

ADVANCE ESTIMATES OF PUBLIC ELEMENTARY AND SECONDARY SCHOOLS
FOR THE SCHOOL YEAR 1953-54

Prepared by
Research Division, National Education Association of the United States

AS COMPARED WITH the school year 1952-53 the present report shows that 1953-54 will be characterized by:

- an increase of 1,197,000 in enrolments in public elementary and secondary schools
- an increase of 38,000 in instructional staff
- an increase of 2000 in the number of teachers who hold emergency or temporary certificates
- an increase of \$500,000,000 in current expenditures
- an increase of nearly \$12 in the average expenditure per pupil in average daily attendance
- an increase of about 4.8 percent in the average salary of instructional staff (classroom teachers, principals, and supervisors)

THIS SUMMARY is a series of estimates based upon information supplied by state and territorial departments of education and education associations. It is the twelfth in a series of national estimates begun in 1942-43.

Most of the figures are estimates based upon facts of previous years, adjusted by expert opinion and preliminary state studies. A number of the states have not completed their statistical compilations for 1952-53 and only a few have systematic data for 1953-54.

On the basis of previous experience it is believed that the present summary presents a reasonably accurate picture of nationwide conditions as of October 1953. Adjustments of facts of individual states may be expected from official studies in the next two years. Elaborate manipulation of these figures, beyond those shown, is not advisable.

Most of the foregoing changes were not unexpected but some of them, such as increasing enrolments, indicate a further piling up of the instructional, financial, personnel, and housing problems which have adversely affected schools during the past few years. In several respects the outlook for 1953-54 is clearly unfavorable:

- The enrolment in teacher-education institutions is not gaining rapidly enough to fill the need for qualified teachers.
- The accelerated growth in pupil enrolments is compelling school systems to employ increasing numbers of teachers who are not fully qualified for standard certificates.
- The shortages in buildings and qualified teachers continue to deprive at least 500,000 pupils of full-time schooling.
- The shortages of buildings and qualified teachers, especially critical in the elementary schools in the past seven years, are now producing serious problems at the secondary-school level.

The gain of 38,000 in the total number of instructional staff, between 1952-53 and 1953-54, took place at the same time that the number of emergency teachers was increasing by 2000 (that is, from 69,626 to 71,589; see Table 5).

Number of emergency teachers--In 1939-40 there were relatively few classroom teachers who did not hold "regular" certificates for teaching in their respective states. While state standards of preparation required of emergency teachers vary widely, as they do also for those holding standard certificates, the total number of emergency teachers both within a single state and for the nation as a whole is indicative of the shortage of qualified teachers. Actually, it is an understatement of the shortage since the total includes two other conditions which are not readily measured: (a) the number of unfilled positions or vacancies and (b) the number of classroom teachers needed to reduce classes to some reasonable size. Another report of the NEA Research Division shows that in a sample of 107,015 elementary-school classrooms in 526 urban areas, 33.2 percent of the pupils were in classes enrolling 35 or more children.^{2/}

During World War II, when many teachers entered the armed services and others took high-paying positions in business, industry, and nonteaching governmental service, it was necessary for school systems each year to employ increasing numbers of persons not fully qualified for regular or standard certificates. The number of persons employed who held substandard certificates was about 1 in 340 of the public-school teachers in 1940-41; the proportion jumped to 1 in 7 by 1946-47. Then the proportion declined steadily from year to year until it reached 1 in 15 in 1951-52. The ratio continued to be 1 in 15 for 1952-53 and 1953-54.

The 1952 report estimated that there were nearly 70,000 emergency classroom teachers in 1951-52. The outlook in October 1952 was that the total would decline to 64,000 in 1952-53. The present survey indicates that actually public schools had to employ 69,626 in 1952-53 and the outlook for 1953-54 is that the total will be 71,589. The "emergency teacher" situation, thought to be a condition which would disappear within 10 years after World War II, is apparently becoming critical again (Table 5).

Type and location of the teacher shortage--Details on this point are given in Table 11. A summarized comparison of reports for 1952-53 and 1953-54 is as follows:

<u>Type of position</u>	<u>Number of states in which the shortage is</u>					
	<u>Very small</u>		<u>Considerable</u>		<u>Very large</u>	
	<u>1952-53</u>	<u>1953-54</u>	<u>1952-53</u>	<u>1953-54</u>	<u>1952-53</u>	<u>1953-54</u>
Rural elementary teachers	2	3	31	29	15	16
Rural secondary teachers						
Regular	29	26	18	20	1	1
*Special	9	4	33	35	6	8
Urban elementary teachers	5	11	39	29	4	8
Urban secondary teachers						
Regular	42	39	6	9	0	0
*Special	15	12	32	34	1	2

(*The term "special" applies to such fields as industrial arts, vocational education, music, physical education, and similar subject areas.)

