-52	1950-51	1951-52
Rural						
Elementary.....	11	18	29	24	8	6
Secondary.....	11	18	33	27	4	3
Urban						
Elementary.....	1	1	23	27	24	20
Secondary.....	9	12	32	33	7	3

The foregoing figures suggest a slight improvement in the nation as a whole with respect to rural-school buildings (both elementary and secondary) and urban secondary schools. However, in view of the states reporting "considerable" and "very large" building shortages the outlook for 1951-52 is essentially the same as in 1950-51--difficulties in three-fourths or more of the states.

It must be kept in mind that, because of birth rates and population mobility, the shortage of buildings for elementary-school pupils is likely to continue for several years after 1956-57 (the estimated year of peak enrolment). High-school enrolments will begin to reflect the higher birth rates of the past decade about 1953-54 and reach top enrolment about 1959-60. Unless the present elementary-school building shortage is cleared by 1953, it will combine with new high-school enrolments to produce a dual problem.

A nationwide summary does not reveal the extreme conditions within the individual states. Population mobility, defense projects, and other factors have produced especially acute conditions in many new communities and in the suburbs of metropolitan centers.

Pupil enrolments--It is not possible to reconcile completely the estimates of the present memorandum and those of the U. S. Office of Education. The October 1951 figure of this report is to some extent an under estimate of the 1951-52 enrolment and the Office of Education estimate of August 1951, based upon statistics obtained at the end of previous years, may be slightly higher than actual numbers.

The present series of advance estimates show the following estimated enrolments for the years 1946-47 thru 1951-52:

The total for 1950-51 is about 28,000 higher than the 1949-50 estimate; the 1951-52 figure is about 23,000 higher than the total in 1950-51. It may not be clear until 1952-53 whether this decline of 5000 is indicative of a lag in available supply of qualified persons or the result of a slowing down in new revenues for the extension of size of staffs. Both restrictions upon the expansion of personnel to meet increasing enrolments and to provide new services are possibilities.

It is noteworthy that despite an estimated increase of 23,000 in total instructional staff members the estimated number of persons employed on substandard certificates is expected to decline by about 4500 in 1951-52 compared with 1950-51. These figures suggest that substantial numbers of teachers have been graduated by the teacher-preparation institutions and that qualified former teachers have returned to teaching. Such gains, however, do not permit too much optimism so long as more than 70,000 continue to be employed on substandard certificates and a demand for 35,000 teachers also exists to reduce class size and to meet increasing enrolments.

Teachers' salaries--Between the calendar years 1940 and 1950 the average salary of instructional staffs (classroom teachers, principals, and supervisors) increased 108 percent while the average annual income of all gainfully employed persons advanced 132 percent. In 1940 the average teacher was earning only 11 percent more than the average gainfully employed person. Thus teachers have been slipping down the economic scale.

Table 4 (columns 2 and 3) show the estimated average salaries of instructional staffs in the 48 states for the school years 1950-51 and 1951-52. Between these two years the average for the nation advanced from \$3097 to \$3290--an advance in purchasing power from \$1704 to \$1750.

Classroom teachers only (column 6) advanced on the average from \$2980 to \$3167--an increase of purchasing power from \$1639 to \$1685.

Since 1943-44 the most substantial gain in average salary of instructional staff was between the school years 1946-47 and 1947-48. The average salary advanced \$385 in dollars paid or \$125 in dollars of prewar purchasing power. Substantial gains were made in 1948-49 and in 1949-50. However, the advance of \$117 in the averages between 1949-50 and 1950-51 actually represented a loss of \$60 in purchasing power because of the sudden rise of prices beginning in the summer of 1950. The increase of \$193 between 1950-51 and 1951-52 is a gain of only \$46 in real income because of price rises since the summer of 1951 and the estimated higher prices expected during the remainder of the school year.

It is estimated (Table 5, column 3) that 3 percent of the classroom teachers (nearly 30,000) will be paid less than \$1500 in 1951-52; an additional 21.7 percent will be paid from \$1500 to \$2399.

The foregoing facts explain why the NEA Board of Directors and other NEA agencies have recommended a minimum annual salary of \$3200 for teachers. Even this amount would be below the sum necessary to restore the average salary of teachers to its prewar status in relation to earnings of all gainfully employed persons.

School expenditures--Beginning in 1950-51 these advance estimates attempted to obtain information on the total expenditures for public schools paid from local and state funds. Estimates also have been made of the expenditure per pupil in average daily attendance and the proportion of the cost paid by state governments.