^{2/} National Education Association, Research Division. Class Size in Elementary Schools, 1952-53. Special Memo, August 1953. Washington, D. C.: the Association, p. 7. (Offset) 254.

on how the total enrolled in teacher education in the current year compares with the enrolment in 1940-41. The general national situation for a period of years is shown by the following:

<u>School year</u>	<u>Number of states reporting current enrolments as</u>		
	<u>Much smaller</u> <u>than 1940-41</u>	<u>About the same</u> <u>as 1940-41</u>	<u>Much larger</u> <u>than 1940-41</u>
1949-50	2	13	33
1950-51	5	11	32
1951-52	3	19	26
1952-53	4	17	27
1953-54	6	18	24

The year 1949-50 has been the most favorable since World War II with respect to the proportion of the states reporting teacher-education enrolments as "much larger" than in 1940-41. Since 1950 the trend has been somewhat unfavorable because of the competition for manpower arising from expanding industries and governmental services, and the heavy manpower demands of the military forces.

To sharpen the focus the survey this year asked also for opinions on how the 1953-54 enrolments in teacher education compare with the enrolments in 1952-53. Five states reported that this year's enrolments are smaller; 29, that enrolments are about the same; and 14, that enrolments are much larger than in 1952-53.

In anticipation of the next few years state officials are asked to estimate how well the teacher-education enrolments in 1953-54 would meet the probable demand for teachers in the next three years. The estimates for the individual states are given in Table 11, columns 10 and 11. Comparisons with other years may be summarized as follows:

<u>Type of teacher</u>	<u>Number of states expecting supply in the next three years</u>								
	<u>To be short</u>			<u>To be balanced</u>			<u>To be an oversupply</u>		
	1951-52	1952-53	1953-54	1951-52	1952-53	1953-54	1951-52	1952-53	1953-54
Elementary ...	42	45	48	6	3	0	0	0	0
Secondary	3	9	22	25	27	20	20	12	6

From a review of the foregoing opinions with regard to teacher-education enrolments it can be seen that the outlook is not a favorable one. Each year the proportion of states entering the "short" columns has shown some increase. All states expect the shortage of elementary-school teachers to continue into the next three years.

With regard to secondary-school teachers 22 states expected a shortage in the next three years. In 1952-53 the number in the "oversupply" column dropped to 12; for 1953-54 the number is six. In other words, the increasing enrolments, which struck the elementary schools in great numbers about 1947, have now begun to affect the secondary schools.

Teachers' salaries--The estimated average salary for all instructional personnel (classroom teachers, principals, and supervisors) in 1953-54 is \$3725, an amount 4.8 percent higher than the \$3554 estimated for 1952-53. Table 6 gives the figures.

The purchasing power of the average salary of the instructional staff is shown by two methods of calculation. The U. S. Bureau of Labor Statistics during the past year has issued a revised Consumers' Price Index, with 1947-1949 as the base of 100.0 instead

The total of 28,729,697 for October 1953 is a good estimate of the number of children and youth who will be enrolled in public schools in the school year 1953-54. It is 1,197,262 above the estimated enrolment in 1952-53. The total column is more reliable than the "elementary" and "secondary" columns taken separately because of variations in the states in classifying Grades VII and VIII.

In a special report,^{4/} made in March 1953, the NEA Research Division estimated that the 1953-54 enrolments in public elementary schools would be 23,105,000; in Grades IX thru XII, 6,061,000--a total for all public schools of 29,166,000. These March estimates differ from the October 1953 estimates by 436,303.

The March 1953 report of the NEA Research Division estimated that the 1953-54 enrolments in nonpublic schools would be: 3,422,000 in elementary schools and 726,000 in high schools--a total of 4,148,000 in nonpublic schools. These figures combined with rounded numbers of public-school enrolments indicate a total enrolment of approximately 24,456,000 in all elementary schools and 8,421,000 in all secondary schools--or a grand total of 32,878,000 in all public and nonpublic schools.

For comparative purposes the enrolments reported by the U. S. Office of Education have been as follows:

<u>Year</u>	<u>Elementary</u>	<u>Secondary</u>	<u>Total</u>
1949-50	19,404,693	5,706,734	25,111,427
1950-51	19,900,000	5,806,000	25,706,000
1951-52	21,318,000	5,456,000	26,774,000
1952-53	22,039,000	6,197,000	28,236,000
1953-54	23,369,000**	6,421,000**	29,790,000**

(**Figures for 1953-54 taken from press release issued August 26, 1953, by the U. S. Office of Education.)

Children deprived of full-time schooling--The steadily increasing enrolments, combined with the shortage of qualified teachers and the lack of school buildings, have produced conditions in many communities whereby thousands of children are deprived of full educational opportunities. The most obvious type of deprivation are those communities where children must attend schools in shifts or for so-called "half day" sessions.

Each year this present series of advance estimates has attempted to present an estimate of the number of children who must attend school for less than a full day. It has been difficult to obtain complete and entirely stable statistics on the problem. School systems have not always reported crowded conditions by October and, with the completion of new buildings during the school year, some of those on part-time sessions are restored to the regular school hours.

On the basis, therefore, of incomplete reporting, the 1952 advance estimates showed that at least 500,000 children and youth were on half day or similar part-time arrangements. The estimate for 1953-54 is that the number may be 632,000 (that is, total enrolment multiplied by 2.2 percent, columns 7 and 8, Table 10).

In August 1953 the U. S. Office of Education estimated that communities had built 50,000 classrooms in 1952-53 and might be expected to construct almost another 50,000

^{4/} National Education Association, Research Division. "The Outlook for School Enrollments." Journal of Teacher Education 4: 46-52; March 1953.

The purchasing power of the 1952-53 per-pupil expenditure of \$235.48 in prewar dollars (1935-1939 base) was \$123.42; on a base of the years 1947-1949 its purchasing power was \$206.38. Both of these calculations are based upon the indexes for September 1952 (190.8 on 1935-1939 base; 114.1 on 1947-1949 base).

The purchasing power of the \$247.45 in prewar dollars is \$128.48; in 1947-1949 dollars the estimated 1953-54 per-pupil expenditure has a purchasing power of \$214.80. (For indexes see footnote, Table 6.)

In 1939-40 the per-pupil expenditure averaged \$88 for the United States; that amount had a purchasing power of \$88 in prewar dollars. The gain between 1939-40 and 1953-54 is estimated as 181 percent in current dollars, but in purchasing power the gain is only 46 percent (that is, in terms of 1935-1939 dollars).

BUILDING SHORTAGE

The present lag in school construction began with the depression of the 1930's because of a lack of funds; it continued during the World War II period because of a lack of materials, funds, and manpower for construction purposes. Meanwhile the birth rates in the years since 1940 have accelerated enrolments far beyond the predictions made in the 1930's. Table 12 summarizes the reports for 1953-54.

Comparison of the conditions in the states (omitting District of Columbia) in 1952-53 and 1953-54 can be summarized as follows:

<u>Type of school</u>	<u>Number of states in which the building shortage is</u>					
	<u>Very small</u>		<u>Considerable</u>		<u>Very large</u>	
	<u>1952-53</u>	<u>1953-54</u>	<u>1952-53</u>	<u>1953-54</u>	<u>1952-53</u>	<u>1953-54</u>
Rural						
Elementary	16	17	23	25	9	6
Secondary (omitting Rhode Island)	17	16	25	25	5	6
Urban						
Elementary	2	1	25	22	21	25
Secondary	20	7	21	34	7	7

The foregoing summary suggests that the building situation for the nation as a whole has improved slightly since 1952-53 with respect to rural elementary schools. Last year 66.6 percent of the states had "considerable" or "very large" building shortages; in 1953-54 64.5 percent are in a similar predicament.

In urban school systems the building problem has definitely become worse. In 1952-53 all but two states had serious shortages in elementary schools and in 1953-54 all but one have such shortages. The secondary-school shortage has reached substantial proportions. In 1952-53 just 28 states estimated that they had serious needs for additional buildings for secondary schools; in 1953-54 the number has jumped to 41. This fact, plus other evidence on the teacher shortage, indicates that the housing of present enrolments now affects both elementary and secondary schools in a majority of the states.

Funds needed to house present enrolments--For the first time in this series of reports an attempt was made in October 1953 to estimate the total amount of money needed to house present enrolments in public-school buildings on a full-time basis. It represents the amount needed for new construction to eliminate half-day sessions, over-
